Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: Listing and third party evaluation are methods to support approval of equipment and should be considered in NEC 110.2; however, they may not be the only methods. The concept of providing fundamental guidance for making the approval decision has merit. Since the approval issue spans several articles, the panel requests that this be taken up by the TCC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
COOK, D.: See my Explanation of Negative on Proposal 10-21 (Log #4280).

10-26 Log #4375 NEC-P10 **Final Action: Reject**
(240.12(1))

Submitter: Alan Manche, Square D Company/Schneider Electric
Recommendation: Add a new sentence to the end of bullet item 1 in paragraph of 240.12:
(1) Coordinated short-circuit protection. <u>A means to intentionally defeat the coordinated short-circuit protection shall not be permitted.</u>
Substantiation: Establishing selectively coordinated systems can increase the arc-flash hazard when maintenance is performed on the system depending upon the design of the system. The arc-flash hazard can be increased in a selectively coordinated system and the panel has accepted those risks in favor of the benefit of selectivity on these systems for the purpose of the hazard that could be created due to a non-orderly shut down. Some system designers are now including a means to defeat selectivity by installing systems that can turn the selectivity off by temporarily changing breaker settings via a switch or sensor in order to protect the electrical worker. There is no prohibition established in the NEC to restrict defeating selectivity, or the life safety aspect for which it was installed, in order to protect the electrical worker.
Unfortunately the enhanced protection for the electrical worker can be a trade-off by defeating the life safety function of the selectively coordinated system and place a greater hazard on numerous other personnel or populations. The most likely time for an incident to happen that would require the system to be selective is when a working is doing maintenance on the system. If the selectivity is defeated, an arc event small or large could initiate a fire hazard or take down lighting, ventilation, or a critical process leaving a system inoperable which places the life safety of others in a dangerous position.
There are solutions available to support the reduction of arc-flash in selectively coordinated system without intentionally defeating selectivity to enhance worker safety.
Panel Meeting Action: Reject
Panel Statement: A system that is selectively coordinated can be designed to additionally limit the amount of energy produced in an arc flash event. When a system is selectively coordinated using circuit breakers without instantaneous trips the inclusion of an energy reducing maintenance switch for the protection of persons maintaining the system may be required.
Selectively coordinated systems as required in Articles 620, 700, 701, and 708 represent electrical systems in venues that are likely to meet the justification requirements of NFPA 70E for energized work. It is not desirable to prohibit a means to reduce the amount of let-through energy in these systems while energized work is being performed.
Also see panel action and statement on Proposal 10-82.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-27 Log #223b NEC-P10 **Final Action: Reject**
(240.13 & 240.21(C))

Submitter: Kim Hovey, Howard R. Green Company
Recommendation: Where 1000A (or more) service or feeder terminates in a factory listed device distribution device, ground fault protection is not required. Where any branch circuit of the listed device is 1000A or more, provide ground fault detection.
Substantiation: I think the intent of the 1000A or more ground fault requirement is not clear, especially, when the handbook explanatory notes make it clear that the ground fault protection is only for the line side, not the supply. Since most service (or feeders) utilize the tap rules, and terminate at a main breaker of a factory listed device, it should be clarified whether the ground fault rule is necessary. To me, there is a large difference between factory distribution devices and field installed conduit and wires.
I have submitted the same proposal to sections 230.95 and 215.10.
Panel Meeting Action: Reject
Panel Statement: The purpose of the referenced paragraphs is to limit the possibility of arcing burn down of equipment. Ground fault detection in these installations would not achieve the same intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-28 Log #3931 NEC-P10 **Final Action: Reject**
(240.13 Exception (New))

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association (NEFA)
Recommendation: Add an exception after the first paragraph.
<u>*Exception: Ground fault relays on the normal source side (line side of the transfer switch) that supply emergency systems, legally required standby systems, or healthcare essential electrical systems, are permitted to be restrained from operating for ground faults on the loadside of the transfer switch if the system complies with both of the following:*</u>
<u>*(a) Ground fault protection relays on the normal source side (line side of the transfer switch) are not restrained from operation for eround faults on the normal source side (line side of the transfer switch)*</u>
<u>*(b) Audible and visual signal devices indicate whenever a ground fault relay has been restrained. Instructions on the course of action to be taken in the event of an indicated eround fault shall be located at or near the sensor location.*</u>
Substantiation: For life-safety purposes and system reliability for the prevention of blackouts, it is desirable that a ground-fault on the load side of a transfer switch in an emergency system, legally required standby system, or healthcare essential electrical system, not take out the ground fault protection on the normal source. This proposal allows the ground fault protection on the normal source to be restrained from operating and taking down all or a large portion of the normal system because of a ground fault on the load side of the transfer switch. For these critical life-safety-related applications, it requires both audible and visual signaling that a ground fault has occurred and that it is being restrained.
Restraining the normal system ground fault protection relays for faults on the load side of the transfer switch is consistent with the concept of continuity of service for emergency systems (700.26 & 700.7(D)). legally required standby systems (701.17), and healthcare essential electrical systems (517.17(B)).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The requirements for ground-fault protection of equipment reside within the panels that have protection requirements for those specific applications outside the general protection requirements established by Panel 10 and therefore should remain under the purview of those specific committees unless otherwise directed by the TCC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(240.15(B)(1))

Submitter: Bryan P. Holland, City of North Port
Recommendation: Revise as follows:
(1) Multiwire Branch Circuit. ~~Except where limited by 210.4(B)~~ Individual single-pole circuit breakers ~~with or without handle ties~~ <u>with a means to simultaneously disconnect all ungrounded conductors per 210.4(B)</u>, shall be permitted as the protection for each...
Substantiation: Section 210.4(B) negates the proposed deleted text of this proposal. This revision better correlates the two sections and helps to clarify the intent of 240.15(B)(1).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 10-30 which meets the intent of the submitter to provide correlation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-30 Log #330 NEC-P10 **Final Action: Accept**
(240.15(B)(1))

Submitter: Paul J. Cormier, Worcester Electrician School
Recommendation: Revise as follows:
(1) Multiwire branch circuit. ~~Except where limited by 210.4(B),~~ Individual single-pole circuit breakers, with ~~or without~~ identified handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase line-to-neutral loads.
Substantiation: There is no longer a limitation given in 210.4(B), and handle ties will be necessary on single-pole breakers used in multiwire circuits to comply with 210.4(B).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-31 Log #531 NEC-P10 **Final Action: Accept**
(240.15(B)(1))

Submitter: Kenneth R. Ryan, Columbia, TN
Recommendation: Delete text to read as follows:
~~Except where limited by 210.4(B)~~, Individual single-pole circuit breakers, with ~~or without~~ identified handle ties, shall be permitted as the protection for each ungrounded conductor of multi-wire branch circuits that serve only single-phase line-to-neutral loads.
Substantiation: 210.4(B) was changed to state that "…each multi-wire branch circuit shall be provided with a means to **simultaneously** disconnect all ungrounded conductors at the point where the branch circuit originates." Article 240.15 (B)(1) should be changed to agree with Art. 210.4 (B). The above language would accomplish this bit of housekeeping.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-32 Log #2355 NEC-P10 **Final Action: Accept**
(240.15(B)(1))

Submitter: Gary P. Mullis, Mecklenburg County, LUESA
Recommendation: Revise text to read as follows:
(1) **Multiwire Branch Circuit.** ~~Except where limited by 210.4 (B), i~~ Individual single-pole circuit breakers, with or without identified handle ties shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single phase line to neutral loads.
Substantiation: 210.4(B) was revised in the 2008 NEC by deleting the limitation to only apply to multiwire circuit conductors serving more than one device or equipment on the same yoke. 210.4(B) now requires each multwire circuit to be provided with a simultaneous disconnect means. The result is that 240.15(B)(1) refers to a non existent limitation. The proposal will align the two sections and eliminate the confusion on limitations in 240.15(B)(1).
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 10-30 which also deletes "or without" as handle ties are now required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-33 Log #2552 NEC-P10 **Final Action: Accept in Principle**
(240.15(B)(1))

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481 IBEW
Recommendation: Delete text as follows:
~~240.15(B)(1) Multiwire Branch Circuit except where...~~
Substantiation: 240.15(B)(1) contradicts new code 210.4(B) Disconnecting Means for Multiwire Branch Circuit.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel has revised the language in order to address the submitter's concern. See panel action on Proposal 10-30.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-34 Log #2887 NEC-P10 **Final Action: Accept**
(240.15(B)(1))

Submitter: Joseph Bellantoni, Rivers Electrical
Recommendation: Revise text to read as follows:
~~Except where limited by 210.4(B),~~ individual single-pole circuit breakers, with ~~or without~~ identified handle ties, shall be permitted as the protection of each ungrounded conductor of multiwire branch circuits that serve only single phase line-to-neutral loads.
Substantiation: 210.4(B) requires the disconnecting means of a multiwire branch circuit to "simultaneously disconnect all ungrounded conductors." The wording of 240.15(B)(1) is misleading and seems to allow the use of single pole circuit breakers with or without handle ties. By removing the word "without" this bring 240.15(B)(1) in line with the requirement called for in 210.4(B) for multiwire branch circuits.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-35 Log #3044 NEC-P10 **Final Action: Accept**
(240.15(B)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal since the existing title was changed from "Multiwire Branch Circuit" to "Multiwire Branch Circuits" within the proposed text.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(A) Text remains unchanged.
FPN: Text remains unchanged.
(B) Text remains unchanged.
(1) Multiwire Branch Circuits. ~~Except where limited by 210.4(B), I~~ Individual single-pole circuit breakers~~,~~ with ~~or without~~ identified handle ties~~,~~ shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase line-to-neutral loads.
Substantiation: This proposal is intended to create uniformity with 210.4(B).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-36 Log #3849 NEC-P10 **Final Action: Accept in Part**
(240.15(B)(1))

Submitter: Bill McGovern, City of Plano
Recommendation: Revise text as follows:
(1) Multiwire Branch Circuit. Multiwire branch circuits with ~~Except where limited by 210.4(B), individual single pole circuit breakers, with or without~~ identified handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase line-to-neutral loads.
Substantiation: 210.4(B) requires multiwire branch circuits to simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates. There seems to be confusion with the wording in 240.15(B)(1) which allows multiwire branch circuits without identified handle ties to be used for multiwire branch circuits that serve single-phase line-to-neutral loads. By eliminating without handle ties it makes it clear that all multiwire branch circuits require simultaneous disconnecting means.
Panel Meeting Action: Accept in Part
The panel accepts the deletion of "Except where limited by 210.4(B)" and "or without." The panel rejects the deletion of "with" handle ties.
Panel Statement: The panel rejects the deletion of "with" handle ties as they are now always required per 210.4(B).
See panel action and statement on Proposal 10-30.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HIDAKA, J.: The 2nd sentence of the Panel action should read: "The panel rejects the deletion of "individual single pole circuit breakers with" handle ties."
This will then correlate to the "Accept" of Proposal 10-30.

10-37 Log #4152 NEC-P10 **Final Action: Reject**
(240.15(B)(1))

Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Delete text as follows:
~~Except where limited by 210.4(B), i Individual single-pole circuit breakers, with or without identified handle ties shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single phase line to neutral loads.~~
Renumber (2) to (1) and (3) to (2).
Substantiation: 210.4(B) was revised in the 2008 by deleting the restriction to multiwire circuit conductors serving more than one device or equipment on the same yoke ending on the same yoke. 210.4(B) now requires each multiwire circuit to be provided with a simultaneous disconnect means. The result is that 240.15(B)(1) refers to a nonexistent limitation. The proposal will align the two sections and delete the confusion on limitations in 240.15(B)(1).
Panel Meeting Action: Reject
Panel Statement: The panel understands the submitter's concern of the present language relative to NEC 210.4(B). The panel has revised the language in order to address the submitter's concern instead of deleting the entire paragraph. See panel action on Proposal 10-30.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-38 Log #4595 NEC-P10 **Final Action: Reject**
(240.15(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this paragraph.
Substantiation: This topic is now completely covered in 210.4(B), which imposes identical requirements. In terms of code administration, it is poor practice to have the same rule in two different places supervised by different panels. This topic is more closely related to the application of branch-circuit configurations than it is to the functioning of overcurrent devices, and so the rules should be in Article 210.
Panel Meeting Action: Reject
Panel Statement: The panel understands the submitter's concern of the present language relative to NEC 210.4(B). The panel has revised the language in order to address the submitter's concern instead of deleting the entire paragraph. See panel action on Proposal 10-30.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-39 Log #4466 NEC-P10 **Final Action: Accept**
(240.15(B)(2), (3), and (4))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Recommendation: Revise the text to read as follows:
(2) Grounded Single-Phase ~~and 3-Wire dc~~ ac Circuits. In grounded systems, individual single-pole circuit breakers rated 120/240 volts ac with identified handle ties shall be permitted as the protection for each ungrounded conductor for line-to-line connected loads for single-phase circuits ~~or 3-wire, direct-current circuits~~.
(3) 3-Phase and 2-Phase Systems. For line-to-line loads in 4-wire, 3-phase systems or 5-wire, 2-phase systems ~~having a grounded neutral point and no conductor operating at a voltage greater than permitted in 210.6~~, individual single-pole circuit breakers rated 120/240 volts ac with identified handle ties shall be permitted as the protection for each ungrounded conductor provided the systems have a grounded neutral point and the voltage to ground does not exceed 120 volts.
(4) 3-Wire dc Circuits. Individual single-pole circuit breakers rated 125/250 volts dc with identified handle ties shall be permitted as the protection for each ungrounded conductor for line-to-line connected loads for 3-wire, direct-current circuits supplied from a system with a grounded neutral where the voltage to ground does not exceed 125 V.
Substantiation: Section 240.15(2) and (3) allows the creation of multi-pole circuit breakers in the field with a handle tie for L-L applications. This provision should be limited to those applications covered by tests in UL 489, in other words, 2 single pole breakers connected with a handle tie for 120/240 Vac and 125/250 Vdc applications.

This proposal will bring the NEC into agreement with the UL White Book DIVQ guide information, which reads as follows:

Single-pole or multi-pole independent trip circuit breakers, with handle ties, rated 120/240 V ac, are suitable for use on multi-wire circuits with line-to-line or line-to-ground connected loads.

2-pole independent trip breakers and single-pole breakers with handle ties, rated 120/240 V ac, are suitable for use in line-to-line single-phase circuits or line-to-line lighting and appliance branch circuits connected to 3-phase, 4-wire systems, provided the systems have a grounded neutral and the voltage to ground does not exceed 120 V.

2-pole independent trip breakers and single-pole breakers with handle ties, rated 125/250 V dc, are suitable for use in line-to-line connected 3-wire dc circuits supplied from a system with a grounded neutral where the voltage to ground does not exceed 125 V.

2-pole independent trip breakers and single-pole breakers with handle ties, rated 125/250 V (both ac and dc), are suitable for use in accordance with either of the above two paragraphs, as applicable.

The proposal will prevent the misapplication of circuit breakers, particularly in light of the availability of three pole handle ties which have come on the market in response to the addition of 210.4(B) in the 2008 NEC. The UL 489 standard supports the applications allowed by the revised text, but no more.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-40 Log #246 NEC-P10 **Final Action: Accept**
(240.15(C))

Submitter: John W. Young, Siemens Energy & Automation
Recommendation: Delete text as follows:
~~(C) Closed-Loop Power Distribution Systems. Listed devices that provide equivalent overcurrent protection in closed-loop power distribution systems shall be permitted as a substitute for fuses or circuit breakers.~~
Substantiation: Article 780 – Closed Loop and Programmed Power Distribution was deleted from the 2008 NEC. Closed Loop is no longer addressed in the NEC therefore this Section should be deleted.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(240.16 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows:

240.x Listing. Overcurrent protective devices shall be listed.
Substantiation: Items critical to safety of electrical installations should provide indication that testing protocols have determined a level of safety.
Panel Meeting Action: Reject
Panel Statement: Listing is a method to support approval of equipment and should be considered in NEC 110.2; but, it may not be the only method. The submitter has not provided technical substantiation that the listing of these devices should always be required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

COOK, D.: See my Explanation of Negative on Proposal 10-21 (Log #4280).

10-43 Log #1551 NEC-P10 **Final Action: Reject**
(240.21)

Submitter: Kristin Quinn, JATC Local 176/Office Assistant / Rep. I.B.E.W. Local #176
Recommendation: Add new text as follows:

240.21 Location in Circuit. General. Overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply except as specified in 240.21(A) through (H). Conductors supplied under the provisions of 240.21(A) through (H) shall not supply another conductor except through an overcurrent protective device meeting the requirements of 240.4.
Substantiation: This would emphasize that the **general rule** is that overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply, except where permitted elsewhere in the code.
Panel Meeting Action: Reject
Panel Statement: The existing text meets the intent of the submitter. The parent text of 240.21 represents the general rule, and the eight first-level subdivisions address other permitted means of protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-44 Log #2273 NEC-P10 **Final Action: Reject**
(240.21)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise the first sentence of the first paragraph of section 240.21 as shown here.
240.21 Location in Circuit. For other than service conductors, overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply except as specified in 240.21(A) through (H).
Substantiation: The proposed inclusion of additional words makes it clear that required OVERCURRENT protection for service conductors is NOT required at their supply point. Section 240.21(D) attempts to address this issue by referencing section 230.91, which addresses the "location" of an "overcurrent device" with respect to a service disconnecting means. Section 230.90, "where required," begins by saying that "each ungrounded service conductor shall have 'overload' protection." The seeming redundant discussion of "where" (location) to provide the "overload" protection using an "overcurrent" device (separately defined) provides an opportunity for misunderstanding about what is intended or required by these sections.
Panel Meeting Action: Reject
Panel Statement: The proposed revision is redundant and not necessary as pointed out by the submitter's substantiation that service conductor protection is already addressed in NEC 240.21(D).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-45 Log #4825 NEC-P10 **Final Action: Reject**
(240.21(B))

Submitter: Don Ganiere, Ottawa, IL
Recommendation: Add text to read as follows:

(B) Feeder Taps. Conductors shall be permitted to be tapped, without overcurrent protection at the tap, to a feeder as specified in 240.21(B)(1) through (B)(5). Feeder taps shall be permitted to originate at the load terminal of an overcurrent protective device. The provisions of 240.4(B) shall not be permitted for tap conductors.
Substantiation: This type of installation is permitted in many areas, but the code does not specifically permit it. The additional wording will make it clear that this is a code compliant installation. As long as all of the conditions of this section are complied with the point of origination of the tap conductor does not create any additional hazard.
Panel Meeting Action: Reject
Panel Statement: The proposed language is not necessary as the present language permits such installation where appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-46 Log #2945 NEC-P10 **Final Action: Accept in Part**
(240.21(B)(1))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text to read as follows:

(1) Taps Not over 3 m (10 ft) Long. If ~~Where~~ the length of the tap conductors does not exceed 3 m (10 ft) and the tap conductors comply with all of the following:

(1) The ampacity of the tap conductors is

a. Not less than the combined calculated loads on the circuits supplied by the tap conductors, and

b. Not less than the rating of the switchboard or other distribution equipment ~~device~~ supplied by the tap conductors or not less than the rating of the overcurrent protective device at the termination of the tap conductors.

(2) The tap conductors do not extend beyond the switchboard, panelboard, disconnecting means, or control devices they supply.

(3) Except at the point of connection to the feeder, the tap conductors are enclosed in a raceway, which shall extend from the tap to the enclosure of an enclosed switchboard, panelboard, or control devices, or to the back of an open switchboard.

(4) For field installations if ~~where~~ the tap conductors leave the enclosure or vault in which the tap is made, the rating of the overcurrent device on the line side of the tap conductors shall not exceed 10 times the ampacity of the tap conductor.

FPN: For overcurrent protection requirements for panelboards, see 408.36.

Substantiation: As defined in Article 100, the word “device” applies very broadly and can include conductors as well as panelboards. Section 408.36 requires overcurrent protection within or on the supply side of the panelboard so “panelboard” is not included in 240.21(B)(1)b. No such requirement for switchboards is found in Article 408.

Section 3.3.4 of the NEC Style Manual states that “where” should not be used to mean “when” or “if.” This proposal intends to use the word “if” where appropriate.

Panel Meeting Action: Accept in Part
Revise text to read as follows:

(1) Taps Not over 3 m (10 ft) Long. If ~~Where~~ the length of the tap conductors does not exceed 3 m (10 ft) and the tap conductors comply with all of the following:

(1) The ampacity of the tap conductors is

a. Not less than the combined calculated loads on the circuits supplied by the tap conductors, and

b. Not less than the rating of the ~~switchboard or other distribution equipment~~ device supplied by the tap conductors or not less than the rating of the overcurrent protective device at the termination of the tap conductors.

(2) The tap conductors do not extend beyond the switchboard, panelboard, disconnecting means, or control devices they supply.

(3) Except at the point of connection to the feeder, the tap conductors are enclosed in a raceway, which shall extend from the tap to the enclosure of an enclosed switchboard, panelboard, or control devices, or to the back of an open switchboard.

(4) For field installations if ~~where~~ the tap conductors leave the enclosure or vault in which the tap is made, the rating of the overcurrent device on the line side of the tap conductors shall not exceed 10 times the ampacity of the tap conductor.

FPN: For overcurrent protection requirements for panelboards, see 408.36.

Panel Statement: The panel accepts the revision of changing “Where” to “If” in order to comply with the style manual. The panel does not accept the change from “device” to switchboard or power distribution equipment” since the language narrows the use of this section well beyond the present permission without necessary substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

COOK, D.: Submitter’s substantiation raises a valid question related to use of the Article 100 defined term “device”. However, the proposed use of the undefined term “distribution equipment” does not provide clear intent of the requirement for typical NEC users. For uniform application and enforcement of the requirement, text must clearly define equipment where 10 foot taps are permitted to terminate. Panel statement indicates proposed text narrows the use well beyond present permission. Based on the current Article 100 definition of device, narrowing the permission seems to be a positive step.

DOLLARD, JR., J.: We are voting negative on the panel action to accept in part proposal 10-46. Our comments are as follows:
The submitter is correct, the use of the word “device” in 240.21(B)(1)(1)(b) is incorrect. The word “device” is defined in Article 100 as follows:
“**Device.** A unit of an electrical system that carries or controls electric energy as its principal function.”
During the discussion on this proposal, it was clear that the panel intends for these “tap conductors” to be provided with overload protection. As presently written, the text permits termination in a device as defined above. The intent of the panel is not met in the present text of this section. The submitter is correct the existing text is confusing and should be clarified.
The present text of 240.21(B)(1)(2) includes more prescriptive text and limits termination of these “tap conductors” to “switchboard, panelboard, disconnecting means, or control devices.” The same level of clarity is necessary in 240.21(B)(1)(1)(b).
The panel statement refers to the present permission of this section. The submitter seeks only to clarify what is permitted. Clarification is needed. 240.21(B)(1)(1)(b) should be revised as follows:
“b. Not less than the rating of the switchboard, disconnecting means, or control device supplied by the tap conductors or not less than the rating of the overcurrent-protective device at the termination of the tap conductors.”
OCKULY, G.: I agree with the comment submitted by Mr. Dollard.
Comment on Affirmative:

FREDERICKS, C.: I agree with the panel action to Accept in Part, but the action should have included acceptance of the submitter’s proposed text “switchboard or other distribution equipment”. Ten foot taps may terminate on bussing or terminals other than the terminals of an overcurrent device. As long as all the requirements for a ten foot tap are satisfied, this should be acceptable.

10-47 Log #3636 NEC-P10 **Final Action: Accept in Principle**
(240.21(B)(1)(4))

Submitter: James T. Smith, Londonderry, NH
Recommendation: Revise text to read as follows:

For field installations where the tap conductors leave the enclosure or vault in which the tap is made, ~~the rating of the overcurrent device on the line side of the tap conductors shall not exceed 10 times~~ the ampacity of the tap conductor shall not be less than 1/10 the rating of the overcurrent device protecting the feeder conductors.

Substantiation: The obtuse wording of 240.21(B)(1)(4) is difficult to interpret when compared to 240.21(B)(2)(1). The wording of 240.21(B)(2)(1) is in a more understandable format and using the same wording would make it easier to interpret both sections.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 10-48.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-48 Log #4193 NEC-P10 **Final Action: Accept**
(240.21(B)(1)(4))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read as follows:

(4) For field installations where the tap conductors leave the enclosure or vault in which the tap is made, the ampacity of the tap conductors is not less than one-tenth of the rating of the overcurrent device protecting the feeder conductors ~~the rating of the overcurrent device on the line side of the tap conductors shall not exceed 10 times the ampacity of the tap conductor~~.

Substantiation: The method of describing the ration of the tap conductor to the feeder conductor should be consistent in this section. No technical change is intended. The language is similar to that used in 240.21(B)(2)(1).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-49 Log #609 NEC-P10 **Final Action: Reject**
(240.21(B)(2)(2))

Submitter: Gregory P. Bierals, Samaritan’s Purse World Medical Mission
Recommendation: Revise text to read as follows:

The tap conductors terminate in a single circuit breaker or a single set of fuses that limit the load to the ampacity of the tap conductors. Where the tap conductors have an ampacity that does not correspond to the standard ampere ratings for fuses and inverse time circuit breakers in 240.6(A), the next standard rating that does not exceed 800 amperes may be used.

Substantiation: The short time insulation withstand rating should be sufficient for this application, even though the overcurrent protection for the tap conductor may be up to three times the tap conductor ampacity.
Panel Meeting Action: Reject
Panel Statement: The present protection rule for tap conductors is a long standing rule and there has been no substantiation presented to reduce the protection requirements of the tap conductors. The submitters substantiation even points to the conductors being protected “up to … the conductor ampacity.”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-50 Log #3045 NEC-P10 **Final Action: Reject**
(240.21(C))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(C) Transformer Secondary Conductors. A set of conductors feeding a single load, or each set of conductors feeding separate loads, shall be permitted to be connected to a transformer secondary, without overcurrent protection at the secondary, as specified in 240.21(C)(1) through (C)(6). The provisions of 240.4(B) shall ~~not~~ be permitted for transformer secondary conductors.
FPN: Text remains unchanged.
Subsections 1 through 6 remain unchanged.
Substantiation: 230.90(A) Ex No 2 allows compliance with 240.4(B), therefore there should therefore be no reason to prohibit using the next standard size for transformer secondary conductors. 240.4(B) has an excellent track record, and should be allowed all transformers, not just those that provide service conductors.
Panel Meeting Action: Reject
Panel Statement: There has been no substantiation presented that reducing the protection of secondary conductors on all transformers in feeders and branch circuits is applicable simply based on permission for a service application. The use and loading of such conductors differ and cannot be equated with feeders and branch circuits without additional information.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-51 Log #1270 NEC-P10 **Final Action: Reject**
(240.21(C)(1))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:
240.21(C)(1)Protection by Primary Overcurrent Device. Conductors supplied by the secondary side of a single-phase transformer having a 2-wire (single-voltage) secondary, or a three-phase, delta-delta connected transformer having a 3-wire (single-voltage) secondary, shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with 450.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio.
~~Single-phase (other than 2-wire) and multiphase (other than delta-delta, 3-wire) transformer secondary conductors are not considered to be protected by the primary overcurrent protective device.~~
FPN:See 240.4(F) Transformer Secondary Conductors
Substantiation: In the interest of not repeating NEC rules in multiple sections, we believe this is a good way to keep the intent at both locations intact. We will propose the opposite change to 240.4(F).
Panel Meeting Action: Reject
Panel Statement: The proposed deletion would cause confusion and misapplication of the NEC. The inclusion of an informational fine print note is not as user friendly as including the requirement.
The duplication in 240.21(C)(1) is necessary to differentiate conductors meeting the general requirements of 240.4(F) from those considered as not being protected at their point of supply in 240.21(C)(2) through (6).
See panel action and statement on Proposal 10-18.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
COOK, D.: Current text in the first paragraph of 240.21 requires conductors to generally be protected at the point they receive their supply except as permitted in (A) through (H). Deleting the text as proposed simply requires the transformer secondary conductors considered in the second paragraph of 240.21(C) (1) to comply with one of the other conditions in 240.21 (C). The proposed FPN is unnecessary. I support an Action to accept in principal based on revisions included above.

10-52 Log #2947 NEC-P10 **Final Action: Accept in Part**
(240.21(C)(2))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text to read as follows:
(2) Transformer Secondary Conductors Not over 3 m (10 ft) Long. If ~~Where~~ the length of secondary conductor does not exceed 3 m (10 ft) and complies with all of the following:
(1) The ampacity of the secondary conductors is
a. Not less than the combined calculated loads on the circuits supplied by the secondary conductors, and
b. Not less than the rating of the switchboard or other distribution equipment ~~device~~ supplied by the secondary conductors or not less than the rating of the overcurrent-protective device at the termination of the secondary conductors
(2) The secondary conductors do not extend beyond the switchboard, panelboard, disconnecting means, or control devices they supply.
(3) The secondary conductors are enclosed in a raceway, which shall extend from the transformer to the enclosure of an enclosed switchboard, panelboard, or control devices or to the back of an open switchboard.
(4) For field installations where the secondary conductors leave the enclosure or vault in which the supply connection is made, the rating of the overcurrent device protecting the primary of the transformer, multiplied by the primary to secondary transformer voltage ratio, shall not exceed 10 times the ampacity of the secondary conductor.
FPN: For overcurrent protection requirements for panelboards, see 408.36.
Substantiation: As defined in Article 100, the word “device” applies very broadly and can include conductors as well as panelboards. Section 408.36 requires overcurrent protection within or on the supply side of the panelboard so “panelboard” is not included in 240.21(B)(1)b. No such requirement for switchboards is found in Article 408.
Section 3.3.4 of the NEC Style Manual states that “where” should not be used to mean “when” or “if.” This proposal intends to use the word “if” where appropriate.
Panel Meeting Action: Accept in Part
Revise text to read as follows:
(2) Transformer Secondary Conductors Not over 3 m (10 ft) Long. If ~~Where~~ the length of secondary conductor does not exceed 3 m (10 ft) and complies with all of the following:
(1) The ampacity of the secondary conductors is
a. Not less than the combined calculated loads on the circuits supplied by the secondary conductors, and
b. Not less than the rating of the ~~switchboard or other distribution equipment~~ device supplied by the secondary conductors or not less than the rating of the overcurrent-protective device at the termination of the secondary conductors
(2) The secondary conductors do not extend beyond the switchboard, panelboard, disconnecting means, or control devices they supply.
(3) The secondary conductors are enclosed in a raceway, which shall extend from the transformer to the enclosure of an enclosed switchboard, panelboard, or control device or to the back of an open switchboard.
(4) For field installations where the secondary conductors leave the enclosure or vault in which the supply connection is made, the rating of the overcurrent device protecting the primary of the transformer, multiplied by the primary to secondary transformer voltage ratio, shall not exceed 10 times the ampacity of the secondary conductor.
FPN: For overcurrent protection requirements for panelboards, see 408.36.
Panel Statement: The panel accepts the revision of changing “Where” to “If” in order to comply with the style manual. The panel does not accept the change from “device” to switchboard or power distribution equipment” since the language narrows the use of this section well beyond the present permission without necessary substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
COOK, D.: Submitter’s substantiation raises a valid question related to use of the Article 100 defined term “device”. However, the proposed use of the undefined term “distribution equipment” does not provide clear intent of the requirement for typical NEC users. For uniform application and enforcement of the requirement, text must clearly define equipment where 10 foot secondary conductors are permitted to terminate. Panel statement indicates proposed text narrows the use well beyond present permission. Based on the current Article 100 definition of device, narrowing the permission seems to be a positive step.
DOLLARD, JR., J.: We are voting negative on the panel action to accept in part proposal 10-52. Our comments are as follows:
The submitter is correct, the use of the word “device” in 240.21(C)(2)(1)(b) is incorrect. The word “device” is defined in Article 100 as follows:
“**Device.** A unit of an electrical system that carries or controls electric energy as its principal function.”
During the discussion on this proposal, it was clear that the panel intends for these “tap conductors” to be provided with overload protection. As presently written, the text permits termination in a device as defined above. The intent of the panel is not met in the present text of this section. The submitter is correct the existing text is confusing and should be clarified.
The present text of 240.21(C)(2)(2) includes more prescriptive text and limits termination of these “tap conductors” to “switchboard, panelboard, disconnecting means, or control devices.” The same level of clarity is necessary in 240.21(C)(2)(1)(b).
The panel statement refers to the present permission of this section. The submitter seeks only to clarify what is permitted. Clarification is needed. 240.21(C)(2)(1)(b) should be revised as follows:
“b. Not less than the rating of the switchboard, disconnecting means, or control device supplied by the secondary conductors or not less than the rating of the overcurrent-protective device at the termination of the secondary conductors.”
OCKULY, G.: I agree with the comment submitted by Mr. Dollard.
Comment on Affirmative:
FREDERICKS, C.: I agree with the panel action to Accept in Part, but the action should have included acceptance of the submitter’s proposed text “switchboard or other distribution equipment”. Ten foot taps may terminate on bussing or terminals other than the terminals of an overcurrent device. As long as all the requirements for a ten foot tap are satisfied, this should be acceptable.

10-53 Log #4597 NEC-P10 **Final Action: Reject**
(240.21(C)(3))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Begin the rule as follows: "For the supply of switchboards in industrial occupancies only, where the length of secondary conductors...".
Substantiation: This is essentially an editorial proposal aimed at clarifying the limited conditions under which this rule can be used because of developments elsewhere in the Code. As a practical matter this provision is limited to tap conductors arriving at the main lugs of a switchboard. A motor control center could not qualify, because overcurrent protection in the form of a singular device is required in accordance with the rating of the common power bus, as covered in 430.94. Power panels no longer comply because all panelboards now require individual overcurrent protection, with exceptions that would not apply here (see 408.36). If the tap arrived at a wireway or auxiliary gutter over the collection of loads intended to be supplied, the individual taps to each of the loads would violate the prohibition against tapping taps, certainly so if they were reduced in size to meet the likely termination limitations of the smaller equipment.
Panel Meeting Action: Reject
Panel Statement: The proposed language limits the rule to specific equipment. The language could easily be construed as permitting switchboards and prohibiting other equipment such as switchgear.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-54 Log #3436 NEC-P10 **Final Action: Reject**
(240.21(D))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
240.21(D). Service-Entrance Conductors. Service-entrance conductors shall be permitted to be protected by overcurrent devices in accordance with 230.91.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: The recommendation is contingent on the acceptance by CMP-4 of proposals that intend to modify service related definitions. The global implications of such a change would require task group action to correlate the use of these terms throughout the document. CMP-10 requests that the TCC direct CMP-4 to comment on this proposal and a task group be formed if necessary. Also see panel action and statement on Proposal 10-11.
Number Eligible to Vote: 12

(240.21(D), (E), and (F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "permitted to be".
Substantiation: Edit. "Permitted" does not impose a requirement, per 90.5 (B).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on 10-55.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-57 Log #1143 NEC-P10 **Final Action: Reject**
(240.21(G))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 13 for action in Article 445.
This action will be considered by the Code-Making Panel 13 as a public comment.
Submitter: Lawrence W. Forshner, Town of Natick
Recommendation: Add subsection (1) at the end of the existing paragraph:
(1) **Multiple feeders without individual overcurrent protection at the source. Conductors not over 15 m (50 ft).** Multiple feeder conductors connected to a common generator bus, on the supply end, and individual enclosures on the load end, as specified in 700.9(B)(5), shall not be required to be sized per 445.13 if the length of the conductors does not exceed 15 m (50 ft) and complies with all of the following:
(1) The conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.
(2) The conductors terminate in a single circuit breaker or single set of fuses that limit the load to the ampacity of the conductors. This devise shall be permitted to supply any number of additional overcurrent devices on its load side.
(3) The generator must be equipped with overcurrent protection meeting the requirements of 445.12.
Substantiation: I am in agreement with the new section 700.9(5) in the 2008 code. However, if a design engineer, installing a gen-set and related feeders chooses to install multiple feeders that terminate in individual enclosures, present code would require the ampacity of each feeder to comply with 445.13. A new subsection to 240.21(G) would address this situation and allow the ampacity of the individual feeders to be sized to the overcurrent protective device that they terminated in. It is appropriate for this new text to be in Article 240, and it is also appropriate for this new text to be in the "tap rule" section, with listed conditions similar to all other subsections of 240.21. It is also appropriate for it to be a subsection to the section commonly referred to in the industry as the "generator tap rule."
If a generator with a full load ampere rating of 1000 amps had three sets of feeders each terminating in 400 amp breakers, the lugs on the 400 amp breaker would have to accept cabling rated at 1000 amps. The generator entrance box would also have to accept three sets of fully rated cables. Three times what they are designed for.
Modern generators are equipped with UL listed protective relays that provide inherent protection for the generator windings, and a single set of tap conductors rated at 100 percent of the generator full load rating. This proposal addresses the overcurrent protection of multiple feeder taps that have an ampacity lower than the full load of the generator.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation to establish relaxing the protection of feeder conductors from a generator. The proposal would in effect establish a 50 ft tap rule without restriction as compared to the numerous other tap rule restrictions.
This proposal includes requirements for the sizing of conductors (445.13), which is outside the scope of Article 240. This proposal may be better suited for Articles 445 or 700.

(240.23)

Submitter: William Gross, Electric Service of Clinton
Recommendation: Revise text to read as follows:
Where a change occurs in the size of the ungrounded conductor, a similar change shall be ~~permitted~~ to be made in the size of the grounded conductor.
Substantiation: Increasing the size of the grounded conductor where there is a change in size of the ungrounded conductors will decrease the impedance of the ground fault current path. This will help to facilitate the operation of the overcurrent devices.
Panel Meeting Action: Reject
Panel Statement: If the ungrounded conductor size is increased, NEC 250.122(B) already requires the equipment grounding conductors to be increased in size. Ground fault current will not flow on the grounded conductor.
If the size of the ungrounded conductor decreases, there is no safety reason to require the size of the grounded conductor to also decrease in size.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-62a Log #1881 NEC-P10 **Final Action: Reject**
(240.24(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (B)(1) add:
(3) Dormitories
(4) Penal institutions
Revise latter part of (B)(2)...supplying, penal institution areas, dormitories, or any guest room(s) or suite(s) without permanent provisions for cooking, shall be permitted to be accessible only to authorized management personnel.
Substantiation: Dormitories in colleges, vacation camps, military schools and academies, and the penal institution areas should be included.
Panel Meeting Action: Reject
Panel Statement: The submitter has not submitted any substantiation to expand the list of occupancies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
COOK, D.: I support the panel action to reject the expansion of the list of occupancies in 240.24(B)(1). A more appropriate action would seem to be a deletion of the existing two building or occupancy types. The key condition limiting access to the service and feeder overcurrent devices seems to be included in the main paragraph of 240.21 (B) (1) and does not seem to be related to the persons excluded from access, but rather based on the continuous building management and maintenance which limit the need for all occupants to be provided access.

10-63 Log #555 NEC-P10 **Final Action: Reject**
(240.24(E))

Submitter: Joe Riley, City of Arlington
Recommendation: Revise text as follows:
(E) Not Located in Bathrooms or Restrooms. ~~In dwelling units and quest rooms or quest suites of hotels and motels,~~ Overcurrent devices, other than supplementary overcurrent protection, shall not be located in any bathroom or restroom.
Substantiation: Many restrooms are constructed with ceramic walls and floors to provide a convenient method of cleansing with hose spray any waste matter and residue to floor drains. The regular wash down and sanitization of restroom walls and floors permits individuals' exposure to electrical shock hazards since the walls and floors are grounded tile surfaces with overcurrent devices installed in restroom areas that may be damp, wet, or where moisture may be present.
Panel Meeting Action: Reject
Panel Statement: The use of a dwelling unit or guest suite bathroom is much different than other bathrooms. The submitter's substantiation shares concern for there being a hose-down application hazard. The environmental protection of overcurrent protective devices is addressed in 240.32.
The submitter has not provided adequate substantiation to expand this requirement to bathrooms/restrooms in other than guest rooms, guest suites, or dwelling units.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
COOK, D.: While I agree with the Panel action to reject the proposal to expand the requirement to additional restroom types, the last sentence of the first paragraph in the Panel statement indicates the environmental protection of overcurrent devices is addressed in 240.32. That statement would seem to apply to the exiting restrooms where overcurrent devices are prohibited. Providing the undesired conditions that need to be avoided for overcurrent devices rather than a building or occupancy type would result in more uniform enforcement.

10-64 Log #2969 NEC-P10 **Final Action: Reject**
(240.24(E))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text as follows:
240.24 Location in or on Premises.
[240.24(A) through 240.24(D) unchanged by this Proposal]
(E) Not Located in Bathrooms <u>and Bedrooms</u>. In dwelling units and guest rooms or guest suites of hotels and motels, overcurrent devices, other than supplementary overcurrent protection, shall not be located in bathrooms. <u>In dwelling units having three or more bedrooms, overcurrent devices, other than supplementary overcurrent protection, shall not be located in bedrooms or in rooms or spaces solely accessible through a bedroom.</u>
[remainder of 240.24 unchanged by this Proposal]
Substantiation: The issue is operational accessibility of overcurrent devices.
“Occupant” in 240.24(B) is undefined and is ambiguous, depending on one’s role, as to whether it is collectively singular or individually singular. To a landlord or building management, each dwelling unit <u>is</u> in the control of a single <u>legal</u> occupant, regardless of how many individuals may reside in that dwelling unit.
In dwelling units located near colleges, universities, schools, organizations having residency and internship programs, etc., it is common for unrelated individuals to pool together to rent and share dwelling units. Where there are three or more unrelated individuals residing together, responsibility for unauthorized use of personal possession unintended for shared usage becomes unclear (the “blame game”) and individuals residing there are frequently motivated to retrofit bedroom doors with keyed deadbolts to secure those personal possessions during absences from the dwelling unit. This deadbolt retrofit may be without the knowledge or concern of the landlord or building management. While the collective occupant or the legal occupant may have ready access to overcurrent devices, some of the (other) individuals residing in that dwelling unit may not.
Panel Meeting Action: Reject
Panel Statement: The submitter’s intent is met in the present text of 240.24(B)(2).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-65 Log #3360 NEC-P10 **Final Action: Accept in Principle in Part**
(240.24(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
In dwelling units, <u>dormitories,</u> and guest rooms or guest suites of <u>inns,</u> hotels and motels overcurrent devices other than supplementary overcurrent protection shall not be located in bathrooms <u>or toilet compartments</u>.
Substantiation: Article 100 Scope indicates commonly defined terms do not require a code definition. A dormitory definition indicates it is a large area containing numerous beds, rooms for individuals or groups. Where a dormitory is provided with a bathroom(s) or toilet compartment(s) this provision should apply.
Panel Meeting Action: Accept in Principle in Part
(E) Not Located in Bathrooms. In dwelling units, <u>dormitories,</u> and guest rooms or guest suites ~~of hotels and motels~~, overcurrent devices, other than supplementary overcurrent protection, shall not be located in bathrooms.
Panel Statement: The inclusion of the term “inns” does not provide additional clarity; the terms guest room and guest suite presently meet the submitter’s intent. The deletion of the reference to hotels and motels meets the intent of the submitter.
The inclusion of the term “toilet compartment” would cause confusion as the term “bathroom” is well defined in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
COOK, D.: See my affirmative comment on Proposal 10-63.

10-66 Log #1483 NEC-P10 **Final Action: Reject**
(240.24(F))

Submitter: Steve Likes, Likes Electric
Recommendation: Add new text as follows:
Not Located over Steps. Overcurrent devices shall not be located over steps <u>in new construction. Existing panels may be changed out to new panels of same amperage</u>.
Substantiation: There are many old fuse panels that were installed over steps. This rule makes it illegal to replace these panels with safer ones with breakers. Many of these homes could not have the panels moved without major remodeling and would not be cost effective. This would leave the options of not replacing the panel and have overloaded fuses (in many cases) or bigger fuse amperages used than the wire is rated for (30 amp fuses for 20 amp fuses) or if it is done to not have the work inspected. Both of these options, in my opinion, are not right and not what the NEC should promote.
I think that panels should not be placed over stairs in new construction, but that we can replace old panels with newer, safer ones.
Panel Meeting Action: Reject
Panel Statement: Panels with overcurrent devices should not be installed over steps. The submitter has not provided adequate substantiation to show that a problem exists.
The panel takes exception to the premise in the substantiation that old fuse panels are unsafe. In Chapter 5 of the July 1, 2008 report by the Fire Protection Research Foundation, titled Residential Electrical System Aging, it is reported that all of the recovered fuses calibrated properly within the allowable time at the test current requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-67 Log #4598 NEC-P10 **Final Action: Reject**
(240.24(F))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows: Overcurrent devices shall not be located over steps of a stairway unless the step or landing below the overcurrent devices has a width in accordance with 110.26(A)(2).
Substantiation: Steps and intermediate landings come in many sizes; not all are unsuitable for this application. It would seem that if there is a flat workspace that meets Article 110 constraints, the equipment should be permitted.
Panel Meeting Action: Reject
Panel Statement: The panel discussed this application during the addition of the present language in the 2008 NEC and concluded that a landing was not a step. The panel also concluded that if a landing had the working space as required in 110.26(A)(2), it is would be acceptable to have overcurrent protection located in such a space based on the present language of the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-68 Log #4141 NEC-P10 **Final Action: Reject**
(240.24(F), FPN (New))

Submitter: Larry LeVoir, City of Irvine
Recommendation: Add new text to read as follows:
<u>FPN: Local building codes contain restrictions on items located in or penetrating stairwells.</u>
Substantiation: This addition is necessary in view of today’s world of overlapping Code requirement. No long can an electrician consult only the NEC for an installation. The 2006 IBC does not permit penetrations into stairwells also known as exit enclosures. Just by looking at 240.24(F) in the NEC, the electrician could be led to believe that as long as they did not place a cabinet containing overcurrent devices over a stairwell that they are good to go.
Panel Meeting Action: Reject
Panel Statement: The submitter’s concern applies generally across the entire NEC; therefore, an FPN for this specific area is not warranted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
COOK, D.: Panel statement could be expanded to: The submitters concern is related to maintaining the fire rating of specific areas of a building which is already addressed in 300.21. It should also be noted that all stairways covered by 240.24(F) are not part of rated assemblies.

10-69 Log #3476 NEC-P10 **Final Action: Reject**
(240.24(G))

Submitter: Danny Thomas, Henderson, NC
Recommendation: Revise text to read as follows:
<u>Mounting Height. No enclosure containing branch circuit overcurrent devices shall be located so that an overcurrent device is located less than two (2) ft above the earth, floor, or working platform.</u>
<u>Exception: Open bottom equipment, such as switchboards or equipment that by its physical size would require the center of the grip of the operating handle, for any service overcurrent device, feeder overcurrent device, or branch circuit overcurrent device installed in it to exceed 2.0 m (6 ft 7 in.) above the floor or working platform.</u>
Substantiation: If an installer decides to place an enclosure with the overcurrent device(s) as close to the earth, floor, or working platform as they choose, there is nothing in the code to prohibit it. To work on it or inspect it would require one to lie down on their side to be able to access it, more than likely with their face in it, possibly being exposed to energized parts.
Article 550 has had a minimum mounting height for the disconnecting means for many years.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any documentation that a problem exists.
The substantiation for requiring a minimum height of 24 inches is NEC 550, but it must be understood that is for a specific application of mobile/manufactured homes. Requiring a general minimum height requirement for locating all overcurrent protection would have a significant impact on the electrical installations including electrical machinery.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-70 Log #3795 NEC-P10 **Final Action: Reject**
(240.24(G) (New))

Submitter: John A. Schultz, St. Paul, MN
Recommendation: Add text to read as follows:
(G) Access to Structure. Where overcurrent devices are located within a structure, access tot he interior of the structure shall be provided by a personnel door.
Substantiation: In many instances, dwelling garages and similar structures are constructed without personnel doors and rely on a vehicle door for interior access. In these instances and where vehicle doors are provided with power openers supplied by overcurrent devices located within the structure and the device interrupts power, there is no way to access the device to restore power to the circuit without damaging the structure or vehicle door. A similar proposal is submitted for Section 210.8.
Panel Meeting Action: Reject
Panel Statement: 240.24(B) requires access to overcurrent devices. A garage door would allow access.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-71 Log #4911 NEC-P10 **Final Action: Reject**
(240, Part III (New))

Submitter: James Brozek, Acton, MA
Recommendation: Develop a new Part III, as shown below, and renumber existing Parts III through IX as IV through X. New Part III is to include a new 240.27 and a new 240.28. If accepted, this proposal would then require the deletion of 240.13, 230.95, 700.26, 215.10, 517.17, and 708.52. See sister proposals that accomplish this action.
III Ground Fault Protection
240.27 Ground-Fault Protection of Equipment. Ground-fault of equipment shall be provided for solidly grounded wye electrical systems of more than 150 volts to ground but not exceeding 600 volts phase-to-phase for each disconnecting means rated 1000 amperes or more. The grounded conductor for the solidly grounded wye system shall be connected directly to ground through a grounding electrical system as specified in 250.50, without inserting any resistor or impedance device.
The rating of the disconnecting means shall be considered to be the rating of the largest fuse that can be installed or the highest continuous-current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted.
The provisions of this section shall not apply to a disconnecting means for the following:
(1) Continuous industrial processes where a nonorderly shutdown will introduce additional or increased hazards
(2) Installations where ground-fault protection of equipment is provided on an upstream disconnecting means
Exception: Where an additional level of ground-fault protection is required for health care and critical operations power systems
(3) Fire pumps
(4) The alternate source circuit for emergency systems
(5) The normal source circuit for emergency systems where the disconnecting means supplies only loads as shown in 230.2(A)(1), (2), (3), and (4)
FPN: 700.76(O) provides the requirements for signaling the presence of a ground fault in an emergency system
(A) Setting. The ground fault protection system shall operate to cause the disconnecting means to open all ungrounded conductors of the faulted circuit. the maximum setting of the ground-fault protection shall be 1200 amperes and the maximum time delay shall be one second for ground-fault currents equal to or greater than 3000 amperes.
(B) Fuse. If a switch and fuse combination is used, the fuses employed shall be capable of interrupting any current higher than the interrupting capacity of the switch during a time that the ground-fault protective system will not cause the switch to open.
(C) Performance Testing. The ground-fault protection system shall be performance tested when first installed on site. The test shall be conducted in accordance with instructions that shall be provided with the equipment. A written record of this test shall be made and shall be available to the authority having jurisdiction.
FNP No. 1: Ground-fault protection that functions to open a disconnecting means affords no protection from fault on the line side of the protective element. It serves only to limit damage to conductors and equipment on the load side in the event of an arcing ground fault on the load side of the protective element.
FPN. No. 2: This added protective equipment may make it necessary to review the overall wiring system for proper selective overcurrent protection coordination. Additional installations of ground-fault protective equipment may be needed on feeders and branch circuits where maximum continuity of electric service is necessary.
FPN No. 3: Where ground-fault protection is provided for a disconnecting means and interconnection is made with another supply system for a transfer device, means or devices may be needed to ensure proper ground-fault sensing by the ground-fault protection equipment.
240.28 Ground-Fault Protection of Equipment for Life-Safety Related Loads.
(A) Applicability. The requirement of 240.28 shall apply to
(1) Hospitals and other buildings (including multiple occupancy buildings) with critical care areas or utilizing electrical life support equipment, and buildings that provide the required essential utilities or services for the operation of critical care areas or electrical life support equipment as described in Article 517, and
(2) Critical operation (including multiple occupancy buildings) with critical operations areas as described in Article 708.
(B) Feeders. Where ground-fault protection is provided for operation of a disconnecting means as specified in 240.27, an additional step of ground fault protection shall be provided in all next level disconnecting means downstream toward the load. Such protection shall consist of overcurrent devices and current transformers or other equivalent protective equipment that shall cause the downstream disconnecting means to open and to selectively coordinate with the upstream disconnecting means for all values of available ground fault currents.
The additional levels of ground fault protection shall not be installed as follows:
(1) On the load side of an essential electrical system transfer switch
(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es)
(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase
(C) Selectivity. Ground fault protection for operation of the upstream and downstream disconnecting means shall be fully selective such that the downstream disconnecting device, but not the upstream device, shall open on ground faults on the load side of the downstream device. A six cycle minimum separation between the upstream and downstream ground-fault tripping bends shall be provided. Operating one of the disconnecting devices shall be considered in selecting the time spread between these two hands to achieve 100 percent selectivity.
(D) Testing. When equipment ground-fault protection is first installed, each level shall be tested to ensure that ground-fault protection is operational.
FPN: Testing is intended to verify the ground fault function is operational. The performance test is not intended to verify selectivity as this is often coordinated similarly to fuses and circuit breakers by reviewing time current curves and properly choosing and setting the equipment. (Selectivity of fuses and circuit breakers is not performance tested for overload and short-circuit.).
Substantiation: There are currently requirements for equipment ground fault protection spread throughtout the NEC, with much duplication, making for difficult understanding and enforcement. The expertise for overcurrent protection, which includes ground-fault protection, lies with Panel 10 and therefore, the requirements for ground fault protection should reside in Article 240. This proposal consolidates requirements for ground fault protection from Articles 215, 230, 240, 517, 700, and 708. As such, it will allow for the deletion of 215.10, 230.95, 240.13, 517.17, 700.26, and 708.52.
The following text shows where each of the pieces of the proposal originates, in legislative text.
From 230.95:
Ground Fault Protection of Equipment. Ground-fault of equipment shall be provided for solidly grounded wye ~~electric services~~ electrical system of more than 150 volts to ground but not exceeding 600 volts phase-to-phase for each ~~service disconnected~~ disconnecting means rated 1000 ampere or more. The grounded conductor for the solidly grounded wye system shall be connected directly to ground through a grounding electrode system, is specified in 220.50 without inserting any resistor or impedance device.
The rating of the ~~service disconnect~~ disconnecting means shall be considered to be the rating of the largest fuse that can be installed or the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted. (This now covers ground fault protection for services (230.95), feeders (215.10), and equipment (240.13), all in one requirement. Reference can be made simply to the disconnecting means, as it will cover all three applications.)
From 240.14:
The provisions of this section shall not apply to ~~the~~ a disconnecting means for the following:
(1) Continuous processes where a nonorderly shutdown will introduce additional or increased hazards
(2) Installations where ground fault protection of equipment is provided ~~by other requirements for services or feeders~~ on an upstream disconnecting means.
Exception: Where an additional level of ground fault protection is required for health care and critical operations power systems.
(3) Fire pumps (the exception covers requirements for two levels of ground fault protection for health care and COPS)
From 700.26:
(4) The alternate source circuit for emergency systems (700.26 does not require ground fault protection for the alternate source circuit of an emergency system.)
New material:
(5) The normal source circuit for emergency systems where disconnecting means supplies only loads as shown in 230.2(A)(1), (2), (3), and (4). (Ground fault protection should not be required for a disconnecting means on the normal

source of an emergency circuit if the disconnecting means serves only (1) fire pumps, (2) emergency system, or (3) legally required standby systems.)

From 700.26:

FPN 700.7(D) provides the requirements for signaling the presence of a ground fault in an emergency system.

From 230.95:

(A) Setting. The ground fault protection system shall operate to cause the ~~service disconnected~~ disconnecting means to open all ungrounded conductors of the faulted circuit. The maximum setting of the ground-fault protection shall be 1200 amperes, and the maximum time delay shall be one second for ground-fault currents equal to or greater than 3000 amperes.

(B) Fuse. If a switch and fuse combination is used, the fuses employed shall be capable of interrupting any current higher than the interrupting capacity of the switch during a time that the ground fault protective system will not cause the switch to open.

(C) Performance Testing. The ground-fault protection system shall be performance tested when first installed on site. The test shall be conducted in accordance with instructions that shall be provided with the equipment. A written record of this test shall be made and shall be available to the authority having jurisdiction.

FPN No. 1: Ground-fault protection that functions to open ~~the service disconnect~~ a disconnecting means affords no protection from faults on the one side of the protective element. It serves only to limit damage to conductors and equipment on the load side in the event of an arcing ground fault on the load side of the protective element.

FPN No. 2: This added protective equipment ~~of the service equipment~~ may make it necessary to review the overall wiring system for proper selective overcurrent protection coordination. Additional installation of ground fault protective equipment may be needed on feeders and branch circuits where maximum continuity of electric service is necessary.

FPN No. 3: Where ground fault protection is provided for ~~the service disconnect~~ a disconnecting means and interconnection is made with another supply system by a transfer device means or devices may be needed to ensure proper ground-fault sensing by the ground-fault protection equipment.

From 517.17:

240.28 ~~**517.17**~~ Ground-Fault Protection of Equipment for Life-Safety Related Loads:

(A) Applicability. The requirements of 517.17 240.28 shall apply to

(1) Hospitals and other Buildings (including multiple occupancy buildings) with critical care areas or utilizing electrical life support equipment, and buildings that provide the required essential utilities or services for the operation of critical care areas or electrical life support as described in Article 517 and

(2) Critical operations (including multiple occupancy buildings) with critical operations areas, as described in Article 708.

(B) Feeders. Where ground-fault protection is provided for operation of ~~the service~~ a disconnecting means or feeder disconnecting means as specified in 240.95 or 215.10 240.27, an additional step of ground fault protection shall be provided in all next level disconnecting means downstream toward the load. Such protection shall consist of overcurrent devices and current transformers or other equivalent protective equipment that shall cause the ~~feeder~~ downstream disconnecting means to open and to selectively coordinate with the upstream disconnecting means for all values of available ground fault currents.

The additional levels of ground-fault protection shall not be installed as follows:

(1) On the load side of an essential electrical system transfer switch

(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es)

(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase

(B) Selectively. Ground -fault protection for operation of the ~~service~~ upstream and ~~feeder~~ downstream disconnecting means shall be fully selective such that the ~~feeder~~ downstream disconnecting device, but not the ~~service~~ upstream device shall open on ground faults on the load side of the ~~feeder~~ downstream device. A six-cycle minimum separation between the ~~service~~ upstream and feeder downstream ground-fault tripping bands shall be provided. Operating time of the disconnecting devices shall be considered in selecting the time spread between these two bands to achieve 100 percent selectivity. (This combines the requirements from 517.17 and 708.52.)

From 708.52(c):

(D) Testing. When equipment ground-fault protection is first installed, each level shall be tested to ensure that ground fault protection is operational.

FPN: Testing is intended to verify the ground fault function is operational. The performance test is not intended to verity selectively ~~in 708.52(D)~~, as this is often coordinated similarly to fuses and circuit breakers by reviewing ~~tie and~~ time-current curves and properly choosing and setting the equipment. (Selectivity of fuses and circuit breakers is not performance tested for overload and short-circuit). (This covers the testing requirements for both 517.17 and 708.52)

Panel Meeting Action: Reject

Panel Statement: The requirements for ground-fault protection of equipment reside within the panels that have protection requirements for those specific applications outside the general protection requirements established by panel 10 and therefore should remain under the purview of those specific committees unless otherwise directed by the TCC.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-72 Log #3877 NEC-P10 **Final Action: Accept in Principle in Part**
(240.35 (New))

TCC Action: The Technical Correlating Committee directs that the Chairs of Code-Making Panels 1 and 10 form a Task Group to correlate the actions taken on Proposals 10-72 and 1-183.

Submitter: Michael J. Farrell, III, Lucas County Building Regulations

Recommendation: Add a new 240.35 as follows:

240.35 Marking with Available Short-Circuit Current. Enclosures, in other than dwelling occupancies, containing service or feeder circuit overcurrent protective devices, shall be field marked with a label containing all of the following:

(1) The available short-circuit current

(2) The date on which the short-circuit calculation was performed

(3) A warning that the available short-circuit current may change over time, requiring a new calculation whenever significant changes are made to the electrical system.

Substantiation: This proposal will significantly increase the enforceability of numerous NEC® requirements. Engineers, contractors, electricians, manufactures, and distributors, must have knowledge of the available short-circuit current before equipment can be designed-in, purchased, and installed. There is simply no way for NEC® Sections 110.9, 110.10, 240.86, 250.4(A)(5), 250.4(B)(4), 409.110, 440.4(B), and 670.3(A) to be met without knowing the available short-circuit current. all the time-consuming work to determine the available short-circuit current must already be completed in order to meet the above-referenced Code sections. This proposal simply requires that this "already-determined" value be posted on the enclosure so that the electrical inspector can easily inspect the installation. It will be of great help to the inspector to understand the values upon which decisions about the equipment were made.

While the available short-circuit current normally may change over time, with changes to the serving distribution system, it is understood that the future user of this information will need to perform additional calculations in the future. The date of the previous calculation will certainly help the user to determine if and when a new calculation is necessary. The warning helps to ensure the user understands that the values can and do change over time.

In summary, this proposal increases enforceability and provides additional data that future users can utilize to make more intelligent decisions.

Panel Meeting Action: Accept in Principle in Part

Add a new section as follows:

240.35 Marking with Available Short-Circuit Current. Equipment enclosures, in other than dwelling occupancies, containing service or feeder circuit overcurrent protective devices, shall be field marked with a label containing the following:

(1) The available short-circuit current as calculated for equipment rating purposes

(2) The date on which the short-circuit calculation was performed or obtained.

Exception: In installations with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment, marking on the enclosure is not required if documentation of 240.35 (1) and (2) is available upon request to the authority having jurisdiction.

Panel Statement: Changes were made to emphasize that this is marking only with the available short-circuit current as calculated for equipment rating purposes. The available short-circuit current shall only be utilized for equipment selection purposes (NEC), not for arc-flash calculation purposes (NFPA 70E). These changes meet the submitter's intent to help with NEC enforcement, but better coordinate with requirements in NFPA 70E.

Also (3) was not accepted, as it is expected to be understood that short circuit currents may change with significant system or utility changes.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 8 Negative: 4

Explanation of Negative:

ELDRIDGE, C.: This proposal should be rejected since the requirement covering the need for most occupancies other than dwellings is already covered by OSHA as stated by the submitter. In addition, the need for restricting the requirements to "other than dwelling units" as proposed, has not been established. Some dwelling occupancies could have higher available fault current than the assumed 10 kA and, in fact exceed 22 kA for some installations.

FREDERICKS, C.: I am voting against the panel action to accept. A label on the equipment could give a false sense of knowledge or security, even if a warning was added as originally proposed. An effective means beyond a warning would need to be provided to ensure that the data can be verified to be applicable, and also up to date. If this proposal is finally accepted, the industrial exception as accepted by the panel should be the general rule, and there should also be a requirement that the data be verified by a responsible party before being used for equipment selection.

HIDAKA, J.: This proposal should be rejected as the available short circuit current (ASCC) information is only of value at the time of installation of the equipment. In addition, the permit process should already require this information to be known to those concerned and would be used at that time so it is redundant to require the marking on the equipment. The hazard is this information may be used in the future for arc flash calculations or future modifications when in fact the utility may have at some point after the initial installation upgraded the source such that a higher available current exists. In all cases (initial or future installations) the utility should be contacted to determine the ASCC. Since this information may only be valid the day it is applied and it needs to be determined by both the AHJ and the designer/installer of the installation at the time modification or maintenance work is being conducted, there is no value added this marking.

MANCHE, A.: The acceptance of this proposal and the panel statement establishes a number of questions and safety concerns. The accepted language requires the "Available Short Circuit Current as calculated for equipment rating purposes" to be marked on equipment that contains service or feeder overcurrent devices. The panel statement, not visible to the user of the NEC, then explains that this calculated available short circuit current is not intended to be used for making arc flash calculations for NFPA 70E purposes. Once a label is placed on the equipment with an "Available Short Circuit Current XXkA," how does the next person know if that
is for "equipment ratings only" or can be used for the arc flash analysis as may be found on markings now required by NFPA 70E? Is the maximum utility value marked on the service or was a calculation performed? Is the value that is marked on the feeder enclosure calculated from the maximum service value or from a study performed based on the actual fault current levels calculated from the actual transformer parameters? The most accurate information can be obtained from a current document based on the status of the system, not based on a marking on the equipment.

Marking the equipment with an Available Short Circuit Current value can create a significant safety hazard as pointed out by the panel statement attempting to describe how the marking is to be used, and not used. NEMA also opposes this marking requirement due to concerns about its validity and accuracy as stated in the panel statement. The marking as conveyed in the accepted text places workers at risk and makes uniform enforcement questionable.

Comment on Affirmative:

COOK, D.: I agree with the concept submitted and the actions taken by CMP-10, but the action should be expanded to include all equipment enclosures containing overcurrent devices where the available short-circuit current is greater than 10,000 amperes. While older overcurrent devices can be located with short circuit ratings as low as 5,000 amperes, I'm not aware of new overcurrent devices rated less than 10,000 amperes. Many utility transformer sizes for many single family dwelling units will limit the available current to less than 10,000, but it is not uncommon on larger custom type homes to see values greater than 10,000 amperes. Large condominium installations (dwelling occupancies) are also likely to exceed the 10,000 ampere value. Apartment complexes (dwelling occupancies) commonly are exposed to values greater than 10,000 amperes. Mixed use developments often include dwelling occupancies in locations where higher short circuit values exit. Numerous examples of "dwelling occupancies" could be provided where short circuit current values greater than 10,000 amperes are possible. The proposed text is also limited to services and feeders when available short circuit values could easily exceed 10,000 amperes at branch circuit overcurrent devices based on the specific electrical design. It also does not seen necessary to mark a value where a service equipment enclosure for a non-dwelling occupancy is supplied from a single phase utility transformer that is 10 or 15 KVA. The key to determining whether the value should be marked is the available short-circuit current value, not the occupancy type or whether the overcurrent devices protect services, feeders, or branch circuits.

OCKULY, G.: Since this proposal is similar to 1-183, the TCC may wish to correlate the actions on both these proposals. This very important proposal in necessary to ensure compliance with NEC 110.9

(Note: Sequence 10-73 was not used)

10-74 Log #2208 NEC-P10 **Final Action: Reject**
(240.50(D))

Submitter: Charles Eldridge, Indianapolis, IN
Recommendation: Revise text as follows:

(D) Renewable Fuses. Class H cartridge fuses of the renewable type shall <u>not</u> be permitted ~~to be used only for replacement in existing installations where there is no evidence of overfusing or tampering~~.

Substantiation: Most commercial and industrial locations where this type of fuse is (was?) used would have enough available fault current to make this type of fuse obsolete.
Panel Meeting Action: Reject
Panel Statement: No evidence of a field problem with Class H renewable fuses applied under the present NEC restrictions has been provided. These fuses are integral to certain older equipment such as oil-filled motor starters, where they could not be substituted. Misapplication of these fuses vs. the available short circuit level has not been substantiated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-75 Log #238 NEC-P10 **Final Action: Reject**
(240.60(C))

Submitter: Roger Downs, Nebraska State Electrical Division
Recommendation: Add new text to read:

Marking shall be visible with the fuse installed.

Substantiation: Presently, to check fuse amperage rating it is sometimes necessary to remove the fuse and turn it around.
Panel Meeting Action: Reject
Panel Statement: Per listing agency requirements, the amount of information that must be provided on the label prohibits it all from being visible on only one side of the fuse.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-76 Log #645 NEC-P10 **Final Action: Reject**
(240.80, FPN (New))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add a new Fine Print Note to read as follows:

FPN: See NFPA 70B, Electrical Equipment Maintenance, for information on circuit breaker maintenance procedures.

Substantiation: NFPA 70B has been available since 1979 and this publication has valuable information on circuit breaker maintenance.
Panel Meeting Action: Reject
Panel Statement: The scope of the NEC covers the installation of electrical system not the maintenance of the electrical system. A reference to NFPA 70B is not appropriate in the general requirements of the NEC: however, it is found in Annex F as an informational reference.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-77 Log #602 NEC-P10 **Final Action: Reject**
(240.83(E), FPN)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add a new Fine Print Note as follows:

FPN: Circuit breakers marked with a slash voltage rating. For example, 120/240 volts or 480 Y/277 volts, are not intended for use on corner grounded delta, ungrounded or impedance grounded systems.

Substantiation: Where it is possible for full phase-to-phase voltage to be present across only one pole, such as may occur if phase "A" develops a fault-to-ground on a 480 volt, B-phase, corner grounded delta system, the ground-fault current may exceed the interrupting rating of the circuit breaker.
Panel Meeting Action: Reject
Panel Statement: The specific application of the circuit breaker ratings are already addressed in 240.85. The proposed language is redundant and unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-78 Log #3645 NEC-P10 **Final Action: Reject**
(240.85)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:

240.85 Applications.

A circuit breaker with a straight voltage rating, such as 240V or 480V, shall be permitted to be applied in a circuit in which the nominal voltage between any two conductors does not exceed the circuit breaker's voltage rating. A two-pole circuit breaker shall not be used for protecting a 3-phase, corner-grounded delta circuit unless the circuit breaker is marked 1–3 to indicate such suitability.

A circuit breaker with a slash rating, such as 120/240V or 480Y/277V, shall ~~be permitted to~~ <u>only</u> be applied in a solidly grounded circuit where the nominal voltage of any conductor to ground does not exceed the lower of the two values of the circuit breaker's voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the circuit breaker's voltage rating.

Substantiation: These breakers can only be used on grounded systems where the voltage to ground does not exceed the lower of the two values, however the existing wording does not actually prohibit the used of these breakers at other voltages. There is no reasonable reading of the words "shall be permitted" that can lead the reader to conclude that these words are intended to prohibit other uses. The used of the words "shall be permitted" in this section is not in compliance with 3.1.2 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: The present language provides permission for the overcurrent device to be used in a particular application. This language is used throughout Article 240 for fuse and breaker applications. A 480Y/277 breaker could be used in a 240 volt grounded delta system, so the proposed language would inappropriately restrict the application with appropriate product ratings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-79 Log #2901 NEC-P10 **Final Action: Reject**
(240.86)

Submitter: Wendell Whistler, Whistler Consulting & Technical Services
Recommendation: Revise text to read as follows:
Provide clarification for use of terms available fault current used at least four times in the NEC and short circuit current rating.
Substantiation: Provide clarification as to the difference between available Fault Current as used in 240.86, 285.6, 700.5 and 701.6 and Short circuit current rating as used in 410.143, 430.8 exceptions 1, 2 & 3, 440.4(B) and 670.3(A)(4).
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided suggested text to define the terms in question. This proposal does not meet the requirements of 4.3.3(c) of the Regulations Governing Committee Projects as follows:
4.3.3 Content of Proposals. Each Proposal shall be submitted to the Council Secretary and shall include the following:
(c) Proposed text of the Proposal, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-80 Log #259 NEC-P10 **Final Action: Reject**
(240.87)

Submitter: Albert Oster, Lynn, MA
Recommendation: Revise text to read as follows:
Circuit Breaker handles larger than 14.29 mm (9/16 in.) by 7.93 mm (5/16 in.) shall have provision for locking or adding a lock that makes the circuit breaker capable of being locked in the open position. The provision for locking or adding a lock shall remain in place with or without the lock installed.
Substantiation: I have a fairly good collection of lock out tag out devices, yet I still encounter breakers that my devices will not fit, or do not fit well, and the device either can be knocked off or damages the breaker handle. I believe safety would be improved if lockout was easier. I have included the size with the intent to exclude the most common size breakers in an attempt to make the proposal more practical, however I wouldn’t be adverse to see this as code without any size limitations.
Panel Meeting Action: Reject
Panel Statement: The substantiation points to a number of lock-out devices being available but not capable of serving the purpose to lock-out the handle. Placing a requirement on nearly all circuit breakers to have a lock-out means does not address that issue.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-81 Log #467 NEC-P10 **Final Action: Reject**
(240.87 (New))

Submitter: James P. Benson, Jim Benson Electrical Contractor
Recommendation: Add new text to read as follows:
Interchangeability. It shall be permissible to interchange circuit breakers of different manufacturer names provided the manufacturer makes a circuit breaker suitable for installation within the panel board and is acceptable to the authority having jurisdiction. Such OCPD devices shall provide an equal connection to the bus.
Substantiation: Currently, the NEC has interchange rules for fuses only. As manufacturers close and are repurchased by other companies, some inspectors are requiring the circuit breaker to be the same name as the panel where it is to be installed, and this can be a hardship on the installer.
Panel Meeting Action: Reject
Panel Statement: The panelboard standard has specific marking requirements to address the specific overcurrent devices that can be used within it to perform appropriately under short-circuit and thermal conditions. The means to ensure an equal connection to the bus is to review the markings on the panelboard for the appropriate overcurrent device that can be installed. This and other important concerns (i.e., short circuit venting, thermal, etc.) are appropriately addressed by the product’s standard.
110.3(B) requires listed material to be installed and used in accordance with any instructions included in the listing or labeling.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-82 Log #3562 NEC-P10 **Final Action: Accept in Principle**
(240.87 (New))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Add new text to read as follows:
240.87 Short-time Delay. Where short-time delay is utilized on a circuit breaker, one of the following shall be provided:
(A) Zone-selective interlocking
(B) Differential relaying
(C) Energy-reducing maintenance switching
FPN: An energy-reducing maintenance switch allows a worker to set a circuit breaker trip unit to instantaneous while the worker is working within an arc-flash boundary as defined in NFPA 70E, and then to set the trip unit back to a short-time delay setting after the potentially hazardous work is complete
Substantiation: Short-time delay is an industry-proven method to achieve selective coordination of circuit breakers. It delays the opening of an upstream circuit breaker while the downstream overcurrent device clears a short-circuit. If however, a short occurs between the two devices, the upstream circuit breaker will still delay its tripping operation, allowing for more let-through energy than would have been allowed if the upstream circuit breaker had utilized an instantaneous trip. This type of installation is typical for electrical power distribution systems. This extra amount of let-through energy may injure workers or damage equipment. There are at least three methods to prevent the increased let-through energy.
Zone-selective interlocking allows the upstream circuit breaker and downstream circuit breaker to communicate with each other and determine whether the upstream circuit breaker should open as quickly as possible or after a pre-set amount of time delay. For shorts on the load side of the downstream circuit breaker, the downstream circuit breaker signals the upstream circuit breaker, telling it to “hold off”, not to trip, since the downstream circuit breaker will trip and take the short off-line. For shorts between the circuit breakers, the downstream circuit breaker does not “see” the short, and therefore does not send a signal to the upstream circuit breaker. Without a signal from the downstream circuit breaker, the upstream circuit breaker will trip as quickly as possible. This reduces the amount of energy that is released into the system for shorts between the devices, and allows for selective coordination at the same time. It offers a higher degree of arc-flash protection for employees and also greater equipment protection.
With differential relaying, the amount of current coming in to the upstream circuit breaker is compared to the amount of current leaving the downstream circuit breakers. Under normal conditions, the difference is zero. If, during a short circuit condition on the load side of the downstream circuit breaker, the difference is zero, the upstream circuit breaker waits for the affected downstream circuit breaker to open. If the difference in current reaches the setting, due to a short circuit between the circuit breakers, the upstream circuit breaker opens as quickly as possible. For short circuits between the devices, as might occur when an employee is working in energized switchgear, the upstream circuit breaker limits the amount of let-through energy to which the worker could be exposed.
With an energy reducing maintenance switch, the worker is able to set the trip unit to instantaneous whenever working within the flash protection boundary as defined by NFPA 70E, and then turn back to the short-time delay mode when finished. This system provides let-through energies while energized work is being performed.
Panel Meeting Action: Accept in Principle
Add new text to read as follows:
240.87 Non-instantaneous Trip. Where a circuit breaker without an instantaneous trip is utilized, one of the following or approved equivalent means shall be provided:
(1) Zone-selective interlocking
(2) Differential relaying
(3) Energy-reducing maintenance switching with a local status indicator
FPN: An energy-reducing maintenance switch allows a worker to set a circuit breaker trip unit to instantaneous while the worker is working within an arc-flash boundary as defined in NFPA 70E, and then to set the trip unit back to a normal setting after the potentially hazardous work is complete.
Panel Statement: The modifications meet the intent of the submitter. The addition of “without an instantaneous trip” more accurately reflects the applications referred to by the submitter. “Other approved means” was added to allow for future technology. The title change more accurately reflects the subject. The addition of “a local status indicator” helps assure that the switch will be returned to the proper position at the completion of work.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
DARLING, D.: Primary direction of NFPA 70E is to De-Energize electrical equipment for worker safety. The proposed features will reduce but will not eliminate the electric hazards which can only be eliminated by removing all energy sources.
If any work needs to be performed on energized equipment a hazard risk analysis must be conducted justifying why the system cannot be de-energized. A similar requirement for first de-energizing electrical equipment unless it is infeasible to do so exists in OSHA Subpart `S”.
FREDERICKS, C.: I am voting against the panel action to accept. The proposal’s intent to protect workers is good, but the language as accepted could unnecessarily restrict other design and operational options that would provide for an equally safe system. These options could include application of PPE that is rated to meet or exceed the available arc flash hazard energy, current limitation, available fault current reduction, arc resistant equipment, and de-energized maintenance. Some of these methods are operational rather than specific to the installation design. As a minimum, these alternate methods should be recognized in a fine print note.
MANCHE, A.: NEMA supports performance enhancements that provide increased worker safety, as covered in NFPA 70E.
However, there has been no substantiation presented that this requirement will always enhance the protection being sought by the submitter. The new

language introduces added equipment in all instances for such devices when having such functionality on selected devices in the system may require the same PPE Category protection for the electrical worker in accordance with NFPA 70E. No data was provided to support that an instantaneous trip function in all circuit breakers will ensure the enhancement in safety sought by the submitter. Overcurrent device instantaneous levels can be set well above any real-world current level that may be induced during an arc flash event. NEMA interprets the submitters goal as seeking a means to enhance worker safety, neither the proposal nor the panel action addresses such an enhancement directly by simply requiring additional product features that may or may not meet the goal of the submitter. Additionally, any performance requirement must be the same for all overcurrent devices, and not specific to circuit breakers.

The TCC should also review this proposal to ensure it resides within the scope of article 240. The scope, and FPN found in the scope, establishes that this article has jurisdiction over the overcurrent protection of conductors and equipment to protect them from excessive or dangerous temperatures. No where is CMP-10 charged with the scope of protecting personnel from hazards arising from the maintenance of electrical systems.

Comment on Affirmative:

COOK, D.: I support the submitted effort to provide greater protection of those required to perform electrical task on energized equipment. I agree with the Panel actions that add “other approved means” to address future technology and require the local status indicator with the energy-reducing maintenance switch. As an enforcement representative I have some concern about the difficulty of identifying non-instantaneous trip circuit breakers in the field. Text similar to that in 500.4(A) could be included to read: Where non-instantaneous trip circuit breakers are installed, documentation shall be available to those authorized to design, install, inspect, maintain, or operate those devices. I also have concerns that complex overcurrent protection schemes that involve field assembly, calibration, and testing to determine functionality. Text to require commissioning of those installations by an accredited party and documentation for that commissioning should be provided to the Authority Having Jurisdiction (AHJ). Typical inspection departments do not have the resources to evaluate that type equipment.

OCKULY, G.: It is my understanding that this requirement will apply to power circuit breakers that do not have an instantaneous trio or where the instantaneous trip is turned to the off position. This requirement would not apply to molded case and insulated case circuit breakers as listed to UL 489.

10-83 Log #214 NEC-P10 **Final Action: Accept**
(240.91 (New))

Note: The following proposal 10-56 and comment 10-27 were returned to Committee at the A2007 Association Technical Meeting and/or subsequent Standards Council Meeting. In accordance with 4.7.1(d) and 4.7.2(c) of the Regulations Governing Committee Projects, it is now being processed as a Proposal for this revision cycle.

Submitter: Dorothy Kellogg, American Chemistry Council, Carl J. Fredericks, The Dow Chemical Company

Recommendation: ROP Text Recommendation: Add new 240.91, as follows:

240.91 Protection of Conductors. Conductors shall be protected in accordance with 240.4, unless otherwise permitted in 240.91(A).

(A) Devices Rated over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than 95% of the rating of the overcurrent device defined in 240.6, where the conductor is protected within recognized time vs. current limits for all short circuit currents of up to 1000 seconds duration.

Substantiation: Problem: Existing NEC rules that effectively require large conductor overload protection at 100% of the ampacity by the overcurrent device are unnecessary and result in inefficient use of conductor materials in Supervised Industrial Installations.

Substantiation: The proposal introduces the equivalent of a “next standard size” exception for large conductors in Supervised Industrial Installations. In these installations, conductors are protected against overload by load calculation and by monitoring, and against short circuit by selection of the overcurrent device as part of an overcurrent coordination study. These factors make overload protection by the overcurrent protection device less critical for these installations. The proposed rule would allow standard conductor sizes to be more readily used with standard overcurrent device sizes in these installations.

ROC Text Recommendation: Continue to accept, but revise the wording as follows:

240.91 Protection of Conductors. Conductors shall be protected in accordance with 240.91(A) or (B).

(A) General. Conductors shall be protected in accordance with 240.4.

(B) Devices Rated over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than 95% of the rating of the overcurrent device defined in 240.6, where the conductor is protected within recognized time vs. current limits for all short circuit currents of up to 1000 seconds duration.

Substantiation: This is a proposed editorial change, refelecting better code text that was developed to improve the clarity.

Substantiation: This proposal 10-56 and comment 10-27 were returned to Committee at the A2007 Association Technical Meeting and/or subsequent Standards Council Meeting. In accordance with 4.7.1(d) and 4.7.2(c) of the Regulations Governing Committee Projects, it is now being processed as a Proposal for this revision cycle.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

COOK, D.: If the negative comments for the proposal and comment ballots of the 2008 NEC cycle have been addressed, they are not provided. No substantiation is provided to indicate the terminations to equipment in Supervised Industrial Installations will perform different than those installed in other installations.

HIDAKA, J.: This proposal should be rejected as it will permit conductor protection above their ampacity for most circuit breaker frame sizes above 800 A. From a review of UL 489, the Standard for Molded Case Circuit Breakers, Molded Case Switches and Circuit Breaker Enclosures, all standard circuit breaker frame sizes rated 1200 – 4000 A (above 4000 A, the breaker is assumed to be bus connected) would allow either the next smaller size conductor, or a reduction by one, the total number of conductors per phase. This will increase the heating load of electrical equipment intended to house circuit breakers. Multiple circuit breakers employing the 95% rule only aggravates the situation further and would subject switchboards and panelboards to more heat than the equipment would have been subjected to during certification/design testing. No substantiation has been submitted to show that a 95 percent ampacity rule permits the safe application of conductors above 800 A. Test data or other substantiation needs to be submitted that demonstrates that the conductors and equipment would not sustain damage from carrying the current permitted by this proposal.

MANCHE, A.: Proposal 10-83 should be rejected because it will permit conductor protection above their ampacity for all currents above 800A. This will also impact the performance of electrical equipment negatively.

Thus the panel continues to take a position that equipment can be used outside the permitted listing safety standard requirements of the equipment. But there is no method to determine the safe use of electrical equipment outside the listing parameters. Only the manufacturer understands the performance of the components within the equipment such as the fuse clip, blade hinge, lubricant, terminals, and plating. The interaction of multiple overcurrent devices within equipment further complicates any attempt to reduce the conductor size and not impact adjacent components. Consider a fusible switchboard with not only devices over 800A, but also those 800A and below. The increase in heat from smaller conductors will not only increase the heat on devices over 800A, but the additional heat will also impact the integrity of neighboring devices 800A or less.

It is foreseeable that a revision to the UL Product Standards to reduce conductor sizes during testing will drive either a derating of present product designs (1200A fuse switch possibly becoming a 1000A switch) or a redesign of products could drive a larger footprint with more copper within the equipment to compensate for the thermal impact of this change. Any short-term savings in wire size will likely be offset by an increase in equipment size and costs in the near future, not only for supervised installations but for all electrical installations.

There has been no substantiation presented that this has or can be accomplished in a safe manner. This change, presumably based on theory, is likely to impact the entire industry by increasing the cost of equipment and by possibly driving larger equipment. These could increase the size of the equipment rooms or reduce working space to NEC minimums.

Lastly, the Panel did not address the questions and technical concerns presented in Comment 10-30 during the 2008 NEC ROC. Failure to address these concerns places the manufacturer in the unfortunate position of having an NEC requirement that is in direct conflict with NEC 110.3 (B).

Comment on Affirmative:

DARLING, D.: The proposed action should have been Accept in Part: The phrase “***all***” and “***up to 1,000 seconds duration***” should be deleted. No published data is currently available to warrant the 1,000 second duration for cable damage curves.

Revised final wording should be:

240.91 Protection of Conductors. Conductors shall be protected in accordance with 240.91(A) or (B).

(A) General. Conductors shall be protected in accordance with 240.4.

(B) Devices Rated over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than 95% of the rating of the overcurrent device defined in 240.6, where the conductor is protected within recognized time vs. current limits for ~~all~~ short circuit currents of ~~up to 1000~~ seconds duration.

10-84 Log #287 NEC-P10 **Final Action: Reject**
(Table 240.92(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "formula" to "equation" in two places.
Substantiation: The term formula refers to a chemical composition whereas an equation refers to a mathematical expression, which follows in both cases.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Reject
Panel Statement: Webster's 11th Collegiate Dictionary, the official dictionary for NFPA, defines formula as "A general fact, rule or principle expressed in usually mathematical symbols."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 250 — GROUNDING

5-51a Log #CP503 NEC-P05 **Final Action: Accept**
(Figure 250.1, Title of Part X, 250.180, 250.182 250.188)

TCC Action: The Technical Correlating Committee directs the panel to clarify the panel action on this proposal with respect to retaining the term "high-voltage" in the first sentence of the revised 250.188(A) and anywhere else in this Article.
This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 5,
Recommendation: Revise the following 2008 NEC sections to read:
X. Grounding of Systems and Circuits of Over 1 kV ~~and over~~ ~~(High Voltage)~~
250.180 General. Where ~~high-voltage~~ systems over 1 kV are grounded, they shall comply with all applicable provisions of the preceding sections of this article and with 250.182 through 250.190, which supplement and modify the preceding sections.
250.182 Derived Neutral Systems. A system neutral point derived from a grounding transformer shall be permitted to be used for grounding ~~high-voltage~~ systems over 1 kV.
250.188 Grounding of Systems Supplying Portable or Mobile Equipment. Systems supplying portable or mobile equipment ~~high-voltage~~ over 1 kV, other than substations installed on a temporary basis, shall comply with 250.188(A) through (F).
(A) Portable or Mobile Equipment. Portable or mobile high-voltage equipment shall be supplied from a system having its neutral conductor grounded through an impedance. Where a delta-connected ~~high-voltage~~ system over 1 kV is used to supply portable or mobile equipment, a system neutral point and associated neutral conductor shall be derived.
(D) Ground-Fault Detection and Relaying. Ground-fault detection and relaying shall be provided to automatically de-energize any ~~high-voltage~~ system over 1 kV component that has developed a ground fault. The continuity of the equipment grounding conductor shall be continuously monitored so as to de-energize automatically the ~~high-voltage~~ over 1 kV circuit to the portable or mobile equipment upon loss of continuity of the equipment grounding conductor.
(F) Trailing Cable and Couplers. Over 1 kV ~~High-voltage~~ system trailing cable and couplers for interconnection of portable or mobile equipment shall meet the requirements of Part III of Article 400 for cables and 490.55 for couplers.
In Figure 250.1 Revise text block to read: Part X Grounding of systems and circuits of over 1kV ~~and over (high voltage)~~.
Substantiation: The term "high-voltage" as used in the NEC is not consistent throughout industry standards. These revisions add clarity, remove any potential conflicts and provide consistency with Articles 280 and 285.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-52 Log #3111 NEC-P05 **Final Action: Accept in Principle**
(250.2.Bonding Jumper, System)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revised Text:
Bonding Jumper, System. The conductor that connects ~~connection between~~ the grounded system ~~circuit~~ conductor at a grounded separately derived system to one or more of the following: ~~and~~ the grounding electrode conductor, the equipment bonding jumper or conductor, or the equipment grounding conductor ~~at a separately derived system~~.
Substantiation: This proposal intends to make changes to the definition to clarify the function of the system bonding jumper. In reality, the system bonding jumper can be installed in several ways. For example, if a multi-barrel lug is connected to the XO terminal of a transformer, the system bonding jumper, grounding electrode conductor, grounded conductor, and bonding jumper can be connected at that connector. If a multi-barrel lug is connected to the transformer or generator enclosure, it is common to connect the system bonding jumper, grounding electrode conductor and the bonding jumper or conductor to that connector. The grounded conductor should always connect directly to the XO terminal.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
The connection between the grounded circuit conductor, and the supply-side bonding jumper, ~~and~~ or the equipment grounding conductor, or both, at a separately derived system.
Panel Statement: The change is needed to correctly use the term "supply-side bonding jumper" and to include additional connections that are permitted or required. In addition, the revision identifies the function of the system bonding jumper as related to the equipment grounding conductor.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-53 Log #4009 NEC-P05 **Final Action: Accept in Principle**
(250.2.Bonding Jumper, System)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read as follows:
Bonding Jumper, System
The connection between the grounded circuit conductor and the equipment bonding jumper ~~equipment grounding conductor at~~ for a separately derived system.
Substantiation: The system bonding jumper is connected to the equipment bonding jumper either in the source or the first system disconnecting means and the text should be changed to match the terms used. for consistency and usability. The term "at" was replaced with "for" because this connection is not always installed at the system, it may be in the disconnecting means.
Panel Meeting Action: Accept in Principle
Panel Statement: See CMP-5 action on Proposal 5-52. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-54 Log #56 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Note: This Proposal appeared as Comment 5-27 on Proposal 5-57 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 5-57 was:
Accept the proposal in principle, but consider the following suggested wording:
Ground Fault. An unintentional, electrically conducting connection between ~~an ungrounded or grounded~~ a normally current carrying conductor of an electrical circuit, and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute-Electric Light & Power Group
Recommendation: Accept in Principle the proposal. Change the definition to read as follows:
Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.
Substantiation: In the National Electrical Code, calling the connection between the normally, current-carrying, grounded, unbalanced current return path and the not-normally, current-carrying, equipment grounding conductor path will cause confusion in the industry and a conflict within the National Electrical Code as it discusses prescriptive requirements for ground-fault protection in 230.95, 215.10, 240.13, 517.17 and Part IV and Part V of Article 430. This definition will also cause conflict and confusion between the National Electrical Code and the Codes and Standards of the Institute of Electrical and Electronic Engineers (IEEE). One such standard is ANSI/IEEE Std 242 – 2001, Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems termed the "Buff Book". This reference sets the current standard for fault current calculation and system protection and the proper selection, application, and coordination of components that may be required to protect industrial and commercial power systems against abnormalities that could reasonably be expected to occur in the course of electrical system operation.
Other IEEE Standards such as the ANSI/IEEE Std 141-1993, IEEE Recommended Practice for Electric Power Distribution for Industrial Plants and the ANSI/IEEE Std 241-1990, IEEE Recommended Practice for Electric Power Systems in Commercial Buildings both reference appropriate editions of ANSI/IEEE Std 242 for fault current calculations. Also, the Bussman, Electrical Protection Handbook discusses and uses the methodologies developed in ANSI/IEEE Std 242 to discuss and recommend overcurrent protection as well as protection from ground faults in accordance with the requirements of the National Electrical Code.
The principle issue in Proposal 5-57 is the use of the phrase "a normally current carrying conductor" in the definition developed by CMP-5 in the Recommendation portion of the comment.
Many times "a normally current carrying conductor" is an ungrounded

conductor (typically referred as a line conductor or a phase conductor). However, a grounded conductor or a neutral conductor is also "a normally current carrying conductor". Connection of a grounded conductor or a neutral conductor of an electric circuit and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth is not a ground fault. Rather the term for this connection is not currently defined in any standard. Defining a grounded conductor or neutral conductor connection to the ground or non-current carrying grounded metal members goes against the history of the term as it is used in calculating the magnitude and phase angle of unbalanced currents during accidental connection of single-line to ground short-circuits or double-line to ground short-circuits.

The history of the term "ground fault" and ground fault current calculations dates back to 1926 when A. P. Mackerras used a mathematical method previously developed by Dr. C. L. Fortescue (later called Symmetrical Components) to establish and publish his work on the determination of single-phase short-circuits on three-phase systems. Unbalanced (unsymmetrical) currents during a single-phase, line-to-ground, short-circuit (termed ground fault) in a three-phase system using the mathematical method could be broken down into three, symmetrical currents to ease the complex circuit calculations. These three symmetrical models of the unsymmetrical current, voltage or impedance are the positive-sequence component, the negative-sequence component and the zero-sequence component.

In order to use the theory of symmetrical components on three-phase systems (that is now widely accepted as a standard practice) with Ohms law for AC systems,

$$\left(I = \frac{E}{Z} \right)$$

voltages (E) and circuit impedances (Z) are broken down into their respective symmetrical sequence components.

Calculations are made at the symmetrical sequence component level and re-constructed back to the unsymmetrical level for an answer to determine the magnitude and phase angle of current. Single-phase systems are much simpler to calculate a shorted phase to ground or shorted phase to neutral current.

In a three-phase wiring system, both the positive-sequence component and the negative-sequence component impedance are based on the resistance (wire resistance) and reactance (geometry) of the individual phase or line conductors. The zero-sequence component impedance is based on the resistance and reactance of the common return path. This work pre-dates the work of Eustace C. Soares and the equipment-grounding conductor philosophy currently found in the National Electrical Code (separate grounded conductor and equipment grounding conductor generally beyond the main disconnecting means in the NEC wired system).

It is interesting to note that the concept of defining Ground Fault and Short Circuit is not a new concept. It was recommended in 1966 by Eustace Soares himself to end the confusion between the definition of a short circuit and a ground fault. He proposed the following two definitions.

SHORT CIRCUIT: A conducting connection, whether intentional or accidental, between any of the conductors of an electrical system whether it be from line to line or line to the grounded conductor.

GROUND FAULT: A conducting connection, whether intentional or accidental between any of the conductors of an electrical system and the conducting material which encloses the conductors or any conducting material that is grounded or that may become grounded.

Here is the reason why these definitions were not accepted in the past. In the NEC system, both the grounded conductor path (usually a wire or busbar) and the equipment-grounding conductor path (generally, a wire, a metallic raceway or metallic conductor enclosure) are part of the zero-sequence component impedance. Connecting these two conducting paths (grounded path and grounding path) together does not constitute a fault and will not cause a high current to flow in the system. Rather, connecting these two together roughly relates to paralleling two impedances together and reducing the overall impedance. This is one technical reason why in patient care areas of health care facilities, a parallel equipment-grounding conductor inside a metallic raceway is used as required by 517-13. It reduces the zero-sequence impedance and improves the effective fault current path (as discussed in 250.4) for line-to-ground faults.

Connecting the grounded conductor to the equipment-grounding conductor path will cause normal unbalanced load current to flow on non-normally current carrying metallic raceways, metallic enclosures and other metallic paths such as building steel, plumbing, metallic support structures and etc. This current flow outside of the normal conductor path is generally undesired (but, not necessarily unsafe) in premises wiring installed in accordance with the National Electrical Code.

The proposed definition in 5-57 falls apart in service enclosures, enclosures such as meter sockets prior to the main disconnecting means, and metallic service raceways. If the bare grounded conductor comes in contact with one of these enclosures, is it a ground fault or a short circuit or just a normal occurrence provided it was intentional? What happens if an electrician intentionally makes an inappropriate connection and re-grounds the grounded conductor in a feeder supplied panel board? Does an erroneously made, intentional connection vitiate the proposed definition of ground fault in 5-57?

If definition of "ground fault" is approved as it appears in Proposal 5-57 of the ROP, the National Electrical Code will now permit ground faults as the normal occurrences with the connection of the main bonding jumper at the service, the system bonding jumper at a separately derived system, or the connections as permitted in 250.32 (B).

I would agree that a term that describes the inappropriate grounding connection (grounding error) between a grounded conductor and the equipment grounding conductor path beyond the main disconnecting means should be developed. However, the term "ground fault" is not the correct term for this occurrence. The revised wording of the definition shown below in this comment accurately defines the term "ground fault".

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.

Further, if this definition of ground fault is accepted, the definition of short circuit could be defined as follows in a future edition of the NEC.

Short Circuit. An unintentional, electrically conducting connection between two or three ungrounded conductors of an electrical circuit.

Panel Meeting Action: Reject

Panel Statement: The proposed definition is not correct. A connection between the grounded conductor and an ungrounded conductor is a short-circuit, not a ground-fault. The current definition is consistent within the context in which the term ground-fault is used in the NEC.

Ballot Results: Affirmative: 16

5-55 Log #4192 NEC-P05 **Final Action: Reject**

(250.2.Likely to Become Energized)

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Add new text as follows:

<u>Likely to Become Energized (New) The failure of insulation on.</u>

Substantiation: This term is used numerous times in Article 250 and is not presently defined in the NEC. It is provided as a term in the NEC Style manual Annex B. Including it in the NEC will increase the understanding of what this term means and will increase usability.

Panel Meeting Action: Reject

Panel Statement: The proposed definition is unclear and appears to be incomplete. CMP-5 concludes that this term is used in more than one article.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-56 Log #579 NEC-P05 **Final Action: Reject**

(250.2.Objectionable Currrent)

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting

Recommendation: Add new text as follows:

<u>**Objectionable Current.** Any steady state of electrical current on grounding conductors or conductive metal parts of equipment that normally does not carry electric current, except for temporary ground fault current flow that is intended to facilitate the operation of the overcurrent protective device or ground-fault detectors on high-impedance grounded systems.</u>

Substantiation: This section (250.6) is unenforceable because the NEC does not define what objectionable currents are, it does define what objectionable currents are not, which is no help to the installer or inspector. The lack of a definition creates a great deal of confusion to installers and inspectors, because everyone has a definition and performs the electrical installation or inspection to their definition. As an instructor, how can you give any examples of objectionable currents, or an installation installed and arranged in a manner that will prevent objectionable current, without a definition of the term?

Panel Meeting Action: Reject

Panel Statement: Objectionable currents are not always steady-state currents. The recommendation does not improve the understanding or application of 250.6. See the panel action and statement on Proposal 5-26.

(Table 250.3)

Submitter: John W. Young, Siemens Energy & Automation
Recommendation: Delete the following line from Table 250.3:
~~Closed-loop and programmed power distribution 780.3~~
Substantiation: Article 780 – Closed Loop and Programmed Power Distribution was deleted from the 2008 NEC. The reference Section – 780.3 – no longer exists.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-58 Log #2775 NEC-P05 **Final Action: Reject**
(250.3)

Submitter: Chris Fackler, FSG Electric
Recommendation: Make all flow charts show the article and section like in 250.3
Substantiation: Allows flow charts to have a quick reference in order to allow users to achieve full comprehention.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided proposed text for this proposal, including the wording to be added, revised (and how revised), or deleted in accordance with 4.3.3(c) of the NFPA Regulations Governing Committee Projects. Also, the submitter has not provided a statement of the problem or substantiation for the proposal in accordance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-58a Log #CP505 NEC-P05 **Final Action: Accept**
(250.4(A)(1) FPN)

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:
FPN: An important consideration for limiting the imposed voltage is the routing of bonding and grounding <u>electrode</u> conductors so that they are not any longer than necessary to complete the connection without disturbing the permanent parts of the installation and so that unnecessary bends and loops are avoided.
Substantiation: The revision has been made to correlate with the deletion of the term “Grounding Conductor” in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term “grounding conductor” from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman’s report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term “grounding conductor.”

5-59 Log #1552 NEC-P05 **Final Action: Reject**
(250.4(A)(2), (3), and (4))

Submitter: Steven French, I.B.E.W. Electrician/Apprentice Instructor / Rep. I.B.E.W. Local #176
Recommendation: Add new text as follows:
250.4 General Requirements for Grounding and Bonding.
The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 250 shall be followed to comply with the performance requirements of this section.
(A) Grounded Systems.
(1) Electrical System Grounding. Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation.
FPN: An important consideration for limiting the imposed voltage is the routing of bonding and grounding conductors so that they are not any longer than necessary to complete the connection without disturbing the permanent parts of the installation and so that unnecessary bends and loops are avoided.
(2) Grounding of Electrical Equipment. **<u>General.</u>** Normally non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.
(3) Bonding of Electrical Equipment. <u>General.</u> Normally non–current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.
(4) Bonding of Electrically Conductive Materials and Other Equipment. <u>General.</u> Normally non–current-carrying electrically conductive materials that are likely to become energized shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.
Substantiation: This would emphasize to the user that non–current-carrying electrically conductive materials that are likely to become energized shall be grounded or bonded as a **<u>general rule,</u>** except where permitted elsewhere in the code.
Panel Meeting Action: Reject
Panel Statement: The requirements in 250.4 are performance requirements. This section identifies what grounding and bonding of electrical systems are required to accomplish. The term “general” is in the title of the section. Adding the term “general” three more times will not add clarity to the code.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-60 Log #2701 NEC-P05 **Final Action: Reject**
(250.4(B)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add “or polarity” after “different phase”.
Substantiation: Edit. The requirement should apply to dc systems.
Panel Meeting Action: Reject
Panel Statement: The word “polarity” is not reserved to denote DC systems and is used interchangeably with “phase” or “line” to indicate a different potential.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-61 Log #605 NEC-P05 **Final Action: Reject**
(250.4(B)(4), FPN)

Submitter: Gregory P. Bierals, Samaritan’s Purse World Medical Mission
Recommendation: Add new text to read as follows:
Ungrounded systems may necessitate the evaluation of overcurrent devices based upon their single-pole short-circuit interrupting rating, which may be less than their normal interrupting rating.
Substantiation: If a second ground-fault occurs on an opposite phase before the first ground-fault is cleared, the full phase-to-phase voltage (480 V, 600 V, or 240 V) would appear across only one pole of the affected overcurrent device. This condition may result in a fault current that exceeds the single-pole interrupting capability.
Panel Meeting Action: Reject
Panel Statement: The recommended requirement is covered by Article 240.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-62 Log #2773 NEC-P05 **Final Action: Reject**
(250.6(A))

Submitter: Kerry G. Ginther, Conifer, CO
Recommendation: Revise text as follows:
Arrangement to prevent objectionable current. The ~~grounding~~ <u>bonding</u> of electrical systems, circuit conductors, surge arrestors, surge protective devices, and conductive normally non-current-carrying metal parts of equipment shall be installed and arranged in a manner that will prevent objectionable current.
Substantiation: Misuse of the term grounding when bonding the electrical systems together is what is inferred. The wording change would coincide with the definitions of grounding and bonding given in Article 100.
Panel Meeting Action: Reject
Panel Statement: Grounding is the better term. Circuit conductors are not “bonded” but are connected to grounded. Surge arresters and surge protective devices are grounded, many times directly by a grounding electrode conductor, not bonded for the earth connection.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
BRENDER, D.: The second sentence of the Panel Statement is incomplete and should read, “Circuit conductors are not “bonded” but are connected to grounded system conductors.”

5-63 Log #658 NEC-P05 **Final Action: Reject**
(250.6(A), FPN (New))

Submitter: Gregory P. Bierals, Samaritan’s Purse World Medical Mission
Recommendation: Add new text to read as follows:
FPN: The normal capacitive charging current in equipment grounding conductors is not the objectionable current addressed in this section.
Substantiation: Negligible capacitive charging current is normal and unavoidable, especially in AC systems where equipment grounding conductors are run with or enclose the circuit conductors.
Panel Meeting Action: Reject

Panel Statement: The panel concludes that the proposed text does not add useful information to 250.6(A). The level at which current becomes objectionable is based on equipment and system design and is variable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-64 Log #3463 NEC-P05 **Final Action: Accept**
(250.6(C))

Submitter: G. Scott Harding, F. B. Harding, Inc.
Recommendation: Revise text to read as follows:
250.6(C) Temporary Currents Not Classified as Objectionable Currents. Temporary currents resulting from ~~accidental~~ abnormal conditions, such as ground faults, shall not be classified as objectionable current for the purposed specified in 250.6(A) and (B).
Substantiation: Under normal conditions, current does not travel on Equipment grounding Conductors, Grounding Electrode Conductors, etc. Ground faults occur when abnormal conditions are present, not necessarily during accidental conditions. An accident is not needed to create a ground fault. "Abnormal" is also utilized in the Article 100 definition of a circuit breaker and would seen to be the applicable word in this case.
Article 100 definition of Circuit Breaker: A switching device capable of making, carrying, and interrupting currents under normal circuit conditions, and also of making, carrying for a specified time, and interrupting currents under specified abnormal circuit conditions, such as those of short circuit.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-65 Log #136 NEC-P05 **Final Action: Reject**
(250.8)

Submitter: Alan A. Loch, Trinity Associates, Inc.
Recommendation: Revise as follows:
"Sheet metal screws and self-tapping screws shall not be used to connect grounding conductors to enclosures. Bolts, washers, lock washers, and nuts or something of equal strength shall be used. The ground bus should be tested at maximum fault current, not just 1200 amps."
Substantiation: A 2500 KVA transformer had its 4000 amp switch close in on a bolted fault t ground. The 50,000 plus amps fault current blew apart the self-tapping attached ground bus.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter is asking the code to introduce requirements that are a part of a product safety standard. There are many standard and self-tapping type screws that provide for the connection of two threads into the enclosure. Self-tapping screws are used extensively in device boxes without any documented problems. The substantiation referenced and the additional documentation refers to a product related issue that should not be addressed in the National Electrical Code.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-66 Log #1000 NEC-P05 **Final Action: Reject**
(250.8)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Grounding ~~conductors and~~ bonding ~~jumpers~~ shall be accomplished ~~connected~~ by one of the following means unless otherwise specified or permitted elsewhere in this Code.
(1) through (8)-no change.
(9) Metal raceway threaded connections
(10) Locknuts or locknuts and bushings connections of metal raceways and cables identified for use as grounding or bonding conductors.
(B) No change.
Substantiation: Present text does not address means other than grounding or bonding jumpers which are permitted elsewhere in the Code, e.g., 230.50, 240.20(D), 240.100(A)(2), 250.4(A) and (B), and 430.225(B).
Panel Meeting Action: Reject
Panel Statement: The proposed revision changes the scope of the requirement without technical substantiation. The use of the proposed numbers 9 and 10 are already allowed by the NEC as bonding connections. Section 250.8 applies to wire type conductors and jumpers and their respective connectors and not conduits. Threaded and other fittings are listed for grounding under separate standards while the conduits are not listed for grounding, but are accepted for grounding per Section 250.118.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-67 Log #3046 NEC-P05 **Final Action: Reject**
(250.8)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(A) Permitted Methods. Grounding conductors and bonding jumpers shall be connected only by one of the following means:
(1) Listed pressure connectors
(2) Terminal bars
(3) Pressure connectors listed as grounding and bonding equipment
(4) Exothermic welding process
(5) Machine screw-type fasteners that engage not less than two threads or are secured with a nut
(6) Thread-forming machine screws that engage not less than two threads in the enclosure
(7) Connections that are part of a listed assembly
(8) Other listed means
~~(B) Methods Not Permitted. Connection devices or fittings that depend solely on solder shall not be used.~~
Substantiation: There are many who argue that the existing 250.8(A) is not written in language that is easily enforced. By adding the word "only" this argument is silenced, and furthermore it allows (B) to be deleted.
Panel Meeting Action: Reject
Panel Statement: The addition of the word "only" does not add clarity to the code. The deletion of 250.8(B) is not substantiated, as it is useful text for the user as it is still specifically cited by AHJs from time to time.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-68 Log #4146 NEC-P05 **Final Action: Reject**
(250.8)

Submitter: Chuck Mello, Underwriters Laboratories
Recommendation: Revise 250.8 to relocate the requirements of 250.12 into 250.8 as follows:
250.8 Connection of Grounding and Bonding Equipment.
(A) Permitted Methods. Grounding conductors and bonding jumpers shall be connected by one of the following means:
(1) Listed pressure connectors
(2) Terminal bars
(3) Pressure connectors listed as grounding and bonding equipment
(4) Exothermic welding process
(5) Machine screw-type fasteners that engage not less than two threads or are secured with a nut
(6) Thread-forming machine screws that engage not less than two threads in the enclosure
(7) Connections that are part of a listed assembly
(8) Other listed means
(B) Methods Not Permitted. Connection devices or fittings that depend solely on solder shall not be used
(C) Clean Surfaces. Nonconductive coatings (such as paint, lacquer, and enamel) on equipment to be grounded shall be removed from threads and other contact surfaces to ensure good electrical continuity or be connected by means of fittings designed so as to make such removal unnecessary.
Substantiation: The 2008 NEC cycle revised 250.8 to clarify what connectors and connection methods could be used and what would not be acceptable. The title for this section is "Connection of Grounding and Bonding Equipment" which seems to cover more than the methods. Presently, in 250.12 there is the requirement to have clean surfaces that is really another aspect of connecting grounding and bonding equipment and devices. The relocation of 250.12 as paragraph "C" under 250.8 seems to be logical and an improvement for clarity by putting these requirements – the methods and the requirement for clean surfaces - together.
A companion proposal to delete the requirements of 250.12 is being submitted.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that this section is easier to cite in a stand-alone section, 250.12.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-68a Log #CP506 NEC-P05 **Final Action: Accept**
(250.8(A))

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:
(A) Permitted Methods. Equipment ~~G~~grounding conductors, grounding electrode conductors, and bonding jumpers shall be connected by one of the following means:
Substantiation: The revisions have been made to correlate with the deletion of the term "Grounding Conductor" in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term "grounding conductor" from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted.

The CMP-5 chairman's report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term "grounding conductor."

5-69 Log #3837 NEC-P05 **Final Action: Reject**
(250.8(A)(1))

Submitter: Tim Cookson, PowerEdge Technologies
Recommendation: Delete text to read as follows:
~~(1) Listed pressure connectors~~
Substantiation: This text allows products such as wire connectors (UL 486) and General compression tank to be used to terminate grounding and bonding conductors. Because Article 250 is specific to grounding and bonding as well as UL 467, only products meeting these requirements should be used for safety and reliability. (See also 250.2 and 250.4(A)(5) for the purpose along with 250.8(A)(3).)
Panel Meeting Action: Reject
Panel Statement: The intent of the existing requirements is the allowance of UL 486 series standard connectors to be used for the connection of grounding and bonding equipment. There was no technical substantiation that standard listed connectors such as used in panelboards, switchboards, and elsewhere have been an issue. The list in 250.8 needs to include both listed pressure connectors and pressure connectors listed for grounding and bonding to ensure the end user understands that it is generally acceptable to use listed pressure connectors such as wire connectors under UL 486A-486B unless required by other sections to use those that are listed for grounding and bonding.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-70 Log #3838 NEC-P05 **Final Action: Reject**
(250.8(A)(2))

Submitter: Tim Cookson, PowerEdge Technologies
Recommendation: Revise text to read as follows:
(2) Terminal Bars <u>Listed or Recognized as Grounding and Bonding Equipment</u>
Substantiation: This text allows products such as wire connectors (UL 486) to be used to terminate grounding and bonding conductors. Because Article 250 is specific to grounding and bonding as well as UL 467, along with the fact that there are terminal bars that meet UL 467, only those products should be used for safety and reliability. (See also 250.2 and 250.4(A)(5) for the purpose.)
Panel Meeting Action: Reject
Panel Statement: Terminal bars are sometimes evaluated as part of an assembly such as for panelboards in UL 67 and are not necessarily specifically evaluated to UL 467. Terminal bars can be individual or accessory parts of equipment. The intent of the existing requirements is the allowance of terminal bars to generally be used for the connection of grounding and bonding equipment. There is no technical substantiation provided to change this allowance. Recognized components should not be referenced in the NEC, as they are not suitable for field installation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-71 Log #186 NEC-P05 **Final Action: Reject**
(250.8(A)(3))

Submitter: Bryan P. Holland, City of North Port
Recommendation: Revise as follows:
(A) Permitted Methods.
~~(3) Pressure connectors listed as grounding and bonding equipment.~~
Substantiation: The connectors identified in (3) are already covered by those identified in (1) Listed pressure connectors. The listing of (1) and (3) is redundant and unnecessary. (1) Listed pressure connectors include all those in (3).
Panel Meeting Action: Reject
Panel Statement: The substantiation is not correct. A listed pressure connector is not always listed as grounding and bonding equipment. Conversely, the listing process for connectors listed as grounding and bonding equipment does not make these suitable for use as standard listed connectors. The processes for the listing are different and each connector type needs to be identified in 250.8.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-72 Log #3839 NEC-P05 **Final Action: Reject**
(250.8(A)(3))

Submitter: Tim Cookson, PowerEdge Technologies
Recommendation: Revise text to read as follows:
(3) Pressure connectors listed <u>or recognized</u> as rounding and bonding equipment.
Substantiation: Assemblies are listed and components are recognized such as terminal bars and connectors that can be added to assemblies such as switches, switchboards, and panelboards. This addition clarifies that a component can be added instead of an assembly replacement if an enhancement is required to meet 250.4(A).
Panel Meeting Action: Reject
Panel Statement: Recognized components are not intended for field installation. Recognized components must be evaluated in the end use product by a testing laboratory.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

Recommendation: Delete text as follows:
~~(8) Other listed means~~
Substantiation: This text is too vague and could be interpreted to mean any electrical, non-electrical, or combination of different listed products connected together.
Panel Meeting Action: Reject
Panel Statement: "Listed" means defines products and methods that have been evaluated by a Nationally Recognized Testing Laboratory for this application.

It is intended to be non-specific as there are numerous methods that can be developed in accordance with the product safety standard. This allows for additional products that do not fit into the list to be introduced into the marketplace without requiring specific code revisions.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-77 Log #1398 NEC-P05 **Final Action: Reject**
(250.10(1))

Submitter: Jayson Ouillette, Rep. IBEW Local 252
Recommendation: Revise text as follows:
Arranged within an enclosure or covering ~~In installations~~ where they are not likely to be damaged.
Substantiation: Change of wording clarifies intent to protect ground clamps. Current wording may be confusing (i.e., They shall be protected from physical damage...where not likely to be damaged!). Current wording can be interpreted to be contradictory.
Panel Meeting Action: Reject
Panel Statement: Grounding clamps and fittings are not necessarily installed in enclosures such as a ground rod clamp that may be directly buried. The recommended text does not provide the additional clarity sought by the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-78 Log #2147 NEC-P05 **Final Action: Reject**
(250.12)

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Revise text as follows:
Nonconductive coatings (such as paint, lacquer, ~~and~~ enamel, rust and any form of corrosion) on equipment to be grounded shall be removed from threads and other contact surfaces to ensure good electrical continuity or be connected by means of fittings designed so as to make such removal unnecessary.
Substantiation: All types of grounding and bonding clamps are installed on rusted pipes, rods and the like. Electrical connections are not always made on new equipment. This article needs to include cleaning of old rusty surfaces for a good electrical connection with existing installs.
Panel Meeting Action: Reject
Panel Statement: The list of items cited in this section is not all-inclusive, rather they are provided as examples. Any nonconductive coating is already required to be removed to ensure good electrical continuity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
PORTER, C.: The current list of examples are all products that are purposefully applied to enclosures, by adding in examples of rust and corrosion it becomes clear that coatings that may arise due to conditions of the environment and were not purposefully applied should be considered as well.

5-79 Log #4147 NEC-P05 **Final Action: Reject**
(250.12)

Submitter: Chuck Mello, Underwriters Laboratories
Recommendation: Delete text to read as follows:
~~250.12 Clean Surfaces.~~
~~Nonconductive coatings (such as paint, lacquer, and enamel) on equipment to be grounded shall be removed from threads and other contact surfaces to ensure good electrical continuity or be connected by means of fittings designed so as to make such removal unnecessary.~~
Substantiation: Delete 250.12. This is the companion proposal to 250.8 where the text of this section was relocated to 250.8 as paragraph "C".
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 5-68.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
TEMBLADOR, R.: While we concur with the panel action and statement on this proposal, the title of this section should be revised to "Electrical Continuity" to better reflect the intent and objective of this section. The revision would offer language consistent with the title of section 300.10.

5-80 Log #3280 NEC-P05 **Final Action: Reject**
(250.13 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add the following:
250.XX: DIRECT-BURIED CONDUCTORS Direct-buried bonding and grounding conductors shall comply with Column 1 of Table 300.5.
Substantiation: Grounding and bonding conductors are critical components and should be specifically required to comply with depth requirements.
Panel Meeting Action: Reject
Panel Statement: CMP-5 has addressed the issue of burial depths in previous revision cycles. The substantiation has not provided technical justification to add this requirement.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-81 Log #2338 NEC-P05 **Final Action: Reject**
(250, Part II)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Change the current heading for Part II of Article 250 to include the words "and System Bonding" as follows: **II. System Grounding and System Bonding.**
Substantiation: In the pursuit of improving code organization, changing the heading for Part II of Article 250 as shown above would justify the use of the word "bonding" over 50 times in this part of the article, and would also provide a clear reason for including 250.28, all of which deals ONLY with bonding, in Part II of Article 250. This proposed change lends clarity to the present code text, which also includes a Part V entitled "Bonding," by helping to distinguish between (supply) "system" bonding and "other" (equipment or interconnection) bonding.
Panel Meeting Action: Reject
Panel Statement: Part II of Article 250 provides rules related to system grounding. Bonding connections are functions included to accomplish the system grounding requirements addressed in Part II. Bonding functions, jumpers, connections, methods, and requirements are covered in Part V of Article 250.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRETT, JR., M.: I disagree with the committee action. The submitter is correct in that the Main Bonding Jumper and the system Bonding jumper rules are found in Part ll. These are the most important rules for bonding in Article 250. I also agree the common bonding requirements to complete a grounding electrode system or equipment bonding jumpers to assure continuity are important functions. Reference titles bonding are appropriate for Parts 2 through 6 also the figure 250.1 should be revised to reflect this.

5-82 Log #455 NEC-P05 **Final Action: Accept**
(250.20(B) & 250.21)

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise text to read as follows:
Change the text "50 Volts to less than 1000 Volts" in the two codes sections noted above.
I have also submitted a proposal to make this change in Table 685.3.
Substantiation: In Article 250, the grounding provisions for these two code sections currently mention "50 Volts to 1000 Volts". Other Article 250 code sections mention 1 kV and Over. Although minor, the code text as noted can create a code requirement conflict when working on systems of 1000 volts or 1 kV. What code sections apply for these systems? This code change is simply a correlation issue. Sections 200.2(A); 250.21(A)(3); 250.24(C); 250.170, Exception 1; and, 250.174 all mention circuits of less than 100 volts.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
BOWMER, T.: There is an editorial error in Panel Substantiation - the last phrase of the substantiation should be "...less than 1,000 volts" not ".. less than 100 volts".

5-83 Log #3226 NEC-P05 **Final Action: Accept**
(250.20(D))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 5-101 that has deleted 250.20(D).
This action will be considered by the panel as a public comment.
Submitter: Mark R. Hilbert, State of New Hampshire
Recommendation: Revise as follows:
(D) Separately Derived Systems. Separately derived systems, as covered in 250.20(A) or (B), shall be grounded as specified in 250.30~~(A)~~. Where an alternate source such as an on-site generator is provided with transfer equipment that includes a grounded conductor that is not solidly interconnected to the service-supplied grounded conductor, the alternate source (derived system) shall be grounded in accordance with 250.30~~(A)~~.
Substantiation: This proposal is being submitted as part of series of proposals addressing a revision of 250.30. The removal of the specific reference to 250.30(A) and just referencing 250.30 will allow the new 250.30(B), regarding buildings or structures supplied by separately derived systems, to become part of the requirements for grounding separately derived systems. This revision would also allow any applicable future changes in 250.30 to be included without having to change this section each time.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BRENDER, D.: The Panel action on this proposal should be "Reject". 250.20(D) is deleted by the Panel action on Proposal 5-101.

5-84 Log #2702 NEC-P05 **Final Action: Reject**
(250.21(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:

(3)a: The system is used exclusively for control <u>or signaling</u> circuits.

c. Continuity of control <u>or signal</u> power is essential ~~required~~.

Substantiation: The provision should include signaling circuits. The provision should be limited to continuity that is deemed essential for safety or other valid reasons.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation to support such a change. Signal circuits can be considered to be control circuits and the additional words are not needed. There is no substantiation for replacing the word "required" with "essential".
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-85 Log #578 NEC-P05 **Final Action: Accept in Principle**
(250.21(B))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text as follows:

(B) Ground Detectors. Ungrounded alternating current systems as permitted in 250.21(A)(1) through (A)(4) operating at not less than 120 volts and not exceeding 1000 volts shall have ground detectors installed on the system. <u>The ground detection system shall be installed as close as practicable to the service equipment where the service is supplied ungrounded or as close as practicable to the ungrounded separately derived system source location.</u>

Substantiation: This proposal seeks clarification as to the appropriate and functional location for ground detection equipment for an ungrounded service or ungrounded separately derived system. The current requirement is that ground detection be provided on the system, but no location is specified. The problem is that if the detection equipment is installed at the branch circuit or feeder in a location multiple levels downstream from the source or service, the disconnecting of a feeder or branch circuit to which the ground detection equipment is connected could result in an unmonitored, ungrounded system as a whole.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
(B) Ground Detectors. Ground detectors shall be installed in accordance with (B)(1) and (B)(2).
(1) Ungrounded alternating current systems as permitted in 250.21(A)(1) through (A)(4) operating at not less than 120 volts and not exceeding 1000 volts shall have ground detectors installed on the system.
(2) The ground detection ~~system~~ <u>sensing equipment</u> shall be ~~installed~~ <u>connected</u> as close as practicable to ~~service equipment~~ where the <u>system receives its supply</u>. ~~service is supplied ungrounded or as close as practicable to the ungrounded separately derived system source location.~~
Panel Statement: The recommendation has been revised to specify it is the connection of the sensors, rather than the system that needs to be installed close to the source in order to monitor as much of the system as possible and not be incapacitated by the opening of a switch or overcurrent protective device. The indicating device can be located at any convenient location. Additionally the recommendation has been revised to comply with the NEC Manual of Style.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-86 Log #3668 NEC-P05 **Final Action: Reject**
(250.21(B))

Submitter: Mark Smythe, Smythe Electric Inc.
Recommendation: Revise text as follows:

250.21(B) Ground Detectors. Ungrounded alternating current systems as permitted in 250.21(A)(1) through (A)(4) operating at not less than 120 volts and not exceeding 1000 volts shall have ground detectors installed on the system. <u>The ground detector system shall have alarm annunciating equipment located in a readily accessible, conspicuous location for personnel to monitor.</u>

Substantiation: Often times the ground detection systems are installed in locked, remote, equipment or electrical rooms where the alarms can not be readily heard or noticed by personnel. The initial ground fault alarm could sound for days or longer, without any response from personnel.
Panel Meeting Action: Reject
Panel Statement: The process of establishing the method of indicating of the ground-fault detection system activation is a design and operation consideration and has to take into account individual factors associated with the installation. The substantiation does not support the use of audible or visual ground-fault indication only.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

MOHLA, D.: The proposal should have been accepted in principle to ensure that a ground alarm is conveyed to an attended location for detection and mitigation purposes.

5-86a Log #CP502 NEC-P05 **Final Action: Accept**
(250.21(C) New)

Submitter: Code-Making Panel 5,
Recommendation: Add a new Section 250.21(C) to read:
Marking. If systems are ungrounded, they shall be legibly marked "Ungrounded System" at the source or first disconnecting means of the system. The marking shall be of sufficient durability to withstand the environment involved.
Substantiation: Presently, if voltage measurements indicate that one phase conductor is grounded individuals are not sure if the system is intended to be grounded or if one conductor has faulted to ground. If the system is grounded, as in a corner grounded application, identification of that conductor is required by 200.6, one is never sure if this was overlooked in the original installation. Individuals consider removing covers of energized equipment, exposing them to electrical hazards, because the systems are supplying multiple loads that owners do not want to shut down.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-87 Log #3780 NEC-P05 **Final Action: Reject**
(250.24)

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Revise text to read as follows:

"Grounding <u>Electric Utility</u> Service Supplied Alternating-Current Systems."

Substantiation: Adding the words "Electric Utility" before "Service Supplied... " further clarifies the intent of the article.
Panel Meeting Action: Reject
Panel Statement: The recommendation is not necessary because of the definition of "Service" in Article 100.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-88 Log #3398 NEC-P05 **Final Action: Reject**
(250.24(A))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:

250.24(A) System Grounding Connections. A premises wiring system supplied by a grounded ac service shall have a grounding electrode conductor connected to the grounded service<u>-entrance</u> conductor, at each service, in accordance with 250.24(A)(1) through (A)(5).

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.
Service<u>-Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service<u>-entrance</u> conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: The broad application of the currently defined term "service conductor" is critical to ensuring that the Article 250 requirements can be properly applied to all installations of service conductors. Acceptance of this proposal would limit application of requirements for service conductors to only service-entrance conductors. It is important that the term "service conductor" remain in this section as conductors, in addition to service-entrance conductors, supply services. This includes service-lateral conductors. These conductors are often installed by electrical contractors and are on the premises wiring side of the service point. CMP-5 is receptive to comments based on actions taken by other code-making panels relative to this proposed terminology revision.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

WHITE, C.: Although I am voting affirmative on this proposal I would like to point out for future reference that the panel did concur with the overall concept these proposals are based on. And, that the panel feels that it needs to wait until CMP-4 has had an opportunity to act on the definition changes that are proposed in support of these proposals. Since several panels have similar proposals that are dependent on the actions of Panel 4, this issue will need to be correlated by the TCC.

5-89 Log #3431 NEC-P05 **Final Action: Reject**
(250.24(A)(1))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

250.24(A)(1) General. The grounding electrode conductor connection shall be made at any accessible point from the load end of the service drop or service lateral to and including the terminal to which the grounded service-entrance conductor is connected to the service disconnecting means.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

WHITE, C.: See My Affirmative with Comment on 5-88.

5-91 Log #4191 NEC-P05 **Final Action: Reject**
(250.24(A)(2))

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Delete text as follows:

~~(2) Outdoor Transformer. Where the transformer supplying the service is located outside the building, at least one additional grounding connection shall be made from the grounded service conductor to a grounding electrode, either at the transformer or elsewhere outside the building.~~

~~*Exceptional: The additional grounding electrode conductor connection shall not be made on high impedance grounded neutral systems. The system shall meet the requirements of 250.36.*~~

Substantiation: This language provides a requirement that is not within the NEC scope and should be deleted. A transformer supplying the service is under the utilities jurisdiction. If the transformer is customer owned, the conductors supplying the building or structure are feeders or branch circuits. Those conductors are not covered by 250.24 which apply to services. Possibly this requirement could be added to 250.32 if CMP 5 desires.

Panel Meeting Action: Reject

Panel Statement: The language in 250.24(A)(2) provides a requirement that is within the scope of the NEC. A transformer supplying the service that is under the utilities' jurisdiction may, in fact, have a service point in the transformer enclosure or adjacent to it. In these applications the installation of the service drops or service lateral is covered in the NEC and thus the rule applies. This requirement provides a first line of defense for protecting the electrical system where the supply transformer is located outside of the building or structure.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-92 Log #3227 NEC-P05 **Final Action: Accept**
(250.24(A)(5), FPN)

Submitter: Mark R. Hilbert, State of New Hampshire
Recommendation: Revise text as follows:
(5) Load-Side Grounding Connections. A grounded conductor shall not be connected to normally non-current-carrying metal parts of equipment, to equipment grounding conductor(s), or be reconnected to ground on the load side of the service disconnecting means except as otherwise permitted in this article.
FPN: See 250.30~~(A)~~ for separately derived systems, 250.32 for connections at separate buildings or structures, and 250.142 for use of the grounded circuit conductor for grounding equipment.
Substantiation: This proposal is being submitted as part of series of proposals addressing a revision of 250.30. The removal of the specific reference to 250.30(A) and just referencing 250.30 will allow the new 250.30(B), regarding buildings or structures supplied by separately derived systems, to be recognized part of the requirements for grounding separately derived systems. This revision would also allow any applicable future changes in 250.30 to be included without having to change this FPN each time.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

(Note: Sequence 5-93 was not used)

5-94 Log #1487 NEC-P05 **Final Action: Reject**
(250.24(C))

Submitter: Steven Carter, Los Alamos, NM
Recommendation: 250.24 Grounding Service-Supplied Alternating-Current Systems.
(C) Grounded Conductor Brought to Service Equipment. Where an AC system operating at less than 1000 volts is grounded at any point, the grounded conductor(s) shall be run to each service disconnecting means and shall be connected to each disconnecting means grounded conductor(s) terminal or bus. A main bonding jumper shall connect the grounded conductor(s) to the ~~disconnecting means enclosure~~ grounding electrode conductor at any single point on the system from the source to the first system disconnecting means or overcurrent device. The grounded conductor(s) shall be installed in accordance with 250.24(C)(1) through (C)(3).
Substantiation: Bonding the grounded conductor and the grounding electrode conductor in more than one place is in conflict with 250.6. This is substantiated in 250.30(A)(1) where bonding the GC and the GEC together in more than one place is prohibited. Requiring multiple connections between the GC and the GEC in services and prohibiting the same connections in separately derived systems is not in line with the clear and consistent position that the NEC needs to have on this issue.
Panel Meeting Action: Reject
Panel Statement: The main bonding jumper must connect the grounded conductor(s) to the disconnecting means enclosure to provide an effective ground-fault current path as required by 250.4. All service disconnecting means must have an effective ground-fault current path back to the utility and have a reference to ground, which means they need both the main bonding jumper and a connection to the grounding electrode conductor.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-95 Log #3112 NEC-P05 **Final Action: Accept**
(250.24(C), (C)(1), (C)(2), and (C)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revised text.
(C) Grounded Conductor Brought to Service Equipment. If ~~Where~~ an ac system operating at less than 1000 volts is grounded at any point, the grounded conductor(s) shall be routed with the ungrounded conductors ~~run~~ to each service disconnecting means and shall be connected to each disconnecting means grounded conductor(s) terminal or bus. A main bonding jumper shall connect the grounded conductor(s) to each service disconnecting means enclosure. The grounded conductor(s) shall be installed in accordance with 250.24(C)(1) through (C)(4) ~~(3)~~.
Exception: If ~~Where~~ two or more ~~than one~~ service disconnecting means are located in a single assembly listed for use as service equipment, it shall be permitted to connect ~~run~~ the grounded conductor(s) to the assembly common grounded conductor(s) terminal or bus. The assembly shall include a main bonding jumper for connecting the grounded conductor(s) to the assembly enclosure.
(1) ~~Routing and~~ Sizing for a Single Raceway. The grounded ~~This~~ conductor shall ~~be routed with the phase conductors and shall~~ not be smaller than the required grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the largest ungrounded service-entrance phase conductor(s). In addition, for sets of service-entrance phase conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 12½ percent of the circular mil area of the largest set of service-entrance phase conductors. ~~The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.~~
(2) Parallel Conductors in Two or More Raceways. If ~~Where~~ the service-entrance phase conductors are installed in parallel in two or more raceways, the grounded conductor shall also be installed in parallel. The size of the grounded conductor in each raceway shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway as indicated in (C)(1) ~~this section~~. ~~Where installed in two or more raceways, the size of the grounded conductor in each raceway shall be based on the size of the ungrounded service-entrance conductor in the raceway~~ but not smaller than 1/0 AWG.
(3) Delta Connected Service. The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.
Retain the existing FPN to follow (C)(2).
Renumber existing 250.24(C)(3) as (C)(4)
Substantiation: Many of the proposed changes are intended to be editorial, to correct terminology or be clarification of application of other NEC rules that apply. The requirement on routing the grounded conductor with the ungrounded conductors is moved to the opening paragraph for clarity.
The rules for all service-entrance conductors being installed in a single raceway like a wireway and for conductors installed in parallel in separate raceways are provided in separate sub-sections.
The rules on sizing the grounded conductor of 3-phase systems are located in their own sub-section for ease of locating and proper application.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-96 Log #4367 NEC-P05 **Final Action: Reject**
(250.24(C) Exception)

Submitter: Terry L. Schneider, Berwick Electric Co.
Recommendation: Revise text as follows:
Exception: Where more than one service disconnecting means are located in a single assembly or have a common enclosure ahead of the service disconnecting means, it shall be permitted to run the grounded conductor(s) to the assembly common grounded conductor(s) terminal or bus or main bonding jumpers to each main disconnecting means terminated on a common terminal or bus within the common enclosure ahead of the service disconnecting means. The assembly or common enclosure ahead of the assembly shall include a main bonding jumper for connecting the grounded conductor(s) to the ~~assembly~~ enclosure.
Substantiation: The present wording mandates that you bond the grounded conductor inside each enclosure. This leads to normal current flow on the nipples, enclosures and conduits when you have a CT can or common gutter ahead of the service disconnects and you bond the neutral in the other enclosures. This will provide an alternative for bonding that meets the intent for bonding of service equipment but eliminate the normal grounded neutral current on the enclosures and other raceways. This practice is prohibited on separately derived systems and could be provided as an alternative for service equipment
Panel Meeting Action: Reject
Panel Statement: Use of the grounded conductor for grounding is permitted on the supply side of the service disconnecting means enclosures as indicated in 250.142(A) and 250.92(B)(1). Parallel paths for neutral current on the line side of the service are not prohibited, and the submitter has not provided, substantiation that this has been a compromise in safety.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-97 Log #595 NEC-P05 **Final Action: Reject**
(250.24(C)(2))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Revise the existing paragraph as follows:
Existing text: ...~~Where installed in two or more raceways, the size of the grounded conductor in each raceway shall be based on the size of the ungrounded service-entrance conductor in the raceway but not smaller than 1/0 AWG.~~
New text: ...Where installed in two or more raceways, the size of the grounded conductor in each raceway shall not be smaller than 12 1/2 percent of the total circular mil area of the phase conductors in all conduits, but not smaller than 1/0 AWG.
The first sentence of the paragraph to remain unchanged.
Substantiation: One of the functions the grounded conductor performs is to carry fault current back to the source. If Table 250.66 is used alone, the grounded conductor may be too small to perform this function if the other parallel grounded conductors have been damaged. This change utilizes the same philosophy as found in 250.122(F) for equipment grounding conductors.

For example, if there are 5-500 kcmil ungrounded conductors per phase in parallel, based on the present wording of 250.24(C)(2) and 250.66 the minimum size grounded conductor would be a 1/0 AWG CU in each conduit. With the proposed change, the minimum size of conductor would be a 350 kcmil in each conduit. Based on the 12 1/2 percent rule found in 250.24(C)(1), the 350 kcmil should be able to clear the upstream overcurrent protective device.

Panel Meeting Action: Reject

Panel Statement: The substantiation provided does not support revising the current requirements to mandate larger grounded conductors.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-98 Log #3424 NEC-P05 **Final Action: Reject**
(250.24(D))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

250.24(D) Grounding Electrode Conductor. A grounding electrode conductor shall be used to connect the equipment grounding conductors,the service-equipment enclosures, and, where the system is grounded, the grounded service-entrance conductor to the grounded electrode(s) required by Part III of this article. This conductor shall be sized in accordance with 250.66, either at the transformer or elsewhere outside the building.

High-impedance grounded neutral system connections shall be made as covered in 250.66.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.

It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

(250.24(E))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

250.24(E) Ungrounded System Grounding Connections. A premises wiring system that is supplied by an ac service that is ungrounded shall have, at each service, a grounding electrode conductor connected to the grounding electrode(s) required by Part III of this article. The grounding electrode conductor shall be connected to a metal enclosure of the service-entrance conductors at any accessible point from the load end of the service drop or service lateral to the service disconnecting means.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.

It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Comment on Affirmative:

WHITE, C.: See My Affirmative with Comment on 5-88.

5-100 Log #3781 NEC-P05 **Final Action: Reject**
(250.24(F))

Submitter: Steven R. Musial, II, CJL Engineering

Recommendation: Add new text to read as follows:

250.24(F) Equipment Grounding Conductor. Under no conditions shall an equipment grounding conductor be connected to the ground bus of service entrance equipment in which the grounding conductor originates on the supply side of electric utility metering.

Substantiation: It is not uncommon for electrical contractors to include a grounding conductor, which originates with the electric utility’s ground bus inside a pad-mounted transformer, in the same conduit with the phase and neutral conductors in lieu of or in addition to the exterior made electrode system established on the load side of the electric utility meter. This practice allows primary short circuit current to enter into customer equipment on the load side of metering.

Panel Meeting Action: Reject

Panel Statement: The title and subject of this recommended action do not correlate with the definition of equipment grounding conductor. Equipment grounding conductors are not present on the supply side of a service disconnecting means. The proposal would restrict use of metallic conduits from being used as the wiring method enclosing service-entrance conductors without substantiation.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-101 Log #3113 NEC-P05 **Final Action: Accept in Principle**
(250.30)

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: New Text as opening paragraph:

250.30. Grounding Separately Derived Alternating-Current Systems. In addition to complying with 250.30(A) for grounded systems or as provided in 250.30(B) for ungrounded systems, separately derived systems shall comply

with 250.20, 250.21, 250.22, 250.24(A)(2) and 250.26.
Delete 250.20(D).

Move FPN No. 1 and 2 following 250.20(D) to follow the above opening paragraph.

Substantiation: This proposal will bring rules for services that are essential for the safety of separately derived systems into effect without repeating them here. For example:

250.20 provides a list of systems that are required to be grounded.

250.21 provides a list of ac systems of 50 to 1000 Volts that are not required to be grounded.

250.21(B) requires ground detectors on ungrounded alternating current systems. This rule should apply equally to separately derived systems for safety.

250.22 provides a list of circuits not to be grounded. This rule should apply equally to separately derived systems for safety.

250.24(A)(2) Outdoor Transformers. This rule should apply equally to separately derived systems for safety. After all, many, many outdoor distribution systems are under the ownership and control of the property owner and are often separately derived systems.

250.26 Conductor to Be Grounded — Alternating-Current Systems. This rule needs to apply equally to separately derived systems as to services.

Panel Meeting Action: Accept in Principle
Section 250.20(D) is deleted by the action on this proposal. For the remainder of the proposal, see the panel action on Proposal 5-102.

Panel Statement: Other action by the panel is included in Proposal 5-102. The panel concludes these actions meet the intent of the submitter.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-102 Log #3224 NEC-P05 **Final Action: Accept in Principle in Part**
(250.30)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal in accordance with 3.2.3 of the NEC Style Manual related to the use of acronyms.

This action will be considered by the panel as a public comment.

Submitter: Mark R. Hilbert, State of New Hampshire

Recommendation: Revise as follows:

250.30 Grounding Separately Derived Alternating-Current Systems. A separately derived ac system shall be grounded in accordance with (A, (B) or (C).

(A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). Except as otherwise permitted in this article, a gronded conductor shall not be connected to normally non-current-carrying metal parts of equipment, to equipment grounding conductors, or be reconnected to ground on the load side of the point of grounding of a separately derived system.

FPN: See 250.32 for connections at separate buildings or structures, and 250.142 for use of the grounded circuit conductor for grounding equipment.

Exception: Impedance grounded neutral system grounding connections shall be made as specified in 250.36 or 250.186.

(1) System Bonding Jumper. An unspliced system bonding jumper in compliance with 25.0.28(A) through (D) that is sized based on the derived phase conductors shall be used to connect the equipment grounding conductors of the separately derived system to the grounded conductor. This connection shall be made at any single point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices.

Exception No. 1: For separately derived systems that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie, a single system bonding jumper connection to the tie point of the grounded circuit conductors from each power source shall be permitted.

Exception No. 2: A system bonding jumper at both the source and the first disconnecting means shall be permitted where doing so does not establish a parallel path for the rounded conductor. Where a grounded conductor is used in this matter, it shall not be smaller than the size specified for the system bonding jumper but shall not be required to be larger than the ungrounded conductor(s). For the purposes of this exception, connection through the earth shall not be considered as providing a parallel path.

Exception No. 3: The size of the system bonding jumper for a system that supplies a Class 1, Class 2, or Class 3 circuit, and is derived from a transformer rated not more than 1000 volt-amperes, shall not be smaller than the derived phase conductors and shall not be small than 14 AWG copper or 12 AWG aluminum.

(2) Equipment Bonding Jumper Size. Where an equipment bonding jumper of the wire type is run with the derived phase conductors from the source of a separately derived system to the first disconnecting means, it shall be sized in accordance with 250.102(C), based on the size of the derived phase conductors.

(3)~~(8)~~ Grounded Conductor. Where a grounded conductor is installed and the system bonding jumper connection is not located at the source of the separately derived system, 250.30(A)~~(8)~~(3)(a), (A)~~(8)~~(3)(b) and (A)~~(8)~~(3)(c) shall apply.

(a) Routing and Sizing. This conductor shall be routed with the derived phase conductors and shall not be smaller than the required grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the largest ungrounded derived phase conductor. In addition, for phase conductors larger than 100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 121/2 percent of the area of the largest derived phase conductor. The grounded conductor of a 3-phase, 3-wire delta system shall have an ampacity not less than that of the ungrounded conductors.

(b) Parallel Conductors. Where the derived phase conductors are installed in parallel, the size of the grounded conductor shall be based on the total circular mil area of the parallel conductors, as indicated in this section. Where installed in two or more raceways, the size of the grounded conductor in each raceway shall be based on the size of the ungrounded conductors in the raceway but not smaller than 1/0 AWG.

FPN: See 310.4 for grounded conductors connected in parallel.

(c) Impedance Grounded System. The grounded conductor of an impedance grounded neutral system shall be installed in accordance with 250.36 or 250.186.

(4) ~~(7)~~ Grounding Electrode. A separately derived system shall have a ~~The~~ grounding electrode ~~shall be~~ that is located as near as practicable to and preferably in the same area as the grounding electrode conductor connection to the system. The grounding electrode shall be the nearest one of the following:

(1) Metal water pipe grounding electrode as specified in 250.52(A)(1)

(2) Structural metal grounding electrode as specified in 250.52(A)(2)

Exception No. 1: Any of the other electrodes identified in 250.52(A) shall be used where the electrodes specified by 250.30(A)~~(7)~~(4) are not available.

Exception No. 2: Where a separately derived system is supplying a building or other structure a grounding electrode shall be installed in accordance with 250.32(A).

Exception No. ~~2~~ 3 to (1) and (2): Where a separately derived system originates in listed equipment suitable for use as service equipment, the grounding electrode used for the service or feeder equipment shall be permitted as the grounding electrode for the separately derived system.

FPN: See 250.104(D) for bonding requirements of interior metal water piping in the area served by separately derived systems.

(5)~~(3)~~ Grounding Electrode Conductor, Single Separately Derived System. A grounding electrode conductor for a single separately derived system shall be sized in accordance with 250.66 for the derived phase conductors and shall be used to connect the grounded conductor of the derived system to the grounding electrode as specified in 250.30(A)~~(7)~~(4). This connection shall be made at the same point on the separately derived system where the system bonding jumper is connected.

Exception No. 1: Where the system bonding jumper specified in 250.30(A)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.

Exception No. 2: Where a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. Where the equipment grounding but internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

Exception No. 3: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derivedfrom a transformer rated not more than 1000 volt-amperes, provided the grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 250.30(A)(1). Exception No. 3, and the transformer frame or enclosure is grounded by one of the means specified in 250.134.

(6)~~(4)~~ Grounding Electrode Conductor, Multiple Separately Derived Systems. Where more than one separately derived system is installed, it shall be permissible to connect a tap from each separately derived system to a common grounding electrode conductor. Each tap conductor shall connect the grounded conductor of the separately derived system to the common grounding electrode conductor. The grounding electrode conductors and taps shall comply with 250.30(A)~~(4)~~(6)(a) through (A)~~(4)~~(6)(c). This connection shall be made at the same point on the separately derived system where the system bonding jumper is installed.

Exception No. 1: Where the system bonding jumper specified in 250.30(A)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar or bus is of sufficient size for the separately derived system.

Exception No. 2: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the system grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 250.30(A(1),
Exception No. 3 and the transformer frame or enclosure is grounded by one of the means specified in 250.134.

(a) Common Grounding Electrode Conductor Size. The common grounding electrode conductor shall not be smaller than 3/0 AWG copper or 250 kcmil aluminum.

(b) Tan Conductor Size. Each tap conductor shall be sized in accordance with 250.66 based on the derived phase conductors of the separately derived system it serves.

Exception: Where a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. Where the equipment ground bus internal to the equipment is no smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

(c) Connections. All tap connections to the common grounding electrode conductor shall be made at an accessible location by one of the following methods:

(1) A listed connector.

(2) Listed connections to aluminum or copper busbars not less than 6 mm × 50 mm 1/4 in. × 2 in.). Where aluminum busbars are used, the installation shall comply with 250.64(A).

(3) The exothermic welding process.

(4) Tap conductors shall be connected to the common grounding electrode conductor in such a manner that the common grounding electrode conductor remains without a splice or joint.

(7)~~(5)~~ Installation. The installation of all grounding electrode conductors shall comply with 250.64(A), (B), (C), and (E).

(8)~~(6)~~ Bonding. Structural steel and metal piping shall be connected to the grounded conductor of a separately derived system in accordance with 250.104(D).

(B) Separately Derived Systems Supplying a Building or Other Structure. Where a grounded separately derived system is supplying a building or other structure, a separate equipment bonding or grounding conductor that provides an effective ground fault current path shall be installed with the supply conductors from the source to the building or other structure disconnecting means in accordance with (1) or (2).

(1) Supply Side of Overcurrent Device. The separate equipment bonding jumper on the supply side of each building or other structure overcurrent device shall be sized in accordance with 250.102(C) based on the size of the derived phase conductors.

(2) Load Side of Overcurrent Device. The separate equipment grounding conductor on the load side of each building or other structure overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device.

(C) ~~(B)~~ Ungrounded Systems. The equipment of an ungrounded separately derived system shall be grounded as specified in 250.30~~(B)~~(C)(1) and ~~(B)~~(C)(2).

(1) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with 250.66 for the derived phase conductors, shall be used to connect the metal enclosures of the derived system to the grounding electrode as specified in 250.30~~(B)~~(C)(2). This connection shall be made at any point on the separately derived system from the source to the first system disconnecting means.

(2) Grounding Electrode. Except as permitted by 250.34 for portable and vehicle-mounted generators, the grounding electrode shall comply with 250.30(A)~~(7)~~(4).

Substantiation: Revising this section as suggested will provide a clearer understanding of installations for separately derived systems. The new 250.30(B) will address situations where buildings or other structures are supplied by a separately derived system. A new sentence has been added following the title of the section to alert users that a separately derived system must be grounded in accordance with either (A)(B) or (C).

The requirements for the grounded conductor have been moved to 250.30(A)(3) to follow the requirements for the equipment bonding jumper as the grounded conductor should be the next consideration when there is a grounded conductor and the system bonding jumper is not located at the source.

The next considerations should be the grounding electrode so the requirements have been moved to 250.30(A)(4) and text has been added to identify that a separately derived system is clearly required to have a grounding electrode. A new Exception No. 2 (mandatory) has been added and the former Exception No. 2 (non-mandatory) has been moved to No. 3.

The new exception will address situations where a separately derived system is supplying a building or other structure and the grounding electrode may not necessarily be at the same location as the grounding electrode conductor connection to system but will be required to meet the same requirements as other supplies to a separate building or other structure.

Although the rest of the items in 250.30(A)(5) through (8) have been renumbered accordingly, the requirements have not been changed.

A new 250.30(B) has been added to address situations where a building or other structure has been supplied by a separately derived system such as where the transformer is located outside the building and the system is customer owned. This new section will provide guidance not formally included and the requirements parallel the move in recent Code cycles toward not using the grounded conductor to ground or bond equipment or to connect to a grounding electrode. The new (B)(1) and (2) are consistent with the language in 250.35 and a companion proposal submitted for 250.32. The revised text will add consistency to all three sections.

Companion proposals to other sections and chapters as appropriate are being made to address the above proposed changes.

Panel Meeting Action: Accept in Principle in Part

The panel does not accept the recommended revision for new Section 250.30(B).

Revise the remainder of the recommendation to read:

250.30 Grounding Separately Derived Alternating-Current Systems. In addition to complying with 250.30(A) for grounded systems or as provided in 250.30(B) for ungrounded systems, separately derived systems shall comply with 250.20, 250.21, 250.22, 250.24(A)(2) and 250.26.

FPN No. 1: An alternate ac power source such as an on-site generator is not a separately derived system if the grounded conductor is solidly interconnected to a service-supplied system grounded conductor. An example of such situations is where alternate source transfer equipment does not include a switching action in the grounded conductor and allows it to remain solidly connected to the service-supplied grounded conductor when the alternate source is operational and supplying the load served.

FPN No. 2: See 445.13 for the minimum size of conductors that must carry fault current. For systems that are not separately derived and are not required to be grounded as specified in 250.30, see 445.13 for minimum size of conductors that must carry fault current. **(5-101)**

(A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). Except as otherwise permitted in this article, a grounded conductor shall not be connected to normally non–current-carrying metal parts of equipment, to equipment grounding conductors, or be reconnected to ground on the load side of the system bonding jumper ~~point of grounding of a separately derived system~~. **(5-103)**

FPN: See 250.32 for connections at separate buildings or structures, and 250.142 for use of the grounded circuit conductor for grounding equipment.

Exception: Impedance grounded neutral system grounding connections shall be made as specified in 250.36 or 250.186.

(1) System Bonding Jumper. An unspliced system bonding jumper shall be installed. It shall be sized in compliance with 250.28(A) through (D) ~~that is sized based on the derived phase conductors shall be used to connect the equipment grounding conductors of the separately derived system to the grounded conductor~~. This connection shall be made at any single point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices, in accordance with (a) or (b). If the source is located outside the building or structure supplied, a system bonding jumper shall be installed at the grounding electrode connection in compliance with (C).

Exception No. 1: For systems installed in accordance with 450.6, ~~separately derived systems that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie,~~ a single system bonding jumper connection to the tie point of the grounded circuit conductors from each power source shall be permitted. **(P 5-107)**

Exception No. 2: A system bonding jumper at both the source and the first disconnecting means shall be permitted if ~~where~~ doing so does not establish a parallel path for the grounded conductor. If ~~Where~~ a grounded conductor is used in this manner, it shall not be smaller than the size specified for the system bonding jumper but shall not be required to be larger than the ungrounded conductor(s). For the purposes of this exception, connection through the earth shall not be considered as providing a parallel path.

Exception No. 3: The size of the system bonding jumper for a system that supplies a Class 1, Class 2, or Class 3 circuit, and is derived from a transformer rated not more than 1000 volt-amperes, shall not be smaller than the derived phase conductors and shall not be smaller than 14 AWG copper or 12 AWG aluminum.

(a) Installed at the Source. The system bonding jumper shall connect the grounded conductor to the supply-side bonding jumper and the normally non–current-carrying metal enclosure.

(b) Installed at the First Disconnecting Means. The system bonding jumper shall connect the grounded conductor to the supply-side bonding jumper, the disconnecting means enclosure, and the equipment grounding conductor(s). The system bonding jumper shall remain within the enclosure where it originates. **(5-105)**

(2) Supply Side ~~Equipment~~ Bonding Jumper ~~Size~~. If the source of a separately derived system and the first disconnecting means are located in separate enclosures, a SSBJ or conductor shall be installed with the circuit conductors from the source enclosure to the first disconnecting means. The bonding jumper shall be of the wire, bus, or nonflexible metal raceway type. If a ~~Where an equipment~~ SSBJ ~~bonding jumper~~ of the wire type is installed ~~run with the derived phase conductors from the source of a separately derived system to the first disconnecting means~~, it shall be sized in accordance with 250.102(C), based on the size of the derived phase conductors. If a bus is installed as the SSBJ, it shall have a circular mil area not less than the bonding jumper of the wire type as determined in 250.102(C). This conductor shall not be required to be larger than the derived circuit conductors. **(5-110, 5-111)**

(3) ~~(8)~~ Grounded Conductor. If ~~Where~~ a grounded conductor is installed and the system bonding jumper connection is not located at the source, ~~of the separately derived system,~~ 250.30(A)(3)(a) through (A)(3)(d) ~~250.30(A)(8)(a), (A)(8)(b), and (A)(8)(c)~~ shall apply.

(a) ~~Routing and~~ Sizing for a Single Raceway. The grounded ~~This~~ conductor shall ~~be routed with the phase conductors and shall~~ not be smaller than the required grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the largest ungrounded service-entrance phase conductor(s). In addition, for sets of ungrounded ~~phase~~ conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 12½ percent of the circular mil area of the largest set of ungrounded ~~phase~~ conductors. ~~The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.~~

(b) Parallel Conductors in Two or More Raceways. If ~~Where~~ the ungrounded ~~phase~~ conductors are installed in parallel in two or more raceways, the grounded conductor shall also be installed in parallel. The size of the grounded conductor in each raceway shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway as indicated in (a) ~~this section~~. ~~Where installed in two or more raceways, the size of the grounded conductor in each raceway shall be based on the size of the ungrounded service-entrance conductor in the raceway~~ but not smaller than 1/0 AWG.

FPN: See 310.4 for grounded conductors connected in parallel.

(c) Delta Connected Service. The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.

(d)~~(c)~~ Impedance Grounded System. The grounded conductor of an impedance grounded neutral system shall be installed in accordance with 250.36 or 250.186. **(P 5-95)**

(4) ~~(3)~~ Grounding Electrode. The grounding electrode shall be as near as practicable to and preferably in the same area as the grounding electrode conductor connection to the system. The grounding electrode shall be the nearest one of the following:

(1) Metal water pipe grounding electrode as specified in 250.52(A)(1)

(2) Structural metal grounding electrode as specified in 250.52(A)(2)

Exception No. 1: Any of the other electrodes identified in 250.52(A) shall be used if ~~where~~ the electrodes specified by 250.30(A)(4)~~(7)~~ are not available.

Exception No. 2 to (1) and (2): If ~~Where~~ a separately derived system originates in listed equipment suitable for use as service equipment, the grounding electrode used for the service or feeder equipment shall be permitted as the grounding electrode for the separately derived system.

FPN No. 1: See 250.104(D) for bonding requirements of interior metal water piping in the area served by separately derived systems.

FPN No. 2: See 250.50 and 250.58 for requirements of bonding all electrodes together if located at the same building or structure. **(5-118)**

(5) ~~(3)~~ Grounding Electrode Conductor, Single Separately Derived System. A grounding electrode conductor for a single separately derived system shall be sized in accordance with 250.66 for the derived phase conductors. It shall be used to connect the grounded conductor of the derived system to the grounding electrode as specified in 250.30(A)(4) ~~(7)~~. This connection shall be made at the same point on the separately derived system where the system bonding jumper is connected.

Exception No. 1: If ~~Where~~ the system bonding jumper specified in 250.30(A)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.

Exception No. 2: If ~~Where~~ a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. If ~~Where~~ the equipment grounding bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

Exception No. 3: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 250.30(A)(1), Exception No. 3, and the transformer frame or enclosure is grounded by one of the means specified in 250.134.

(6) ~~(4)~~ Grounding Electrode Conductor, Multiple Separately Derived Systems.

A common grounding electrode conductor for multiple separately derived systems shall be permitted. If installed, the common grounding electrode conductor shall be used to connect the grounded conductor of the separately derived systems to the grounding electrode as specified in 250.30(A)(4). ~~Where more than one separately derived system is installed, it shall be permissible to connect a tap from each separately derived system to a common grounding electrode conductor.~~ A grounding electrode conductor tap shall then be installed from each separately derived system to the common grounding electrode conductor. Each tap conductor shall connect the grounded conductor of the separately derived system to the common grounding electrode conductor. ~~The grounding electrode conductors and taps shall comply with 250.30(A)(4)(a) through (A)(4)(c).~~ This connection shall be made at the same point on the separately derived system where the system bonding jumper is connected ~~installed~~. **(5-113, 5-114)**

Exception No. 1: If ~~Where~~ the system bonding jumper specified in 250.30(A)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor tap to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.

Exception No. 2: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the system grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 250.30(A)(1), Exception No. 3 and the transformer frame or enclosure is grounded by one of the means specified in 250.134.

(a) Common Grounding Electrode Conductor ~~Size~~. The common grounding electrode conductor shall be permitted to be one of the following:

(1) A wire-type conductor shall not be smaller than 3/0 AWG copper or 250 kcmil aluminum.

(2) The metal frame of the building or structure that complies with 250.52(A)(2) or is connected to the grounding electrode system by a conductor not smaller then 3/0 AWG copper or 250 kcmil aluminum. **(5-116)**

(b) Tap Conductor Size. Each tap conductor shall be sized in accordance with 250.66 based on the derived phase conductors of the separately derived system it serves.

Exception: If ~~Where~~ a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. If ~~Where~~ the equipment ground bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

(c) Connections. All tap connections to the common grounding electrode conductor shall be made at an accessible location by one of the following methods:

(1) A ~~listed~~ connector listed as grounding and bonding equipment. **(5-117)**

(2) Listed connections to aluminum or copper busbars not less than 6 mm × 50 mm (¼ in. × 2 in.). If ~~Where~~ aluminum busbars are used, the installation shall comply with 250.64(A).

(3) The exothermic welding process.

Tap conductors shall be connected to the common grounding electrode conductor in such a manner that the common grounding electrode conductor remains without a splice or joint.

(7) ~~(5)~~ Installation. The installation of all grounding electrode conductors shall comply with 250.64(A), (B), (C), and (E).

(8) ~~(6)~~ Bonding. Structural steel and metal piping shall be connected to the grounded conductor of a separately derived system in accordance with 250.104(D).

(B) Ungrounded Systems. The equipment of an ungrounded separately derived system shall be grounded and bonded as specified in 250.30(B)(1) through ~~and~~ (B)(3) ~~(2)~~.

(1) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with 250.66 for the derived phase conductors, shall be used to connect the metal enclosures of the derived system to the grounding electrode as specified in 250.30(B)(5) or (6) as applicable ~~(2)~~. This connection shall be made at any point on the separately derived system from the source to the first system disconnecting means. If the source is located outside the building or structure supplied, a grounding electrode connection shall be made in compliance with (C).

(2) Grounding Electrode. Except as permitted by 250.34 for portable and vehicle-mounted generators, the grounding electrode shall comply with 250.30(A)(4)~~(7)~~.

(3) Bonding Path and Conductor. A bonding jumper or conductor consisting of a non-flexible metal raceway or conductor of the wire or bus type shall be installed from the source of a separately derived system to the first disconnecting means. A bonding jumper of the wire type shall be sized in accordance with 250.102(C), based on the size of the derived phase conductors. **(5-121)**

250.30(C) Outdoors Source. If the source of the separately derived system is located outside the building or structure supplied, a grounding electrode connection shall be made at the source location to one or more grounding electrodes in compliance with 250.50. In addition, the installation shall comply with (A) for grounded systems or with (B) for ungrounded systems.

Exception: The grounding electrode conductor connection shall not be made at the outdoor source for high-impedance grounded neutral systems. The system shall meet the requirements of 250.36. **(5-102)**

Panel Statement: The panel accepts the reorganization of Section 250.30 as provided in this proposal. Text is being added by the panel to ensure proper rules for separately derived systems that have their source outside the building or structure served. The proposed new Section 250.30(B) is not accepted as the subject of buildings or structures supplied by a feeder or branch circuit are more properly covered in 250.32. The action on this proposal includes the concepts or text from the following proposals: 5-101, 5-103, 5-104, 5-105, 5-106, 5-107, 5-109, 5-110, 5-111, 5-113, 5-114, 5-116, 5-117, 5-118, and 5-121.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

HARDING, G.: Continue to accept the proposal. This section was restructured and modified after extensive work by several code panel members both before and at the ROP Meeting with the goal to improve usability and clarity. The full panel provided further review and comment at the ROP meeting.

JOHNSTON, M.: Continue to accept this proposal which incorporates several important proposed revisions as well as a restructuring for improved usability. This section as revised is the result of extensive work completed by several members of CMP-5 before the ROP meeting and additional work and input provided by the full panel during the full panel during the ROP.

5-103 Log #2986 NEC-P05 **Final Action: Accept in Principle**
(250.30(A))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:

(A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). Except as otherwise permitted in this article, a grounded conductor shall not be connected to normally non–current-carrying metal parts of equipment, to equipment grounding conductors, or be reconnected to ground on the load side of the ~~point of grounding~~ system bonding jumper of a separately derived system.

FPN: See 250.32 for connections at separate buildings or structures, and 250.142 for use of the grounded circuit conductor for grounding equipment.

Exception: Impedance grounded neutral system grounding connections shall be made as specified in 250.36 or 250.186.

Substantiation: The term system bonding jumper is clearly defined, whereas the term "point of grounding" is not.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-104 Log #3464 NEC-P05 **Final Action: Accept in Principle**
(250.30(A))

Submitter: G. Scott Harding, F. B. Harding, Inc.
Recommendation: Revise text to read as follows:

250.30 Grounding Separately Derived Alternating-Current Systems.

(A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). Except as otherwise permitted in this article, a grounded conductor shall not be connected to normally non–current-carrying metal parts of equipment, to equipment grounding conductors, or be reconnected to ground on the load side of the ~~point of~~ grounding electrode connection point of a separately derived system.

Substantiation: The phrase "point of grounding" is made more specific by noting its location as the connection point of the grounding electrode conductor. This provides better clarity.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-105 Log #3114 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(1))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revised Text.

(1) System Bonding Jumper. An unspliced system bonding jumper in compliance with 250.28(A) through (D) that is sized based on the largest derived phase conductor or set of conductors shall be installed to connect the system grounded conductor to the grounding electrode conductor and the bonding conductor or jumper ~~used to connect the equipment grounding conductors of the separately derived system to the grounded conductor~~. This connection shall be made at any single point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices. The system bonding jumper shall remain within the enclosure where it originates.

Retain the existing exceptions.

Substantiation: This proposal intends to make changes to this section to clarify the function of the system bonding jumper and common installation methods. In reality, the system bonding jumper can be installed in several ways. For example, if a multi-barrel lug is connected to the XO terminal of a transformer, the system bonding jumper, grounding electrode conductor, grounded conductor, and bonding jumper can be connected at that connector. If a multi-barrel lug is connected to the transformer or generator enclosure, it is common to connect the system bonding jumper, grounding electrode conductor and the bonding jumper or conductor to that connector. The grounded conductor should always connect directly to the XO terminal.

The new last sentence is intended to address an interpretation and installation practice that seems incorrect. Some have stated this section permits the system bonding jumper to be installed from the source (for example a transformer) through a raceway to the enclosure for the system disconnecting means. As such, the system bonding jumper is being installed between enclosures in place of the bonding jumper or conductor.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-106 Log #4010 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(1))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read as follows:

System Bonding Jumper. An unspliced system bonding jumper in compliance with 250.28(A) through (D) that is sized based on the derived phase conductors shall be used to connect the equipment bonding jumper(s) ~~grounding conductors~~ of the separately derived system to the grounded conductor. This connection shall be made at any single point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices.

Substantiation: The system bonding jumper is connected to the "equipment bonding jumper" not the "equipment grounding conductor". Section 250.30(A)(2) uses the term "equipment bonding jumper".
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-107 Log #2389 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(1) Exception No. 1)

Submitter: Thomas F. Mueller, Southern Company
Recommendation: Revise text to read as follows:

Exception No. 1: For ~~separately derived~~ systems that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie, a single system bonding jumper connection to the tie point of the grounded circuit conductors from each power source shall be permitted.

Substantiation: Separately derived systems are defined as systems that have no direct electrical connections "including a solidly connected grounded circuit conductor." The exception is describing two systems that have a grounded conductor connection, and, therefore, the systems are not separately derived. Deletion of the words "separately derived" will eliminate confusion.
Panel Meeting Action: Accept in Principle
Revise 250.30 Exception No 1 to read:
Exception No. 1: For systems installed in accordance with 450.6, ~~separately derived systems that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie,~~ a single system bonding jumper connection to the tie point of the grounded circuit conductors from each power source shall be permitted.
Panel Statement: The panel has revised the application of the exception to relate to transformer systems covered in 450.6. This action has been incorporated into the panel action on Proposal 5-102.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-108 Log #2547 NEC-P05 **Final Action: Reject**
(250.30(A)(1) Exception No. 4 (New))

Submitter: Mike Jones, Purdue University
Recommendation: Add new Exception No. 4 to 250.30(A)(1), to read as follows:

Exception No. 4: A system bonding jumper shall be permitted to contain splices when the system bonding jumper is part of a manufactured busway system containing factory splices.

Substantiation: When power delivery into a building has been defined to be through a separately derived system, the grounded (Neutral) conductor is permitted to be bonded at the transformer via the system bonding jumper. In these circumstances, the bonding jumper consists of a conductor routed from the grounded conductor (neutral point) of the transformer to the equipment ground bus in the first system disconnecting means. (Please refer to the 2008 NEC Handbook, Exhibit 250.13 for illustration). In many cases, the wiring method from the transformer to the first system disconnecting means is power busway. When power busway is used, the ground in the busway then becomes the system bonding jumper. (Depending on the busway manufacturer, the busway ground can be either a separate bus bar or the busway case itself. Due to the nature and construction of power busway, the ground bus (serving as the system bonding jumper) will contain factory splices at each busway joint. Presently, the only way to comply with 2008 NEC 250.30(A)(1) is to route a separate conductor, sized per 2008 NEC 250.28(D), from the grounded conductor (neutral point) of the transformer to the equipment ground bus in the service entrance rated switchgear (serving as the first system disconnecting means). (This separate conductor is routed adjacent to the power busway).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: System bonding jumpers are typically installed within an enclosure such as a transformer, a generator, or the first disconnecting means. A manufactured busway system would not be appropriate for this purpose.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-109 Log #817 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(2))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission

Recommendation: Add new text to read as follows:

Where the source of the separately derived system is located outside the building, the connection of the grounded supply conductor to the grounding electrode(s) shall be made at the source of the separately derived system or elsewhere outside the building.

Substantiation: Where the source of the separately derived system (transformer, generator, etc.) is outside the building, transient voltages associated with lightning or external power faults may be a constant threat. This new reference would be consistent with 250.24(A)(2) for service supplied systems and would provide better protection from transient voltages.

Panel Meeting Action: Accept in Principle

Add a new Section 250.30 to read:

250.30(C) Outdoors Source. If the source of the separately derived system is located outside the building or structure supplied, a grounding electrode connection shall be made at the source location to one or more grounding electrodes in compliance with 250.50. In addition, the installation shall comply with (A) for grounded systems or with (B) for ungrounded systems.

Exception: The grounding electrode conductor connection shall not be made at the outdoor source for high-impedance grounded neutral systems. The system shall meet the requirements of 250.36.

Add a new last sentence of 250.30(A)(1) to read:

If the source is located outside the building or structure supplied, a system bonding jumper shall be installed at the grounding electrode connection in compliance with (C)."

Add a new last sentence of 250.30(B)(1) to read:

If the source is located outside the building or structure supplied, a grounding electrode connection shall be made in compliance with (C)."

Panel Statement: The panel has made revisions to the proposal to incorporate the concepts in the proposal into this section. The panel concludes this action meets the intent of the recommendation. This action has been incorporated into the panel action on Proposal 5-102.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-110 Log #3047 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(2))

Submitter: Mike Holt, Leesburg, FL

Recommendation: Revise text as follows:

(2) Equipment Bonding Jumper Size. Where an equipment bonding jumper of the wire type is run with the derived phase conductors from the source of a separately derived system to the first disconnecting means, it shall be sized in accordance with 250.102(C), based on the size of the derived phase conductors. This conductor shall not be required to be larger than the derived phase conductors.

Substantiation: As currently written, a small transformer with 12 AWG secondary conductors would require an 8 AWG bonding jumper. This is contrary to the general rule(s) of not requiring a bonding conductor to be larger than the circuit conductors.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-111 Log #3115 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(2))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise the existing text of the 2008 NEC as follows:

(2) ~~Equipment~~ Bonding Jumper ~~Size~~. If the source of a separately derived system and the first disconnecting means are located in separate enclosures, a bonding jumper or conductor shall be installed with the circuit conductors from the enclosure for the separately derived system to the first disconnecting means. The bonding jumper shall be of the wire, or bus, or nonflexible metal raceway type. If a ~~Where an equipment~~ bonding jumper of the wire type is installed ~~run with the derived phase conductors from the source of a separately derived system to the first disconnecting means~~, it shall be sized in accordance with 250.102(C), based on the size of the derived phase conductors. If a bus is installed as the bonding jumper, it shall have a circular mil area not less than the bonding jumper of the wire type as determined in 250.102(C).

Substantiation: As presently worded, this section does not clearly require the installation of an equipment bonding jumper from the separately derived system to the first disconnecting means and must do so. This proposal intends to correct that. In addition, this proposal adds needed language to recognize that metal raceways of the "nonflexible type" are not suitable for use as an equipment bonding conductor or jumper. Sections 250.118(5), (6) and (7) demonstrate the very limited current-carrying capability of these flexible raceways. They are not suitable to function as the fault-current path described in 250.4.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-112 Log #4368 NEC-P05 **Final Action: Reject**
(250.30(A)(3) Exception No. 4)

Submitter: Terry L. Schneider, Berwick Electric Co.

Recommendation: Add the following new text:

Where the grounding conductor used for bonding the primary of a separately derived system is a wire and is sized in accordance with 250.30(A)(2) shall be permitted to be used as the grounding electrode conductor if it meets the requirements of 250.30(A)(7) and is installed in accordance with 250.64.

Substantiation: It is unclear in the code, (many jurisdictions prohibit) if it is permissible to install the grounding electrode conductor with the supply conductors for a separately derived system. Some jurisdictions are requiring a separate conductor for the primary ground and another for the grounding electrode conductor when they terminate in the same place on both ends. This will help clarify the intent of the code panel.

Panel Meeting Action: Reject

Panel Statement: CMP-5 has created a new definition for a supply-side bonding jumper that is installed from the source of a separately derived system to the first system disconnecting means. Its function and location in the separately derived system does not allow it to be used as an equipment grounding conductor.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-113 Log #3116 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(4))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise the existing text of the 2008 NEC as follows:

(4) Grounding Electrode Conductor, Multiple Separately Derived Systems. If ~~Where~~ the grounding electrode required in 250.30(A)(7) is not present in the area served by the separately derived system, and more than one separately derived system is installed, it shall be permissible to install a common grounding electrode conductor from the grounding electrode system required in 250.50 to serve the separately derived systems. A ~~connect a~~ grounding electrode conductor tap shall then be installed from each separately derived system to the ~~a~~ common grounding electrode conductor. Each tap conductor shall connect the grounded conductor of the separately derived system to the common grounding electrode conductor. The grounding electrode conductors and taps shall comply with 250.30(A)(4)(a) through (A)(4)(c). This connection shall be made at the same point on the separately derived system where the system bonding jumper is installed.

The remainder of this section is to remain unchanged by this Proposal.

Substantiation: Changes to this section include:

(1) Clarifying that the common grounding electrode conductor and tap provisions apply only if the grounding electrode required in 250.30(A)(7) is not available. If available in the area served by the separately derived system, the grounding electrodes specified in 250.30(A)(7) should be used.

(2) Clarifies that the common grounding electrode conductor, if installed, must connect to the building or structure grounding electrode system.

(3) Other changes are intended to be editorial.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Principle

Submitter: Ronald E. Hackett, Village of Buffalo Grove / Rep. NE Suburban IAEI
Recommendation: Add new text as follows:
(a) Common Grounding Electrode Conductor Size. The common grounding electrode conductor shall not be smaller than 3/0 AWG or 250 kcmil aluminum.
The National Electrical Code does not place a limit on the length of the grounding electrode conductor. For example, for runs over 100 ft, the grounding electrode conductor may be required to be larger than a #3/0 AWG copper or 250 kcmil aluminum.
Substantiation: For clarification purposes, the proposal above should be included under 250.30(A)(4)(a). There is a misconception in that in all situations the grounding electrode conductor (GEC) is required to be as short as practical. However, as short as practical may mean hundreds of feet. A clarification for the users' of the NEC would benefit knowing that for some situations, like distance, the GEC may be required to be larger than a #3/0 AWG copper or 250kcmil aluminum.
The understanding in the field, and what is being communicated in continuing education classes is that the largest grounding electrode conductor ever required is a 3/0 AWG copper or 250 –kcmil aluminum. The 2008 National Electrical Code Handbook concurs. See attached sheet. (No "sheet" was received by NFPA with this proposal).
This proposal will provide the user of the National Electrical Code an example where the GEC may be required to be larger than specified. Where an AHJ or an engineer specifies a larger GEC than a 3/0 AWG copper or 250 –kcmil aluminum due to distance, all concerned users of the National Electrical Code then would be afforded guidance from the code by finding positive code language.
If the National Electrical Code remains silent on this topic, the grounding electrode system may be insufficiently sized when called to carry out its performance function. It is imperative that the National Electrical Code re-work all code sections concerning the size of the GEC. It must be made clear in all instances that a 3/0 AWG copper or 250 –kcmil aluminum conductor is the minimum and not the maximum. This proposal will clarify, avoid arguments, and result in a more user friendly understanding concerning sizing the GEC.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation that a hazard exists. The proposal does not include language suitable for mandatory enforcement but rather makes statements.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-116 Log #4148 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(4)(a))

Submitter: Chuck Mello, Underwriters Laboratories
Recommendation: Revise 250.30(A)(4)(a) to read as follows:
(a) The common grounding electrode conductor shall be permitted to be one of the following:
(1)~~The common grounding electrode~~A wire type conductor ~~shall~~ not be smaller than 3/0 AWG copper or 250 kcmil aluminum.
(2) The metal frame of the building or structure that is connected to the grounding electrode system by a conductor not smaller than 3/0 AWG copper or 250 kcmil aluminum.
Substantiation: This is a companion proposal to correct a technical error in 250.52(A)(2) specifying what a structural metal grounding electrode is. The issue found in trying to resolve in the 2008 cycle was that the metal frame of the building is often really being used as a common grounding electrode conductor, but 250.30(A) did not recognize that. This proposal would clearly allow the metal frame of a building that is connected to the grounding electrode system to be recognized as a common grounding electrode conductor and used just as the wire type is permitted now. The size of the conductor connecting the metal frame of the building to the grounding electrode system was set to be the same as what is required for the wire type common grounding electrode conductor.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-117 Log #2238 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(4)(c))

Submitter: Gregory J. Steinman, Thomas & Betts Corporation
Recommendation: Revise 250.30(A)(4)(c)(1) as follows:
(c) *Connections.* All tap connections to the common grounding electrode conductor shall be made at an accessible location by one of the following methods:
(1) A ~~listed~~ connector listed as grounding and bonding equipment.
(2) Listed connections to aluminum or copper busbars not less than 6 mm × 50 mm (1/4 in. × 2 in.). Where aluminum busbars are used, the installation shall comply with 250.64(A).
(3) The exothermic welding process.
Tap conductors shall be connected to the common grounding electrode conductor in such a manner that the common grounding electrode conductor remains without a splice or joint.

Substantiation: Grounding electrode conductors are expected to experience lightning induced current since they can be installed on exteriors of buildings and structures. Listed connectors are not required to pass a short time high current test. Connectors listed as grounding and bonding equipment must pass a short time high current test to confirm the ability of the connector to conduct safely these currents.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 5-102 in which the recommended text has been incorporated without any change. The panel concludes this action meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: The substation for the proposal does support being consistent with 250.64(A). Stating that a connector has to be listed as grounding and bonding equipment in list item (1) but allowing any listed connector in list item (2) does not make sense. If any listed connector is acceptable then list item 1 is not necessary.

5-118 Log #4142 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(7), FPN 2)

Submitter: Larry LeVoir, City of Irvine
Recommendation: Add new text to read as follows:
Add Fine Print Note
FPN No. 2: See 250.50 and 250.58 for requirements of bonding all electrodes together where located in the same building or structure.
Substantiation: Although this is required by the Code by sections 250.50 and 250.58, it seems to be overlooked by many installers and inspectors. Where a separately is located in a building without grounding electrodes of building steel or water piping nearby, installers will commonly install a ground rod at the separately derived system. This ground rod is required to be properly bonded back to the grounding electrode system in the building or structure. This requirement was also reinforced by obtaining an informal interpretation from NFPA. Informal interpretation NFPA 70 - 2002 (Log #25594) has been provided with this proposal. The Fine Print Note will reinforce and remove doubt as to whether this is required.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-119 Log #229 NEC-P05 **Final Action: Reject**
(250.30(A)(7) Exception No. 3)

Submitter: Don A. Hursey, Durham County Inspections Department
Recommendation: For existing premises wiring systems only the metal water pipe shall no be limited to (1.5 m) (5 ft.) from the point of entrance to the building.
Substantiation: For existing buildings that are multistory and the only available grounding electrode is the metal water pipe, in so many instances it is impossible to install a new separately derived system on the upper floors and install the grounding electrode conductor all the way back to within 5 ft of entrance.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation to delete the requirement for the connection of the grounding electrode conductor to a grounding electrode currently indicated in Section

250.30(A)(7). The issue of connecting to a metal water pipe for purposes of serving as a grounding electrode conductor is adequately covered in Sections 250.52 and 250.53.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-120 Log #596 NEC-P05 **Final Action: Reject**
(250.30(A)(8)(b))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Revise the existing paragraph as follows:
Existing text: ...~~Where installed in two or more raceways, the size of the grounded conductor in each raceway shall be based on the size of the ungrounded conductors in the raceway but not smaller than 1/0 AWG.~~
New text:... Where installed in two or more raceways, the size of the grounded conductor in each raceway shall not be smaller than 12 1/2 percent of the total circular mil area of the phase conductors in all conduits, but not smaller than 1/0 AWG.
The first sentence of the paragraph to remain unchanged.
Substantiation: One of the functions the grounded conductor performs is to carry fault current back to the source. If Table 250.66 is used alone, the grounded conductor may be too small to perform this function if the other parallel grounded conductors have been damaged. This change utilizes the same philosophy as found in 250.122(F) for equipment grounding conductors. For example, if there are 5-500kcmil ungrounded conductors per phase in parallel, based on the present wording of 250.30(A)(8)(b) and T250.66 the minimum size grounded conductor would be a 1/0AWG CU in each conduit. With the proposed change, the minimum size of conductor would be a 350kcmil in each conduit. Based on the 12 1/2 percent rule found in 250.30(A)(8)(a), the 350kcmil should be able to clear the upstream overcurrent protective device.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 5-97.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-121 Log #3117 NEC-P05 **Final Action: Accept in Principle**
(250.30(B))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing text of the 2008 NEC as follows:
(B) Ungrounded Systems. The equipment of an ungrounded separately derived system shall be grounded <u>and bonded</u> as specified in 250.30(B)(1) <u>through</u> and (B)<u>(3)</u>~~(2)~~.
(1) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with 250.66 for the derived phase conductors, shall be used to connect the metal enclosures of the derived system to the grounding electrode as specified in 250.30(B)(2). This connection shall be made at any point on the separately derived system from the source to the first system disconnecting means.
(2) Grounding Electrode. Except as permitted by 250.34 for portable and vehicle-mounted generators, the grounding electrode shall comply with 250.30(A)(7).
<u>**(3) Bonding Path and Conductor.** A bonding jumper or conductor consisting of a non-flexible metal raceway or conductor of the wire or bus type shall be installed from the source of a separately derived system to the first disconnecting means. A bonding jumper of the wire type shall be sized in accordance with 250.102(C), based on the size of the derived phase conductors.</u>
Substantiation: The additional requirement ensures a low-impedance and adequate fault-current return path should a second ground-fault occur on a different phase from a first ground-fault before the first ground-fault is cleared. As clarified by CMP-5 in Section 250.4(B)(4) in the 2008 NEC, a second-ground fault on a different phase from the first ground-fault becomes a phase-to-phase fault.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-102 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-122 Log #4468 NEC-P05 **Final Action: Reject**
(250.32 Exception No. 2 (New))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise text to read as follows:[
250.32(A)] Designate current exception as "Exception <u>No. 1</u>." Add new exception no.2 as follows:
<u>Exception No. 2: A grounding electrode shall not be required for manufactured homes with permanent foundations that comply with 550.32(A).</u>
Substantiation: There is an apparent conflict in code requirements between sections 250.32(A) and the last sentence of 550.32(B), which states that "Where the service is not installed in or on the unit {manufactured home with permanent foundation}, the installation shall comply with the other provisions of this section. Presumably that invokes part (A) of 550.32 with the last sentence that says, "Grounding at the DISCONNECTING MEANS shall be in accordance with 250.32. That leaves the door open for an electrode being installed **only at the disconnecting means** and NOT at the "building or structure" that is, in fact, the manufactured home. Acceptance of this proposal resolves that conflict and restore consistency in the code.
Panel Meeting Action: Reject
Panel Statement: In accordance with Section 90.3 requirements in Chapter 5 can modify or amend the general requirements in Chapters 1 through 4. If the service equipment is to be located in or on the unit it must be permanently anchored to the foundation and the GEC must be routed to the service. If the service equipment is mounted in or on the unit, the provision of 550.32(A) applies.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-123 Log #3048 NEC-P05 **Final Action: Reject**
(250.32(A) Exception)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(A) Grounding Electrode. Text remains unchanged
Exception: A grounding electrode shall not be required where only a single branch circuit, including a multiwire branch circuit, supplies the building or structure. ~~and the branch circuit includes an equipment grounding conductor for grounding the normally non–current-carrying metal parts of equipment.~~

Substantiation: The proposed deleted text is unnecessary, as providing an equipment grounding conductor, generally speaking, is not optional. The proposed deleted text simply muddies the waters that were made clearer in the 2008 changes to this section. If a grounded conductor is used for bonding equipment, as permitted by exception, it should not change the allowance for a single circuit without a grounding electrode system.
Panel Meeting Action: Reject
Panel Statement: The requirement for an equipment grounding conductor is essential to this provision and it cannot be deleted. The present text is clear as to the condition under which the exception is permitted to be applied.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-124 Log #4599 NEC-P05 **Final Action: Reject**
(250.32(A) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee
Recommendation: Revise the Exception to read as follows:
<u>Exception:</u> A grounding electrode at a separate building or structure shall not be required where no branch circuits originate at that building or structure. The branch circuit(s) shall include an equipment grounding conductor for grounding the noncurrent-carrying parts of all equipment.
Substantiation: This rewrite differs from the 2008 NEC in that a second building fed with branch circuits from another can be wired without a grounding electrode if there is none available. The 1996 NEC, without any technical substantiation, removed the prior provision that an electrode had to be provided only if the second building itself supplied the multiple branch circuits (i.e., was supplied with a feeder.) In its rejection of this proposal in the 1999 cycle, the panel reiterated the intent while continuing to omit any technical substantiation for the 1996 change. The 1993 wording assured that a suitable enclosure (usually a panelboard) was available to make the connection. This proposal restores that allowance in those cases where there are multiple branch circuits, but they originate in the first building. This is very common in dwellings with detached garages. Note that if a qualified grounding electrode is available, however, it must be used. That was required in the 1993 NEC and would be unchanged under this proposed revision.
There are severe practical constraints associated with imposing the current NEC limitations on multiple branch circuits arriving from another location. The smallest grounding electrode conductor permitted by 250.66 is 8 AWG, and there only if run in raceway or cable armor. Generally the smallest conductor will be a 6 AWG. Terminating such a conductor properly in a device box installed for a GFCI receptacle (as an example) is problematic at best given the volume constraints imposed by 314.16. If such a receptacle were the only load served, the current exception would allow this to be avoided. Exactly how does a second branch circuit supplying a luminaire (as an example) create a greater safety concern? The current wording is plainly excessive, and the variance from the feeder rules that governed from the 1987 through the 1993 editions of the NEC has never been substantiated despite repeated attempts to restore such a provision.
Panel Meeting Action: Reject
Panel Statement: The proposed exception would allow multiple circuits to feed a building that has no grounding electrode systems. The panel concludes that this would lessen the current requirement without justification. The panel does not agree with the submitted assertions regarding previous editions of the NEC.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-125 Log #899 NEC-P05 **Final Action: Reject**
(250.32(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
For a grounded system ~~at the~~ supplying a separate building or structure a wire-type equipment grounding conductor shall be run with the circuit conductors and be... (remainder unchanged).
Substantiation: The wording of this provision implies a wire type conductor, although 250.118 describes other types. See 547.9(B)(3)(1).
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation to support eliminating equipment grounding conductors of other than the wire type. Several additions and a deletion of text in the recommendation have not been supported in the substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-126 Log #3225 NEC-P05 **Final Action: Accept in Principle**
(250.32(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal in accordance with 3.2.3 of the NEC Style Manual related to the use of acronyms.
This action will be considered by the panel as a public comment.
Submitter: Mark R. Hilbert, State of New Hampshire
Recommendation: Revise 250.32(B) as follows:
(B) Grounded Systems. For a grounded system at the separate building or structure, an equipment bonding or grounding conductor that provides and effective ground fault current path ~~as described in 250.118~~ shall be run with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s) in accordance with (1) or (2). The equipment bonding or grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. ~~The equipment grounding conductor shall be sized in accordance with 250.122.~~ Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).
(1) Buildings or Structures Supplied From a Building or Structure. Where a building or structure is supplied from another building or structure, the separate equipment grounding conductor shall be as described in 250.118 and sized in accordance with 250.122.
(2) Buildings or Structures Supplied From a Separately Derived System. Where a building or structure is supplied from a separately derived system, the separate equipment or bonding conductor shall be in accordance with 250.30(B).
Exception: For existing premises wiring systems only, the grounded conductor run with the supply to the building or structure shall be permitted to be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded where all the requirements of (1), (2), and (3) are met:
(1) An equipment bonding or grounding conductor is not run with the supply to the building or structure.
(2) remains unchanged
(3) remains unchanged
Substantiation: Section 250.32(B) has been revised to specifically state that the equipment bonding conductor is to provide and effective fault current path and to include installations where the building or structure has been supplied by a separately derived system such as where the transformer is located outdoors and is customer owned.
Item No. 1 of the exception to (B) has been revised to address situations where an equipment bonding conductor has been included with the supply conductors to the building or structure. The remainder of the exception is unchanged.
The proposed text is consistent with 250.35, the proposed revisions to 250.30 and the move in the previous Code cycles to not use the grounded conductor to ground or bond equipment or to connect to a grounding electrode.
Companion proposals are being submitted to other Articles as appropriate to address the above changes.
Panel Meeting Action: Accept in Principle
Revise the recommendation for Section 250.32(B) to read:
(B) Grounded Systems.
(1) Supplied by a Feeder or Branch-Circuit. ~~For a grounded system at the separate building or structure,~~ An equipment grounding conductor as described in 250.118 shall be run with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The equipment grounding conductor shall be sized in accordance with 250.122. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).
Exception: For existing premises wiring systems only, the grounded conductor run with the supply to the building or structure shall be permitted to be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded if ~~where~~ all the requirements of (1), (2), and (3) are met:
(1) An equipment grounding conductor is not run with the supply to the building or structure.
(2) There are no continuous metallic paths bonded to the grounding system in each building or structure involved.
(3) Ground-fault protection of equipment has not been installed on the supply side of the feeder(s).
If ~~Where~~ the grounded conductor is used for grounding in accordance with the provision of this exception, the size of the grounded conductor shall not be smaller than the larger of either of the following:
(1) That required by 220.61
(2) That required by 250.122
(2) Supplied by Separately Derived System.
(a) Having Overcurrent Protection. If overcurrent protection is provided where the conductors originate, the installation shall comply with (B)(1).
(b) Without Overcurrent Protection. If overcurrent protection is not provided where the conductors originate, the installation shall comply with 250.30(A). If installed, the SSBJ shall be connected to the building or structure disconnecting means and to the grounding electrode(s).
Panel Statement: The panel has incorporated requirements for electrical systems in buildings or structures supplied by separately derived systems.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-127 Log #3528 NEC-P05 **Final Action: Reject**
(250.32(B))

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise the existing text of the 2008 NEC as follows:
(B) Grounded Systems. For a grounded system at the separate building or structure, an equipment grounding conductor as described in 250.118 shall be run with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The equipment grounding conductor shall be sized in accordance with 250.122. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).
~~Exception: For existing premises wiring systems only, the grounded conductor run with the supply to the building or structure shall be permitted to be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded where all the requirements of (1), (2), and (3) are met:~~
~~(1) An equipment grounding conductor is not run with the supply to the building or structure.~~
~~(2) There are no continuous metallic paths bonded to the grounding system in each building or structure involved.~~
~~(3) Ground-fault protection of equipment has not been installed on the supply side of the feeder(s).~~
~~Where the grounded conductor is used for grounding in accordance with the provision of this exception, the size of the grounded conductor shall not be smaller than the larger of either of the following:~~
~~(1) That required by 220.61~~
~~(2) That required by 250.122~~
Substantiation: Deleting this exception will complete the transition CMP-5 has made over the last several NEC cycles to ensure conductive paths between buildings or structures are not in parallel with a grounded or neutral conductor. Deleting the exception will be similar to other transitions in the NEC the most recent of which was replacing the term "lighting fixture" with "luminaire."
Deleting the Exception will not have negative consequences on existing installations since the provisions of a new edition of the NEC does not apply to installations made under previous editions unless the new NEC is specifically modified by the AHJ during the adoption process. Several states or other local inspection jurisdictions have not permitted the neutral or grounded conductor to be regrounded at buildings or structures supplied for some time.
Panel Meeting Action: Reject
Panel Statement: The language proposed for deletion was included in the 2008 cycle to allow changes to premises wiring in existing structures without requiring replacing the feeder to the structure. This provision for existing installations is similar to the provisions for existing branch circuits supplying ranges and clothes dryers in Section 250.140.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
BRENDER, D.: The concepts in the proposal should have been accepted. The reference to "premises wiring" has caused confusion among installers and inspectors. Generally, electrical inspectors allow an installation made under a previous edition of the NEC to remain intact unless it is modified at which time compliance with the edition of the NEC in effect is required.
WILLIAMS, D.: This proposal should be accepted.The 2008 Code required a separate equipment grounding conductor for a feeder to a separate building.

The exception in the 2008 code was to let people know what was accepted in the previous code cycles. It is not necessary to continue to have this exception in the code. All installations that fall under this exception were approved at that time and the current code would not require them to make a change.

5-128 Log #239 NEC-P05 **Final Action: Reject**
(250.32(B) Exception No. 2)

Submitter: John Bayduss, Baytown, TX
Recommendation: Revise as follows:
There are no continuous ~~metallic~~ conductive paths bonded to the grounding system in each building or structure involved.
Substantiation: Concrete pathways can be considered conductive.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation that concrete paths in parallel with the equipment grounding conductor have been a problem. This section applies only to metallic paths.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-129 Log #3531 NEC-P05 **Final Action: Accept in Principle**
(250.32(C))

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise the existing text of the 2008 NEC as follows:
(C) Ungrounded Systems. For an ungrounded system at the separate building or structure, an equipment grounding conductor as described in 250.118 shall be installed with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s). The grounding electrode(s) shall also be connected to the building or structure disconnecting means.
Substantiation: The additional requirement for an equipment grounding conductor ensures a low-impedance and adequate fault-current return path is provided should a second ground-fault occur on a different phase from a first ground-fault before the first ground-fault is cleared.
As clarified by CMP-5 in Section 250.4(B)(4) in the 2008 NEC, a second-ground fault on a different phase from the first ground-fault becomes a phase-to-phase fault. It is important that a properly sized equipment grounding conductor be installed with the supply conductors to provide an effective fault-current return path to facilitate the operation of an overcurrent device.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
(C) Ungrounded Systems. For an ungrounded system supplying a ~~at the~~ separate building or structure, an equipment grounding conductor as described in 250.118 shall be installed with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s). The grounding electrode(s) shall also be connected to the building or structure disconnecting means.
Panel Statement: The revision to the recommendation clarifies that the ungrounded system is supplying the building or structure.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-130 Log #1508 NEC-P05 **Final Action: Reject**
(250.34)

Submitter: Tom Stalnaker, West Chester, PA
Recommendation: Add new text to read as follows:
(D) Ungrounded Neutral. The neutral conductor of a portable or vehicle mounted generator shall not be required to be grounded under the following conditions:
(1) Portable Generators. The generator supplies only equipment mounted on the generator, cord-and-plug-connected equipment through receptacles mounted on the generator, or both.
(2) Vehicle Mounted Generators. The generator supplies only equipment located on the vehicle or cord-and-plug-connected equipment through receptacles mounted on the vehicle or on the generator, or both equipment located on the vehicle and cord-and-plug-connected equipment through receptacles mounted on the vehicle or on the generator.
Substantiation: Many available small portable generators, which are also sometimes mounted on vehicles and grounded per 250.34(B), have the neutral isolated from ground, or floating. The current wording of the NEC does not address this situation unless the generator is connected to another system such as a premises wiring system. This change clarifies that if the generator is not connected to anything other than local cord-and-plug connected equipment, the generator and/or vehicle are not a premises wiring system needing the requirements of 250.26.
Panel Meeting Action: Reject
Panel Statement: A portable or vehicle-mounted generator is a separately derived system, and the neutral conductor is required to be bonded to the frame. If this were not so, the equipment grounding conductor would not function to carry fault current back to the source.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-131 Log #3049 NEC-P05 **Final Action: Reject**
(250.35(B))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
250.35 Permanently Installed Generators.
A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).
(A) Text to remain unchanged.
(B) Nonseparately Derived System. Where the generator is not installed as a separately derived system, an equipment bonding jumper shall be installed between the generator equipment grounding terminal and the equipment grounding terminal or bus of the enclosure of supplied disconnecting mean(s) in accordance with (B)(1) or (B)(2). A connection to a grounding electrode shall not be required at the generator.
(1) Text to remain unchanged.
(2) Text to remain unchanged.
Substantiation: This proposal is intended simply to help the code user to understand the requirements for nonseparately derived generators.
Panel Meeting Action: Reject
Panel Statement: System grounding at the generator is not required for systems that are not separately derived. A grounding electrode and grounding electrode conductor connection to the generator frame may be required for other reasons and this proposal would eliminate that with no technical substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-132 Log #3465 NEC-P05 **Final Action: Accept**
(250.35(B))

Submitter: G. Scott Harding, F. B. Harding, Inc.
Recommendation: Revise text to read as follows:
250.35 Permanently Installed Generators.
(B) Nonseparately Derived System. Where the generator is not installed as a separately derived system, an equipment bonding jumper shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the enclosure of supplied disconnecting mean(s) in accordance with (B)(1) or (B)(2).
Substantiation: The addition of the comma and the word "bar" revises the text to be the same as that used in 250.30(A)(3), Exception 1; 250.30(A)(4,) Exception 1; and 250.24(A)(4). This clarifies that a lug, grounding bar or grounding bus can be utilized for the connection point.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-133 Log #3639 NEC-P05 **Final Action: Reject**
(250.35(B))

Submitter: Peter Ramus, City of Lebanon Codes Dept.
Recommendation: Revise text to read as follows:
250.35(B) Nonseparately Derived Systems. Where the generator is ~~not~~ installed as a nonseparately derived system, an equipment bonding jumper shall be installed between the generator equipment grounding terminal and the equipment grounding terminal or bus of the enclosure of supplied disconnection mean(s). ~~in accordance with (B)(1) or (B)(2).~~ Where the system supplied is grounded in accordance with 250.20, equipment bonding and grounding conductors between the generator and the location of the main or system bonding jumper of the system supplied shall be sized in accordance with 250.102(C), based on the terminal conductor size requirements of 445.13. Where the equipment grounding conductors are not of the wire or bus type, raceways shall be bonded as specified in 250.92(B), except for (B)(1). The requirements of this section shall apply to one feeder of multiple feeder applications.
(B)(1) Delete Entirely.
(B)(2) Delete Entirely.
Substantiation: Application of Table 250.122, per 250.35(B)(2), to grounding conductors on the load side of the first generator OC device is technically incorrect and inconsistent with other Code Sections. Per 250.35(B)(1), bonding jumpers on the line side of the first OC device are appropriately sized to Table 250.66. However, in nonseparately derived systems, the circuit for line side ground fault current continues through he equipment grounding conductors on the load side of the first OC device to the system or main bonding jumper of the system served by the generator. There is no precedence in the NEC supporting the downsizing of grounding conductors midway in the grounding circuit. But that is the result of applying Table 250.122 as permitted by 250.35(B)(2). All grounding conductors between the nonseparately derived generator and the system or main bonding jumper of the systems served, whether classified as equipment ground or bonding jumper, are components of the equipment grounding circuit of equipment located ahead of the generator OC protection. Therefore, at least one set should be sized per Table 250.66.
Application of the larger conductor sizes of Table 250.66, as opposed to

Table 250.122, is particularly important in installations where the nonseparately derived generator is hundreds of feet away from the point of system bonding such as in the case of units located outside, remote from the structure served. This change will provide consistency with Sections 250.30, 250.4(A)(3), 250.4(A)(5), and 445.13.

Panel Meeting Action: Reject

Panel Statement: The first sentence of the substantiation is not correct because equipment grounding conductors on the load side of the overcurrent protective device are properly sized per Section 250.122. This section already addresses what is proposed, and the recommendation does not add clarity or improve usability of the current rule.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-134 Log #3477 NEC-P05 **Final Action: Reject**
(250.35(B)(1) and (2))

Note: This proposal is reported as "Reject" as it did not receive the Simple Majority affirmative vote.

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

It was the further action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.

This action will be considered by the panel as a public comment.

Submitter: Danny Thomas, Henderson, NC

Recommendation: Revise text to read as follows:

Nonseparately Derived System. Where the generator is not installed as a separately derived system, an equipment bonding jumper shall be installed between the generator equipment grounding terminal and the equipment grounding terminal or bus of the enclosure of the supplied disconnecting means. This conductor shall be sized in accordance with (B)(1) ~~or (B)(2).~~ Where an equipment grounding conductor is installed it shall be installed between the generator equipment grounding terminal and the equipment grounding terminal or bus of the enclosure of the supplied disconnecting means. This conductor shall be sized in accordance with (B)(2).

Substantiation: In 250.35(B), it states for "nonseparately derived systems" to install "an equipment bonding jumper" between the generator equipment grounding terminal and the equipment grounding terminal or bus of the enclosure of supplied disconnecting means in accordance with (B)(1) or (B)(2). The subject of (B)(1) is the sizing of an "equipment bonding jumper".

In part (B)(2),m the subject in the sizing of an "equipment grounding conductor." Revising the text as written above clears this confusion up as to whether we are dealing with an equipment bonding jumper or an equipment grounding conductor and how to size them accordingly.

Panel Meeting Action: Reject

Panel Statement: The proposed text is not needed. The rules are consistent with the definitions of equipment bonding jumper and equipment grounding conductor.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 4 Negative: 12

Explanation of Negative:

BOWMER, T.: This proposal was accepted in principle at the Panel meeting and was mistakenly shown here as Reject. -- "The following test was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Based on the above explanation and text the new Panel Statement/ Substantiation should be as follows: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

BRENDER, D.: The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

BRETT, JR., M.: The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

DOBROWSKY, P.: Following is the suggested comment on the vote on **Proposal 5-134** to preserve the recommended action by the 250.30 Task Group as approved by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009.

"The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

HAMMEL, D.: "The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

HARDING, G.: This proposal should have been to accept with the actions as recommended by CMP-5 indicated below:

The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

JOHNSTON, M.: The panel action on this proposal should have been to Accept in Principle with the changes recommended by CMP-5 as indicated below:

The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

5-135 Affirmative

Continue to reject this proposal and note the following information is included for public review. The following information was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was not included in the official NFPA report of the actions of CMP-5. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.

High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

(2) Ground detectors are installed on the system.

(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate."

MELLO, C.: The following was included in the 250.30 Task Group report with the recommendation to Accept Proposal 5-134 in Principle with revisions. The task group report was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. However the panel action is shown as a Reject and should have been recorded as an Accept in Principle with the following revisions.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

MOHLA, D.: This proposal should be accepted in Principle consistent with the task group assigned to address this proposal.

Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

TEMBLADOR, R.: The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

WHITE, C.: The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

WILLIAMS, D.: "The following was included in the 250.30 Task Group report. The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject." The following information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.35 Permanently Installed Generators.

A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).

(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.

(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator

~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~

~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~

Panel Statement: This revision incorporates the concept of the SSBJ (supply-side bonding jumper) and makes other editorial changes. This proposal incorporates the proposed change in Proposal 5-132.

5-135 Log #607 NEC-P05 **Final Action: Reject**
(250.36(C), FPN 2 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

It was the further action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.

This action will be considered by the panel as a public comment.

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission

Recommendation: Add new text to read as follows:

FPN: High-Impedance grounded neutral systems may necessitate the evaluation of overcurrent devices based upon their single-pole short-circuit interrupting rating, which may be less than their normal interrupting rating.

Substantiation: If a second ground-fault occurs on this type of system before the first ground-fault is cleared, the full phase-to-phase voltage (480 V or 600 V) would appear across only one pole of the affected overcurrent device. This condition may result in a fault current that exceeds the single-pole interrupting rating of the device.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 5-61.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 10 Negative: 6
Explanation of Negative:

DOBROWSKY, P.: Following is the suggested comment on the vote on **Proposal 5-135** to preserve the recommended action by the 250.30 Task Group as approved by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009.

"The following was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was not included in the official NFPA report of the actions of CMP-5. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.
High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.
(2) Ground detectors are installed on the system.
(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate."

HAMMEL, D.: The following was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was not included in the official NFPA report of the actions of CMP-5. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.
High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.
(2) Ground detectors are installed on the system.
(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate."

MELLO, C.: The following was included in the 250.30 Task Group as a Panel Proposal but was not reflected in the record. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. The ballot should reflect a panel action as Accept in Principle with the revisions below as part of the panel action. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.
High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.
(2) Ground detectors are installed on the system.
(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate."

TEMBLADOR, R.: The following was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was not included in the official NFPA report of the actions of CMP-5. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.

High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

(2) Ground detectors are installed on the system.

(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors

for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate."

WILLIAMS, D.: "The following was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was not included in the official NFPA report of the actions of CMP-5. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.

High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

(2) Ground detectors are installed on the system.

(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate."

Comment on Affirmative:

BOWMER, T.: Although the proposal for anew FPN was rejected the actions on 5-61 and 5-134 addressed the concerns raised by proposal 5-135.

The following was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was not included in the official NFPA report of the actions of CMP-5. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.

High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

(2) Ground detectors are installed on the system.

(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Based on the above explanation and text the new Panel Statement/ Substantiation should be as follows: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100. Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate."

BRENDER, D.: The following was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was not included in the official NFPA report of the actions of CMP-5. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.

High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

(2) Ground detectors are installed on the system.

(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate."

BRETT, JR., M.: The following was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was not included in the official NFPA report of the actions of CMP-5. This information needs to be included in the Report on Proposals so the public is fully informed of the actions of CMP-5.

250.36 High-Impedance Grounded Neutral Systems.

High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if ~~where~~ all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

(2) Ground detectors are installed on the system.

(3) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If ~~Where~~ a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but shall not ~~In no case shall the grounded system conductor~~ be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) ~~Equipment~~ Bonding Jumper. The ~~equipment~~ bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) ~~Equipment~~ Bonding Jumper Size. The ~~equipment~~ bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If ~~Where~~ the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If ~~Where~~ the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Panel proposal intends to use the word "if" where appropriate.

HARDING, G.: Continue to reject this proposal and note the following information is included for public review. The following information was included in the 250.30 Task Group as a Panel Proposal. The recommendation was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. 5-136 Log #2257 NEC-P05 **Final Action: Reject**
(250.50)

Submitter: John G. Narcizo, John G. Narcizo dba
Recommendation: Add that ALL reinforcing steel present in a building or structure shall be bonded to the grounding electrode system.
Substantiation: In reading 250.50 it states that concrete-encased electrode must be 1/2 in. thick and 20 ft under 2 in. of concrete. In reading this paragraph I would not need to bond 3/8 in. or smaller. I feel that all rods need to be bonded due to the protocol present from the power company.
Panel Meeting Action: Reject
Panel Statement: Reinforcing steel (rebar) that meets the requirements of 250.52(A)(3) are grounding electrodes and required to be connected together with other electrodes. There is no technical substantiation provided for the inclusion of all reinforcing steel.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-137 Log #2569 NEC-P05 **Final Action: Reject**
(250.50)

Submitter: Charles Palmieri, Palmieri Assoc.
Recommendation: Revise the text of 250.50, as indicated:

All grounding electrodes as described in 250.52(A)(1) through (A)~~(7)~~(8) that are present at each building or structure served shall be bonded together to form the grounding electrode system. Where none of these grounding electrodes exist, one or more of the grounding electrodes specified in 250.52(A)(4) through (A)~~(8)~~(9) shall be installed and used.

Substantiation: I have proposed a revision to 250.52(A)(3) and the new text creating (9) rather than (8) sub parts to 250.52(A). If those proposals are accepted, then an editorial change is required to this paragraph.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposals 5-142 and 5-143 where CMP-5 rejected division of existing 250.52(A)(3) in two different subsections. The proposed recommendation by the submitter is no longer applicable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

(Note: Sequence 5-138 was not used)

5-139 Log #3523 NEC-P05 **Final Action: Reject**
(250.50)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: This is a companion proposal that should be considered separately, but in addition to a proposal by me for Section 250.50 FPN.

Add new text to read:

250.50(A) For engineered, supervised, industrial installations it shall be permissible to eliminate the bonding of the concrete-encased steel reinforcing bars in foundations to the grounding electrode system where it has been determined that corrosion of the steel reinforcing bars will occur due to galvanic corrosion and that the grounding electrode system has a resistance to ground of 25 ohms or less without the connection to the concrete-encased steel reinforcing bar.

Substantiation: Refer to the substantiation on the companion proposal.
Panel Meeting Action: Reject
Panel Statement: The corrosion concern between concrete encased rebar and copper wire has been specifically addressed in the Institute of Electrical and Electronic Engineers standard 142, *IEEE Recommended Practice for Grounding of Industrial and Commercial Power Systems* (Green Book). It clearly mentions " It should be noted that steel rebar, when encased in concrete, has approximately the same potential as copper and thus will not corrode." Industry has been using concrete encased reinforcing bar grounding systems with and without connecting to the copper wires without any reported concerns.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-140 Log #2207 NEC-P05 **Final Action: Reject**
(250.50, FPN)

Submitter: Paul Guidry, Fluor Enterprises, Inc
Recommendation: Add new text as follows:

FPN: Bonding of dissimilar metals will result in corrosion of one of the metals. Cathodic protection systems may need to be installed to mitigate the corrosion. Refer to NACE Standard Recommended Practice RP0290-2000, Item No. 21403, Impressed Current Cathodic Protection of Reinforcing Steel in Atmospherically Exposed Concrete Structures, and IEEE Std. 142 for more information regarding steel corrosion and other deterioration phenomena with concrete-encased electrodes.

Substantiation: During the 2008 NEC cycle Proposal 5-143 and subsequent Comment 5-77 were submitted to address the concerns associated with corrosion of concrete-encased rebar where bonded to copper grounding electrode conductors. Both were rejected. There seems to be a lack of understanding among the panel as to the problems that bonding copper and concrete-encased steel together creates with respect to corrosion. I think it is probably due to the fact that electrical engineers typically don't deal with corrosion issues. What electrical engineers are concerned with is safety of the electrical system- and rightly so. However, I believe that the panel must look at the bigger picture. If doing something for safety of the electrical system and it causes problems for the structural system, an effort must be made to correlate the two.

The panel refers to rebar in buildings being bonded to the copper grounding electrodes in the panel statements for the Proposal mentioned above. I agree that this usually won't present a problem in buildings since buildings typically don't have large amounts of copper installed for grounding electrodes. The issue arises in places such as petrochemical plants and refineries where there are usually large amounts of copper buried for a grounding grid. And, according to the changes that occurred in 2005 this grid must be bonded to the rebar that is installed in every pile cap, footing, or foundation. This will create a failure of the rebar if not addressed by the use of a cathodic protection system. Most electrical designers and engineers are not aware of the corrosion problem that occurs when bonding copper to steel. Adding the FPN will at least alert electrical designers and engineers to the fact that there is a corrosion problem. Ideally there would be an exception to 250.50 that would allow the connection between copper and rebar to not be made under engineering supervision. But, since the panel is apparently unwilling to permit this exception, the next best thing is to add the FPN.

I am currently on the working committee for IEEE Std. 142 (Green Book) and will incorporate the NEC requirement of bonding the copper electrodes to the steel rebar. I'm also attaching a copy of an article that was published in EC&M magazine in the June 2008 issue that addresses this problem and may help the panel understand what the issue is. It is based on IEEE PCIC paper #PCIC-2007-25, entitled "The Conflict and Solutions to Complying with the Grounding Revisions of the 2005 National Electrical Code for Cathodically Protected Facilities".

Note: Supporting material is available for review at NFPA Headquarters.

Ballot Results: Affirmative: 16

5-141 Log #2253 NEC-P05 **Final Action: Reject**

(250.52(3))

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector

Recommendation: Revise text to read as follows:

"...of a concrete foundation ~~or~~ footing that is in direct contact with the earth.

Substantiation: 250.52(3) Concrete-Encased Electrode.

The word "foundation" has confused many electrical inspectors. A foundation is what supports the loads of the structure. A foundation footing is what supports the foundation wall (all part of a foundation). The foundation footing is more likely to have better contact with the earth than a foundation wall. For instance, a foundation wall on a dwelling has barely any contact with the earth surrounding it. On one side, there is empty space (basement), on the other side; there is a protective film (waterproofing/damp-proofing) that separates the earth from foundation. Therefore, there is no direct contact between concrete and earth. On the other hand, the foundation footing is surrounded by earth on at least two sides, if not three. The reason for this deletion is to understand the intention of the code, which I understood to be near the bottom, as seen on the sample in the supporting material.

Thus, the deletion of the word "or" to better define the intent of the code, which I think is to use the structural steel members located in the foundation footing of a foundation and not the whole foundation (walls, piers, monolithic, etc.).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: A concrete encased electrode may be found in either a footing or foundation provided it is in direct contact with the earth.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-142 Log #2567 NEC-P05 **Final Action: Reject**

(250.52(3))

Submitter: Charles Palmieri, Palmieri Assoc.

Recommendation: Delete the texts as indicated. (3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm ($^1/_2$ in.) in diameter, ~~or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG~~. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means. Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.

Substantiation: 250.50 requires all electrodes mentioned in 250.52(A)(1) through (A)(7) when present at a structure shall be bonded together. It further indicates that when (A)(1), (2), and (3) are not present that 250.52(A)(4) through (A)(7) may be used. It would seem that the intent was to require bonding of the water pipes, building steel and concrete encased electrodes when construction dictated their installation. I am not aware of a construction requirement to install 20 feet of bare No 4. AWG Cu in a footing or foundation. I am proposing that a new subsection (8) be added to the 2011 Code to include the deleted electrode (No 4. AWG) as a permitted installed electrode.

Panel Meeting Action: Reject

Panel Statement: The grouping in this section is not intended to be sorted by trade. The present wording does not require that the concrete encased electrode be a construction requirement. Whether the conductor within the concrete is rebar or a copper conductor is immaterial.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-143 Log #2570 NEC-P05 **Final Action: Reject**

(250.52(8) (New))

Submitter: Charles Palmieri, Palmieri Assoc.

Recommendation: Add a new sub section number (8) to section 250.52(A) to read as follows renumber existing subsection (8), as (9).

(8) Other Concrete Encased Electrodes. At least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG, encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth.

Substantiation: I have proposed that the included text be removed from 250.52(A)(3) Concrete Encased Electrodes. I believe that its inclusion, as a permissible installed electrode will improve the readability of this section. The 4 AWG is not a requirement amongst the building Codes for the construction of a footing or foundation. And, 250.52(A)(1) through (3) seem to direct their language towards materials that are engineered into the construction of a structure. Existing Sub Parts (A)(4) through (7) seem to include electrodes that the electrician would install to provide a reliable grounding electrode system. Simply stated, my argument is that the No. 4 AWG bare conductor would be installed rather than utilized by the electrician.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 5-142.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-144 Log #3532 NEC-P05 **Final Action: Reject**

(250.52(A) (New))

Submitter: Phil Simmons, Olympia, WA

Recommendation: Add text to read as follows:

250.52 Grounding Electrodes.

(A) General. Only the portion of grounding electrode(s) installed below the frost level, as determined by the local authority having jurisdiction, shall be considered in direct contact with the earth.

Renumber existing 250.52(A) to (B) and existing (B) to (C).

Substantiation: Several authoritative sources show the conductivity of the earth is reduced sharply if the earth is frozen. Building codes typically require that footings for building foundations be installed below the frost line. Frozen earth will severely reduce the opportunity of the grounding electrode to make a connection to the earth. Underground metal water pipes are typically required to be buried below the frost level for obvious reasons.

This clarification needs to be added to the Code since CMP-5 made a change to 250.52(A)(4) for the 2008 NEC that permits concrete-encased electrodes to be installed vertically. Only the portion of the grounding electrode that is below the frost should be considered when determining whether a qualifying grounding electrode is present.

Panel Meeting Action: Reject

Panel Statement: All grounding electrodes have the same issue with frozen earth. The submitter has not provided any technical substantiation to support such a change.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BRENDER, D.: The Panel Statement is incorrect as some grounding electrodes are inherently installed below the frost line such as concrete-encased electrodes and underground metal water pipes. These are required to be below the frost level as building codes require the foundation and supply water pipes including fire protection water pipes to be below the frost level.

5-145 Log #3219 NEC-P05 **Final Action: Reject**

(250.52(A)(1))

Submitter: Paul J. Kennedy, Jr., Kennedy Seminars

Recommendation: Revise text as follows:

(A) Electrodes Permitted for Grounding.

(1) Metal Underground Water Pipe. The grounding electrode conductor shall be connected on the street side of the water meter for the first connection to the water pipe and within 5 ft of entering the building and shall be supported separately to that point. A metal underground water pipe in direct contact with the earth for 3.0 m (10 ft) or more (including any metal well casing bonded to

the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductors. Interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnected electrodes that are part of the grounding electrode system.

Substantiation: I have inspected many new services and have found that the electrician has made his first connection to the water pipe up near the ceiling and then tie wrapped down the pipe and around the water meter. The problem with this type of installation is that the water department takes off the second ground clamp so that they can replace the water meter. This results in a loss of connection from the service to the water pipe and this loss of connection could be deadly to the water department worker.

Panel Meeting Action: Reject

Panel Statement: A bonding jumper is required around water meters or similar equipment that may be removed for servicing. See Section 250.53(D)(1). It is not necessary to connect to the street side of the water meter in all applications. In many areas water meters are located outside of the building or structure and more than 10 ft away.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-146 Log #3534 NEC-P05 **Final Action: Accept**
(250.52(A)(1))

Submitter: Phil Simmons, Olympia, WA

Recommendation: Revise text to read as follows:

(1) Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth for 3.0 m (10 ft) or more (including any metal well casing bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductor<u>(s) or jumper(s) if installed</u>. ~~Interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system.~~

~~*Exception: In industrial, commercial, and institutional buildings or structures where conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system, provided that the entire length, other than short sections passing perpendicularly through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.*~~

Substantiation: Section 250.52(A) intends to describe the condition(s) under which a metallic object in the form of metal water pipe is recognized as a grounding electrode. The portions of this subsection proposed to be deleted relate to functions of the water pipe that do not relate to making a connection to the earth. Metallic water pipes located above the earth may function as a conductive path or a grounding electrode conductor but cannot be considered a part of a grounding electrode.

"… or jumper(s) if installed" is proposed to be added as bonding jumpers or conductors are not always installed.

A companion proposal has been made to add the concepts to 250.62 that are proposed for deletion here.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-147 Log #4011 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(1) and Exception)

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Delete text as follows:

(1) Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth for 3.0 m (10 ft) or more (including any metal well casing bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductors. ~~Interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system.~~

~~*Exception: In industrial, commercial, and institutional buildings or structures where conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system, provided that the entire length, other than short sections passing perpendicularly through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.*~~

Substantiation: The definition of "grounding electrode" is for objects that make a connection to the earth. An object that is not actually in the earth should not be described as an electrode but as presently allowed can be used as a conductor to make that connection The text that is proposed to be deleted is also being proposed to being added to 250.68 as new material in that location.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action on Proposal 5-146.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

JOHNSTON, M.: Continue to accept this proposal as it is part of an overall effort to improve consistency in the use of grounding and bonding words and terms. The revisions in proposals 5-170, 5-182 and 5-212 preserve the allowances for metal water pipes to be used as conductive paths to grounding electrodes (grounding electrode conductor) which more accurately describes how they are currently being used. The revision is part of a larger effort to promote more consistent use of defined words and terms related to grounding and bonding, while at the same time improving clarity by providing specific language in this section that reflects how the building steel and water piping systems are actually being used which is inconsistent with the defined term "grounding electrode." This revision fixes that inconsistency in the NEC.

5-148 Log #4748 NEC-P05 **Final Action: Reject**
(250.52(A)(1) Exception)

Submitter: Charles M. Trout, Maron Electric Company

Recommendation: Delete 250.52(A)(1) Exception in its entirety

Substantiation: The body of the text in 250.52(A)(1) satisfactorily contains the necessary requirement for the use of a metal underground water pipe as a grounding electrode regarding the use of interior metal water piping. The exception permits a lesser degree of safety based on an undocumented qualified person hypothetically servicing the installation. No requirements are present to ensure that the conditions of maintenance and supervision will ensure that only qualified persons service the installation actually exist. This is a blatant example of a performance requirement with no prescriptive requirements to judge the effectiveness of compliance with the performance requirement.

Panel Meeting Action: Reject

Panel Statement: The exception is included for installations where it is not practicable to install the grounding electrode conductor all the way back to the service such as in some large commercial, industrial and institutional buildings. The definition of "qualified person" is contained in Article 100. The submitter has not provided sufficient technical substantiation to support removal of this provision. It should be noted that the panel action on Proposal 5-212 relocates the existing exception to a new Section 250.68(C).

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-149 Log #3535 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(2))

Submitter: Phil Simmons, Olympia, WA

Recommendation: Revise text to read as follow:

(2) Metal Frame of the Building or Structure. The metal frame of the building or structure <u>if</u> ~~that is connected to the earth by any of the following methods:~~

~~(1)~~ 3.0 m (10 ft) or more of a single structural metal member <u>is</u> in direct contact with the earth or <u>is</u> encased in <u>not less than 50 mm (2 in.) of</u> concrete that is in direct contact with the earth

~~(2) Connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or ground ring as provided in 250.52(A)(4)~~

~~(3) Bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(7) that comply with 250.56~~

~~(4) Other approved means of establishing a connection to earth~~

Substantiation: The definition of "Grounding Electrode" was revised in the 2008 NEC to read, "A conducting object through which a direct connection to earth is established." The options included in 250.52(A)(2)(2), (3) and (4) do not ensure a "direct connection" is being made by the metal frame of a building or structure.

The rule needs to include "… encased in not less than 50 mm (2 in.) …" to be consistent with the rules for concrete encased grounding electrodes in 250.52(A)(3).

A companion proposal is being made to 250.62 relating to the use of structural metal as a grounding electrode conductor as well as to interconnect other grounding electrodes.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 5-150.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

JOHNSTON, M.: Continue to accept the revisions proposed to Section 250.52(A)(1) to provide consistency with the defined term "grounding electrode." The revisions in proposals 5-182 and 5-212 preserve the allowances for structural metal building frames to be used as conductive paths to grounding electrodes which more accurately describes how they are currently being used. The revision is part of a larger effort to promote more consistent use of defined words and terms related to grounding and bonding, while at the same time improving clarity by providing specific language in this section that reflects how the building steel and water piping systems are actually being used which is inconsistent with the defined term “grounding electrode.” This revision fixes that inconsistency in the NEC.

5-150 Log #3705 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise and Delete Wording to 250.52(A)(2) as follows:
(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth by any of the following methods:
(1) 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth ~~or encased in concrete that is in direct contact with the earth~~
(2) Where 3.0 m (10 ft) or more of a single structural metal member is encased in concrete and where the concrete is in direct contact with the earth for 3.0 m (10 ft) or more
(3) Where each of the hold-down bolts securing a single structural steel column are exothermic welded to at least 6.0 m (20 ft) of one or more concrete encased bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods not less than 13 mm (½ in.) in diameter
~~(2) Connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or ground ring as provided in 250.52(A)(4)~~
~~(3) Bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(7) that comply with 250.56~~
~~(4) Other approved means of establishing a connection to earth.~~
Substantiation: This is meant to clarify where the metal frame of a building or structure is actually an electrode and remove existing language contained in 250.52(A)(2) that allows the metal frame to “act” as an electrode when in fact it is acting as a bonding jumper and part of the grounding electrode conductor in attaching the electrical systems grounded conductor to a concrete encased electrode or ground ring as in current subsection (A)(2)(2), or to a rod, pipe, or plate electrode as in current subsection(A)(2)(3).

It makes little sense to have a 400-ampere rated service with 500 kcmil copper ungrounded service conductors be attached to the metal frame of a building with a 1/0 copper grounding electrode conductor when the basis for the metal frame being an electrode is a 6 AWG copper grounding electrode conductor that runs between an ungrounded metal frame and a ground rod, pipe, or plate electrode as permitted in 250.52(A)(2)(3). This same principle applies in the application of allowing an ungrounded metal frame to be “declared grounded” when a 4 AWG from a concrete encased electrode or a 2 AWG from a ground ring electrode is used to support the steel frame as an electrode when a larger than 4 AWG copper or 2 AWG copper grounding electrode conductor is required because of the size of the ungrounded service conductors.

Subsection (A)(4) is not required and is inadequate. Other approved means is already provided for in 90.4 where it states, “By special permission, the authority having jurisdiction may waive specific requirements in this Code or permit alternative methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.” The same degree of equivalent objectives should be the objective here and any deviation from the NEC should be in writing as is required when special permission is requested and granted.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
250.52(A)(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth by one or more of the following methods:
(1) At least one structural metal member that is in direct contact with the earth for 3.0 m (10 ft) or more, with or without concrete encasement.
(2) The hold-down bolts securing the structural steel column are connected to a concrete encased electrode that complies with 250.52(A)(3) located in the support footing or foundation. The hold-down bolts shall be connected to the concrete-encased electrode by welding, exothermic welding, the usual steel tie wires, or other approved means.
Panel Statement: The panel accepts the concepts from Proposals 5-149, 5-150, 5-151, and 5-152 and has combined them into the revised text. The panel revised the single structural metal member to permit the application of more than one of the structural metal members to qualify as a grounding electrode. The panel concludes the revised text meets the intent of all the submitters.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-151 Log #4012 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(2))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Delete text as follows:
(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth by any of the following methods:
(1) 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth or encased in concrete that is in direct contact with the earth
~~(2) Connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or ground ring as provided in 250.52(A)(4)~~
~~(3) Bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(7) that comply with 250.56~~
~~(4) Other approved means of establishing a connection to earth~~
Substantiation: The definition of “grounding electrode” is for objects that make a connection to the earth. An object that is not actually in the earth should not be described as an electrode but as presently allowed can be used as a conductor to make that connection. The text that is suggested to be deleted is also being proposed on being added to 250.68 to be used as a conductor.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 5-150.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-152 Log #4149 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(2))

Submitter: Chuck Mello, Underwriters Laboratories
Recommendation: Revise 250.52(A)((2) to read as follows:
250.52(A)(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth by any of the following methods:
(1) 3.0 m (10 ft) or more of a single structural metal member in direct contact with the earth or encased in concrete that is in direct contact with the earth
(2) Connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode in the supporting footing or foundation as provided in 250.52(A)(3) ~~or ground ring as provided in 250.52(A)(4)~~
~~(3) Bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(7) that comply with 250.56~~
~~(4)~~ (3) Other approved means of establishing a connection to earth
Substantiation: Section 250.52 is to define what constitutes a grounding electrode. The definition accepted by CMP-5 for the 2008 NEC specifies the grounding electrode be “A conducting object through which a direct connection to earth is established.” For correct application of the definition from Article 100, the structure metal needs to be the conducting object with a direct contact with the earth. Connection of the structural metal to another electrode such as a ground ring, rods, pipes or plates is not a direct connection but an indirect connection to earth, therefore not meeting the Article 100 definition. Part of the substantiation used to revise this section from the “effectively grounded” terminology was that some users were considering the bonding to the service as required in 250.104 as then creating the structural metal as being a grounding electrode. The conflict with using the structural metal as a “common grounding electrode conductor” for separately derived systems in 250.30(A) has been covered by a companion proposal so the need to continue to falsely define structural metal that is connected to earth by bonding to another electrode is no longer necessary. The added language in item (2) clarifies the rebar connection is to be the rebar in the specific footing or foundation for that structural metal member. This aspect follows from the original requirement and substantiation provided for structural metal when it came into the NEC.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 5-150.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-153 Log #1093 NEC-P05 **Final Action: Reject**
(250.52(A)(2)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
3.0 m (10 ft) or more of a ~~single~~ continuous (unbroken) structural metal member located in accordance with 250.52(A) ~~in direct contact with the earth or encased in concrete that is in direct contact with the earth~~.
Substantiation: “Single” implies a 10 ft section cannot be joined to another section. In contact with the earth includes a slab on grade and any portion of above ground concrete, but in contact with the earth, which may not provide a low impedence path to earth. This section does not correlate well with 250.52(A)(3) which also relates to concrete-encased electrodes.
Panel Meeting Action: Reject
Panel Statement: There is insufficient technical substantiation for the proposed changes. The reference to 250.52(A) does not provide any guidance as there is no text for this section except the list items. There was not technical substantiation for added and deleted text from existing code that was not indicated in the proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-154 Log #2760 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Tom Dwyer, City of Bismarck
Recommendation: Revise text to read as follows:
(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means. Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system. Concrete-encased electrodes shall be supplemented with any of the other grounding electrodes permitted in 250.52(A).
Substantiation: The installation of the re-bar and the steel tie wires can be poorly installed. The electricians are not always aware of how the re-bar was installed. As a building inspector and licensed electrician I have witnessed many poor re-bar grounding installations that had to be corrected because the installations were made by concrete contractors who did not understand or care about a good grounding system. Many areas of the country do not require a concrete inspection and the first time the electrician looks at the re-bar ground is after the concrete has been installed. The grounding must be in the hands of the electricians.
Panel Meeting Action: Reject
Panel Statement: Research has determined that the concrete encased electrode is a suitable electrode. The submitter has not provided any technical substantiation to support this proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-155 Log #2877 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Mark A. Heller, Mark Heller Electric
Recommendation: Revise text to read as follows:
250.52(A)(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete in contact with earth, installed as specified in 250.53(I)(1) or (2). ~~located horizontally within and near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means.~~ Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.
Substantiation: Relocates specific details of, and expands on guidance for the installation, construction of, and connection to Concrete-Encased Electrodes to 250.53 where similar guidance on other electrodes is located, and serves to clarify the previously worded version of 250.52(A)(3). (See proposal from same author for new text of proposed 250.53(I)).
Panel Meeting Action: Reject
Panel Statement: Rules contained in 250.52 A(3) are necessary to determine if the installed footing qualifies as an electrode. The panel concludes the requirements for the concrete encased electrode need to be located in 250.52(A)(3) for better clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-156 Log #3050 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (½ in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means. ~~Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.~~
Substantiation: This is a companion proposal one being made in 250.50 (adding a second exception). 250.52(A)(3) is the wrong location the proposed deleted text in this section. 250.52(A) simply describes what an electrode is…it has no requirements. The requirement for bonding electrodes together is found in 250.50. The proposed deleted text seems to be an exception to a rule that is not in this section (250.52).
Panel Meeting Action: Reject
Panel Statement: There is no companion proposal to relocate the deletion.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-157 Log #3051 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (½ in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means. Exposed or concealed reinforcing bars that are bonded to reinforcing bars meeting the criteria of this section shall be considered part of the electrode. Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.
Substantiation: There is a long standing debate as to whether or not a piece of rebar (connected to the footing/foundation steel) that pierces the concrete and is installed inside of a framed wall can be connected to and be used as a concrete encased electrode. This proposal is intended to clarify this practice is a permitted one.
Panel Meeting Action: Reject
Panel Statement: Only the portion of an electrode that is in contact with the earth can be called an electrode. The exposed portion of the rebar could be used as a connection point but cannot be considered as the electrode.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-158 Log #3536 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise text to read as follows:
(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, ~~located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth,~~ consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (½ in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars for use as a concrete-encased electrode shall be in one continuous 6.0-m (20-ft) length or, if in multiple pieces of reinforcing bars, shall ~~permitted to~~ be connected ~~bonded~~ together in compliance with building or structural codes by the usual steel tie wires, welding, or other effective means to create one or more 6.0-m (20-ft) length(s). If ~~Where~~ multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.
(a) Location. Metallic components shall be located horizontally within that portion of a concrete foundation or footing that is in direct contact with the earth or within vertical foundations or structural components or members that are in direct contact with the earth.
Substantiation: A new subsection is proposed to cover the location requirements of concrete-encased electrodes. This will make the requirements more user-friendly. Changes are proposed to add requirements on how to create the minimum 20-ft length of concrete-encased electrode. Methods of connecting lengths of reinforcing steel together are outside the scope of the NEC and thus this section should recognize the building or structural code for those requirements.
CMP-5 added the permission to use concrete-encased electrodes in a "vertical" orientation but now needs to "fill in the blanks" on how this style of electrode is to be installed or recognized. Some members of CMP-5 have stated it is their opinion the vertical grounding electrode must be in one 20-ft length. Others have opined that 4, 5-ft lengths should suffice. This proposal intends to require not less than one 20-ft length as that is the documentation that accompanied the original proposal to add the "Ufer ground" to Article 250 (so far as I can determine). Four, 5-ft lengths may perform adequately but documentation to support that premise has not been supplied to CMP-5. A concrete-encased grounding electrode installed in a vertical orientation needs to have direct earth contact to ensure the concrete-encased grounding electrode will maintain essential moisture level so as to remain conducive.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Reject
Panel Statement: Electrical Inspectors are not responsible for ensuring compliance with structural codes. Welding reinforcing steel may or may not be permitted by structural designs.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

BRENDER, D.: The Panel action and statement are not responsive to the proposal or substantiation. It is a fallacy to assume the NEC is enforced by only electrical inspectors. There are a wide variety of enforcers included in the Fine Print Note to the definition of Authority having Jurisdiction in Article 100. In addition, many users of the NEC choose to comply with the NEC as being the minimum standard for safety.

The proposal does not require welding of the reinforcing steel but permits it. The AHJ or consulting engineer can permit or allow welding where appropriate.

Finally, the Panel Statement is inconsistent with its accepted text in proposal 5-150 where the Panel crafted the language, "The hold-down bolts shall be connected to the concrete-encased electrode by welding, exothermic welding, the usual tie wires, or other approved means."

5-159 Log #3608 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Roger J. Montambo, Glavan Industries, Inc.
Recommendation: Revise text to read as follows:

An electrode encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth shall consist~~ing~~ of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. ~~Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means.~~ Where multiple steel reinforcing bars or rods are used, the electrode and any portion of the reinforcing steel rising above the bottom wall plate line used to connect to the grounding electrode conductor shall be metallically joined together by welding or other listed means to form a continuous electrical electrode. Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.

Substantiation: There has never been any technical substantiation submitted with Proposal 5-144 during the 2002 Code revision cycle to Code-Making Panel-5 for accepting multiple steel reinforcing rods tied together by the "usual' tie-wires in place of a singular 20-foot continuous length of reinforcement steel for creating a concrete encased electrode. Therefore, unless testing of actual in-place concrete electrodes of multiple pieces of reinforcing steel shows the "usual" tie wires to be adequate, this change was questionable when accepted, and remains questionable as no follow-up testing has been performed to assure compliance to NEC 250.56 to our knowledge.

A. G U'fer's report to the AIEE on August 24, 1961 (Paper No. CP61-978) recording the development and test of this concrete-encased system installed at the Davis-Monthan Air Force Base in Tucson, AZ clearly suggested that further testing be performed. In the section titled 'Description of Installation' U'fer states that… "Across the upper ends of these vertical rods one-half inch steel reinforcing bars were laid horizontally and secured to the vertical rods embedded in the concrete of the footings, by welding to every alternate vertical rod in the footing." It is not clear if the rebar was a single piece, or simply constructed of welded sections (assume they were welded based on having access to such equipment). 'Wire ties' are not mentioned anywhere in the U'fer report. Why would anything other that a single piece of #4 rebar, or a single rebar constructed of welded sections comprising a 20 foot length, be considered if the original substantiation differs from the existing code based upon U'fer's own conclusions?

Panel Meeting Action: Reject
Panel Statement: Sections 250.8 and 250.70 already require that listed specific methods are to be used for making connections to electrodes. See the panel action and statement on Proposal 5-157.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-160 Log #3903 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Michael Gassman, ERICO International Corp.
Recommendation: Revise text as follows:

(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least one 6.0 m (20 ft) continuous length ~~of one~~ or ~~more~~ two bare, ~~or zinc galvanized~~, or other electrically conductive coated steel reinforcing bars or rods of not less than ~~13~~ 12.7 mm (1/2 in.) in diameter, or consisting of at least one length 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Two ~~R~~reinforcing bars or rods shall be permitted to be bonded together by ~~the usual steel tie wires or other~~ an effective electrical means. Where multiple concrete encased electrodes are present at a building or structure, the electrodes ~~it~~ shall be ~~permissible to~~ bonded ~~only one~~ into the grounding electrode system.

Substantiation: 1. IEEE Std 80, Sec 14.6 Concrete-encased electrodes

"Splitting of concrete may occur... because corroded steel... passage of a very high current,..."

2. NFPA 780 Sec. 4.13.3.2

"At least 6 m (20 ft) of one or more steel reinforcing bars... overlapping 20 diameters..."

3. IEEE Transactions on Power Apparatus and Systems, Vol. PAS-97, no. 1 January/February 1978

Testing of concrete electrodes under high fault conditions. Dick and Holliday concurred that concrete-encased electrodes do provide a low resistance ground, but also found minor to complete destruction from high current faults in the range of 500 to 2600 amperes.

4. Concrete International, Jan. 2007 - A Brief Look at Lightning Strikes

"Rapid heating can cause localized damage to concrete"

Corn silo investigation - Researchers concluded that strain in the concrete caused by thermal expansion at spark gaps throughout the concrete was a major contributor to the observed damage.

Michigan State Highway Department - Occurrence of spalling due to thunderstorm. Arcing between steel and concrete interface caused the damage.

5. Electrical Earthing Using Reinforced Concrete Foundations by P.G. Wright

"Difficulty was initially experienced in understanding the electrical properties of damp-proof material applied to structural foundations... a membrane barrier of such high resistivity as to preclude this method of earthing."

"The fault energy is dissipated as heat throughout the fault circuit but concentrated at those positions of greater resistance."

6. Typical faults are higher than in the 1940's when Ufer did his studies on concrete-encased electrodes.

7. IEEE Transactions on Industry Applications Vol. 32, No. 5, September/October 1996

"At high fault lightning currents, the Ufer ground needs and external metallic path to ground. Failure to provide a direct metallic path means that lightning or faults will be conducted from the rebar through the concrete into the earth. The water bound up in the concrete may be turned to steam and spall the concrete."

8. Concrete-encased electrodes are part of the grounding system and would require bonding to other electrical grounding systems per the NEC. A path would be required to an external system.

9. National Electrical Code Internet Connection, June 27, 2007

"A Ufer ground consisting solely of the tower foundation is a bad idea. Lightning surges passing through the foundation can vaporize the concrete and damage the foundation through rapid expansion of steam."

10. Tie wires are typically 16 gauge and have a current carrying capacity of 350 amps for 1/2 seconds

11. Bare copper conductor must be one length of 20 ft. A steel rod which is less conductive and is more electrically resistant may be assembled using upwards of 24 - 20 inch reinforcing bars or rods (overlapping X 20 diameters).

12. Tie wire is used as a mechanical support. It is not intended as an electrical connector.

13. If the concrete encased electrodes are not bonded together, a difference in potential will be set up between the competing electrodes. This is an unsafe condition.

14. Lightning Damage to Concrete Including Damage from Flying Concrete and Reinforcement (Shortcut to: http://www.srh.noaa.gov/lch/severe/ltg1.php)

Panel Meeting Action: Reject
Panel Statement: No substantiation was provided for limiting the steel reinforcing to one continuous 20-ft piece or two pieces. No substantiation was provided for removing zinc galvanized reinforcing steel. No field evidence was provided in the substantiation for eliminating the use of tie wires, which has been a common practice for many years.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-161 Log #4150 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Chuck Mello, Underwriters Laboratories
Recommendation: Revise 250.52(A)(3) to read as follows:

(3) Concrete-Encased Electrode. An electrode consisting of rebar or wire encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth. The electrode shall consist~~ing~~ of at least 6.0 m (20 ft) of concrete encasing one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (½ in.) in diameter, or ~~consisting of~~ encasing at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means. Where multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.

Substantiation: The research completed by Mr. Herbert Ufer, which is the basis for the concrete encased electrode, determined that a minimum of 20 feet of concrete containing rebar or wire in direct contact with the earth is a suitable electrode. This length of concrete in contact with the earth and encompassing that volume of earth provides the connection necessary as an electrode. The metal contained within the concrete provides the conductive means to connect to the earth through the concrete. With the change in the 2008 NEC allowing vertical installations for pier construction, some individuals has interpreted the

present language to allow several short lengths of rebar, for example 4 segments each 5 feet long, the sum being 20 feet, and encased in a 5 foot deep concrete pier to be considered a concrete encased electrode. Taken to the extreme, 20 one foot rebar segments in a 16 inch deep block of concrete could meet this interpretation and be called an electrode, but clearly this is not supported by the original research. The proposed language clarifies that the electrode is a system with a minimum of 20 feet of concrete in direct contact with the earth that encases rebar or copper wire of the lengths specified.
Panel Meeting Action: Reject
Panel Statement: The original work of Herbert Ufer does not require 20 ft of concrete. No substantiation was provided for this change. CMP-5 does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-162 Log #4369 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Terry L. Schneider, Berwick Electric Co.
Recommendation: Revise text as follows:
An electrode encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0 linear m (20 linear ft) of one or more…
Substantiation: Some jurisdictions have interpreted this to mean that you could install a 20' length of rebar coiled up, or 10-2' pieces could be tied together and meet the intent of the code. The revised text should help clarify the original intent in the 1968 NEC and not deviate in a direction not intended by the code panel.
Panel Meeting Action: Reject
Panel Statement: Adding the term linear does not improve the clarity of this section. The proposed change could be interpreted as requiring a single 20 ft piece of reinforcing steel.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-163 Log #4372 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Rand Veerman, Town of Normal
Recommendation: Revise text as follows:
(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of ~~at least 6.0 m (20 ft) of~~ one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in) in diameter, or consisting of ~~at least 6.0 m (20 ft) of~~ bare copper conductor not smaller than 4 AWG.
The electrode length shall be sufficient to require a minimum of 6.0 m (20 ft.) of concrete in a single dimension in direct contact with the earth.
Substantiation: Currently a coil of wire or a group of rods tied together dropped in the pour is sufficient to meet the code This change requires electrode length sufficient that 20 linear feet of concrete in contact with the soil.
Panel Meeting Action: Reject
Panel Statement: The original work of Herbert Ufer does not require 20 ft of concrete. No substantiation was provided for this change.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-164 Log #4600 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the following sentence after the sentence ending with "...not smaller than 4 AWG."
"The segments comprising a concrete-encased electrode shall be electrically continuous but are permitted to be physically discontinuous, provided the total embedded length in concrete in direct earth contact is not less than 6.0 m (20 ft)."
Substantiation: This wording would allow for the benefits of Ufer grounding to be applied in buildings with piers that are not 20 ft deep into the earth, but rather as short as, for example, 5 ft within the earth on 4 corners. The section already allows multiple segments of rebar to comprise an electrode, as long as they are run together with the "usual steel tie wires". So, four 5-ft rebars tied together are already permitted to comprise one of these electrodes. What difference would there be if the same length of steel is in four locations, provided the bonding is correctly executed? This is arguably permitted by the current wording, but after discussions with several CMP 5 members it appears this was not fully discussed. This proposal will provide the vehicle for this discussion.
Panel Meeting Action: Reject
Panel Statement: The proposed language does not add clarity and can be misleading. The concept provided in the substantiation is permitted if the multiple pieces of reinforcing steel are bonded together.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-165 Log #2527 NEC-P05 **Final Action: Reject**
(250.52(A)(4))

Submitter: Don Ganiere, Ottawa, IL
Recommendation: Add new text as follows:
(4) Ground Ring or Ground Radial A ground ring encircling the building or structure, or a grounding radial in direct contact with the earth, consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 2 AWG.
Substantiation: What is the magic about a ground ring? A 20 ft copper conductor not smaller than 2 AWG installed as a radial or lateral will perform at least as well as the ground ring encircling the building or structure. In fact a 20 ft radial will actually perform better than a 20 ft ring as a result if the over lapping sphere of influence that will exist with a 20 ft ring and would not exist with a 20 ft radial. Radials are specifically permitted by NFPA 780, 4.13.5 for lightning protection system and that is one of the primary purposes for the grounding electrodes required by the NEC. Grounding radials are commonly used for radio and TV transmission towers. The NEC currently permits what is really an 8 ft radial grounding electrode in 250.53(G). There should be no question that a 20 ft radial would be a better grounding electrode that an 8 ft rod buried horizontally.
Panel Meeting Action: Reject
Panel Statement: The function of a "radial electrode" for an Article 250 grounding electrode system differs from the function of grounding electrodes used for the purposes of NFPA 780. In addition to function in the event of lightning or other short-time events, grounding electrode systems for the purposes of the NEC provide protection for personnel and equipment. Encircling the building with the ground ring is tantamount to this function. The submitter has not provided documentation that demonstrates a "radial electrode" is equivalent to a ground ring encircling the building or structure.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-166 Log #4145 NEC-P05 **Final Action: Reject**
(250.52(A)(5))

Submitter: Chuck Mello, Underwriters Laboratories
Recommendation: Revise 250.52(A)(5) to read as follows:
(5) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 2.44 m (8 ft) in length and shall consist of the following materials.
(a) Pipe Electrodes. ~~Grounding~~ electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size ¾) and, where of steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.
(b) Rod Electrodes.Rod type electrodes shall comply with the following:
(1) Shall be constructed of steel or ~~Grounding electrodes of~~ stainless steel
(2) Where of steel, rods shall be coated by ~~and~~ copper or zinc ~~coated steel~~
(3) Shall be not less than 12.70 mm (½ in.) in diameter
Shall be listed as grounding and bonding equipment ~~at least 15.87 mm (5/8 in.) in diameter, unless listed and not less than 12.70 mm (½ in.) in diameter.~~
Substantiation: With the global market supply, a number of field reports have been received for ground rods. These field reports were for such issues as coatings less than the minimum requirements and inconsistent application of the coatings. Some areas on rods were found to have the minimum thickness coating and other areas on the same rod significantly less than allowed by the product standard. Some of these were Listed and others were not. Those that were listed allow appropriate corrective action to be taken by the listing laboratory, while no laboratory action can be taken for an unlisted product found out of compliance. It has also been observed that some ground rods in the market place are only 6 feet long and not the minimum 8 feet. Inspectors have a very difficult time ensuring an installed ground rod meets the requirements of the NEC. In addition the NEC should set the minimum safety requirements and the present language sets two levels for size without technical basis. The revised language would provide for assurance of properly constructed ground rods, correct length and suitable coatings, and provide a easy means via the listing mark for AHJs to confirm the ground rod meets the applicable standards. This would be also consistent with the panel's previous actions to require the connectors to attach the grounding electrode conductor to the ground rod to be listed as grounding and bonding equipment.
Panel Meeting Action: Reject
Panel Statement: The NEC cannot control the manufacture of noncompliant products. The substantiation states that some products were manufactured under the audit of an NRTL. The revised wording does not add clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-167 Log #2342 NEC-P05 **Final Action: Accept**
(250.52(A)(5)(b))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise 250.52(A)(5)(b) as follows: **(b) Rod-type g~~G~~rounding electrodes of stainless steel and copper or zinc coated steel shall be at least 15.87 mm (5/8 in.) in diameter, unless listed and not less than 12.70 mm (1/2 in.) in diameter.**
Substantiation: By distinguishing clearly that section (b) addresses only “rod” grounding electrodes, it reduces potential confusion for code users without being redundant or verbose. This also provides a similar level of detail as is given to section (a) also in 250.52(A)(5).
Panel Meeting Action: Accept
Panel Statement: The title of the section adequately describes what is covered by the requirements in 250.52(A)(5)(a) and (b).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-168 Log #3706 NEC-P05 **Final Action: Reject**
(250.52(A)(5)(b))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
Grounding electrodes of stainless steel and copper or zinc coated steel shall be at least 15.87 mm (5/8 in.) in diameter, unless listed~~ and not less than 12.70 mm (1/2 in.) in diameter~~.
Substantiation: Simplification. NEC does not establish the listing requirements.
Panel Meeting Action: Reject
Panel Statement: The substantiation does not support removing a minimum requirement that may or may not be incorporated into the applicable product standard.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
MOHLA, D.: The National Electrical Code should not establish criteria for listing standards.
STEINMAN, G.: The UL 467 Standard requires the minimum size of a listed rod to be the identical size as presently described in the NEC, 12.7 mm (1/2 in). The NEC is intended to be an installation code and not a product design collection.

5-169 Log #3707 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(7))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
250.52 Grounding Electrodes.
(7) Plate Electrodes. Each plate electrode shall expose not less than 0.186 m2 (2 ft2) of surface to exterior soil. Electrodes of bare or coated iron or steel plates shall be at least 6.4 mm (1/4 in.) in thickness. Solid, uncoated ~~E~~electrodes of ~~nonferrous metal~~ copper shall be at least 1.5 mm (0.06 in.) in thickness.
Substantiation: While plate electrodes may result in higher resistance than a rod or pipe electrode in most soils, their use is primarily in rocky conditions where they are the electrode of last resort. There may be NO alternative in pure rock conditions and should be retained in the NEC.
“Bare or coated” plates include metal plate electrodes of bare steel, or coated with a conductive material such as zinc or copper.
What was referred to as “nonferrous metal” (because it does not contain iron) includes copper plates and which of course would be un-coated. Stainless-steel would not be nonferrous as it contains iron. This change is primarily editorial for clarification.
Electrical inspectors, due to confusing wording of coating types, and the words ‘ferrous’ and ‘nonferrous’ often interpret this section incorrectly. Therefore editorial changes minimize confusion in applying this paragraph.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
(7) Plate Electrodes. Each plate electrode shall expose not less than 0.186 m2 (2 ft2) of surface to exterior soil. Electrodes of bare or conductively coated iron or steel plates shall be at least 6.4 mm (1/4 in.) in thickness. Solid, uncoated electrodes of nonferrous metal ~~copper~~ shall be at least 1.5 mm (0.06 in.) in thickness.
Panel Statement: The panel action clarifies that any coating applied to the plate electrode is to be conductive. Additionally the term “nonferrous metal” has been retained so as to not limit the material to copper only.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRENDER, D.: The change from copper to “nonferrous” is incorrect as copper is not the only nonferrous metal, and many non-ferrous materials are not suitable for direct-burial applications.

5-169a Log #CP500 NEC-P05 **Final Action: Accept**
(250.53(A))

Submitter: Code-Making Panel 5,
Recommendation: Revise Section 250.53(A) to read:
(A) Rod, Pipe, and Plate Electrodes. Rod, pipe and plate electrodes shall meet the requirements of (A)(1) through (A)(3)
(1) Below Permanent Moisture Level. If practicable, rod, pipe, and plate electrodes shall be embedded below permanent moisture level. Rod, pipe, and plate electrodes shall be free from nonconductive coatings such as paint or enamel.
(2) Supplemental Electrode Required. A rod, pipe or plate electrode shall be supplemented by an additional electrode of a type specified in 250.52(A)(2) through (A)(8). The supplemental electrode shall be permitted to be bonded to one of the following:
(a) The rod, pipe or plate electrode
(b) The grounding electrode conductor
(c) The grounded service-entrance conductor
(d) The nonflexible grounded service raceway
(e) Any grounded service enclosure
Exception: If a single rod, pipe, or plate grounding electrode has a resistance to earth of 25 ohms or less, the supplemental electrode shall not be required.
(3) Supplemental Electrode. If multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart.
FPN: The paralleling efficiency of rods longer than 2.5 m (8 ft) is improved by spacing greater than 1.8 m (6 ft).
Substantiation: CMP-5 has received proposals related to Section 250.56 over several revision cycles. The common thread that resonates in the substantiation for these proposals is that the current text of Section 250.56 is confusing and can result in misapplication of the requirement. At this point CMP-5 has concluded that the substantiation accompanying any of these proposals does not warrant complete removal of the long-standing 25 ohm requirement from the Code. To that end, the panel has relocated the 25 ohm provision from Section 250.56 to an exception in a revised Section 250.53(A) covering the installation requirements for rod, pipe, and plate grounding electrodes. This relocation and revision should resolve many of the usability concerns cited in this and other proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
HARDING, G.: Continue to accept the proposal. The relocation of the rule from 250.56 is better clarified at this location. The requirement as proposed, more accurately matches the standard industry practice of driving two rods unless the requirement of “a resistance to earth of 25 ohms or less” can be demonstrated.
JOHNSTON, M.: Continue to accept this proposal. The revisions propose requirements that are consistent with actual industry practices in the field today regarding the 25 ohm requirement in 250.56. It is understood that the actions here do result in the deletion of 250.56 even though it is not clearly indicated in the action on Proposal 5-176a.

5-169b Log #CP501 NEC-P05 **Final Action: Accept**
(250.53(B))

Submitter: Code-Making Panel 5,
Recommendation: Revise Section 250.53(B) to read:
(B) Electrode Spacing. Where more than one of the electrodes of the type specified in 250.52 (A)(5) or (A)(7) are used, each electrode of one grounding system (including that used for ~~air terminals~~ strike termination devices) shall not be less than 1.83 m (6 ft) from any other electrode or another grounding system.
The remainder of paragraph is the same as in the 2008 NEC.
Substantiation: The term “air terminals” is no longer used in NFPA 780, and has been replaced by the term “strike termination devices”. Panel 5 has already approved changes in terminology in Sections 250-60 (Proposal 5-179) and 250-106 FPN No. 1 (Proposal 5-258). Section 250.53(B) was omitted in error.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-170 Log #3537 NEC-P05 **Final Action: Accept in Principle**
(250.53(D))

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise text to read as follows:
If ~~Where~~ used as a grounding electrode, metal underground water pipe grounding electrodes shall meet the requirements of 250.53(D)(1) through ~~and~~ (D)(3) ~~(D)(2)~~.
(1) Continuity. Continuity of the grounding path or the bonding connection to interior piping shall not rely on water meters or filtering devices and similar equipment.

(2) Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in 250.52(A)(2) through (A)(8). If ~~Where~~ the supplemental electrode is of the ~~a~~ rod, pipe, or plate type, it shall comply with 250.56. The supplemental electrode shall be ~~permitted to be~~ bonded to one of the following:
(a) the grounding electrode conductor,
(b) the grounded service-entrance conductor,
(c) a ~~the~~ nonflexible grounded service raceway, or
(d) any grounded service enclosure.
(e) as provided in 250.32(B)
Exception: The supplemental electrode shall be permitted to be bonded to the interior metal water piping at any convenient point as covered in 250.53(D)(3) Exception ~~250.52(A)(1) Exception~~.
(3) Limitation. Interior metal water piping, that is directly connected to an underground metal water pipe grounding electrode, and is located more than 1.52 m (5 ft) from the point of entrance of the water pipe into the building shall not be used as a conductor to interconnect electrodes that are part of the grounding electrode system.
Exception: In industrial, commercial, and institutional buildings or structures where documented conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a conductor to interconnect electrodes that are part of the grounding electrode system, if the entire length of the interior metal water pipe that is being used for the conductor is exposed other than short sections passing perpendicularly through walls, floors, or ceilings.
Substantiation: This proposal addresses the issue that interior or aboveground metal water piping is not a grounding electrode. It may serve as a bonding conductor and to interconnect other grounding electrodes for creation of a grounding electrode system. CMP-5 modified the definition of “grounding electrode” in the 2008 NEC to emphasize the conductive object is used to make a “direct connection to the earth.”

This proposal also relocates the limitations on the use of the interior metal water pipe associated with the underground water pipe grounding electrode from 250.52(A)(1) to this section as the aboveground portion of the water pipe is not a part of the grounding electrode but may be acceptable for bonding other grounding electrodes together. The exception for industrial, commercial and institutional buildings is also proposed to be relocated here. The qualifications of persons to service and maintain the installation need to be documented.

Several of the proposed changes, including putting the equipment suitable for connecting the grounding electrode conductor to in list form, are intended to be editorial. One primary purpose of the proposal is to require the connection of the supplemental grounding electrode to one of the acceptable points rather than the existing permissive language. The permissive phrase “shall be permitted to be bonded to” needs to be deleted so the connections are required to be made at one of the locations specified.

The section needs to point to 250.32(B) as the location of connection needs to comply with that section at buildings or structures supplied by a feeder or branch circuit.

Section 3.3.4 of the NEC Style Manual states that “where” should not be used to mean “when” or “if.” This proposal intends to use the word “if” where appropriate.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
If used as a grounding electrode, metal underground water pipe shall meet the requirements of 250.53(D)(1) and (D)(2).
(1) Continuity. Continuity of the grounding path or the bonding connection to interior piping shall not rely on water meters or filtering devices and similar equipment.
(2) Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in 250.52(A)(2) through (A)(8). If the supplemental electrode is of the rod, pipe, or plate type, it shall comply with 250.56. The supplemental electrode shall be bonded to one of the following:
(1) The grounding electrode conductor
(2) The grounded service-entrance conductor
(3) A nonflexible grounded service raceway
(4) Any grounded service enclosure
(5) As provided in 250.32(B)
Exception: The supplemental electrode shall be permitted to be bonded to the interior metal water piping at any convenient point as covered in 250.68(C)(1)53(D)(3) Exception ~~250.52(A)(1) Exception~~.
~~**(3) Limitation.** Interior metal water piping, that is directly connected to an underground metal water pipe grounding electrode, and is located more than 1.52 m (5 ft) from the point of entrance of the water pipe into the building shall not be used as a conductor to interconnect electrodes that are part of the grounding electrode system.~~
~~*Exception: In industrial, commercial, and institutional buildings or structures where documented conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a conductor to interconnect electrodes that are part of the grounding electrode system, if the entire length of the interior metal water pipe that is being used for the conductor is exposed other than short sections passing perpendicularly through walls, floors, or ceilings.*~~
Panel Statement: The panel concludes that the location recommended for the new 250.53(D)(3) is more appropriately located in new 250.68(C). See the panel actions on Proposal 5-212. Editorial revisions to the remaining part of the recommendation have been made for clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-171 Log #2883 NEC-P05 **Final Action: Reject**
(250.53(D)(2))

Submitter: William Gross, Electric Service of Clinton
Recommendation: Add after the Exception: FPN: See 250.6(A) for Objectionable Current over Grounding Electrodes.
Substantiation: Inspection authorities and utility companies are creating connection schemes for connection of supplementary grounding electrodes that can result in creating parallel paths and objectionable current flowing over grounding electrode conductors.
Panel Meeting Action: Reject
Panel Statement: The addition of a fine print note to this section does not address the concerns in the submitter’s substantiation. There is insufficient information on the utility or inspector required schemes that are being indicated as creating hazardous conditions. The information regarding objectionable current over grounding conductors and electrodes is provided in 250.6.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-172 Log #2876 NEC-P05 **Final Action: Reject**
(250.53(I))

Submitter: Mark A. Heller, Mark Heller Electric
Recommendation: Add new text to read as follows:

250.53(I) Concrete-Encased Electrode. The electrode shall be installed and constructed so that it be encased by at least 50 mm (2 in.) of concrete, located horizontally for a length of 20 ft, or vertically for a length of 20 ft, or combination thereof within that portion of a concrete foundation, footing or pier that is in direct contact with the earth, by one of the following methods:

(1) Constructed of at least 6.0 m (20 ft) of one or more bare, zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in.) in diameter. Where multiple reinforcing bars are used they shall be permitted to be bonded together by the usual steel tie wires or other effective means. Corrosion protection shall be used for any exposed portions of steel reinforcement bars or rods in wet or damp locations. Such corrosion protection shall be hot-dipped zinc galvanized, copper clad, or approved electrically conductive permanent coating suitable for the conditions, and done prior to the pouring of concrete, and be continuous from a point at least 2 in. inside the concrete, and extend to the exposed end.
(2) Constructed of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Where copper conductor is used as a concrete-encased electrode, exposed portions of the electrode shall comply with 250.64(B), and may be used as a grounding electrode conductor if complying with 250.64(F) and continuous within the concrete.
For purposes of 250.68(A), any exposed portion of the electrode shall be considered part of the concrete-encased electrode for its entire length, if continuous to the qualifying portion(s). Connections to any exposed portion of concrete-encased electrode (copper conductor or reinforcing rods) shall comply with 250.70. Where connection to the grounding electrode conductor is not encased, it shall be accessible.
Substantiation: Relocates specific details of, and expands on guidance for the installation, construction of, and connection to Concrete-Encased Electrodes to 250.53 where similar guidance on other electrodes is located, and serves to clarify the previously worded version of 250.52(A)(3). (See proposal from same author deleting construction details from 250.52(A)(3).

Adds guidance for corrosion protection, and installation of exposed steel reinforcement bars or rods if used as the material for the electrode.

The revised text also clarifies use, connection to, and installation of copper conductor as a concrete-encased electrode. As well as, its popular dual use of the un-encased portion as both a grounding electrode, and grounding electrode conductor. Which may be superior in that it may provide fewer (if any) points of connection failure, and lower impedance.

Current wording of 250.52(A)(3) is in direct conflict with 250.68 in many interpretive views that regard exposed portions of the concrete-encased electrode as a non-qualifying location for connection to the concrete-encased electrode. The added text clarifies this possible conflict that may otherwise place the connection to the concrete-encased electrode beyond inspection or repair unnecessarily if interpreted in this method.

Other interpretations have considered the exposed portion of copper conductor as a “grounding electrode conductor”, limiting connection to them to one of two methods, exothermic welding or irreversible compression. Methods not required for connection to any other electrode - often resulting in abandonment or considerable expense.

Clarifies that copper conductor, if used as the concrete encased electrodes, need not be continuous upon exiting concrete, and may be connected to as would be allowed in 250.68(A) and 250.70.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 5-155
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-173 Log #1550 NEC-P05 **Final Action: Reject**
(250.54)

Submitter: Billie Van Duyne, I.B.E.W. Electrician/Apprentice Instructor / Rep. I.B.E.W. Local #176
Recommendation: Revise text as follows:
250.54 Auxiliary Grounding Electrodes.
One or more auxiliary grounding electrodes, such as ground rods, shall be permitted to be installed. Where connected to equipment, the auxiliary grounding electrodes are not permitted to be used in lieu of the equipment grounding conductor, but they may be used to provide a local earth connection at electrical equipment locations. For example, auxiliary grounding electrodes may be used for lightning protection or to establish a reference to ground in the area of electrically operated equipment. 250.4(A)(5) and 250.4(B)(4) also specify that the earth not be used as the sole equipment grounding conductor or effective (ground) fault current path. ~~connected to the equipment grounding conductors specified in 250.118 and~~ Auxiliary grounding electrodes shall not be required to comply with the electrode bonding requirements of 250.50 or 250.53(C) or the resistance requirements of 250.56. ~~but earth shall not be used as an effective ground-fault current path as specified in 250.4(A)(5) and 250.4(B)(4).~~
The auxiliary grounding electrodes shall be connected to the premises wiring grounding system(s) as required in:
1. 250.60 Use of Air Terminals
2. 250.106 Lightning protection Systems
3. 800.100 Cable and Primary Protector Grounding.
4. 810.21 Grounding Conductors — Receiving Stations
5. 820.100 Cable Grounding
6. 830.100 Cable, Network Interface Unit, and Primary Protector Grounding
FPN: Hazardous conditions of differences of potential and grounding loops should be avoided.
Substantiation: Installers often misunderstood the function of auxiliary grounding electrode(s), probable reason may be because there is not a definition of auxiliary grounding electrode and its function is not explained well.
Panel Meeting Action: Reject
Panel Statement: The proposal would permit, and mandate, the same rule. The proposed text does not add clarity to the code. The recommendation includes examples and explanations, which are not appropriate code language.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-174 Log #1400 NEC-P05 **Final Action: Accept in Principle**
(250.56)

TCC Action: The Technical Correlating Committee directs the panel to reconsider and clarify whether or not it was their intent to delete 250.56.
This action will be considered by the panel as a public comment.
Submitter: Bob Ludecke, Ludecke's Electrical Service
Recommendation: Delete text as follows:
~~250.56 Resistance of Rod, Pipe, and Plate Electrodes. A single electrode of a rod, pipe, or plate that does not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 250.52(A)(4) through (A)(8). Where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart.~~
Substantiation: Our research has failed to turn up any substantiation for this requirement. There is no stated method for determining ground resistance or whether the testing needs to be by a 3rd party. In most soils the ground resistance changes with the seasons and moisture content of the soil. No other types of grounding electrodes are subject to this requirement (i.e., concrete encased electrode or 10' of ½ " buried metal water pipe), nor is this requirement of less than 25 ohms resistance applied to multiple electrodes which seems to imply that the requirement is unnecessary to begin with.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 5-169a.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposal and the related revisions in proposals 5-176a and 5-169a.

5-175 Log #3053 NEC-P05 **Final Action: Reject**
(250.56)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
A ~~single~~ grounding electrode system consisting of only a single rod, pipe, or plate that does not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 250.52(A)(4) through (A)(8). Where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart.
FPN: The paralleling efficiency of rods longer than 2.5 m (8 ft) is improved by spacing greater than 1.8 m (6 ft).
Substantiation: This proposal is intended to clarify that this rule only applies if the single rod, pipe or plate creates the entire grounding electrode system. A very literal reading of this rule tells us that a if a grounding electrode system consists of a metal water pipe, a concrete encased electrode and a ground rod, the ground rod would still have to comply with this rule. This does not make sense, as the ground rod would not required at all.
Panel Meeting Action: Reject
Panel Statement: The present text is clear that the requirement is applied to a single electrode consisting of a rod, a pipe, or a plate. Any two or more electrodes bonded together are a grounding electrode system and this section does not apply. A single grounding electrode does not constitute a grounding electrode system.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRETT, JR., M.: I believe the submitter is correct. Where there are no qualified grounding electrodes and a rod plate or pipe is installed to meet the requirements, then and only then is the 25 ohm test required.

5-176 Log #3607 NEC-P05 **Final Action: Reject**
(250.56)

Submitter: James Lund, Galvan Industries
Recommendation: Revise text to read as follows:
A single electrode consisting of a rod, pipe, concrete encased electrode, or plate that does not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 250.52.(A)(2) through (A)(8). Where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart.
Substantiation: The electrical inspector is often unable to inspect the grounding conductor connection to the rebar which should have a listed connector for that application. Many connectors are used, some that are compliant for the rebar application and some that are not.
If the electrical inspector cannot inspect the connection, and if the contractor, for whatever reason does not have the equipment to prove that the resistance is 25 ohms or less resistance on the concrete encased electrode, the wording in this proposal allows for a means for that installation to be code compliant using the same criteria used for other grounding electrodes.
For safety, it is important that an additional electrode supplement the concrete encased electrode ("Ufer") or any other type of electrode per 250.56. U'fer's original testing was based upon "welded" rebar versus wire ties splicing.. The 2008 edition of the NEC allow wire ties, definitely a lesser quality connector than a weld and not in compliance with U'fer testing.
Panel Meeting Action: Reject
Panel Statement: The substantiation does not provide any data to support concrete-encased grounding electrode testing to meet the requirement of 250.56.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-176a Log #3574 NEC-P05 **Final Action: Accept in Principle**
(250.56)

TCC Action: The Technical Correlating Committee directs the panel to reconsider and clarify whether or not it was their intent to delete 250.56.
This action will be considered by the panel as a public comment.
Submitter: George M. Stolz, II, Pierce, CO
Recommendation: Delete the section in it's entirety.
Substantiation: This section has been kicked around for several cycles now, which has everyone in the field that has any interest in it puzzled. In my research, I have found that apparently it originally appeared in the NEC in 1918 in the following form: *"The combined resistances of the ground wires and connections of any grounded circuit, equipment, or lightning arrester should not exceed 3 ohms for water pipe connections nor 25 ohms for artificial grounds where these must be used. Where, because of dry or other high resistance soils it is impracticable to obtain artificial ground resistance as low as 25 ohms, two such grounds six feet apart if practicable must be installed, and no requirements shall be made as to resistance."* I will make two observations about this section, which is the ancestor of 250.56 - it was rife with vague and unenforceable terms (practicable), and was written very softly as more of a design suggestion than a law. I also noticed that that old section contained a water pipe resistance "suggestion" as strongly worded as the 25-ohm rule. I do not know why the 3-ohm water pipe suggestion became extinct, but I believe that the time has finally come for the 25-ohm rule to follow the 3-ohm rule's lead. Previous references from that era and prior that concerned 25-ohms were strictly telegraph-related sources.

250.56 has enormous potential for misinterpretation, and rampant misunderstanding the panel's intent for allowing it to remain. Some view it as a requirement for the grounding electrode system at a structure to have no more than 25 ohms resistance to earth overall, which the panel has made clear it does not intend. Quite often, inspectors who enforce this rule won't even allow its literal execution - inspectors know as well as anyone else that the resistance of a ground rod will change with the season. A ground rod driven after a nice spring rain will have a lower resistance than it would later in the year when the soil dries further. So, if a fellow drives a rod and claims it has 23 ohms to earth the inspector may disregard the results as seasonal and require the second rod anyway.

There is a fundamental lack of logic that surrounds this section, and it is readily evident. The problem is, if the panel continues to ignore this fundamental problem with this article it simply compounds the confusion and frustration users of the NEC may have when using this very important book. If one person's attention to the NEC is drawn to a very important bonding requirement in this article instead of puzzling and wasting time over this ancient oddity, then that is progress. That could be a life saved, instead of another frustrated student throwing down the book in disgust with the sentiment that the NEC is just a complicated book full of secret handshakes to keep them from passing a state test.

Two rods at 5,000,000 ohms resistance to earth are not better at directing lightning towards the earth than one ground rod at 30 ohms. There are two choices: reject this proposal, and secure the profit margin of the ground rod producing industry, or accept the proposal and be done with this requirement once and for all. I ask that in the event the panel rejects this proposal, please substantiate your response with a solid defense of this section beyond a weak: "This section has been successfully used for years." A nation of tired, panting, ground rod driving installers and a broader audience of inspectors, engineers and whoever else I left out are anxious to understand what we're not seeing that you folks are. I appreciate your time, and your efforts to clean up 250.

One more thing: The panel has effectively brought UFER to life in 2005-and it will continue to do more for us than just another rod.

Panel Meeting Action: Accept in Principle

Panel Statement: CMP-5 has received proposals related to this section over several revision cycles. The common thread that resonates in the substantiation for this proposal and some of the past proposals is that the current text of Section 250.56 is confusing and can result in misapplication of the requirement. At this point CMP-5 has concluded that the substantiation accompanying any of these proposals does not warrant complete removal of the long-standing 25 ohm requirement from the code. To that end, the panel has relocated the 25 ohm provision from Section 250.56 to an exception in a revised Section 250.53(A) covering the installation requirements for rod, pipe, and plate grounding electrodes. This relocation and revision should resolve many of the usability concerns cited in this and other proposals. See the panel action on Panel Proposal 5-169a.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BRETT, JR., M.: Reference to 5-169A should be made in panel action to direct the submitter to the panel proposal where the change occurred. However, I do not believe this adds clarity. See my comment on voting in 5-175

5-177 Log #587 NEC-P05 **Final Action: Reject**
(250.56, FPN)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission, James Moore

Recommendation: Revise text to read as follows:

~~The paralleling efficiency of rods longer than 2.5 m (8 ft) is improved by spacing greater than 1.8 m (6 ft).~~

The paralleling efficiency of rods is increased by spacing adjacent rods by a distance equal to twice the length of a single rod. Where the rods are not of the same length, the spacing of the paralleled rods shall be permitted to be based at twice the length of the longer rod.

Substantiation: The sphere of influence or relative earth cylinder or earth shell of a single rod is determined by the driven depth of the rod. No other rod should occupy this shell. Therefore, where it is possible to provide this spacing, the overall resistance to ground of the paralleled rods would be approximately half that of a single rod. I have seen certain local authorities require a 6 foot spacing between rods and this is certainly a misinterpretation of this concept.

Panel Meeting Action: Reject

Panel Statement: The panel has relocated the provisions of this section to 250.53(A). The proposed FPN contains a permissive requirement that does not meet the requirements of the NEC Style Manual. The fine print note offers information on how to improve the efficiency beyond the minimum established by the requirement, but the exact separation is a design consideration.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

JOHNSTON, M.: The concepts provided in this proposal are technically accurate and should be accepted in principle and relocated to 250.53(A) as indicated in the action by CMP-5. The proposed text should be revised to address the NEC Style Manual concerns in the Panel statement.

5-178 Log #661 NEC-P05 **Final Action: Reject**
(250.58, FPN (New))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission

Recommendation: Add new text to read as follows:

FPN: See 250.188(E) for information on isolating the grounding electrode for portable or mobile high-voltage equipment.

Substantiation: This purposeful and important isolation of this specific grounding electrode is an exception to the general concept of intersystem bonding in order to reduce the effects of voltage differences among various systems.

Panel Meeting Action: Reject

Panel Statement: Section 250.200 already states that all the requirements in Article 250, Parts I to IX apply unless modified or supplemented by requirements in Part X. Section 250.188(E) provides such a modification.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-179 Log #1516 NEC-P05 **Final Action: Accept**
(250.60)

Submitter: Mark S. Harger, Harger Lightning & Grounding / Rep. BICSI

Recommendation: Revise text to read as follows:

250.60 Use of ~~Air Terminals~~ Strike Termination Devices.

~~Air terminal~~ conductors and driven pipes, rods, or plate electrodes used for grounding strike termination devices ~~air terminals~~ shall not be used in lieu of the grounding electrodes required by 250.50 for grounding wiring systems and equipment. This provision shall not prohibit the required bonding together of grounding electrodes of different systems.

FPN No. 1: See 250.106 for spacing from ~~air terminals~~ strike termination devices. See 800.100(D), 810.21(J), and 820.100(D) for bonding of electrodes.

FPN No. 2: Bonding together of all separate grounding electrodes will limit potential differences between them and between their associated wiring systems.

Substantiation: NFPA 780, Standard for the Installation of Lightning Protection Systems, 2008, Section 3.3.24 defines a strike termination device as a component of a lightning protection system that intercepts lightning flashes and connects them to a path to ground. Strike termination devices include air terminals, metal masts, permanent metal parts of structures as described in Section 4.9, and overhead ground wires installed in catenary lightning protection systems. By using this term "air terminal", one could interpret that ground electrodes used for strike termination devices other than ones used for air terminals could be used in lieu of the grounding electrodes required by 250.50, thus, creating a safety issue.

Also see my Proposal on 250.106.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-180 Log #2672 NEC-P05 **Final Action: Accept in Part**
(250.62)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

The grounding electrode conductor shall be of copper, aluminum, or copper-clad aluminum. The material selected shall be resistant to any corrosive conditions existing or likely to exist at the installation or shall be ~~suitably~~ protected against corrosion by identified means. The conductor shall be solid or stranded, insulated, covered, or bare. Insulated or covered conductors shall be identified in accordance with 250.119.

Exception No. 1: Where installed as a single isolated insulated or covered conductor 250.119 shall not apply.

Exception No. 2: Where installed in cable tray identification shall be at intervals acceptable to the authority having jurisdiction.

Substantiation: Corrosion resistance requirement should apply where the condition does not exist at time of installation but is likely to occur. "Suitably" is subjective and a term to be avoided per the Style Manual. The grounding electrode conductor may be installed in enclosures or cable tray with other conductors and should then be identified. A voltage or continuity test of such conductor run with other conductors may suggest it is a grounded circuit conductor which may be tapped. If identified with green marking it would identify the conductor as suitable for connection of an equipment grounding conductor, as permitted elsewhere.

Panel Meeting Action: Accept in Part

The panel accepts only the portion of the recommendation to delete "suitably" and rejects the remainder of the recommendation.

Panel Statement: The substantiation does not support the remainder of the technical changes contained in the recommendation.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-181 Log #2676 NEC-P05 **Final Action: Accept in Part**
(250.62)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
The grounding electrode conductor shall be of copper, aluminum, or copper-clad aluminum. The material selected shall be resistant to any corrosion condition existing or likely to exist at the installation or shall be ~~suitably~~ protected against corrosion by identified means (remainder unchanged).
Substantiation: Edit. Corrosion may not exist at time of installation but may be likely thereafter. "Suitably" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Accept in Part
The panel accepts only the portion of the recommendation to delete "suitably" and rejects the remainder of the recommendation.
Panel Statement: The future condition of "likely to exist" is undefined and subjective, which leads to inconsistent enforcement. No substantiation was provided on what "identified means" is when referring to corrosion protection. The panel notes that the term "corrosive" was changed to "corrosion" in the recommendation without any substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-182 Log #3538 NEC-P05 **Final Action: Accept in Principle**
(250.62)

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise text to read as follows:
250.62 Grounding Electrode Conductor Material.
(A) Wire or Busbar. The grounding electrode conductor shall be of copper, aluminum, or copper-clad aluminum. The material selected shall be resistant to any corrosive condition existing at the installation or shall be suitably protected against corrosion. The conductor shall be solid or stranded, insulated, covered, or bare.
(B) Water Pipe. Interior metal water piping located within 1.52 m (5 ft) from the point of entrance to the building shall be permitted to be used as a grounding electrode conductor or as a conductor to interconnect electrodes that are part of the grounding electrode system.
Exception: If procedures, acceptable to the authority having jurisdiction, are maintained to ensure only qualified persons service and maintain the installation in industrial, commercial, and institutional buildings or structures, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a grounding electrode conductor or as a conductor to interconnect electrodes that are part of the grounding electrode system, if the entire length of the metal water pipe is exposed other than short sections passing perpendicularly through walls, floors, or ceilings.
(C) Structural Metal. The metal frame of a building or structure that is a grounding electrode or is bonded as provided in 250.104(C) shall be permitted as a grounding electrode conductor for separately derived systems or to interconnect grounding electrodes described in 250.52(A)(1), (A)(3), (A)(4), (A)(5), (A)(6), (A)(7) and (A)(8).
Substantiation: Material and concepts from 250.52(A)(1) has been relocated to create 250.62(B) as the material is more appropriate here as the water pipe located above the earth is not a grounding electrode but may act as a grounding electrode conductor and may be suitable for interconnecting other grounding electrodes.
Text is proposed to allow the metal frame of a building or structure to be used as a grounding electrode conductor and to interconnect other grounding electrodes as this is an appropriate use for the structural metal.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 5-212.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

(Note: Sequence 5-183 and 5-184 and be found on page 274)

5-185 Log #3915 NEC-P05 **Final Action: Accept in Principle**
(250.64)

Submitter: David A. Williams, Delta Township
Recommendation: Revise text as follows:
250.64 Grounding Electrode Conductor Installation.
Grounding electrode conductors at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at separately derived system shall be installed as specified in 250.64(A) through (F). The grounding electrode conductor shall not also be used for another conductor.
Substantiation: The Code does not prohibit you from using the grounding electrode conductor to also function as an equipment grounding conductor. The grounding electrode conductor serves a specific purpose and has installation requirements that would normally make this type of installation prohibited. The use of the grounding electrode conductor for equipment grounding has been attempted in the past and often leads to code violations due to the installation requirements of the GEC.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 5-259.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-186 Log #4407 NEC-P05 **Final Action: Reject**
(250.64)

Submitter: Dean Hunter, Hunter Electric
Recommendation: Add the following new text:
250.64(G) Indentification. Grounding electrode conductors that are covered or insulated shall be identified at all termination points at the time of installation with a distinctive green marking. The marking shall encircle the conductor.
Substantiation: This is identification used for equipment grounding conductors and commonly used to identify grounding electrode conductors - though it is not required. With the great work done in the 2008 cycle to "clean up" not only the language of grounding but to eliminate the inappropriate (and inadvertenet) re-grounding the neutral conductor a requirement to identify the grounding electrode conductor is necessary.
Panel Meeting Action: Reject
Panel Statement: The technical substantiation provided does not support a mandatory identification requirement for the grounding electrode conductor. The NEC does not prohibit identification in accordance with 250.119.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-187 Log #1290 NEC-P05 **Final Action: Reject**
(250.64(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part of first sentence:
...or where likely to be subject to corrosive conditions.
Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation to support such a change. The future condition of "likely to be" is undefined and subjective, which leads to inconsistent enforcement.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
BOWMER, T.: Agree with rejection and panel substantiation. An alternate language is offered to change the part of the sentence in question from "... where subject to corrosive conditions" to "...where corrosive conditions are possible".

5-188 Log #3054 NEC-P05 **Final Action: Accept**
(250.64(A))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(A) Aluminum or Copper-Clad Aluminum Conductors. Bare aluminum or copper-clad aluminum grounding electrode conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum grounding electrode conductors shall not be terminated within 450 mm (18 in.) of the earth.
Substantiation: The fact that this rule is found in 250.64 implies that it applies only to grounding electrode conductors. The text of the rule, however, states that it applies to any grounding conductor.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-189 Log #322 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: Alan Chech, Alan Chech Electrical Seminars
Recommendation: Add new text to read as follows:
...grounding electrode conductors smaller than 6 AWG shall be in RMC, IMC, RNC (intended for the use), EMT, or cable armor.
Substantiation: The presently conflicts with 352.12(F) and 300.5(D)(4). Be consistent. Use PVC 80.
Panel Meeting Action: Reject
Panel Statement: The substantiation does not support the proposed change as Section 352.12(F) relates to the use of PVC conduit in theaters, and Section 300.5 does not apply as it regulates underground installations.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-190 Log #1266 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:
250.64 (B) **Securing and Protection Against Physical Damage.** Where exposed, a grounding electrode conductor or its' enclosure shall be securely fastened to the surface on which it is carried. A ~~4~~ 6 AWG or larger copper or aluminum grounding electrode conductor shall be protected where exposed to physical damage. A 6 AWG that is exposed to physical damage, or an 8 AWG grounding electrode conductor ~~that is free from exposure to physical damage shall be permitted to be run along the surface of the building construction without metal covering or protection where it is securely fastened to the construction; other wise, it~~ shall be in rigid metal conduit, intermediate metal conduit, ~~rigid non-metallic conduit~~ PVC conduit, electrical metallic tubing, or cable armor. ~~Grounding electrodes smaller than 6 AWG shall be in rigid metal conduit, intermediate metal conduit, rigid non-metallic conduit, electrical metallic tubing, or cable armor.~~
Substantiation: We feel that 250.64 (B) as written is too repetitive and confusing. A more concise wording that meets the intent of the article is needed.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation is provided to support removing the allowance of a 6 AWG to be installed without protection only if securely fastened to the construction. The recommendation does not improve the understanding of this section. There is no technical substantiation provided to limit the use of rigid nonmetallic conduit to Type PVC only. See the panel action on Proposal 5-195.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-191 Log #2414 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Revise text to read as follows:
It shall be in rigid metal conduit, intermediate metal conduit, rigid ~~nonmetallic~~ PVC conduit.
Substantiation: Conforming to style manual Article 352.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation provided to limit the use of rigid nonmetallic conduit to Type PVC only. See the panel action on Proposal 5-195.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-192 Log #2682 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:
INSTALLATION. Grounding electrode conductors shall be installed in identified nonflexible raceways or enclosures.
Exception No. 1: Where direct buried or encased in concrete or masonry.
Exception No. 2: Where installed as open aerial conductors or part of open wiring on insulators.
Exception No. 3: Where fished between access points through concealed spaces in finished buildings or structures.
Exception No. 4: Where installed as armored ground wire.
Exception No. 5: Flexible nonmetallic conduit shall be permitted where not likely to be subject to physical damage.
Exception No. 6: Where installed in cable trays.
Exception No. 7: As part of a messenger supported wiring system.
Exception No. 8: A 6 AWG or larger grounding electrode conductor shall be permitted without a raceway, enclosure, or armor, where not likely to be subject to physical damage. Where not fished, direct buried, encased in concrete or masonry, installed in raceways, not installed as aerial conductors or open wiring on insulators, or in cable trays, grounding electrode conductors shall be securely fastened to supports at intervals not exceeding 1.8 m (6 ft).
Substantiation: Proposal covers possible installation scenarios. Fastening and support should be specified as is done for other wiring and conductors. Where installed in conduit or tubing support is covered by the raceway article.
Panel Meeting Action: Reject
Panel Statement: The proposed revision with eight exceptions does not improve clarity or increase usability.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-193 Log #2963 NEC-P05 **Final Action: Reject**
(250.64(B))

Submitter: James A. Burch, City of Glendale, Arizona
Recommendation: Revise as follows:
(B) ~~Securing and~~ Protection Against Physical Damage.
~~Where exposed, a~~ A grounding electrode conductor or its enclosure shall be securely fastened to the surface on which it is carried. ~~A 4 AWG or larger copper or aluminum grounding electrode conductor shall be protected where exposed to physical damage. A 6 AWG grounding electrode conductor that is free from exposure to physical damage shall be permitted to be run along the surface of the building construction without metal covering or protection where it is securely fastened to the construction; otherwise, it shall be in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or cable armor. Grounding electrode conductors smaller than 6 AWG~~ A grounding electrode conductor where not concealed and protected by building construction shall be in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or cable armor.
Substantiation: Due to the increase in theft, conductors should not be routed exposed. Theft of the grounding electrode conductors creates a significant safety issue. Numerous news articles across the country and instances within my own jurisdiction have caused us to add an amendment to require the concealing or protection of grounding electrode conductors.
Panel Meeting Action: Reject
Panel Statement: The recommended installation method is not prohibited by the code. The substantiation does not support the technical changes.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-194 Log #3539 NEC-P05 **Final Action: Accept in Principle**
(250.64(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action with respect to the provisions of this proposal that are included in the panel action on Proposal 5-195.
This action will be considered by the panel as a public comment.
Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise text to read as follows:
(B) Securing and Protection Against Physical Damage. If ~~Where~~ exposed, a grounding electrode conductor or its enclosure shall be securely fastened to the surface on which it is carried. Grounding electrode conductors shall be permitted to be installed on or through framing members. A 4 AWG or larger copper or aluminum grounding electrode conductor shall be protected if ~~where~~ exposed to physical damage. A 6 AWG grounding electrode conductor that is free from exposure to physical damage shall be permitted to be run along the surface of the building construction without metal covering or protection if ~~where~~ it is securely fastened to the construction; otherwise, it shall be in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or cable armor. Grounding electrode conductors smaller than 6 AWG shall be protected in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or cable armor.
Substantiation: This proposal intends to clarify that it is permitted to route grounding electrode conductors through or on framing members. Without this provision being specifically stated, some enforcement authorities are prohibiting such installations.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Other changes are intended to be editorial.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 5-195.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRENDER, D.: It does not appear the Panel action on Proposal 5-195 included the concepts contained in this proposal as included in the Panel Statement on both proposals.
Comment on Affirmative:
HAMMEL, D.: See my comment on proposal 5-195.

5-195 Log #4740 NEC-P05 **Final Action: Accept in Principle**
(250.64(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with respect to the provisions of Proposal 5-194 that have been included.
This action will be considered by the panel as a public comment.
Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
250.64 Grounding Electrode Conductor Installation.
Grounding electrode conductors at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at a separately derived system shall be installed as specified in 250.64(A) through (F).
(B) Securing and Protection Against Physical Damage. Where exposed, a grounding electrode conductor or its enclosure shall be securely fastened to the surface on which it is carried. A 4 AWG or larger copper or aluminum grounding electrode conductor shall be protected where exposed to physical damage. A 6 AWG grounding electrode conductor that is free from exposure to physical damage shall be permitted to be run along the surface of the building

construction without metal covering or protection where it is securely fastened to the construction; otherwise, it shall be in rigid metal conduit, intermediate metal conduit, rigid ~~nonmetallic~~ <u>polyvinyl chloride</u> conduit <u>(PVC), reinforced thermosetting resin conduit (RTRC)</u>, electrical metallic tubing, or cable armor. Grounding electrode conductors smaller than 6 AWG shall be in rigid metal conduit, intermediate metal conduit, rigid ~~nonmetallic~~ <u>polyvinyl chloride</u> conduit<u>(PVC), reinforced thermosetting resin conduit (RTRC)</u>, electrical metallic tubing, or cable armor.

Substantiation: This is an addition from the result of the 2008 NEC adding of new code articles for each of the specific nonmetallic raceways and the conditions for their intended use. Remove the reference of "nonmetallic" and add in each of the specific raceway types as acceptable for protection of grounding electrode conductor as limited by the conditions of the articles.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

250.64 Grounding Electrode Conductor Installation.

Grounding electrode conductors at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at a separately derived system shall be installed as specified in 250.64(A) through (F).

(B) Securing and Protection Against Physical Damage. Where exposed, a grounding electrode conductor or its enclosure shall be securely fastened to the surface on which it is carried. A 4 AWG or larger copper or aluminum grounding electrode conductor shall be protected where exposed to physical damage. A 6 AWG grounding electrode conductor that is free from exposure to physical damage shall be permitted to be run along the surface of the building construction without metal covering or protection where it is securely fastened to the construction; otherwise, it shall be in rigid metal conduit, intermediate metal conduit, rigid ~~nonmetallic~~ <u>polyvinyl chloride</u> conduit <u>(PVC), reinforced thermosetting resin conduit (RTRC)</u>, electrical metallic tubing, or cable armor. Grounding electrode conductors smaller than 6 AWG shall be in rigid metal conduit, intermediate metal conduit, rigid ~~nonmetallic~~ <u>polyvinyl chloride</u> conduit <u>(PVC), reinforced thermosetting resin conduit (RTRC)</u>, electrical metallic tubing, or cable armor.

Panel Statement: The panel accepts the recommendation and has included the provisions from the recommendation in Proposal 5-194. Additionally the panel action clarifies the acceptable types of nonmetallic conduits that can be used to meet the requirements of this provision.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

HAMMEL, D.: The Panel Statement for proposal 5-194 is: See the panel action and statement on Proposal 5-195. For some reason, the changes from proposal 5-194 were not included in the official NFPA report of the actions on proposal 5-195.

JOHNSTON, M.: Continue to accept the proposed revisions and restructure the section into a list format to improve clarity and usability.

5-196 Log #3540 NEC-P05 **Final Action: Accept in Principle**
(250.64(D))

Submitter: Phil Simmons, Olympia, WA

Recommendation: Revise text to read as follows:

(D) Service with Multiple Disconnecting Means Enclosures. <u>If</u> ~~Where~~ a service consists of more than a single enclosure as permitted in 230.71(A), grounding electrode connections shall be made in accordance with (D)(1), (D)(2), or (D)(3).

(1) <u>Common</u> Grounding Electrode Conductor <u>and</u> Taps. ~~Where the service is installed as permitted by 230.40, Exception No. 2,~~ <u>A</u> common grounding electrode conductor and grounding electrode conductor taps shall be installed. The common grounding electrode conductor shall be sized in accordance with 250.66, based on the sum of the circular mil area of the largest ungrounded service-entrance conductor(s). <u>If</u> ~~Where~~ the service-entrance conductors connect directly to a service drop or service lateral, the common grounding electrode conductor shall be sized in accordance with Table 250.66, Note 1.

A tap <u>grounding electrode</u> conductor shall extend to the inside of each service disconnecting means enclosure. The grounding electrode conductor taps shall be sized in accordance with 250.66 for the largest <u>service-entrance</u> conductor serving the individual enclosure. The tap conductors shall be connected to the common grounding electrode conductor by <u>one of the following methods</u> ~~exothermic welding or with connectors listed as grounding and bonding equipment~~ in such a manner that the common grounding electrode conductor remains without a splice or joint<u>:</u>

<u>(a) exothermic welding</u>

<u>(b) connectors listed as grounding and bonding equipment</u>

<u>(c) connections to an aluminum or copper busbar not less than 6 mm × 50 mm (¼ in. × 2 in.). The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process. If aluminum busbars are used, the installation shall comply with 250.64(A).</u>

Substantiation: CMP-5 added a great deal of clarity by adding this subsection in the 2008 NEC. Several proposed changes are intended to be editorial. The phrase, "Where the service is installed as permitted by 230.40, Exception No. 2" is not necessary as the concept is included in the opening paragraph.

The most significant change intends to allow the busbar method of connection of the common and tap grounding electrode conductors as provided in 250.30(A)(4) and 250.64(F). This proposal also puts the options for making the connections in list form which is easier to read and thus is user-friendly.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Principle

Revise the first sentence of the second paragraph of the recommendation to read:

A ~~tap~~ grounding electrode conductor <u>tap</u> shall extend to the inside of each service disconnecting means enclosure.

The remainder of the recommendation is accepted as submitted.

Panel Statement: The revision provides consistency.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-183 Log #3805 NEC-P05 **Final Action: Accept in Principle**
(250.64(D)(1))

Submitter: Michal Hofkin, Middle Atlantic Inspections

Recommendation: Add language to the end of 250.62(D)(1) after the words "...conductor remains without a splice or joint." as follows: <u>The equipment grounding conductor serving a load-side panelboard, disconnect, switchboard, or similar equipment shall not be used as a grounding electrode conductor tap or to otherwise extend the grounding electrode conductor.</u>

Substantiation: Due to a long held belief and misconception that a connection to a busbar under a binding screw is not a "splice" and therefore complies with 210.65(C), many electricians and inspectors believe that a grounding electrode conductor can be run to a load-side panelboard (subpanel). Since the connection on the busbar in that panelboard is not, in their view, a splice, they consider the grounding electrode conductor to be continuous. They then permit the use of the equipment grounding conductor serving the panelboard as an extension or tap to carry the grounding electrode conductor to the system grounded conductor in the service disconnect.

The equipment grounding conductor should not serve simultaneously as a grounding electrode conductor. If this practice is permitted, then we are inviting lightning strikes and/or over voltages to travel along feeder wiring, increasing the chance of a fire and/or damage to the structure or wiring.

By adding this sentence, it would be clear that this practice is not permitted, thus leading to safer electrical installation.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action on Proposal 5-259.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

(250.64(D)(1))

Submitter: Michal Hofkin, Middle Atlantic Inspections

Recommendation: Add language to the end of 250.62(D)(1) after the words "…conductor remains without a splice or joint." as follows:

<u>The equipment grounding conductor serving a load-side panelboard, disconnect, switchboard, or similar equipment shall not be used as a grounding electrode conductor tap or to otherwise extend the grounding electrode conductor.</u>

Substantiation: Due to a long held belief and misconception that a connection to a busbar under a binding screw is not a "splice" and therefore complies with 210.64(C), many electricians and inspectors believe that a grounding electrode conductor can be run to a load-side panelboard (subpanel). Since the connection on the busbar in that panelboard is not, in their view, a splice, they consider the grounding electrode conductor to be continuous. They then permit the use of the equipment grounding conductor serving the panelboard as an extension or tap to carry the grounding electrode conductor to the system grounded conductor in the service disconnect.

The equipment grounding conductor should not serve simultaneously as a grounding electrode conductor. If this practice is permitted, then we are inviting lightning strikes and/or over voltages to travel along feeder wiring, increasing the chance of a fire and/or damage to the structure or wiring.

By adding this sentence, it would be clear that this practice is not permitted, thus leading to safer electrical installations.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action on Proposal 5-259.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-197 Log #1287 NEC-P05 **Final Action: Reject**
(250.64(E))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise last sentence:

Where a raceway is used ~~as protection for~~ <u>to enclose</u> a grounding electrode conductor <u>or a bonding conductor</u>, the installation shall comply with the <u>applicable provisions</u> ~~requirements~~ of the appropriate raceway article <u>including conductor fill</u>.

Substantiation: Bonding conductors should be included. Raceway conductor fill requirements are often overlooked where a grounding electrode conductor or bonding conductor is the only conductor installed in a raceway. Compliance with provisions which are not requirements, per se should be noted.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation provided to indicate that a single grounding electrode conductor in a raceway has a heating issue to limit fill. There was no substantiation to change the word "requirements" to "applicable provisions". The requirements of Section 250.53(C) indicate that the bonding jumper shall comply with Section 250.64(E).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-198 Log #1728 NEC-P05 **Final Action: Reject**
(250.64(E))

Submitter: Michael Gregory Owen, Electrical Training & Consulting Service
Recommendation: Revise text to read as follows:
~~Ferrous~~ Metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to the cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting. ~~Nonferrous metal~~ Non-metallic enclosures shall not be required to be ~~electrically~~ physically continuous. ~~Ferrous~~ Metal enclosures that are not physically continuous…". Bonding shall apply at each end to all intervening ~~ferrous~~ metal raceways, boxes, and…".
Substantiation: Whether or not the enclosures or raceways are constructed of IRON is not of significance. Any conductive metal raceway or enclosure will be affected by the AC magnetic field created by current flowing thru the GEC. An induced voltage is not dependent upon iron raceways, merely conductive raceways. Relative motion between an alternating magnetic field and any conductive material will produce an induced voltage and a resulting current flow. Such a current flow may affect the impedance of the grounding electrode conductor.
Panel Meeting Action: Reject
Panel Statement: The magnetic interaction of the conductor within ferrous raceways and enclosures is understood. There is no technical substantiation that other than ferrous metal raceways and enclosures have resulted in problems with operation of the grounding electrode conductor and that "current flow may be affected".
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-199 Log #3541 NEC-P05 **Final Action: Accept**
(250.64(E))

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise text to read as follows:
(E) Enclosures for Grounding Electrode Conductors. Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting. Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding methods in compliance with 250.92(B) for installations at service equipment locations and with 250.92(B)(2) through (B)(4) for other than service equipment locations shall apply at each end and to all intervening ferrous raceways, boxes, and enclosures between the cabinets or equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the enclosed grounding electrode conductor. If ~~Where~~ a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.
Substantiation: The reference to 250.92(B) for bonding methods ensures proper methods are used for the bonding of the ferrous metal enclosures for grounding electrode conductors.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-200 Log #4881 NEC-P05 **Final Action: Reject**
(250.64(E))

Submitter: Peter D. Novak, Jr., Philadelphia, PA
Recommendation: Revise text as follows:
~~Ferrous~~ Metal Enclosures. For grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting. ~~Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous~~ Metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ~~ferrous~~ metal raceways, boxes, and enclosures between the cabinet or equipment and the grounding electrode. The bonding jumper for a grounding electrode raceway or cable armor shall be the same size, or larger than, the enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.
Substantiation: Under certain conditions, unbonded sections of electrically conductive metal raceways, fittings, and enclosures may be subjected to arcing, resulting in a potential fire hazard.
This wold be the case whether ferrous or nonferrous metal is involved. The proposed revision to text eliminates this concern where nonferrous metal is utilized for grounding electrode conductor installations.
Panel Meeting Action: Reject
No substantiation has been provided indicating there is a problem with arcing if nonferrous enclosures for grounding electrode conductors are not bonded at both ends.
Panel Statement: See the panel action and statement on Proposal 5-198.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-201 Log #2731 NEC-P05 **Final Action: Reject**
(250.64(F)(4))

Submitter: James A. Burch, City of Glendale, Arizona
Recommendation: Add paragraph (4) as follows:
(4) Grounding electrode conductor(s) shall not be routed within the same raceway as premises wiring except within the enclosure where the connection to grounded conductor is made.
Substantiation: Routing of a grounding electrode conductor with premises wiring may subject the wiring systems to over voltages created by the utility or lightning.
The Code does not restrict the routing of the GEC. If raceways are bonded at both ends, the Code, as now written, is complied with. If raceways are ferrous, most induced lightning current and associated voltage stress is routed along the outside of the raceway and may protect any conductors inside the raceway but if PVC or aluminum raceways are used any conductors will be subject to high voltage stress possibly damaging the cable as well as any equipment served by the conductors.
Panel Meeting Action: Reject
Panel Statement: There was no documented evidence in the substantiation that a problem exists with the current requirements covering the routing of the grounding electrode conductor.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-202 Log #349 NEC-P05 **Final Action: Accept**
(250.64(F)(1))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change "per" to "in accordance with".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-203 Log #2314 NEC-P05 **Final Action: Reject**
(250.64(F)(3))

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Add to end of (F)(3)... Where the busbar is not within sight of the service equipment, the location of the busbar shall be indicated by signs at each service location of the busbar shall be indicated by signs at each service location and the busbar shall be labeled 'SYSTEM GROUNDING BUS'
Substantiation: Where buildings are of sufficient size to require multiple services or where additions result in a new service or new grounding arrangements, the grounding electrode system could have connections in out-of-the-way places that may be inadvertently disconnected. This change will help prevent that possibility and make it easier to find the busbar when it's installed remote from the service location.
Panel Meeting Action: Reject
Panel Statement: No substantiation is provided to support that there is a problem, only the possibility of a problem.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-204 Log #662 NEC-P05 **Final Action: Reject**
(250.64(G))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text to read as follows:
Grounding electrode conductors shall not be any longer than necessary and shall avoid unnecessary bends.
Substantiation: The length of the grounding electrode conductor is directly related to voltage drop and the resultant voltage rise above. Earth potential on systems and equipment, and, in order to limit the conductor impedance under lightning conditions, unnecessary and especially sharp bends must be avoided.
Panel Meeting Action: Reject
Panel Statement: The terms "longer than necessary" and "unnecessary bends" are subjective and difficult to enforce in a consistent manner.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-205 Log #472 NEC-P05 **Final Action: Reject**
(Table 250.66)

Submitter: Michael Mercer, Electrical Workers - JATC - LU26
Recommendation: Revise text to read as follows:
Table 250.66 Grounding Electrode Conductor, Grounded Conductor, and Main Bonding Jumper for Alternating-Current Systems Size of Grounding Electrode Conductor, Grounded Conductor, and Main Bonding Jumper (AWG/kcmil).
Substantiation: Clarify the use, application and purpose of Table 250.66 MBJ size referred to Table 250.66 from 250.28(D). Grounded Conductor referred to Table 250.66 from 250.24(c)(1) Routing & Sizing.
Panel Meeting Action: Reject
Panel Statement: The title of the table is appropriate based on its location in the code. There are code rules that are clear where Table 250.66 is used for sizing conductors or jumpers other than grounding electrode conductors, but these rules also have additional provisions that require sizes that exceed the parameters of Table 250.66. The proposed text does not add clarity and could easily lead to confusion resulting in undersized grounded conductors, system bonding jumpers, and main bonding jumpers.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-206 Log #1724 NEC-P05 **Final Action: Reject**
(Table 250.66)

Submitter: Ronald E. Hackett, Village of Buffalo Grove / Rep. NE Surburban IAEI
Recommendation: Add new text as follows:
Table 250.66 Minimum Size Grounding Electrode Conductor for Alternating-Current Systems.
Substantiation: Article 250 includes two important tables concerning sizing a particular grounding conductor. Table 250.122 Minimum Size Equipment Grounding Conductors for Grounding Raceway and Equipment and Table 250.66 Grounding Electrode Conductors for Alternating-Current Systems. When we view the heading for Table 250.122, we know that this is the minimum size EGC. When we view the heading for Table 250.66, it does not specify minimum size GEC. Looking only at the table headings, one may ascertain that one table is the minimum size and the other is not. Therefore, is Table 250.66 the minimum or maximum GEC? There is confusion in the field. As an AHJ, I have been told repeatedly that Table 250.66 is the maximum size GEC or that a 3/0- kcmil conductor is the largest GEC ever required per NEC. Many code articles written on sizing the GEC tells the reader that the 3/0 copper conductor is the largest conductor ever required.
Please see the documentation I have provided.
Documentation No. 1.
A letter from an engineering firm indicating their position on sizing the GEC. This letter confirms the error that is made when applying Table 250.66. The letter goes on saying that Table 250.66 indicates the largest ground conductor to be 3/0. "We have done hundreds of jobs in the Chicago land area and across the country and to our knowledge this is the only community or state that has required a ground wire larger than 3/0".
Clarification of Table 250.66 is much needed. This documentation clearly shows confusion when applying Table 250.66. An engineering firm is designing the grounding electrode system based on their expertise that Table 250.66 is the maximum GEC. Their error is then translated to the electrician and inspector who will refer to the drawings during the construction of project. This has a twinkle down effect.
There is substantial documentation concerning accidents and equipment failures due to improper grounding. A function of the GEC is to provide a low-impedance connection from earth to the neutral as a return path for current. Connecting the electrical system to the earth helps to limit the voltage potential between the equipment and earth. Electrical equipment may be subjected to damage or danger from outside forces, such as lightning, line surges or inadvertent contact from high voltage to low voltage lines.
If the size of the grounding electrode conductor is taken as the maximum size required; the grounding electrode conductor may not be properly sized and, thus, may not be able to withstand the maximum current that may likely be imposed upon it. For safety, consistency, and clarification, the NEC must make it clear that Table 250.66 is the minimum size GEC and be consistent with the existing language already present in Table 250.122.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The title of the table is appropriate and is intended for grounding electrode conductors. The recommended text does not add clarity and the rules are found in Section 250.66, which requires the grounding electrode conductor to be sized not less than shown in Table 250.66. Several of the submitter's assertions on the function of the grounding electrode conductor are technically incorrect. The requirement of Section 250.66 and Table 250.66 is that 3/0 AWG copper or 250 kcmil aluminum is the largest size grounding electrode conductor required by the NEC.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
HARDING, G.: Continue to reject the proposal. The submitter has not provided any evidence of an actual problem or failure in the field. As indicated by the panel statement, the technical substantiation provided contains errors regarding the function of the grounding electrode conductor. The function of the equipment grounding conductor (Table 250.122) is not the same as the grounding electrode conductor (Table 250.66). There is no technical reason to have the language of the two tables match together.

5-207 Log #2769 NEC-P05 **Final Action: Reject**
(Table 250.66)

Submitter: Larry Cross, Local Union #98 IBEW
Recommendation: Add Notes to Table 250.66 as follows:
Note 3 250.24(C)(1) Grounded Conductor brought to service equipment routing and sizing.
Note 4 250.28(D)(1) Main bonding jumper and system bonding jumper size.
Note 5 250.30(A)(8)(a) Grounded conductor routing and sizing
Substantiation: The identification of the Grounded Conductor, the Main Bonding Jumper and the System Bonding Jumper is Non-Existent in the Table 250.66. This is a violation of the NEC Style Manual 3.3 Writing Style and 2.3 Table and Figures. The 3 Notes must be addressed and added to Table 250.66.
Panel Meeting Action: Reject
Panel Statement: The recommended notes do not provide clarity for code users. A user would have needed to review the referenced sections in order to be directed to the table. The panel concludes that the existing table is clear. The table is referenced in text conforming to Section 2.3.1 of the NEC Style Manual. There are current code rules that are clear where Table 250.66 is used for sizing conductors or jumpers other than grounding electrode conductors.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-208 Log #253 NEC-P05 **Final Action: Reject**
(Table 250.66 and Table 250.122)

Submitter: Jay L. Breneman, Netzsch Fine Particle Technology
Recommendation: Add new text as follows:
Change Table 250.66 Grounding Electrode Conductor for Alternating Current Systems to match Table 250.122 Minimum Size of Equipment Grounding Conductors for Grounding Raceway and Equipment.
Or err on the side of caution and have Table 250.122 values match Table 250.66.
Or a fine print note to explain the "why" of the different values of each table.
Substantiation: Using an example and the tables listed above will show the discrepancy in size from the Grounding Electrode Conductor and the Equipment Grounding Conductor.
A service entrance is protected with a single means of disconnect.
The service entrance conductors are copper, parallel 500 kcm per phase.
Using Table 250.66, the minimum size grounding electrode conductor should be 2/0 copper. Table 310.16 THHN, 75 deg. C column rates 2/0 copper at 175 Amps.
The service entrance disconnect rated at 800 Amps and feeds a distribution panel.
Using Table 250.122, the equipment grounding conductor for equipment protected at 800 Amps is 1/0 copper. Table 310.16 THHN, 75 deg. C column rates 1/0 copper at 150 Amps.
This is used to provide a ground path to earth ground which is the grounding electrode conductor.
Even using a larger service with a single means of disconnect to a distribution panel, the same discrepancy exists.
Using a 1800 Amp service, the service entrance conductors are 4 750 kcm per phase.
In this case, the Table 250.66 is not used, but the sum of the largest phase conductor times 12.5%.
This will equate to 3000 kcm ×.125 to equal 375 kcm. Since 375 kcm is not a standard wire size, the next highest size 400 kcm is used. Table 310.16 THHN, 75 deg. C column rates 400 kcm copper at 335 Amps.

Again, the service disconnect feeds a distribution panel, the value of the equipment grounding conductor per Table 250.122 is 250 kcm, using the value of 2000 Amps. Table 310.16 THHN, 75 deg. C column rates 250 kcm copper at 255 Amps.

The confusion is the grounding electrode conductor and service bonding jumper are larger than the equipment grounding conductor for the same size conductors feeding the service as well as feeding a distribution panel of the same amperage and conductors on the load side of the main service disconnect.

A fine print note explaining the difference in simple English may suffice. I cannot think of a logical reason for the difference in the "ground wire" sizes, as electricity will take the easiest path to ground as quick as it becomes available. If a smaller wire is sufficient in one table, why is it not sufficient to carry the same load to the grounding electrode, and be also used for the service entrance bonding jumper?

This confusion was noted at an NFPA 70 2008 Code update seminar during the discussion of Article 250. The instructors were very knowledgeable. However, the above question was posed when those in attendance were asked to do an example similar to the above examples. There was no good logical explanation for the difference in wire sizes. Those of us in the field need one.

Panel Meeting Action: Reject

Panel Statement: Tables 250.66 and 250.122 provide different sizing requirements that are related to the performance of various conductors of the grounding and bonding system depending on the location of overcurrent protective devices. Line-side conductors and jumpers are sized different than load-side because of conductor withstand capabilities and overcurrent protection clearing times. Substantiation has not been provided indicating that the minimum values in Table 250.122 are inadequate.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-209 Log #1723 NEC-P05 **Final Action: Reject**

(Table 250.66, FPNs No. 1 and 2 (New))

Submitter: Ronald E. Hackett, Village of Buffalo Grove / Rep. NE Surburban IAEI

Recommendation: Add new text as follows:

<u>FPN. No 1: 250.66 Table 250.66 is based on 100-foot runs. The National Electrical Code does not limit the length of a grounding electrode conductor. The length restrictions found in Article 800 is not applicable for a grounding electrode conductor.</u>

<u>FPN. No. 2: The grounding electrode conductor may be larger than the value found in table 250.66 due to the length of this conductor.</u>

Substantiation: Fine print notes assist the user of the NEC by providing helpful information concerning the interpretation of how to apply the NEC rules. Fine print notes also raise the level of awareness concerning a particular issue. This is evident when reading 310.10, FPN No. 2 of the 2005 NEC, 250.20(D), and FPN No. 1 and 800.100(4) FPN from 2008 NEC.

Whether it's guidance addressing the adverse effects on the conductors on rooftops where there is not enough reliable data at the time of print, or assistance on determining when an electrical system is separately derived. More specific, 800.100(4) FPN offers an awareness to why the grounding conductor for the primary protector is required to be as short as practicable. This fine print note makes an awareness and understanding to a grounding conductor's length. A precedent has been established. We need similar awareness for Table 250.66. Fact of the matter is that these fine print notes enhance or bring a higher level of awareness in applying NEC code requirements. A key point to make is, the fine print notes are not a design specification.

The purpose of the NEC per 90.1 is the practical safeguarding of persons and property from the hazards arising from the use of electricity. As one can see, the fine print notes listed above aid and assist the user of the NEC on achieving the objective of 90.1.

In order to apply Table 250.66, one should be made aware as to how the values shown are derived. This is the benchmark or foundation of this table. Confusion is present because the foundation of this table is unstable and not understood. This problem can be corrected by informing the user of the NEC that the table is based on 100-foot runs. Please note that the proposal is not asking for some kind of formula. Only making an important awareness as to the fact that this table is based on 100-foot runs.

With the tremendously important performance function of the grounding electrode conductor, additional clarification is required. In many applications per 250.52(A)(1) – (8), the only grounding electrode that is most commonly present in a building or structure is the metal underground water pipe. This includes new and existing installations. It may include a new electrical service or a separately derived system(s).

The problem that arises is that the existing metal underground water pipe may be hundreds of feet away. There is an erroneousness assumption that the grounding electrode conductor is required to be kept short in length. This assumption in part may be due to the grounding requirements found in Article 800. In this section, it is understood why the grounding conductor is required to be as short as possible.

It's not unrealistic to be confronted with a grounding electrode (metal pipe) over 400 feet away and the building steel/metal frame of the building within 25-feet of the equipment (electrical service or separately derived system(s)) that is to be grounded. Where the requirements found in 250.52(A)(2) are not met, one should not be using the metal frame of the building as a grounding electrode. Where this is proposed to be done or is already done, the only substantiation offered is that the metal frame of the building is closer. Grounding to the nearest building steel is still prevalent. The misconception is that building steel (not meeting the requirements of 250.52(A)(2) is a better grounding electrode than the metal underground pipe because it is closer. The NEC needs to make it clear that the code does not limit the length of a grounding electrode conductor.

In the NEC, Table 250.66 is used in determining the size of the GEC. For example, when you have over 1100 kcmil of conductors and the length of the GEC is over 400 ft. Table 250.66 shows a 3/0 copper conductor. The majority of the time, if not in all cases, a 3/0 -kcmil copper conductor or a 250- kcmil aluminum conductor is interpreted and communicated as to the largest GEC ever required by the NEC. As it is currently shown, some clarification is required in applying this table as intended. As an AHJ, I witness first hand the many, many misapplications of this table.

Is this 3/0 copper GEC going to provide a low impedance path in carrying out its performance function in relation to its length? Are we providing an inferior level of safety for equipment and personnel concerning the function and purpose of the grounding electrode? There is documentation concerning the safety aspect of this conductor.

Past NEC clarifications have had a positive effect on both the interpretation and the installation of the electrical system. For instance, Code Section, 250.50(A)(2) Metal Frame of Building or Structures. This section now provides guidelines for building steel concerning the grounding electrode system. With this helpful clarification, in the past or under earlier editions of the NEC the building steel was used for the grounding electrode system when it should not have been. This was a huge clarification for the purpose of safeguarding persons and property from potential hazards.

The guidelines make it clear when building steel can be used as a grounding electrode which should be differentiated from the grounding electrode conductor. The above proposal will help clarify this.

The evolution of the NEC depends on the code making process. This process involves the clarification to existing and new code requirements. The code making process is an on-going process. Clarifications found in the 2008 NEC will lead to additional clarifications in subsequent NEC editions. This all helps the usability of the code. The clarification may be in the form of a Fine print note or actual code language.

For many reasons, including safety and usability, the NEC needs to include the above mentioned proposal. The NEC should make aware that the GEC depending upon its length may be larger than the values shown in Table 250.66. If we adhere to the status quo, than Table 250.66 should read the Maximum Grounding Electrode Conductor for Alternating-Current Systems. If Table 250.66 is intended to be the minimum Grounding Electrode Conductor for Alternating-Current Systems, then it should be clearly stated on the heading of the table. In addition, the FPN should be added to address the length of the GEC in relation to the table. This would only bring awareness to an area that the NEC should not remain silent on. This proposal is not a design specification for there are different methods to install this conductor.

Please see the documentation I have provided.

<u>Document No. 1.</u>

A plan review response letter from an engineering firm (Name of firm withheld). The letter expresses their understanding of the NEC and more specifically 250.50 and 250.66. The letter explains their position on the GEC where the AHJ has increased the size of this conductor. The AHJ was requesting a larger GEC than specified due to the overall length of this conductor was shown to be 550 ft. The firm indicates in the letter that the largest size ground wire per NEC is a 3/0 copper conductor. "The sizing of these electrode conductors is based on Table 250.66 of the NEC which indicates the largest ground conductor to be 3/0."

I would ask, is this the intent of Table 250.66? At the very least, this firm indicates that they have done extensive work in the Chicago area and across the nation. This statement is an eye opener for misapplication of Table 250.66. This is a nation wide problem and not just a local issue. If the design engineers misinterpret Table 250.66, how can you expect the AHJs or electricians to understand it?

<u>Document No. 2.</u>

Soars Book on Grounding and Bonding, 9th Ed, pg. 129.

Over 100-foot Grounding Electrode Conductor.

Reading this information from Soars concerning a GEC over 100 ft, an understanding on where the sizes shown in Table 250.66 are derived. For example, looking at Table 250.66 and selecting a #8 copper wire. Applying information from the Soars, this # 8 copper conductor has a voltage drop of 30 volts. 16510 CirMils @ short time ratings of 391 amps and a dc resistance of.778 (stranded conductor) ohms for 100 ft, results in a voltage drop of 30 volts. As shown in Table 250.66, a # 8 copper conductor would be acceptable. This formula is applied for the remaining sizes shown in Table 250.66. At this time, Table 250.66 appears to be the largest GEC ever required. When using the NEC, there is a lack of awareness on the subject concerning a GEC over 100 ft.

The Soars Book has invaluable information on grounding and bonding. However, do all engineers, AHJs or electricians have access to this book? No, and this is the point. Most significantly, where a disagreement occurs in the plan review stage or in the field, our guidance must be sought through the NEC. This is the document that the installation is based on. This is the document that is accessible. When push comes to shove, an AHJ is not standing on solid ground when an attempt is made to reference the Soars Book because the NEC has no information on this topic. The NEC Handbook has no information on this.

Document No. 3.

Soars Book on Grounding and Bonding, 9th Ed, pg. 113.

Chapter 7, Grounding Electrode Conductors. The title page to this chapter indicates that GEC is not required to exceed 3/0 AWG copper or 250- kcmil aluminum. Again, this causes conflict. The person reading this sees that the GEC is not required to exceed 3/0 AWG copper. This is misleading and causes misapplication in the field where the GEC has a length longer than 100-ft.

Document No. 4.

An excerpt from an article from EC Magazine. This question was submitted during the 1999 NEC. The question concerns a GEC with a distance of 180 ft. The AHJ had requested a larger conductor then specified in Table 250.66.

The question was answered by explaining the information found in the Soars Book on the GEC over 100 ft. However, the referenced code sections shown at the bottom of the excerpt are really elusive and do not directly give you the correct code section. That is because; there is currently no code section. An AHJ has an obligation to present a code reference when called to do so.

In conclusion, in order to align the horse in front of the cart, a clarification in the form of awareness is very much needed. This question goes all the way back to the 1999 NEC. The result of this lack of information within the NEC on this topic is simple. The thinking in the field is, a 3/0 copper conductor is the largest conductor required, that's it. Think about it, this question goes all the way back to the 1999 NEC. It is time to address this subject. It has to be addressed in the NEC first and then educational materials or educational seminars can then follow. This will put the horse where it belongs, in front of the cart. At this time, the cart is in front of the horse.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 5-206.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-210 Log #559 NEC-P05 **Final Action: Reject**
(250.66(B))

Submitter: James W. Moore, Samaritan's Purse World Medical Mission, Gregory P. Bierals

Recommendation: Revise text to read as follows:

Where the grounding electrode conductor is connected to a concrete-encased electrode as permitted in 250.52(A)(3), that portion of the conductor that is the sole connection to the grounding electrode shall not be required to be larger than 4 AWG copper wire. This conductor shall be extended from this connection to an additional electrode(s) to protect the concrete from damage associated with ground-seeking current.

FPN: See IEEE F77-115-9.

Substantiation: Concrete footings may be damaged by lightning and other fault currents. Heat associated with these currents may cause the rapid expansion of moisture that has been absorbed by the concrete and possibly cause damage to the footing. The connection to the additional grounding electrode(s) will provide another path to the earth instead of flowing solely through the absorbed moisture.

Panel Meeting Action: Reject

Panel Statement: No substantiation has been provided to support revision or to indicate that concrete footings (concrete-encased electrodes) are being damaged by lightning events.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-211 Log #323 NEC-P05 **Final Action: Reject**
(250.66(D))

Submitter: Marc R. Hurwitz, James Posey Associates

Recommendation: Add new text to read as follows:

(D) No Larger than Ungrounded Conductors.

In no case shall the grounding electrode conductor be required to be larger than the ungrounded conductors for the AC system.

Substantiation: There is no purpose served by having the grounding electrode conductor be larger than the phase conductors. I run into this situation where I have a 9-KVA transformer providing power for a small 120/208-V load and use #10 conductors with a #8 grounding electrode conductor.

Panel Meeting Action: Reject

Panel Statement: Grounding electrode conductors are sometimes subject to stresses imposed by lightning or unintentional contact with higher voltage lines. The substantiation provided does not support that a reduced size grounding electrode conductor would be adequate when subject to those conditions warranting a change. This conductor has a different function than the circuit conductors.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-212 Log #4013 NEC-P05 **Final Action: Accept in Principle**
(250.68(C) (New))

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Add new text as follows:

(C)(C) Grounding Electrode Conductor and Bonding Jumper Connection Locations

Grounding electrode conductors and bonding jumpers shall be permitted to be connected to the following locations and be used to extend the connection to an electrode(s):

(1) Interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall not be used as a conductor to interconnect electrodes that are part of the grounding electrode system.

Exception: In industrial, commercial, and institutional buildings or structures where conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a conductor to interconnect electrodes that are part of the grounding electrode system, provided that the entire length, other than short sections passing perpendicularly through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.

(2) The structural frame of a building as follows:

(a) Connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or ground ring as provided in 250.52(A)(4)

(b) Bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(7) that comply with 250.56

(c) Other approved means of establishing a connection to earth

Substantiation: This text is being proposed as being deleted from 250.52 and relocated here because items that are not in the earth should not be considered to be electrodes but can be used as a conductor to create a path to the electrode.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(C) Grounding Electrode Conductor and Bonding Jumper Connection Locations.

Grounding electrode conductors and bonding jumpers shall be permitted to be connected at ~~to~~ the following locations and be used to extend the connection to an electrode(s):

(1) Interior metal water piping located not more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted to ~~not~~ be used as a conductor to interconnect electrodes that are part of the grounding electrode system.

Exception: In industrial, commercial, and institutional buildings or structures ~~where~~ if conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a bonding conductor to interconnect electrodes that are part of the grounding electrode system, or as a grounding electrode conductor, provided that the entire length, other than short sections passing perpendicularly through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.

(2) The structural frame of a building as follows:

(a) By connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or ground ring as provided in 250.52(A)(4)

(b) By bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(7) that comply with 250.56

(c) By other approved means of establishing a connection to earth

Revise the first sentence of Section 250.68(C) to read:

The connection of a grounding electrode conductor at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at a separately derived system and associated bonding jumper(s) shall be made as specified in 250.68(A) ~~and~~ through (~~B~~C).

Panel Statement: Editorial revisions have been made for clarity. The first sentence of Section 250.68 has been revised to reflect the added subdivision. See the panel action and statement on Proposal 5-170.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-213 Log #588 NEC-P05 **Final Action: Reject**
(250.70)

Submitter: Stephen Yates, Mesa, AZ

Recommendation: Add new text as follows:

250.70 – New wording not more than one conductor shall be connected to the grounding electrode by a single clamp or fitting unless the clamp is listed for multiple conductors.

Revise – not more than one conductor shall be connected to grounding electrode by a single clamp or mechanical lug or fitting unless the clamp or fitting is listed for multiple conductors.

Substantiation: Just because a mechanical lug is rated for example #6 thru 250 mcm, that is the size of wire it can accommodate not how may wires you can install in the same lug but not going over the total circular mills.

Panel Meeting Action: Reject

Panel Statement: The current requirement already specifies what is being recommended in the proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-214 Log #166 NEC-P05 **Final Action: Accept**
(250.70(3))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Change "telecommunications" to "communications".
Substantiation: Changing "telecommunications" to "communications" will correlate with Article 800, Communications Circuits.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-215 Log #2660 NEC-P05 **Final Action: Reject**
(250.71 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:

<u>250.XX IDENTIFICATION. Insulated or covered grounding electrode conductors installed in a cable tray and not in a raceway or cable armor, or installed in a raceway or other enclosure with other circuit conductors shall be identified by tagging or other effective means acceptable to the authority having jurisdiction at every point where the conductor is accessible. Where installed as part of an open wiring on insulators installation or open overhead spans other means of identification acceptable to the authority having jurisdiction shall be provided.</u>
<u>Exception: Identification shall not be required in conduit bodies that have no unused hubs.</u>

Substantiation: The Code does not prohibit installation in cable trays, raceways or enclosures with other conductors. Without identification a simple test can indicate it is a grounded circuit conductor and tapped as such.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation or field evidence of a problem was provided to require identification.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-216 Log #3400 NEC-P05 **Final Action: Reject**
(250.80)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:

250.80 Service Raceways and Enclosures. Metal enclosures and raceways for service<u>-entrance</u> conductors and equipment shall be connected to the grounded system conductor if the electrical system is grounded or to the grounding electrode conductor for electrical systems that are not grounded.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.
Service<u>-Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service<u>-entrance</u> conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 5-88.
Number Eligible to Vote: 16

WHITE, C.: See My Affirmative with Comment on 5-88.

5-222 Log #3542 NEC-P05 **Final Action: Accept**
(250.92(A))

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise text to read as follows:
(A) Bonding of Equipment for Services. The normally non–current-carrying metal parts of equipment indicated in ~~250.92~~(A)(1) and (A)(2) shall be bonded together.
(1) All ~~The~~ ~~service~~ raceways, cable trays, cablebus framework, auxiliary gutters, or service cable armor or sheath that enclose, contain or support service conductors except as permitted in 250.80 ~~250.84~~
(2) All ~~service~~ enclosures containing service conductors, including meter fittings, boxes, or the like, interposed in the service raceway or armor
Substantiation: The title is changed to recognize it is not the "service" that is required to be bonded but equipment for services. The word "normally" is proposed in (A) as the metal parts of equipment required to be bonded do not normally carry current but only during a ground-fault. Editorial changes are proposed for (A)(1) and (A)(2) and the reference is corrected to 250.80. The word "service" is proposed to be deleted in (A)(2) as it is not needed and is incorrect as self-contained meter fittings included in the list are not considered service equipment. See 230.66.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-223 Log #695 NEC-P05 **Final Action: Accept in Part**
(250.92(B))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
250.92 Services.
(A) Bonding of Services. *[unchanged by this Proposal]*
(B) Method of Bonding at the Service. Electrical continuity at service equipment, service raceways, and service conductor enclosures shall be ensured by one of the following methods:
(1) Bonding equipment to the grounded service conductor in a manner provided in 250.8
(2) Connections utilizing threaded couplings or threaded bosses on enclosures where made up wrenchtight
(3) Threadless couplings and connectors where made up tight for metal raceways and metal-clad cables
(4) Other listed devices, such as bonding-type locknuts, bushings, or bushings with bonding jumpers
Bonding jumpers meeting the other requirements of this article shall be used around oversized, concentric, or eccentric knockouts that are punched or otherwise formed so as to impair the electrical connection to ground. Standard locknuts or bushings shall not be the sole means for the bonding required by this section.
FPN: An example of an oversized knockout is a field-fabricated knockout where minor tool misalignment or tool drift during fabrication results in an enclosure or box hole larger than that permitted by the product Listing standard for a factory-fabricated knockout in Listed equipment.
Substantiation: As reflected in 250.97 Exception, 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C), oversized knockouts can also impair the electrical connection to ground, as can concentric and eccentric knockouts. Inclusion of oversized knockouts here provides consistency with these other requirements.
The FPN is added [as I am proposing separately for 250.97 Exception, 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C)] because "oversized knockouts" are not defined either dimensionally or descriptively, nor are they defined comparatively to standard, NON-oversized knockouts, which are also undefined dimensionally either directly in the *NEC*® or indirectly by reference to other standards.
Panel Meeting Action: Accept in Part
The panel accepts the addition of the word "oversized" in Section 250.92(B). The panel does not accept the recommended fine print note.

Panel Statement: The fine print note cites only one example of an oversized knockout, and other conditions exist under which an oversized knockout may occur.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-224 Log #3429 NEC-P05 **Final Action: Reject**
(250.92(B))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
250.92(B) Method of Bonding at the Service. Electrical continuity at service equipment, service raceways, and service-entrance conductor enclosures shall be ensured by one of the following methods:
(1) Bonding equipment to the grounded service-entrance conductor in a manner provided in 250.8 (The remainder of the text of 250.92(B) to remain unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 5-88.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
WHITE, C.: See My Affirmative with Comment on 5-88.

5-225 Log #3533 NEC-P05 **Final Action: Accept in Principle**
(250.92(B))

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise the existing text of the 2008 NEC as follows:
(B) Method of Bonding at the Service. Bonding jumpers meeting the requirements of this article shall be used around impaired connections such as reducing washers or concentric or eccentric knockouts. Standard locknuts or bushings shall not be the only means for the bonding required by this section but are permitted to be installed to make a mechanical connection of the raceway(s).
Electrical continuity at service equipment, service raceways, and service conductor enclosures shall be ensured by one of the following methods:
(1) Bonding equipment to the grounded service conductor in a manner provided in 250.8
(2) Connections utilizing threaded couplings or threaded hubs ~~bosses~~ on enclosures if ~~where~~ made up wrenchtight
(3) Threadless couplings and connectors if ~~where~~ made up tight for metal raceways and metal-clad cables
(4) Other listed devices, such as bonding-type locknuts, bushings, or bushings with bonding jumpers
~~Bonding jumpers meeting the other requirements of this article shall be used around concentric or eccentric knockouts that are punched or otherwise formed so as to impair the electrical connection to ground. Standard locknuts or bushings shall not be the sole means for the bonding required by this section.~~
Substantiation: It is proposed to reorganize this section to improve the syntax. The proposal also intends to simplify the requirements. Finally, the proposal intends to prevent reducing washers from being used at these connections of circular raceways containing service-entrance conductors without a positive bonding connection. Keep in mind, the conductors contained in these raceways do not have overcurrent protection and positive bonding is essential for safety. Electricians who have installed reducing washers recognize that they rarely make a reliable connection that is capable of carrying the fault current. No regulations exist in the NEC for installing reducing washers. For example, nothing in the NEC prevents them from being installed on top of concentric or eccentric knockouts or on top of painted surfaces. Section 250.12 does deal with connection surfaces as does 250.96(A).
It is proposed that the sentences on bonding jumpers and on standard locknuts be relocated for improved organization and readability.
Finally, the word “where” is being replaced with “if” where appropriate to comply with Section 3.3.4 of the NEC Style Manual.
Panel Meeting Action: Accept in Principle
Revise the first paragraph of the recommendation to read:
(B) Method of Bonding at the Service. Bonding jumpers meeting the requirements of this article shall be used around impaired connections such as reducing washers or oversized, concentric, or eccentric knockouts. Standard locknuts or bushings shall not be the only means for the bonding required by this section but shall be permitted ~~are~~ to be installed to make a mechanical connection of the raceway(s).
Accept the remainder of the recommendation.
Panel Statement: The panel action incorporates the action on Proposal 5-223. Editorial revisions have been made to comply with the NEC Style Manual.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-225a Log #CP507 NEC-P05 **Final Action: Accept**
(250.94)

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:
An intersystem bonding termination for connecting intersystem bonding and grounding electrode conductors required for other systems shall be provided external to enclosures at the service equipment and at the disconnecting means for any additional buildings or structures. The intersystem bonding termination shall be accessible for connection and inspection. The intersystem bonding termination shall have the capacity for connection of not less than three intersystem bonding conductors. The intersystem bonding termination device shall not interfere with opening a service or metering equipment enclosure. The intersystem bonding termination shall be one of the following:
Substantiation: The revision has been made to correlate with the deletion of the term “Grounding Conductor” in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term “grounding conductor” from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman’s report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term “grounding conductor.”

5-226 Log #2239 NEC-P05 **Final Action: Accept**
(250.94)

Submitter: Gregory J. Steinman, Thomas & Betts Corporation
Recommendation: Revise 250.94 as follows:
250.94 Bonding for Other Systems. An intersystem bonding termination for connecting intersystem bonding and grounding conductors required for other systems shall be provided external to enclosures at the service equipment or metering equipment enclosure and at the disconnecting means for any additional buildings or structures. The intersystem bonding termination shall be accessible for connection and inspection. The intersystem bonding termination shall have the capacity for connection of not less than three intersystem bonding conductors. The intersystem bonding termination device shall not interfere with opening a service or metering equipment enclosure. The intersystem bonding termination shall be one of the following:
(the remainder of article unchanged).

Substantiation: There has been some confusion that the intersystem bonding termination cannot be applied to a metering equipment enclosure since 230.66 states that individual meter socket enclosures shall not be considered service equipment.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DOBROWSKY, P.: Adding metering equipment enclosure is appropriate. The panel should make 250.142 Ex. match this language related to the use of the term "metering".

5-227 Log #3055 NEC-P05 **Final Action: Reject**
(250.94)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
250.94 Bonding for Other Systems.
An intersystem bonding termination for connecting intersystem bonding and grounding conductors required for other systems shall be provided external to enclosures <u>near</u> ~~at~~ the service equipment and at or <u>near</u> the disconnecting means for any additional buildings or structures.
<u>Exception: An intersystem bonding termination shall not be required for buildings or structures that do not require a grounding electrode system.</u>
The intersystem bonding termination shall be accessible for connection and inspection. The intersystem bonding termination shall have the capacity for connection of not less than three intersystem bonding conductors. The intersystem bonding termination device shall not interfere with opening a service or metering equipment enclosure. The intersystem bonding termination shall be one of the following:
(1) A set of terminals securely mounted <u>and electrically connected</u>, to the ~~to the meter enclosure and electrically connected to the~~ meter enclosure or <u>service equipment</u>. The terminals shall be listed as grounding and bonding equipment.
(2) A bonding bar near the service equipment enclosure, meter enclosure, or raceway for service conductors. The bonding bar shall be connected with a minimum 6 AWG copper conductor to an equipment grounding conductor(s) in the service equipment enclosure, meter enclosure, or exposed nonflexible metallic raceway.
(3) A bonding bar near the grounding electrode conductor. The bonding bar shall be connected to the grounding electrode conductor with a minimum 6 AWG copper conductor.
Exception: In existing buildings or structures where any of the intersystem bonding and grounding conductors required by 770.93, 800.100(B), 810.21(F), 820.100(B), 830.100(B) exist, installation of the intersystem bonding termination is not required. An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be permitted at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:
(1) Exposed nonflexible metallic raceways
(2) An exposed grounding electrode conductor
(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment
FPN No. 1: Text to remain unchanged.
FPN No. 2: Text to remain unchanged.
Substantiation: CMP-5 did the industry a great service in revising 250.94 for the last code cycle. A few questions that come up, however, are:
1) Does every building need the termination, and
2) Can the termination be at the meter or at the disconnect (refer to Article 100 for the confusion).
This proposal is intended to answer these questions. A correlating proposal to the Article 100 definition of the Intersystem Bonding Termination will be made to address the meter vs. disconnect issue.
Panel Meeting Action: Reject
Panel Statement: The word "near" is identified as a word that should not be used based on the NEC Style Manual. It is subjective and leads to inconsistent enforcement. The proposed exception should not be accepted because the exception in 250.32 could be modified by the requirements in Chapter 8 to install an electrode where one does not exist for use with limited energy systems in or on the separate building or structure. This could happen even if only one branch circuit is supplying the building or structure. See the panel action on Proposal 5-226.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-228 Log #3621 NEC-P05 **Final Action: Reject**
(250.94)

Submitter: David A. Williams, Delta Township
Recommendation: Revise text to read as follows:
The intersystem bonding termination shall be <u>on the exterior side of the building and be</u> one of the following:
Substantiation: The termination of the intersystem bonding needs to be on the outside of the building because most communication companies, cable TV companies, and dish installers do not go into the home. Their point of demarcation ends outside of the building. If a provision for this termination is not on the outside of the building. it may not get connected.
Panel Meeting Action: Reject
Panel Statement: There are many installations where the telephone and cable service demarcation points are inside the building or structure served. There is no technical substantiation to require the intersystem bonding terminal to always be installed outside.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-229 Log #3861 NEC-P05 **Final Action: Reject**
(250.94)

Submitter: Mike Theisen, Midwestern Electrical Seminars
Recommendation: Revise text as follows:
250.94 Bonding for Other System. An intersystem bonding termination for connecting intersystem bonding and grounding conductors required for other systems shall be provided external to enclosures at the service equipment <u>in a building</u> and at the disconnecting means for any additional buildings ~~or structures~~. The intersystem bonding termination shall be accessible for connection and inspection. The intersystem bonding termination shall have the capacity for connection of not less than three intersystem bonding conductors. The intersystem bonding termination device shall not interfere with opening a service or metering equipment enclosure. The intersystem bonding termination shall be one of the following:
Substantiation: The addition of 'in a building' adds a condition to when a service installation requires the intersystem bonding termination. A free standing outdoor service is a structure that has no need for CATV etc. By deleting the term 'structure', the intersystem bonding termination will not be required at a structure. A roadside billboard is a structure, a grain bin is a structure, and a backboard for an RV service is a structure. Buildings are the most likely locations to be served by CATV, telephone, or fire alarm systems and should be the only locations requiring the intersystem bonding termination.
Panel Meeting Action: Reject
Panel Statement: There are many structures that have multiple services of power and communications equipment. The intersystem bonding terminal does not need to always be in the building.
Structures such as billboards may well have multiple systems feeding them such as electric power for display, telephone, or optical fiber telecommunications lines to communicate and change message, antenna systems for wireless communications, CCTV surveillance, and security systems. For such systems appropriate intersystem bonding is required. See the panel action and statement on Proposal 5-228.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-230 Log #1115 NEC-P05 **Final Action: Accept in Principle**
(250.94 FPN No. 2)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise the text as follows:
FPN No. 2: See 800.100, 810.21, ~~and~~ 820.100<u>, and 830.100</u> for <u>intersystem</u> bonding and grounding requirements for communications circuits, radio and television equipment, ~~and~~ CATV circuits<u>, and network-powered broadband communications systems</u>.
Substantiation: The reference to 830 should be added as it is part of the communications articles of Chapter 8. It apparently was not picked up when 830 was added a number of revision cycles ago. The addition of the term "intersystem" is appropriate as it is intersystem bonding and grounding that is the subject of 250.94.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-232 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-230a Log #CP508 NEC-P05 **Final Action: Accept**
(250.94 Exception)

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:
Exception: In existing buildings or structures where any of the intersystem bonding and grounding <u>electrode</u> conductors required by 770.93, 800.100(B), 810.21(F), 820.100(B), 830.100(B) exist, installation of the intersystem bonding termination is not required. An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be permitted at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:
(1) Exposed nonflexible metallic raceways
(2) An exposed grounding electrode conductor
(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding <u>electrode</u> conductor to the grounded raceway or equipment.

Substantiation: The revisions have been made to correlate with the deletion of the term "Grounding Conductor" in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-231 Log #1114 NEC-P05 **Final Action: Accept in Principle**
(250.94 Exception)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise text as follows:
"*Exception: In existing buildings or structures where any of the intersystem bonding and grounding ~~conductors~~ means required by ~~770.93~~ 770.100(B)(2), 800.100(B)(2), 810.21(F)(2), 820.100(B)(2), 830.100(B)(2) exist, installation of the intersystem bonding termination is not required. An accessible means external …*".
Substantiation: The term "bonding and grounding 'means'" is appropriate in this context to correlate with the title of 770.100(B)(2), 800.100(B)(2), 810.21(F)(2), 820.100(B)(2) and 830.100(B)(2). Certain of the items contained in these sections, e.g., structure grounding electrode system, metallic service raceway, are not 'conductors', i.e., in the sense of a wire, but a conductive means to achieve intersystem bonding and grounding. The revised references reflect revisions made to 770, 800.100, 810.21(F), 820.100 and 830.100 during the 2008 revision cycle.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-232 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-232 Log #185 NEC-P05 **Final Action: Accept in Principle**
(250.94 Exception and FPN No 2)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
Exception: In existing buildings or structures where any of the intersystem bonding and grounding conductors required by 770.100(B)~~770.93~~, 800.100(B), 810.21(F), 820.100(B), 830.100(B) exist, installation of the intersystem bonding termination is not required. An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be permitted at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:
(1) Exposed nonflexible metallic raceways
(2) An exposed grounding electrode conductor
(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment.
FPN No. 1: A 6 AWG copper conductor with one end bonded to the grounded nonflexible metallic raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means covered in 250.94, Exception item (3).
FPN No. 2: See 770.100, 800.100, 810.21, ~~and~~ 820.100 and 830.100 for bonding and grounding requirements for conductive optical fiber cables, communications circuits, radio and television equipment, and CATV circuits.
Substantiation: In the 2008 NEC, CMP 16 established grounding requirements for Article 770 in new section 770.100(B). 770.100(B) has the same requirements as 800.100(B), 820.100(B) and 830.100(B).
Panel Meeting Action: Accept in Principle
Revise 250.94 Exception and FPN No. 2 as follows:
Exception: In existing buildings or structures where any of the intersystem bonding and grounding ~~conductors~~ means required by ~~770.93~~ 770.100(B)(2), 800.100(B)(2), 810.21(F)(2), 820.100(B)(2), 830.100(B)(2) exist, installation of the intersystem bonding termination is not required. An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be permitted at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:
(1) Exposed nonflexible metallic raceways
(2) An exposed grounding electrode conductor
(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment
FPN No. 1: Text to remain unchanged.
FPN No. 2: See 770.100, 800.100, 810.21, ~~and~~ 820.100 and 830.100 for intersystem bonding and grounding requirements for conductive optical fiber cables, network-powered broadband communications systems communications circuits, radio and television equipment, and CATV circuits.
Panel Statement: The panel accepts the recommendation and has incorporated the recommendations from Proposals 5-230 and 5-231. This action also revises code references to be more precise.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-233 Log #2759 NEC-P05 **Final Action: Accept in Principle**
(250.94(1))

Submitter: Rich Wolfe, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
(1) A set of terminals securely mounted and bonded to the meter ~~enclosure~~ or service equipment enclosure ~~and electrically connected to the meter enclosure.~~ The terminals shall be listed as grounding and bonding equipment.
Substantiation: This proposal would allow the grounding bar or listed equipment to be used on both meter and service equipment enclosures. Changing electrically connected to bonded, eliminates the interpretation that an additional connection would have to be made to meet this requirement. The listed set screw type of bar that is being used on meter enclosures is not electrically connected, but actually bonded.
Panel Meeting Action: Accept in Principle
Revise the Section 250.94(1) to read:
(1) A set of terminals securely mounted and electrically connected to the meter enclosure or service equipment enclosure. The terminals shall be listed as grounding and bonding equipment.
Panel Statement: The panel action clarifies the point of connection for the intersystem bonding termination.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-234a Log #CP509 NEC-P05 **Final Action: Accept**
(250.96(A))

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:
(A) General. Metal raceways, cable trays, cable armor, cable sheath, enclosures, frames, fittings, and other metal non–current-carrying parts that are to serve as <u>equipment</u> grounding conductors, with or without the use of supplementary equipment grounding conductors, shall be bonded where necessary to ensure electrical continuity and the capacity to conduct safely any fault current likely to be imposed on them. Any nonconductive paint, enamel, or similar coating shall be removed at threads, contact points, and contact surfaces or be connected by means of fittings designed so as to make such removal unnecessary.
Substantiation: The revision has been made to correlate with the deletion of the term "Grounding Conductor" in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term "grounding conductor" from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman's report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term "grounding conductor."

5-235 Log #2010 NEC-P05 **Final Action: Reject**
(250.97)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: For circuits over 250 volts, the electrical continuity of metal raceways, metal enclosures, and cables with metal coverings that contain conductors other than service conductors shall be provided by one or more of the methods specified for services in 250.92(B) except for (B)(1). Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where all segments of a knockout are removed and reducing washers are not used, the following methods shall be permitted:
(1) Couplings and connectors identified for the use.
(2) Two locknuts for metal raceways or metal covered cable connectors, one inside and one outside of boxes, cabinets, and other enclosures.
Substantiation: "To ground" is superfluous; since the definition of voltage to ground includes grounded and ungrounded systems. The provision should include enclosures which are not raceways or cables. "Sheath" implies other types of metal coverings are not included. Listed fittings and bonding are already covered in this article; this provision is an exception to such.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided for deleting the provision for listed boxes where the concentric or eccentric knockouts are listed for grounding and bonding over and under 250 volts. The intent of this section is to cover systems operating over 250 volts to ground.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-236 Log #3428 NEC-P05 **Final Action: Reject**
(250.97)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
250.97 Bonding for Over 250 Volts. For circuits of over 250 volts to ground, the electrical continuity of metal raceways and cables with metal sheaths that contain any conductor other than service<u>-entrance</u> conductors shall be ensured by one or more of the methods specified for services in 250.92(B), except for (B)(1).
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.
Service<u>-Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service<u>-entrance</u> conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

WHITE, C.: See My Affirmative with Comment on 5-88.

5-237 Log #696 NEC-P05 **Final Action: Reject**
(250.97 Exception)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
250.97 Bonding for Over 250 Volts.
For circuits of over 250 volts to ground, the electrical continuity of metal raceways and cables with metal sheaths that contain any conductor other than service conductors shall be ensured by one or more of the methods specified for services in 250.92(B), except for (B)(1).
Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where a box or enclosure with concentric or eccentric knockouts is listed to provide a reliable bonding connection, the following methods shall be permitted:
(1) Threadless couplings and connectors for cables with metal sheaths
(2) Two locknuts, on rigid metal conduit or intermediate metal conduit, one inside and one outside of boxes and cabinets
(3) Fittings with shoulders that seat firmly against the box or cabinet, such as electrical metallic tubing connectors, flexible metal conduit connectors, and cable connectors, with one locknut on the inside of boxes and cabinets
(4) Listed fittings
<u>FPN: An example of an oversized knockout is a field-fabricated knockout where minor tool misalignment or tool drift during fabrication results in an enclosure or box hole larger than that permitted by the product Listing standard for a factory-fabricated knockout in Listed equipment.</u>
Substantiation: Requirements in existing 250.97 Exception and requirements added to the 2008 *NEC*® in 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C) are predicated upon whether or not the knockout opening is oversized or not. "Oversized knockouts", however, are not defined either dimensionally or descriptively, nor are they defined comparatively to standard, NON-oversized knockouts, which are also undefined dimensionally either directly in the *NEC*® or indirectly by reference to other standards.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 5-223.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

Ballot Results: Affirmative: 16

5-240 Log #3530 NEC-P05 **Final Action: Accept in Principle**
(250.102)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal in accordance with 3.2.3 of the NEC Style Manual related to the use of acronyms.
This action will be considered by the panel as a public comment.
Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise text to read as follows:
250.102 ~~Equipment~~ Bonding Jumpers.
(A) Material. ~~Equipment~~ Bonding jumpers shall be of copper or other corrosion-resistant material. A bonding jumper shall be a wire, bus, screw, or similar suitable conductor.
(B) Attachment. ~~Equipment~~ Bonding jumpers shall be attached in the manner specified by the applicable provisions of 250.8 for circuits and equipment and by 250.70 for grounding electrodes.
(C) Size — ~~Equipment~~ Bonding Jumper on Supply Side of Service. The bonding jumper shall not be smaller than the sizes shown in Table 250.66 for grounding electrode conductors. If ~~Where~~ the service-entrance phase conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area not less than 12½ percent of the area of the largest set of phase conductors except that, if ~~where~~ the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors. If ~~Where~~ the service-entrance conductors are paralleled in two or more raceways or cables, the equipment bonding jumper, where routed with the raceways or cables, shall be installed ~~run~~ in parallel. The size of the bonding jumper for each raceway or cable shall be based on the size of the service-entrance conductors in each raceway or cable.
(D) Size — Equipment Bonding Jumper on Load Side of Service. The equipment bonding jumper on the load side of the service overcurrent devices shall be sized, as a minimum, in accordance with the sizes listed in Table 250.122, but shall not be required to be larger than the largest ungrounded circuit conductors supplying the equipment and shall not be smaller than 14 AWG.
A single common continuous equipment bonding jumper shall be permitted to connect two or more raceways or cables if ~~where~~ the bonding jumper is sized in accordance with Table 250.122 for the largest overcurrent device supplying circuits therein.
(E) Installation. ~~The equipment~~ Bonding jumpers or conductors and equipment bonding jumpers shall be permitted to be installed inside or outside of a raceway or enclosure.
(1) Inside a Raceway or Enclosure. If installed inside a raceway, equipment bonding jumpers and bonding jumpers or conductors shall comply with the requirements of 250.119 and 250.148.
(2) Outside a Raceway or Enclosure. If ~~Where~~ installed on the outside, the length of the bonding jumper or conductor or equipment bonding jumper shall not exceed 1.8 m (6 ft) and shall be routed with the raceway or enclosure. ~~Where installed inside a raceway, the equipment bonding jumper shall comply with the requirements of 250.119 and 250.148.~~
Exception: An equipment bonding jumper longer than 1.8 m (6 ft) shall be permitted at outside pole locations for the purpose of bonding or grounding isolated sections of metal raceways or elbows installed in exposed risers of metal conduit or other metal raceway and for bonding grounding electrodes and shall not be required to be routed with a raceway or enclosure.
(3) Protection. Bonding jumpers or conductors and equipment bonding jumpers shall be installed in accordance with 250.64(A) and (B).
Substantiation: The requirements are proposed to be converted to list format for user friendliness. They are being re-organized to allow the exception to modify the portion of the rules it relates to.
The word "equipment" is proposed to be deleted as needed to comply with the definition of "Bonding Jumper" and "Equipment Bonding Jumper" in Article 100. Essentially, bonding jumpers or conductors are installed on the line or supply side of an overcurrent device and are sized on the basis of 250.102(C). Equipment bonding jumpers complete the equipment grounding conductor path and are installed on the load side of the overcurrent device and are sized on the basis of Table 250.122 and 250.102(D).
Bonding jumpers or conductors are also installed for the purpose of bonding grounding electrode conductors as required in 250.50 and covered in 250.53(C). These conductors may easily be longer than 6 ft. Articles 800, 810, 820, and 830 provide for the installation of a grounding electrode remote from the grounding electrode(s) for the power and lighting service. Should this be done, these Articles require that the communications system grounding electrode be bonded to the grounding electrode system for the electrical service. These bonding conductors are typically 20 ft or more in length. Bonding conductors installed outside the protection of a raceway or enclosure must be protected identically to the grounding electrode conductors as provided in 250.64(B).
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
(A) Material. ~~Equipment~~ Bonding jumpers shall be of copper or other corrosion-resistant material. A bonding jumper shall be a wire, bus, screw, or similar suitable conductor.
(B) Attachment. ~~Equipment~~ Bonding jumpers shall be attached in the manner specified by the applicable provisions of 250.8 for circuits and equipment and by 250.70 for grounding electrodes.
(C) Size — ~~Equipment~~ SSBJ ~~Bonding Jumper~~ on Supply Side of an Overcurrent Device ~~Service~~. The SSBJ ~~bonding jumper~~ shall not be smaller than the sizes shown in Table 250.66 for GEC ~~grounding electrode conductors~~. If ~~Where~~ the ungrounded supply ~~service-entrance phase~~ conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the SSBJ ~~bonding jumper~~ shall have an area not less than 12½ percent of the area of the largest set of ungrounded supply ~~phase~~ conductors. ~~except that,~~ If ~~where~~ the ungrounded ~~phase~~ supply conductors and the SSBJ ~~bonding jumper~~ are of different materials (copper or aluminum), the minimum size of the SSBJ ~~bonding jumper~~ shall be based on the assumed use of ungrounded ~~phase~~ conductors of the same material as the SSBJ ~~bonding jumper~~ and with an ampacity equivalent to that of the installed ungrounded supply ~~phase~~ conductors. If ~~Where~~ the ungrounded supply ~~service-entrance~~ conductors are paralleled in two or more raceways or cables, the SSBJ ~~equipment bonding jumper~~, if ~~where~~ routed with the raceways or cables, shall be installed ~~run~~ in parallel. The size of the SSBJ ~~bonding jumper~~ for each raceway or cable shall be based on the size of the ungrounded supply ~~service-entrance~~ conductors in each raceway or cable.
(D) Size — Equipment Bonding Jumper on Load Side of an Overcurrent Device ~~Service~~. The equipment bonding jumper on the load side of an ~~the service~~ overcurrent device(s) shall be sized ~~as a minimum,~~ in accordance with ~~the sizes listed in Table~~ 250.122. ~~but shall not be required to be larger than the largest ungrounded circuit conductors supplying the equipment and shall not be smaller than 14 AWG.~~
A single common continuous equipment bonding jumper shall be permitted to connect two or more raceways or cables if ~~where~~ the bonding jumper is sized in accordance with ~~Table~~ 250.122 for the largest overcurrent device supplying circuits therein.
(E) Installation. ~~The equipment~~ Bonding jumpers or conductors and equipment bonding jumpers shall be permitted to be installed inside or outside of a raceway or enclosure.
(1) Inside a Raceway or Enclosure. If installed inside a raceway, equipment bonding jumpers and bonding jumpers or conductors shall comply with the requirements of 250.119 and 250.148.
(2) Outside a Raceway or Enclosure. If ~~Where~~ installed on the outside, the length of the bonding jumper or conductor or equipment bonding jumper shall not exceed 1.8 m (6 ft) and shall be routed with the raceway or enclosure. ~~Where installed inside a raceway, the equipment bonding jumper shall comply with the requirements of 250.119 and 250.148.~~
Exception: An equipment bonding jumper or SBBJ longer than 1.8 m (6 ft) shall be permitted at outside pole locations for the purpose of bonding or grounding isolated sections of metal raceways or elbows installed in exposed risers of metal conduit or other metal raceway and for bonding grounding electrodes and shall not be required to be routed with a raceway or enclosure.
(3) Protection. Bonding jumpers or conductors and equipment bonding jumpers shall be installed in accordance with 250.64(A) and (B).
Panel Statement: The revisions to the recommendation have been made to incorporate the new terminology introduced by the panel action on Proposal 5-5. Other editorial revisions have been made to improve clarity. The recommendation of Proposal 5-245 has been incorporated into the panel action on Section 250.102(D) in this proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
MOHLA, D.: The title as proposed is misleading and should read "Bonding Jumper on Supply side of Overcurrent device"
As amended, the new title reads "SSBJ on Supply Side of an Overcurrent Device". and, it will be read as " *Supply Side* Bonding Jumper on the *Supply side* of Overcurrent Protection device.
It implies that SSBJ can also be used on the load side of an overcurrent device. "Section 250.102(C) also uses the acronym "SSBJ" which is defined only once in 250.30(A)(2). Use of the acronym is a new practice and will confuse the readers and reduce usability until the acronym is in general use by the industry. This may take several Code cycles. Until then, the acronym as well as the full name should be included the first time it is used at each and every new place."

5-241 Log #1273 NEC-P05 **Final Action: Reject**
(250.102(C))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:
250.102(C) Add FPN following 250.102(C)
FPN: For sizing of the equipment bonding jumper for metallic raceways that enclose the grounding electrode conductor this section may need to be modified by 250.64(E).
Substantiation: When the grounding electrode conductor (GEC) is run with the service conductors between for example a meter base and the service disconnect means, a metallic raceway shall be bonded to the GEC on both ends of the raceway per 250.64(E). I have made this error and I am sure others have as well. It may not be caught every time, but this reminder may help the journeyman and authority having jurisdiction.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the recommended text does not improve understanding of this requirement.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-242 Log #3056 NEC-P05 **Final Action: Accept in Principle in Part**
(250.102(C))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(C) Size — Equipment Bonding Jumper on Supply Side of Service. The bonding jumper shall not be smaller than the sizes shown in Table 250.66 for grounding electrode conductors. Where the service-entrance ~~phase~~ ungrounded conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area not less than 12½ percent of the area of the largest ~~phase~~ ungrounded conductor except that, where the ~~phase~~ ungrounded conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of ~~phase~~ ungrounded conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed ~~phase~~ ungrounded conductors.
Where the service-entrance conductors are paralleled in two or more raceways or cables, the equipment bonding jumper, where routed with the raceways or cables, shall be permitted to be run in parallel. The size of the bonding jumper for each raceway or cable shall be based on the size of the ungrounded service-entrance conductors in each raceway or cable. A single common continuous equipment bonding jumper shall also be permitted to connect two or more raceways or cables.
Substantiation: This proposal is intended to allow the very common violation of using a single bonding jumper to bond multiple raceways on the supply side of the service. It borrows language from 250.102(D), where this practice is already permitted. The proposal also changes the word "phase conductors" in a few locations to the term "ungrounded conductors", so that the defined terms of Article 100 are used in this code rule. This proposal also breaks the text up into two paragraphs for ease of reading.
Panel Meeting Action: Accept in Principle in Part
The recommendation to replace "phase" with "ungrounded" is accepted and occurs through the panel action on Proposal 5-240. The remainder of the recommendation is rejected.
Panel Statement: The provision recommended as the last sentence of this section is not prohibited by the current requirement.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-243 Log #3752 NEC-P05 **Final Action: Accept in Principle**
(250.102(C))

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise 250.102(C) as shown:
(C) Size — Equipment Bonding Jumper on Supply Side of Service or Separately Derived System. The bonding jumper shall not be smaller than the sizes shown in Table 250.66 for grounding electrode conductors. Where the ~~service-entrance~~ phase conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area not less than 12½ percent of the area of the largest phase conductor except that, where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors. Where the ~~service-entrance~~ conductors are paralleled in two or more raceways or cables, the equipment bonding jumper, where routed with the raceways or cables, shall be run in parallel. The size of the bonding jumper for each raceway or cable shall be based on the size of the ~~service-entrance~~ largest phase conductor~~s~~ in each raceway or cable.
Substantiation: This proposal is to clean up some wording in 250.102(C) and remove the confusion created by referencing "service entrance conductors" throughout the text. 250.30(A)(2) sends the user to 250.102(C) for sizing of the equipment bonding jumper that may be installed between the separately derived system source and the first disconnecting means. However, the current text of 250.102(C) discusses only service entrance conductors in its text.
The recommended revisions will add separately derived systems to the title. In addition, the deletion of "service entrance" in three places in the text will make the text applicable to "phase conductors" which will cover both the service application and the separately derived system application.
Lastly, it is recommended that the last sentence reference the "largest phase" conductor with respect to sizing. This will cover a situation where there may be more feeder in the conduit.
Panel Meeting Action: Accept in Principle
The panel action on Proposal 5-240 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-244 Log #4014 NEC-P05 **Final Action: Accept in Principle**
(250.102(C))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read as follows:
(C) Size — Equipment Bonding Jumper on Supply Side of ~~Service~~ an Overcurrent Device. The bonding jumper shall not be smaller than the sizes shown in Table 250.66 for grounding electrode conductors. Where the ~~service-entrance~~ supply phase conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area not less than 12½ percent of the area of the largest phase conductor except that, where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors. Where the ~~service entrance~~ supply conductors are paralleled in two or more raceways or cables, the equipment bonding jumper, where routed with the raceways or cables, shall be run in parallel. The size of the bonding jumper for each raceway or cable shall be based on the size of the service-entrance conductors in each raceway or cable.
Substantiation: This section is referenced in other parts of the NEC that are not for service conductors such as 250.30(A)(2). The language has been modified to improve usability and add clarity. The sizing criteria is the same for services which are on the line side of the overcurrent device as they are for separately derived system secondary conductors.
Panel Meeting Action: Accept in Principle
The panel action on Proposal 5-240 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-245 Log #3057 NEC-P05 **Final Action: Accept in Principle**
(250.102(D))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(D) Size — Equipment Bonding Jumper on Load Side of Service. The equipment bonding jumper on the load side of the service overcurrent devices shall be sized~~, as a minimum,~~ in accordance with ~~the sizes listed in Table~~ 250.122.~~, but shall not be required to be larger than the largest ungrounded circuit conductors supplying the equipment and shall not be smaller than 14 AWG.~~
A single common continuous equipment bonding jumper shall be permitted to connect two or more raceways or cables where the bonding jumper is sized in accordance with ~~Table~~ 250.122 for the largest overcurrent device supplying circuits therein.
Substantiation: Referring the code user to *Table* 250.122 inadvertently prohibits the allowances (or requirements) of *section* 250.122. The sentence that the proposal deletes appears to have been included in this section to address this concern, but the concern is easier addressed by not referring directly to the code table.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended text has been incorporated into the panel action on Section 250.102(D) in Proposal 5-240.
Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-249 Log #3058 NEC-P05 **Final Action: Reject**
(250.104)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
250.104 Bonding of Piping Systems and Exposed Structural Steel.
(A) Metal Water Piping. The metal water piping system shall be bonded as required in (A)(1), (A)(2), or (A)(3) of this section. The bonding jumper(s) shall be installed in accordance with 250.64(A) and~~,~~ (B)~~, and (E)~~. The points of attachment of the bonding jumper(s) shall be accessible.
(1) General. Metal water piping system(s) installed in or attached to a building or structure shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with ~~Table 250.66~~ 250.122 based on the largest overcurrent device serving the building or structure, except as permitted in 250.104(A)(2) and (A)(3).
(2) Text remains unchanged
(3) Multiple Buildings or Structures Supplied by a Feeder(s) or Branch Circuit(s). The metal water piping system(s) installed in or attached to a building or structure shall be bonded to the building or structure disconnecting means enclosure where located at the building or structure, to the equipment grounding conductor run with the supply conductors, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with ~~250.66~~, 250.122 based on the largest overcurrent device serving the building or structure. ~~size of the feeder or branch circuit conductors that supply the building. The bonding jumper shall not be required to be larger than the largest ungrounded feeder or branch circuit conductor supplying the building.~~
(B) Text remains unchanged.
FPN: Text remains unchanged.
(C) Structural Metal. Exposed structural metal that is interconnected to form a metal building frame and is not intentionally grounded and is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with ~~Table 250.66~~ 250.122 based on the largest overcurrent device serving the building or structure. The bonding jumper shall be ~~and~~ installed in accordance with 250.64(A)~~,~~ and (B)~~, and (E)~~. The points of attachment of the bonding jumper(s) shall be accessible.
(D) Separately Derived Systems. Metal water piping systems and structural metal that is interconnected to form a building frame shall be bonded to separately derived systems in accordance with (D)(1) through (D)(3).
(1) Metal Water Piping System(s). The grounded conductor of each separately derived system shall be bonded to the nearest available point of the metal water piping system(s) in the area served by each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with ~~Table 250.66~~ 250.122 based on the largest overcurrent device installed on the separately derived system. ~~ungrounded conductor of the separately derived system.~~
Exception No. 1: Text remains unchanged. Exception No. 2: Text remains unchanged.
(2) Structural Metal. Where exposed structural metal that is interconnected to form the building frame exists in the area served by the separately derived system, it shall be bonded to the grounded conductor of each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with ~~Table 250.66~~ 250.122 based on the largest overcurrent device installed on the separately derived system. ~~ungrounded conductor of the separately derived system.~~
Exception No. 1: Text remains unchanged.
Exception No. 2: Text remains unchanged.
(3) Text remains unchanged.
Exception: Text remains unchanged.
Substantiation: Throughout the code, grounding conductors that are intended to establish a connection to earth are sized in accordance with 250.66. Bonding conductors (or equipment grounding conductors) that are intended to create an effective ground fault current path are sized to 250.122. If the water and/or structural metal is not being used as a grounding electrode (which is the case in 250.104), the conductor that connects to them should be sized per 250.122, not 250.66, because this conductor is intended to create an effective ground fault current path, it is not intended to create a connection to earth. It seems that this section already realizes this concept in 250.104(A)(2) for multiple occupancy buildings, but it then disagrees with itself in the rest of the section’s text.
Lastly, this proposal deletes the requirement to comply with 250.64(E). The requirement of 250.64(E) is intended to apply to conductors that make a connection to earth. The conductor discussed in this section does not establish such a connection.
Panel Meeting Action: Reject
Panel Statement: The sizing requirements in 250.104(A) and (C) provide adequate sizing should the building or structure be supplied by a utility service at a later date. This requirement correlates with the requirements for building disconnects to be suitable for use as service equipment even when supplied by a feeder or branch circuit as specified in Article 225. The substantiation for this significant change is inadequate. By this change water piping and structure metal would require a 750 kcmil copper conductor where the largest overcurrent device in the building is 4000 Amps. There was no evidence provided that present code sizing is inadequate to provide an equalizing voltage path between the water pipe and structural metal conductive surfaces to the electrical system.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-250 Log #3576 NEC-P05 **Final Action: Reject**
(250.104(A))

Submitter: George M. Stolz, II, Pierce, CO
Recommendation: Add new text as follows:
For the purposes of this section, a metal water piping system shall be any metal piping containing water for domestic, fire suppression or other use that is 25 ft or more in length, which is accessible without disturbing the building finish.
Substantiation: The main objective of this proposal is clarity, and an attempt to spur the panel into providing us with some definition of what they consider a “metal water piping system.” How much pipe must be in place for us to worry about bonding it? An isolated manifold in a PEX system? Half of a house separated from the service by a PVC coupling repair? Enforcement of this section is wildly sporadic, due to the different views left open by the lack of a definition. A definition is needed to provide more uniform enforcement and understanding of these requirements in the NEC.
Panel Meeting Action: Reject
Panel Statement: The 25 ft parameter in the recommendation is not technically substantiated.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-251 Log #3740 NEC-P05 **Final Action: Reject**
(250.104(B))

Submitter: Robert Torbin, Cutting Edge Solutions, LLC
Recommendation: Revise text as follows:
250.104 Bonding of Piping Systems and Exposed Structural Steel
B) Other Metal Piping. Where installed in or attached to a building or structure, a metal piping system(s), including gas piping, that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of

sufficient size, or the one or more grounding electrodes used. ~~The bonding jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means.~~ The points of attachment of the bonding jumper(s) shall be accessible.

(1) Other than Corrugated Stainless Steel Tubing (CSST). The bonding jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means.

(2) CSST. Corrugated stainless steel tubing gas piping systems shall be bonded by connection to a metallic piping segment or fitting, either outside or inside the building, between the individual gas meter and the first CSST fitting. The bonding jumper shall be sized in accordance with Table 250.66 based on the size of the service-entrance conductor or feeder supplying each occupancy and as permitted in 250.66(A), (B) and (C) but not smaller than 6 AWG copper (or equivalent).

Substantiation: Statement of Problem:

There have been numerous accounts of damage to corrugated stainless steel tubing (CSST) from both direct and indirect lightning strikes on or near residential structures containing this type of gas piping system. The damage is consistent: an arc-induced perforation is created through the tubing wall from a voltage imbalance between the CSST and another electrically conductive system in close proximity. Fires are often associated with this type of damage, and have resulted in partial or total losses of property.

All CSST manufacturers have subsequently revised their installation requirements to mandate the direct bonding of all CSST systems. CSST is a listed fuel gas system and is certified by CSA in accordance with a nationally recognized standard: ANSI LC-1-2005. Thus, the manufacturer’s Design and Installation Guide is considered part of the listed system. Recently, a new bonding requirement for CSST systems was added to the 2009 edition of the National Fuel Gas Code (NFPA 54).

These related changes could create potential conflicts with the NEC because it does not require this additional bonding for gas piping systems. The CSST manufacturers recognize the fact that the bonding of CSST will be installed by electrical contractors and enforced through the electrical inspectors rather than the plumbing/mechanical contractors and inspectors. However, the NEC currently does not require this additional bond to be installed, and electrical inspectors have indicated a reluctance to enforce this requirement. At the same time, mechanical/plumbing contractors and inspectors are trying to follow the manufacturer’s mandatory bonding instructions and the requirements of the National Fuel Gas Code (NFPA 54). Approval of this proposal to the National Electrical Code would clearly indicate the acceptability of such a bond connection, and clarify the responsibility of the contractors and inspectors regarding the installation of the bonding conductor.

Substantiation:

It is well known that direct bonding of metallic systems to the grounding electrode system will reduce the chances of arcing between electrically conductive pathways when energized by a high voltage source. The term “direct” bonding is intended to mean the use of a dedicated conductor and appropriately listed clamps to make an electrical connection between the piping and the grounding electrode system in the shortest and most straightforward path practical. In addition, NFPA 780 recommends “equipotential” bonding of all metallic systems to reduce the potential for damage when energized by lightning. Although Section 250.104(B) of the NEC allows the use of the equipment grounding conductor as the bonding means for a gas piping system (for personal safety purposes), it is not intended to preclude the direct bonding of the piping system. The 2008 NEC Handbook commentary supports this interpretation.

Laboratory testing and engineering analysis on the effectiveness of direct bonding have been performed. The data verify that bonding will result in a significant reduction in the potential for arc-induced damage to CSST when it is energized by any source of external energy. All CSST manufacturers now recommend the direct bonding of CSST to the grounding electrode system of the premise in which it is installed utilizing at least a 6 AWG copper wire or equivalent. The point of bonding attachment must be near the point where the gas piping enters the premise using a standard bonding clamp installed in accordance with its listing to the UL 467 standard. Generic installation instructions for residential CSST bonding have been written to insure consistent field practices among installers, and to provide guidance to local code enforcement officials. In addition, the ANSI standard for CSST systems is being updated to include a requirement for bonding instructions and performance requirements to verify the electrical properties.

The NFPA 54/National Fuel Gas Code Technical Committee considered published reports of damage to the CSST from lightning strikes and recommended new coverage for the bonding of CSST systems in the 2009 edition. The 2009 edition was approved by ANSI on September 5, 2008. That language (in part) includes the following requirement:

7.13.2 CSST. CSST gas piping systems shall be bonded to the electrical service grounding electrode system at the point where the gas service enters the building. The bonding jumper shall not be smaller than 6 AWG copper wire or equivalent.

Direct bonding of all metallic piping systems entering a building is an important, but often overlooked, approach when considering protection of a building and its contents during an electrical storm. The Fine Print Note in Section 250.104(B) of the NEC supports the claim that this type of bonding is beneficial. Direct bonding (using a 6 AWG copper wire) of piping systems to the building grounding electrode system allows these systems to be energized at (or near) the same rate as the electrical system and in unison with the voltage wave caused or induced by a direct or indirect lightning strike.

The National Electrical Code contains many requirements for bonding of electrically conductive materials including wiring, piping, ducts, communications cable and structural steel. These requirements are specified throughout the NEC and all have the common goal of protecting the public safety from electrical faults within the premise wiring system by establishing an effective, low-impedance ground fault current path. The use of a 6 AWG copper bond wire is a well established approach for other, similar conductive metallic systems and a 6 AWG copper wire will be an effective means for diverting (to earth) the energy associated with a lightning strike.

The use of the equipment grounding conductor (EGC) as the bonding means will not achieve the same effect. The EGC associated with residential gas equipment (typically a 12 or 14 AWG copper wire) does not allow the mechanical equipment and piping to be energized at (or near) the same rate as the electrical system following a lightning strike. The path to ground through the EGC is typically much longer (and with greater impedance) than the direct bonding distance (near the service entrance) between the piping system and the grounding electrode system. When energized by lightning, this situation permits the electrical potential in the many conductive pathways to become unbalanced, and thus arcing is more likely to occur.

Panel Meeting Action: Reject

Panel Statement: CMP-5 is not convinced that bonding to or around portions of CSST will solve the problem. No test records were provided to substantiate the adequacy of the minimum 6 AWG conductor. The problem could be directly related to the design and wall thickness of CSST. CMP 5 was made aware of at least one manufacturer’s product that does not require bonding beyond the requirements of Section 250.104 contrary to the information provided in the substantiation. The mitigation of the effects of lightning is a design option. The purpose of the NEC is the practical safeguarding of persons and property from hazards arising from the use of electricity. The recommendation is not currently prohibited by the NEC and should be covered by product standards. NFPA 54 contains bonding requirements specific to this product, and those requirements do not conflict with the NEC requirements in Section 250.104(B).

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BRENDER, D.: See my statement on vote on Proposal 5-252.

Comment on Affirmative:

HARDING, G.: Continue to reject the proposal. Though a difficult problem exists, not enough information was provided to indicate that the proposed revisions would eliminate this problem.

JOHNSTON, M.: I support CMP-5’s action on this proposal. While I am mindful of some unfortunate failures and events related to CSST piping, revising a long standing adequate NEC rule does not appear to be the solution for these problems. The proposal appears to be an effort to include NEC requirements that would solve or reduce a specific product problem related to lightning. These claims are not fully and technically substantiated, which would be difficult to do with any protective technique for lightning. The instructions and information from CSST manufacturers relative to bonding are inconsistent and not all CSST products require any additional bonding beyond what the NEC-2008 currently requires. I believe that revising this section based on the substantiation provided would set the wrong precedent relative to the NEC addressing problems or concerns of protection from lightning.

5-252 Log #3529 NEC-P05 **Final Action: Accept in Principle in Part**
(250.104(B), (C), and (D))

Submitter: Phil Simmons, Olympia, WA

Recommendation: Revise the existing text of the 2008 NEC as follows:

(B) Metal Gas Piping. Metal gas piping installed in or attached to a building or structure shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor if of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 250.66 except as permitted in 250.104(A)(2) and (A)(3). The bonding conductor or jumper shall be connected in an accessible location to a non-flexible and non-corrugated portion of the gas piping between the downstream side of the utility meter and the point of entrance into the building or structure. Bonding conductors or jumpers shall be installed in accordance with 250.64(A), (B), and (E).

(C) Other Metal Piping. If ~~Where~~ installed in or attached to a building or structure, a metal piping system(s)~~, including gas piping,~~ that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor if ~~where~~ of sufficient size, ~~or the~~ to one or more grounding electrodes used. The bonding conductor(s) or jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of

attachment of the bonding jumper(s) shall be accessible. Bonding conductors or jumpers shall be installed in accordance with 250.64(A), (B), and (E).
FPN: Bonding all piping and metal air ducts within the premises will provide additional safety.

Renumber existing 250.104(C) as (D) and 250.104(D) as (E).

Substantiation: Metal gas piping systems, including corrugated stainless steel tubing, should be bonded similar to the requirements for bonding metal water piping and exposed structural metal and for the same reasons. The metal gas piping is an excellent conductor and thus needs to be bonded for safety. The utility gas piping to a dwelling or small commercial building may be nonmetallic. This is similar to the water pipe supply to smaller buildings or structures. Yet, metal water piping in these buildings or structures is required to be bonded with a "full size" conductor even though not connected to a water pipe grounding electrode. Likewise, exposed metal structural frames that are not installed or connected as a grounding electrode or grounding electrode conductor are required to be bonded with a "full size" conductor. Gas piping presents an identical safety hazard and should be bonded in the same manner.

This proposal intends to include bonding requirements for CSST as required in the *National Fuel Gas Code*, NFPA-54.

Other changes are intended to be editorial or for uniformity or consistency with similar requirements for bonding metal water piping or metal structural frames.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Principle in Part

Revise the 2008 text of Section 250.104(B) to read:

(B) Other Metal Piping. If ~~Where~~ installed in or attached to a building or structure, a metal piping system(s) - including gas piping that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor if ~~where~~ of sufficient size, or ~~the~~ to one or more grounding electrodes used. The bonding conductor(s) or jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.

Panel Statement: The panel agrees with the recommended revisions to comply with the NEC Manual of Style. The panel concludes that the current requirements covering the bonding of gas piping system provides the practical safeguarding required and rejects the recommended text for a new section (B). The substantiation provided does not technically support the significant changes recommended by the submitter. There is no evidence to support that using the equipment grounding conductor of the circuit that is likely to energize the piping has been an unsafe practice.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 14 Negative: 2

Explanation of Negative:

BRENDER, D.: The proposal should have been accepted based upon the language of the proposal as well as the substantiation. Many commercial and industrial occupancies contain as much or more metallic gas piping as metal water piping that is not being used as a grounding electrode. It is just as conductive and poses identical risk of electric shock as metal water pipe. Section 250.104(A)(1) requires the bonding of metal water piping with a conductor sized according to Table 250.66 even though the metal piping is not a grounding electrode. It is inconsistent of the Panel to not apply the same requirement to metal gas piping.

The action on this proposal is also inconsistent with the Panel's action on Proposal 5-254 for bonding of structural metal that is not a grounding electrode.

WILLIAMS, D.: The submitter is correct that the bonding of the metal gas piping systems needs to be increased to be sized in accordance with Table 250.66. The gas piping system needs to be properly bonded for safety. The gas piping system in many buildings often ends up being hundreds of feet of piping. An equipment grounding conductor of a 12 AWG will not properly bond this system to safely de-energize the system in a ground fault condition. The gas piping includes additional hazards with the volatile mixture that could explode. Bonding the gas piping with a larger conductor may also provide additional protection for the problems with CSST.

Comment on Affirmative:

JOHNSTON, M.: Continue to accept the revisions as proposed to ensure consistency with the use of defined words and terms related to grounding and bonding.

5-253 Log #3059 NEC-P05 **Final Action: Accept in Principle**
(250.104(C))

Submitter: Mike Holt, Leesburg, FL

Recommendation: Revise text as follows:

(C) Structural Metal. Exposed structural metal that is interconnected to form a metal building frame and is not intentionally grounded and is likely to become energized shall be bonded to the service equipment enclosure, the disconnecting means for building or structures supplied by a feeder or branch circuit, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 250.66 and installed in accordance with 250.64(A), (B), and (E). The points of attachment of the bonding jumper(s) shall be accessible.

Substantiation: The existing code language does not seem to address the need for bonding at buildings/structures supplied by a feeder or branch circuit.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel has made revisions to the recommendation to improve clarity. The panel action on this proposal has been incorporated into the panel action on Proposal 5-254. See the panel action on Proposal 5-254.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-254 Log #3527 NEC-P05 **Final Action: Accept in Principle in Part**
(250.104(C))

Submitter: Phil Simmons, Olympia, WA

Recommendation: Revise the existing text of the 2008 NEC as follows:

(C) Structural Metal. Exposed structural metal that is interconnected to form a metal building frame and is not intentionally grounded or bonded ~~and is likely to become energized~~ shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor if ~~where~~ of sufficient size, or the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 250.66 except as permitted in 250.104(A)(2) and (A)(3) and installed in accordance with 250.64(A), (B), and (E). The points of attachment of the bonding jumper(s) shall be accessible unless installed in compliance with 250.68 Exception No. 2.

Substantiation: The phrase "likely to become energized" is proposed for deletion as most often, electrical inspectors enforce bonding of structural metal if the building or structure has exposed metal members and the building or structure is supplied with a service, feeder or branch circuit.

The reference to 250.104(A)(2) and (A)(3) will allow adjustment in the size of bonding conductors and jumpers if the building s supplied by a feeder.

The reference to 250.68 Exception No. 2 permits the connection of bonding conductors or jumpers to be fireproofed and not be accessible if appropriate.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

(C) Structural Metal. Exposed structural metal that is interconnected to form a metal building frame and is not intentionally grounded or bonded and is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the disconnecting means for buildings or structures supplied by a feeder or branch circuit, the grounding electrode conductor ~~where~~ if of sufficient size, or the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 250.66 and installed in accordance with 250.64(A), (B), and (E). The points of attachment of the bonding jumper(s) shall be accessible unless installed in compliance with 250.68(A) Exception No. 2.

Panel Statement: The panel does not accept the deletion of "likely to become energized". If the AHJ believes the structural metal is likely to become energized then bonding is required. There is no reason to eliminate the flexibility provided when situations occur involving structural metal that is unlikely to become energized. The panel does not accept the recommendation to refer to Sections 250.104(A)(2) and (A)(3) because these sections cover bonding of metal water piping. The panel action on Proposal 5-253 has been incorporated into the panel action on this proposal.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-255 Log #3228 NEC-P05 **Final Action: Accept**
(250.104(D)(3))

Submitter: Mark R. Hilbert, State of New Hampshire

Recommendation: Revise as follows:

(3) Common Grounding Electrode Conductor. Where a common grounding electrode conductor is installed for multiple separately derived systems as permitted by 250.30(A)~~(4)~~(6), and exposed structural metal that is interconnected to form the building frame or interior metal piping exists in the area served by the separately derived system, the metal piping and the structural metal member shall be bonded to the common grounding electrode conductor.

Substantiation: This proposal is being submitted as part of series of proposals addressing a revision of 250.30. The subsection referencing common grounding electrode conductors will be changed to 250.30(A)(6) as part of this revision.

Panel Meeting Action: Accept

Panel Statement: See the panel action on Proposal 5-102 in which Section 250.30 was revised.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-256 Log #4601 NEC-P05 **Final Action: Accept in Principle**
(250.104(D)(3))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Where separately derived systems serve different areas of a building and utilize a common grounding electrode conductor, these connections shall be made for each such area at the same point on the common grounding electrode conductor as the connection(s) to the bonding jumper from the local separately derived system(s).
Delete the exception that follows.
Substantiation: This proposal makes this provision consistent with the wording in (D)(1), for the same reason. The current literal text of the NEC can be read to allow, in a 50-story building with a common grounding electrode conductor throughout, one connection from building steel and a metallic water piping system in the basement, and no local connections to any of the separately derived systems on upper floors. Such a connection does bond "the metal piping and the structural metal member" to "the common grounding electrode conductor" but not in a way that would meet the objectives of this part of the Code. These interconnections must be in each area served by a derived system to be of benefit.
This wording also addresses the topic of the exception. The existing exception is actually a Style Manual problem because it does not take exception to any provision of the rule it follows. Nothing in the rule requires bonding jumpers directly from a system to piping and structural metal, and therefore an exception relieving such a connection requirement is an exception to nothing. The rule requires common connections to the common grounding electrode conductor, and therefore anticipates the exception to the point of making it superfluous.
Panel Meeting Action: Accept in Principle
Revise the current text of Section 250.104(D)(3) to read:
Common Grounding Electrode Conductor. Where a common grounding electrode conductor is installed for multiple separately derived systems as permitted by 250.30(A)(4), and exposed structural metal that is interconnected to form the building frame or interior metal piping exists in the area served by the separately derived system, the metal piping and the structural metal member shall be bonded to the common grounding electrode conductor in the area served by the separately derived system.
Exception: A separate bonding jumper from each derived system to metal water piping and to structural metal members shall not be required where the metal water piping and the structural metal members in the area served by the separately derived system are bonded to the common grounding electrode conductor.
Panel Statement: The panel action meets the intent of the recommendation. It is necessary to retain the exception to eliminate multiple connections from metallic water pipe and structural metal to several separately derived systems that may be in close proximity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-257 Log #4096 NEC-P05 **Final Action: Reject**
(250.106)

Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Add exception (1) as follows:
Exception (1). In cases where galvanic corrosion is a concern or where a direct bond is not allowed per local code, the use of an isolating spark gap is permitted to serve as the bonding connection between the grounding electrode system and the ground loop conductor (when a ground loop conductor is required per NFPA 780, section 4.20.1.2).
Substantiation: In the latest edition of NFPA 780, a requirement was added to the code requiring a "ground loop conductor" for buildings "whose height is over 60 ft" (Article 4.20.1.2). In the past, for many of our buildings, we've utilized the building steel as the down conductor for a lightning protection system and utilized the concrete encased rebar in the building footings for the grounding electrode (as allowed in NEC® 250.52(A)(3)). Now, with the revisions to NFPA 780, it appears we are now requiring the "ground loop conductor" for buildings over 60 ft in height in addition to the required concrete encased "rebar" in the footings (NEC® 250.50). The problem arises because we are required to interconnect the ground loop conductor (which is copper in compliance with Article 4.13.4 as referenced in the Annex to 780) with the building grounding system (required by both NFPA 780 Article 4.14.1 and NEC® 250.106) which at a bare minimum includes the concrete encased rebar in the footings. As noted in the IEEE PCIC paper PCIC 2007-25, depending on soil conditions, galvanic action may result from interconnecting the systems as prescribed in Article 4.14.1. The fact is apparently recognized by the authors of NFPA 780 as they include a note in the Appendix A.4.14.1 indicating that "Isolating Spark Gaps can be used to provide the required bond in those cases where galvanic corrosion is a concern or where a direct bond is not allowed by local code." I don't see any corresponding language, however, in the NEC® to confirm that the NEC® code panel so agrees that such a connection will satisfy the requirements of Article 250.106.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: While the concept may be applicable, the proposed text does not provide adequate requirements as to the locations permitted or locations not permitted for the spark gap to be installed. The spark gap should also be listed for the application and the environment where it is to be installed. There are listed spark gaps available. See the panel statement on Proposal 5-139 relating to galvanic corrosion.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: The panel should have recognized the isolating spark gaps and allowed their use.

5-258 Log #1517 NEC-P05 **Final Action: Accept**
(250.106, FPN 1)

Submitter: Mark S. Harger, Harger Lightning & Grounding / Rep. BICSI
Recommendation: Revise text to read as follows:
FPN No. 1: See 250.60 for use of strike termination devices ~~air terminals~~. For further information, see NFPA 780-2008, Standard for the Installation of Lightning Protection Systems, which contains detailed information on grounding, bonding, and sideflash distance from lightning protection systems.
Substantiation: NFPA 780, Standard for the Installation of Lightning Protection Systems, 2008, Section 3.3.24 defines a strike termination device as a component of a lightning protection system that intercepts lightning flashes and connects them to a path to ground. Strike termination devices include air terminals, metal masts, permanent metal parts of structures as described in Section 4.9, and overhead ground wires installed in catenary lightning protection systems. By using this term "air terminal", one could interpret that ground electrodes used for strike termination devices other than ones used for air terminals could be used in lieu of the grounding electrodes required by 250.50, thus, creating a safety issue.
Also see my Proposal on 250.60.

5-259 Log #4526 NEC-P05 **Final Action: Accept**
(250.108 (New))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Create a new Section 250.108 as follows:
250.108 Use of Equipment Grounding Conductors.
An equipment grounding conductor shall not be used as a grounding electrode conductor.
Substantiation: This new section will clarify that grounding electrode conductors and equipment grounding conductors serve a different purpose in the electrical safety system, are sized differently and have different installation requirements. Equipment grounding conductors do not normally carry current while a grounding electrode conductor may normally carry current since it is often in parallel with the neutral conductor.
Panel Meeting Action: Accept
Panel Statement: The panel notes that this new section is to be located in Part VI and suggests it be numbered as Section 250.121.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-260 Log #4527 NEC-P05 **Final Action: Reject**
(250.110)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revised text as follows:
250.110 Equipment Fastened in Place (Fixed) or Connected by Permanent Wiring Methods ~~(Fixed)~~.
Exposed, normally non–current-carrying metal parts of fixed equipment supplied by or enclosing conductors or components operating at more than 50 volts ~~likely to become energized~~ shall be connected to an ~~the~~ equipment grounding conductor under any of the following conditions:
(1) If ~~Where~~ within 2.5 m (8 ft) vertically or 1.5 m (5 ft) horizontally of ground or grounded metal objects and subject to contact by persons
(2) If ~~Where~~ located in a wet or damp location and not isolated
(3) If ~~Where~~ in electrical contact with metal
(4) If ~~Where~~ in a hazardous (classified) location as covered by Articles 500 through 517
(5) If ~~Where~~ supplied by a ~~metal-clad, metal-sheathed, metal-raceway, or other~~ wiring method that provides an equipment grounding conductor ~~ground~~, except as permitted by 250.86, Exception No. 2, for short sections of metal enclosures
~~(6) Where equipment operates with any terminal at over 150 volts to ground~~
Exception No. 1: Metal frames of electrically heated appliances, ~~exempted by special permission,~~ that have ~~in which case~~ the frames ~~shall be~~ permanently and effectively insulated from ground shall not be required to be grounded if exempted by special permission.
Exception No. 2: Distribution apparatus, such as transformer and capacitor cases, mounted on wooden poles, at a height exceeding 2.5 m (8 ft) above ground or grade level shall not be required to be grounded.

Exception No. 3: Listed equipment protected by a system of double insulation, ~~or its equivalent~~, shall not be required to be connected to the equipment grounding conductor. If ~~Where~~ such a system is employed, the equipment shall be distinctively marked.

Substantiation: The word "fixed" is proposed to be relocated to more clearly support the portion of the title it describes.

The word "normally" is proposed to be added to the beginning of the first sentence as the metallic parts of equipment governed by this section are not intended to carry current on a normal basis but only when a line-to-ground fault occurs.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Section 3.1.4.1 of the NEC Style Manual requires exceptions to be complete sentences. Changes are proposed to Exceptions No. 1 and 2 to bring these exceptions into compliance.

The electric shock threshold of 50 volts is introduced in this section to bring this rule into harmony with the OSHA. NFPA 70E also uses 50 volts as the threshold above which shock protection techniques are required to be employed when working on or about electrical equipment that is energized.

Other proposed changes are intended to be editorial in nature.

Panel Meeting Action: Reject

Panel Statement: The substantiation does not support changing the voltage level from 150 volts to 50 volts. There are a number of products that operate above 50 volts that are not required to be equipped with an equipment grounding conductor that are deemed safe. Additionally the substantiation does not support removing the condition "likely to become energized".

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BRENDER, D.: Replacing the phrase "likely to become energized" with the 50-volt threshold would make this section more logical and more easily enforced.

The 50-volt threshold is used in many locations throughout the NEC to indicate a voltage above which equipment is required to be guarded or systems grounded. It makes sense to include that concept in this section.

In addition, several editorial improvements were included that were discarded by this action.

5-261 Log #1311 NEC-P05 **Final Action: Reject**
(250.110 Exception No. 3)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add:

This exception shall not apply to electrically operated hand-held drill motors, hedge clippers, lawn trimmers, hammers, and the like.

Substantiation: Double-insulated equipment does not protect against shock where such equipment drills or cuts into concealed or buried energized conductors or its own supply cord, or where the supply cord ungrounded conductor short-circuits to the metal enclosure of the equipment.

Panel Meeting Action: Reject

Panel Statement: The substantiation does not support the recommendation. No incidences have been cited involving accidents where double insulated tools are used.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-262 Log #1478 NEC-P05 **Final Action: Reject**
(250.112)

Submitter: Richard A. Janoski, Finleyville, PA

Recommendation: Revise text to read as follows:

Fastened in Place or Connected by Permanent Wiring Methods (Fixed) - Specific. Exposed, non-current-carrying metal parts of the kinds of equipment described in 250.112(A) through (K), and non-current-carrying metal parts of equipment and enclosures described in 250.112(L) and (M), shall be grounded regardless of voltage. Unless otherwise stated.

Substantiation: The phrase "shall be grounded regardless of voltage" is a statement that is "Mandatory" and "Specifically Requires" 250.112(A) through (K) and (L) through (M) to be grounded regardless of voltage. This phrase is contradictory to it's proceeding subsections since 250.112(F), and 250.112(I) contain voltage restrictions. To eliminate any confusion, the phrase "Unless otherwise stated" should be added.

Panel Meeting Action: Reject

Panel Statement: The recommended text is unclear as to how it is to be applied and what it refers to.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-263 Log #4528 NEC-P05 **Final Action: Accept**
(250.112)

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revised text as follows:

250.112 Specific Equipment Fastened in Place (Fixed) or Connected by Permanent Wiring Methods ~~(Fixed) — Specific~~.

Except as permitted in 250.112(I), exposed, normally non–current-carrying metal parts of ~~the kinds of~~ equipment described in 250.112(A) through (K), and normally non–current-carrying metal parts of equipment and enclosures described in 250.112(L) and (M), shall be connected to the equipment grounding conductor regardless of voltage.

Substantiation: The word "normally" is proposed to be added to the beginning of the first sentence as the metallic parts of equipment governed by this section are not intended to carry current on a normal basis but only when a line-to-ground fault occurs.

The title of the section is proposed to be revised for clarity.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-264 Log #4529 NEC-P05 **Final Action: Reject**
(250.112(J))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise the existing text of the 2008 NEC as follows:

(J) Luminaires. Luminaires shall be connected to an equipment grounding conductor as follows: ~~as provided in Part V of Article 410~~.

(1) Exposed Conductive Parts. Luminaires having exposed metal parts shall be connected to an equipment grounding conductor.

Exception: Small metal parts that are isolated by nonconductive parts shall be permitted to be ungrounded if inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 38 mm (1½ in.) from lamp terminals shall not be required to be grounded.

(2) Methods of Grounding. Luminaires and equipment shall be mechanically connected to an equipment grounding conductor sized in accordance with 250.122.

(3) Replacement Luminaires. Replacement luminaires having exposed conductive parts at an outlet without an equipment grounding conductor present shall be permitted to be connected to an equipment grounding conductor in compliance with 250.130(C).

Exception: Luminaires directly wired or attached to outlets supplied by a wiring method that does not provide an equipment grounding conductor shall be made of insulating material, shall have no exposed conductive parts, and shall be permitted to be installed without connection to an equipment grounding conductor.

Substantiation: This proposal relocates the appropriate portions of Part V of Article 410 to Article 250 under the jurisdiction of CMP-5.

Changes are proposed to ensure that luminaires with exposed conductive parts are provided with an effective ground-fault return path for safety. The GFCI equivalency to an equipment grounding conductor as provided in existing Part V of Article 410 is not included in this Proposal. In essence, the practice of installing a GFCI without an equipment grounding conductor connected creates a "trap" of sorts. Since a ground-fault return path is not provided, a ground-fault in a luminaire will simply energize the metal frame of the luminaire waiting for the unsuspecting user (often a homeowner) to complete the fault return path by contacting the faulted luminaire and a grounded appliance or ground-fault return path such as a sink. The owner provides the fault-current path for testing the GFCI device! This hardly seems appropriate!

If that isn't bad enough, recent published data from UL indicates nearly 10 percent of the existing GFCI devices tested as a part of the Aging Wiring Study would not operate properly. IAEI published an article several years ago that showed a significant number of GFCI devices tested by home inspectors would not function properly. Hardly the sort of reports needed to instill confidence in the technology and to allow a GFCI to replace an equipment grounding conductor!

Panel Meeting Action: Reject

Panel Statement: The substantiation supporting this recommendation is based on GFCIs manufactured in accordance with former editions of UL 943. GFCIs manufactured in accordance with the current edition of UL 943 address the substantiation for this recommendation. There has been no evidence submitted supporting that the current allowance in Section 410.42 Exception No. 2 has been an unsafe practice.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BRENDER, D.: The Panel failed to address the substantiation for the proposal. It is difficult to argue that a GFCI device offers safety equivalent to an equipment grounding conductor.

5-265 Log #1603 NEC-P05 **Final Action: Reject**
(250.112(N) (New))

Submitter: Bruce Wagner, Avery Electric, Inc.

Recommendation: Add new text to read as follows:

250.112(N) All sheet metal and metallic panning associated with residential forced air heating systems shall be bonded together and to the furnace. The grounding conductor associated with the dedicated branch circuit feeders will serve as the grounding means for this system.

Substantiation: In that supply and return air ducting are sometimes made electrically non-continuous by means of a rubber sleeve or boot to allow positioning of the furnace, the then remote trunk lines may become energized with no effective grounding.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation to require remote trunk lines for ductwork to be connected to an equipment grounding conductor. Note that there is a FPN in 250.104(B) permitting the practice but not requiring it.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-266 Log #1972 NEC-P05 **Final Action: Reject**
(250.114 Exception No. 1 for (2) and Exception No. 2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Exception No. 1: Motors, where guarded and isolated from conductive material shall not be required to be connected to an equipment grounding conductor.

Exception No. 2: Metal frames of ~~electrically heated~~ listed portable electrical heating appliances ~~exempted by special permission in which case the frames shall permanently and effectively be insulated from ground.~~

Substantiation: Edit. A guarded motor will not provide safety if in contact with metal piping or other metal structures or material. Exception No. 2 should apply to portable heating appliances not fixed appliances such as built-in bathroom heaters or heat lamp fixtures.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided regarding the “isolation” requirements, therefore leaving this requirement as subjective and unenforceable in a consistent manner. No technical substantiation provided to change “electrical heating appliances” to “portable electric heating appliances”. No substantiation is provided on why the existing Exception No. 2 should not apply to fixed equipment.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-267 Log #3678 NEC-P05 **Final Action: Accept**
(250.114(3)(b))

Submitter: Richard F. VanWert, Middle Department Inspection Agency
Recommendation: Revise text as follows:

b. Clothes-washing, clothes drying, dishwashing machines; ranges

Substantiation: With the four conductor cords required for dryers and ranges, the equipment grounding conductor rule must be extended to plug and cord connected ranges also.
Panel Meeting Action: Accept
Panel Statement: The panel notes that this action just adds “ranges” to the current list of appliances in this section in the 2008 NEC.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-267a Log #3339 NEC-P05 **Final Action: Reject**
(250.116, FPN)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete “extensive”.
Substantiation: Edit. “Extensive” is not defined and is subjective.
Panel Meeting Action: Reject
Panel Statement: The fine print note is not enforceable and is not a requirement. The term “extensive” used in the fine print note is related to judgment that can be applied to large quantities of metallic or interconnected metallic materials that could be bonded for additional safety.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-268 Log #3060 NEC-P05 **Final Action: Accept**
(250.118)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
250.118 Types of Equipment Grounding Conductors.

The equipment grounding conductor run with or enclosing the circuit conductors shall be one or more or a combination of the following:

FPN: Text remains unchanged
(1) Text remains unchanged
(2) Text remains unchanged
(3) Text remains unchanged
(4) Text remains unchanged
(5) Listed flexible metal conduit meeting all the following conditions:
a. Text remains unchanged
b. Text remains unchanged
c. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ~~ground return~~ ground-fault current path does not exceed 1.8 m (6 ft).
d. Text remains unchanged
(6) Listed liquidtight flexible metal conduit meeting all the following conditions:
a. Text remains unchanged
b. Text remains unchanged
c. For metric designators 21 through 35 (trade sizes ¾ through 1¼), the circuit conductors contained in the conduit are protected by overcurrent devices rated not more than 60 amperes and there is no flexible metal conduit, flexible metallic tubing, or liquidtight flexible metal conduit in trade sizes metric designators 12 through 16 (trade sizes 3/8 through ½) in the ~~grounding~~ ground-fault current path.
d. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ~~ground return~~ ground-fault current path does not exceed 1.8 m (6 ft).
e. Text remains unchanged
(7) Flexible metallic tubing where the tubing is terminated in listed fittings and meeting the following conditions:
a. Text remains unchanged
b. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ~~ground return~~ ground-fault current path does not exceed 1.8 m (6 ft).
(8) Text remains unchanged
(9) Text remains unchanged
(10) Text remains unchanged
(11) Text remains unchanged
(12) Text remains unchanged
(13) Text remains unchanged
(14) Text remains unchanged

Substantiation: This proposal simply replaces undefined terms with a term that is defined in 250.2.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-269 Log #4184 NEC-P05 **Final Action: Reject**
(250.118)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read as follows:

Types of Equipment Grounding Conductors and Equipment Bonding Jumpers. The equipment grounding conductor or equipment bonding jumper run with or enclosing the circuit conductors shall be one or more or a combination of the following:

Substantiation: The items in the list are also used as equipment bonding jumpers.
Panel Meeting Action: Reject
Panel Statement: The list is an all-inclusive list of acceptable equipment grounding conductors and potential equipment bonding jumpers. However the only practical equipment bonding jumper are those contained in Item 1. Adding the proposed new wording would not add clarity to the existing text.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

DOBROWSKY, P.: The items listed in Item 1 can be used as bonding conductors. Why are the others only suitable for use as equipment grounding conductors. The panel should also consider using the methods included in the supply side bonding jumper allowances.

5-270 Log #456 NEC-P05 **Final Action: Reject**
(250.118(10)c. (New))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Add new item letter “c” to Section 250.118(10):

c. The metallic sheath and grounding/bonding conductor of interlocked metal tape–Type MC cable.

Substantiation: Add new item “c” to cover the newer Type MC cable that includes a grounding/bonding conductor. This Type MC cable does not require the use of the combined metallic sheath and grounding conductor for equipment grounding purpose. Due to the internal grounding/bonding conductor, the cable sheath serves as the equipment grounding conductor for termination purposes. As such, there is no need to terminate the grounding/bonding conductor as there is with the combined metallic sheath and grounding conductor Type MC cable. The grounding/bonding conductor can be cut clean at the termination point of the cable — similar to Type AC cable. This change will help to differentiate between the differing types of MC cables and will also help to correlate with the requirements of Section 250.148. Section 250.148 requires that “any equipment grounding conductor(s) associated with those circuit conductors shall be connected within the box or to the box...” The termination of this newer type MC cable would be similar to that of smooth or corrugated tube type MC cable. It should also be noted that this change is in order to correlate with the product standard as UL Standard 1569 was revised to address this newer Type MC cable. As an additional note, the construction specifications noted in Section 330.108 states “Where Type MC cable is used to provide an equipment grounding conductor, it shall comply with 250.118(10) and 250.122. ” Section 330.108 specifically references Sections 250.18(10) and 250.122. In contrast, the construction specifications noted in Section 320.108, Equipment Grounding Conductor for Type AC cable, simply references Sections 250.4(A)(5) or (B)(4).

Panel Meeting Action: Reject

Panel Statement: The panel concludes that there is no need for item "c" or that there are any correlation issues. Section 250.118(10)(a) was specifically modified during the 2002 NEC cycle to effectively cover the aforementioned MC cable construction. The components that form the ground fault current path (EGC) for interlocked armor MC cable are the combined interlocked armor and the bare conductor. The language in item "a" covers the option of constructing the cable to allow the interlocked armor to serve as the ground and may be listed as such. The armor and the bare conductor of this cable are constructed to insure that the two components are in intimate contact throughout the entire cable length, thereby enabling the interlocked armor to serve as the equipment grounding conductor.

Section 250.148 requires equipment grounding conductor(s) associated with the circuit conductors be connected within the box or "to the box" with devices suitable for use. With an interlocked armor ground MC cable, the interlocked armor, and the bare conductor in intimate contact with the armor, may be connected "to the box" using MC cable fittings listed for grounding per Section 250.148(C). The reference to Section 250.122 in Section 330.108 assures that the ground path performance requirement for the armor is equivalent in performance to that of a conventional wire type equipment grounding conductor listed in Table 250.122.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-271 Log #4602 NEC-P05 **Final Action: Reject**
(250.118(10)(c) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Add the following:

c. The combined metallic sheath and bonding conductor of interlocked metal-tape-type MC cable where the armor and bonding conductor are qualified as an effective fault current path without the necessity of making a separate termination for the bonding conductor.

Substantiation: This is another attempt to constructively legitimize the new interlocking-armor metal clad cable product. The existing text of "a." does not quite cover this product because the grounding conductor specified is one that must terminate within enclosures along with the circuit conductors. The NEC should address this construction in a straightforward manner and without regard to whether or not a listing has been obtained.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 5-270.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-269a Log #CP510 NEC-P05 **Final Action: Accept**
(250.118(10) a & b)

Submitter: Code-Making Panel 5,

Recommendation: Revise text to read as follows:

(10) Type MC cable where listed and identified for grounding in accordance with the following:

a. The combined metallic sheath and <u>equipment</u> grounding conductor of interlocked metal tape–type MC cable

b. The metallic sheath or the combined metallic sheath and <u>equipment</u> grounding conductors of the smooth or corrugated tube-type MC cable.

Substantiation: The revisions have been made to correlate with the deletion of the term "Grounding Conductor" in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term "grounding conductor" from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman's report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term "grounding conductor."

5-272 Log #237 NEC-P05 **Final Action: Reject**
(250.118(4))

Submitter: Sprague Owings, Nassau County, Florida

Recommendation: Delete as follows:

~~250.110(4) Electrical metallic tubing.~~

Substantiation: As concern grows for having a reliable grounding path (the return of a separate equipment ground to dryers and ranges, etc.) it would seem to follow that it may be time to delete the use of EMT without an equipment ground simply because this use depends on many mechanical connections (each and every connector and coupling). One run of EMT could easily have 10 or more couplings in the run and just one loose screw or compression fitting could jeopardize the ability of the conduit to carry a short back to source. This is not so much a problem with flex or cables where there are only 2 mechanical connections in the path (at the beginning and end of the run.)

I have also submitted a companion proposal to Code-Making Panel 8 to revise section 358.60.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided technical substantiation supporting his recommendation to remove EMT as an acceptable equipment grounding conductor. EMT does provide a reliable and safe ground fault return path. When metal raceways are installed in accordance with the National Electrical Code they provide a low impedance ground-fault current path.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

MOHLA, D.: It is regrettable that, after many years of proposals indicating that there is a real problem on roof tops, Code Panel 5 continues to use the same answer of "no technical substantiation". There is evidence of real world issues of fittings coming apart or loose and leaving equipment ungrounded. EMT can be installed easily without adequate tightening of fittings or loose fittings. As a result, the raceway is adequate for installing conductors but inadequate as an equipment grounding conductor. This issue will not go away as evidenced by the proposal at every Code cycle.

5-273 Log #2343 NEC-P05 **Final Action: Accept in Principle**
(250.118(5)(d))

Submitter: David Mercier, Southwire Company

Recommendation: Revise the first sentence of 250.118(5)(d):

"Where used to connect equipment where flexibility is required <u>to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement</u> after installation, an equipment grounding conductor shall be installed."

Substantiation: The purpose of this change is to clarify the use of the term "flexibility" with respect to using an equipment grounding conductor in flexible metal conduit, to ensure the integrity of the ground path. Installed flexible conduit which is connected to equipment which may be moved or subject to vibration can compromise continuity of the ground path. A companion proposal has been submitted to Panel 8 for 348.60.

Panel Meeting Action: Accept in Principle

Revise the recommendation to read:

~~Where~~ <u>If</u> used to connect equipment where flexibility is ~~required~~ <u>necessary</u> to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed.

Panel Statement: The panel action restores terminology used in the 2008 NEC and makes an editorial correction for clarity.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

JOHNSTON, M.: Continue to accept this proposal except the text should be revised to remove one instance of the word "flexibility" because it is redundant. This will be proposed in a comment on this proposal.

5-274 Log #2344 NEC-P05 **Final Action: Accept in Principle**
(250.118(6)(e))

Submitter: David Mercier, Southwire Company

Recommendation: Revise the first sentence of 250.118(6)(e):

"Where used to connect equipment where flexibility is required <u>to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement</u> after installation, an equipment grounding conductor shall be installed."

Substantiation: The purpose of this change is to clarify the use of the term "flexibility" with respect to using an equipment grounding conductor in liquidtight flexible metal conduit, to ensure the integrity of the ground path. Installed liquidtight flexible conduit which is connected to equipment which may be moved or subject to vibration can compromise continuity of the ground path. A companion proposal has been submitted to panel 8 for 350.60.

Panel Meeting Action: Accept in Principle

Revise the recommendation to read:

~~Where~~ <u>If</u> used to connect equipment where flexibility is ~~required~~ <u>necessary</u> to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed.

Panel Statement: The panel action restores terminology used in the 2008 NEC and makes an editorial correction for clarity.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-275 Log #115 NEC-P05 **Final Action: Accept in Principle in Part**
(250.119)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
Power-limited, class 2 ~~or~~ and class 3 ~~circuit~~ cables, (Article 725), power-limited fire alarm cables (Article 760), communications cables (Article 800) and network-powered broadband communications cables (Article 830) ~~containing only circuits operating at less than 50 volts~~ shall be permitted to use a conductor with green insulation for other than equipment grounding purposes.
Substantiation: Green wires are an integral part of the color code for the wires in communications cables. Article 725 permits communications cables to be substitute for class 2 and class 3 cables. See 725.154(G). A typical data cable is listed communications cable that is installed in accordance with Article 725 provisions for class 2 and class 3 cables. Article 760 permits communications cables to substitute for power-limited fire alarm cables. See 760.154(D). Ungrounded green wires are routinely used in these applications. The exception to 250.119 needs to be modified to reflect industry practice.
Panel Meeting Action: Accept in Principle in Part
Revise 2008 NEC 250.119 Exception as follows:
Power-limited, Class 2 or Class 3 ~~circuit~~ cables, power-limited fire alarm cables, communications cables, ~~and~~ or network-powered broadband communications cables containing only circuits operating at less than 50 volts where connected to equipment not required to be grounded in accordance with 250.112(I) shall be permitted to use a conductor with green insulation or green with one or more yellow stripes for other than equipment grounding purposes.
Panel Statement: The panel does not accept the recommendation to remove the 50-volt limitation of the exception to restrict application to only specific types of circuits. Editorial revisions for clarity have been made and the action incorporates the recommendation of Proposal 5-278.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-276 Log #1557 NEC-P05 **Final Action: Reject**
(250.119)

Submitter: Joseph E. Rossi, Township of Clinton
Recommendation: Revise text as follows:
Individually covered or insulated equipment grounding conductors shall have a continuous manufactures outer finish that is either green or green with one or more yellow stripes except as permitted in this section.
Substantiation: There is a lot of confusion about this section of the code. I have failed contractors many times because they will take the two ends of a black wire and tape them green. When I cite this section to them, they tell me about section 250.199(A). That is for larger than #6 wire. Therefore, by putting the word "manufactures" before the word "green" it would be a clearer definition of what needs to be done.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the code. The present code language addresses the submitter's concern as the conductors in sizes 6 AWG and smaller are required to have an outer finish that is either green or green with one or more yellow stripes.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-277 Log #3325 NEC-P05 **Final Action: Reject**
(250.119)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
IDENTIFICATION of EQUIPMENT GROUNDING and BONDING CONDUCTORS. Unless ~~required~~ otherwise provided elsewhere in this Code equipment grounding and bonding conductors shall be permitted to be bare, covered, or insulated. Individually covered or insulated equipment grounding and bonding conductors shall have a continuous outer finish that is green, green with one or more yellow stripes except as otherwise permitted in this section. Conductors ~~with insulation or individual covering that is green, green with one or more yellow stripes or otherwise~~ identified ~~as permitted by~~ in accordance with this section shall not be used for ungrounded or grounded circuit conductors.
Exception: No change.
(A) CONDUCTOR LARGER THAN 6 AWG. Equipment grounding and bonding conductors larger than 6 AWG shall comply with 250.119(A)(1) and (A)(2).
(1) An insulated or covered conductor larger than 6 AWG shall be permitted ~~at the time of installation~~ to be permanently identified as an equipment grounding or bonding conductor at each end and at every point where the conductor is accessible.
Exception No. 1: Conductors larger than 6 AWG shall not be required to be marked in conduit bodies that contain no splices or unused hubs.
Exception No. 2: Conductors larger than 6 AWG installed as overhead aerial spans shall be permitted to be marked at each end and intermediate points of support.
Exception No. 3: Conductors larger than 6 AWG and part of open wiring on insulator, concealed knob and tube wiring, or as permitted in the exception for 590.4(C) shall only be required to be identified at termination and splice points.
Exception No. 4: Identification shall be permitted at terminations and at intervals acceptable to the authority having jurisdiction where conductors larger than 6 AWG are installed in cable trays, wireways, or auxiliary gutters and not in a raceway or cable armor.
Substantiation: Edit. The proposal attempts to cover other types of installations. Present wording in (A) (1) "where the conductor is accessible" requires continuous identification of conductors in overhead aerial spans, in wireways, in auxiliary gutters, cable trays, in cable bus, knob and tube and open wiring on insulators installations, and as permitted in 590.4(C) exception.
Panel Meeting Action: Reject
Panel Statement: The proposed text lessens the requirement for identifying equipment grounding conductors. The submitter has not provided technical substantiation to support such a change. The panel concludes that it is permitted to identify bonding conductors.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-278 Log #4603 NEC-P05 **Final Action: Accept in Principle**
(250.119 Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee
Recommendation: Revise to read as follows:
Exception: Where equipment is connected by a multiconductor cable and is not required to be grounded in accordance with 250.112(1), the color green shall be permitted to be used for other than grounding conductors.
Substantiation: The wording of this exception creates a direct conflict with the orderly implementation of 250.20(A) and 250.112(I) in numerous cases. It allows green wire in control cables to be used as an ordinary circuit conductor if the system operates at 50 volts or less. However, 250.20(A) requires (and has required for over seventy years) that circuits operating under 50 volts, but supplied from outdoor overhead wiring, or from transformers supplied from primary systems that are either ungrounded or operating over 150 volts to ground, be grounded. If a circuit is required to be grounded, 250.112(I) requires the use of an equipment grounding conductor, and 250.119 requires a certain color code for such conductors. The new allowance in this section is generally sound since the majority of power-limited control circuits originate from transformers with 120V primaries, but the permission must not conflict with 250.112(I).
CMP 5 accepted this text in principle for the 2008 cycle, but worked from a different comment and reached an outcome that is incorrect when the secondary is required to be grounded for other reasons, even if the voltage does not exceed 50 volts. There are many practical applications where these control circuits become subject to 250.112(I) requirements, such as 277V duct heaters incorporating Class 2 transformers and lighting circuits using power-limited energy management controls.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-275 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-279 Log #3327 NEC-P05 **Final Action: Reject**
(250.120(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Where not run with circuit conductors, as permitted in 250.130(C) and Exception No. 2 for 250.134(B) equipment grounding conductors smaller than 6 AWG shall be protected from physical damage by an identified raceway or cable armor except where run in hollow spaces of buildings or structures and not likely to be subject to physical damage.
Substantiation: This section appears intended to apply to equipment grounding conductors permitted in 250.130(C) and 250.134(B) Exception No. 2. However, literal wording includes equipment grounding conductors in nonmetallic-sheathed cable and Type UF cable. "Walls or partitions" may be inferred as excluding ceiling and floor spaces. Structures which are not deemed "buildings" should be included.
Panel Meeting Action: Reject
Panel Statement: Equipment grounding conductors are generally required to be run with the circuit conductors and therefore have the physical protection afforded by that installation. There was no technical substantiation provided to support that these new requirements are necessary in the few cases where equipment grounding conductors are not run with circuit conductors.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-280 Log #990 NEC-P05 **Final Action: Accept**
(Table 250.122)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete the 30 ampere and 40 ampere figures (3rd and 4th lines).
Substantiation: Edit. The heading above the ampere column states "not exceeding" (amperes) which indicates an overcurrent device not exceeding 30 amperes requires a 10 AWG or 8 AWG equipment grounding conductor. However, the 40 and 60 ampere overcurrent devices which do exceed 30 amperes require a 10 AWG or 8 AWG equipment grounding conductor. The 30 and 40 ampere figures are superfluous.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-281 Log #2206 NEC-P05 **Final Action: Reject**
(Table 250.122)

Submitter: Paul Guidry, Fluor Enterprises, Inc
Recommendation: Delete existing Table 250.122. Replace Table 250.122 with new Table 250.122.

Table 250.122 Minimum Size Equipment Grounding Conductors For Grounding Raceway and Equipment

Equivalent Size of Ungrounded Conductors (AWG or kcmil)	Equivalent Size of Equipment Grounding Conductor (AWG or kcmil)
14	14
12	12
10	10
8	10
6	8
4	8
2	6
1	6
1/0	6
2/0	6
3/0	4
4/0	4
250	4
300	4
350	3
400	3
500	2
750	1
1000	1/0

For parallel conductors, the equivalent size of the multiple ungrounded conductors shall be used to calculate the equivalent minimum size of equipment grounding conductor(s).

Substantiation: This proposal will change equipment grounding conductor (EGC) sizes to be based on ungrounded conductor sizes instead of overcurrent protective device (OCPD) sizes. Currently, manufacturers of multiconductor cable assemblies install a standard size of EGC with a given size of ungrounded conductor. If the conductors are increased due to voltage drop, you lose the curve that is built in to Table 250.122 for reducing the size of EGCs due to 250.122(B). For example, a 50A OCPD on a circuit requires an 8 AWG, type XHHW, CU conductor. It is increased to a 2 AWG due to voltage drop. Utilizing 250.122(B), the proportion is 2 AWG to 8 AWG = 66,360cm / 16,510cm = 4.02. For a 50A OCPD, according to existing Table 250.122. A 10 AWG was originally able to be used for an EGC. So, multiply (10AWG) 10,380cm X 4.02 = 41,721cm. So, now the EGC would have to be a 4 AWG.

This typically isn't a problem when installing raceways with single conductor wire. However, with multi-conductor cables, the standard EGC that is manufactured with a 2 AWG cable is a 6 AWG. This is a fairly typical problem in industrial plants today. The proportion calculation specified in 250.122 isn't being adhered to since it requires special cables to be ordered, or possibly the use of a four conductor cable with the EGC sized equivalent to the ungrounded conductors. When four insulated conductors are required plus the EGC, then special cable has to be ordered. This isn't a cost issue as much as it's a waste of copper or aluminum.

Table 250.122 as it stands today allows a reduction for the EGC. Utilizing the new table would allow the reduction to be utilized in multiconductor cables.

This a companion proposal to one for 250.122(B).
Panel Meeting Action: Reject
Panel Statement: The table leaves standard conductor sizes such as 3 AWG, 600, 700, 900, 1250, 1500, and 1750 kcmil out. There was no direction provided on how to size the equipment grounding conductor for these conductors when used as ungrounded conductors. It was also noted that in several cases the size of the equipment grounding conductor was increased one size without technical substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

MOHLA, D.: I agree the proposal is not complete and requires adding sizes missing from the proposal based on standard size equipment grounding conductor used in UL listed multiconductor cable.

250.122(F) requires each paralleled EGC be sized on the basis of ampere rating of overcurrent device protecting the circuit conductors in the raceway or cable in accordance with table 250.122. Phase conductors are protected are protected by overcurrent protective device based on total ampacity of all circuit conductors (current is shared between all circuit conductors) but EGC is required to be provided in each raceway based on overcurrent protective device without the benefit of other EGC in other paralleled raceways.The submitter is correct with the substantiation that 250.122 (F) limits the ability to parallel multiconductor cables with equipment grounding conductors.EGC in UL listed multiconductor cables is a standard size based on the ungrounded conductors.

Utilizing 250.122(F) as written when utilizing parallel conductor either requires utilizing an unlisted special cable with EGC in each cable sized based on table 250.122 or order special cables that require separate listing. AHJ's normally do not allow use of non listed cable and getting special listing requires a cost prohibitive option of either requiring large quantities of able than needed and/or cost of listing.

250.24 (C)(2) and 250.30(A)(8)(b) for services supplied or separately derived alternating current systems respectively allow grounded conductors in parallel cables to be sized based on ungrounded conductor in each raceway not total. The grounded conductor(s) on the supply side of overcurrent protective devices provides the same function on short circuit or ground fault as provided by EGC during ground fault conditions on the load side of the overcurrent protective devices. If it is safe to parallel grounded conductor on the supply side, why it is not safe to parallel EGC on the load side? If we can depend on multiple grounded conductors in parallel to share short circuit and ground fault currents in the event of a fault, we should allow EGC to do the same.

CMP 5 should consider rewriting last paragraph to allow sharing of EGC on the load side of overcurrent protective devices to permit use of listed cables with EGC be used. One suggested rewrite of the last paragraph of 250.122 (F) is give below for panel consideration:
Conductors in parallel: If the ungrounded conductors are installed in parallel in two or more raceways or cables as permitted in 310.4, the equipment grounding conductors shall also be installed in parallel in each raceway or cable. The size of the equipment grounding conductor in each raceway or cable shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway or cable. The equipment grounding conductor shall not be smaller than grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the ungrounded circuit conductors in each raceway or cable. Where supply conductors are larger than 1100 kcmil copper, or 1750 kcmil aluminum, the equipment grounding conductor shall have an area not less 12-1/2 percent of the area of the ungrounded conductors in each raceway or cable.

I agree the proposal is not complete and requires adding sizes missing from the proposal based on standard size equipment grounding conductor used in UL listed multiconductor cable.
250.122(F) requires each paralleled EGC be sized on the basis of ampere rating of overcurrent device protecting the circuit conductors in the raceway or cable in accordance with table 250.122. Phase conductors are protected are protected by overcurrent protective device based on total ampacity of all circuit conductors (current is shared between all circuit conductors) but EGC is required to be provided in each raceway based on overcurrent protective device without the benefit of other EGC in other paralleled raceways.

The submitter is correct with the substantiation that 250.122 (F) limits the ability to parallel multiconductor cables with equipment grounding conductors. EGC in UL listed multiconductor cables is a standard size based on the ungrounded conductors.

Utilizing 250.122(F) as written when utilizing parallel conductor either requires utilizing an unlisted special cable with EGC in each cable sized based on table 250.122 or order special cables that require separate listing. AHJ's normally do not allow use of non listed cable and getting special listing requires a cost prohibitive option of either requiring large quantities of able than needed and/or cost of listing.

250.24 (C)(2) and 250.30(A)(8)(b) for services supplied or separately derived alternating current systems respectively allow grounded conductors in parallel cables to be sized based on ungrounded conductor in each raceway not total. The grounded conductor(s) on the supply side of overcurrent protective devices provides the same function on short circuit or ground fault as provided by EGC during ground fault conditions on the load side of the overcurrent protective devices. If it is safe to parallel grounded conductor on the supply side, why it is not safe to parallel EGC on the load side? If we can depend on multiple grounded conductors in parallel to share short circuit and ground fault currents in the event of a fault, we should allow EGC to do the same.

CMP 5 should consider rewriting last paragraph to allow sharing of EGC on the load side of overcurrent protective devices to permit use of listed cables

with EGC be used. One suggested rewrite of the last paragraph of 250.122 (F) is give below for panel consideration:
Conductors in parallel: If the ungrounded conductors are installed in parallel in two or more raceways or cables as permitted in 310.4, the equipment grounding conductors shall also be installed in parallel in each raceway or cable. The size of the equipment grounding conductor in each raceway or cable shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway or cable. The equipment grounding conductor shall not be smaller than grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the ungrounded circuit conductors in each raceway or cable. Where supply conductors are larger than 1100 kcmil copper, or 1750 kcmil aluminum, the equipment grounding conductor shall have an area not less 12-1/2 percent of the area of the ungrounded conductors in each raceway or cable.

5-282 Log #3679 NEC-P05 **Final Action: Reject**
(Table 250.122)

Submitter: Richard F. VanWert, Middle Department Inspection Agency
Recommendation: Revise text:
Copper
70 10 or 8?
80 10 or 8?
90 10 or 8?
Substantiation: It is not clear to interpreter whether the values between 60 and 100 should be 10 copper or 8 copper.
Panel Meeting Action: Reject
Panel Statement: The heading of the table states “Rating or Setting of Automatic Overcurrent Device in Circuit Ahead of Equipment, Conduit, etc., Not Exceeding (Amperes)” indicating that an 8 AWG copper conductor is required for the stated ratings or settings in the proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-283 Log #3814 NEC-P05 **Final Action: Accept**
(Table 250.122)

Submitter: Christel K. Hunter, Alcan Cable
Recommendation: Revise text to read as follows:

Table 250.122 Minimum Size Equipment Grounding

Conductors for Grounding Raceway and Equipment

3000	400	600
4000	500	~~800~~750
5000	700	1200

Substantiation: The size of the aluminum EGC specified in Table 250.122 for a 4000 amp OCD is incorrectly sized. According to ICEA Standard #P-32-382-1999, the equivalent size aluminum EGC required to carry the same amount of fault current for the same amount of time for equivalent insulation types as a 500 kcmil copper conductor would be a 750 kcmil aluminum conductor. This size aluminum EGC is also the most generally chosen substitution size for a 500 kcmil copper conductor since it carries more current according to Table 310.16. In addition, 750 kcmil aluminum conductors are an industry standard size, whereas 800 kcmil is not.
When this table was expanded in the 1968 NEC to assist in choosing equipment grounding conductors for larger installations, there was no substantiation given for the sizes of the conductors included in the new version. The graph provided shows that a 500 kcmil copper and a 750 kcmil aluminum conductor with equivalent insulation are equally capable of carrying the same fault current.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-284 Log #997 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 250.122, ~~but in no case shall they~~ shall not be required to be larger than the circuit conductors supplying the equipment where made of the same material.
Substantiation: Table 310.21 permits an ampacity of 98 amperes for 8 AWG copper conductors, which may be protected at 100 amperes. Table 250.122 requires an an EGC of aluminum to be 6 AWG for a 100 ampere circuit. Present wording indicates a conflict with Table 250.122.
Panel Meeting Action: Reject
Panel Statement: There is no conflict and the existing wording of this section is clear. The recommendation does not improve understanding of the requirement.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-285 Log #1645 NEC-P05 **Final Action: Accept**
(250.122(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a second paragraph:
“Equipment grounding conductors shall be permitted to be sectioned within a multiconductor cable, provided the combined circular mil area complies with Table 250.122.”
Substantiation: Addition of this additional paragraph will correlate with 310.13 and the multiconductor cable product standards and is more appropriately located in 250.122. A single equipment grounding conductor frequently will not fit in the interstice between the insulated conductors in a multiconductor cable and is required to be sectioned for manufacturing purposes. The product standards already permit sectioned conductors.
The use of a positive code rule rather than an exception is in accordance with 3.1.4 of the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-286 Log #3343 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Copper, aluminum, copper-clad aluminum equipment grounding conductors and bonding conductors of the wire type shall not be smaller than shown in Table 250.122, but in no case shall they be required to be larger than the circuit conductors supplying the equipment, where made of the same material.
Substantiation: Edit. Bonding conductors should be included. Aluminum equipment grounding conductors and bonding conductors used with copper circuit conductors may be required to be larger.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided for deleting the last sentence of the existing code text. There was no technical substantiation provided for adding bonding conductor and further confusing the applications of the equipment grounding conductor and bonding-type conductors.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-287 Log #3816 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Christel K. Hunter, Alcan Cable
Recommendation: Add new text to read as follows:
250.122 Size of Equipment Grounding Conductors.
(A) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 250.122, but in no case shall they be required to be larger than the circuit conductors supplying the equipment, including in parallel circuits. Where a cable tray, a raceway, or a cable armor or sheath is used as the equipment grounding conductor, as provided in 250.118 and 250.134(A), it shall comply with 250.4(A)(5) or (B)(4).
Substantiation: Until the reorganization of the Code in 1999, the EGCs in parallel circuits were not required to be larger than the circuit conductors. When 250.122 was reorganized, the exception that clarified this case was moved into (A). Until recently, AHJs have agreed that the language in (A) applies to (F), parallel circuits. However, there has been a change in enforcement in the last few years after the publication of articles interpreting this code language. Even with the addition of the language “in no case” in the 2008 NEC, there are still AHJs requiring that the EGCs be larger than the ungrounded conductors in some parallel circuits.
The language proposed would clarify that the EGCs need not be larger than the ungrounded conductors in parallel circuits. This was clearly the case until the 1999 NEC, and no proposal was made nor substantiation provided to change the application of the code. It appears that the intent of the changes made at that time were simply to clean up the language and use positive language. However, the editorial changes have resulted in an unintended technical change that was never proposed nor discussed by the CMP.
Panel Meeting Action: Reject
Panel Statement: The substantiation provided does not support reducing the current sizing requirement. The panel concludes that the rating of the overcurrent device is the determining feature for sizing all equipment grounding conductors, including those installed in parallel circuits.
Number Eligible to Vote: 16

Ballot Results: Affirmative: 13 Negative: 3
Explanation of Negative:
DOBROWSKY, P.: Accepting this change would match the requirements for supply side bonding jumpers installed in parallel.
MOHLA, D.: This propsal should have been either accepted or as a minimum required a clear statement by the panel that that parallel circuits conductors are also circuit conductors and included. The submitter is correct in stating the requirement that "in no case the equipment grounding conductors are required to be larger than the circuit conductors" apply also to parallel circuits.Identical requirements exist in 250.24 (C) (1) for grounded conductor brought to Service Equipment and in 250.30 (A) (8) (a) for grounded conductor for separately derived systems. Grounded conductor on the supply side of overcurrent protective device performs the same function as EGC on the load side of the overcurrent protective device i.e. provides a path for ground fault currents. Sizing requirements for supply side grounded conductors and load side EGC should be same as they perform the same function during ground fault conditions.
TEMBLADOR, R.: One primary factor that limits the current that flows during a ground fault is the impedance of the circuit or circuits. Within a specific circuit, the weakest link (highest impedance) in the chain of devices connected together limits the current.
There are multiple circuit paths that are formed during a ground-fault condition which are primarily comprised of the ungrounded circuit conductor, equipment grounding conductors (EGC) and bonded metal enclosing the circuit conductors. During a phase-to-ground fault in a circuit with paralleled conductors, ground fault current will travel down all available paths to return to the source. The current that flows divides at the point of the fault and travels back to the source through both ends at which the ungrounded conductor, and the bonded metal enclosing the circuit conductors or EGC's are paralleled, or both. Current flowing down the EGC's and bonded metal enclosing circuit conductors does not only flow down one path. It too will travel down all available paths to return to the source. Consider a ground fault scenario where the EGC's are larger than the phase conductors. In this instance, the weakest link in the circuit is the paralleled ungrounded phase conductor and it will limit the fault current.
The equipment grounding conductors should not be required to be larger than the ungrounded phase conductors where conductors are paralleled in multiple raceways or cable.

5-288 Log #3866 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Mike Weitzel, Bechtel
Recommendation: Revise text as follows:
250.122(A) General, Copper, aluminum...
Add one sentence to the end of the paragraph:
<u>Where a metallic raceway meets the requirements to serve as an equipment grounding conductor in accordance with 250.118 and a wire type equipment grounding conductor is installed in the metal raceway, the equipment grounding conductor shall meet the minimum sizing requirements for the feeder or circuit EGC in accordance with 250.122.</u>
Substantiation: Wire type equipment grounding conductors have been added to raceways that at one time qualified as an equipment grounding conductor in accordance with 250.118, and later did not meet the requirements. Examples are as the circuit or feeder installation was damaged, and unanticipated deterioration of the metal raceway system occurred. The circuit then has undersized equipment grounding conductor fault current path, which may remain undiscovered, but could be ineffective to pass enough current to clear a fault in accordance with 250.4(A).
The point is that the wire type equipment grounding conductor was not required by the NEC in this case, and that if installed it should be full-sized per 250.122.
Panel Meeting Action: Reject
Panel Statement: The recommendation simply repeats what is stated in the opening text of Section 250.122. Additionally, Section 250.120(A) requires wire type equipment grounding conductors to comply with the applicable provisions of the code.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-289 Log #4095 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Add exception (1) as follows:
Exception (1). In cases where a High-Resistance Grounded Neutral System is employed, in accordance with 250.36, the Equipment Grounding Conductor shall be permitted to be sized in accordance with the Equipment Bonding Jumper per 250.36(G).
Substantiation: Existing language in 250.122(A) requires equipment grounding conductors (EGC) to be sized in accordance with Table 250.122. 250.36(E), however, defines the "Equipment Bonding Jumper" as "the connection between the equipment grounding conductors and the grounding impedance" and 250.36(G) further defines how to size the "Equipment Bonding Jumper". As currently written, Table 250.122 typically results in an equipment grounding conductor being sized larger than the "Equipment Bonding Jumper", even though as previously discussed, the "Equipment Bonding Jumper" is placed in series between the "EGC" and the grounding impedance. Clarifying in 250.122(A) that "EGC" Sizing should be in accordance with 250.36(G) when an HRG system is employed would correct this problem without impacting the safety of the installation, as the grounding resistor limits the current in the EGC in an HRG system.
Panel Meeting Action: Reject
Panel Statement: The equipment grounding conductor has to carry full short-circuit current when a second ground-fault occurs. The equipment bonding jumper and the neutral conductor currents are limited by the ground impedance inserted into that part of the circuit for the first ground-fault, but not in the event of a second ground-fault.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to reject this proposal for the reasons indicated in the panel statement.

5-290 Log #1511 NEC-P05 **Final Action: Reject**
(250.122(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action to Reject this proposal while also providing revised text.
This action will be considered by the panel as a public comment.
Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Recommendation: Revise text to read as follows:
(B) Increased in Size. Where ungrounded conductors are increased in size <u>from the minimum size that has sufficient ampacity for the intended installation</u>, grounding conductors, where installed, shall be increased in size proportionally according to the circular mil area of the ungrounded conductors.
Substantiation: NOTE: This is the first of two similar proposals that I am submitting. Each is intended to resolve the same concern, but the two accomplish this resolution in different ways. The following substantiation paragraph is identical for both.
This proposal would correct an error in the use of the English language. The phrase "increased in size" is incomplete, without there being some reference point from which to determine whether the size had been increased. The phrase begs the question, "Increased from what?" Absent an answer to that question, the paragraph is unenforceable.
An absurd example would be if a mechanical engineer decides to use a larger pump than had appeared on the preliminary plans. As a result, the electrical engineer's final plans must show #10 wire, instead of the #12 shown in the preliminary plans. Is that an "increase in size"? Certainly not, because the #12 does not have sufficient ampacity for the new, larger motor. A more practical example would be if a project's ambient temperature forces the use of a larger wire, because of the correction factors of Table 310.16. Use of the smaller size wire would not have been legal, because its ampacity, under the conditions of use, was insufficient. Use of the next size larger wire was required, in order to obtain the minimum ampacity for the application. Is that an "increase in size"? It should not be, but the present wording of 250.122(B) does not make a clear distinction on this point.
The wording of this article needs to clearly establish whether it is intended to mean "an increase in size from a size that could have been legally used in this application," as opposed to "an increase in size from the value shown in the ampacity tables, before the application of any adjustment or correction factors."
Panel Meeting Action: Reject
Revise text to read as follows:
(B) Increased in Size. Where ungrounded conductors are increased in size from the minimum size that has sufficient ampacity for the intended installation, grounding conductors, where installed, shall be increased in size proportionally according to the circular mil area of the ungrounded conductors.
Panel Statement: The recommended text does not improve the understanding of the provision of Section 250.122(B). The panel concludes there are numerous reasons for increasing the size of the ungrounded conductors in addition to ampacity adjustment and correction factors such as considerations for voltage drop, overcurrent device performance, and other engineering factors. The NEC is a minimum requirement and this section is addressing any increase over the minimum required by code.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRENDER, D.: This proposal has merit and should have been accepted in principle. Establishing the threshold from which conductors are increased would add clarity to the existing rule. The reported Panel vote of Reject is inconsistent with the panel action as a revised Panel action is reported.

5-291 Log #2205 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Paul Guidry, Fluor Enterprises, Inc
Recommendation: Delete 250.122(B). This is a companion proposal to one to revise Table 250.122.
~~(B) Increased in Size. Where ungrounded conductors are increased in size, equipment grounding conductors, where installed, shall be increased in size proportionately according to the circular mil area of the ungrounded conductors.~~
Substantiation: This section will not be required if the equipment grounding conductor is based upon the size of the ungrounded conductors, much like 250.66 is presently. See example on companion proposal. The calculation required today doesn't take into account reduced sizes of equipment grounding conductors.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 5-281 was to reject, thus this companion proposal is also rejected.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

Ballot Results: Affirmative: 16

5-293 Log #4604 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the words "for reasons other than the application of ampacity adjustment factors" after "Where ungrounded conductors are increased in size".
Substantiation: This is a resubmittal of Proposal 5-276 in the previous code cycle, which was accepted and then reversed in the comment period. It should have remained accepted. Since this submitter cannot improve on the original substantiation, it is repeated below:

"Where ampacity correction factors are applied, the conductor is required to be protected at its ampacity after the adjustments, or it can be increased in size. Conductors are often increased in size when ampacity correction factors are necessary rather than reducing the size of the overcurrent protective device. The feeder or branch circuit equipment grounding in these cases is not impacted from a performance standpoint and the Code should not require more than the minimum sizes provided in Table 250.122 in these specific cases."

What can be done, however, is respond to the substantiation that came with the comment that resulted in rejection. The historical context for 250.122(B) addressed instances where increases to lower voltage drop implied a similar benefit for a long equipment grounding conductor. The substantiation for the subsequent change (from voltage drop to any increase) pointed to instances where designers would ignore the rule by simply stating that the increase was for design reasons unrelated to voltage drop. None of that had anything to do with an increase to meet minimum NEC requirements, even on a feeder that is only 10 ft long. Example D3(a) does not make this increase, but the issue will be reviewed in the 2011 edition of the Code.

In the prior comment period, the panel rejected this wording based on reasoning that derating reflected increased heating and the resistance of wire increases with increasing temperatures, which was comparable to the traditional voltage drop problem. This ignores the simple fact that the reason to apply derating factors is to prevent additional heating. The only way to make the comment substantiation correct is to violate the Code and not apply the derating factors.

For example, suppose a feeder is being designed to carry 100 A (noncontinuous), and is initially sized at 3 AWG THHN with an 8 AWG equipment grounding conductor. Then it is discovered that there is harmonic loading (derating factor = 0.8) and that the ambient temperature will be 50°C, resulting in an adjustment factor of 0.82. The smallest wire that can be used under these conditions is 1/0 AWG THHN, with an adjusted ampacity of 112 A. At 30°C (the usual design constraint in Table 310.16) and no 310.15(B)(2)(a) derating the resistance of 3 AWG is 0.209 Ù/1000 ft and that of 8 AWG is 0.653 Ù/1000 ft; (average out and back, out on the ungrounded conductor to the fault, and back over the equipment grounding conductor, being 0.431 Ù/1000 ft). At 50°C the resistance of 1/0 AWG is 0.112 Ù/1000 ft and that of 8 AWG is 0.702 Ù/1000 ft (average out and back being 0.407 Ù/1000 ft), about a 6 percent decrease. The total impedance of the faulted circuit decreased 6 percent over the conditions for which everyone agrees the values in Table 250.122 give acceptable performance. Of course, if the equipment grounding conductor were proportionately increased (to 4 AWG) the impedance would decline further, but a result that only improves on the NEC minimum requirement does not justify a still further improvement.

5-294 Log #1512 NEC-P05 **Final Action: Reject**
(250.122(B), FPN (New))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Recommendation: Revise text to read as follows:

(B) Increased in Size. Where ungrounded conductors are increased in size, grounding conductors, where installed, shall be increased in size proportionally according to the circular mil area of the ungrounded conductors.

<u>FPN: A conductor that is larger than the minimum size that has sufficient ampacity for the intended installation, after any applicable adjustment factors and correction factors have been applied, is considered to have been increased in size.</u>
Substantiation: NOTE: This is the first of two similar proposals that I am submitting. Each is intended to resolve the same concern, but the two accomplish this resolution in different ways. The following substantiation paragraph is identical for both.

This proposal would correct an error in the use of the English language. The phrase "increased in size" is incomplete, without there being some reference point from which to determine whether the size had been increased. The phrase begs the question, "Increased from what?" Absent an answer to that question, the paragraph is unenforceable.

An absurd example would be if a mechanical engineer decides to use a larger pump than had appeared on the preliminary plans. As a result, the electrical engineer's final plans must show #10 wire, instead of the #12 shown in the preliminary plans. Is that an "increase in size"? Certainly not, because the #12 does not have sufficient ampacity for the new, larger motor. A more practical example would be if a project's ambient temperature forces the use of a larger wire, because of the correction factors of Table 310.16. Use of the smaller size wire would not have been legal, because its ampacity, under the conditions of use, was insufficient. Use of the next size larger wire was required, in order to obtain the minimum ampacity for the application. Is that an "increase in size"? It should not be, but the present wording of 250.122(B) does not make a clear distinction on this point.

The wording of this article needs to clearly establish whether it is intended to mean "an increase in size from a size that could have been legally used in this application," as opposed to "an increase in size from the value shown in the ampacity tables, before the application of any adjustment or correction factors."
Panel Meeting Action: Reject
Panel Statement: The recommended fine print note does not improve the understanding of the provision of 250.122(B).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-295 Log #1479 NEC-P05 **Final Action: Accept**
(250.122(F))

Submitter: Richard A. Janoski, Finleyville, PA
Recommendation: Revise text to read as follows:

250.122(F) Conductors inParallel. Where conductors are run in parallel in multiple raceways or cables as permitted in 310.4, the equipment grounding conductors, where used, shall be run in parallel in each raceway or cable. <u>Where conductors are run in parallel in the same raceway, cable, or cable tray as permitted in 310.4, a single equipment grounding conductor shall be permitted. Equipment grounding conductors installed in cable tray shall meet the minimum requirements of 392.3(B)(1)(c).</u>

Each ~~parallel~~ equipment grounding conductor shall be sized on the basis of the ampere rating of the overcurrent device protecting the circuit conductors in the raceway, cable <u>or cable tray</u> in accordance with Table 250.122.
Substantiation: When ungrounded conductors are installed in parallel in the same raceway, cable, or cable tray, only one equipment grounding conductor needs to be installed for the entire parallel set. The existing code section does not address parallel installations in a single raceway, or cable tray. Without this language, this code is often misinterpreted as there is a need to install one equipment grounding conductor for each ungrounded parallel set in a cable tray. The ungrounded conductors are being paralleled to create a combined current carrying capacity. There is no need for the equipment grounding conductor to be paralleled when installed in the single raceway, cable, or cable tray. The conductor would be sized per Table 250.122 and would be at sufficient size to serve as the grounding means for equipment and to also serve as the ground fault current path for the installation. The proposed text should

add clarity to how an equipment grounding conductor should be installed in parallel.

Ballot Results: Affirmative: 16

5-296 Log #2865 NEC-P05 **Final Action: Reject**

(250.122(F))

Submitter: James M. Imlah, City of Hillsboro

Recommendation: Revise text to read as follows:

250.122 Size of Equipment Grounding Conductors.

(F) Conductors in Parallel. Where conductors are run in parallel in multiple raceways or cables as permitted in 310.4, the equipment grounding conductors, where used, shall be run in parallel in each raceway or attached to each cable.

Substantiation: As written equipment ground conductors shall be connected in parallel "in" each raceway or cable. It has been interpreted that a cable equipment grounding conductor has to be included within the jacketed cable. Unless cables are special ordered for paralleling equipment grounding conductors, this can be a long lead item. Additionally, I do not believe the intent was to be restrictive that alternate methods could not be applied when a cable is installed in a raceway. Yes it is possible to include an appropriately size equipment grounding conductor with a cable in a raceway (where allowed by manufacturer's allowances or code references), it is not so clear when type MC, TC, or possibly other cable types are run in the open. This appropriately sized could be attached by a method (cable ties, tape, or any other acceptable method) along its entire length.

Panel Meeting Action: Reject

Panel Statement: The installation proposed by the submitter is a violation of Sections 300.3 and 250.134(B).

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-297 Log #589 NEC-P05 **Final Action: Reject**

(250.126)

Submitter: Dennis J. Cox, Elkhart County Building Dept.

Recommendation: Add new text as follows:

Heading: 250.126 Identification of Wiring Device Terminals (and Splices)

Text: The Terminal (and splice connections) of the equipment grounding conductor shall be identified by one of the following:

(4) (A approved bare copper krimp connector).

Substantiation: This change would include wire nuts in device boxes to be identified as green or bare, for equipment grounding conductors. 250.126 is unclear, and this change would help people to better understand this section.

Panel Meeting Action: Reject

Panel Statement: This section is for device terminals only. The recommended text is overly restrictive, and there is no technical substantiation provided on why the present requirements are inadequate. The proposed text expands the requirement for identifying terminals to splices. The panel concludes that this section should apply to identification of wiring device terminals only.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-298 Log #4171 NEC-P05 **Final Action: Reject**

(250.128)

Submitter: Robert E. Johnson, ITE Safety

Recommendation: Add new text as follows:

250.128 Ground Access Point. A listed Ground Access Point shall be provided within three feet of and external to the service disconnect enclosure. this ground access point shall consist of a 1/4 in. square bar, minimum 6 in. long, suitable for ground connections. Provision of ground access points at other locations such as service panels is permitted. It shall be bonded to the grounded service conductor with minimum 6 AWG. Space for wiring or attachment devices of two inches on either side, one inch behind and one inch in front shall be provided. It shall be labeled or marked with the symbol shown in figure 250.126.

The ground access point shall be provided with two additional terminals for attachment of up to 6 AWG conductors and four terminal points for connections of up to 12 AWG conductors. The use of additional terminals or devices intended for ground access points is expected.

Substantiation: A host of points may need grounding in a typical home. These include

- Telephone systems
- CATV
- TV and similar antennas
- Heating ducts
- Aluminum siding
- Structural steel
- Metal greenhouse frames
- Other metallic structures or appliances likely to become energized.
- Plumbing for water, gas, air, etc.
- Portable generators

Installation of these systems is done by phone or cable techs, homeowners, plumbers, carpenters and many others who have no business getting into an electrical panel in order to make a secure ground. It is also not advisable to drill into an enclosure to drive ground screws into electrical boxes or wrap wires around mounting screws just to get a ground. They need a safe, dependable and accessible point to make ground connections. Thus provides a simple standardized mounting for use by manufacturers for lightning arrestors, terminals and other items needing to be grounded by a non-electrician.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The requirements proposed by the submitter are included in existing code language in Section 250.94 for the intersystem bonding termination. The product prescriptive text is unnecessary and overly restrictive as there are already several methods and listed products to provide the bonding termination desired. There is no technical substantiation to provide an access point for other than those systems covered in Section 250.94. The intersystem bonding termination is not limited to only three termination points.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

(250.130(A))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

250.130(A) For Grounded Systems. The connection shall be made by bonding the equipment grounding conductor to the grounded service-entrance conductor and the grounding electrode conductor.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

(250.142(B))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(B) Load-Side Equipment. Except as permitted in 250.30(A)(1) and 250.32(B) exception, a grounded circuit conductor shall not be used for grounding non–current-carrying metal parts of equipment on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means or the overcurrent devices for a separately derived system not having a main disconnecting means.
Exceptions to remain unchanged.
Substantiation: This is simply correcting the code reference after the 2008 change to 250.32(B).
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-305 Log #1314 NEC-P05 **Final Action: Reject**
(250.146(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Where the box is mounted on the surface or extends past the surface direct metal-to-metal...(remainder unchanged).
Substantiation: Edit. The provision should include semi-recessed boxes.
Panel Meeting Action: Reject
Panel Statement: The recommended text does not add clarity to the current requirement. The current requirement ensures that there will always be direct metal-to-metal contact between the surface-mounted box and the device. A partially recessed box does not provide the same assurance.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-306 Log #4605 NEC-P05 **Final Action: Accept**
(250.146(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the words "or nut" after "thread locking or screw" and before "locking means and".
Substantiation: This addition will clarify that the knurled nut surfaces now commonly provided with raised covers meet this requirement. Otherwise the terminology can be read to insist on something that actually engages the screw, such as a lock washer under the screw head ("screw locking"), or something which actually engages the threads ("thread locking"), such as a jam nut.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-307 Log #1313 NEC-P05 **Final Action: Reject**
(250.148)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Metal enclosures (boxes) are already required to be grounded by 250.86 and provided with grounding means (314.40(D)). Whether circuit conductors are spliced or terminated in equipment is irrelevant; if they pass through unspliced or not terminated the provision doesn't apply. Connection to a nonmetallic box where nothing is to be grounded serves no purpose. This provision doesn't cover enclosures other than boxes, such as cabinets, wireways, or auxiliary gutters. Connection of grounding conductors is covered

elsewhere in the Code such as 250.148(A) and (C). The exception is covered by 250.146(D).
Panel Meeting Action: Reject
Panel Statement: The panel concludes that there are necessary rules in 250.148 that cover grounding continuity and attachment of grounding equipment to the box. Additionally, the panel does not follow the circular logic provided in the substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-308 Log #4530 NEC-P05 **Final Action: Reject**
(250.150 (New))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing text of the 2008 NEC as follows:
250.150 Snap Switches . Snap switches, including dimmer and similar control switches, shall be connected to an equipment grounding conductor. Snap switches shall be considered to be part of an effective ground-fault current path if either of the following conditions is met:
(1) The switch is mounted with metal screws to a metal box or metal cover that is connected to an equipment grounding conductor or to a nonmetallic box with integral means for connecting to an equipment grounding conductor.
(2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.
Exception: If an equipment grounding conductor does not exist within the enclosure for snap-switches or similar equipment, a snap switch without a connection to an equipment grounding conductor shall be permitted for replacement purposes only. A snap switch wired under the provisions of this exception and located within reach of earth, grade, conducting floors, or other conducting surfaces shall be provided with a faceplate of nonconducting, noncombustible material.
Substantiation: This proposal intends to relocate rules on connections of equipment grounding conductor to snap switches from 404.9(B) to Article 250 under the jurisdiction of CMP-5. The concept in 404.9(B) of allowing a GFCI device to serve as a substitute for an equipment grounding conductor is not included to ensure an effective ground-fault circuit path.
In essence, the practice of installing a GFCI as a substitute for an equipment grounding conductor connected creates a “trap” of sorts. Since a ground-fault return path is not provided, a ground-fault in a switch box can energize a metal cover waiting for the unsuspecting user person to complete the fault return path by contacting the energized switch plate and a grounded surface. The person provides the test path for the GFCI device! This hardly seems appropriate!
If that isn’t bad enough, recent published data from UL indicates nearly 10 percent of the existing GFCI devices tested as a part of the Aging Wiring Study would not operate properly. IAEI published an article several years ago that showed a significant number of GFCI devices tested by home inspectors would not function properly. Hardly the sort of reports needed to instill confidence in the technology!
Section 3.3.4 of the NEC Style Manual states that “where” should not be used to mean “when” or “if.” This proposal intends to use the word “if” where appropriate.
Panel Meeting Action: Reject
Panel Statement: The recommended text is already covered by the requirements in Section 404.9(B). Additionally, see the panel statement on Proposal 5-264 relative to the GFCI allowance for limited applications where equipment grounding conductors are not present.
Number Eligible to Vote: 16

(250.178)

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:
250.178 Instrument Equipment Grounding Conductor.
Substantiation: The revision has been made to correlate with the deletion of the term “Grounding Conductor” in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term “grounding conductor” from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman’s report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term “grounding conductor.”

5-311 Log #4366 NEC-P05 **Final Action: Reject**
(250.184(A)(1) and 250.184(A)(3))

Submitter: Donald W. Zipse, Electrical Forensics, LLC
Recommendation: Delete Section 250.184 (A) (1) and Section 250.184 (A) (3) and renumber
Substantiation: It is important to re-state the purpose of the NEC: “It is the safeguarding of persons from hazards arising from the use of electricity.
By continuing to allow the “grounded circuit conductors”, commonly referred to as the neutral to be installed bare allows the neutral current to flow uncontrolled over the earth. This uncontrolled flow of “stray current” results in the potential to harm not only humans but to cows and pigs but has resulted in severely injuring two teenagers and killing another during this past code cycle. (New information)
“In order to have and maintain an electrical installation safe from electrical shocks and to prevent electrocution from stray current: All continuously, flowing man made electric current shall be contained within a conductor, insulated from earth, except at one place within the system and only one place can the neutral be connected to earth.”
This is accomplished within industrial facilities since they do not make the bastardized electrical transformer connection between the primary neutral and the secondary neutral, which allows the continuous flow of dangerous and hazardous high voltage neutral current over the earth and ground conductors. The industrial facilities keep the neutral insulated and carry the ground conductor with the phase conductors. (See IEEE Standard 141, “Electrical Power Distribution”, The Red Book.)
Within the past three years 4 young people were injured due to the uncontrolled flow of neutral current in the earth. Two suffered permanent brain damage and another was declared dead due to electrocution from neutral current (Bryan K. Fitzpatrick (“Bryan”) and Diana J. Fitzpatrick (“Diana”), individually, and Timothy Sean Fitzpatrick (“Timothy”), a minor, by and through his Next Friend Bryan K. Fitzpatrick).
Over thirty years ago the Code Making Panel charged with trailers realized persons were being killed by neutral current flowing uncontrolled on the trailers and the over the earth. That panel required an insulated neutral conductor run to all trailers. The next code cycle the panel responsible for marinas adopted the same requirement for insulated neutrals. For 21 years code proposals were submitted to a third panel to make the neutral insulated, which after seven (7) code cycles they did.
Proposals have been submitted to other sections of the code to eliminate bare neutral conductors.
Panel Meeting Action: Reject
Panel Statement: The submitter’s substantiation does not apply to the recommendation. Deleting Section 250.184(A)(1) eliminates all of the insulation requirements for installing neutrals for systems and circuits of 1 kV or over. Section 250.184(A)(3) does not exist.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-312 Log #4365 NEC-P05 **Final Action: Reject**
(250.184(C))

Submitter: Donald W. Zipse, Electrical Forensics, LLC
Recommendation: Delete Section 250.184 (C)
Substantiation: I am trying to save paper by asking the panel to re-read my NEC 2008 cycle proposal for the elimination of the dangerous and hazardous multigrounded neutral distribution system.

However, new information detailing how dangerous multigrounded neutral distribution system have come to light during the past three years. Within the past three years 4 young people were injured due to the uncontrolled flow of neutral current in the earth from a multigrounded neutral distribution system.. Two suffered permanent brain damage and another was declared dead due to electrocution from neutral current (Bryan K. Fitzpatrick ("Bryan") and Diana J. Fitzpatrick ("Diana"), individually, and Timothy Sean Fitzpatrick ("Timothy"), a minor, by and through his Next Friend Bryan K. Fitzpatrick).

The solution is to require a transformer at the interface with the utilities dangerous and hazardous multigrounded neutral distribution system. I have installed such a transformer at my summer home in Rehoboth Beach, DE. The New York PUC required the local utility to install a test transformer several years ago. The documentation appeared as an IEEE technical paper.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided documented substantiation for the recommendation to delete Section 250.184(C). Deletion of this section would eliminate an important and safe option for neutral installation on systems and circuits of 1 kV and over.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

MOHLA, D.: The Panel Statement is not correct. This proposal has been presented many times in the past for each Code cycle. Each time the Proposer presents additional substantiation of the hazards of the multigrounded system without repeating the previous substantiation. New Panel members are remiss if they do not seek out the previous substantiation which is pertinent to deciding how to address this issue. The Panel Statement is not correct in stating that the multigrounded neutral system is safe. This section was added in a previous Code cycle without substantiation except to state that it was permitted in the National Electric Safety Code used by the Utilities. Use by the Utilities is for the purpose of protecting the linemen and does not address the issue of ground currents that are hazardous to the public.

5-312a Log #CP512 NEC-P05 **Final Action: Accept**
(250.186(A))

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:

(A) Location. The grounding impedance shall be inserted in the grounding <u>electrode</u> conductor between the grounding electrode of the supply system and the neutral point of the supply transformer or generator.
Substantiation: The revision has been made to correlate with the deletion of the term "Grounding Conductor" in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term "grounding conductor" from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman's report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term "grounding conductor."

5-313 Log #615 NEC-P05 **Final Action: Accept in Principle**
(250.190)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel's 6 and 10 for comment.
Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Add new text to existing 250.190, second paragraph and FPN No. 1 to read:

Equipment grounding conductors not an integral part of a cable assembly shall not be smaller than 6 AWG copper or 4 AWG aluminum. <u>Equipment grounding conductors shall be sized in accordance with Table 250.122 based on the time phase overcurrent setting of the protection device.</u>
<u>FPN No. 1: The protection device may be a breaker, fuse, or protection relay.</u>
<u>FPN No. 2:</u> See 250.110, Exception No. 2, for pole-mounted distribution apparatus.
Substantiation: Presently, there isn't any guidance given in Art. 250, Part X (systems over 1kV) on what the minimum equipment grounding conductor size is to be based on other than the automatic overcurrent device ahead of the equipment. The addition of this sentence should clarify that the size should be based upon the protective device whether it's a breaker, fuse or relay.
Panel Meeting Action: Accept in Principle

Revise Section 250.190 in the 2008 NEC to read:
250.190 Grounding of Equipment.
(A) Equipment Grounding. All non–current-carrying metal parts of fixed, portable, and mobile equipment and associated fences, housings, enclosures, and supporting structures shall be grounded.
Exception: Where isolated from ground and located such that any person in contact with ground cannot contact such metal parts when the equipment is energized shall not be required to be grounded.
FPN: See 250.110, Exception No. 2, for pole-mounted distribution apparatus.
(B) Grounding Electrode Conductor. If a grounding electrode conductor connects non-current carrying metal parts to ground, the grounding electrode conductor shall be sized in accordance with Table 250.66 based on the size of the largest ungrounded service, feeder, or branch circuit conductors supplying the equipment. The grounding electrode conductor shall not be smaller than 6 AWG copper or 4 AWG aluminum.
(C) Equipment Grounding Conductor. Equipment grounding conductors shall comply with (C)(1) through (C)(3)
(1) General. Equipment grounding conductors that are not an integral part of a cable assembly shall not be smaller than 6 AWG copper or 4 AWG aluminum.
(2) Shielded Cables. If the cable assembly is suitably rated for the ground fault current and is of the concentric neutral type, the shield conductors shall be permitted as the equipment grounding conductor. For solidly grounded systems, the cable copper screen or ribbon shield or combination of both shall not be used as an equipment grounding conductor.
(3) Sizing. Equipment grounding conductors shall be sized in accordance with (a) and (b) as follows:
(a) Equipment grounding conductors shall be sized in accordance with Table 250.122 based on the current rating of the fuse or the overcurrent setting of the protective relay.
FPN: The overcurrent rating for a circuit breaker is the combination of the current transformer ratio and the current pickup setting of the protective relay.
(b) Equipment grounding conductors that are not an integral part of a cable assembly shall not be smaller than 6 AWG copper or 4 AWG aluminum.
~~FPN No.1: The protection device may be a breaker, fuse, or protection relay.~~
~~FPN No. 2: See 250.110, Exception No. 2, for pole-mounted distribution apparatus.~~
Panel Statement: The panel revision of Section 250.190 separates equipment connected to an equipment grounding conductor from equipment connected to a grounding electrode conductor and provides requirements for connection and conductor size. Editorial changes and new fine print notes have been added for clarity and to assist the user in understanding these provisions. The panel action meets the intent of the recommendation relative to the sizing requirements for equipment grounding conductors. The panel action incorporates a new provision on the limited use of cable shields as equipment grounding conductors based on their action on Proposal 5-314. CMP-5 recommends that this action be referred to CMP-6 and CMP-10 for comment.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

HAMMEL, D.: I agree with the revision of Section 250.190. However, the text of the current second paragraph is repeated in the revised 250.190(C)(1) and (C)(3)(b). It is not necessary to repeat the rule.

MOHLA, D.: If the cable assembly <u>metallic insulation tape</u> shield or <u>drain wire</u> shield is suitably rated for the ground fault current ~~*and*~~ or is of the concentric neutral type <u>with an overall cable jacket</u>, the <u>metallic</u> shield conductor shall be permitted as the equipment grounding conductor. ~~For solidly grounded systems,~~ <u>The</u> Cable <u>copper tape screen</u> or ~~ribbon~~ drain wire shield or combination of both shall not be used as equipment grounding conductor <u>for solidly grounded systems.</u>

Terms used in the proposal have been corrected to utilize terminology used in 310.6. Concentric neutral wires without an overall jacket have been reported damaged thereby affecting the integrity of shield continuity. Last sentence has been rearranged for clarity<u>.</u>

5-314 Log #3853 NEC-P05 **Final Action: Accept in Principle**
(250.190)

Submitter: Bill McGovern, City of Plano
Recommendation: Revise text as follows:

Equipment grounding conductors not an integral part of cable assembly shall not be smaller than 6 AWG copper or 4 AWG aluminum. <u>The cable copper screen or ribbon shield or combination of both shall not be used as as an equipment grounding conductor.</u>
Substantiation: There have been three instances of medium voltage distribution systems 24940Y/14400 being installed using ribbon shield MV cable and the ribbon being used as the equipment grounding conductor. The cross sectional area of the copper ribbon only equates to an 8 AWG copper conductor, too small to meet the requirements of 250.190. Placing this statement in the body of the text makes it clear in no uncertain terms that an equipment grounding conductor is required to be installed along with the medium voltage feeder conductors.

Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 5-313 meets the intent of the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-315 Log #616 NEC-P05 **Final Action: Accept in Principle**
(250.191 (New))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Add new Section 250.191 to read:
<u>250.191 Grounding System in AC Substations. For AC Substations, the grounding system shall be in accordance with Part III of Article 250.</u>
<u>FPN: For further information on AC substation grounding, see ANSI/IEEE 80-2000, *IEEE Guide for Safety in AC Substation Grounding.*</u>
Substantiation: The NEC presently doesn't address part of the grounding systems commonly used in AC high voltage substations such as touch and step bonding. NEC requirements are a good start, but IEEE 80 goes into much more detail on how to design a proper grounding system for AC substations.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
250.191 Grounding System <u>at</u> ~~in~~ AC Substations. For AC substations, the grounding system shall be in accordance with Part III of Article 250.
FPN: For further information on <u>outdoor</u> AC substation grounding, see ANSI/IEEE 80-2000, *IEEE Guide for Safety in AC Substation Grounding.*
Panel Statement: The panel revision clarifies the title of the new section and provides more specificity to the fine print note.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this revision. CMP-5 is aware that this provision is somewhat redundant, but concluded that the reference to Part III is warranted. Where high and medium voltage systems are concerned, it is important to include this language here to clarify that Part III does apply unless excluded by falling under the NESC or another exemption. It is recognized that more complete requirements related to medium and high voltage installations need to be included in the NEC for installations where the NEC applies.

ARTICLE 280 — SURGE ARRESTERS

5-316 Log #2730 NEC-P05 **Final Action: Accept**
(280.5)

Submitter: T. W. Olsen, Siemens Energy, Inc.
Recommendation: Delete 280.5, without substitution. ~~280.5 Listing. A surge arrester shall be a listed device.~~
Substantiation: 280.5 was added in the 2008 edition of NFPA 70. There are no listed surge arresters for 1000V and higher. For reference, see category VZQK in the UL. This category is entitled "Surge Arresters 1000 Volts and Higher", and it has no listing of firms that have a listing to this category. The UL reference is available at the following website http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm, and enter VZQK is in the "UL Category Code" box.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
MELLO, C.: See the ballot and comment for Proposal 5-317.
WILLIAMS, D.: Surge Arresters should remain listed and this proposal be rejected. As an electrician or an electrical inspector we often refer to the installation instructions that come with listed products for installing them properly. There is comfort in knowing that the product being installed has been evaluated by a National Recognized Testing Laboratory and tested to an appropriate listing standard. There are no surge arresters listed at this time, because they have not been submitted to a testing laboratory to be considered for meeting the standard criteria for surge arresters. Surge arresters are a product that electricians and inspectors are not very familiar with and the listing mark should be something they look for in choosing a product.

5-317 Log #2863 NEC-P05 **Final Action: Accept**
(280.5)

Submitter: Paul Lindemulder, MacLean Power Systems
Recommendation: Delete 280.5
~~280.5 Listing. A surge arrester shall be a listed device.~~
Substantiation: The 2008 NEC introduced a Listing requirement for surge arresters rated over 1000V for the first time in the history of the NEC. There was no substantiation presented that a safety issue exists with arresters rated over 1kV. The Listing requirement for surge protection was introduced into the NEC when Article 285 was introduced into the NEC to ensure the technology employed in a TVSS would protect safely.
The UL substantiation for adding 280.5 to the 2008 NEC refers strictly to low voltage arresters and UL1449. However section 280 is titled Surge Arresters Over 1kV. These arresters are not tested to UL1449 (as they note) and have very different application and test requirements. The only reference to high voltage arresters is that "The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over".
Therefore Article 280.5 does not apply to low voltage surge protective devices or conflict with the requirement to list them. Therefore their argument provides no substantiation for listing surge arresters over 1kV.
Surge arresters rated above 1000V are governed by the ANSI/IEEE standard. More than 99% of arresters installed in the US are for use by the electric utilities. Electric utilities maintain their own approval process for manufacturers based on the ANSI/IEEE standard. UL does not have the capability to test surge arresters rated 1000V and above. To require listing by UL will be redundant testing for products that have already been certified independently for utility approval.
Installation of surge arresters is performed by installers trained and certified specifically for equipment 1000V and above. Of the arresters installed in non-utility plant, by virtue of the safety requirements for higher than 1kV, all of these arresters are installed in safe locations not accessible to the public. Safety requirements are described in the 2007 National Electrical Safety Code (NESC) and OSHA 1910.269. The UL category has been in existence for years but there have been no market or safety issues that have led any surge arrester manufacturers to pursue such a listing. To date, there are no Listed surge arresters over 1000V. Currently there is no means to comply with the NEC requirement for Listed arrester over 1000V and there is no substantiation that would indicate a safety issue exists for arresters rated over 1000V. The Listing requirement for arrester has no basis for being in the NEC and should be deleted.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
MELLO, C.: Just because there are no Listings is no reason to delete this requirement. This is a new requirement and has not been really implemented by enforcement to cause listings to happen. Without a Listed surge arrester there is no way for users that are not part of utilities to have assurance of its safety, proper operation, and compliance with the applicable safety standard(s). Contrary to what was presented, these surge arrestors at the 5 kV, 8 kV, 15 kV, 25 kV and higher voltage classes are being installed at other than the interface of the utility and the premises wiring. These products are being installed by regular electricians separately or being installed within medium voltage equipment being installed or maintained by electricians. There are numerous projects underway today with outdoor substations, padmounted transformers and medium voltage switchgear incorporating these type surge arresters. Changes to the IEEE standard for surge arresters adopted since the completion of the 2008 NEC cycle, now requires short circuit testing and a short circuit rating. The present surge arrestors on the market likely are not tested for short circuit as yet and will not be unless there is a requirement to do so. The base technology of these surge arresters, is a MOV, which is the same technology as the under 1KV SPDs covered in UL 1149 and required by 285.5. The substantiation for the inclusion of listing for these in Article 285 was based on the same concerns for the reliability and performance under abnormal conditions and that a failure does not cause additional damage or hazards to the installation. It should be noted that there has been one submission by a manufacturer for a surge arrester over 1KV and that certification project is underway.
WILLIAMS, D.: See my Explanation of Negative on Proposal 5-316 (Log #2730).

5-318 Log #3592 NEC-P05 **Final Action: Accept**
(280.5)

Submitter: Chad Kennedy, Square D Company/Schneider Electric / Rep. NEMA
Recommendation: Delete 280.5
~~280.5 Listing. A surge arrester shall be a listed device.~~
Substantiation: The 2008 NEC introduced a Listing requirement for surge arresters rated over 1000V for the first time in the history of the NEC. There was no substantiation presented that a safety issue exists with arresters rated over 1kV. The Listing requirement for surge protection was introduced into the NEC when Article 285 was introduced into the NEC to ensure the technology employed in a TVSS would protect safely.
To date, there are no Listed surge arresters over 1000V. The UL category has been in existence for years but there has been no market or safety reason to pursue such listing. As a purchaser of these devices, there is no means to comply with the NEC requirement for a Listed arrester over 1000V and there is no substantiation that would indicate a safety issue exists for arresters rated over 1000V. The Listing requirement for arrester has no basis for being in the NEC and should be deleted.

Substantiation: The revision has been made to correlate with the deletion of the term "Grounding Conductor" in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term "grounding conductor" from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman's report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term "grounding conductor."

5-320 Log #3405 NEC-P05 **Final Action: Reject**
(280.21(1))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
280.21 Connection.
(1) Grounded service-<u>entrance</u> conductor.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-<u>Entrance</u> Cable. Service-<u>entrance</u> conductors made up in the form of a cable.
Service-<u>Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-<u>entrance</u> conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

ARTICLE 285 — TRANSIENT VOLTAGE SURGE SUPPRESSORS: TVSSs

5-321 Log #4376 NEC-P05 **Final Action: Reject**
(285.4)

Submitter: Alan Manche, Square D Company/Schneider Electric
Recommendation: Revise text in paragraph 285.4 as follows:
285.4 ~~Number Required~~ <u>Surge Protection Devices for the Electrical System</u>.
Where used at a point on a circuit, the SPD (surge arrester or TVSS) shall be connected to each ungrounded conductor.
(A) <u>SPDs in Dwelling Units</u>. <u>A surge protective device (SPD) shall be installed either integral or immediately adjacent to the service disconnecting means of the dwelling unit(s).</u>
<u>(1) Type. The surge protective device shall be a Type 1 or Type 2 SPD.</u>

(2) Replacement. When the service equipment is replaced, all of the requirements of this section shall apply.

Substantiation: The damage and losses associated with electrical surge sources including, lightning, utility switching and even internal operation of the electrical system continues to grow. Some damage is easily recognized and other is more difficult to understand simply based on shortened life of the device with electronics. I have personally experienced losses due to surges which include the loss of the communication interconnects for the smoke alarms, and the control panel within the air-handling equipment within my home. I only installed a whole house surge protection device at my service after the losses in my home that mounted to hundreds of dollars due to replacing the smoke alarms and having the air-handler service call in order to replace the electronic controller.

Panel Meeting Action: Reject

Panel Statement: Installation of surge protection is a design issue. Where mandated by design specification, surge protection becomes a requirement, but inadequate substantiation has been provided that demonstrates a need for requiring surge protection in the type of occupancy listed in this proposal.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

WILLIAMS, D.: Surge protective devices can prevent damage to electrical components, reduce electrical fires, and may save lives. I need to relate a fire that I investigated about a year ago. The utility high-voltage line had one of the insulators break due to high winds and the line landed on the 120/240 service drop feeding a house. A person driving by saw the front of a house on fire, across the street from the short circuit. The fire started at the outside receptacle on the front of the house. There was nothing plugged into the outlet when the fire occurred. The fire damaged the electrical device box and the siding on the front of the house. There was also a small fire in a GFCI receptacle device in the bathroom. Appliances were also affected by this high voltage surge into the premise wiring. If this home would have been protected by a surge protective device this fire may have been prevented. Fortunately someone saw the fire before it caused extensive damage and the residents were not harmed.

5-322 Log #4377 NEC-P05 **Final Action: Reject**
(285.4)

Submitter: Alan Manche, Square D Company/Schneider Electric

Recommendation: Revise text in paragraph 285.4 as follows:

285.4 ~~Number Required~~ Surge Protection Devices for the Electrical System.

Where used at a point on a circuit, the SPD (surge arrester or TVSS) shall be connected to each ungrounded conductor.

(B) SPDs Occupancies other than Dwelling Units. A surge protective device (SPD) shall be installed either integral or immediately adjacent to the service disconnecting means for occupancies including banks, churches, healthcare facilities, hotels, office buildings, restaurants, schools, stores and other similar occupancies where electronics are likely to be utilized.

(1) Type. The surge protective device shall be a Type 1 or Type 2 SPD.

(2) Replacement. When the service equipment is replaced, all of the requirements of this section shall apply.

Substantiation: The damage and losses associated with electrical surge sources including, lightning, utility switching and even internal operation of the electrical system continues to grow. Some damage is easily recognized and other is more difficult to understand simply based on shortened life of the device with electronics. It is common for a building to house multiple occupancies and the occupant does not own or have access to provide the protection necessary at the service in order to protect the electrical system or electronic assets of the individual occupant.

Many federal agencies have surge suppression requirements for their various electrical systems. Agencies that have established standard facility designs have SPD mandated as well as virtually all commercial designs. There are several agencies with very specific SPD requirements, based on the criticality of their power supplies. The FAA has categorized various bus segments of specific facilities as “critical” (the output of facility UPS systems), “essential” (lighting, HVAC) or “Standby” (emergency generator).

The FAA mandates specific SPD requirements for all Air Traffic Control Towers (ATCTs) and Terminal Radar Approach Control (TRACON) facilities and Air Traffic Control Centers (ATCC). In fact, virtually every FAA system, including runway lighting, radar, shelters, etc., have mandatory SPD requirements. SPD requirements also exist for Signal Data and Control Lines.

The occupancies listed in the proposal are already found and recognized in Table 220.12 in the NEC for load calculations. The entire list of occupancies was not included as surge protection may not be necessary in a garage, warehouse or other areas not listed.

Panel Meeting Action: Reject

Panel Statement: Installation of surge protection is a design issue. Where mandated by design specification, surge protection becomes a requirement, but inadequate substantiation has been provided that demonstrates a need for requiring surge protection in the types of occupancies listed in this proposal.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

WILLIAMS, D.: See my Explanation of Negative on Proposal 5-321 (Log #4376).

5-323 Log #2884 NEC-P05 **Final Action: Reject**
(285.8 (New))

Submitter: William Gross, Electric Service of Clinton

Recommendation: Add new text to read as follows:

285.8 Status Indication. An SPD device shall be equipped with status indication that the device is energized and indication that they are no longer effective or usable.

Substantiation: Many SPD devices do not indicate whether they are still effective for suppressing transient voltages. The MOV technology on which these devices are based will degrade as they absorb transient energy making them ineffective over time. Therefore, these devices should have status indication to alert the user that these devices are no longer effective and should be replaced.

Panel Meeting Action: Reject

Panel Statement: This proposed revision addresses a product standard issue and should be addressed in that arena. If the product standard requires this indication, then there is no need for inclusion in the NEC. Introducing this as a requirement in the code without a requirement in UL 1449 could lead to field installation of indication devices that could impact the original product certification or listing.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-323a Log #CP516 NEC-P05 **Final Action: Accept**
(285.23(B))

Submitter: Code-Making Panel 5,

Recommendation: Revise text to read as follows:

(B) At the Service. When installed at services, ~~the grounding conductor of a~~ Type 1 SPD shall be connected to one of the following:

Substantiation: The revision has been made to correlate with the deletion of the term “Grounding Conductor” in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term “grounding conductor” from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman’s report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term “grounding conductor.”

5-324 Log #3704 NEC-P05 **Final Action: Accept in Principle**
(285.25)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise text to read as follows:

285.25 Type 3 SPDs. Type 3 SPDs (TVSSs) shall be permitted to be installed anywhere on the load side of branch-circuit overcurrent protection up to the equipment served~~,~~. ~~provided t~~The Type 3 SPD connection ~~is~~must be a minimum 10 m (30 ft) of conductor distance from the service or separately derived system disconnect if the Type 3 SPD includes a cautionary marking, tag, or instruction statement pertaining to the 10 m (30 ft) distance.

Substantiation: The product listing standard, UL 1449, third edition, includes an exception for Type 3 SPDs that have been subjected to the Type 2 SPD Nominal Discharge Current Test to be installed anywhere on the load side of the branch-circuit overcurrent protection. The requirement and exception are as follows:

“64.2 Type 3 SPDs shall be marked on the unit, a marking tag, or an instruction sheet packed with the unit – “CAUTION – Do not install this device if there is not at least 10 meters (30 feet) or more of wire between the electrical outlet and the electrical service panel.”

Exception: Type 3 SPDs that have been subjected to the Nominal Discharge Current Test need not be provided with this marking.”

Since UL 1449 was not finalized at the time of the Code-Making Panel discussions for the 2008 NEC, there is no allowance for this exception in the 2008 NEC. The proposed revision corrects this omission.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

285.25 Type 3 SPDs. Type 3 SPDs (TVSSs) shall be permitted to be installed anywhere on the load side of branch-circuit overcurrent protection up to the equipment served~~,~~. ~~provided t~~The Type 3 SPD connection ~~is~~ ~~must~~ shall be a minimum 10 m (30 ft) of conductor distance from the service or separately derived system disconnect if the Type 3 SPD includes a cautionary marking, tag, or instruction statement pertaining to the 10 m (30 ft) distance.

Panel Statement: The panel action replaces the word “must” with “shall” to comply with the NEC Style Manual rules for mandatory requirements.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-324a Log #CP517 NEC-P05 **Final Action: Accept**
(285.27)

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:
An SPD (surge arrester or TVSS) shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, equipment grounding conductor, or grounding electrode conductor. The grounded conductor and the equipment grounding conductor shall be interconnected only by the normal operation of the SPD (surge arrester or TVSS) during a surge.
Substantiation: The revisions have been made to correlate with the deletion of the term "Grounding Conductor" in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16

ARTICLE 300 — WIRING METHODS

3-6 Log #175 NEC-P03 **Final Action: Reject**
(300)

Submitter: Tommy Young, Commonwealth of Kentucky
Recommendation: Add to Wiring Methods article:
On renovation projects shall remove abandoned raceways.
Substantiation: Confusing on locating raceways for identification and cosmetic.
Panel Meeting Action: Reject
Panel Statement: The proposal did not provide any technical substantiation for the change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-7 Log #4817 NEC-P03 **Final Action: Reject**
(300.1(B))

Submitter: George Ferguson, Technical Education & Safety Institute
Recommendation: Revise text to read as follows:
"The provisions of this article are not intended to apply to the conductors that form an integral part of listed equipment,...".
Substantiation: I have had building owners try to supply electrical equipment which had no listing provision and was of inferior quality. Adding "listed" to this section would preclude that problem.
Panel Meeting Action: Reject
Panel Statement: Not all equipment is listed or even available as listed equipment, such as many motors, over 600-volt equipment, and unique equipment that must be field evaluated. This change may affect the use of classified equipment, which technically is not listed. In addition, the phrase "listed utilization equipment", which is already located in the existing text, covers utilization equipment.
The panel understands that the Technical Correlating Committee has jurisdiction over
Scope issues.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-8 Log #4815 NEC-P03 **Final Action: Reject**
(300.2(B))

Submitter: George Ferguson, Technical Education & Safety Institute
Recommendation: Revise text to read as follows:
Temperation limitation of conductors shall be in accordance with 310.10 and 110.14(C)(1).
Substantiation: Many electricians I work with are still unaware of the ampacity limitations of 110.14(C)(1) and are using THHN at 90 degrees celsius ampacity regardless of terminal listing. This overheats the terminals. The new language will help the electrician's awareness of the situation.
Panel Meeting Action: Reject
Panel Statement: 300.2(B) deals with the temperature limitation of conductors, whereas 110.14(C) deals with the terminals where the conductors are connected so the reference is not appropriate for this section. The NEC is not a manual for untrained personnel and the text on terminal temperature at equipment has been in the NEC since the 1993 Edition of the NEC so all electricians should be aware of it by now.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-9 Log #1997 NEC-P03 **Final Action: Reject**
(300.3(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part to read as follows: ....unless permitted otherwise elsewhere in this Code or in accordance with 300.3 (B)(1) through (B)(4).
Substantiation: Edit. Refer to 250.130 (C), 426.42, and 427.47.
Panel Meeting Action: Reject
Panel Statement: The added text is not necessary since 300.3(B) applies very specifically to raceways, auxiliary gutters, cable trays, cable bus assemblies, trenches, cables, or cords. The substantiation uses 250.130(C), which is already covered in 300.3(B)(2) for bonding and grounding conductors. In addition, the substantiation uses 426.42 and 427.47, but skin-effect heating systems as referred to in these two sections actually use a ferromagnetic envelope to encase the single conductor and not a wiring method or normal enclosure as would be covered in Chapter 3. The text in these two sections also excludes any application of 300.20 to these systems.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-10 Log #2575 NEC-P03 **Final Action: Reject**
(300.3(B)(1) and Exception No. 2 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Exception No. 1: Conductors of alternating current circuits installed in nonmetallic or nonmagnetic raceways run underground or in concrete slabs, concrete or masonry walls or ceilings shall be permitted to be arranged as isolated phase or grounded conductor installations. The raceways shall be installed in close proximity to each other but not in close proximity with parallel metal structural members, metal piping, or metallic-wiring, methods and the conductors shall comply with the provisions of 300.20(B).
Add new Exception No. 2: Conductors of direct-current circuits shall be permitted to be arranged as isolated polarity, neutral, or grounded conductor installations.
Substantiation: Conductors should be noted as AC since the reference is to isolated phases. Raceways that are nonmagnetic should be permitted, also isolated grounded or neutral conductors, not generally perceived as phase conductors. Such installations in concrete slabs or masonry should be acceptable where the likelihood of induced currents in nonelectrical metal is minimized. Is there a safety consideration why paralleled dc circuit conductors that comply with 300.4 should not be permitted as isolated installations?
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to expand the existing exception to include nonmagnetic metal raceways to be installed with all the same phase conductors in a paralleled conductor application. There was also no technical substantiation provided to add a new exception covering isolated polarity dc systems, other than it "should be acceptable where the likelihood of induced currents in non-electrical metal is minimized." The submitter also did not explain what constitutes "non-electrical metal".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-11 Log #4153 NEC-P03 **Final Action: Reject**
(300.3(B)(5))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 2 for action.
This action will be considered by Code-Making Panel 2 as a public comment.
Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Add new text as follows:
(5) Grouping. Individual branch circuits shall comply with 210.4 for grouping, including the Exception.
Substantiation: Grouping of ungrounded and grounded conductors in panelboards, similar distribution equipment, and other enclosures should apply to all branch circuits, not just multiwire branch circuits. The hazards are the same. This would assure that any extensions made to these circuits would utilize the correct grounded conductor.
Panel Meeting Action: Reject
Panel Statement: 210.4(B) only applies to multiwire branch circuits, not individual branch circuits. Using 210.4(B) to apply to an individual branch circuit would be an improper reference. The submitter could have removed the word "multiwire" in the title of 210.4 and elsewhere within 210.4(D) so the grouping requirement would apply to individual branch circuits. Code-Making Panel 3 does not have jurisdiction over the text in 210.4, however, Code-Making Panel 2 has jurisdiction and this proposal should be sent to Panel 2 for information.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-12 Log #4755 NEC-P03 **Final Action: Reject**
(300.3(B)(5))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 2 for action.
This action will be considered by Code-Making Panel 2 as a public comment.
Submitter: Robert K. Smith, City of WInston-Salem / Rep. Winston-Salem County Inspections Division
Recommendation: Add new text to read as follows:
Individual branch circuits shall comply with the grouping requirements of Section 210.4(D), including the exception.
Substantiation: Grouping of the ungrounded and grounded conductors in panelboards or similar distribution equipment, junction boxes and other enclosures should apply to all branch circuits, not just multiwire branch circuits. The same hazards exist. Also, this would assure that any extensions from these circuits would utilize the correct grounded conductor.
Panel Meeting Action: Reject
Panel Statement: See the Panel Statement on Proposal 3-11.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-13 Log #4606 NEC-P03 **Final Action: Accept in Principle**
(300.3(C)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the exception; revise the fine print note by adding "See 690.4(B) for photovoltaic source and output circuits."
Substantiation: Ever since Art. 690 entered the Code in the 1984 edition, these circuits have been segregated from normal power applications; and there is no problem with technical merit. In fact, however, this exception should be removed and added to the existing fine print note. Back in the 1984 Code it was commonly believed that these exceptions in Chapters. 1 to 4 were necessary, but 90.3 makes this unnecessary and this construction violates 4.1 of the NEC Style Manual.
Panel Meeting Action: Accept in Principle
The Panel "Accepts" deleting the exception.
Change the existing "FPN" to "FPN No. 1" and add a new FPN No. 2 to read as follows:
"FPN No. 2: See 690.4(B) for photovoltaic source and output circuits."
Panel Statement: Rather than incorporating the text reference for 690.4(B) into the existing FPN, a new FPN was developed to ensure that the important reference to 725.136(A) for Class 2 and 3 conductors was not minimized or masked.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-14 Log #4769 NEC-P03 **Final Action: Reject**
(300.3(C)(2))

Submitter: Peter D. Noval, Jr., Philadelphia, PA
Recommendation: Revise text to read as follows:
(2) Over 600 volts, nominal. Conductors of circuits rated over 600 volts, nominal, shall not occupy the same equipment wiring enclosure, cable or raceway with conductors of circuits rated 600 volts, nominal, or less unless otherwise permitted in (C)(2)(a) through (C)(2)(e).
(a) Secondary wiring to electric-discharge lamps of 1000 volts or less, if insulated for the secondary voltage involved, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.
(b) Primary leads of electric-discharge lamp ballasts insulated for the primary voltage of the ballast, where contained within the individual wiring enclosure, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.
(c) Excitation, control, relay, and ammeter conductors used in connection with any individual motor or starter shall be permitted to occupy the same enclosure as the motor-circuit conductors.
(d) In motors, switchgear and control assemblies, and similar equipment, conductors of different voltage ratings shall be permitted.
(e) In manholes, if the conductors of each system are permanently and effectively separated from the conductors of the other systems and securely fastened to racks, insulators, or other approved supports, conductors of different voltage ratings shall be permitted.
~~Conductors having nonshielded insulation and operating at different voltage levels shall not occupy the same enclosure, cable, or raceway.~~
Where conductors operating at different voltage levels occupy the same enclosure, cable or raceway, those of circuits rated over 600 volts, nominal, shall have shielded in insulation.
Substantiation: This section, as presently written, can be interpreted to mean that all conductors, including those of circuits rated 600 volts, nominal, or less, require shielded insulation when occupying the same enclosure, cable or raceway and operating at different voltage levels.
This existing language is modified to clarify that the requirement for shielded insulation does not apply to those conductors operating at 600 volts, nominal, or less, only to those conductors of circuits rated over 600 volts, nominal.
The proposed revision will help to eliminate any misinterpretations of this section, facilitating design and inspection of such installation.
Panel Meeting Action: Reject
Panel Statement: The intent of the existing sentence in 300.3(C)(2) is to not permit non-shielded insulated conductors rated up to 2400 volts, as permitted by 310.6, Exception No. 1, to be installed with conductors rated for a different voltage level. The existing sentence applies to circuits rated over 600 volts and is not a part of (C)(2)(a) through (C)(2)(e) so the existing sentence is more applicable.
Reading it as a last sentence before (a) through (e) makes the existing text easier to understand that it does not permit 600-volt or less conductors to be installed with non-shielded over 600-volt installations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-15 Log #4899 NEC-P03 **Final Action: Reject**
(300.3(C)(2))

Submitter: Peter D. Novak, Jr., Philadelphia, PA
Recommendation: Revise text as follows:
(2) Over 600 Volts, Nominal. Conductors of circuits rated over 600 volts, nominal, shall not occupy the same equipment wiring enclosure, cable, cable tray or raceway with conductors of circuits rated 600 volts, nominal, or less unless otherwise permitted in (C)(2)(a) through (C)(2)(e).
(a) Secondary wiring to electric-discharge lamps of 1000 volts or less, if insulated for the secondary voltage involved, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.
(b) Primary leads of electric - discharge lamp ballasts insulated for the primary voltage of the ballast, where contained within the individual wiring enclosure, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.
(c) Excitation, control, relay, and ammeter conductors used in connection with any individual motor or starter shall be permitted to occupy the same enclosure as the motor-circuit conductors.
(d) In motors, switch gear and control assemblies, and similar equipment, conductors of different voltage ratings shall be permitted.
(e) In manholes, if the conductors of each system are permanently and effectively separated from the conductors of the other systems and securely fastened to racks, insulators, or other approved supports, conductors of different voltage ratings shall be permitted.
Conductors having nonshielded insulation and operating at different voltage levels shall not occupy the same enclosure, cable, cable tray, or raceway.
Substantiation: This section, as presently written, does not appear to specifically address cable tray as a wiring method. Consequently, the prohibited installation of conductors rated over 600 volts, nominal, in cable tray containing conductors of circuits rated 600 volts, nominal, or less can only be infrarred.
Further, the requirement for shielded insulation for conductors of circuits rated over 600 volts, where different voltage levels are present, should also be clarified to address cable tray.
By helping to eliminate potential misinterpretations, the proposed revision to text provides language an inspector can readily cite and convey the intent of this section to designers and installers alike.
Panel Meeting Action: Reject

Panel Statement: This is already covered in 392.6(F) and is under the jurisdiction of Code-Making Panel 8, not Code-Making Panel 3.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
AYER, L.: The panel action is correct, yet the panel statement is not accurate. The panel statement infers that the submitter's intent of not allowing conductors over 600 volts to occupy the same cable tray with conductors below 600 volts is already covered in 392.6(F). 392.6(F) allows conductors of different voltages to occupy the same cable tray as long as a barrier is provided. Adding "cable tray" to this section would convey the wrong message.

3-16 Log #1244 NEC-P03 **Final Action: Reject**
(300.3(C)(2)(e))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
In <u>handholes and</u> manholes if the conductors of each system are permanently and effectively separated from the conductors of the other system. ~~and~~ <u>Where installed in manholes conductors shall be</u> securely supported and fastened to racks insulators, or other approved supports. Conductor of different voltage rating shall be permitted.
Conductors having nonshielded insulation and operating at different voltage levels shall not occupy the same enclosure, cable, or raceway unless they comply with 300.3(C)(2)(e).
Substantiation: Handholes should be included. Racks, insulators and supports should not be necessary for handholes. Proposed deletion is superfluous, this subsection concerns circuit ratings, not conductor ratings. Section 300.3 should be referenced.
Panel Meeting Action: Reject
Panel Statement: Providing permanent and effective separation of 600-volt or less from over 600-volt conductors within a handhole would be very difficult, if not impossible. The submitter should provide additional technical substantiation and data showing handholes and the method of providing permanent and effective separation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-17 Log #2908 NEC-P03 **Final Action: Reject**
(300.3(D) (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 6 for action in Article 310.
This action will be considered by Code-Making Panel 6 as a public comment.
Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Add new paragraph as follows:
<u>300.3(D) **Fire-Rated Cable and Conductors**. Fire-rated cable and conductors shall be listed as part of an electrical circuit protective system. Cables and conductors shall also be listed for use in accordance with the wiring methods described in this code.</u>
<u>FPN: One method of defining the fire rating of electrical circuit protective systems is by testing the system in accordance with UL 2196-2006, *Standard for Tests of Fire Resistive Cables*.</u>
<u>(1) **Definition.** Cables and conductors used for survivability of critical circuits to ensure continued operation during a specified time under fire conditions.</u>
<u>(2) **Installation**. The installation of the electrical circuit protective system shall comply with any restrictions provided in the listing of the electrical circuit protective system such as cable and/or raceway support, couplings, boxes, conduit bodies, optional splices, vertical supports, grounds, and pulling lubricants.</u>
<u>FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.</u>
<u>(3) **Marking.** In addition to the marking required on the cable and/or tag by the product standard and electrical circuit protective system, cable and conductors shall be surface marked with the suffix –CIR (Circuit Integrity Rating), along with the circuit integrity duration in hours and system identifier.</u>
<u>FPN: For example; –CIR 2 FHIT.XX.</u>
Substantiation: There has been confusion between fire-rated and non-fire-rated cables. As an example, a RHW cable may be fire-rated as part of an electrical circuit protective system. This standardized marking would distinguish between the two types. There are particular installation requirements in order to maintain a fire rating, but these are not identified in the current code. The section on installation provides some guidance to clarify this.
Panel Meeting Action: Reject
Panel Statement: 300.3 applies unilaterally to conductors within cables and not to cables. This text providing listing requirements more appropriately belongs in the front of Article 310 with the marking requirements in 310.11 with the remainder of conductors and cable markings.
This is under the jurisdiction of Code-Making Panel 6, and the panel requests that the Technical Correlating Committee forward this proposal to Code-Making Panel 6 for their review and comment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-18 Log #57 NEC-P03 **Final Action: Reject**
(300.4)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 9 for information.
Note: This Proposal appeared as Comment 3-8 on Proposal 3-32 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 3-32 was:
Add new text to read as follows:
Conductors, inside electrical boxes, subject to physical damage (such as router bits, sheetrock saws or knives) or nonconductive coatings (such as drywall mud, paint, lacquer or enamel) must be temporarily protected by means of a rigid metal coverplate, not less than.047 inches thick (the required thickness to prevent the router from penetrating the metal plate).
Exception No. 1: Listed covers to have equivalent strength and characteristics shall be permitted.
Submitter: John T. Smith, Wire Guard, Inc.
Recommendation: Add new text as follows:
300.4 Protection Against Physical Damage.
(G) Conductors Inside Electrical Boxes. Conductors, inside electrical boxes, subject to physical damage from router bits, sheet rock saws, and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel, must be protected during the construction process by means of a rigid cover, plate, or insert of a thickness and strength as to prohibit penetration by the above mentioned items.
Substantiation: I have been an electrician for over 30 years. During this time, I have encountered thousands of wires inside the electrical box damaged by sheetrock routers, knives, saws, mud, paint, enamel, and lacquer.
Furthermore, I have received many calls from homeowners complaining of "the smell of burning wires" or "a receptacle or switch that doesn't work". What I inevitably find are damaged wires inside the electrical box. The insulation on the wires has melted due to excessive heat because the amperage rating of the wires has been compromised or lessened as a result of a nick or cut in the wires. If the homeowner hadn't noticed the "smell of burning wires" or "that the switch or receptacle was not operational", the damaged wire would have eventually caused a fire.
Per the US Home Product Report, Appliances & Equipment, 01/02 issued by the NFPA's Fire Analysis & Research, Quincy, MA:
The number one cause of an "Electrical Distribution Equipment" fire is a short circuit or a ground fault. Damaged conductors cause short circuits and ground faults. When the conductors are damaged the amperage rating of the conductor is compromised or lessened. This results in overheating, which results in the fire.
The form of material first ignited from an "Electrical Distribution Equipment" fire is the electrical wire or cable insulation.
There are codes in place that provide for the Integrity of Electrical Equipment and Connections 110.12(C) and Protection Against Physical Damage 300.4(A-F).
These codes specifically protect the wire at all points of vulnerability from the distribution panel up to, but not including, the point where the wires are inserted into the electrical box.
There is no code that specifically ensures the protection of the conductors after they are inserted in the electrical box.
Once the conductors are inserted in the electrical box, they are extremely vulnerable to the inevitable damage caused by sheet rock routers, sheet rock saws and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel.
It may be assumed that an inspection will detect damaged wires and the electrician will be required to rerun the wires. That is not always true. An inspector may not always see a damaged wire hidden in the wall or spliced. The plug in tester used during the inspection will confirm that the outlet or receptacle is working even though the amperage rating of the conductor is compromised or lessened due to damage.
It may also be assumed that electricians will re-run a damaged wire that violates code 300.14 "Length of Free Conductors at Outlets, Junctions, and Switch Panels". However, from my experience and from conversations I've had with many electricians, that is not what is occurring.
Please see supporting material results of Survey of Electricians conducted from 2004 through 2006.
It is a simple case of economics, the electrician has contracted the job for a certain fee that doesn't allow for re-doing any part of the job. Nor does the electrician's scheduling for completion of that job or to begin future jobs permit the added delays. Nor will the electrician be a favorite with the General Contractor if he demands the drywall be removed so new wires can be run. As a result, electricians have found a work-around to re-running the wires.
As members of the NFPA, I feel that we have a responsibility to ensure that the wires are explicitly protected by a specific code at every point of vulnerability during construction from the distribution panel to inside the electrical box.

This is especially true of the conductors once they are inside the electrical box as they are extremely vulnerable to the inevitable damage from sheet rock routers, sheet rock saws and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel.

Please note that since this was is a proposal that was held by the Technical Correlating Committee, it has also been forwarded to Code-Making Panel 9 for their input.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The NEC Technical Correlating Committee established a Task Group, between the 2008 NEC and the 2011 NEC code cycles, to study the issue of whether Code-Making Panel 1, Code-Making Panel 3, or Code-Making Panel 9 has jurisdiction over requirements for protective cover plates for boxes.

Some of the discussion during the Task Group Meeting was related to plate thickness, enforceability, installation procedures and similar technical issues. The Task Group determined that Code-Making Panel 9 would have jurisdiction over this issue since Code-Making Panel 9 specifically deals with conductors within the box, box and cover construction requirements, and common box as well as cover sizes. Adding the suggested text to 300.4 would not be appropriate until after Code-Making Panel 9 deals with the technical issues of box covers.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-19 Log #1832 NEC-P03 **Final Action: Reject**
(300.4)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: Where <u>likely to be</u> subject to physical damage, conductors shall be ~~adequately~~ protected <u>by approved means</u>.

Substantiation: Edit. “Adequately” is subjective and a term to be avoided per the Style Manual. “Likely” is defined as such a nature or circumstance as to make something probable and is used in many sections.

Panel Meeting Action: Reject

Panel Statement: “Protected by approved means” is already a requirement of 90.4, 90.7, 110.2, and 110.3 so changing the text in this section is not necessary and could be subject to misinterpretation by installers. “Likely” to be damaged is very subjective and is recognized in Table 3.2.1 in the NEC Style Manual as a vague and unenforceable term. Section 3.2.5.5 of the NEC Style Manual uses similar text to the existing text to provide clarity on the subject of physical protection.

(300.4)

Note: This Proposal appeared as Comment 3-8 on Proposal 3-32 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 3-32 was:

Add new text to read as follows:

Conductors, inside electrical boxes, subject to physical damage (such as router bits, sheetrock saws or knives) or nonconductive coatings (such as drywall mud, paint, lacquer or enamel) must be temporarily protected by means of a rigid metal coverplate, not less than.047 inches thick (the required thickness to prevent the router from penetrating the metal plate).

Exception No. 1: Listed covers to have equivalent strength and characteristics shall be permitted.

Submitter: John T. Smith, Wire Guard, Inc.

Recommendation: Add new text as follows:

300.4 Protection Against Physical Damage.

(G) Conductors Inside Electrical Boxes. Conductors, inside electrical boxes, subject to physical damage from router bits, sheet rock saws, and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel, must be protected during the construction process by means of a rigid cover, plate, or insert of a thickness and strength as to prohibit penetration by the above mentioned items.

Substantiation: I have been an electrician for over 30 years. During this time, I have encountered thousands of wires inside the electrical box damaged by sheetrock routers, knives, saws, mud, paint, enamel, and lacquer.

Furthermore, I have received many calls from homeowners complaining of “the smell of burning wires” or “a receptacle or switch that doesn’t work”. What I inevitably find are damaged wires inside the electrical box. The insulation on the wires has melted due to excessive heat because the amperage rating of the wires has been compromised or lessened as a result of a nick or cut in the wires. If the homeowner hadn’t noticed the “smell of burning wires” or “that the switch or receptacle was not operational”, the damaged wire would have eventually caused a fire.

Per the US Home Product Report, Appliances & Equipment, 01/02 issued by the NFPA’s Fire Analysis & Research, Quincy, MA:

The number one cause of an “Electrical Distribution Equipment” fire is a short circuit or a ground fault. Damaged conductors cause short circuits and ground faults. When the conductors are damaged the amperage rating of the conductor is compromised or lessened. This results in overheating, which results in the fire.

The form of material first ignited from an “Electrical Distribution Equipment” fire is the electrical wire or cable insulation.

There are codes in place that provide for the Integrity of Electrical Equipment and Connections 110.12(C) and Protection Against Physical Damage 300.4(A-F).

These codes specifically protect the wire at all points of vulnerability from the distribution panel up to, but not including, the point where the wires are inserted into the electrical box.

There is no code that specifically ensures the protection of the conductors after they are inserted in the electrical box.

Once the conductors are inserted in the electrical box, they are extremely vulnerable to the inevitable damage caused by sheet rock routers, sheet rock saws and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel.

It may be assumed that an inspection will detect damaged wires and the electrician will be required to rerun the wires. That is not always true. An inspector may not always see a damaged wire hidden in the wall or spliced. The plug in tester used during the inspection will confirm that the outlet or receptacle is working even though the amperage rating of the conductor is compromised or lessened due to damage.

It may also be assumed that electricians will re-run a damaged wire that violates code 300.14 “Length of Free Conductors at Outlets, Junctions, and Switch Panels”. However, from my experience and from conversations I’ve had with many electricians, that is not what is occurring.

Please see supporting material results of Survey of Electricians conducted from 2004 through 2006.

It is a simple case of economics, the electrician has contracted the job for a certain fee that doesn’t allow for re-doing any part of the job. Nor does the electrician’s scheduling for completion of that job or to begin future jobs permit the added delays. Nor will the electrician be a favorite with the General Contractor if he demands the drywall be removed so new wires can be run. As a result, electricians have found a work-around to re-running the wires.

As members of the NFPA, I feel that we have a responsibility to ensure that the wires are explicitly protected by a specific code at every point of vulnerability during construction from the distribution panel to inside the electrical box.

This is especially true of the conductors once they are inside the electrical box as they are extremely vulnerable to the inevitable damage from sheet rock routers, sheet rock saws and knives, and nonconductive coatings; such as drywall mud, paint, lacquer and enamel.

Please note that since this was is a proposal that was held by the Technical Correlating Committee, it has also been forwarded to Code-Making Panel 3 for their input.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 9-51.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

3-21 Log #4573 NEC-P03 **Final Action: Accept in Part**
(300.4 and 300.4(A))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise the existing text of the 2008 NEC as follows:

300.4 Protection Against Physical Damage.

<u>If likely to be damaged at the location installed,</u> ~~Where subject to physical damage,~~ conductors<u>, raceways and cables</u> shall be protected.

(**A) Cables and Raceways Through Wood <u>Framing</u> Members.**

(1) Bored Holes. In both exposed and concealed locations, <u>if</u> ~~where~~ a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1¼ in.) from the nearest edge of the wood member. <u>If</u> ~~Where~~ this distance <u>is not</u> ~~cannot be~~ maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate(s) or bushing(s), at least 1.6 mm (1/16 in.) thick, and of appropriate length and width installed to cover the area of the wiring. <u>The steel plate shall be installed as soon as practicable after the wiring is installed.</u>

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(2) Notches in Wood. If ~~Where~~ there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in wood studs, joists, rafters, or other wood members if ~~where~~ the cable or raceway at those points is protected against damage by ~~against~~ nails or screws by a steel plate at least 1.6 mm (1/16 in.) thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed as soon as practicable after the wiring is installed ~~before the building finish is applied~~.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

Substantiation: It can be safely said that all wiring methods are "subject to physical damage." This phrase is far too general and subjective. All wiring methods should be installed in a manner and location so the wiring method is not expected to be damaged in ordinary use. For example, the exposed wiring covered by the present rule can be reasonably expected to be isolated from physical damage in ordinary building operations. Can the cables be damaged in an unexpected event such as using the cables to support other objects or persons? Certainly. However that is not likely to happen in normal building operation. Wiring installed in a concealed location can be easily damaged by a reciprocating saw when a cut is made during remodeling project. Is the wiring that was installed in compliance with 300.4 "subject to physical damage?" The answer is most likely "Yes." However, the wiring, if installed in compliance with 300.4 is not likely to be damaged in the location installed. This seems to be a better phrase to use.

The term "likely" is used in many NEC sections such as providing a condition the event or condition will occur such as: "… likely to become energized …", "… maximum fault current likely to be imposed …", "… not likely to be damaged …", "…equipment likely to be disconnected for repairs or replacement …", "… not likely to stretch during or after installation …" and "… conduct safely any fault current likely to be imposed".

Adding "raceways and cables to the opening sentence seems appropriate since raceways and cables are covered in the following rules.

Steel plates for protection should be required to be installed as soon as practicable after the wiring is installed since the sub-sections apply to both concealed and exposed wiring. If the wiring is installed through framing members at a location where building finish is not to be applied, the protection should still be required to be installed.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Part

The panel "Accepts" the addition of "raceways and cables" in 300.4, however, "Rejects" the remainder of the proposed text.

Panel Statement: "Likely" to be damaged is very subjective and is recognized in Table 3.2.1 in the NEC Style Manual as a vague and unenforceable term.

Section 3.2.5.5 of the NEC Style Manual uses similar text to the existing text to provide clarity on the subject of physical protection.

The suggested text to require steel protector plates to be "installed as soon as practicable after the wiring is installed" is unenforceable. Where a plate is necessary for protection of wiring methods, the plate must be installed at a time between the installation of the wiring method and the inspection by the electrical inspector. Many electricians wait until the end of the rough-in stage before installing the nail plates. The new text implies a possible violation since the plate, obviously, could have been installed sooner than at the end of the rough-in stage.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-22 Log #1594 NEC-P03 **Final Action: Reject**
(300.4(A) Exception No. 1)

Submitter: Russell LeBlanc, The Peterson School of Engineering

Recommendation: Revise text to read as follows:

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, (~~rigid nonmetallic conduit~~), (schedule 80 PVC conduit), or electrical metallic tubing.

Substantiation: Schedule 40 PVC, HDPE, and RTRC are all nonmetallic conduits, but only Schedule 80 PVC is specifically identified for areas of physical damage.

See 352.10(F), FPN.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation was provided to justify the change from rigid nonmetallic conduit to Schedule 80 PVC conduit.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-23 Log #1392 NEC-P03 **Final Action: Reject**
(300.4(A)(1))

Submitter: Charles Eldridge, Indianapolis, IN

Recommendation: Revise text to read as follows:

(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in ~~joists, rafters, or~~ vertical wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (11/4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate(s) or bushing(s), at least 1.6 mm (1/16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.

In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in floor joists, holes shall be bored so that the edge of the hole is not less than 50 mm (2 in.) from the nearest edge of the joist and shall not exceed one-third the depth of the joist. Where bored holes are bored into engineered wood joists, the penetrations shall be done in accordance with the manufacturer's written directions.

In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in ceiling joists, holes shall be bored so that the edge of the hole is not less than 50 mm (2 in.) from the nearest edge of the joist. The diameter of the holes bored or cut into members shall not exceed one-third the depth of the joist. Where bored holes are bored into engineered wood joists, the penetrations shall be done in accordance with the manufacturer's written directions.

Substantiation: The building codes require 2" from the edge of joists for strength; the NEC should require the same 2".

Panel Meeting Action: Reject

Panel Statement: The purpose of 300.4 is to provide protection for conductors and the proposed text is dealing with structural integrity of wood joists. The proposed text is more appropriately covered in a building code based on structural integrity with the building inspector determining whether holes drilled in the support structure for a building have affected the structural integrity of the building.

Electricians must be aware of requirements in the building code, as well as requirements in the National Electrical Code, but building code issues should stay in the building code and not be placed in the NEC.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-24 Log #2761 NEC-P03 **Final Action: Reject**
(300.4(A)(1))

Submitter: Tom Dwyer, City of Bismarck

Recommendation: Revise text to read as follows:

(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (1 1/4 in.) from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate(s) or bushing(s), at least 1.6 mm (1/16 in.) thick, and of appropriate length and width installed to cover the area of the wiring and the steel plates or bushings shall extend past the bored hole 1/2 in. on both sides of the joists, rafters, or wood members.

Substantiation: The drywall installers miss the framing members and drive screws into the wiring. The extra 1/2 in. on both sides of the framing members would give added protection.

Panel Meeting Action: Reject

Panel Statement: There was no technical substantiation provided to justify the addition of a ½ inch on either side of the bored hole. There may be installations where more than ½ inch would be needed for protection, but other cases where a nail plate directly over the hole is sufficient.

The panel recommends that the submitter provide the panel with a research report or some technical substantiation justifying the distance recommended in the proposal.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-25 Log #2075 NEC-P03 **Final Action: Reject**
(300.4(A)(1), 300.4(A)(2), 300.4(D), and 300.4(F) Exception No. 1)

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Revise text to read as follows:

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, ~~rigid nonmetallic conduit,~~ or electrical metallic tubing.

Substantiation: Rigid nonmetallic conduit, as defined in Article 352, is not adequately protected by its construction to resist penetration by nails, staples, screws or other power-driven fasteners, and this consequently poses a risk of damage to the conductors contained within. On many occasions, nails, staples, or screws have been found to have penetrated the PVC conduit wall (before wire installation) or the conduit wall and contained wires where the conduit is routed through the bottom plate, inside of the structure wall, to a flush meter or

panel enclosure. By removing this type of conduit from the exception, this potential hazard will be diminished, and inspectors will have the code authority to enforce a level of protection which many already acknowledge the need for.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to justify the deletion of "rigid nonmetallic conduit".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-26 Log #2595 NEC-P03 **Final Action: Reject**
(300.4(A)(2) Exception No. 1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Steel plates shall not be required to protect rigid metal conduit or intermediate metal conduit~~, rigid nonmetallic conduit, or electrical metallic tubing~~.
Substantiation: RNMC and EMT secured in place in holes or notches can be penetrated rather easily with nails, motor-driven screws, power driven fasteners, electric saws, which may result in shock or short-circuit explosion.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to justify the deletion of "rigid nonmetallic conduit" or "electrical metallic tubing".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-27 Log #1592 NEC-P03 **Final Action: Reject**
(300.4(A)(2) Exception No. 2)

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Revise text to read as follows:
Exception No. 2: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, (~~rigid nonmetallic conduit~~), (schedule 80 PVC conduit), or electrical metallic tubing.
Substantiation: Schedule 40 PVC, HDPE, and RTRC are all nonmetallic conduits, but only Schedule 80 PVC is specifically identified for areas of physical damage.
See 352.10(F), FPN.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement in Proposal 3-22.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-28 Log #1541 NEC-P03 **Final Action: Reject**
(300.4(B)(2))

Submitter: Richard Hollander, City of Tucson
Recommendation: Revise text as follows:
(B) **~~Nonmetallic Sheathed~~ Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.**
(2) ~~Nonmetallic Sheathed~~ Cables and Electrical Nonmetallic Tubing. Where nails or screws are likely to penetrate ~~nonmetallic sheathed~~ cables or electrical nonmetallic tubing, a steel sleeve, steel plate, or steel clip not less than 1.6 mm (1/6 in.) in thickness shall be used to protect the cable or tubing.
Substantiation: Cable Types AC, MC, and MI are subject to the same damages as nonmetallic-sheathed cable. The intent is to cover all cables not just nonmetallic-sheathed cable. With today's construction needs, the use of shallow steel stud is becoming more prevalent. Shallow steel studs are what used to be called furring strips (See 300.4(D)), but now are being used for partition walls.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any technical substantiation to require the same physical protection for Types MC, AC, and MI cable, as is presently provided for NM cable in a metal framing member. The first sentence in the substantiation is incorrect because NM cable is more prone to possible damage due to its different characteristics.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-29 Log #3810 NEC-P03 **Final Action: Reject**
(300.4(D))

Submitter: Larry E. Ellison, Jr., Progressive Electrical Services
Recommendation: Revise text to read as follows:
Cables and Raceways Parallel to Framing Members and Furring Strips. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, shall be installed through bored holes in joists and rafters, holes shall be bored so that the edge of the hole is not less than (3 in.) from the nearest edge of the wood member.
Substantiation: Less of a chance of cable- or raceway type wiring methods being damaged from nails or screws.
Panel Meeting Action: Reject
Panel Statement: The proposal specifies the location of a bored hole. This section of 300.4 addresses installations parallel to framing members and is, therefore, inappropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-30 Log #4572 NEC-P03 **Final Action: Reject**
(300.4(D))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing text of the 2008 NEC as follows:
(D) Cables and Raceways Parallel to Framing Members and Furring Strips. In both exposed and concealed locations, if ~~where~~ a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, or is installed parallel to furring strips, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 32 mm (1¼ in.) from the nearest edge of the framing member or furring strips ~~where nails or screws are likely to penetrate~~. If ~~Where~~ this distance cannot be maintained, the cable or raceway shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1.6 mm (1/16 in.) thick. The steel plate shall be installed as soon as practicable after the wiring is installed.
Maintain the three exceptions.
Substantiation: The phrase "where nails or screws are likely to penetrate" should be removed from this section as it adds an unnecessary subjectivity to the protection issue and is subject to debate. This phrase is not used in 300.4(A) or (B). If the condition applies, install the protection!
Steel plates for protection should be required to be installed as soon as practicable after the wiring is installed since the sub-section applies both to concealed and exposed wiring. If the wiring is installed parallel to framing members at a location where building finish is or is not to be applied, the protection should still be required to be installed at the time the wiring project is being done.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Reject
Panel Statement: The word "where" does not imply a time justifying the use of either "when" or "if" as indicated in the substantiation. The word "where" just indicates that the cable or raceway must be installed so that there is at least 1 ¼ inch space from the edge of the framing member or furring strips.
The text "where nails or screws are likely to penetrate" provides the electrical inspector with the ability to not require the clearance where it is judged that screws or nails are already installed, such as where outside siding is already installed or there is only stucco being installed as an outer coating without the possibility of nails and screws being used during construction.
The suggested text to require steel protector plates to be "installed as soon as practicable after the wiring is installed" is unenforceable.
Where a plate is necessary for protection of wiring methods, the plate would have to be installed at a time between the installation of the wiring method and the inspection by the electrical inspector.
Many electricians wait until the end of the rough-in stage before installing the nail plates. The new text implies a possible violation since the plate obviously could have been installed sooner than at the end of the rough-in stage.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-31 Log #1593 NEC-P03 **Final Action: Reject**
(300.4(D) Exception No. 1)

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Revise text to read as follows:
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, (~~rigid nonmetallic conduit~~), (schedule 80 PVC conduit), or electrical metallic tubing.
Substantiation: Schedule 40 PVC, HDPE, and RTRC are all nonmetallic conduits, but only Schedule 80 PVC is specifically identified for areas of physical damage.
See 352.10(F), FPN.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 3-22.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-32 Log #1493 NEC-P03 **Final Action: Accept in Principle**
(300.4(E))

Submitter: Robert G. Fahey, City of Janesville
Recommendation: Add new text as follows:
300.4(E) Cables or Raceways Installed Above or Below ~~Under~~ Roof Decking. A cable or raceway type wiring method, installed in exposed locations under metal-corrugated sheet roof decking, shall be installed and supported so the nearest outside surface of the cable or raceway is not less than 38 mm (1 ½ in.) from the nearest surface of the roof decking. A cable or raceway type wiring method shall not be installed where concealed directly above the metal-corrugated sheet roof decking, where concealed between the roof decking and the roof insulation/rubber roofing material.

Substantiation: The problem I have encountered on a construction site, is the electrical contractor has installed electrical nonmetallic tubing above the metal roof decking for supplying lights in the store, the ENT was then concealed by the roof insulation and the rubber roof system. When the rubber roof is initially installed or when replaced in the future, these concealed/invisible conduits and cables are subject to the long screws and may damage the conduits and cables and wiring inside the ENT as the future roofers will most likely not anticipate conduits or cables in this location. The additional wording in this section will add to the safety of the individuals who will work on the roof now and in the future. Many times the circuits in these conduits/cables are 277 or 480 volt circuits supplying lighting within the building.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 3-34 that addresses the submitter's concern without specifically naming the type of roofing material (roof insulation/rubber roofing) because the more generic text in Proposal 3-34 applies to all types of roofing materials that could be used with metal corrugated sheet roofing.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
CASPARRO, P.: The panel statement states that the panel action and statement on Proposal 3-34 addresses the submitters concern. I disagree. The submitter intends to prohibit the installation of cable and raceway between the metal roof decking and roof insulation and rubber roofing. The Panel may have incorrectly interpreted the submitter's intent to mean "In the webbing on the underside of the metal roof decking". The submitter intends to prohibit the practice of laying cables and raceways on top of the metal deck prior to the installation of the roofing material. As the submitter correctly points out, the wiring method is concealed as soon as the installation of the insulating material is put down. When the roofing contractor secures the insulation with screws, he has no way of knowing where the wiring methods have been placed and thus could very easily damage the wiring method. The Panel should have accepted this Proposal.

3-33 Log #1694 NEC-P03 **Final Action: Reject**
(300.4(E))

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Delete the exception to 300.4(E) to read as follows:
300.4 Protection Against Physical Damage.
(E) Cables and Raceways Installed Under Roof Decking. [remainder unchanged]
~~Exception: Rigid metal conduit and intermediate metal conduit shall not be required to comply with 300.4(E).~~
Substantiation: The self-taping screws that are used to hold down the insulated roofing material can penetrate a substantial metal roof deck and could easily penetrate IMC or rigid conduit, therefore, all conduit should be subject to the "1 1/2 in. from the nearest surface of the roof decking" provision.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide substantiation or any data to delete the exception that would indicate that problems have been encountered in the field.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-34 Log #2763 NEC-P03 **Final Action: Accept in Principle**
(300.4(E))

Submitter: Donald R. Offerdahl, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
(E) Cables ~~and~~, Raceways and Boxes Installed Under Roof Decking. A cable- or raceway-type wiring method, installed in exposed or concealed locations under metal-corrugated sheet roof decking shall be installed and supported so the nearest outside surface of the cable or raceway is not less than 38 mm (1 1/2 in.) from the nearest surface of the roof decking.
A cable- or raceway-type wiring method shall not be installed in concealed locations in metal-corrugated sheet decking type roof.
Exception: Rigid metal conduit and intermediate metal conduit shall not be required to comply with 300.4(E).
Substantiation: Boxes are exposed to the same damage as the cables and raceways are. This also true when cables or raceways are installed on top of the metal-corrugated sheet decking before the insulation material is installed.
Panel Meeting Action: Accept in Principle
Revise the recommended wording in the proposal to read as follows:
"(E) Cables, Raceways, or Boxes Installed In or Under Roof Decking.
A cable, raceway, or box, installed in exposed or concealed locations under metal-corrugated sheet roof decking, shall be installed and supported so there is not less than 38 mm (1 1/2 in.) measured from the lowest surface of the roof decking to the top of the cable, raceway, or box.
A cable, raceway, or box shall not be installed in concealed locations in metal-corrugated sheet decking type roof."
The existing exception remains unchanged.
Panel Statement: Changing the title to include cables, raceways, or boxes that are installed in roof decking will ensure that the title of this section reflects the existing and new text.
The text in the requirement was changed to delete "cable- or raceway-type wiring method" since cables and raceways are wiring methods and the additional text is redundant.
Adding "or box" to both the first and second paragraphs of the proposal will make the text consistent with the title.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-35 Log #3802 NEC-P03 **Final Action: Accept in Principle**
(300.4(E))

Submitter: Mark R. Hilbert, Wolfeboro, NH
Recommendation: Revise 300.4(E) as follows:
(E) Cables and Raceways Installed Under Roof Decking. A cable- or raceway-type wiring method, installed in exposed or concealed locations under metal-corrugated sheet roof decking, shall be installed and supported ~~so the nearest outside surface of the cable or raceway~~ there is not less than 38 mm (11/2 in.) measured from the ~~nearest~~ lowest surface of the roof decking to the top of the raceway or cable.
The existing FPN and Exception remain the same.
Substantiation: Having been involved in the original submittal of the proposal for this new requirement for the 2008 NEC it is true the work "nearest" was chosen to describe the lowest point of the deck as while standing on the floor and looking up at the bottom of the roof deck the nearest surface of the underside of the deck was the lowest point. However, as described in Support Material-Figure 1 of this proposal, this section is worded in the 2008 NEC, a raceway or cable method could be installed so the nearest edge of the raceway or cable is 1 1/2 in. from the nearest surface of the roof deck and still be subject to penetration by the fastener. The proposed text will make it clear that the cable or raceway must be at least 1 1/2 in. from the lowest point of the roof deck and thereby significantly reducing the possibility of damage from a fastener.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 3-34.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-36 Log #3831 NEC-P03 **Final Action: Reject**
(300.4(E))

Submitter: James H. Maxfield, Dover, NH
Recommendation: Revise text to read as follows:
(E) Cables, Raceways, Enclosures, and Luminaires Installed Under roof decking.
(1) A cable or... (remaining text unchanged)
FPN: (existing text unchanged)
Exception: (existing text unchanged)
(2) Enclosures and Luminaires installed in exposed locations under metal-corrugated sheet roof decking shall be installed and supported so the nearest outside surface of the enclosure or luminaire is not less than 38 mm (1-1/2 in.) from the nearest surface of the roof decking.
Substantiation: Physical damage is not limited to only cables and raceways installed within this area. Enclosures, luminaires and conductors within this equipment are also subject to the same physical damage. See the substantiation of NFPA 70,2008 edition comment on proposals 3-31.
Current code language helps protect the conductors within cable assemblies and raceways however the current language does not prohibit the installation of enclosures and luminaires in this area where the same physical damage hazards are possible. This is the appropriate code section for this requirement as it is specific to the wiring methods used under metal corrugated sheet roof decking. Acceptance of this proposal parallels the panel's objective in the last code cycle and is in harmony with 90.1(A) of NFPA 70, NEC, 2008 edition.
Panel Meeting Action: Reject
Panel Statement: Damage from long screws in metal corrugated roofing could occur to enclosures and luminaires; however, Article 300 only addresses wiring methods and accepting the proposed text would be outside the jurisdiction of Panel 3.
Enclosures are defined as the case or housing of apparatus to protect electrical equipment from physical damage, which is much more than just a box as found in wiring methods, although some handhole enclosures are found in Article 314. Handhole enclosures are designed to be installed in the ground and nowhere close to corrugated roofing.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-37 Log #3856 NEC-P03 **Final Action: Accept in Principle**
(300.4(E))

Submitter: Bill McGovern, City of Plano
Recommendation: Revise text as follows:
Junction Boxes, Cables, and Raceways Installed Under Roof Decking. A junction box, cable- or raceway type wiring method, installed in exposed or concealed locations under metal-corrugated sheet roof decking, shall be installed and supported so the nearest outside surface of the junction box, cable or raceway is not less than 38 mm (1$^1/_2$ in.) from the nearest surface of the roof decking.
Substantiation: Substantiation of proposal 3-31, log 3310 for the 2008 NEC addressed the hazards of cables and raceways being attached to the bottom side of the roof deck making them susceptible to penetration by long roof decking screws. The same requirements for junction boxes should be applied here requiring 1$^1/_2$ in of spacing from the nearest surface of the roof decking.
Panel Meeting Action: Accept in Principle
Panel Statement: The suggested change in this proposal only applies to junction boxes, but the change should apply to all boxes.
See the panel action and statement on Proposal 3-34.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-38 Log #3867 NEC-P03 **Final Action: Accept in Principle**
(300.4(E))

Submitter: Mike Weitzel, Bechtel
Recommendation: In 300.4(E) insert one word in the title and one word in the paragraph as follows;
(e) Cables. raceways, and Boxes Installed Under Roof Decking. A box, cableway, or cable type wiring method... remainder of paragraph remains the same.
Substantiation: Boxes require physical or mechanical protection just as much as raceways and cables. Not including this wording in the 2008 NEC may have been an oversight. The IAEI 2008, *Analysis of Changes* book, which I assisted with, has an excellent illustration to justify this proposal to protect boxes as well.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 3-34.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-39 Log #4608 NEC-P03 **Final Action: Accept in Principle in Part**
(300.4(E))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee
Recommendation: Delete the exception and revise the rule and fine print note to read as follows:
(E) Cables and Raceways Installed Under Roof Decking. A cable- or raceway-type wiring method, installed in exposed or concealed locations below metal-corrugated sheet roof decking, shall be installed and supported so the upper outside surface of the cable or raceway is not less than 38 mm (1½ in.) below the lowest surface of the roof decking.
FPN: Roof decking material is often repaired or replaced after the initial raceway or cabling and roofing installation and may be penetrated by the screws or other mechanical devices designed to provide “hold down” strength of the water-proof membrane or roof insulating material. Where the deck is of corrugated construction, the length of the holding screws is usually chosen to penetrate the lowest level of any corrugation as measured from the upper roof surface.
Substantiation: This proposal follows from extensive discussion on this topic at the “Super Code” IAEI meeting on Cape Cod in 2007 that included people who developed the original NEC proposal. There is no problem with the objective of the new NEC provision, however, the wording chosen by CMP 3 is likely to be misapplied in the field and inconsistently enforced. The principal issue is that the NEC will limit wiring placements “from the nearest surface of the roof decking” instead of from the lowest surface. The drawing below shows the problem with this wording:
The NEC text can easily be read as limiting the wiring method from the “nearest” decking surface in the sense of the lower side of the adjacent decking as opposed to the farthest surface (the upper part of the roof surface). The intent, however, is to limit the wiring placement in terms of the “nearest” decking surface in the sense of being nearest to the ground (lowest), even if a higher surface is actually closer to the wiring method. The roofing screws will be of consistent length regardless of where they are driven. The drawing shows a raceway 1½ in. from the decking surface nearest to its actual location. The NEC text could easily support this interpretation, and the raceway would be damaged by a screw of a length that would likely be used. The wording in this proposal, together with the additional sentence added to the fine print note, should make these concepts clear to installers and inspectors.
This proposal also includes RMC and IMC in the new rule by deleting the exception that would exempt them. This exception was never included in or substantiated by the original proposal or its supporting comment. The panel simply added it with the statement that these wiring methods would not be damaged. That is not true. The hold-down screws used for this roofing have robust drill points designed to easily penetrate heavy steel decking. If a section of steel conduit happens to be secured near the point of penetration of one of those deck screws, the screw will easily penetrate even heavy-wall conduit. When UL performed the fact-finding investigation requested by armored cabling manufacturers to support an exception for these cables from the requirements in NEC 300.4(D), in some instances sheet-rock screws were shown to penetrate heavy-wall steel conduits. Steel deck screws would certainly do the same, routinely.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle in Part
The panel rejects the deletion of the exception and the newly added sentence to the Fine Print Note, and Accepts in Principle the word “upper” and the phrase “below the lowest”.
Panel Statement: See the panel actions and statements on Proposals 3-33 and 3-34. The Fact Finding Report alluded to in the substantiation does not address this particular application.
The submitter did not provide substantiation or any data to delete the exception that would indicate that problems have been encountered in the field.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
STENE, S.: The Fact Finding Report alluded to in the substantiation was not addressing this particular application and should not be used as part of the substantiation for addressing this proposed change.

3-40 Log #4724 NEC-P03 **Final Action: Accept in Principle**
(300.4(E))

Submitter: Phillip J. Yehl, City of Peoria
Recommendation: Revise text as follows:
(E) Cables and Raceways Installed Under or Over Roof Decking.
A cable or raceway-type wiring method, installed in exposed or concealed locations under or over metal-corrugated sheet roof decking, shall be installed and supported so the nearest outside surface of the cable or raceway is not less than 38 mm (11/2 in.) from the nearest surface of the roof decking.
Substantiation: The new wording would make it clear that above the decking in the void of corrugation is included in this requirement no just underside. I have recently seen this very same installation.
See handbook Exhibit 300.4
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 3-34, which addresses the submitter’s concerns.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-41 Log #677 NEC-P03 **Final Action: Reject**
(300.4(G))

Submitter: Richard E. Loyd, R & N Associates
Recommendation: The Proposal should be Accepted. Add the following wording to 300.4(G):
Protection of Outlet Boxes During Construction. The open front of both metal and nonmetallic electrical outlet boxes shall be temporarily covered to protect insulated electrical conductors and components from physical damage due to power routers, and other cutting tools. Conductors and components shall not be damaged or contaminated by foreign materials such as paint, plaster, cleaners, abrasives, or corrosive residues. There shall be no damaged parts that may adversely affect safe operation of the equipment such as parts that are broken; cut and other potential damage during construction. The cover shall be constructed of a nonmetallic material and shall be clearly marked “Not for Permanent Installation”.
Substantiation: The integrity of the electrical installation is a problem and 110.12(C) is not adequate to cover this problem. Why would we pass codes about unused openings in junction boxes, but not address circuit integrity? It is not uncommon for an electrician to find that the copper wires have turned green due to an oxidation chemical reaction, and electricians often remove foreign materials and debris from junction boxes at their own time and expense.
Typically, the inspector and electrical contractor are not onsite during, or able to monitor, the sheet rock installation. Therefore, there is no care, nor custody, of electrical systems and terminations. It is not practical to hold the sheet rock installer liable; the only solution is to have the electrician protect his work from other crafts onsite.
Damage has continued to occur for many years often undetected due to the difficulty in seeing nicks and cuts to the insulation. Installers often encounter receptacles and switches full of sheetrock mud and paint when they are installing the final trim. They don’t always replace these damaged devices leading to early failure or worse fire and shock hazards.
In conclusion, the electrical conductors and enclosed devices need to be protected. It makes sense to protect electrical conductors from construction debris, until final electrical installation. The fire alarm industry manufacturers

ship smoke detectors with a protective covering, which is removed after there is no longer potential damage from the various construction trades. Some fire alarm control panels are shipped with a protective device (often a piece of cardboard) to place over the fire alarm system wiring and terminals in a rough-in-box for protection from paint, plaster, and general construction site grime. A steel plate may not be necessary for protection. Also, I recently renovated my condo. I was disappointed with the sheetrock mud, paint, and other construction debris that had to be scraped and chipped out of the electrical boxes and off the electrical conductors.

This requirement is an easy-to-implement solution to the aforementioned problem. It would shield against the plaster, spray from insulation, power routers, and paint contamination that is so often present as a result of the carelessness of nonelectrical tradespersons who are eager to finish their work in a timely manner. It would provide protection so that wiring and other electrical components within electrical outlet boxes are not damaged, broken, bent or cut by others during the rough-in or construction phases.

Please accept this proposal.

Panel Meeting Action: Reject

Panel Statement: This proposal was a comment held by the NEC Technical Correlating Committee from the 2008 ROC with the new reference section number as 300.4(G) for protector plates.

Since it was not accepted, but held for 2011, the section reference at the top of this proposal is incorrect. See the panel action and statement on Proposal 3-18.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-42 Log #1351 NEC-P03 **Final Action: Accept**

(300.4(G))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Change “substantial” in two places to “identified”.

Substantiation: Edit. The fitting and insulating material should be recognized as suitable for the use. “Substantial” is subjective and a term to be avoided.

Panel Meeting Action: Accept

Panel Statement: Identified (as applied to equipment) is a more appropriate term to use since the definition is as follows:

“Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular Code requirement.”

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-43 Log #1534 NEC-P03 **Final Action: Reject**

(300.4(G))

Submitter: Carlo Compagnone, Jr., Compa Covers, Inc.

Recommendation: Add new text as follows:

The open front of both metal and nonmetallic electrical device boxes shall be temporarily covered to protect insulated electrical conductors from physical damage or deterioration due to power routers, plaster, paint spray guns, spray foam insulation, and other potential damage during construction. The covers shall be clearly marked “Not For Permanent Installation”.

Substantiation: Leaving the front end of an electrical box open during the preliminary stages of construction results in exposed wires. This allows electrical wiring to be vulnerable to be cut or damaged during construction with power routers along with plaster filled boxes and overspray from paint guns and spray foam insulation guns, which in the end will leave a poor and unsafe working environment. Having a temporary cover on an electrical box is most of all a safety factor. Such covers will prevent build up of debris and puts a stop to unauthorized personnel tampering with wiring during the time of construction.

I have also submitted this proposal to Code-Making Panel 9 for 314.17(E) or 314.26.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This proposal was a comment held by the NEC Technical Correlating Committee from the 2008 ROC with the new reference section number as 300.4(G) for protector plates. Since it was not accepted, but held for 2011, the section reference at the top of this proposal is incorrect. See the panel action and statement on Proposal 3-18.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-44 Log #2151 NEC-P03 **Final Action: Reject**

(300.4(G))

Submitter: Mark T. Rochon, Peabody, MA

Recommendation: Revise text as follows:

Where raceways contain ~~4 AWG or larger~~ insulated circuit conductors and these conductors enter a cabinet, box, enclosure, or raceway, the conductors shall be protected by a substantial fitting providing a smoothly rounded insulating surface, unless the conductors are separated from the or raceway by substantial...

Substantiation: Conductors smaller than #4 AWG still get damaged by the pressure or weight on the conductor as it rests on the edge of the raceway. When pulling smaller than #4 AWG conductors, the insulation still gets nicked and skinned as it comes in contact with the 90° edge of raceway or enclosure.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation that conductors smaller than No. 4 AWG have been damaged due to physical weight of the conductors on the edge of a fitting. The submitter also has not clarified if the insulation of the conductors mentioned in the substantiation was actually nicked and skinned.

The nylon jacket of THHN/THWN is for mechanical protection and not part of the insulation of the conductors.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-45 Log #1608 NEC-P03 **Final Action: Reject**

(300.4(H) (New))

Submitter: Sanford E. Egesdal, Egesdal Associates PLC

Recommendation: Add new 300.4(H):

(H) Conductors Inside Electrical Boxes. Conductors, inside electrical boxes, subject to physical damage from router bits, sheet rock saws, and knives, and nonconductive coatings, such as drywall mud, paint, lacquer and enamel, must shall be protected during the construction process by means of a rigid cover, plate, or insert of a thickness and strength as to prohibit penetration by the above mentioned items.

Substantiation: This proposal is a placeholder.

The proposed requirement was accepted by Code Making Panel 3 last code cycle, during the ROC meeting. The NEC TCC changed the action on the comment and related proposal to “hold.” The TCC appointed a Task Group with members from Panels 1, 3, and 9 to determine which Code Making Panel should have jurisdiction over the new material recommended by the related proposals and comments. The Task Group agreed, by a majority, that Panel 9 has jurisdiction. As a result, Panel 9 will have a proposal to consider this code cycle.

However, Panel 9 meets the week after the Panel 3 meeting. So, it seems reasonable for Panel 3 to take affirmative action on this comment. Then, if Panel 9 accepts text similar to this proposal, Panel 3 can revise 300.4(H) to reference 314.xx, along with other appropriate text.

It is important that this requirement be included in 300.4. Protection of conductors is part of the construction process. A protective cover should be placed on the electrical box after conductors are present in the box.

Panel Meeting Action: Reject

Panel Statement: The Article 300 text is meant to apply to only those issues not specifically covered in other articles in Chapter 3.

See the panel action and statement on Proposal 3-18.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-46 Log #2277 NEC-P03 **Final Action: Reject**

(300.4(H) (New))

Submitter: David H. Kendall, Thomas & Betts Corp.

Recommendation: Add a new Section 300.4(H) to read as follows:

(H) Structural Construction Joints. Conduits, tubings and other raceways shall utilize a listed expansion/deflection fitting or other approved means when crossing a structural construction joint used in buildings, bridges, parking garages, or other structures.

Substantiation: Add a new Section 300.4(H) Structural Construction Joints. Raceways are damaged when improperly installed in structural construction joints leaving conductors or cables exposed. Structural construction joints will experience shear and lateral loads due to gravity, expansion and contraction and movement of the structure. The International Building Code, Section 1906, refers you to the provisions of ACI 318 (American Concrete Institute). However, neither of these codes addresses the use of an expansion/deflection fitting or other approved means when electrical raceways cross the construction joint. It is the responsibility of the engineer or architects to define all construction joints in construction documentation and to ensure they are constructed as required.

This new section will emphasize that a raceway can be damaged if improperly installed in a construction joint and will be a tool for the electrical inspector to ensure the proper installation of electrical raceways. Currently there are expansion/deflection fittings on the market, in addition, the language in the new section allows for other approved means.

The attached pictures shows damage ENT, a flexible and pliable raceway, crossing a structural construction joint. Conductors are exposed which creates a safety hazard. Also attached is a drawing which shows an example of an approved, Department of Transportation, installation utilizing an expansion/deflection fitting in a structural construction joint.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Table 300.5

Location of wiring method or circuit	Column 1 Direct Burial Cables or Conductors	Column 4 Residential Branch Circuits rated 120 Volts or Less with GFCI Protection and Maximum Overcurrent Protection of 20 Amperes	Column 5 Circuits for Control of Irrigation and Landscape Lighting Limited to Not More Than 30 Volts and Installed with Type UF or in Other Identified Cable or Raceway
Under a building	0 0 (in only raceway or Type MC cable identified for direct burial)	0 0 (in only raceway or Type MC cable identified for direct burial)	0 0 (in only raceway or Type MC cable identified for direct burial)

Panel Statement: Even though the Department of Transportation has provided a drawing showing an expansion fitting permitting deflection of 30 degrees in all directions, the expansion fitting was only tested for expansion and contraction, not deflection, during the listing procedure. Expansion and contraction is already covered in 300.7(B).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
CASPARRO, P.: This Proposal should have been accepted. Listed expansion/deflection couplings are readily available and are tested for both deflection and expansion. Section 300.7(B) does not address Structural Expansion Fittings found in buildings, bridges and other structures.
EASTER, L.: This proposal should have been accepted by Panel 3. Listed expansion/deflection couplings are readily available and are tested for both deflection and expansion. Section 300.7(B) addresses "thermal" expansion and contraction due to temperature. Section 300.7(B) does not address Structural Expansion Fittings found in buildings, bridges and other structures that are affected by other forces such as wind, loading and ground movement.

3-47 Log #807 NEC-P03 **Final Action: Reject**
(300.5)

Submitter: William Marino, North Haven, CT
Recommendation: Revise text to read as follows:
Direct buried conductors and cables emerging from grade that are continuous, not terminated, spliced and/or entering a structure need to be protected from the minimum cover depth, to a point at least 2.5 m, 8 ft above grade.
Substantiation: The article states the "Direct buried conductors and cables emerging from grade need to be protected from the minimum cover depth, to a point at least 2.5 m, 8 ft above grade".
I find this wording to be confusing. It sounds as if the NEC is telling me to extend a raceway up 8 ft above the finished grade and then come back down with another piece of pipe to install a GFCI 18 in. above ground.
The wording should clarify that conductors that are terminated in a box, or if a conduit body enters a building, less than 8 ft above finished grade, then the conductors only need to be protected for that distance.
Panel Meeting Action: Reject
Panel Statement: The submitter is not applying the existing text correctly. The direct buried conductors must be protected by raceways extending from the minimum cover given in Table 300.5 and by a raceway that may have to extend up to 8 feet. If an enclosure is installed at 6 feet, then the raceway protects the direct buried conductors from the burial depth to the enclosure. The recommended text would allow the direct buried conductors or cables that are not continuous, are terminated, and/or enter a structure to be installed without any protection, which is certainly not the intent of the section.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-48 Log #2650 NEC-P03 **Final Action: Accept in Principle in Part**
(300.5)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows: Direct-buried conductors, cables, conduit or other and raceways shall be... (remainder unchanged).
(C) Underground conductors and cables except Type MI cable installed under a building shall be installed in a raceway.
(D)(1) Direct-buried conductors and cables (except Type MI cable) emerging from grade and specified in Columns 1 and 4 of Table 300.5 shall be protected by identified enclosures or raceways extending from the minimum cover distance required by 300.5(A) to a point at least not less than 2.5 m (8 ft) above finished grade or termination in an enclosure or transition to another identified wiring method.
Exception: Where the conductors or cables are identified for use aboveground and emerge into a wall space enclosures or raceways shall not be required.
Substantiation: Edit. "Cables" may be perceived as multiconductor types; (B), (D), (D)(1) and (2) Include "conductors". The provision should allow for a lower height for termination in enclosures or transition to other wiring methods. Limiting the requirement to Columns 1 and 4 of Table 300.5 doesn't correlate with cover requirements of column 5.
Panel Meeting Action: Accept in Principle in Part
Revise the wording in the proposal to read as follows:
"(C) Underground Cables Under Buildings. Underground cable installed under a building shall be in a raceway."
The exception in the proposal has been revised to read as follows:
"Exception No. 1: Type MI Cable shall be permitted under a building without installation in a raceway where embedded in concrete, fill, or other masonry in accordance with 332.10(6) or in underground runs where suitably protected against physical damage and corrosive conditions in accordance with 332.10(10).
Other suggested changes in the proposal were not accepted.
Panel Statement: The panel accepted the addition of MI Cable as a new Exception No.1 since there are certain conditions based on requirements in 332.10 before MI Cable can be installed underground under a building without an additional raceway requirement.
The remainder of the proposal is rejected since direct buried conductors and cables must be protected from physical damage by a wiring method that is suitable for use in an area subject to physical damage based on the requirements in the individual articles in Chapter 3.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-49 Log #4525 NEC-P03 **Final Action: Accept in Principle**
(Table 300.5)

Submitter: Phil Simmons, National Armored Cable Manufacturers Assn. / Rep. NACMA
Recommendation: Revise Columns 1, 4 and 5 of Table 300.5 for the "under a building" location as follows:

See Table 300.5 on Page 316

Substantiation: This is a companion proposal to one submitted for 300.5(C). In the ROC for the 2008 NEC the panel statement for comment 3-22 said, "The main reason for this subsection (300.5(c)) is to enable direct buried cables installed under a concrete slab under a building,"
MC Cable is available that is rated for direct burial and for encasement in concrete. It is not clear that the "Under a Building" rule requires that the cable or conductors be in a raceway. For example, Type MC cable that is listed and identified for direct burial is certainly suitable for installation in a crawl space under a building, for direct burial, as well as encased in concrete.
Panel Meeting Action: Accept in Principle
Revise the proposed text in Columns 1, 4, and 5 as follows:
"(in raceway or Types MC or MI cables identified for direct burial.)"
Panel Statement: The panel added "MI Cable" to correlate with the addition of two new Exceptions for 300.5(C) based on the actions on Proposals 3-48 and 3-52 recognizing MC and MI cable directly buried under a building without insertion in a raceway.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-50 Log #3449 NEC-P03 **Final Action: Reject**
(300.5(A))

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Add text to read as follows:
Direct-buried cables or conduit or other raceways shall be installed to meet the minimum cover requirements of table 300.5 and have their location identified by a warning ribbon that is placed in the trench above the underground installation.
Substantiation: Any added protection to underground installations could help protect personnel from puncturing and damaging the raceways or cables whether it is a homeowner or professional possibly preventing a shock hazard, or leakage into the ground causing nuisance tripping of the overcurrent protection.
Panel Meeting Action: Reject
Panel Statement: Adding the proposed text to 300.5(A) would require warning ribbons to all installations in Table 300.5 including raceways under a building with zero depth, rigid and IMC raceways under concrete with a burial depth of 6 in., and other similar installations.
The reason 300.5(D)(3) requires service conductors to have a warning ribbon installed 12 in. above the direct buried cable is service conductors are not protected by overcurrent protective devices and constitute a much greater hazard where the service conductors may be damaged during excavation.
Anyone digging in a location where directly buried service conductors have a ribbon installed 12 in. above the cable should be warned that there is a cable below that location. Expanding this warning ribbon requirement to all underground direct burial applications would tend to desensitize the effect of the warning ribbon.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
CASPARRO, P.: I disagree with the panel action and panel statement. While it is true that a requirement cannot be made which would apply to the entire Table 300.5 since some of the installations do not require any cover, it should be made a requirement for all installations which are required to be 18” or deeper, similar to the requirement in 300.5(D)(3). I disagree with the panel statement “service conductors are not protected by overcurrent protective devices and constitute a much greater hazard”. The fact that these conductors are protected by overcurrent protective devices is irrevelent in this case. Overcurrent protective devices are intended for the protection of the conductors not the personnel doing the excavation. Protection for personnel is provided by GFCI not overcurrent protection devices.
Comment on Affirmative:
OWEN, R.: See my Comment on Affirmative on Proposal 3-55 (Log #2644).

3-51 Log #3560 NEC-P03 **Final Action: Reject**
(300.5(C))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
(C) Underground Cables Under Buildings. A single conductor cable or multiconductor ~~Underground~~ cable assembly installed under a building shall be in a raceway.
Substantiation: The proposed revision to 300.5(C) is editorial in nature. This proposed revision will provide increased clarity and usability by specifically recognizing single cables as well as multiconductor cable assemblies.
Panel Meeting Action: Reject
Panel Statement: 300.5(C) applies to all underground cables, whether single, multiconductor cables, or cable assemblies; therefore, adding this text is unnecessary and does not provide any additional clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-52 Log #4531 NEC-P03 **Final Action: Accept in Principle**
(300.5(C))

Submitter: Phil Simmons, National Armored Cable Manufacturers Assn. / Rep. NACMA
Recommendation: Revise 300.5(C) as follows:
(C) Underground Cables Under Buildings. Underground cable installed under a building shall be in a raceway. Type MC cable listed for direct burial or concrete encasement shall be permitted without installation in a raceway.
Substantiation: Type MC cable is available listed for direct earth burial and concrete encasement. This cable does not require protection in a raceway under a building for suitable installation.
Panel Meeting Action: Accept in Principle
Add the following new Exception No. 2: “Exception No. 2: Type MC Cable listed for direct burial or concrete encasement shall be permitted under a building without installation in a raceway in accordance with 330.10(A)(5) and in wet locations in accordance with 330.10(11).”
Panel Statement: The suggested text was added as an exception since the main text requires installation in a raceway and the proposed text permits MC cable without a raceway.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
STENE, S.: There is currently no exception to 300.5(C). Therefore, the new exception is the only exception, not exception 2.

3-53 Log #975 NEC-P03 **Final Action: Reject**
(300.5(D)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Direct-buried circuit conductors and cables emerging from grade and specified in columns 1 and 4 of Table 300.5 shall be protected by ~~enclosures~~ identified raceways from the minimum cover ~~distance~~ depth below grade required by 300.5(A) to a point not less than at least 2.5 m (8 ft) above finished grade unless the raceway(s) terminate inside a pole, within a wall, at a cabinet, box, or other enclosure, or transitions to another approved wiring method. ~~In no case shall protection be required to exceed 450 mm (18 in.) below finished grade.~~ Raceways on the exterior of buildings, poles or other structures and less than 2.5 m (8 ft) above finished grade shall be rigid metal conduit, intermediate metal conduit, electrical metallic tubing, schedule 80 PVC conduit or other approved types.
Substantiation: Circuit conductors should be specified since direct-buried grounding and bonding conductors do not have a required burial depth (proposals for such have been rejected) and are covered by 110.27(B) and 250.63(B) for protection. Direct-buried conductors do not always extend 8 ft. above finished grade. Since column 1 of Table 300.5 may require a burial depth greater than 18 in. (24 in.) the raceways should extend to that depth since protection to 18 in. would leave 6 in. of conductor at less than 4 in. deep. Proposal for raceways is prompted by 300.50(B) which specifies specific raceways.
Panel Meeting Action: Reject
Panel Statement: Adding “circuit” is not necessary since this section is dealing with the actual direct buried conductors, not the circuit.
Adding the word “identified” is unnecessary since only raceways appropriate for the installation can be installed based on the particular raceway article in Chapter 3.
Changing “distance” to “depth” does not correspond to Note 1 in the table where it uses “shortest distance.”
Inserting the phrase “unless the raceway(s) terminate inside a pole, within a wall, at a cabinet, box, or other enclosure, or transitions to another approved wiring method” adds unnecessary complexity.
The submitter is not applying the existing text correctly. The direct buried conductors must be protected by raceways extending from the minimum cover given in Table 300.5 and by a raceway that may have to extend up to 8 ft. If an enclosure is installed at 6 ft, then the raceway protects the direct buried conductors from the burial depth to the enclosure.
Adding a sentence requiring specific raceway types is also not necessary since any wiring method may be appropriate for the installation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-54 Log #3820 NEC-P03 **Final Action: Reject**
(300.5(D)(1))

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Add new text to read as follows:
300.5(D)(1) Emerging from Grade. Direct-buried conductors and cables, where judged subject to physical damage, emerging from grade, etc.
Substantiation: It is permissible to attache some cable wiring methods to the exterior of buildings or structures provided it is rated for exposure to sun light and not subject to physical damage without a mounting height restriction. The existing wording would require such a cable emerging directly from earth burial to be protected by a raceway up to eight feet and an adjacent cable of the same type that originated in the building to be installed without the height restriction.
Panel Meeting Action: Reject
Panel Statement: The individual article for the particular wiring method within Chapter 3 would determine whether the wiring method could be used where subject to physical damage, therefore, inserting the text here is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-55 Log #2644 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Warning Ribbon. Direct-buried conductors, cables, and raceways (other than rigid metal conduit or intermediate metal conduit) that are not encased in a minimum 50 mm (2 in.) concrete envelope or not installed under a minimum 102 mm (4 in.) concrete cover shall have their location indicated by a continuous warning ribbon identified for the purpose placed in the trench at least 300 mm (12 in.) above the underground installation.
Substantiation: The presumed purpose is to minimize shock hazard rather than interruption of power. Conductors other than service conductors can provide the same degree of shock hazard and explosive power (MVA) (such as industrial premises). Since RMC and IMC can be buried 6 in. it is not practical to place the ribbon 12 in. above the installation. Such raceways are likely to be noticed if dug into or deenergize the circuit by short-circuit. Conductors under a concrete slab are not likely to be damaged. Circuits protected by ground-fault devices should be excluded.
Panel Meeting Action: Reject
Panel Statement: 300.5(D) only applies to direct buried conductors and cables and not raceways, as proposed in the change. See the panel statement on Proposal 3-50.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
CASPARRO, P.: This proposal should have been Accepted in Principle. Service conductors, Feeders, and Branch circuits that are buried 18 in. or more, and are not encased in concrete should have a warning ribbon placed 12 in. above the installation because of the high available fault currents that are present at various locations today.
Comment on Affirmative:
OWEN, R.: Although I am voting in the affirmative on the panel actions on this Proposal and Proposal 3-50, I am doing so because neither proposal has a completely effective solution for this issue. To reject this proposal by saying you can't be injured by a feeder or branch circuit with overcurrent is definitely open to debate. I agree you cannot require a warning ribbon if there is not adequate raceway burial depth to maintain the clearance, but to have the same requirement for a feeder or circuit buried 18" or greater has merit and should be reconsidered by the Panel.

3-56 Log #3412 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
300.5(D)(3) Service Conductors. Underground service-entrance conductors that are not encased in concrete and that are buried 450 mm (18 in.) or more below grade shall have their location identified by a warning ribbon that is placed in the trench or at least 300 mm (12 in.) above the underground installations.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: Underground service lateral conductors, based on the Technical Correlating Committee comment in the 2008 ROP, are not limited to the "line side" of the service point with the existing text applying to any service conductors, not just service-entrance conductors. A Technical Correlating Committee Task Group has been assigned to deal with this entire issue. This Technical Correlating Committee Task Group has been given the task of coordinating the definitions and terminology for conductors covered by NESC and those covered by the NEC. The service point normally describes the point of demarcation from the utility company to the premises wiring, but with deregulation, the service point has become a moving target. This suggested change is part of an effort Panel 4 started at the end of last cycle and has been picked up by this Task Group. Panel 1 and Panel 4 must provide a clearer definition.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-57 Log #3331 NEC-P03 **Final Action: Reject**
(300.5(D)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by (D)(1) and (D)(2) and other permitted and not permitted uses of raceways.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to delete this section, and deleting this section is not editorial as indicated in the substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-58 Log #3884 NEC-P03 **Final Action: Reject**
(300.5(F))

Submitter: Josh Brantley, E Light Electric Services
Recommendation: Revise text as follows:
Backfill that contains large rocks, paving materials cinders, large or sharply angular substances, or corrosive material shall not be placed in or compacted with an excavation where materials may damage raceways, cables, or other substructures ~~or prevent adequate compaction of fill~~ or contribute to corrosion of raceways, cables, or other substructures.
Where necessary to prevent physical damage to the raceway or cable, protection shall be provided in the form of granular or selected material, suitable running boards, suitable sleeves, or other approved means.
Substantiation: The revised wording clarifies the original text.
Panel Meeting Action: Reject
Panel Statement: The existing text is very specific to not permitting large rocks or sharply angular substances, etc that would prevent adequate compaction of the fill. Where adequate compaction is not possible, damage to raceways, cables, or other substructures may eventually occur due to settling or deflection of the raceway from voids in the earth. The new text would imply that compaction of large objects may damage the raceways, but that concept is covered in the first part of the existing text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-59 Log #3145 NEC-P03 **Final Action: Reject**
(300.5(G), FPN and 300.50(E))

Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: Revise both 300.5 (G) and 300.50 (E) to read the same and as shown below. Eliminate the existing FPN after 300.5(G)
300.5(G) Raceway Seal. Where a raceway enters a building from an underground system, both ends of the raceway shall be sealed with an identified compound or plugged so as to limit the likely hood of entrance of moisture or gases. Gas-venting devices shall be permitted to supplement sealing or plugging in order to minimize the building up of positive gas pressures in the raceway. Raceways shall be so arranged to prevent moisture from contacting live parts.
300.50(E) Raceway Seal. Where a raceway enters a building from an underground system, both ends of the raceway shall be sealed with an identified compound or plugged so as to limit the likely hood of entrance of moisture or gases. Gas-venting devices shall be permitted to supplement sealing or plugging in order to minimize the building up of positive gas pressures in the raceway. Raceways shall be so arranged to prevent moisture from contacting live parts.

Substantiation: This proposal provides consistency of the requirements for the raceway seal regardless of the voltage of the cable or conductor within the raceway. This proposal also provides similar requirements as discussed in Rule 322 (B)(4) in the National Electrical Safety Code. The seals needed for the raceway are not required to be explosion proof seals.
Panel Meeting Action: Reject
Panel Statement: The proposed text would require raceway seals even where there may be no likelihood of entrance of moisture or gases. 300.7(B) applies where there may be a difference of temperature that could potentially cause moisture within the raceway or the connected equipment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
MENENDEZ, J.: Reason to Ballot Negatively on Proposal 3-59
This proposal should have been accepted because it brings a uniform requirement to the installations covered within Article 300. The panel statement doesn't address the issue because there are conflicting requirements between the existing 300.5(G) and 300.50 (E) included as reference. One requirement is in the 600 Volt, nominal and less Part of Article 300 and the other requirement is in the above 600 Volt, nominal Part of Article 300.
However, there isn't any relationship between the voltage of the conductors within the raceway and the necessity of the raceway seal. Therefore, the requirements of both sections should be identical. Acceptance of this proposal will make these requirements identical.
Existing 2008 NEC included as reference.
2008 Edition of the NEC
300.5 (G) Raceway Seals. Conduits or raceways through which moisture may contact live parts shall be sealed or plugged at either or both ends.
FPN: Presence of hazardous gases or vapors may also necessitate sealing of underground conduits or raceways entering buildings.
300.50 (E) Raceway Seal. Where a raceway enters from an underground system, the end within the building shall be sealed with an identified compound so as to prevent the entrance of moisture or gases, or it shall be so arranged to prevent moisture from contacting live parts.

3-60 Log #1985 NEC-P03 **Final Action: Reject**
(300.5(I))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: All conductors of the same circuit, and where used, the equipment grounding and bonding conductors shall be installed in the same raceway, cable, cable tray or other enclosure. Direct-burial type conductors shall be installed in close proximity in the same trench, manhole, or handhole.
Exception No. 1: Conductors in parallel shall be permitted in accordance with applicable provisions of 310.4.
Exception No. 2: It shall be permitted to isolate ac phase, dc polarity, grounded conductors, equipment grounding or bonding conductors from such other paralleled conductors. Where such isolated ac circuit conductors are installed in raceways or cables, the raceways and cable outer coverings shall be nonmetallic or nonmagnetic. Raceways and cables for such ac circuits shall be in close proximity to each other.
Exception No. 3: Single conductor Type MC and Type MI cables shall be permitted.
Exception No. 4: Conductors installed for skin effect heating as covered in Articles 426 and 427.
Substantiation: Cable trays and other enclosures should be included; auxiliary gutters for example are not indicated as a raceway in the raceway definition. The reference to 310.4 provides additional applicable requirements. Exception No. 2 should include nonmagnetic raceways. Close proximity should only be required for ac circuits. Proposed exceptions 3 and 4 are necessary for correlation.
Panel Meeting Action: Reject
Panel Statement: 300.5 covers underground installations and (I) covers underground conductors of the same circuit. Adding cable trays and auxiliary gutters as indicated in the proposed text and the substantiation would not be possible since cable trays and auxiliary gutters are not approved for underground installations.
300.3(B)(1) already covers paralleled conductors in the same raceway, trench, or cable based on 310.4.
There was no technical substantiation provided in proposed Exception No. 2 to include nonmagnetic raceways in an exception permitting isolated conductors of the same circuit to be installed separately. This issue is already adequately covered in existing 300.3(B)(1), Exception for nonmetallic raceways.
Proposed Exception No. 3 covering single conductor MC and MI cables is already adequately covered in 300.3(B)(3).
Adding conductors for skin-effect heating as covered in 426.42 and 427.47 is not appropriate since skin-effect heating systems, as referred in these two sections, actually use a ferromagnetic envelope to encase the single conductor, not a wiring method or normal enclosure as would be covered in Chapter 3. The text in these two sections also excludes any application of 300.20 to these systems.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-61 Log #4607 NEC-P03 **Final Action: Accept in Principle**
(300.5(I) Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows:
Conductors shall be permitted to be run in paralleled groups. Each raceway, or cable assembly, or grouping of single conductors shall contain all conductors of the same circuit including equipment grounding conductors.
Substantiation: The literal text of the current NEC requires that for single-conductor cables run in parallel, all of the conductors must run together, because this exception only covers cables or raceways that are capable of containing all of the circuit conductors, and therefor omits single conductors. Since derating applies to all conductors run in the same trench, the derating penalties for doing this are severe. This omission appears to be an inadvertent one, and needs to be corrected. There is no good reason to penalize single conductor make-ups, such as will frequently exist with USE applications.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
"Exception No. 1: Conductors shall be permitted to be installed in parallel in raceways, multiconductor cables, or direct-buried single conductor cables. Each raceway or multiconductor cable shall contain all conductors of the same circuit including equipment grounding conductors. Each direct-buried single conductor cable shall be located in close proximity in the trench to the other single conductor cables in the same parallel set of conductors in the circuit, including equipment grounding conductors."
Panel Statement: The text was reworded from the proposed text to cover multiconductor underground cables (USE multiple conductor cables) as well as single underground conductor cables (single USE conductor cables) as provided in Article 338.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-62 Log #3555 NEC-P03 **Final Action: Reject**
(300.5(L))

Submitter: Robert Byrd, Winter Garden, FL
Recommendation: Add new text to read as follows:
All PVC boxes, Underground, shall be installed in a manner that does not allow the penetration of water through which entry and exit holes were created for conduits. You shall use a neoprene gasketed fitting on all openings.
Substantiation: With the entry holes having a threaded PVC Adapter with a regular lock nut, the entry holes are allowing water into the junction boxes, eventually flooding out the connections.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided in the proposal that water enters into an underground enclosure through the threaded PVC box openings. There are many different ways water can enter into an underground enclosure, other than just at threaded openings, such as leakage through covers and other potential leakage points. Condensation from temperature differentials could be a cause. Even if water does enter into the underground enclosure, the conductors [310.8(C) for conductors in wet locations] and any connectors [110.14(B) last sentence in the first paragraph] installed in the enclosure must be rated for wet locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-63 Log #3361 NEC-P03 **Final Action: Reject**
(300.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "suitable" to "identified".
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: Section 3.2.1 of the NEC Style Manual states the term "suitable" shall be reviewed in context and if the resulting requirement is unenforceable or vague, the term shall not be used. "Suitable for the environment" is not vague and is enforceable so it can remain as is. There was no technical substantiation provided in the proposal to justify this change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-64 Log #3646 NEC-P03 **Final Action: Reject**
(300.6(A))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
(A) Ferrous Metal Equipment. Ferrous metal raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, nipples, fittings, supports, and support hardware shall be suitably protected against corrosion inside and outside (except threads at joints) by a coating of approved corrosion-resistant material. Where corrosion protection is necessary and the conduit ~~is threaded in the field~~, threads do not have corrosion protection, the threads shall be coated with an approved electrically conductive, corrosion-resistant compound.
Substantiation: The current wording only applies to field cut threads. Where factory nipples and bends are used, these threads do not have corrosion protection and need field applied protection just like field cut threads do.
Panel Meeting Action: Reject
Panel Statement: RMC and IMC are listed and the corrosion protection is part of the listing. Section 5.4.2 in UL 6 provides the requirements for protection of threads. IMC and RMC are threaded before the final coating is provided for the overall length, but if it is field cut (after the final coating) then protection must be applied before the conduit is installed as required in 300.6(A). There is no technical substantiation to justify this proposed requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-65 Log #2153 NEC-P03 **Final Action: Accept in Principle**
(300.7)

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Revise text as follows:
Where portions of a cable, raceway or sleeve are known to be subjected to different temperatures and where condensation is known to be a problem, as in cold storage areas of buildings or where passing from the interior to the exterior of a building.
Substantiation: This comma being added between “cable” and “raceway” would allow the ends of the cable(s) being sealed to stop condensation and water from passing through the inside of the cables.
Panel Meeting Action: Accept in Principle
In the proposed wording, add a comma after “cable” and after “raceway” to read as follows:
“300.7 Raceways Exposed to Different Temperatures.
(A) Sealing. Where portions of a cable, raceway, or sleeve are known to be subjected to different temperatures and where...”.
Panel Statement: Add the comma between the word “cable” and the word “raceway” as proposed in addition, add a comma after the word “raceway” to comply with the NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
OWEN, R.: This text has remained “cable raceway” since its introduction into the NEC in 2002. The comma was included in the ROC text in the Panel Action for Comment 3-40 but was not carried over to the NEC text for 2002. This does not explain, however, how to seal the end of a cable if, for example, the cable extends well beyond the boundary between cold and hot environments. There was no technical substantiation that condensation inside a cable has been a problem, nor any technical information as to how far a cable can extend beyond this temperature boundary safely. Enforcement of this requirement becomes impossible.

3-66 Log #350 NEC-P03 **Final Action: Reject**
(300.7(B), FPN)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to the NFPA Glossary of Terms Advisory Committee for information.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change “per” to “/” in four places and bring the text together on both sides of the slash.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: Adding a division sign, as proposed by the submitter, would create a unit of measurement that may be unclear to the user of the code. The present form is more appropriate.
The panel requests that the Technical Correlating Committee forward this Proposal to the Advisory Committee on the Glossary of Terminology for consideration of the Manual of Style recommendation made in the proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-67 Log #2818 NEC-P03 **Final Action: Reject**
(300.9)

Submitter: Jack Giblin, White Horse Electric, Inc.
Recommendation: Add text as follows:
300.9 Exception: Watertight raceways not more than 3 m (10 ft) in length where utilized to carry NM cable on single and two-family dwelling units from a dry location to a Type 3R enclosure or breaker panel, closely following and securely fastened to the building structure.
Substantiation: 300.9 does not allow for a common wiring method of bringing home runs out of a basement, attic, or crawl space, into a breaker panel. It has been suggested to mount a Type 3R junction box on the outside of the structure, making splices, then continuing the home runs in raceway to the panel with either UF or THWN. It would be better and safer to not have so many unnecessary splices in the home runs.
Panel Meeting Action: Reject
Panel Statement: While it may be possible to install a watertight raceway, exposure of the raceway to varying temperature in an outside environment can cause condensation inside the raceway due to varying temperatures and humidity. Type NM Cable is not designed or listed for use in a wet location. Type UF Cable can be installed in this application since Type UF Cable is approved for a wet location.
This proposal covers Type NM Cable, specifically, and more appropriately belongs with Code-Making Panel 7.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-68 Log #3698 NEC-P03 **Final Action: Reject**
(300.9)

Submitter: Joseph Whitt, JW Electric
Recommendation: Revise text to read as follows:
300.9 Raceways and Enclosures in Wet Locations Above Grade. Where raceways and enclosures are installed in wet locations abovegrade, the interior of these raceways and enclosures shall be considered to be a wet location. Insulated conductors and cables installed in raceways and enclosures in wet locations abovegrade shall comply with 310.8(C).
Substantiation: By adding “and enclosures” to 300.9 it will bring this section in line with 300.5. As presently worded one could argue that an enclosure installed in a wet location would provide protection for conductors or cables not mentioned in 310.8(C).
In the definition of wet location it states, “and in unprotected locations exposed to weather” and 300.9 makes no reference to enclosures attached to or installed outside of a building.
It could be argued that the enclosure would provide protection to wet locations or exposure to weather which would allow the installation of conductors and cables not outlined in 310.8(C).
Would not the interior of an enclosure be in the same location as the enclosure itself just as in a raceway?
Panel Meeting Action: Reject
Panel Statement: Enclosures installed in an underground application as noted in the substantiation and as covered by 300.5(B) is totally different than the enclosures installed above grade. The underground enclosures are assumed to be wet location rated since the enclosures are often submerged due to rain, ground water, or other circumstances. Above ground enclosures may have some small amounts of water intrusion due to the entrance of water around raceway fittings and other sources of water leakage. Type 3R enclosures, for example, have drain holes in the two back corners of the enclosure to permit water that may accumulate within the enclosure to drain out.
This issue is already addressed in 110.20 and Table 110.20 in the existing NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-69 Log #4495 NEC-P03 **Final Action: Reject**
(300.9)

Submitter: James H. Bundy, Randolph Community College
Recommendation: Revise text as follows:
300.9 Raceways and enclosures in Wet Locations Above Grade.
Where raceways and enclosures are installed in wet locations above grade, the interior of these raceways and enclosures shall be considered to be a wet location. Insulated conductors and cables installed in raceways and enclosures in wet locations above grade shall comply with 310.8(C).
Substantiation: This section should include enclosures as the interior of an enclosure installed in a wet location should be considered to be a wet location the same as a raceway. An enclosure installed in a wet location would also include the interior of the enclosure as it would be impossible to install an enclosure in one location and the interior of that enclosure in another location.
300.5 includes enclosures therefore 300.9 should include enclosures.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-68.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-70 Log #1737 NEC-P03 **Final Action: Reject**
(300.9 Exception (New))

Submitter: Gerald Garth Barnes, Mecklenburg County Inspection Dept.
Recommendation: Add a new Exception as follows:
300.9 Raceways in Wet Locations Above Grade. Where raceways are installed in wet locations above grade, the interior of these raceways shall be considered a wet location. Insulated conductors and cables installed in raceways in wet locations above grade shall comply with 310.8(C).
Exception: In residential applications it shall be permissible to sleeve NM cable in short sections of Rigid Nonmetallic Conduit or Liquidtight Flexible Nonmetallic Conduit to allow access to an outdoor panel from an attic or crawl space. Sleeves shall be as short as practicable and shall extend through the exterior wall.
Substantiation: The provisions of 300.9 require the use of UF cable or single conductors rated for wet locations in a completed raceway system to be used to gain access to crawl spaces and attics from an outdoor panel. This is commonly achieved by setting a junction box in the crawl space or attic, then changing over to NM cable to complete homeruns. Not only does this create unnecessary splices, but it further detracts from the integrity and safety of the installation by bringing into play grounding issues of metal boxes when used, weak points in the circuits and sometimes restricted accessibility to junction boxes that might otherwise not exist.
When properly installed in this type of installation, Rigid Nonmetallic Conduit and Liquidtight Flexible Nonmetallic Conduit make an adequate sleeve with sufficient protection from the elements and physical damage.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-71 Log #750 NEC-P03 **Final Action: Reject**
(300.11(A))

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Delete 2008 NEC 300.11(A)(1) and (A)(2) and revise the text in 300.11(A) as follows:
(A) Secured in Place. Raceways, cable assemblies, boxes, cabinets, and fittings shall be securely fastened in place. Support wires that do not provide secure support shall not be permitted as the sole support. Support wires and associated fittings that provide secure support and that are installed in addition to the ceiling grid support wires shall be permitted as the sole support and shall be permitted to be attached to the assembly. Where independent support wires are used, they shall be secured at both ends. Cables and raceways shall not be supported by ceiling grids. Where independent support wires are used, they shall be distinguishable by color, tagging or other effective means from those that are part of the ceiling support wires.
Exception No. 1: The ceiling support system for fire-rated assemblies shall be permitted to support wiring and equipment that have been tested as part of the fire-rated assembly.
FPN: One method of determining fire rating is testing in accordance with NFPA 251-1999, Standard Methods of Tests of Fire Endurance of Building Construction and Materials.
Exception No. 2: The ceiling support system for non-fire rated assemblies shall be permitted to support branch-circuit wiring and associated equipment where installed in accordance with the ceiling system manufacturer's instructions.
Substantiation: 300.11(A) currently includes requirements that prohibit the use of "ceiling support wires" for support of electrical cables, raceways, and other equipment. That requirement applies to both rated and non-rated ceiling assemblies. Current requirements only require the identification of the independent support wires for rated assemblies. Since the use of independent wires is a mandatory requirement for both ceiling types, it is equally important that these support wires be identified from an enforcement standpoint.
Panel Meeting Action: Reject
Panel Statement: Addressing specific issues with fire rated ceiling assemblies and those not fire rated with separate subsections provides more specific information for each type of installation. Requiring coloring identification or other methods of distinguishing between ceiling support wires and wiring support is a major issue for fire rated ceiling assemblies since the integrity of the ceiling assembly and its fire rating is based upon the design and specific installation methods.
A non-fire rated ceiling assembly is not as critical as a fire rated ceiling. The contractor is certainly not prohibited, by the existing NEC from color identifying the wiring support for non-rated ceilings.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-72 Log #4831 NEC-P03 **Final Action: Reject**
(300.11(A)(1), FPN)

Submitter: T. David Mills, T. David Mills Associates
Recommendation: Modify the fine print note as follows:
FPN: ~~One method of determining fire rating is testing in accordance with NFPA 251-2006, Standard Methods of Tests of Fire Resistance of Building Construction and Materials~~. See {1}, Annex I.
Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.
I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.
Panel Meeting Action: Reject
Panel Statement: This FPN information is valuable for the user of the code, and the user should not have to go back to an annex for this information.
The NEC Technical Correlating Committee has had a standing task group to promote user-friendliness of the NEC for the past four code cycles, and the panel requests that the Technical Correlating Committee review this information and provide feedback on this issue to Code-Making Panel 3.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
SANDERS, M.: The panel statement that this "FPN information is valuable for the user of the code, and the user should not have to go back to an annex for this information" implies that the user in the field would actually have access to the referenced standards in the field. While this panel statement may be true for most FPN's, it does not apply in this case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation. Annex I would only be used for referenced standards, not other FPN information.

3-73 Log #486 NEC-P03 **Final Action: Accept in Principle**
(300.11(A)(2))

Submitter: Bill Schmenk, Maple Hts. Building Dept. / Rep. IAEI
Recommendation: Revise text as follows:
Where independent support wires are used, they shall be distinguishable by color, tagging, or other effective means from those that are part of the non-fire rated assemblies.
Substantiation: As an inspector, how do I know which support wires are being used to support ceiling assemblies and which are being used to support electrical piping cables-boxes.
Panel Meeting Action: Accept in Principle
Revise the proposed text and add as a new last sentence to read as follows:
"Where independent support wires are used, they shall be distinguishable by color, tagging, or other effective means."
Panel Statement: The revision in the wording was made to ensure that the all wording in the paragraphs of this section remain consistent.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
CASPARRO, P.: Continue to Accept in Principle this proposal. It is very important for the inspector to be able to identify independent support wires being used to support electrical piping, cables, and boxes.

3-74 Log #4188 NEC-P03 **Final Action: Reject**
(300.11(B)(4) (New))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Add new text as follows:
(4) Where the raceway is used to support equipment bonding jumpers in accordance with 250.102(E).
Substantiation: Using an external equipment bonding jumper is permitted by 250.102(E) and attaching it to the raceway is a common practice and makes sense but this section does not specifically permit it.
Panel Meeting Action: Reject
Panel Statement: The raceway is not supporting the equipment bonding jumper installed on the outside of the raceway as referenced in 250.102(E) since the bonding conductor is not permitted to be longer than 6 ft and must be connected to an approved fitting at each end of the raceway.
An example of this installation is a 6-ft length of liquidtight flex with an external bonding jumper. The fittings on both ends of the liquidtight are designed for the connection of the bonding jumper. Unlike grounding electrode conductors where securing is required by 250.64, there are no requirements in Part V of Article 250 for securing bonding conductors.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-75 Log #1505 NEC-P03 **Final Action: Reject**
(300.13(B))

Submitter: Bill Higgins, Lookout Mtn., GA
Recommendation: Revise text to read as follows:
"...in (~~multiwire~~) (all) branch circuits...".
Substantiation: Currently, a multiwire branch circuit must be fed from single disconnecting means for all ungrounded conductors - so if one leg is disconnected, the other leg will also be disconnected - thus, it is essentially no different, in that one sense, from a single branch circuit. Personally, I always pigtail my neutrals, even on single branch circuits, after discovering outlets that were overloaded, corroded, or burned away at the terminal screens, which resulted in outlets in the circuit being energized on the hot side, but with no neutral return to the source.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation to expand the requirements in 300.13(B) to an individual branch circuit, rather than for multiwire branch circuits.
The purpose of this section is to ensure that a multiwire branch circuit does not inadvertently cause loss of the neutral to other downstream devices on a different energized circuit.
As stated in the substantiation, the NEC permits an installer to pigtail all of the neutrals for all circuits.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-76 Log #1524 NEC-P03 **Final Action: Reject**
(300.13(B))

Submitter: Richard S. Anderson, RTKL Associates Inc.
Recommendation: Revise text to read as follows:
(B) Device Removal. ~~In multiwire~~ Conductors in branch circuits ~~the continuity of a grounded conductor~~ shall not depend on device connections such as lampholders, receptacles, and so forth, where the removal of such devices would interrupt ~~the~~ circuit continuity.
Substantiation: When devices such as receptacles are used as a means of splicing branch circuit conductors to provide continuity, the accumulative load of the circuit is required to feed through the first few devices, this in turn shortens the life expectancy of the device and will lead to failure which can and frequently does result in fire. This change would reduce the risk of fire in overloaded branch circuits and provide an increased safety factor particularly in residential installations.
Panel Meeting Action: Reject
Panel Statement: There are listed devices that are specifically designed and tested for downstream load connections to the devices. This information is located in the 2008 UL White Book on page 296.
Single and duplex receptacles rated 15 and 20 A that are provided with more than one set of terminals for the connection of line and neutral conductors have been investigated to feed branch circuit conductors connected to other outlets on a multi-outlet branch circuit, as follows:
● Back wire (screw actuated clamp type) terminations with multiple wire access holes used concurrently to terminate more than one conductor.
● Side wire (binding screw) terminals used concurrently with their respective push-in (screw-less) terminations to terminate more than one conductor.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Abstain: 1
Explanation of Abstention:
KEDEN, R.: I expect the submitter to return in the ROC with refined substantiation.

3-77 Log #2546 NEC-P03 **Final Action: Reject**
(300.14)

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:
300.14 **Length of Free Conductors at Outlets, Junctions, and Switch Points.** After a conductor is spliced or terminated, each conductor shall be long enough to extend at least 75 mm (3 in.) outside the opening of the box. Where the opening to an outlet, junction, or switch point is more than 200 mm (8 in.) in any dimension, ~~A~~t at least 150 mm (6 in.) of free conductor, measured from the point in the box where it emerges from its raceway or cable sheath, shall be left at each outlet, junction, and switch point for splices or the connection of luminaires or devices. ~~Where the opening to an outlet, junction, or switch point is less than 200 mm (8 in.) in any dimension, each conductor shall be long enough to extend at least 75 mm (3 in.) outside the opening.~~
Substantiation: When an electrician first looks at this rule in 300.14, he/she has to stop and think, "What did I just read?" Bottom line, what is the general rule? If we have a 12x12x6 junction box, and we want to splice a conductor entering from opposite sides of the box is 6 in. enough? Is 7 in. enough? 300.14 implies that the general rule is a minimum of 6 in. unless the box is smaller than 8 in. in any dimension, then it can be shorter if it extends 3 in. beyond the surface. We believe that the general rule should be 3 in. beyond the surface in all cases if a splice or termination is made for ease of installation and repair/maintenance. The 6 in. minimum rule for larger than 8 in. box makes sense so that every conductor entering a box has enough length that after repairs/changes it can be spliced or terminated again.
Panel Meeting Action: Reject
Panel Statement: The suggested text in the first sentence would require the 3-in. measurement to be applied after the splice or termination. The purpose of the existing text is to require each conductor to be a minimum of 6 in. long from the point in the box where it emerges from the raceway or cable sheath so that the electrician can easily splice or terminate the conductor. This length is acceptable for larger boxes where the electrician can easily work with the individual conductors. Where the opening into an enclosure is smaller than 8 in. in any dimension, the conductors must be able to extend outside the enclosure for at least 3 in. to permit easy and safe termination or splicing.
The proposed new text would require potentially longer conductor lengths for the larger boxes without any technical substantiation that there is a problem with the lengths provided in the existing text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-78 Log #3888 NEC-P03 **Final Action: Reject**
(300.14)

Submitter: Tom Church, E Light Electric Services
Recommendation: Revise text as follows:
At least 150 mm (6 in.) of free conductor, measured from ~~the point in the box where it emerges from its raceway or cable sheath~~, the face of the box shall be left at each outlet, junction and switch point for splices to the connection of luminaires or devices. Where the opening to an outlet, junction or switch point is less than 200 mm (8 in.) in any dimension each conductor shall be long enough to extend at least 75 mm (3 in.) outside the opening.
Substantiation: Often times in deep junction boxes there is not enough free conductor left to allow for maintenance or repair after installation, especially for those installations that are recessed. This change will ensure that enough free conductors is left regardless of the box size. This can be accomplished now that box depth minimums have been added to 314.24.
Panel Meeting Action: Reject
Panel Statement: The proposed text would require 6 in. of conductor measured from the face of the enclosure substantially increasing the conductor fill of the box without any additional advantage over the existing method of measurement. The purpose of the existing text is to require each conductor to be a minimum of 6 in. long from the point in the box where it emerges from the raceway or cable sheath so that the electrician can easily splice or terminate the conductor. This length is acceptable for larger boxes where the electrician can easily work with the individual conductors. Where the opening into an enclosure is smaller than 8 in. in any dimension, the conductors must be able to extend outside the enclosure for at least 3 in. to permit easy and safe termination or splicing. The proposed new text would require potentially longer conductor lengths for the larger boxes without any technical substantiation that there is a problem with the lengths provided in the existing text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-79 Log #1520 NEC-P03 **Final Action: Reject**
(300.15(F) Exception (New))

Submitter: William Marino, North Haven, CT
Recommendation: Add and Exception to 300.15(F) that allows the use of field assembled combination fittings. See the material and photos that I have provided.
"Exception: If due to spacing, design, and other limitations encountered during the installation of a raceway, a box or conduit body cannot be used, and there is no commercially available "identified combination fitting." Then it shall be permitted to construct a field combination fitting. A rigid conduit coupling shall be permitted to mechanically join together EMT and flexible metal conduit or liquid metal conduit to transition from one wiring method to another. It shall be made wrench tight. All fittings are to be listed, labeled, and used within the scope of the fitting's design, and all applicable wiring methods followed. There shall be no splices or terminations within these fittings."
Substantiation: Now a fitting that is not identified as a combination fitting to transition from EMT to flex or liquidtight and field assembled, is in violation of the NEC.
300.15(F) states: "A fitting identified for use shall be permitted in lieu of a box or conduit body where conductors are not spliced or terminated." For instance, a combination fitting that would transition from flexible metal conduit to EMT, or liquidtight. Such fittings are common, and commercially available in smaller sizes of raceways. It's in the larger sizes of raceways, in areas of limited space, or the design of an installation that it becomes a problem. In many cases, field assembled fittings are often created to accommodate the transition from one type of wiring method to another. Such as using a rigid steel coupling to connect an EMT connector to a flexible metal conduit connector, or liquidtight. I've been told that this is a violation of 300.15(F) because technically, these field constructed fittings are not identified for the purpose they are being used for.

Also, in Article 100 definitions, "Identified (as applied to equipment) equipment must be used for its intended purpose." Since this is a common practice in the field, and all the fittings used are "listed & labeled" for use in electrical installations, my proposal is that an exception be added to 300.15(F) that allows for the use of field assembled combination fittings such as these shown in the photos I have provided.

I sent in this proposal because of an article I saw in EC&M magazine, (Sept./Oct., 2006) showing this as a violation of the NEC.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The existing second sentence of 300.15 already covers the application in the proposal as follows:

"Fittings and connectors shall be used only with the specific wiring methods for which they are designed and listed."

For example, where a rigid metal conduit is stubbed out of the ground, a threaded coupling can be installed on the end of the rigid **metal conduit** with a liquidtight flexible connector screwed into the rigid coupling.

The example given in the substantiation with an EMT connector screwed into a threaded coupling and then a liquidtight flex connector screwed into the coupling is certainly acceptable where transitioning from EMT to liquidtight. Section 110.2 requires the installation to be approved (acceptable to the AHJ). There are also transition fittings that are specifically listed for transitioning from one wiring method to another.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-80 Log #2860 NEC-P03 **Final Action: Reject**
(300.15(F) Exception (New))

Submitter: Richard M. Delgado, Apco Electric

Recommendation: Add new Exception as follows:

Exception: EMT, IMC, RMC, FMC, PVC couplings do not need to be accessible after installation. MC, AC connectors do not need to be accessible after installation. NM connectors do not need to be accessible after installation. Straight MC to EMT and FMC to EMT couplings do not need to be accessible after installation.

Substantiation: The definition of a fitting in article 100 is very broad. In 300.15(F), it states "the fitting shall be accessible after installation". As the AHJ, you could interpret this article incorrectly. According to 300.15(F) an EMT coupling would need to be accessible after installation. Please add exceptions or revise this article.

Panel Meeting Action: Reject

Panel Statement: The purpose of providing "fittings" in 300.15 is to permit fittings such as capped elbows and similar raceway fittings where these fittings are installed in lieu of a box. Couplings, connectors, and similar fittings are certainly used for all raceways, but are not being installed in lieu of a box as intended in 300.15(F).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-81 Log #247 NEC-P03 **Final Action: Accept**
(300.15(M))

Submitter: John W. Young, Siemens Energy & Automation

Recommendation: Delete text to read as follows:

~~(M) Closed Loop. A box shall not be required with a closed-loop power distribution system where a device identified and listed as suitable for installation without a box is used.~~

Substantiation: Article 780 – Closed Loop and Programmed Power Distribution was deleted from the 2008 NEC. Closed Loop is no longer addressed in the NEC therefore this Section should be deleted.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-82 Log #4609 NEC-P03 **Final Action: Accept**
(300.15(M))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee

Recommendation: Delete this paragraph.

Substantiation: Article 780 was deleted in the 2008 cycle for lack of interest. The application addressed by this rule no longer exists. Refer to the submitter's substantiation for Proposal 10-59 in the ROP for the 2008 NEC.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-83 Log #1432 NEC-P03 **Final Action: Reject**
(300.17)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: The number and size of conductors in any raceway <u>or enclosure</u> shall not be more than will permit dissipation of the heat and ready installation and withdrawal <u>and removal</u> of the conductors without damage to the conductors or <u>to other components</u> ~~their installation~~.

Add to the FPN: Auxiliary gutters 366.22, Boxes and conduit bodies 314.16, Handhole enclosures 314.30.

Substantiation: Edit. Since this provision is of a general nature it should include enclosures other than raceways.

Panel Meeting Action: Reject

Panel Statement: The text in 300.17 and the fine print note references are all dealing with dissipation of heat and ready installation and removal of conductors out of a raceway without damaging the insulation of the conductors, not removal or installation into enclosures.

There was no technical substantiation provided by the submitter to expand this section to cover enclosures. Raceways are often connected to boxes, conduit bodies, and handhole enclosures, but requiring ready installation and removal of conductors applies to the raceway, not the enclosure, and is more appropriately covered in Article 314.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-84 Log #181 NEC-P03 **Final Action: Reject**
(300.17, FPN)

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

FPN: See the following sections of this Code: intermediate metal conduit, 342.22; rigid metal conduit, 344.22; flexible metal conduit, 348.22; liquidtight flexible metal conduit, 350.22; PVC conduit, 352.22; HDPE conduit, 353.22; RTRC, 355.22; liquidtight nonmetallic flexible conduit, 356.22; electrical metallic tubing, 358.22; flexible metallic tubing, 360.22; electrical nonmetallic tubing, 362.22; cellular concrete floor raceways, 372.11; cellular metal floor raceways, 374.5; metal wireways, 376.22; nonmetallic wireways, 378.22; surface metal raceways, 386.22; surface nonmetallic raceways, 388.22; underfloor raceways, 390.5; fixture wire, 402.7; theaters, 520.6; signs, 600.31(C); elevators, 620.33; audio signal processing, amplification, and reproduction equipment, 640.23(A) and 640.24; Class 1, Class 2, and Class 3 circuits, Article 725~~;~~ <u>and</u> fire alarm circuits, Article 760~~; and optical fiber cables and raceways, Article 770.~~

Substantiation: Article 770 has no conductors.

Panel Meeting Action: Reject

Panel Statement: Composite optical fiber cables contain optical fibers and current-carrying electrical conductors with installation in various raceways, including optical fiber raceways, so reference to Article 770 in the fine print note is appropriate.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-85 Log #235 NEC-P03 **Final Action: Reject**
(300.18(C))

Submitter: Sprague Owings, Nassau County, FL

Recommendation: Add new text to read:

<u>(C) No Obstructions. All conduit raceways shall have the same interior dimension from start to end. Conduit size shall not change except at approved boxes or conduit bodies.</u>

Substantiation: I have been encountering periodic installations where a reducing bushing is used somewhere in the middle of a conduit run, thus creating an obstruction in the raceway.

This insertion could be accompanied by insertions to 342, 344, 348, 350, 352, 353, 356, 360 and 362 as:

Example: 342.21 Obstructions. No obstruction shall be created in a conduit by changing the size in mid-point in accordance with 300.18(C).

Panel Meeting Action: Reject

Panel Statement: There are many different locations in a raceway run where a listed reducing bushing can be installed within a hazardous (classified) location in a seal off device to permit a larger seal off device than the raceway fitting and expansion fittings.

If a listed reducing fitting was installed mid-span of a raceway installation, then it was a violation of the listing of the fitting. Adding the suggested text will affect those fittings that are listed for use with the raceway and unduly restrict the use of the legitimate fittings where used properly.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-86 Log #263 NEC-P03 **Final Action: Accept**
(Table 300.19(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change the column heading on the first column from "Size of Wire" to "Conductor Size".
Substantiation: The change in terminology will correlate with the use of the term in 310.19(A) and in other parts of the table.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-87 Log #1787 NEC-P03 **Final Action: Reject**
(300.19(A) and (C)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A), delete "cable" in the second sentence.
In (C)(3), change "cables" to "conductors".
Substantiation: Edit. The use of "cables" and "conductors" implies some difference, such as single or multiconductor types. (B) uses the words "cables" and "conductors". "Conductors" includes single and multiconductor types.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to make the change from "cable support" to "conductor support" and no technical information on the availability of "cable support" methods and "conductor support."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-88 Log #1829 NEC-P03 **Final Action: Reject**
(300.20(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Where conductors ~~carrying~~ <u>of</u> alternating current <u>circuits</u> are installed in ferrous metal enclosures, or ferrous metal raceways, <u>or ferrous metal-covered cables,</u> they shall... (remainder unchanged).
Substantiation: Though raceways are enclosures they are specifically noted, and metal covered cables should also be specifically noted.
Panel Meeting Action: Reject
Panel Statement: The conductors in ferrous metal-covered cables cannot be arranged in the cable or in an enclosure unless the metal sheathing is removed since these cables are manufactured with the conductors in the cable.
Adding ferrous metal covered cables does not make sense in this application.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-89 Log #1998 NEC-P03 **Final Action: Reject**
(300.20(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. This provision is covered by 300.3 (B) which is more comprehensive and covers cable trays, trenches, and cords. The exceptions are superfluous since the referenced sections already apply.
Panel Meeting Action: Reject
Panel Statement: The submitter is incorrect in his statement that the requirements in 300.20(A) are covered in 300.3. 300.20(A) applies to both raceways and enclosures, with the arrangement of the alternating current conductors installed within the raceways and enclosures.
An example might be an auxiliary gutter with 10 sets of paralleled conductors per phase and neutral where all the phase A are installed first, then all phase B, then all phase C, and then all the neutrals.
These paralleled conductors must be installed in 10 groups of Phase A, Phase B, Phase C, and the neutral so the magnetic lines of flux will cancel properly, not set up currents within the ferrous metal auxiliary gutter, and cancel the magnetic lines of flux so each parallel conductor will carry the same amount of current as the other paralleled conductors in the same set.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-89a Log #3822 NEC-P03 **Final Action: Reject**
(300.20(A))

Submitter: James S. Nasby, Skokie, IL
Recommendation: Add a new: Exceptions No. 3 & 4:
<u>*Exception No. 3: Conductors carrying no more than 20 amperes if agreeable with the equipment, enclosure or raceway manufacturer.*</u>
<u>*Exception No. 4: Conductors carrying no more than 2 amperes, such as signaling circuits.*</u>
Substantiation: 1) In most, if not all, cases, 20 amperes will not cause noticeable metal heating.
2) 2 amperes won't cause noticeable metal heating.
3) These exceptions will prevent damage to equipment caused by field modifications which aren't needed.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided for either of the proposed exceptions. The substantiation in (1) indicates the submitter's uncertainty with the possibility of heating of the enclosures, even at 20 amperes.
The submitter did not provide any technical information as to why 2 amperes was picked for the low end in signaling circuits.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-90 Log #4370 NEC-P03 **Final Action: Reject**
(300.20(B))

Submitter: Travis Hannah, Tyco Thermal Controls Ltd.
Recommendation: Revise text as follows:
300.20 Induced Currents in Ferrous Metal Enclosures or Ferrous Metal Raceways
(B) Individual Conductors. Where a single conductor carrying alternating current<u>**, that exceeds 200 amps, per conductor,**</u> passes through metal with magnetic properties, the inductive effect shall be minimized by (1) cutting slots in the metal between the individual holes through which the individual conductors pass or (2) passing all the conductors in the circuit through an insulating wall sufficiently large for all of the conductors of the circuit.
Substantiation: The current wording in 2008 NEC Article 300.20(B) is in conflict with 2006 Canadian Electrical Code Section 12-Subsection 3022 Entrance of conductors into boxes, cabinets, and fittings. Note (7) "Where single-conductor cables or conductors enter metal boxes through separate openings, precaution shall be taken to prevent overheating of the metal by induction if the current carried per conductor exceeds 200A."
Reason for this proposal is for the continuing harmonization of the electrical code towards IEC standard, as proposed by members of the CANENA Technical Harmonization Committees (UL, CSA, ANCE).
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to justify setting a 200-ampere minimum current threshold. Providing the substantiation submitted to the Canadian Electrical Code for the corresponding change dealing with this issue may provide some justification that was not provided in the proposal by the submitter.
Harmonization between countries is good, but technical substantiation must still be provided.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-90a Log #3823 NEC-P03 **Final Action: Reject**
(300.20(B))

Submitter: James S. Nasby, Skokie, IL
Recommendation: Revise text to read as follows:
(1) ~~cutting slots in the metal between the individual holes through which the individual conductors pass~~ passing all of the conductors thru a non-ferrous metal wall or (2) passing all the conductors in the circuit through an insulating wall...
Substantiation: Cutting slots in the field will:
1) Almost always void the equipment or raceway or enclosure warrantee
2) Almost always void the equipment or enclosure Type (NEMA) rating.
3) Will void the Short Circuit (WIC) rating of equipment so labeled.
Panel Meeting Action: Reject
Panel Statement: Switchboard and panelboard enclosures mounted on a maintenance pad could have slots cut into the bottom without affecting the structural integrity of the enclosure.
For example, a manufacturer or an electrician could cut slots between the entry points with reinforcing metal installed within the enclosure based on the terminology in 300.20(B) with a field evaluation or approval from the AHJ.

3-91 Log #1600 NEC-P03 **Final Action: Reject**
(300.21)

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Add a third sentence to 300.21: <u>Conduits or raceways entering enclosures of the ventilated type, shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway into other areas of the building or structure.</u>
Substantiation: A fire in the area where the enclosure is located will produce smoke, poison gases, and other products of combustion which can easily be carried through the enclosure's vents and these unsealed raceways to other areas in the building. Essentially defeating any firewalls. I have not seen this particular problem addressed in building codes or fire resistance directories since these raceways are not "sleeves" which ARE required to be fire stopped, but rather they are complete raceway systems which generally require only sealing up around the OUTSIDE of the pipe where it penetrates a firewall. In this particular installation smoke could easily pass right through the INSIDE of the raceway because of the ventilation openings in the enclosure.

I have witnessed the results of this "chimney-effect" problem when the smoke from a fire in a basement electric room spread throughout the upper floors of a high rise building because the raceways leaving the switch gear acted like chimneys and transported heavy smoke from the basement directly to panelboards and switchboards on the upper floors of the building thus bypassing and defeating any fire walls that the raceways penetrated and completely filling the UPPER floors with smoke. Luckily nobody was injured. If the ends of the raceways were simply filled with some fire-stopping type caulk or similar material this situation would probably never have happened.

Once a fire starts to produce toxic fumes we almost have to think of that area as a Hazardous (classified) location similar to those in Article 500. We must try to prevent those hazardous gases passing from one area in a building to another.

Just as other sealing requirements throughout the code prevent moisture, condensation, dusts, gases or vapors from traveling through raceways, this requirement for some simple fire proof putty could prevent toxic fumes from spreading throughout the building. The seals required by this proposal are equally as important as any other seals required by the NEC such as 230.8, 300.5(G), 300.7(A), 300.50(E), 312.5(C) exception to (D), 324.40(A), 332.40(A), 368, 238, 372.7, 501.15, 502.15, 504.70, 505.16, 506.16, 680.24(B) and any other seals that may be required.

I am submitting companion proposals to sections 300.21, 770.26, 800.26, 820.26 and 830.26.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: There was no technical substantiation provided for this very sweeping change. Based on the suggested text, any enclosure, including Type 1 outlet, junction, device, and many other types of enclosures, supplied by a raceway enclosing conductors would require a seal. The raceway could be ½ in. or larger and connected to a box that would require a seal preventing possible products of combustion from the conductor insulation from spreading into the building.

The submitter suggested that a fire in a high rise building developed smoke in the basement that spread through the upper floors of the building through raceways originating in the basement and connecting to the upper floors.

This incident is anecdotal without a fire report or any investigative report on the cause and origin as well as the cause of the smoke spread.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-92 Log #4518 NEC-P03 **Final Action: Accept in Part**
(300.21)

Submitter: Salvatore DiCristina, Rutgers, The State University of New Jersey / Rep. Building Code Development Committee (BCDC)

Recommendation: Revise text to to read as follows:

300.21 Spread of Fire or Products of Combustion.

~~Electrical installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased.~~ When required by the building, fire or mechanical code, electrical installations within shaftways, plenums and air-handling ducts shall maintain a flame spread and smoke development index. Openings around electrical penetrations into or through ~~fire-resistant–rated~~ fire-resistive walls, partitions, floors, or ceilings and smoke partitions shall be firestopped using approved methods ~~to maintain the fire resistance rating~~.

Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.

This section covers two issues: 1) appurtenances in certain locations must comply with flamespread and smoke development requirements established in the building, fire and mechanical codes; and 2) penetrations made in fire-resistive construction shall be provided with firestopping to maintain their fire-resistance rating.

Currently, the first sentence is vague. It is unclear what quantitatively will prevent the possible spread of fire or products of combustion from being substantially increased. What is "substantially". Additionally, we could not identify what constitutes a hollow space, and we could not identify any requirement that the combustible loading is regulated in general in hollow spaces. We do agree that building, fire and mechanical codes regulate flame spread and smoke development for spaces that are used for air distribution, see 300.22.

The second issue is addressed in the second sentence, which has been clarified. The end of the second sentence is revised to eliminate redundancy. Adding the term "into or" makes it clear that not only through penetrations, but also membrane penetrations into fire-resistive construction must be provided with firestopping to maintain the fire-resistance rating. This should also apply to smoke partitions, which are not required to be fire resistive construction. Note that a "smoke barrier" is also required to be fire-resistive, hence the change to "fire-resistive" in the second sentence.

See similar proposal to 800.26.

Panel Meeting Action: Accept in Part

Revise the wording in the proposal to read as follows:

"Electrical installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around electrical penetrations into or through fire-resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating."

The FPN is to remain unchanged.

The panel rejects all other proposed changes in the recommended text.

Panel Statement: The proposed changes to the first sentence do not explain what a shaftway is and is not as clear as the existing text using "electrical installations in hollow spaces and vertical shafts."

Adding the requirement to comply with the building code, fire code, or mechanical code is unnecessary since in any installation where these codes exist, compliance with these other codes is already a requirement.

Adding the requirement to "maintain a flame spread and smoke development index" does not provide an electrician with any explanation of how to maintain that flame and smoke index. This information is more appropriately covered in the Fine Print Note directly below the required text in 300.21.

The change dealing the addition of "into or" in the second sentence was accepted since openings must be fire-stopped where there are penetrations into or through the wall, floor, ceiling, or partition.

Ballot Results: Affirmative: 14

3-93 Log #3559 NEC-P03 **Final Action: Accept in Principle**
(300.22)

Submitter: James T. Dollard, Jr., IBEW Local 98

Recommendation: Revise text to read as follows:

300.22 Wiring in Ducts and Plenums~~, and Other Air-Handling Spaces~~. The provisions of this section apply to the installation and uses of electrical wiring and equipment in ducts, and plenums~~, and other air-handling spaces~~.

FPN: See Article 424, Part VI, for duct heaters.

(A) Ducts for Dust, Loose Stock, or Vapor Removal. No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors. No wiring system of any type shall be installed in any duct, or shaft containing only such ducts, used for vapor removal or for ventilation of commercial-type cooking equipment.

(B) Ducts or ~~Plenums~~ Spaces Used Solely for the Movement of Environmental Air. Only wiring methods consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, or rigid metal conduit without an overall nonmetallic covering shall be installed in ducts or plenums specifically fabricated to transport environmental air. Flexible metal conduit shall be permitted, in lengths not to exceed 1.2 m (4 ft), to connect physically adjustable equipment and devices permitted to be in these ducts and plenum chambers. The connectors used with flexible metal conduit shall effectively close any openings in the connection. Equipment and devices shall be permitted within such ducts or plenum chambers only if necessary for their direct action upon, or sensing of, the contained air. Where equipment or devices are installed and illumination is necessary to facilitate maintenance and repair, enclosed gasketed-type luminaires shall be permitted.

(C) ~~Other Space~~ Space Used as a Plenum for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and spaces ~~plenums~~ as specified in 300.22(A) and (B). This section ~~It~~ does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN No.1: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.

Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

FPN No.2: The term "Space Used as a Plenum For Environmental Air" used in this section correlates with the use of the term "plenum" in NFPA 90A and other Mechanical Codes. The use of the term plenum in NFPA 90A and other Mechanical Codes is typically used for all air handling spaces.

No changes are proposed to 300.22(C)(1), 300.22(C)(2) or 300.22(D).

Substantiation: This proposal is written in an effort to eliminate confusion between the use of the terms, duct, plenum, and other space.

As used in the current edition of the NEC, the term "plenum" essentially means a space built for the sole purpose of moving air. In the NEC a duct is a plenum but a plenum is not always a duct because a shaft built solely for the purpose of moving air is a plenum. This applies regardless of whether the duct or shaft is used for supply, return or exhaust.

As used in the current edition of the NEC, the term "Other Space Used For Environmental Air" essentially means a space built for many purposes in which return air is moved. The existing informational FPN does a good job explaining that the most common "other space" is the space above a hung ceiling used to move return air as well as to contain supply ducts, electrical power distribution, lighting, sprinkler and other systems.

Tremendous confusion occurs when building officials and users of other codes such as NFPA 90A, the International Mechanical Code (IMC), and the Uniform Mechanical Code attempt to apply their rules for air handling spaces that contain conductors and equipment addressed in the NEC. These other codes and standards refer to all spaces that move air as "plenums" including spaces that the NEC identifies as "other spaces." NFPA 90A and the IMC may use the following terms to describe a 300.22(C) space; plenum, ceiling cavity plenum and raised floor plenum

Additionally, confusion exists with product markings. A product tested, listed and labeled for use in a space addressed by 300.22(C) is often required to be marked as "suitable for use in "other spaces for environmental air" or equivalent language to comply with requirements in the NEC. However, this leads to confusion when the installer/maintainer is attempting to satisfy NFPA 90A or other Mechanical Codes where the term "plenum" is used. Conversely, if products are listed and labeled for use in "plenums", the installer/maintainer may misinterpret that the product (listed for use only in a 300.22(C) space) marked as "plenum" (to comply with the IMC and NFPA 90A) is rated for a 300.22(B) space due to the problems created by the use of different terms.

The proposed changes are additionally substantiated as follows:

- The term "plenum" is removed from 300.22(B) and the section is clarified as addressing ducts and spaces being used solely for the movement of environmental air." This will help to clarify these spaces.
- This proposal seeks the deletion of term "Other Air Handling Spaces" as this term is the basis for confusion when an installation must comply with more than one code or standard. This proposal suggests using the term "space used as a plenum for environmental air." This clearly describes a space such as the space above a ceiling or below a raised floor that is not built solely to move air.

This proposal is essentially editorial in nature seeking clarity with respect to 300.22 and other relevant codes and standards including NFPA 90A, the International Mechanical Code, and the Uniform Mechanical Code.

During the last code cycle, CMP-3 was directed to remain status quo on several issues until guidance could be given from NFPA 90A. This proposal follows that directive and attempts to better align terms with NFPA 90A. As a member of the NFPA 90A committee, I see first hand the tremendous confusion and feel that these changes are essential to clarify the application of 300.22(B) and (C).

Panel Meeting Action: Accept in Principle

3-94 Log #4399 NEC-P03 **Final Action: Accept in Principle**
(300.22)

Submitter: Dwayne E. Sloan, Underwriters Laboratories Inc.

Recommendation: Revise text as follows:

300.22 Wiring in Ducts and Plenums~~, and Other Air-Handling Spaces~~. The provisions of this section apply to the installation and uses of electrical wiring and equipment in ducts, plenums, and other air-handling spaces.

(A) Ducts for Dust, Loose Stock, or Vapor Removal. No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors. No wiring system of any type shall be installed in any duct, or shaft containing only such ducts, used for vapor removal or for ventilation of commercial-type cooking equipment.

(B) Ducts or ~~Plenums~~ Spaces Solely for the Movement of Environmental Air. Only wiring methods consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, or rigid metal conduit without an overall nonmetallic covering shall be installed in ducts or plenums specifically fabricated to transport environmental air. Flexible metal conduit shall be permitted, in lengths not to exceed 1.2 m (4 ft), to connect physically adjustable equipment and devices permitted to be in these ducts and plenum chambers. The connectors used with flexible metal conduit shall effectively close any openings in the connection. Equipment and devices shall be permitted within such air ducts or plenum chambers only if necessary for their direct action upon, or sensing of, the contained air. Where equipment or devices are installed and illumination is necessary to facilitate maintenance and repair, enclosed gasketed-type luminaires shall be permitted.

(C) ~~Other Space~~ Space Used as a Plenum for Environmental Air. This section applies to space used for environmental air-handling purposes other than air ducts and plenums used solely for the movement of environmental air as specified in 300.22(A) and (B). This section applies to raised floors and ceiling spaces where the space is not built for the sole purpose of moving air. ~~It~~ This section does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN No.1: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.

Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

FPN No.2: The term "Space Used as a Plenum For Environmental Air" used in this section correlates with the use of the term "plenum" in NFPA 90A and other Mechanical Codes where the plenum is used for return air purposes. The use of the term plenum in NFPA 90A and other Mechanical Codes is typically used for all air handling spaces.

Substantiation: The purpose of this proposal is to avoid confusion with the use of the terms, duct, plenum, and other space used for environmental air.

There is currently considerable confusion as Authorities Having Jurisdiction and other users of codes such as NFPA 90A, the International Mechanical Code (IMC), and the Uniform Mechanical Code (UMC) attempt to apply the requirements for air handling spaces that contain conductors and equipment addressed in the NEC. These other codes and standards refer to all spaces that move air as "plenums" including spaces that the NEC identifies as "other spaces." NFPA 90A, the UMC, and the IMC may use the following terms to describe a 300.22(C) space; plenum, ceiling cavity plenum and raised floor plenum.

Confusion also exists with product listed and labeled for use in a space addressed by 300.22(C). These products are often required to be marked as "suitable for use in "other spaces for environmental air" or equivalent language to comply with requirements in the NEC. However, this leads to confusion when the installer/maintainer is attempting to satisfy NFPA 90A or other Mechanical Codes where the term "plenum" is used. Conversely, if products are listed and labeled for use in "plenums", the installer/maintainer may misinterpret that the product (listed for use only in a 300.22(C) space) marked as "plenum" (to comply with the IMC, UMC, and NFPA 90A) is rated for a 300.22(B) space due to the problems created by the use of different terms.

The proposed changes are additionally substantiated as follows:

· The term "plenum" is removed from 300.22(B) and the section is clarified as addressing ducts and spaces being used solely for the movement of environmental air." This will help to clarify these spaces.

· This proposal seeks the deletion of term "Other Space Used for Environmental Air" as this term is the basis for confusion when an installation must comply with more than one code or standard. This term is not in NFPA 90A. This proposal suggests using the language "space used as a plenum for environmental air." This clearly describes a space such as the space above a ceiling or below a raised floor that is not built solely to move air.

In summary, this proposal is seeking align 300.22 with other relevant codes and standards including NFPA 90A, the International Mechanical Code, and the Uniform Mechanical Code. During the last code cycle, CMP-3 was directed to remain status quo on several issues until guidance could be given from NFPA 90A. This proposal follows that directive and attempts to better align terms with NFPA 90A.

Panel Meeting Action: Accept in Principle

Revise the wording in the proposal as follows:

"300.22 Wiring in Ducts Not for Air Handling~~, Plenums,~~ Fabricated Ducts For Environmental Air, and Other Spaces For Environmental Air (Plenums) ~~Air-Handling Spaces~~.

The provisions of this section apply to the installation and uses of electrical wiring and equipment in ducts used for dust, loose stock, or vapor removal, ~~plenums,~~ ducts specifically fabricated for environmental air, and other spaces used for environmental air (plenums). ~~air-handling spaces~~.

FPN: See Article 424, Part VI, for duct heaters.

(A) Ducts for Dust, Loose Stock, or Vapor Removal. No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors. No wiring system of any type shall be installed in any duct, or shaft containing only such ducts, used for vapor removal or for ventilation of commercial-type cooking equipment.

(B) Ducts ~~or Plenums Used~~ Specifically Fabricated for Environmental Air. Only wiring methods consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, or rigid metal conduit without an overall nonmetallic covering shall be installed in ducts ~~or plenums~~ specifically fabricated to transport environmental air. Flexible metal conduit shall be permitted, in lengths not to exceed 1.2 m (4 ft), to connect physically adjustable equipment and devices permitted to be in these fabricated ducts ~~and plenum chambers~~. The connectors used with flexible metal conduit shall effectively close any openings in the connection. Equipment and devices shall be permitted within such ducts ~~or plenum chambers~~ only if necessary for the ~~their~~ direct action upon, or sensing of, the contained air. Where equipment or devices are installed and illumination is necessary to facilitate maintenance and repair, enclosed gasketed-type luminaires shall be permitted.

(C) Other Spaces Used for Environmental Air (Plenums). This section applies to spaces not specifically fabricated ~~used~~ for environmental air-handling purposes but used for air handling purposes as a plenum ~~, other than ducts and plenums as specified in 300.22(A) and (B).~~ It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN No. 1: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.

FPN No. 2: The phrase "Other space used for environmental air (plenum) used in this section correlates with the use of the term "plenum" in NFPA 90A, the Standard for the Installation of Air-Conditioning and Ventilating Systems, 2009, and other mechanical codes where the plenum is used for return air purposes, as well as some other air-handling spaces.

Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for ~~the~~ use within an air handling space, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables, conductors, and raceways shall be permitted to be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.

(2) Equipment. Electrical equipment with a metal enclosure, or electrical equipment with a nonmetallic enclosure listed for ~~the~~ use within an air handling space and having adequate fire-resistant and low-smoke-producing characteristics, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.

Exception: Integral fan systems shall be permitted where specifically identified for ~~such~~ use within an air handling space."

Panel Statement: The titles have been revised to handle "fabricated" in (B) and "not specifically fabricated" in (C).

In 300.22(C)(2), the words "or electrical equipment" were added to the first sentence to clarify that electrical equipment with a metal enclosure is one issue and electrical equipment with a nonmetallic enclosure is a different issue.

The remainder of the revisions are editorial.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

EGESDAL, S.: If the NEC intends to correlate with NFPA 90A-2009, the two documents should use the same terms and definitions. Using different terms for the same part of a HVAC system is confusing to users of the documents, and leads to poor correlation. For example in NFPA 90A-2009, an air-handling room plenum is fabricated with noncombustible material or limited combustible material having a smoke developed index not greater than 50. An air-handling room plenum is essentially an air duct that is missing a section of air duct between return air duct (typically an opening in the wall) and the air handler (fan) inlet, and should fall under the requirements of 300.22(B). On the other extreme for plenum construction is the ceiling cavity plenum (hung ceiling) that is permitted to be constructed of combustible material having a flame spread index not greater than 25 and a smoke developed index not greater than 50, and is correctly placed under the requirements of 300.22(C). Also, an apparatus casing plenum is really a section of air duct that is fabricated to provide a transition (e.g., between a furnace bonnet and an air duct).

(300.22(C)(1))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Recommendation: Revise text as follows:

300.22 Wiring in Ducts, Plenums, and Other Air-Handling Spaces.

The provisions of this section apply to the installation and uses of electric wiring and equipment in ducts, plenums, and other air-handling spaces.

FPN: See Article 424, Part VI, for duct heaters.

(A) *(no change to text)*

(B) *(no change to text)*

(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.

Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

(1) Wiring Methods. The wiring methods for such other space shall be limited to the following:

(a) Totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections

(b) Type MI cable

(c) Type MC cable without an overall nonmetallic covering

(d) Type AC cable

(e) Factory-assembled multiconductor control or power cable that is specifically listed for the use

(f) Listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath

(g) Cables and conductors installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers

(h) Cables listed as plenum cables, types CL2P, CL3P, NPLFP, FPLP, OFNP, OFCP, CMP, CATVP, BLP.

FPN: One method of defining a plenum cable is a cable that is low smoke-producing cable and fire-resistant cable by exhibiting a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

~~totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers~~.

(2) Equipment. Electrical equipment with a metal enclosure, or with a nonmetallic enclosure listed for the use and having adequate fire-resistant and low-smoke-producing characteristics, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.

Exception: Integral fan systems shall be permitted where specifically identified for such use.

(D) *(no change to text)*

Substantiation: This proposal does not alter any of the requirements presently found in the NEC for wiring methods. However, this proposal does help the NEC user by explicitly placing all the appropriate wiring methods into article 300.22, instead of having them appear spread out throughout the code, in articles 725, 760, 770, 800, 820 and 830, where they appear somewhat haphazardly. This refers to the wiring methods in (h) which are now permitted by the following sections of the NEC, in articles 725, 760, 770, 800, 820 and 830. The wording in each section is different but the end result is that cables "listed as being suitable for use in ducts, plenums, and other space used for environmental air" and also "listed as having adequate fire resistant and low smoke producing characteristics" by exhibiting "a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262" are permitted for use as wiring methods in "other spaces used for environmental air". This is also consistent with the requirements in the 2009 edition of NFPA 90A, Standard for the Installation of Air-Conditioning and Ventilating Systems, which has been given jurisdiction by Standards Council over the fire safety requirements for materials in plenums.

The 2008 NEC wording follows:

725.3 Other Articles.

Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through (G). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.

(C) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22.

Exception: Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air in accordance with 725.154(A).

725.154 Applications of Listed Class 2, Class 3, and PLTC Cables.

Class 2, Class 3, and PLTC cables shall comply with any of the requirements described in 725.154(A) through (H).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C). Only Type CL2P or CL3P cable shall be permitted to be installed in these raceways.

760.3 Other Articles.

Circuits and equipment shall comply with 760.3(A) through (G). Only those sections of Article 300 referenced in this article shall apply to fire alarm systems.

(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts or plenums or other spaces used for environmental air.

Exception: As permitted in 760.53(B)(1) and (B)(2) and 760.154(A).

760.53 Multiconductor NPLFA Cables.

Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.176 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.53(A) and (B).

(B) Applications of Listed NPLFA Cables. The use of non–power-limited fire alarm circuit cables shall comply with 760.53(B)(1) through (B)(4).

(1) Ducts and Plenums. Multiconductor non–power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts or plenums.

FPN: See 300.22(B).

(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type NPLFP.

Exception No. 1: Types NPLFR and NPLF cables installed in compliance with 300.22(C).

Exception No. 2: Other wiring methods in accordance with 300.22(C) and conductors in compliance with 760.49(C).

Exception No. 3: Type NPLFP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.
760.154 Applications of Listed PLFA Cables.
PLFA cables shall comply with the requirements described in either 760.154(A), (B), or (C) or where cable substitutions are made as shown in 760.154(D).
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.
770.3 Other Articles.
Circuits and equipment shall comply with 770.3(A) and (B). Only those sections of Chapter 2 and Article 300 referenced in this article shall apply to optical fiber cables and raceways.
(B) Ducts, Plenums, and Other Air-Handling Spaces. The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.
Exception: As permitted in 770.154(A).
770.154 Applications of Listed Optical Fiber Cables and Raceways.
Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through (D) or where cable substitutions are made as shown in 770.154(E).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.
800.3 Other Articles.
(B) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.
800.154 Applications of Listed Communications Wires and Cables and Communications Raceways.
Communications wires and cables shall comply with the requirements of 800.154(A) through (D), 800.154(F) and 800.154(G) or where cable substitutions are made in accordance with 800.154(E).
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
820.3 Other Articles.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.
Exception: As permitted in 820.154(A).
820.154 Applications of Listed CATV Cables and CATV Raceways.
CATV cables shall comply with the requirements of 820.154(A) through (E) or where cable substitutions are made as shown in Table 820.154(E).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
830.3 Other Articles.
Circuits and equipment shall comply with 830.3(A) through (D).
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.
Exception: As permitted in 830.154(A).
830.151 Medium-Power Network-Powered Broadband Communications System Wiring Methods.
Medium-power network-powered broadband communications systems shall be installed within buildings using listed Type BM or Type BMR, network-powered broadband communications medium power cables.
(A) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 shall apply.
830.154 Low-Power Network-Powered Broadband Communications System Wiring Methods.
Low-power network-powered broadband communications systems shall comply with any of the requirements of 830.154(A) through (C).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type BLP. Type BLX cable installed in compliance with 300.22 shall be permitted.

This proposal does not change any requirements; it simply makes the code more user-friendly.
This has been proposed before but was caught in the NEC moratorium associated with plenum cables.
Panel Meeting Action: Reject
Panel Statement: Providing a list of the additional permitted wiring methods does not add any clarity to the section. Article 300 is an introductory article to wiring methods with other articles, such as Articles 725, 760, and others in Chapter 8, specifically covering cables and wiring systems installed in other spaces for environmental air.
Inserting all of these various cables into 300.22(C) is unnecessary since the application and listing requirements are in Articles 725, 760, and so forth.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-96 Log #4398 NEC-P03 **Final Action: Accept in Principle**
(300.22(C)(2))

Submitter: Dwayne E. Sloan, Underwriters Laboratories Inc.
Recommendation: Insert the following additional Fine Print Note after 300.22 (C) (2):
<u>FPN: One method of defining adequate fire-resistant and low-smoke producing characteristics for electrical equipment with a nonmetallic enclosure is that the equipment meets the requirements of ANSI/UL 2043-2008, *Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces*.</u>
Substantiation: The purpose of this FPN is to provide guidance towards an appropriate test method and the requirements used to determine adequate fire-resistant and low-smoke producing characteristics for discrete electrical equipment with nonmetallic enclosures. UL2043 has been used to establish listing for such equipment. Furthermore, Authorities Having Jurisdiction have accepted testing to UL2043 since the Standard was first published in 1992.
During the 2008 cycle, a similar proposal was rejected by the Committee based on the Standard Council's decision to remain "status quo" on issues that needed resolution through NFPA 90A. This issue has been resolved through NFPA 90A (2009 Edition) as it now permits electrical equipment with combustible enclosures in ceiling cavity plenums when tested in accordance with UL 2043. (Reference NFPA 90A 4.3.11.2.6.5).
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
"FPN: One method of defining adequate fire-resistant and low-smoke producing characteristics for electrical equipment with a nonmetallic enclosure is in ANSI/UL 2043-2008, Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces."
Panel Statement: Deleting the phrase "that the equipment meets the requirements of" removes the mandatory text in the FPN in the proposal and replaces it with non-mandatory text consistent with the NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-97 Log #2278 NEC-P03 **Final Action: Accept in Principle**
(300.22(E) (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by adding "Systems" to the title in (2) and to the title in (b).
This action will be considered by the panel as a public comment.
Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Revise Section 300.22(C)(1) as follows:
(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables, conductors, and raceways shall be permitted to be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers ~~or solid bottom metal cable tray with solid metal covers~~.
Add a new Section to 300.22(E) to read as follows:
<u>**(E) Cable Tray in a Plenum.** This section applies to the use of metallic cable tray systems when used in ducts, plenums or other space used for environmental air.</u>
<u>**(1) Metal Cable Tray Systems.** Metal cable tray systems, including, but not limited to solid bottom metal cable trays systems with solid metal covers, are permitted to be used in ducts, plenums, and other air-handling spaces to support those wiring methods defined in 300.22 and/or to support raceways and/or cable types permitted for use in other spaces used for environmental air as described elsewhere in this *Code*.</u>
<u>**(2) Solid Bottom Metal Cable Tray.** Solid bottom metal cable trays systems with solid metal covers shall be permitted to be used in other air-handling spaces to support other types of cables, conductors, raceways not defined in 300.22(C)(1).</u>

Substantiation: This new language clarifies the use of Cable Trays systems in Ducts, Plenum or Other Space for Environmental Air applications. Section 300.22(C)(1) makes it clear that solid bottom metal cable tray systems with solid covers are permitted to be used with non-plenum rated cables and raceways. Other types of metallic cable trays system such as ladder or ventilated are permitted to be used with those wiring methods defined in the separate sections of 300.22 and the raceways and cables found in Chapters 7 and 8.

Cable Tray is not a raceway, but a support system for wiring methods.

Panel Meeting Action: Accept in Principle

Revise the proposed wording as follows:

(2) Cable Tray in Other Spaces Used for Environmental Air (Plenums). ~~in a Plenum~~. ~~This~~ The provisions of this section apply ~~applies~~ to the use of metallic cable tray systems ~~when used~~ in ~~ducts, plenums or~~ other spaces used for environmental air (plenums).

(a) Metal Cable Tray Systems. Metal cable tray systems~~, including, but not limited to solid bottom metal cable trays systems with solid metal covers~~, shall be ~~are~~ permitted ~~to be used in ducts, plenums, and~~ in other ~~air-handling~~ spaces used for environmental air (plenums) to support ~~those~~ wiring methods ~~defined in 300.22 and/or to support raceways~~ and~~/or~~ cable types permitted ~~for use~~ in other spaces used for environmental air (plenums) ~~as described elsewhere in this *Code*~~.

(b) Solid Bottom Metal Cable Tray. Solid bottom metal cable trays systems with solid metal covers shall be permitted where accessible ~~to be used in other air-handling spaces~~ to ~~support~~ enclose other types of cables, conductors, and raceways not specifically permitted to be installed exposed in other ~~air-handling~~ spaces used for environmental air (plenums) ~~not defined in 300.22(C)(1)~~."

Renumber the remainder of the section accordingly.

Panel Statement: The proposed text has been changed to ensure that cable trays are not installed in a specifically fabricated duct as covered in 300.22(B).

The proposed (2) and the text within the proposed section has been changed to apply only to other spaces used for environmental air (plenums) as changed in the action taken on Proposal 3-94.

The proposed phrase "defined in 300.22" in both (a) and (b) was deleted since 300.22 does not contain any definitions of wiring methods.

Proposed (a) has been reworded to simplify the application of any metal cable tray in an other space used for environmental air (plenum) and (b) was reworded to ensure that only solid bottom covered cable tray be used with raceways, cables, or other wiring methods not suitable for use in any other spaces used for environmental air (plenum).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-98 Log #1970 NEC-P03 **Final Action: Accept**
(300.37)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add: "in auxiliary gutters" after "in cable trays".

Substantiation: Edit. Auxiliary gutters are not included in "other raceways" since not listed in Article 100 definition of raceway, but are suitable for enclosing conductors.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-99 Log #2415 NEC-P03 **Final Action: Accept in Principle**
(300.37)

Submitter: Jerry Feagans, City of St. Louis

Recommendation: Revise text to read as follows:

"...shall be installed in rigid metal conduit, intermediate metal conduit, in electrical metallic tubing, in rigid ~~nonmetallic~~ PVC conduit.

Substantiation: Conforming to style manual Article 352.

Panel Meeting Action: Accept in Principle

In the recommended wording, the panel is deleting the word "rigid" and inserting "RTRC".

The text will now read as follows:

"**300.37 Aboveground Wiring Methods.**
Aboveground conductors shall be installed in rigid metal conduit, in intermediate metal conduit, in electrical metallic tubing, in RTRC and PVC conduit, in cable tray...".

Panel Statement: The word "rigid" was deleted to be consistent with the use of the term "PVC." "RTRC" was added since PVC and RTRC can be used for above ground nonmetallic wiring methods for systems in excess of 600-volt installations.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-100 Log #270 NEC-P03 **Final Action: Reject**
(Table 300.50)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Delete "(1)" through "(6)" from the beginning of the column headings in the table.

Substantiation: These numbers were added into the column headings in the 2005 code when the last three columns were added, however, there are no notes or explanations that specifically relate to the parenthetical numbers.

There are three general notes that apply to the table and the four specific footnotes are identified with superscripts a through d.

Panel Meeting Action: Reject

Panel Statement: These column numbers provide a good method for the user (electrician, engineer, or inspector) of the NEC to reference the various columns within the table.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-101 Log #2416 NEC-P03 **Final Action: Accept in Part**
(Table 300.50)

Submitter: Jerry Feagans, City of St. Louis

Recommendation: (2) Rigid ~~nonmetallic~~ PVC conduit.

Substantiation: Conforming to style manual Article 352.

Panel Meeting Action: Accept in Part

In the column (2) title, replace "Rigid Nonmetallic Conduit" with "RTRC, PVC Conduit, and HDPE Conduit."

The panel requests that the bracketed numbers above the text be placed in a separate row at the top of each column, under the first set of headings, to clarify that they do not reference the Notes at the bottom of the table.

Panel Statement: Replacing "Rigid Nonmetallic Conduit" with "PVC, HDPE, and RTRC" applies this column to the three nonmetallic underground installation wiring methods that constitute the minimum cover requirements for these wiring methods.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-102 Log #2627 NEC-P03 **Final Action: Reject**
(300.50)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise heading: UNDERGROUND and EMBEDDED INSTALLATIONS.

Delete text of (B) and substitute: Underground or embedded conductors emerging from finished grade shall be enclosed in listed identified raceways or Type MI cable. Raceways installed on the exterior of poles, posts or other structures shall be identified for the use extending from the minimum cover depth specified in Table 300.60 to a point not less than 2.5 m (8 ft) above finished grade unless terminated in a box, cabinet, or other enclosure.

Substantiation: Conductors may emerge from concrete slabs which are not "ground" or in contact with ground. Type MI cable should be permitted where not subject to damage, or protected. Schedule 80 PVC is not necessary where emerging from a 3 or 4 ft high concrete base supporting a pole but could be required by "suitable for the use". EMT should be permitted also if "suitable for the use". "Equivalent" is a term to be avoided per the Style Manual. Present literal wording does not permit a height higher than 8 ft for the raceway. This section is somewhat redundant and conflicting with 300.5(D) which doesn't specify raceways.

Panel Meeting Action: Reject

Panel Statement: There was no technical substantiation provided to justify adding the term "embedded" or the deletion of the specific raceways in the existing NEC.

This table covering over 600-volt installations is not conflicting with Table 300.5 since wiring methods for over 600 volts are very specific for protection of the high voltage cables.

"Identified for use" is not acceptable, based on the NEC Style Manual, and is in the process of being corrected by various code panels during each code cycle wherever the use of "listed for the use" or "identified for use" is used.

Where MI cables are listed for direct burial, Column 1 already provides the depth requirements.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-103 Log #4913 NEC-P03 **Final Action: Reject**
(Table 300.50, Note 3)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: In Note 3 to Table 300.50, insert the words "or institutional" after the word "industrial".
Substantiation: This allowance had been in routine use at major institutional settings as well as industrial occupancies from the 1968 NEC until the 2005 NEC, and should be resumed. The submitter's home jurisdiction has routinely approved the use of this cover reduction at the flagship state university (under state rules implementing the language of this proposal). This campus has a staff of approximately 60 FTE licensed electricians and they are responsible for the campus 13.8 kV distribution as well as utilization voltages. The level of sophistication at that campus equals or exceeds that often seen at industrial facilities. The inspection community should not be routinely forced into providing special permission pursuant to 90.4 in facilities that are not "industrial" but have an equivalent level of control. Other panels are taking comparable actions. As an example, the broadening of 225.32 Exception No. 1 from industrial occupancies to all occupancies with appropriately documented procedures in the 1999 cycle had a similar motivation and substantiation.
CMP 3 rejected a comment making some of these arguments in the previous code cycle, saying the extension to institutional occupancies had not been substantiated. However, the panel has it exactly backwards. CMP 3 has never provided any substantiation to support its withdrawal of a permission that had been in the NEC for 36 years. The point of this proposal is either to restore that permission or else elicit compelling technical substantiation as to why it should be limited to industrial occupancies after all this time and without a single proposal from the public ever having been received (since the 1968 cycle) to impose such a limitation.
Panel Meeting Action: Reject
Panel Statement: The term "institutional" is vague and could be interpreted far beyond the submitter's example of a university. As the submitter pointed out, if the AHJ accepts a lesser burial depth for high voltage cables in occupancies other than an industrial location, where public access is usually limited, then the AHJ can use 90.4.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-104 Log #1996 NEC-P03 **Final Action: Reject**
(300.50(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Direct–burial type conductors emerging from the ground shall be enclosed in an identified raceway, equipment enclosure, or enclosed wall space. Such raceways shall extend from the minimum cover depth specified in Table 300.50. Where exposed the raceway shall extend to a point not less than 2.5m (8ft) above finished grade or to the point of connection to an enclosure or other identified wiring method. Conductors entering a building or structure shall be protected by an identified raceway or enclosure from the minimum cover depth to the point of entrance. Where direct-buried conductors, cables, or raceways are likely to be subject to movement by settlement or freezing they shall be installed to minimize damage to conductors and other associated equipment.
Substantiation: The provision appears to address direct-burial type conductors since other types will be in a cable or raceway. Conductors may also emerge into pedestal mounted equipment or floor or slab mounted equipment, or inside a pole. The height limitation should not be limited to installations on poles but to any exposed installation unless terminated in an enclosure or changed to another identified wiring method. Grounding is covered in Article 250 which permits enclosures (raceways) to be ungrounded per 250.86 Exceptions No. 2 and 3.
Panel Meeting Action: Reject
Panel Statement: Conductors emerging from ground must be enclosed in listed raceways with the listing requirements determining the identification requirements for the raceways; therefore, changing "listed" to "identified" is unnecessary. The existing text already covers installations located above finished grade and entering into a building so further change is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-105 Log #3701 NEC-P03 **Final Action: Accept**
(300.50(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add the following text as a new (B) and renumber the existing text (current (B) becomes (C), etc.).
<u>**Wet Locations.** The interior of enclosures or raceways installed underground shall be considered to be a wet location. Insulated conductors and cables installed in these enclosures or raceways in underground installations shall be listed for use in wet locations and shall comply with 310.8(C). Any connections or splices in an underground installation shall be approved for wet locations.</u>
Substantiation: This is the same text that was added to 300.5(B) (*Underground Installations)* in the 2008 NEC. This text should also appear in 300.50 (*Requirements for over 600 Volts, Nominal – Underground Installations)* to make it clear that the inside of all raceways and enclosures installed underground is a wet location regardless of voltage).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-106 Log #3927b NEC-P03 **Final Action: Accept in Principle**
(300.50(B))

Submitter: Goran Haag, Champion Fiberglass, Inc.
Recommendation: Add new text to read as follows:
Everywhere Schedule 80 PVC is mentioned, "Type RTRC marked with the suffix -XW" should also be included.
Substantiation: For the NEC 2008, Type RTRC marked with the suffix –XW and Schedule 80 PVC were added as sufficient for Class I Division 2 installations. The Type RTRC marked with the suffix –XW were "forgotten" at some places in the NEC, needs to be corrected.
Panel Meeting Action: Accept in Principle
Add "RTRC-XW " to 300.50(B) to read as follows:
"**300.50(B) Protection from Damage.** Conductors emerging from the ground shall be enclosed in listed raceways. Raceways installed on poles shall be of rigid metal conduit, intermediate metal conduit, RTRC-XW, Schedule 80 PVC conduit, or equivalent, extending from the minimum.
Panel Statement: The panel added "RTRC-XW " to the text in 300.50(B) as requested by the submitter. This text was not added anywhere else in Part II of Article 300 since there was no specific proposal to add RTRC in other than this location.
Number Eligible to Vote: 14

ARTICLE 310 — CONDUCTORS FOR GENERAL WIRING

6-8 Log #2395 NEC-P06 **Final Action: Accept in Principle**
(310)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation:
Revise Article 310 as shown except do not include the parenthetical identifiers of where the paragraphs were located in the 2008 Code when there was no identifying section number:

Article 310 Conductors for General Wiring

<u>**I. General**</u>

310.1 Scope. This article covers general requirements for conductors and their type designations, insulations, markings, mechanical strengths, ampacity ratings, and uses. These requirements do not apply to conductors that form an integral part of equipment, such as motors, motor controllers, and similar equipment, or to conductors specifically provided for elsewhere in this Code.

FPN: For flexible cords and cables, see Article 400. For fixture wires, see Article 402.

<u>310.2 Definitions</u>
~~310.60 Conductors Rated 2001 to 35,000 Volts.~~
~~(A) Definitions.~~
Electrical Ducts. As used in Article 310, electrical ducts shall include any of the electrical conduits recognized in Chapter 3 as suitable for use underground; other raceways round in cross section, listed for underground use, and embedded in earth or concrete.

Thermal Resistivity. As used in this Code, the heat transfer capability through a substance by conduction. It is the reciprocal of thermal conductivity and is designated Rho and expressed in the units °C-cm/watt.

<u>310.6</u> ~~(1) General~~. <u>Conductor Types.</u> For explanation of type letters used in tables and for recognized sizes of conductors for the various conductor insulations, see <u>Table 310.106(A) through Table 310.106(E)</u> ~~Table 310.13(A) and Table 310.13(B)~~. For installation requirements, see ~~310.1 through~~ 310.10 and the various articles of this Code. For flexible cords, see Table 400.4, Table 400.5(A), and Table 400.5(B). (was 310.15(B)(1) in 2008 Code)

<u>**II. Installation**</u>

<u>310.10 Uses Permitted</u>

These conductors shall be permitted for use in any of the wiring methods recognized in Chapter 3 and as specified in their respective tables or as permitted elsewhere in this Code. (was 2nd paragraph in 310.13 in 2008 Code)

FPN: Thermoplastic insulation may stiffen at temperatures lower than -10°C (+14°F). Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, such as at points of support. Thermoplastic insulation, where used on dc circuits in wet locations, may result in electroendosmosis between conductor and insulation. (was in 310.13 in 2008 Code)

~~310.8 Locations.~~
(A) Dry Locations. Insulated conductors and cables used in dry locations shall be any of the types identified in this Code.

(B) Dry and Damp Locations. Insulated conductors and cables used in dry and damp locations shall be Types FEP, FEPB, MTW, PFA, RHH, RHW, RHW-2, SA, THHN, THW, THW-2, THHW, THWN, THWN-2, TW, XHH, XHHW, XHHW-2, Z, or ZW.

(C) Wet Locations. Insulated conductors and cables used in wet locations shall comply with one of the following:
(1) Be moisture-impervious metal-sheathed
(2) Be types MTW, RHW, RHW-2, TW, THW, THW-2, THHW, THWN, THWN-2, XHHW, XHHW-2, ZW
(3) Be of a type listed for use in wet locations

(D) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to direct rays of the sun shall comply with (D)(1) or (D)(2):
(1) Conductors and cables shall be listed, or listed and marked, as being sunlight resistant
(2) Conductors and cables shall be covered with insulating material, such as tape or sleeving, that is listed, or listed and marked, as being sunlight resistant

(E) ~~310.6~~ Shielding.
Solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All metallic insulation shields shall be connected to a grounding electrode conductor, grounding busbar, or a grounding electrode. Shielding shall be for the purpose of confining the voltage stresses to the insulation.

Exception No. 1: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 2400 volts under the following conditions:
(a) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.
(b) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.
(c) Insulation and jacket thicknesses shall be in accordance with Table 310.106(D) ~~310.13(D)~~.

Exception No. 2: Where permitted in 310.10(F) ~~310.7~~, Exception No. 2.

(F) ~~310.7~~ Direct-Burial Conductors.
Conductors used for direct-burial applications shall be of a type identified for such use.

Cables rated above 2000 volts shall be shielded.

Exception No. 1: Nonshielded multiconductor cables rated 2001–2400 volts shall be permitted if the cable has an overall metallic sheath or armor.

The metallic shield, sheath, or armor shall be connected to a grounding electrode conductor, grounding busbar, or a grounding electrode.

Exception No. 2: Airfield lighting cable used in series circuits that are rated up to 5000 volts and are powered by regulators shall be permitted to be nonshielded.

FPN to Exception No. 2: Federal Aviation Administration (FAA) Advisory Circulars (ACs) provide additional practices and methods for airport lighting.

FPN No. 1: See 300.5 for installation requirements for conductors rated 600 volts or less.

FPN No. 2: See 300.50 for installation requirements for conductors rated over 600 volts.

(G) ~~310.9~~ Corrosive Conditions.
Conductors exposed to oils, greases, vapors, gases, fumes, liquids, or other substances having a deleterious effect on the conductor or insulation shall be of a type suitable for the application.

(H) ~~310.4~~ Conductors in Parallel.
(1) ~~(A)~~ General. Aluminum, copper-clad aluminum, or copper conductors of size 1/0 AWG and larger, comprising each phase, polarity, neutral, or grounded circuit conductor shall be permitted to be connected in parallel (electrically joined at both ends).

Exception No. 1: Conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, or for frequencies of 360 Hz and higher, provided all of the following apply:
(a) They are contained within the same raceway or cable.
(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.
(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.

Exception No. 2: Under engineering supervision, grounded neutral conductors in sizes 2 AWG and larger shall be permitted to be run in parallel for existing installations.

FPN to Exception No. 2: Exception No. 2 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

(2) ~~(B)~~ Conductor Characteristics. The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall comply with all of the following:
(1) Be the same length
(2) Have the same conductor material
(3) Be the same size in circular mil area
(4) Have the same insulation type
(5) Be terminated in the same manner

(3) ~~(C)~~ Separate Cables or Raceways. Where run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors and shall have the same electrical characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor to achieve balance.

(4) ~~(D)~~ AmpacityAdjustment. Conductors installed in parallel shall comply with the provisions of 310.84(B)(1)(a) ~~310.15(B)(2)(a)~~.

(5) ~~(E)~~ Equipment Grounding Conductors. Where parallel equipment grounding conductors are used, they shall be sized in accordance with 250.122. Sectioned equipment grounding conductors smaller than 1/0 AWG shall be permitted in multiconductor cables in accordance with 310.106 ~~310.13~~, provided the combined circular mil area in each cable complies with 250.122.

310.~~15~~ 80 Ampacities for Conductors Rated 0–2000 Volts.

~~(A) General.~~

(A) ~~(1)~~ Tables or Engineering Supervision. Ampacities for conductors shall be permitted to be determined by tables as provided in 310.82 ~~310.15(B)~~ or under engineering supervision as provided in 310.86 ~~310.15(C)~~.

FPN No. 1: Ampacities provided by this section do not take voltage drop into consideration. See 210.19(A), FPN No. 4, for branch circuits and 215.2(A), FPN No. 2, for feeders.

FPN No. 2: For the allowable ampacities of Type MTW wire, see Table 13.5.1 in NFPA 79-2007, Electrical Standard for Industrial Machinery.

(B) ~~(2)~~ Selection of Ampacity. Where more than one calculated or tabulated ampacity could apply for a given circuit length, the lowest value shall be used.

Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length figured at the higher ampacity, whichever is less.

FPN: See 110.14(C) for conductor temperature limitations due to termination provisions.

(C) ~~310.10~~ Temperature Limitation of Conductors~~.~~ No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.

FPN: The temperature rating of a conductor [see Table 310.104(A)

~~310.13(A)~~ and Table 310.104(C) ~~310.13(C)~~] is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 310 and the ampacity tables of Annex B, the correction factors associated with ~~at the bottom of~~ these tables, and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors.

The principal determinants of operating temperature are as follows:
(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.
(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.
(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.
(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

310.82 ~~(B)~~ Tables. Ampacities for conductors rated 0 to 2000 volts shall be as specified in the Allowable Ampacity Table 310.82(A) ~~310.16~~ through Table 310.82(D) ~~310.19~~, and Ampacity Table 310.82(E) ~~310.20~~ and Table 310.82(F) ~~310.21~~ as modified by 310.84 ~~(B)(1) through (B)(6)~~.

FPN: Table 310.82(A) ~~310.16~~ through Table 310.82(D) ~~310.19~~ are application tables for use in determining conductor sizes on loads calculated in accordance with Article 220. Allowable ampacities result from consideration of one or more of the following:

(1) Temperature compatibility with connected equipment, especially the connection points.
(2) Coordination with circuit and system overcurrent protection.
(3) Compliance with the requirements of product listings or certifications. See 110.3(B).
(4) Preservation of the safety benefits of established industry practices and standardized procedures.

Table 310.82(A) ~~16~~ Allowable Ampacities of Insulated Conductors Rated 0 Through 2000 Volts, 60°C Through 90°C (140°F Through 194°F), Not More Than Three Current-Carrying Conductors in Raceway, Cable, or Earth (Directly Buried), Based on Ambient Temperature of 30°C (86°F)

Insert existing Table 310.20
(not submitted)

Table 310.82(F) ~~21~~ Ampacities of Bare or Covered Conductors in Free Air, Based on 40°C (104°F) Ambient, 80°C (176°F) Total Conductor Temperature, 610 mm/sec (2 ft/sec) Wind Velocity

Insert existing Table 310.21
(not submitted)

310.84 ~~(2)~~ Adjustment Factors.

(A) ~~(a)~~ More Than Three Current-Carrying Conductors in a Raceway or Cable. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.84(A) ~~310.15(B)(2)(a)~~. Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.

Table 310.84(A) ~~310.15(B)(2)(a)~~ Adjustment Factors for More Than Three Current-Carrying Conductors in a Raceway or Cable

Insert existing Table 310.15(B)(2)(a)
(not submitted)

FPN No. 1: See Annex B, Table B.310.11, for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

FPN No. 2: See 366.23(A) for adjustment factors for conductors in sheet metal auxiliary gutters and 376.22(B) for adjustment factors for conductors in metal wireways.

Exception No. 1: Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the derating factors shown in Table 310.84(A) ~~310.15(B)(2)(a)~~ shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).

Exception No. 2: For conductors installed in cable trays, the provisions of 392.11 shall apply.

Exception No. 3: Derating factors shall not apply to conductors in nipples having a length not exceeding 600 mm (24 in.).

Exception No. 4: Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3.05 m (10 ft) and if the number of conductors does not exceed four.

Exception No. 5: Adjustment factors shall not apply to Type AC cable or to Type MC cable without an overall outer jacket under the following conditions:
(1) Each cable has not more than three current-carrying conductors.
(2) The conductors are 12 AWG copper.
(3) Not more than 20 current-carrying conductors are bundled, stacked, or supported on "bridle rings."

A 60 percent adjustment factor shall be applied where the current-carrying conductors in these cables that are stacked or bundled longer than 600 mm (24 in.) without maintaining spacing exceeds 20.

(B) ~~(b)~~ More Than One Conduit, Tube, or Raceway. Spacing between conduits, tubing, or raceways shall be maintained.

(C) ~~(c)~~ Conduits Exposed to Sunlight on Rooftops. Where conductors or cables are installed in conduits exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.84(C) ~~310.15(B)(2)(c)~~ shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.82(A) ~~16~~ and Table 310.82(C) ~~18~~.

FPN: One source for the average ambient temperatures in various locations is the ASHRAE Handbook — Fundamentals.

Table 310.84(C) ~~310.15(B)(2)(c)~~ Ambient Temperature Adjustment for Conduits Exposed to Sunlight On or Above Rooftops

Insert existing Table 310.15(B)(2)(c) and FPN
(not submitted)

(D) ~~(3)~~ Bare or Covered Conductors. Where bare or covered conductors are installed with insulated conductors, the temperature rating of the bare or covered conductor shall be equal to the lowest temperature rating of the insulated conductors for the purpose of determining ampacity.

(E) ~~(4)~~ Neutral Conductor.
(1) ~~(a)~~ A neutral conductor that carries only the unbalanced current from other conductors of the same circuit shall not be required to be counted when applying the provisions of 310.84(A) ~~310.15(B)(2)(a)~~.
(2) ~~(b)~~ In a 3-wire circuit consisting of two phase conductors and the

neutral conductor of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral load currents of the other conductors and shall be counted when applying the provisions of 310.84(A) ~~310.15(B)(2)(a)~~.
(3) ~~(c)~~ On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, harmonic currents are present in the neutral conductor; the neutral conductor shall therefore be considered a current-carrying conductor.

(F) ~~(5)~~ Grounding or Bonding Conductor. A grounding or bonding conductor shall not be counted when applying the provisions of 310.84(A) ~~310.15(B)(2)(a)~~.

(G) ~~(6)~~ 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.84(G) ~~310.15(B)(6)~~, shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service-lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder between the main disconnect and the panelboard that supplies, either by branch circuits or by feeders, or both, all loads that are part or associated with the dwelling unit. The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.

Table 310.84(G) ~~310.15(B)(6)~~ Conductor Types and Sizes for 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. Conductor Types RHH, RHW, RHW-2, THHN, THHW, THW, THW-2, THWN, THWN-2, XHHW, XHHW-2, SE, USE, USE-2

Insert existing Table 310.15(B)(6)
(not submitted)

(H) ~~(D)~~ Ampacity Adjustment. Conductors installed in parallel shall comply with the provisions of 310.84(A) ~~310.15(B)(2)(a)~~.

310.86 ~~(C)~~ Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated by means of the following general formula:

Insert existing equation from 310.15(C) with corrected subscripts
(not submitted)

where:
TC= conductor temperature in degrees Celsius (°C)
TA= ambient temperature in degrees Celsius (°C)
TD= dielectric loss temperature rise
RDC= dc resistance of conductor at temperature TC
YC= component ac resistance resulting from skin effect and proximity effect
RCA= effective thermal resistance between conductor and surrounding ambient

FPN: See Annex B for examples of formula applications.

310.90 ~~60(B)~~ Ampacities of Conductors Rated 2001 to 35,000 Volts

~~(B) Ampacities of Conductors Rated 2001 to 35,000 Volts.~~ Ampacities for solid dielectric-insulated conductors shall be permitted to be determined by tables or under engineering supervision, as provided in 310.92 and 310.96 ~~310.60(C) and (D)~~.

~~(1) Selection of Ampacity.~~ Where more than one calculated or tabulated ampacity could apply for a given circuit length, the lowest value shall be used.

Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length figured at the higher ampacity, whichever is less.

FPN: See 110.40 for conductor temperature limitations due to termination provisions.

310.92 ~~(C)~~ Tables. Ampacities for conductors rated 2001 to 35,000 volts shall be as specified in the Ampacity Table 310.92(A) ~~310.67~~ through Table 310.92(T), ~~310.86~~ adjusted in accordance with 310.94(A), (B), or (C). Ampacities at ambient temperatures other than those shown in the tables shall be determined by the formula in 310.94(D) ~~310.60(C)(4)~~.

FPN No. 1: For ampacities calculated in accordance with 310.96 ~~310.60(B)~~, reference IEEE 835-1994 (IPCEA Pub. No. P-46-426), Standard Power Cable Ampacity Tables, and the references therein for availability of all factors and constants.

FPN No. 2: Ampacities provided by this section do not take voltage drop into consideration. See 210.19(A), FPN No. 4, for branch circuits and 215.2(A), FPN No. 2, for feeders.

310.94 Adjustment Factors

(A) ~~(1)~~ Grounded Shields. Ampacities shown in Table 310.92(C) ~~310.69~~, Table 310.92(D) ~~310.70~~, Table 310.92(O) ~~310.81~~, and Table 310.92(P) ~~310.82~~ are for cable with shields grounded at one point only. Where shields are grounded at more than one point, ampacities shall be adjusted to take into consideration the heating due to shield currents.

(B) ~~(2)~~ Burial Depth of Underground Circuits. Where the burial depth of direct burial or electrical duct bank circuits is modified from the values shown in a figure or table, ampacities shall be permitted to be modified as indicated in 310.94(B)(1) and (2) ~~(C)(2)(a) and (C)(2)(b)~~.

(1) ~~(a)~~ Where burial depths are increased in part(s) of an electrical duct run, no decrease in ampacity of the conductors is needed, provided the total length of parts of the duct run increased in depth is less than 25 percent of the total run length.

(2) ~~(b)~~ Where burial depths are deeper than shown in a specific underground ampacity table or figure, an ampacity derating factor of 6 percent per 300-mm (1-ft) increase in depth for all values of rho shall be permitted.

No rating change is needed where the burial depth is decreased.

(C) ~~(3)~~ Electrical Ducts in Figure 310.94(C) ~~310.60~~. At locations where electrical ducts enter equipment enclosures from under ground, spacing between such ducts, as shown in Figure 310.94(C) ~~310.60~~, shall be permitted to be reduced without requiring the ampacity of conductors therein to be reduced.

Insert existing Figure 310.60
(not submitted)

Figure 310.94(C) ~~310.60~~ Cable Installation Dimensions for Use with Table 310.92(K) ~~310.77~~ Through Table 310.92(T) ~~310.86~~.

(D) ~~(4)~~ Ambients Not in Tables. Ampacities at ambient temperatures other than those shown in the tables shall be determined by means of the following formula:

Insert existing equation from 310.60(C)(4) with corrected subscripts
(not submitted)

where:
I 1= ampacity from tables at ambient TA1
I 2= ampacity at desired ambient TA2
TC= conductor temperature in degrees Celsius (°C)
TA1= surrounding ambient from tables in degrees Celsius (°C)
TA2= desired ambient in degrees Celsius (°C)
TD= dielectric loss temperature rise

310.96 ~~(D)~~ Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated by means of the following general formula:

Insert existing equation from 310.60(D) with corrected subscripts

(not submitted)

where:
TC= conductor temperature in °C
TA= ambient temperature in °C
TD= dielectric loss temperature rise
RDC= dc resistance of conductor at temperature TC
YC= component ac resistance resulting from skin effect and proximity effect
RCA= effective thermal resistance between conductor and surrounding ambient

FPN: See Annex B for examples of formula applications.

III. Construction Specifications

310.104 ~~310.13~~ Conductor Constructions and Applications.
Insulated conductors shall comply with the applicable provisions of Table 310.104(A) ~~310.13(A)~~ through Table 310.104(E) ~~Table 310.13(E)~~.

Equipment grounding conductors shall be permitted to be sectioned within a listed multiconductor cable, provided the combined circular mil area complies with 250.122. (was last paragraph in 310.13 in 2008 Code)

FPN: Thermoplastic insulation may stiffen at temperatures lower than -10°C (+14°F). Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, such as at points of support. Thermoplastic insulation, where used on dc circuits in wet locations, may result in electroendosmosis between conductor and insulation.

Insert existing Table 310.13(E)
(not submitted)

310.106 ~~310.2~~ Conductors

(A) ~~310.5~~ Minimum Size of Conductors. The minimum size of conductors shall be as shown in Table 310.106(A) ~~310.5~~, except as permitted elsewhere in this Code.

Table 310.106(A) ~~310.5~~ Minimum Size of Conductors

Insert existing Table 310.5
(not submitted)

(B) ~~310.2(B)~~ Conductor Material. Conductors in this article shall be of aluminum, copper-clad aluminum, or copper unless otherwise specified.

~~310.14 Aluminum Conductor Material.~~
Solid aluminum conductors 8, 10, and 12 AWG shall be made of an AA-8000 series electrical grade aluminum alloy conductor material. Stranded aluminum conductors 8 AWG through 1000 kcmil marked as Type RHH, RHW, XHHW, THW, THHW, THWN, THHN, service-entrance Type SE Style U and SE Style R shall be made of an AA-8000 series electrical grade aluminum alloy conductor material.

(C) ~~310.3~~ Stranded Conductors. Where installed in raceways, conductors of size 8 AWG and larger shall be stranded.

Exception: As permitted or required elsewhere in this Code.

(D) ~~2(A)~~ Insulated. Conductors shall be insulated.

Exception: Where covered or bare conductors are specifically permitted elsewhere in this Code.

FPN: See 250.184 for insulation of neutral conductors of a solidly grounded high-voltage system.

310.110 ~~12~~ Conductor Identification.

(A) Grounded Conductors. Insulated or covered grounded conductors shall be identified in accordance with 200.6.

(B) Equipment Grounding Conductors. Equipment grounding conductors shall be in accordance with 250.119.

(C) Ungrounded Conductors. Conductors that are intended for use as ungrounded conductors, whether used as a single conductor or in multiconductor cables, shall be finished to be clearly distinguishable from grounded and grounding conductors. Distinguishing markings shall not conflict in any manner with the surface markings required by 310.120 ~~11~~ (B)(1). Branch-circuit ungrounded conductors shall be identified in accordance with 210.5(C). Feeders shall be identified in accordance with 215.12.

Exception: Conductor identification shall be permitted in accordance with 200.7.

310.120 ~~11~~ Marking.
(A) Required Information. All conductors and cables shall be marked to indicate the following information, using the applicable method described in 310.120(B) ~~310.11(B)~~:
(1) The maximum rated voltage.
(2) The proper type letter or letters for the type of wire or cable as specified elsewhere in this Code.
(3) The manufacturer's name, trademark, or other distinctive marking by which the organization responsible for the product can be readily identified.
(4) The AWG size or circular mil area.
FPN: See Conductor Properties, Table 8 of Chapter 9, for conductor area expressed in SI units for conductor sizes specified in AWG or circular mil area.
(5) Cable assemblies where the neutral conductor is smaller than the ungrounded conductors shall be so marked.

(B) Method of Marking.
(1) Surface Marking. The following conductors and cables shall be durably marked on the surface. The AWG size or circular mil area shall be repeated at intervals not exceeding 610 mm (24 in.). All other markings shall be repeated at intervals not exceeding 1.0 m (40 in.).
(a) ~~(1)~~ Single-conductor and multiconductor rubber- and thermoplastic-insulated wire and cable
(b) ~~(2)~~ Nonmetallic-sheathed cable
(c) ~~(3)~~ Service-entrance cable
(d) ~~(4)~~ Underground feeder and branch-circuit cable
(e) ~~(5)~~ Tray cable
(f) ~~(6)~~ Irrigation cable
(g) ~~(7)~~ Power-limited tray cable
(h) ~~(8)~~ Instrumentation tray cable

(2) Marker Tape. Metal-covered multiconductor cables shall employ a marker tape located within the cable and running for its complete length.

Exception No. 1: Mineral-insulated, metal-sheathed cable.

Exception No. 2: Type AC cable.

Exception No. 3: The information required in 310.120(A) ~~310.11(A)~~ shall be permitted to be durably marked on the outer nonmetallic covering of

Type MC, Type ITC, or Type PLTC cables at intervals not exceeding 1.0 m (40 in.).

Exception No. 4: The information required in 310.120(A) ~~310.11(A)~~ shall be permitted to be durably marked on a nonmetallic covering under the metallic sheath of Type ITC or Type PLTC cable at intervals not exceeding 1.0 m (40 in.).

FPN: Included in the group of metal-covered cables are Type AC cable (Article 320), Type MC cable (Article 330), and lead-sheathed cable.

(3) Tag Marking. The following conductors and cables shall be marked by means of a printed tag attached to the coil, reel, or carton:
(a) ~~(1)~~ Mineral-insulated, metal-sheathed cable
(b) ~~(2)~~ Switchboard wires
(c) ~~(3)~~ Metal-covered, single-conductor cables
(d) ~~(4)~~ Type AC cable

(4) Optional Marking of Wire Size. The information required in 310.120(A)(4) ~~310.11(A)(4)~~ shall be permitted to be marked on the surface of the individual insulated conductors for the following multiconductor cables:
(a) ~~(1)~~ Type MC cable
(b) ~~(2)~~ Tray cable
(c) ~~(3)~~ Irrigation cable
(d) ~~(4)~~ Power-limited tray cable
(e) ~~(5)~~ Power-limited fire alarm cable
(f) ~~(6)~~ Instrumentation tray cable

(C) Suffixes to Designate Number of Conductors. A type letter or letters used alone shall indicate a single insulated conductor. The letter suffixes shall be indicated as follows:
(1) D — For two insulated conductors laid parallel within an outer nonmetallic covering
(2) M — For an assembly of two or more insulated conductors twisted spirally within an outer nonmetallic covering

(D) Optional Markings. All conductors and cables contained in Chapter 3 shall be permitted to be surface marked to indicate special characteristics of the cable materials. These markings include, but are not limited to, markings for limited smoke, sunlight resistant, and so forth.
Substantiation: This revision will comply with the NEC Style Manual and provide consistency with other Articles in Chapter 3. Other than some additional Part headings, renumbering of sections, and relocation of text, all rules and contents of tables have remained the same as currently in the 2008 Code. It was not the intent to make any changes to the existing rules. The proposed revised Article is shown in the proposal. Table contents and equations that appear in the 2008 NEC have been omitted but their locations have been indicated.
310.6 was revised to include conductors rated over 2000 V since 310.6 addresses all conductor types within Article 310.
Additional references were proposed when the existing rules had to be separated into separate sections to comply with 2.3.1 of the NEC Style Manual which states “That tables and figures shall be referenced in the text and shall be designated by the number of the NEC rule in which they are referenced.” Without the separation, confusion might exist with the table or figure designations to the NEC rules.
Panel Meeting Action: Accept in Principle
Panel Statement: This proposal is strictly editorial and complies with the NEC Style Manual. There are no technical changes being made. In addition, this proposal is modified by the panel actions on all associated proposals related to this section.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-9 Log #3212 NEC-P06 **Final Action: Reject**
(310.2.Jacket and Sheath (New))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: This proposal should only be considered if the proposal to renumber Article 310 is accepted.
Add the following definitions to 310.2:
Jacket. A nonmetallic material applied as an outer covering over a single conductor or a multiconductor cable.
Sheath. A metallic interlocking armor or a continuous metal covering.
Substantiation: These definitions will provide consistency in the use of the terms “jacket” and “sheath” and prevent confusion when the terms are interchanged.
Panel Meeting Action: Reject
Panel Statement: NM is a sheathed cable but is not metallic. Sheath is commonly used to refer to both metallic and non-metallic materials. UL currently refers to jackets with cords but there is no convention and they are routinely used interchangeably. Section 300.6(C) refers to metallic jackets. No additional clarification is provided by the addition of these definitions.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-10 Log #1554 NEC-P06 **Final Action: Reject**
(310.2(A))

Submitter: Pat Goggins, I.B.E.W. Electrician/Apprentice Instructor / Rep. I.B.E.W. Local #176
Recommendation: Add new text as follows:
310.2 Conductors.
(A) Insulated. **General.** Conductors shall be insulated.
Exception: Where covered or bare conductors are specifically permitted elsewhere in this Code.
Substantiation: This would emphasize that the **general rule** is that conductor(s) are to be insulated, except where permitted elsewhere in the code.
Panel Meeting Action: Reject
Panel Statement: This proposal violates the NEC Style Manual.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
PICARD, P.: The Panel should have replaced “Insulated” with “General”, which seems to be more consistent with NEC practice. We can find no violation of the NEC Style manual. The word “General” is often used as a title for subdivisions in the NEC, see 250.122(A), 110.22(A), 210.60(A), 310.4(A), etc.

6-11 Log #3767 NEC-P06 **Final Action: Accept**
(310.2(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
(A) Insulated. Conductors, not having specific permission elsewhere in this Code to be covered or bare, shall be insulated.
~~*Exception: Where covered or bare conductors are specifically permitted elsewhere in this Code.*~~
Substantiation: This revision will change an exception into a positive rule and comply with the TCC request to convert exceptions into positive text wherever possible.
Panel Meeting Action: Accept
Number Eligible to Vote: 11

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: 310.3 Stranded Conductors. Where installed in raceways, conductors ~~of size~~ 8 AWG and larger, not having specific permission or requirements elsewhere in this Code to be solid, shall be stranded.
~~Exception: As permitted or required elsewhere in this Code.~~
Substantiation: This revision will change an exception into a positive rule and comply with the TCC request to convert exceptions into positive text wherever possible.
The text "of size" was deleted as being redundant.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-16 Log #3647 NEC-P06 **Final Action: Accept in Principle in Part**
(310.4)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
310.4 Conductors in Parallel.
(A) General. Aluminum, copper-clad aluminum, or copper conductors of size ~~1/0~~ 1 AWG and ~~larger~~ smaller, comprising each phase, polarity, neutral, or grounded circuit conductor shall ~~be permitted to~~ not be connected in parallel (electrically joined at both ends). Where conductors of size 1/0 and larger are installed in parallel they shall be installed in accordance with 310.4(B) through 310.4(E).
Substantiation: There is no reasonable reading of the words "shall be permitted" in the current code that leads the reader to conclude that these words are intended to prohibit the paralleling of conductors smaller than 1/0. The words "shall be permitted" in no way act to prohibit other uses. The use of "shall be permitted" in this section are not in compliance with the intended use per 3.1.2 of the NEC Style Manual as they do not permit an optional or alternate method.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
310.4 Conductors in Parallel.
(A) General. Aluminum, copper-clad aluminum, or copper conductors ~~of size 1/0~~ 1 AWG and ~~larger~~ smaller, comprising each phase, polarity, neutral, or grounded circuit conductor shall not be permitted to be connected in parallel (electrically joined at both ends). Where conductors 1/0 AWG and larger are installed in parallel they shall be installed in accordance with 310.4(B) through 310.4(E).
Panel Statement: The panel rejected the deletion of the text "be permitted to" and accepted the remainder of the proposal because it is necessary text. The panel deleted "of size" because it is redundant.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-17 Log #3754 NEC-P06 **Final Action: Accept**
(310.4)

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise item (B) as shown and add a new item (F):
(B) Conductor Characteristics. The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, ~~or~~ equipment grounding conductor, or equipment bonding jumper shall comply with all of the following:
(F) Equipment Bonding Jumpers. Where parallel equipment bonding jumpers are installed in raceways, they shall be sized and installed in accordance with 250.102.
Substantiation: During a recent review of a set of plans, it became evident that we do not address the issue of paralleled equipment bonding jumpers in 310.4. Take the example of a transformer (separately derived system) that is supplying a large switchboard with multiple paralleled conduits. The conductor that joins the metallic parts of the transformer and the switchboard is actually an equipment bonding jumper and not an equipment grounding conductor. 250.102(C) has the sizing requirements for the equipment bonding jumper in this case and makes it clear that the EBJ has to be installed in the parallel conduits and is sized based on the conductors in the conduit.
However, since this is a parallel conductor the user is naturally drawn to 310.4 for any other requirements. Since there are none, it raises the question as to whether we expect the bonding jumper to be the same size, material, length, etc. 310.4 already states this for equipment grounding conductors and it would appear that an extension to equipment bonding jumpers makes good technical sense.
To cover the EBJ, 310.4(B) is revised to add in equipment bonding jumper. A new item (F) is added to 310.4 to simply refer the user to the sizing requirements outlined in 250.102. Having these provisions will also make it clear that the 1/0 minimum size limitation on paralleled conductors does not apply to the EBJ.
Panel Meeting Action: Accept
Panel Statement: Panel 5 accepted the actions referenced by the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-18 Log #271 NEC-P06 **Final Action: Reject**
(310.4(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "Exception No. 2" to "Exception" and relocate following the first paragraph in 310.4(A).
Change "FPN to Exception No.2: Exception No. 2 can" to "FPN: The Exception may" and locate following the exception.
Delete the words "Exception No. 1:" and relocate all of the text in that exception intact as a positive code ruling following the exception and FPN.
Substantiation: Exception No. 1 can readily be changed into a positive code rule with no changes in the content. It does not conflict with the first paragraph since it specifically defines different conditions. This change from an exception to a positive code rule complies with the recommendation in 3.1.4 of the NEC Style Manual.
Placement of the exception and FPN immediately following the first paragraph is in accordance with 2.6.1 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: This proposal would conflict with the panel action on Proposal 6-16.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-19 Log #2024 NEC-P06 **Final Action: Accept in Principle in Part**
(310.4(A) Exception No. 2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Under electrical engineering supervision 2 AWG and 1 AWG grounded neutral conductors ~~in size 2 AWG and larger~~ shall be permitted to be run in parallel for existing installations of the same size conductors where installed in compliance with applicable provisions of 310.4.
Substantiation: Conductors 1/0 ("and larger") are already permitted to be run in parallel without engineering supervision. All engineering disciplines may not be qualified.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
Under engineering supervision 2 AWG and 1 AWG grounded neutral conductors ~~in size 2 AWG and larger~~ shall be permitted to be run in parallel for existing installations.
Panel Statement: The panel is of the opinion that other engineering disciplines may be qualified to supervise the installation. The panel does agree with the submitter that conductors 1/0 ("and larger") are already permitted to be run in parallel without engineering supervision. The proposed phrase "of the same size conductors where installed in compliance with applicable provisions of 310.4" is already a requirement in the code and is not needed.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-20 Log #4532 NEC-P06 **Final Action: Accept in Principle in Part**
(310.4(C))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revised text as follows:
(C) Separate Cables or Raceways. If ~~Where~~ run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors and shall have the same physical ~~electrical~~ characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor ~~to achieve balance~~.
Substantiation: Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
The phrase "electrical characteristics" was changed from "physical characteristics" by the Panel during the processing of the 2008 NEC. However, the Panel did not provide substantiation for the change. The term "physical characteristics" had been used for many years to ensure that raceways used to enclose conductors in parallel are identical in physical and electrical properties. This requirement helps ensure an equal distribution of the current in the parallel conductors. The term "physical characteristics" is easier for the installer and inspector to understand that "electrical characteristics." This answers questions such as does the rule intend that all conduits be magnetic? or conductive? or non-conductive?
The phrase "to achieve balance" is not needed in the rule as this states the purpose for the entire rule, not only this section. Stating the purpose of the rule is not an essential component of the NEC requirements.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
(C) Separate Cables or Raceways. When ~~Where~~ run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors and shall have the same electrical characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor ~~to achieve balance~~.
Panel Statement: The panel accepts in principle the change from the word "where" but finds the word "when" more appropriate than "if," and both words are in compliance with the NEC Style Manual. The Panel agrees with the submitter that there was no substantiation for the change from "physical" to "electrical" in the 2008 Code. However, subsequent discussions within the panel resulted in the agreement that "electrical" was the more appropriate term. The panel accepts the deletion of the phrase "to achieve balance".
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-21 Log #266 NEC-P06 **Final Action: Accept**
(Table 310.5)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise Table 310.5 as shown:
0-2000 14 12
~~2001-8000 8 8~~
–2001-5000 8 8
5001-8000 6 6
8001-15,000 2 2
15,001-28,000 1 1
28,001-35,000 1/0 1/0
Substantiation: This revision will correlate Table 310.5 with the current Tables 310.13(B), (D), and (E).
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-21a Log #CP600 NEC-P06 **Final Action: Accept**
(310.6)

Submitter: Code-Making Panel 6,
Recommendation: Revise section 310.6 as follows :
310.6 Shielding. Solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All
metallic insulation shields shall be connected to a grounding electrode conductor, grounding busbar, or a grounding electrode. ~~Shielding shall be for the purpose of confining the voltage stresses to the insulation.~~
Create new FPN to 310.6 as follows:
The primary purposes of shielding are to confine the voltage stresses to the insulation, dissipate insulation leakage current, drain off the capacitive charging current, and carry ground fault current to facilitate operation of ground fault protective devices in the event of an electrical cable fault.
Substantiation: The proposed fine print note clarifies the purpose and benefits of shielding. The noted text was moved from the body of the Code to the new fine print note because it was explanatory information and does not belong in the body of the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
MCCLUNG, L.: Support the panel action with the following affirmative statement: "Requirements for Grounding of metallic shields over 1kV are covered in NEC Article 250 Part X."
ZIMNOCH, J.: For proper ground fault protection, the amount of shielding may or may not be sufficient depending on the amount of fault current available.

6-21b Log #CP601 NEC-P06 **Final Action: Accept**
(310.6)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with 3.1.3 of the NEC Style Manual related to Fine Print Notes.
This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 6,
Recommendation: Renumber the existing exception No.2 to exception No.3. and add a new exception No. 2 to read as follows:
Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 5000 volts to replace existing nonshielded conductors in industrial establishments only, under the following conditions:
(a) Where the condition of maintenance and supervision ensures that only qualified personnel install and service the installation.
(b) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.
(c) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.
(d) Insulation and jacket thicknesses shall be in accordance with Table 310.13(D).
FPN: Cable usage is intended to be limited to the replacement of existing nonshielded cable on existing equipment. Relocation or replacement of equipment may not meet the term 'existing' as related to this exception.
Substantiation: The Panel recognizes the issue and concerns of current requirements for replacing existing nonshielded cable with shielded cable for existing installations, and believes that replacing nonshielded cable in existing installations with nonshielded cable is appropriate.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
FRIEDMAN, S.: Panel proposal 6-21b accepting use of 5 KV unshielded cables for existing installations should not be accepted. This proposal is not enforceable and does not belong in the NEC. Without providing a date and defining "existing installations" for every possible occurrence this change will only add confusion. In addition, the panel has stated repeatedly that non-shielded cables are not safe. In the previous code cycle the panel consistently indicated that additional technical substantiation would be required to permit the use of non-shielded cables.
ZIMNOCH, J.: The definition of "existing", "replacement" and "relocation" are not adequately defined.
Comment on Affirmative:
CLINE, S.: I hope that we all keep the excellent balance achieved after so many hours of discussion in multiple meetings. This is a very rational allowance for existing conditions. It will result in a superior and safer cable replacing old, without requiring some adapted field-conversion of termination facilities. My guess is that if 6-21b and 6-24 are enacted, the subject will be essentially closed. Please Accept this Proposal.
HUDDLESTON, JR., R.: The Panel should be commended for realizing that they placed undue burden on users of non-shielded cable by requiring the use of shielded cable for replacement of existing cable. This Proposal is excellent.
KENT, G.: While the unshielded cable above 2000 volts needs to continue to be eliminated, the fact is much of it is in existence and time is needed to work it out of the system. There is not need to put lives in danger using unsafe means in existing equipment. I would have preferred this to have a sunset clause.
LAIDLER, W.: We are voting affirmative with the panel action to Accept proposal number 6-21b. The action on this proposal provides relief for situations in industrial facilities where the cable in existing raceways must be replaced. Without this new exception, the cable would have to be replaced with shielded cable which may create concerns due to the fact that the raceway and enclosures are sized for nonshielded cable.
WALL, C.: I am voting affirmative. I believe the panel has acted properly to allow the replacement of existing non-shielded cables with non-shielded cables. There are many pieces of equipment in service that have small termination enclosures without adequate space for the longer terminations required by shielded cable. This change will simplify the replacement of existing non-shielded cables and provide safe installations.

6-22 Log #1394 NEC-P06 **Final Action: Reject**
(310.6)

Submitter: Gordon Robertson, American Petroleum Institute (API)
Recommendation: Revise text to read as follows:
310.6 Shielding. Solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All metallic insulation shields shall be connected to a grounding electrode conductor, grounding busbar, or a grounding electrode. Shielding shall be for the purpose of confining the voltage stresses to the insulation.
Exception No. 1: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to ~~2400~~ 5000 volts under the following conditions:
(a) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.
(b) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.
(c) Insulation and jacket thicknesses shall be in accordance with Table 310.13(D).
Exception No. 2: Where permitted in 310.7, Exception No. 2.
Substantiation: This proposal undoes the change to the 2005 NEC that eliminated unshielded 5 kV cable as a valid power cable. The substantiation for this proposal is in 7Parts:
1) Nonshielded insulated single conductor and multi-conductors up to 5000 volts can be safely applied provided that proper minimum insulation thicknesses are used. This proposal is coupled with and requires a companion proposal recommending revisions to Table 310.13D that add the required insulation thicknesses for 2401 volt through 5000 volt conductors. The companion proposal re-establishes the same insulation requirements that existed in the 2002 NEC for nonshielded conductors rated up to 8000 volts. Note that the insulation thicknesses required in the companion proposal for cable rated 5000 volts is up to twice the levels required for cable rated 2400 volts.
2) One reason for potential problems in the past has been the allowable thin 90, 110, and 125 mil insulation thickness levels for up to 5000 volt jacketed conductors that were permitted in the 1999 NEC Table 310-63 and the 2002 NEC Table 310.63. These thin insulation thicknesses have caused some problems, especially in cases where the conductor jacket is removed and the insulation is lying directly against grounded surfaces such as within motor junction boxes and, in some cases has exhibited corona discharge within the interstices of three-conductor cables within a jacket. This proposal greatly increases the minimum insulation thicknesses required for the 5000 volt nonshielded cables in wet or dry locations and will alleviate the problems that led to the 2005 NEC position to completely eliminate the use of unshielded 5000 volt cable except in the case of airport lighting.
3) Proposal 6-12 of the May 2004 RoP provided only one example of a non-shielded cable application that may have posed a safety risk. The Panel did not consider if a shielded cable in the same application would have created the same or additional safety risks.
4) The substantiation Panel 6 based their May 2004 decision on was insufficient. Proposal 6-12 of the May 2004 RoP provided only one example of a non-shielded cable application and characterized it as a safety risk. In the same Code cycle, the Panel dismissed at least 9 comments that provided numerous examples citing years and miles of safe and reliable installations using non-shielded cable. Despite the overwhelming experience of numerous safe installations, the Panel determined that the single cable failure was a substantial argument while the numerous safe installation examples were not. We could probably locate a GFCI failure that was manufactured or installed improperly, yet we would not outlaw all GFCIs because of faulty manufacturing or inadequate installation of the device.
5) For the 2008 NEC, Panel 6 received another 7 Proposals and 19 Comments advocating a reinstatement of the use of non-shielded cables at voltages above 2400 volts. Again, despite solid arguments in support of the proposals, the Panel rejected them all with little basis other than the single example of a potential safety risk mentioned during the previous Code cycle.
6) While the NEC is not an installation document, the proper installation of both shielded and non-shielded cable is a critical factor in determining whether a particular application will be safe and reliable. Specifically, a non-shielded cable must be carefully installed respecting pulling tensions and minimum bending requirements and avoiding abrasions, the insulation must be cleanly and carefully removed at the termination points, appropriately sized lugs with the proper metallurgy must be properly crimped to the conductor, and then the termination must be properly mated with the utilization or supply equipment and properly torqued. For a shielded cable, ALL of the preceding requirements must be met, but in addition, a properly selected shield termination and a stress control method must also be properly installed at each termination. A shielded cable quite simply requires a more complicated termination, and therefore, requires a higher skill level.
7) The 2008 NEC now includes an exception to 310.7 that permits the use of 5kV non-shielded cables for airport lighting. By accepting that Airport Lighting circuits can be installed safely using 5kV non-shielded cable, Panel 6 also accepts that this type of cable can be installed safely.
Panel Meeting Action: Reject
Panel Statement: The Panel rejects this proposal for the following reasons, which correspond to the submitter's substantiation numbering:
(1,2) The substantiation does not provide any technical information or documentation to justify the proposed changes. The Panel has addressed existing installations in 6-21b and new installations in Proposal 6-24.
(3,4,5) All previous editions of the code are there due to compliance with the rules of the Code. Any challenge to the decisions of the panel needed to be made to the TCC. Stating disagreement with the Panel's previous action is not proper substantiation on its own - evidence supporting the disagreement must be presented.
(6) Compliance with installation requirements is always required.
(7) This special condition allowance does not transfer as rationalization for general allowance.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
HUDDLESTON, JR., R.: The Panel should have Accepted In Principle and referred to Proposal 6-24, which (after modification by the Panel) allows the use of non-shielded metal-sheathed cable up to 5 kV.

6-23 Log #3868 NEC-P06 **Final Action: Accept**
(310.6)

Submitter: Mike Weitzel, Bechtel
Recommendation: All text in the paragraph remains the same, with three new words inserted.
310.6 Shielding. Solid Dielectric insulated conductors... ". All metallic insulation shields shall be connected to a grounding electrode conductor, grounding busbar, equipment grounding conductor, or a grounding electrode. Shielding...".
Substantiation: Connecting on over 2,000-volt feeder or branch circuit metallic cable shield to an equipment grounding conductor that is installed in accordance with the requirements found in 250.180 is a safe and accepted practice.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-24 Log #4089 NEC-P06 **Final Action: Reject**
(310.6)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Change first and second sentences in 310.6 to read:
Non-shielded, ozone-resistant insulated conductors with a maximum phase-to-phase voltage of 5000 volts shall be permitted in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and the cables have an overall metallic sheath or armor, or are installed in a metal raceway such as rigid metal conduit. For other establishments, solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded.
Substantiation: For years, large industrial facilities have utilized non-shielded insulated conductors for medium voltage distribution and motor feeder systems within their facilities. Virtually all problems that have arisen have been caused by improper installation techniques, such as allowing conductors to cross at skew angles in junction boxes where corona between cables can manifest. The proposal submitted requires that the cable be either armored, protected in an overall metal sheath, or placed in a metal raceway such as rigid metal conduit, which completely eliminates any safety concerns to personnel.
Since the question of safety involving the installation and use of unshielded 5 KV cable began two NEC code cycles ago, many different user organizations, including but not limited to API, Edison Institute, and IEEE have researched the use of nonshielded cable at 5 KV and have found no cases where properly installed and maintained installations had any reported problems. There simply is no data to support the original basis for deleting this installation practice from the NEC.
Often, older electrical gear and equipment does not allow enough room for stress cones terminations, and modifications to the enclosures may be required in order to terminate shielded cables. Listed equipment should never be modified or the listing is voided, which could necessitate replacing the equipment at enormous cost.
The National Electrical Code is written to provide for "the practical safeguarding of person and property from hazards arising from the use of electricity." (90.1(A)). Nonshielded medium voltage cable, when properly installed and maintained in supervised industrial installations, with an overall metallic sheath or armor or when installed in a conduit system, in no way violates this purpose.
Panel Meeting Action: Accept in Part
Revise text to read as as follows:
Non-shielded, ozone-resistant insulated conductors with a maximum phase-to-phase voltage of 5000 volts shall be permitted in industrial establishments where the conditions of maintenance and supervision ensure that only qualified

persons service the installation and the cables have an overall metallic sheath. For other establishments, solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded.

Panel Statement: The panel's action is in recognition of the enhanced reliability of the construction of metal-armored cable containing non-shielded conductors; the conductors have a concentric lay-orientation and their insulation is protected from damage during installation. The requirements for insulation type, the industrial establishments, and qualified personnel convince us to allow use at the higher level.

The panel does not agree with the use of non-shielded conductors within metal raceways. The inconsistencies of conductors-into-conduit installation do not assure a lack of insulation damage and do not assure a concentric lay-orientation of the cables.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 7 Negative: 4

Explanation of Negative:

FRIEDMAN, S.: The panel has changed its position on use of armored non-shielded 5 KV cable without any additional technical information establishing why the panel position should be changed. The panel for two code cycles has agreed that 5 KV non-shielded armored or not armored cable is not safe and has now decided to change. NEMA does not agree to modify position without better substantiation for doing so.

KENT, G.: For existing installations, the panel has addressed the submitters request. New installations of cables above 2000 volts can be safely installed using shielded cable.

PICARD, P.: The Panel has agreed that shielded cable provides a safer installation and that new installations should be designed for shielded cables when voltage is over 2.4kV. In this cycle the Panel provided an exception, Panel Proposal 6-21b, allowing the use of nonshiedled cable up to 5kv for existing facilities meeting specified criteria. The submitter has not provided sufficient substantiation to negate previous work on limiting use of nonshielded cables.

ZIMNOCH, J.: See My Explanation of Negative on 6-21b.

Comment on Affirmative:

CLINE, S.: Again, as with 6-21b I have to hope that we all keep our good balance. This restricted application provides for a cable type with superior physical and electrical-physical attributes leading to an installation with practical safeguarding. This is our charge in Article 90: the "practical safeguarding of persons and property from hazards arising from the use of electricity." We worked so many hours over two cycles to get here, I hope we don't throw it away. My guess is that if 6-21b and 6-24 are enacted, the subject will be essentially closed. Please Accept this Proposal.

HUDDLESTON, JR., R.: The Panel should be commended for realizing that non-shielded metal-sheathed cable can be safely used up to 5 kV. Further information shall be provided to the panel members substantiating many other safe long-term installations of non-shielded metal-sheathed cable.

LAIDLER, W.: We are voting affirmative with the panel action to Accept in Principle proposal number 6-24. We continue to support the use of shielded cable on systems where the voltage exceeds 2400 volts. During the panel's discussion it was brought to light that because of the way metal-armored cable is constructed the electrostatic charges circling the conductors are kept uniformly distributed around the insulation by the grounded armor which reduces the concentration of the stress lines and the possibility of a discharge to ground or to another conductor.

WALL, C.: I am voting affirmative. I agree with the panel that non-shielded cables with metallic armor can be installed, operated and maintained safely. I do not agree with the panel's concerns about non-shielded cables in metal raceways. The panel alluded to insulation damage being caused by inconsistencies and lack of concentric lay orientation, none of which were supported by technical substantiation.

Additionally, the termination enclosures on medium voltage motors are dictated by NEMA standard MG-1. Discussion during the panel meeting revealed that NEMA has not revised standard MG-1 to provide increased dimensions for termination enclosures on motors requiring shielded cables. This is justification for allowing use of non-shielded cables up to 5000 volts because there is insufficient space in many termination enclosures for shielded cable terminators. Also, observance of NFPA 70E, Electrical Safety in the Workplace, ensures safety in the workplace for work involving live parts.

6-25 Log #3488 NEC-P06 **Final Action: Accept in Principle**
(310.6 Exception No. 1)

Submitter: Mark Rucker, Toyota Motor Mfg., Kentucky, Inc.

Recommendation: Revise text to read as follows:

Exception No. 1: Non-shielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to ~~2400~~ 8000 volts under the following conditions:

Substantiation: We possess ~25 4, 160V starters made during the 1980s and 1990s. All the starters used non-shielded 5kV cable to make internal connections. (Conductors leaving the starters to feed loads are shielded type.) The internal connections are numerous and do not allow room to make stress cones if shielded cable is used in place of non-shielded. We also possess 7.3kV capacitor/reactor banks that were made using non-shielded 8kV cable to make internal connections.

With NEC 2005, the provisions for non-shielded 5kV and 8kV conductors were dropped. Manufacturers of medium voltage cable now no longer make for open market purchase non-shielded cable rated above 2.4kV, requiring us to use the 2.4 kV rated cable made to the old 5kV specifications but listed for only 2.4kV to make repairs, or to buy a custom made, specially marked, non-listed cable by the 10,000 ft reel for a 10 ft piece.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel has addressed existing installations in 6-21b. See panel action on that proposal.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 2

Explanation of Negative:

FRIEDMAN, S.: Panel proposal 6-21b accepting use of 5 KV unshielded cables for existing installations should not be accepted. This proposal is not enforceable and does not belong in the NEC. Without providing a date and defining "existing installations" for every possible occurrence this change will only add confusion. In addition, the panel has stated repeatedly that non-shielded cables are not safe. In the previous code cycle the panel consistently indicated that additional technical substantiation would be required to permit the use of non-shielded cables.

ZIMNOCH, J.: See My Explanation of Negative on 6-21b.

Comment on Affirmative:

WALL, C.: See my statement for 6-21b and 6-24.

6-26 Log #3564 NEC-P06 **Final Action: Accept in Principle**
(310.6 Exception No. 1)

Submitter: Thomas L. Adams, Macomb, IL

Recommendation: Revise text to read as follows:

Exception No. 1: Non-shielded insulated conductors listed by a qualifying testing laboratory shall be permitted for use up to ~~2400~~ 5000 volts under the following conditions: (The remainder of the text to remain the same.)

Substantiation: Please reconsider the changes to this section based on the negative ballot comments from the last cycle. The use of any wiring method is unsafe if used improperly. Properly installed, operated and maintained as specified, listed non-shielded cables achieve the required level of safety.

As noted in the ballot comments, the main hazard is the removing of a cover from a termination enclosure while the cables are energized. That hazard exists whether it is a shielded or non-shielded conductor. However, by following the requirements of NFPA 70E and OSHA, safe installation, operation and maintenance are achieved. In fact, as also noted in the ballot comments, there are "many years of solid evidence supporting the fact that non shielded cable may be used safely…".

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 6-21b.

Number Eligible to Vote: 11

6-27 Log #3824 NEC-P06 **Final Action: Accept in Principle**
(310.6 Exception No. 3 (New))

Submitter: James S. Nasby, Skokie, IL

Recommendation: Add new text to read as follows:

Exception No. 3: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 5000 volts under the following conditions:

(a) Conductors are part of a fire pump circuit and in the fire pump room.

(b) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.

(c) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.

(d) Insulation and jacket thicknesses shall be in accordance with Table 310.13(D).

Substantiation: 1) Junction Boxes on Medium voltage Fire Pump Motors, which are typically in the range of 100 thru 400 Hp, are too small for shield cable and stress cones.

2) No problem is known to exist using non-shielded cable at up to 4,800 Volt is know to exist, even with installations several decades old.

3) The 2002 Edition and older allowed Listed Cable up to 8,000 Vac.

4) Fire Pump Rooms are now all required to be two hour construction.

5) Corona is not significant at and below 5,000 Volts with Listed 5,000 Volt

Cable.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel actions on Proposals 6-24 and 6-21b. In addition, the submitter did not provide any technical documentation to support his substantiation.

6-30 Log #4818 NEC-P06 **Final Action: Accept in Principle in Part**
(310.10, FPN No. 2 (New))

Submitter: George Ferguson, Technical Education & Safety Institute
Recommendation: FPN No. 2: Also see 110.14(C)(1).
Substantiation: Many electricians are still using THHN at full 90 degree ampacity regardless of terminal rating. New text will help emphasize the need to include terminal consideration when calculating conductor size.
Panel Meeting Action: Accept in Principle in Part
1. Re-identify the existing FPN in 310.10 as FPN No.1.
2. Add text as follows:
FPN No. 2: Refer to 110.14(C) for the temperature limitation of terminations.
Panel Statement: Re-identification of the FPN as FPN No. 1 is required since there are now two FPNs. The rewording of the proposed FPN No. 2 was made for consistency with text used in other parts of the Code. The Panel rejects the reference to (1) of 110.14(C) as well as the word 'also see' to further clarify the FPN.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-31 Log #244 NEC-P06 **Final Action: Reject**
(310.11(A)(6))

Submitter: Ronald Deering, City of Portage
Recommendation: Add new text to read as follows:
(6) The conductor color for types THHN/THVN 51260 14 AWG through 6 AWG.
Substantiation: Various contractors have mentioned an issue with the green and gray conductors being hard to distinguish by a color blind individual. Without supervision, a safety issue could result on most installations by that person.
Panel Meeting Action: Reject
Panel Statement: Technical substantiation must include documentation of a problem and the submitter has not provided that with his recommendation. Currently, there is no evidence of a problem.
Qualified individuals who are color blind have worked in the electrical industry since its inception. These individuals are well aware of their disability and have used methods such as re-identifying the conductor with tape or using wire markings to compensate for that disability.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

FPN: Included in the group of metal-covered cable are type AC cable (Article 320) and Type MC cable (Article 330).~~, and lead sheathed cable.~~

Substantiation: Except for some major city electric utilities, lead-sheathed cable is not manufactured for the users that are governed by the NEC due to environmental restrictions.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 2

Explanation of Negative:

LAIDLER, W.: We are voting against this Proposal because it has been pointed out that lead-sheathed cable is still being manufactured and used in the industry.

ZIMNOCH, J.: Many NEC users still install lead sheathed cable for hostile environments and require NEC acknowledgment. UL still lists this type cable.

6-36 Log #2683 NEC-P06 **Final Action: Reject**
(310.11(B)(3), FPN (New))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add:

FPN: See 400.6 for flexible cords and cables.

Substantiation: Edit. Tag marking required by 400.6(A) should be referenced for correlation.

Panel Meeting Action: Reject

Panel Statement: A new Fine Print note to 310.11(B)(3) would be redundant because of the Fine Print Note in 310.1. This fine print note refers the user to Articles 400 and 402 for the requirements for flexible cord and fixture wire.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-37 Log #2393 NEC-P06 **Final Action: Accept**
(310.13)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 5 for information.

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Delete the second paragraph that reads: “Equipment grounding conductors shall be permitted to be sectioned within a listed multiconductor cable, provided the combined circular mil area complies with 250.122.”

Substantiation: This is a companion proposal to relocate this text to 250.122(A) and is contingent upon CMP-5 accepting the proposal to include this text in 250.122(A).

It is more appropriate to have this provision located under 250.122(A) Size of Equipment Grounding Conductors rather than under 310.13 Conductor Constructions and Applications.

Panel Meeting Action: Accept

Panel Statement: The panel accepts this proposal contingent upon acceptance of Proposal 5-285 by Panel 5. The panel recognizes that this is in reference to the third paragraph.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-38 Log #2553 NEC-P06 **Final Action: Accept in Principle**
(Table 310.13)

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481 IBEW

Recommendation: Revise text as follows:

XHHW~~4~~

Substantiation: Note 4 doesn’t apply any more - 2005 Code Table 310.13, Note 4 stated the “2” suffix equals 90°C - now Note 4 covers rubber insulation.

Panel Meeting Action: Accept in Principle

1. In Table 310.13(A), delete the superscript “4” from type letters XHHW, RHW, and RHW/RHW-2 in the column titled “Outer Covering”.
2. Delete Note 4.
3. Renumber Notes 5 through 7 as Notes 4 through 6 respectively and change the superscripts in the table.

Panel Statement: The panel understands that the proposal addresses Table 310.13(A) since Table 310.13 was re-identified as Table 310.13(A) in the 2008 code. Rubber insulation can be used in both XHHW and RHW and depending on the insulation characteristics may not require an outer covering to comply with the product standards. Notes 1 and 4 are redundant and Note 1 is more general.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-39 Log #1155 NEC-P06 **Final Action: Accept**
(Table 310.13(A))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: In the “mm” and “mils” columns under “Thickness of Insulation”, add columns with the dimensions for (B) Nylon jacket or equivalent.

	(A)	(B)	(A)	(B)	(A) NONE (B) NYLON JACKET OR EQUIVALENT
22-12	0.76	0.38	30	15	
10	0.76	0.51	30	20	
8	1.14	0.76	45	30	
6	1.52	0.76	60	30	
4-2	1.52	1.02	60	40	
1-4/0	2.03	1.27	80	50	
213-500	2.41	1.52	95	60	
501-1000	2.79	1.78	110	70	

Substantiation: Construction B was inadvertently dropped from the 2008 NEC. Missing text was taken from the 2005 NEC.

Panel Meeting Action: Accept

Panel Statement: Based on the proposed text, the panel understands that this addition refers to type MTW in Table 310.13(A).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-40 Log #3519 NEC-P06 **Final Action: Accept**
(Table 310.13(A))

Submitter: Tim Henry, Code Electrical Classes Inc.

Recommendation: Revise as follows:

THW (size 14-8 only as permitted in ~~410.33~~ 410.68)

Substantiation: Old Section 410.33 is now Section 410.68.

Panel Meeting Action: Accept

Panel Statement: This may have already been processed as an errata and corrected in some copies of the 2008 Edition. This should be corrected for all future editions.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-41 Log #1153 NEC-P06 **Final Action: Accept**
(Table 310.13(C))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Relocate “105°C” under “90°C”.

Substantiation: The maximum operating temperature for Type MV-105 is 105°C.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-42 Log #449 NEC-P06 **Final Action: Reject**
(Table 310.13(D))

Submitter: Harold Ueland, American Crystal Sugar Co.
Recommendation: Revise text to read as follows:

Break up table into 2 voltage ratings: 2400 Dry & 4160/2400 Wet or Dry Cable.

Table 310.13(D)a Thickness … Rated 2400v …

Dry Locations, Single Cond.						Multiconductor Insulation	
Without Jacket Insulation		With Jacket					
		Insulation		Jacket			
mm	mils	mm	mils	mm	mils	mm	mils

Table 310.13(D)b Thickness … Rated 4160/2400 WYE …

Wet or Dry Locations, Single Conductor			
Insulation		Jacket	
mm	mils.	mm	mils.

Substantiation: For purposes of safety and reliability, thick, jacketed non-shielded cable should be allowed. Safety is enhanced because a live cable can easily be detected with a wide range of field effect voltage sensors, ensuring that a cable is dead before it is touched or cut into. Such sensors do not work on shielded cable. Reliability is enhanced because there are no stress cones/terminators to fail. These observances are based on 25 years of experience with both cables.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the proposal because the submitter has not provided the information needed to construct the wall thickness table. The table printed is incomplete. While the intent of the submitter may be appropriate, we need to see a complete and unambiguous construction submitted. The submitter did not provide technical justification to support his changes.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-43 Log #1393 NEC-P06 **Final Action: Reject**
(Table 310.13(D))

Submitter: Gordon Robertson, American Petroleum Institute (API)
Recommendation: Revise table to read as follows:

Table 310.13(D) Thickness of Insulation and Jacket for Nonshielded Solid Dielectric Insulated Conductors Rated ~~2400~~ 2001-5000 Volts

	2001-2400 volt												2401-5000 volt

*Under a common overall covering such as a jacket, sheath, or armor.

Substantiation: This proposal is a companion proposal to 310.6. It is required when the proposal for 310.6 is accepted. The figures used originate from the 2002 NEC, but were actually acceptable for up to 8000 volts in the 2002 NEC. Please note: the insulation level required for cable rated 5000 volts is twice the level required for cable rated 2400 volts.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect and does not match the 2002 text. See panel action on Proposal 6-44.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-44 Log #3489 NEC-P06 **Final Action: Accept in Principle in Part**
(Table 310.13(D))

TCC Action: The Technical Correlating Committee understands that in the panel statement the reference to Proposal 6-24 should be to Proposal 6-21b.
Submitter: Mark Rucker, Toyota Motor Mfg., Kentucky, Inc.
Recommendation: Table 310.13(D) Thickness of Insulation and Jacket for Nonshielded Solid Dielectric Insulated Conductors Rated ~~2400~~ 2001 to 8000 Volts

(Proposer's note: this table replaces the 2008 table and includes text lifted directly from NEC 2002, Table 310.63) **Table is shown on page 343.**
Substantiation: We possess ~25 4, 160V starters made during the 1980s and 1990s. All the starters used non-shielded 5kV cable to make internal connections. (Conductors leaving the starters to feed loads are shielded type.) The internal connections are numerous and do not allow room to make stress cones if shielded cable is used in place of non-shielded. We also possess 7.3kV capacitor/reactor banks that were made using non-shielded 8kV cable to make internal connections.

With NEC 2005, the provisions for non-shielded 5kV and 8kV conductors were dropped. Manufacturers of medium voltage cable now no longer make for open market purchase non-shielded cable rated above 2.4kV, requiring us to use the 2.4 kV rated cable made to the old 5kV specifications but listed for only 2.4kV to make repairs, or to buy a custom made, specially marked, non-listed cable by the 10,000 ft reel for a 10 ft piece.
Panel Meeting Action: Accept in Principle in Part

1. Delete entire column for '5001-8000 Volts 100 Percent Insulation'.
2. Revise table heading as follows: Table 310.13(D) Thickness of Insulation and Jacket for Nonshielded Solid Dielectric Insulated Conductors Rated ~~2400~~ 2001 to 5000 Volts.

Panel Statement: See panel action on Proposal 6-24 as this proposal limits the voltage to 5000 volts.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:

FRIEDMAN, S.: Panel proposal 6-21b accepting use of 5 KV unshielded cables for existing installations should not be accepted. This proposal is not enforceable and does not belong in the NEC. Without providing a date and defining "existing installations" for every possible occurrence this change will only add confusion. In addition, the panel has stated repeatedly that non-shielded cables are not safe. In the previous code cycle the panel consistently indicated that additional technical substantiation would be required to permit the use of non-shielded cables.

1501-2000	3.56	140	2.92	115	2.03	80	4.32	170	3.94	155	2.03	80						

*Under a common overall covering such as a jacket, sheath, or armor.

ZIMNOCH, J.: See My Explanation of Negative on 6-21b.
Comment on Affirmative:
THOMPSON, J.: Panel Statement reference to 6-424a should be changed to 6-21b.

6-45 Log #610 NEC-P06 **Final Action: Reject**
(Table 310.13(E) Note (New))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Add new note to Table 310.13(E) after 100/133/173 percent insulation level categories to read:
<u>The cable insulation level shall be calculated with the system voltage at which the circuit operates, not the nominal voltage classification.</u>
Substantiation: It is fairly common to have a high resistance grounded 4.16 kV system in industrial applications. The initial ground fault may remain over one hour while maintenance crews locate the fault. It is indicated in these instances that 173% insulation level must be used. If 5/8 kV cable is used, then it will be acceptable if 4.16 kV is multiplied by 173% (4160V x 1.73 = 7197V). However, if the nominal voltage classification of the cable is used (5000V x 1.73 = 8650V) then 5/8 kV cable cannot be used. This note will clarify to users that the intention is to multiply the actual circuit voltage by the appropriate factor and not the nominal voltage classification.
Panel Meeting Action: Reject
Panel Statement: This text does not provide any additional clarification in the code. This issue is currently addressed in Section 110.4, and the proposed text is not needed.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
ZIMNOCH, J.: ICEA currently lists a 5 kV, 173% insulation level as 140 mils, thus a 5 kV 173% cable is already accepted by the industry. The submitter may want to submit a comment to add the 133 and 173% insulation levels to Table 310.13(E) for the 2001-5000v category.

6-46 Log #3770 NEC-P06 **Final Action: Reject**
(310.15(A)(2))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal and on Proposal 6-47 to comply with 3.1.4 of the NEC Style Manual.
See the Technical Correlating Committee action on Proposal 6-47.
This action will be considered by the panel as a public comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
(2) Selection of Ampacity. Where more than one calculated or tabulated ampacity could apply for a given circuit length <u>then</u>~~, the lowest value shall be used~~.
<u>(1) If the lower ampacity length of two ampacities is not greater than 3.0 m(10 ft) and not greater than 10 percent of the higher ampacity length, the higher ampacity shall be permitted to be used.</u>
<u>(2) For all other cases, the lowest ampacity shall be used.</u>
~~*Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length figured at the higher ampacity, whichever is less.*~~
FPN: See 110.14(C) for conductor temperature limitations due to termination provisions.
Substantiation: This revision will change an exception into a positive rule and comply with the TCC request to convert exceptions into positive text wherever possible.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the requirements.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
ZIMNOCH, J.: The panel should reconsider this as it does convert exception into a positive statement in accordance with TCC guidelines.

6-47 Log #3902 NEC-P06 **Final Action: Accept**
(310.15(A)(2))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 6-46.
See the Technical Correlating Committee action on Proposal 6-46.
This action will be considered by the panel as a public comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise the first paragraph as follows:
(2) Selection of Ampacity. Where more than one ~~calculated or tabulated~~ ampacity ~~could apply~~ <u>applies</u> for a given circuit length, the lowest value shall be used.
Substantiation: 310.15(A)(1) specifies that the ampacity can be obtained from the tables or calculated under engineering supervision and does not need to be repeated in (2).
Panel Meeting Action: Accept
Panel Statement: Accept the deletion of “calculated or tabulated” and the change from “could apply’ “to “applies”. This action modifies the action taken on Proposal 6-46.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-48 Log #277 NEC-P06 **Final Action: Reject**
(310.15(A)(2) Exception)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “figured” to “calculated”.
Substantiation: The term “calculated” more accurately describes the operation and agrees with the wording in 310.60(A)(2).
This is one of a series of proposals to provide consistent terminology throughout the code.
Panel Meeting Action: Reject
Panel Statement: The panel actions on Proposals 6-46 and 6-47 changed the text and removed the term ‘figured’ from the requirement.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-49 Log #666 NEC-P06 **Final Action: Reject**
(310.15(A)(2) Exception)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Revise text to read as follows:
Exception: Where different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length figured at the higher ampacity, whichever is less.
Substantiation: The present wording with the reference to the word "two" is unnecessary.
Panel Meeting Action: Reject
Panel Statement: The existing language that contains the word "two" is clearer and more precise. in addition, no technical substantiation was provided by the submitter. See panel action on Proposals 6-46 and 6-47.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-50 Log #2662 NEC-P06 **Final Action: Reject**
(310.15(A)(2) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
EXCEPT AS PROVIDED IN 334.80 WHERE TWO DIFFERENT AMPACITIES APPLY...(REMAINDER UNCHANGED).
Substantiation: Edit. Correlation with 334.80.
Panel Meeting Action: Reject
Panel Statement: This exception applies in general. Section 334.80 applies specifically to the use of Type NM cable. The scope of Article 310 is general requirements for conductors.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-51 Log #1646 NEC-P06 **Final Action: Accept in Principle**
(310.15(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add an additional paragraph at the end of 310.15(B) to read:
The temperature correction factors and the adjustment factors shall be permitted to be applied to the ampacity for the temperature rating of the conductor, provided the corrected and adjusted ampacity does not exceed the ampacity for the temperature rating of the termination.
Substantiation: This will clarify that the ampacity for the temperature rating of the conductor may be used for application of the temperature correction and adjustment factors but the lower of the corrected and adjusted ampacity or the ampacity for the temperature rating of the conductor must be used.
Panel Meeting Action: Accept in Principle
Add new text as follows:
The temperature correction and adjustment factors shall be permitted to be applied to the ampacity for the temperature rating of the conductor, provided the corrected and adjusted ampacity does not exceed the ampacity for the temperature rating of the termination in accordance with the provisions of 110.14(C).
Panel Statement: The added language will provide further information to the user. The actual temperature rating of the conductor can be used for ampacity adjustment or conductor correction factors. The resultant ampacity cannot exceed the temperature limitations of the termination.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-52 Log #1613 NEC-P06 **Final Action: Accept in Principle in Part**
(310.15(B) and Table 310.16 through Table 310.21)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 2, 7, and 8 for information relative to Proposals 2-377, 2-382, 2-384, 7-53, 7-54, 7-71, 8-172, and 8-173.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 310.15(B) as shown:
(B) Tables. Ampacities for conductors rated 0 to 2000 volts shall be as specified in the Allowable Ampacity ~~Table 310.16 through Table 310.19, and Ampacity Table 310.20 and Table 310.21~~ Table 310.15(B)(1) through 310.15(B)(4), and Ampacity Table 310.15(B)(5) and Table 310.15(B)(6) as modified by (B)(1) through (B)(6).
In the FPN, change "Table 310.16 through 310.19" to "Table 310.15(B)(1) through Table 310.15(B)(4)".
In 310.15(B)(2)(c), change "Table 310.16 and Table 310.18" to "Table 310.15(B)(1) and Table 310.15(B)(3)".
Renumber Table 310.16 as Table 310.15(B)(1).
Renumber Table 310.17 as Table 310.15(B)(2).
Renumber Table 310.18 as Table 310.15(B)(3).
Renumber Table 310.19 as Table 310.15(B)(4).
Renumber Table 310.20 as Table 310.15(B)(5).
Renumber Table 310.21 as Table 310.15(B)(6).
Substantiation: This revision will bring the Code into compliance with 2.3.1 of the NEC Style Manual which states "Tables and figures shall be referenced in the text and shall be designated by the number of the *NEC* rule in which they are referenced.
Proposals are also being submitted to correlate all the references to these Tables throughout the Code.
Panel Meeting Action: Accept in Principle in Part
1. Revise text as follows:
B) Tables. Ampacities for conductors rated 0 to 2000 volts shall be as specified in the Allowable Ampacity ~~Table 310.16 through Table 310.19, and Ampacity Table 310.20 and Table 310.21~~ Table 310.15(B)(16) through 310.15(B)(19), and Ampacity Table 310.15(B)(20) and Table 310.15(B)(21) as modified by (B)(16) through (B)(21).
In the FPN, change "Table 310.16 through 310.19" to "Table 310.15(B)(16) through Table 310.15(B)(19)".
In 310.15(B)(2)(c), change "Table 310.16 and Table 310.18" to "Table 310.15(B)(16) and Table 310.15(B)(18)".
2. Renumber tables as follows:
Renumber Table 310.16 as Table 310.15(B)(16).
Renumber Table 310.17 as Table 310.15(B)(17).
Renumber Table 310.18 as Table 310.15(B)(18).
Renumber Table 310.19 as Table 310.15(B)(19).
Renumber Table 310.20 as Table 310.15(B)(20).
Renumber Table 310.21 as Table 310.15(B)(21).
Panel Statement: The panel accepts the change to rename the tables in section 310 to Section 310.15. The panel rejects the numbering of 1 through 6 due to a conflict in the table numbering with existing tables. The panel has selected table numbers 16 through 21 to match the existing table numbers and improve usability. This is in compliance with the NEC Style Manual.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
KENT, G.: The existing table should remain in parenthesis for at least one code cycle.

6-53 Log #628 NEC-P06 **Final Action: Accept**
(310.15(B)(2))

Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: In 310.15(B), renumber (2) through (6) as (3) through (7) after making the following changes to the existing sections.
Revise 310.15(B): "…as modified by (B)(1) through ~~(B)(6)~~ (B)(7)."
In 310.15(B)(2)(a) and 310.15(B)(2)(a), Exception No 1, change "Table 310.15(B)(2)(a)" to "Table 310.15(B)(3)(a)"
Renumber Table 310.15(B)(2)(a) as Table 310.15(B)(3)(a).
In 310.15(B)(2)(c), change "Table 310.15(B)(2)(c)" to "Table 310.15(B)(3)(c)" and revise the last sentence as shown: "…to determine the applicable ambient temperature for application of the correction factors in ~~Table 310.16 and Table 310.18~~ Table 310.15(B)(2)(a) ~~and~~ or Table 310.15(B)(2)(b)."
Renumber Table 310.15(B)(2)(c) as Table 310.15(B)(3)(c) and change the two references in the FPN to agree.
In 310.15(B)(4)(a) and (b) and 310.15(B)(5), revise as shown: "…the provisions of ~~310.15(B)(2)(a)~~ 310.15(B)(3)(a)."
In 310.15(B)(5), change "310.15(B)(2)(a)" to "310.15(B)(3)(a)"
In 310.15(B)(6), change "Table 310.15(B)(6)" to "Table 310.15(B)(7)".
Renumber Table 310.15(B)(6) as Table 310.15(B)(7)
Add a new 310.15(B)(2) to read:
(2) Ambient Temperature Correction Factors. Ampacities for ambient temperatures other than those shown in the ampacity tables shall be corrected in accordance with Table 310.15(B)(2)(a), Table 310.15(B)(2)(b), or shall be permitted to be calculated using the following equation:

$$I' = I\sqrt{\frac{T_c - T_a'}{T_c - T_a}}$$

where:

I' =	ampacity corrected for ambient temperature
I =	ampacity shown in the tables
Tc =	temperature rating of conductor (ºC)
Ta' =	new ambient temperature (ºC)
Ta =	ambient temperature used in the table (ºC)

Table 310.15(B)(2)(a) Ambient Temperature Correction Factors Based on 30ºC (86ºF)

For ambient temperatures other than 30ºC (86ºF), multiply the allowable ampacities specified in the ampacity tables by the appropriate correction factor shown below.				
Ambient Temperature (ºC)	Temperature Rating of Conductor			Ambient Temperature (ºF)
	60ºC	75ºC	90ºC	
10 or less	1.29	1.20	1.15	50 or less
11-15	1.22	1.15	1.12	51-59
16-20	1.15	1.11	1.08	60-68
21-25	1.08	1.05	1.04	69-77
26-30	1.00	1.00	1.00	78-86
31-35	0.91	0.94	0.96	87-95
36-40	0.82	0.88	0.91	96-104
41-45	0.71	0.82	0.87	105-113
46-50	0.58	0.75	0.82	114-122
51-55	0.41	0.67	0.76	123-131
56-60	—	0.58	0.71	132-140
61-65	—	0.47	0.65	141-149
66-70	—	0.33	0.58	150-158
71-75	—	—	0.50	159-167
76-80	—	—	0.41	168-176
81-85	—	—	0.29	177-185

Add the following footnote: "** Refer to 310.15(B)(2) for the ampacity correction factors where the ambient temperature is other than 30ºC (86ºF)."

Table B.310.3:

Add "**" at the end of the Table title.

Delete the Correction Factors portion of the table.

Relocate the existing footnote to follow the ampacity table.

Add the following footnote: "** Refer to 310.15(B)(2) for the ampacity correction factors where the ambient temperature is other than 40ºC (104ºF)."

310.10 FPN No. 1:

Revise the second sentence as follows: "…the ambient temperature correction factors in 310.15(B)(2) ~~at the bottom of these tables~~…"

400.5(A):

Revise the third sentence as follows: "Where cords are used in ambient temperatures exceeding 30ºC (86ºF), the temperature correction factors from Table 310.15(B)(2)(a) ~~Table 310.16~~ that correspond to the temperature rating of the cord shall be applied to the ampacity in ~~from~~ Table 400.5(B)."

The following editorial correlation changes will also be required with the addition of this new section.

Change "310.15(B)(6)" to "310.15(B)(7)" in 110.14(C)(1); 215.2(A)(3); 230.90, Exception No. 5; and 550.33(B).

Change "310.15(B)(2)(a)" to "310.15(B)(3)(a)" in 310.4(D); 312.5(C)(g) FPN; 334.80 in two places; 366.22(A); 366.23(A) and (B); 376.22(B); 378.22; 384.22; 386.22; 392.11(A)(1); 392.11(B); 520.42; 675.5; 725.51(A) and (B); 725.130(A), Exception No. 1; 760.51(A) and (B); 760.130(A); Chapter 9, Table 1, Note 4; and Annex D, Example D3(a) in two places.

Table 310.15(B)(2)(b) Ambient Temperature Correction Factors Based on 40ºC (104ºF)

For ambient temperatures other than 40ºC (104ºF), multiply the allowable ampacities specified in the ampacity tables by the appropriate correction factor shown below.							
Ambient Temperature (ºC)	Temperature Rating of Conductor						Ambient Temperature (ºF)
	60ºC	75ºC	90ºC	150ºC	200ºC	250ºC	
10 or less	1.58	1.36	1.26	1.13	1.09	1.07	50 or less
11-15	1.50	1.31	1.22	1.11	1.08	1.06	51-59
16-20	1.41	1.25	1.18	1.09	1.06	1.05	60-68
21-25	1.32	1.20	1.14	1.07	1.05	1.04	69-77

201-225	—	—	—	—	—	0.35	393-437

For correlation with the addition of this section, the following changes are also required:

Tables 310.16 and 310.17:

Add "**" at the end of each Table title.

Delete the Correction Factors from the bottom of each table.

Relocate the existing footnote "* See 240.4(D)." to follow the ampacity table and revise it to read "* Refer to 240.4(D) for conductor overcurrent protection limitations."

Add the following footnote to the tables: "** Refer to 310.15(B)(2) for the ampacity correction factors where the ambient temperature is other than 30ºC (86ºF)."

Tables 310.18, 310.19 and 310.20:

Add "**" at the end of each Table title.

Delete the Correction Factors table from the bottom of each table.

Add the following footnote to the tables: "** Refer to 310.15(B)(2) for the ampacity correction factors where the ambient temperature is other than 40ºC (104ºF)."

Table B.310.1:

Add "**" at the end of the Table title.

Delete the Correction Factors portion of the table.

Relocate the existing footnote to follow the ampacity table.

Change "310.15(B)(4)" to "310.15(B)(5)" in 366.23(A) and 376.22(B).

Change "310.15(B)(2)" to "310.15(B)(3)" in 372.17; 374.17; and 390.17.

Change "310.15(B)(4)(c)" to "310.15(B)(5)(c)" in Annex D, Example D3(a).

In Annex D, Example D4(a), revise last line as shown: "[See Table 310.16 through Table 310.21, and 310.15(B)(2), (B)(3) and (B)(5) ~~(B)(4)~~.]"

As information to NFPA staff, in the Index:

Change "310.15(B)(3)" to "310.15(B)(4)" for Bare Conductor Ampacities.

Change "310.15(B)(5)" to "310.15(B)(6)" for Conduit fill Grounding conductor.

Change "310.15(B)(4), 310.15(B)(6)" to "310.15(B)(5), 310.15(B)(7)" for **Neutral** Conductor.

Change "310.15(B)(2)(c)" to "310.15(B)(3)(c)" for Roofs, conduits exposed to sunlight on.

Substantiation: Acceptance of this new section will harmonize the ampacity correction factors for various ambient temperatures between the NEC and the CEC, consolidate the ampacity correction and adjustment factors into a single section [310.15(B)], and consolidate seven ambient temperature correction tables into two tables.

The equation proposed to be added is the same equation that is permitted in 310.60(C)(4) to calculate the ampacity correction factors for various ambient temperatures based on the conductor temperature ratings in the tables. The term

ÄTD was omitted from the equation since it is not necessary to include it for cables rated below 46kV as the temperature rise due to dielectric heating is insignificant compared to the conductor losses. This equation also appears in 3.4.1 of *IEEE STD 835, IEEE Standard Power Cable Ampacity Tables*.

Since the NEC is used internationally, the lower and higher ambient temperatures were added to provide the appropriate ampacity correction factors for colder and warmer climates.

Some of the ambient temperature ranges were revised to 5ºC increments to harmonize with the proposal submitted for the CEC, to correlate with existing NEC Tables 310.20 and B310.3, and to provide consistency with the 30ºC table.

The ampacity correction factors for 85ºC (185ºF) that are included in Table B.310.3 were not included in the revised table since, due to environmental restrictions, paper and lead cable is no longer commonly used in applications covered by the NEC. The ampacities remain in Table B.310.3 for reference in existing installations and the ambient temperature correction factors can be calculated using the equation in 310.15(B)(2).

This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr
Mark Earley	Steve Douglas
Christel Hunter	Duncan Dunshire
Alan Manche	David Mascarenhas
David Mercier	Robert Nelson
Jeff Sargent	Shawn Paulsen
John Stacey	Tim Pope
John Thompson	Doug Reith
	Brian Savaria
	Ark Tsisserev

Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

LAIDLER, W.: We are voting against the panel's action to accept this proposal. The panel should have accepted this proposal in part only. We agree with relocating the correction factors to 310.15 (B)(2), but we do not think that the correction factors for ambient temperatures lower than 21 degrees (C) or 70 degrees (F) should be included in the table. If conductors are installed for an electrical installation in a large area where the temperature is going to be maintained and controlled below 21 degrees (C) or 70 degrees (F), such as a large warehouse, the temperature correction factors for the lower ambient temperature could be applied permitting the ampacity of a particular size conductor to be increased. That installation would be fine as long as that lower ambient temperature is maintained. However, the question remains what if it is not? What if the use of the area changes and we have undersized conductors? This could happen where we applied the correction factors for a high ambient temperature and were required to increase the conductor size but, in that case, we would have oversized conductors. I think the panel needs to look at this potential situation more closely.

6-54 Log #2172 NEC-P06 **Final Action: Accept**
(310.15(B)(2))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:

(2) Adjustment Factors.
(a) Text to remain unchanged
FPN No. 1: Text to remain unchanged
FPN No. 2: Text to remain unchanged

Exception No. 1: Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the adjustment ~~derating~~ factors shown in Table 310.15(B)(2)(a) shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).

Exception No. 2: Text to remain unchanged

Exception No. 3: Adjustment ~~Derating~~ factors shall not apply to conductors in nipples having a length not exceeding 600 mm (24 in.).

Exception No. 4: Adjustment ~~Derating~~ factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3.05 m (10 ft) and if the number of conductors does not exceed four.

Exception No. 5: Text to remain unchanged

Substantiation: The term "adjustment factor" should be used throughout this section. It appears that "adjustment factor" and "derating factor" mean the same thing, so only one term should be used.
Panel Meeting Action: Accept
Panel Statement: Change is intended to be editorial only. There is no technical change in the requirements.

6-56 Log #476 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(a))

Submitter: Carl V. Cardi, III, CVC 1 Limited LLC
Recommendation: Revise text to read as follows:

Section 310.15(B)(2)(a) Adjustment Factors.

(a) More Than Three Current-Carrying Conductors in a Raceway or Cable. Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, [w]here there is no load diversity and the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are stacked or bundled longer than 600 mm (24 in.) without maintaining spacing and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(2)(a). Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.

FPN No. 1: See Annex B, Table B.310.11 for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

FPN No. 2: See 366.23(A) for correction factors for conductors in sheet metal auxiliary gutters and 376.22 for correction factors for conductors in metal wireways.

Exception No. 1: Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the derating factors shown in Table 310.15(B)(2)(a) shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).

Exception No. 2: For conductors installed in cable trays, the provisions of 392.11 shall apply.

Exception No. 3: Derating factors shall not apply to conductors in nipples having a length not exceeding 600 mm (24 in.).

Exception No. 4: Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3.05 m (10 ft) and if the number of conductors does not exceed four.

Exception No. 5: Adjustment factors shall not apply to Type AC cable or to Type MC cable without an overall outer jacket under the following conditions:

(1) Each cable has not more than three current-carrying conductors.
(2) The conductors are 12 AWG copper.
(3) Not more than 20 current-carrying conductors are bundled, stacked, or supported on "bridle rings."

A 60 percent adjustment factor shall be applied where the current-carrying conductors in these cables that are stacked or bundled longer than 600 mm (24 in.) without maintaining spacing exceeds 20.

Substantiation: The ampacity derating factors of Section 310.15(B)(2)(a) severely limit the ampacities of conductors placed in sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways. This proposal establishes exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17 that allow for the placement of metallic devices to elevate, separate, and space the current-carrying conductors in those raceways so as to increase the number permitted by taking full advantage of the cooling capacity in the entire cross-sectional area of the raceway and the heat conducting properties of the metallic devices. The exception tendered for each of those sections contains five stringent conditions under which the devices may be used for such purpose. The report issued by INTERTEK, ETL SEMKO dated June 4, 2007, that accompanies this proposal provides test results that support the proposal.

I. Introduction:

A. Carl Cardi, III:

Mr. Cardi is presently a city electrical inspector for the city of Columbus, Ohio, a former electrical contractor, and an inventor. He is also President of CVC 1 Limited, LLC, the manufacturer of Cool Wire products.

B. Arnold E. Shaheen, Jr., Esq.:

Mr. Shaheen is counsel for CVC 1 Limited, LLC, and the author of this Proposal. Mr. Shaheen is licensed to practice law in the state of Ohio and received his Juris Doctorate Degree from Capital University in Columbus, Ohio, and a Bachelor of Science Degree in Electrical Engineering from The Ohio State University. Before, during, and after his attending college and law school, Mr. Shaheen also worked from childhood until 1985 in his family's electrical construction business, which engaged in commercial and industrial electrical construction. Between 1971 and 1985, Mr. Shaheen was licensed as an electrical contractor in Columbus, Ohio.

C. The Proposal:

Mr. Cardi has submitted this Proposal in an effort to provide suggested revisions to the National Electric Code ("NEC") that respect the intent and purpose of Section 310.15(B)(2)(a), but which allow for more flexibility in the design of electrical wiring systems that incorporate the use of sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways by allowing for new technologies that provide elevation, separation, and spacing of current-carrying conductors within those wiring systems. In so doing, it is submitted that these new technologies will provide better ambient cooling within those wiring systems by taking full advantage of all of the airspace within their cross-sectional areas as well as the heat conductive properties of the metallic devices that incorporate these new technologies and will allow for the placement of more current-carrying conductors in a raceway than would otherwise be permitted by the application of Section 310.15(B)(2)(a).

II. Heat Generated By Current-Carrying Conductors:

Well known principles of physics that govern the transfer of heat energy establish that heat energy cannot be dissipated without a thermal gradient. The principles of heat transfer are analogous to the concepts of current, resistance, and voltage embodied in Ohm's Law. Heat, like current, cannot flow unless there is a thermal gradient, as in the case of a difference in electrical potential, or voltage, in an electrical circuit. If there is no thermal gradient, or if the heat source is surrounded by insulation, the heat source will not cool or may even grow warmer if the heat source is, itself, a generator of heat energy. When current flows through a wire, the wire becomes a heat source that generates heat energy because the flow of electricity encounters resistance, the degree of which is a function of both the size of the wire and the conductivity of the material from which the wire is manufactured.

From a fire prevention perspective, the danger, of course, is that a wire will become so hot that its insulation degrades resulting in the potential for a short circuit between a bare spot on a current-carrying conductor and a bare spot on another current-carrying conductor or between a bare spot on a current-carrying conductor and the metallic enclosure in which the conductor is placed. Even where adequate overcurrent protection exists, the potential for a fire or for further degradation of the insulation of surrounding conductors exists if the temperature of current-carrying conductors is allowed to rise above the rated temperature limitation of their insulation.

Insulated, current-carrying conductors that are bundled together or which lie in contact with one another, particularly those that are totally surrounded by and in contact with other current-carrying conductors, will rise in temperature because there exists no thermal gradient through which to dissipate the heat. Section 310.10, FPN No.1, subparagraph 4, recognizes this physical phenomenon.

III. Section 310.15(B)(2)(a):

Section 310.15(B)(2)(a) requires that the ampacity derating factors of Table 310.15(B)(2)(a) shall apply to any raceway that contains more than three current-carrying conductors. On its face, Section 310.15(B)(2)(a) was meant to apply to all systems defined as raceways in Article 100. The traditional practice in the electrical industry was to readily apply this section to all forms of conduit. However, confusion arose in the enforcement and application of articles of the NEC that applied to other types of raceways because those articles contained only fill limitations and not ampacity derating requirements. The result, in many cases, was that the fill requirements of a particular article were allowed to trump the requirements of Section 310.15(B)(2)(a) and, thus, create the risk of overheated raceways because of the number of current-carrying conductors placed within them, resulting in the commensurate risk of short circuits and fire.

To resolve the confusion and to better clarify the NFPA's intent regarding the application and enforcement of Section 310.15(B)(2)(a), the 2005 edition of the NEC added ampacity derating requirements within articles pertaining to specific types of raceways. Section 374.17 pertaining to cellular metal floor raceways and Section 390.17 pertaining to underfloor raceways are but two examples.

However, underlying the application and enforcement of Section 310.15(B)(2)(a) is the assumption that the conductors in a raceway will all lie at the bottom of the raceway and in close proximity to or in contact with one another. This assumption fails to take into account the cooling effect that the surrounding ambient **within the raceway** will have when the current-carrying conductors are elevated, separated, and spaced within the raceway nor does it account for the benefit of the heat conductive properties of the metallic devices described in this Proposal.

Many sections of the NEC recognize that spacing promotes the cooling of current-carrying conductors. The requirement to provide spacing between conduits, tubing, or raceways set forth in Section 310.15(B)(2)(b) is one example. The spacing dimensions for electrical ducts depicted in Figure 310.60 of Article 310 and those depicted for single insulated conductors in nonmagnetic underground electrical ducts in FPN Figure B.310.5 of Appendix B are other examples.

However, none of the articles, in their current form, containing sections identified in this Proposal address either the potential benefit of ambient cooling that could be realized by the elevation, separation, and spacing of current-carrying conductors within a raceway or the benefit of the heat conductive properties of the metallic devices described in this Proposal. It is those benefits that this Proposal addresses, while, at the same time, honoring the intent of Section 310.15(B)(2)(a) to prevent the degradation of the insulation of current-carrying conductors due to overheating.

IV. Proposed Changes to Sections 310.15(B)(2)(a), 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17:

This Proposal sets forth exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, each containing five subparagraphs. Those five subparagraphs are discussed in sequence, below:

A. Subparagraph (1):

Metallic devices that provide elevation, separation, and spacing among current-carrying conductors would be allowed in lieu of the application of the derating factors of Table 310.15(B)(2)(a). Those devices would separate raceways into channels, however, no channel would be permitted to hold more than nine conductors, which is the upper limit for the number of conductors to which the 70 percent derating factor of Table 310.15(B)(2)(a) presently applies. This numerical limit recognizes that, even though dividing raceways into channels enables the cooling of current-carrying conductors, there are physical limits to this effect. The devices must be labeled in compliance with the definition of that term as set forth in Article 100 and the requirements of Section 110.3(A)(1) FPN.

B. Subparagraph (2):

The metallic devices that provide elevation, separation, and spacing must also permit convection within a channel and between and among channels such that the transient and steady-state temperatures of the current-carrying conductors within any channel remain below the rated temperature for their insulation as indicated in the applicable column of Table 310.16.

C. Subparagraph (3):

The metallic devices must prevent contact between current-carrying conductors in different channels within the raceway, except at points of egress and ingress. However, because the number of conductors is limited to nine within any given channel, conductors within that channel may be in contact without additional separation within that channel.

D. Subparagraph (4):

The metallic devices must be secured so as to prevent movement of the devices and to maintain contact with the walls and floor of the raceway in order to enable the device to transmit heat away from the current-carrying conductors and to the walls and floor of the raceway so that the raceway may, in turn, transmit the heat either into the air, if the raceway is an auxiliary gutter or wireway, or to concrete, if the raceway is a cellular metal raceway or an underfloor raceway.

E.Subparagraph (5):

In order to prevent abrasion of current-carrying conductors within a channel, this subparagraph provides that all edges of the metallic devices that provide elevation, separation, and spacing of the current-carrying conductors must be protected where those edges would come into contact with the conductors.

F. Section 310.15(B)(2)(a):

The words, "Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, where there is no load diversity...." have been added. This additional language makes explicit that the exceptions to the application of Section 310.15(B)(2)(a) established by this Proposal apply only to the enumerated sections and only when load diversity is not available.

G. Section 366.22(A):

The preamble to the exception for this section limits its applicability in the case of sheet metal auxiliary gutters to situations where the 20 percent fill limitation prescribed for this type of raceway is not exceeded, but where there are more than 30 current-carrying conductors placed within the raceway.

H. Section 366.23(A):

The preamble to the exception for this section mimics the preamble contained in Section 366.22(A), which also applies to sheet metal auxiliary gutters.

I. Section 374.17:

Since the language of this section contains no limitations upon the applicability of Section 310.15(B)(2)(a) to cellular metal raceways, no preamble was necessary. The exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 374.17 and to cellular metal raceways.

J. Section 376.22:

As in the case of sheet metal auxiliary gutters, the preamble to the exception for this section limits its applicability to those instances in which the 20 percent fill limitation is not exceeded, but where there are also more than 30 current-carrying conductors placed within the metal wireway.

K. Section 384.22:

In the case of strut-type channel raceways, the preamble to the exception limits its applicability to those instances in which the percentage fill requirements of Table 384.22 are not exceeded and where the outside diameter dimensions of types and sizes of wire as set forth in the tables in Chapter 9 are met, but where the cross-sectional area of the raceway exceeds 2500mm² (4in.²) and where the number of current-carrying conductors in the raceway is greater than 30, but where the cross-sectional area of all current-carrying conductors does not exceed 20 percent of the cross-sectional area of the raceway.

L. Section 386.22:

The preamble to the exception for this section mimics that of Section 384.22 and applies to surface metal raceways.

M. Section 390.17:

As in the case of cellular metal raceways, the exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 390.17 and to underfloor raceways.

V. Test Evidence Submitted In Support of Proposal:

A. Testing Protocol:

Between May 29, 2007, through June 1, 2007, electrical testing involving metallic devices described in this Proposal was performed by INTERTEK, ETL SEMKO of Cortland, New York. Two different types of raceways and two sizes of conductors, 12 AWG THHN and 10 AWG THHN were tested. Testing was performed for the purpose of: (1) measuring the heating of the conductors under the testing protocol; and, (2) to determine how many conductors could be placed within the raceways without the temperature of the conductors exceeding the 90° C limitation of their insulation. Tests for physical abrasion were not conducted.

In the first instance, a 12 in. x 3 in. x 5 ft underfloor raceway was tested under various scenarios in order to determine the conductor temperatures. Similar testing was performed for an 8 in. x 8 in. x 5 ft metallic wireway. The ends of both raceways were stuffed with styrofoam in order to trap heat so as to create a worst-case scenario. Where it was appropriate to do so, both raceways were tested in a double-blind manner, that is, they were tested under the same conditions with and without the metallic devices described in this Proposal.

Constant loading of the conductors in each instance occurred throughout the duration of each test. No unloaded conductors, or fillers, were placed within the raceways. The time period used as a benchmark in order to attain steady-state temperature conditions was three hours. Thermocouples were placed on one conductor in each channel. One thermocouple was used to measure the room ambient.

The graphs indicating the test results show the temperatures measured by the thermocouples along the Y-axis and the time periods for those temperatures along the X-axis. The temperature recording for each conductor is indicated on each graph by a different color of line. The letters, “UF,” noted in the keys for the graphs for the tests denote conductors in the underfloor raceway. The letters, “WW,” denote conductors in the metal wireway. The maximum temperatures that were recorded for each conductor to which a thermocouple was attached are displayed in a table at the bottom of each graph for either one or both raceways, depending upon how each test was conducted.

B. Test Nos. 1 and 10:

In Test No. 1, the underfloor raceway was wired using 81 #12 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used to elevate, separate, and space the conductors. The test load on each of the conductors was 16 amperes. Upon removal of the underfloor raceway cover it was noted that one of the supports had moved. Thus, this test was redone as Test No. 10 only as to the underfloor raceway.

In Test No. 1, the metallic wireway was wired with 90 #12 THHN conductors in 10 groupings of 9 conductors.

In Test No. 1, the temperatures for all conductors for both raceways, after more than 3 hours, remained below 90°C and in a steady-state condition. The ambient temperature remained at approximately 25°C throughout the test.

Test No.1, as to the underfloor raceway, was repeated in Test No. 10. Again, the test results were the same. After more than three hours and in steady-state condition, the temperatures of all of the conductors remained below 90°. The ambient temperature approximated 22°C throughout the test.

During neither Test No. 1 nor Test No. 10 did the temperature of any of the conductors exceed 90°C at any point in time.

C. Test No. 2:

The same test protocol were used in this test as in Test No. 1 for both raceways. However, the metallic devices described in this Proposal were not used. After 91 minutes, in the case of both raceways, the temperatures of the conductors remain in a transient state and on an upward incline towards their 90°C limitation of their insulation. At that point in time, the highest temperature reached by any conductor in the underfloor raceway was 89.24°C and in the metal wireway was 81.97°C.

D. Test No. 3:

In Test No. 3, the underfloor raceway was wired with 81 #12 THHN conductors using a vertical divider system that did not permit air to flow between the divided chambers within the raceway. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes. After only 64 minutes, the temperatures of all of the conductors in the underfloor raceway remained in a transient state and the temperature of one conductor had exceeded the 90°C limitation of its insulation.

E. Test No. 4:

In Test No. 4, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

After more than 3 hours, the highest temperature reached in the underfloor raceway was 60.45°C and in the case of the metal wireway the highest temperature reached was 52.40°C.

F. Test No. 5.

In Test No. 5, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. For both the underfloor raceway and the metallic wireway, the metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

This test demonstrated the upper limit of the cooling effect of the metallic devices described in this Proposal in the case of the underfloor raceway. The transient state temperatures of the underfloor conductors began to approximate 90°C after 33 minutes. At that point the cover of the underfloor raceway was removed.

However, in the case of the metal wireway, the highest temperature of the conductors was 82.03°C in steady-state condition after 190 minutes.

The ambient approximated 22°C throughout the test.

G. Test No. 6:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groups of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

The highest temperature reached by a conductor after 203 minutes was 67.74°C in a steady-state condition. The ambient temperature for the test ranged between 22° and 28°C.

H. Test No. 7:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groupings of 9 conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

After 157 minutes, the temperatures of the conductors remained in a transient state condition. By that time, one of the conductors had reached 89.06°C. The ambient temperature ranged between 22°C and 28°C.

I. Test No. 8:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

After 126 minutes, the temperatures of the conductors in the underfloor raceway remained in a transient condition and were gradually rising. At that point in time the highest temperature for the underfloor conductors was 75.17°C.

After the same time period, the conductors in the wireway, for the most part, remain in a transient condition with the highest temperature recorded at 71.09°C.

The ambient temperature ranged between 22°C and 25°C.

J. Test No. 9:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The graph of the temperatures of the conductors in the two types of raceways demonstrates that the temperatures in both raceways were rising rapidly. Within 14 minutes after the commencement of the test, the highest temperature of a conductor in the underfloor raceway is 97.95°C and for the metal wireway is 93.43°C.

The ambient remained at approximately 22°C throughout the test.

K. Test Conclusions:

The use of the metallic devices described in this Proposal demonstrate a marked decrease in the transient and the steady-state temperatures of the conductors within the limitations of the cooling effects of the devices. This can be readily shown by comparing the test results in Test Nos. 6 and 7, the test results in Test Nos. 4 and 8, and by comparing the test results in Test Nos. 1 and 10 with Test No. 2. Within the limitations of the devices, as demonstrated in Test No. 5 as it relates to underfloor raceways, the 90°C limitations of the conductors’ insulation is not exceeded during the three hour protocol for the tests where the devices were used.

VI. Conclusion:

This Proposal provides for exceptions to the applicability of Section 310.15(B)(2)(a) to sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, and underfloor raceways that impose five conditions so as to preserve the intent of that section to prevent thermal degradation of insulation, but yet allow for more current-carrying conductors to be placed within those raceways. Due to the stringent nature of those conditions, the reasons cited in the narrative, above, and the test results supplied with this Proposal, the Proposer requests that the Proposal be approved.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The requirements found in Article 310 are general requirements. The test data provided is in support of requirements that are outside the scope of this panel and should be addressed by the appropriate code-making panel where special exception could be considered.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-57 Log #635 NEC-P06 **Final Action: Accept**
(Table 310.15(B)(2)(a))

Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: Revise first column heading in Table 310.15(B)(2)(a) from "Number of Current-Carrying Conductors" to "Number of Conductors (See Note 1.)".
Add a Note below the Table before FPN No. 1 to read:
[1] Number of Conductors is the total number of conductors in the raceway or cable adjusted in accordance with 310.15(B)(4) and (5).
Substantiation: A companion proposal is being submitted for Table B.310.11.
This Table was originally added to the Code in 1940 and the column heading remained as "Number of Conductors" until 1993. During the 1993 NEC revision cycle, the column headings in Table 310.15(B)(2)(a) and Table B.310.11 were editorially changed to "Number of Current-Carrying Conductors". There was no Proposal, Comment, or Panel Action to make the change. A chronological history of the changes in the Tables is attached for reference.
This reinstatement of the original column heading permits the user to take the total number of conductors in the cable or raceway and subtract the neutral conductors not required to be counted under 310.15(B)(4) and the grounding or bonding conductors not required to be counted under 310.15(B)(5). The result is the number of conductors that **may** be simultaneously energized and this number would be used to select the adjustment factor from the Table.
The Note is proposed for clarity since there has been some confusion that the column referred to the total number of conductors in the raceway or cable.
The correction to the column heading also correlates with the column headings in Table 400.5 in the NEC and Table 5C in the 2006 Canadian Electrical Code, Part I.
This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr
Mark Earley	Steve Douglas
Christel Hunter	Duncan Dunshire
Alan Manche	David Mascarenhas
David Mercier	Robert Nelson
Jeff Sargent	Shawn Paulsen
John Stacey	Tim Pope

Ballot Results: Affirmative: 11

6-59 Log #3062 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(a))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered by the panel relative to the actions taken on Proposals 8-155, 8-194, and 8-204.
The Technical Correlating Committee directs the Chairs of Code-Making Panels 6 and 8 form a Task Group to correlate Proposals 6-59, 8-155, 8-194 and 8-204, and submit comments, if deemed appropriate.
This action will considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(2) Adjustment Factors.
(a) More Than Three Current-Carrying Conductors in a Raceway or Cable. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(2)(a). Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.
Fine print notes and exceptions are to remain unchanged in their content.
Substantiation: This proposal takes the code language out of 376.22(B), 366.22(A) and 378.22, and relocates it here, where it is more appropriate. Correlating proposals to those sections will also be made.
Panel Meeting Action: Reject
Panel Statement: While the reference phrase is contained in all of the sections referenced, the proposal would allow signaling and control cables to be loaded into circular raceways and in cables and not require adjustment. These conductors would take up space, reduce airflow, and reduce heat dissipation. The restrictive nature of circular raceways is different from auxiliary gutters, metallic, and non-metallic wireways. The proposed text should not apply as a general rule.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-60 Log #3771 NEC-P06 **Final Action: Accept**
(310.15(B)(2)(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
(2) Adjustment Factors.
(a) More than Three Current-Carrying Conductors in a Raceway or Cable. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(2)(a). each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.
~~Exception No. 1:~~ Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the derating factors shown in Table 310.15(B)(2)(a) shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).
FPN No. 1: See Annex B, Table B.310.11, for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.
FPN No. 2: See 366.23(A) for adjustment factors for conductors in sheet metal auxiliary gutters and 376.22(B) for adjustment factors for conductors in metal wireways.
The following adjustments shall be permitted for the conductors and installation methods listed in (1) through (4):
~~Exception No. 2:~~ (1) For conductors installed in cable trays, the provisions of 392.11 shall apply.
~~Exception No. 3:~~ (2) Derating factors shall not apply to conductors in nipples having a length not exceeding 600 mm (24 in.).
~~Exception No. 4:~~ (3) Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3.05 m (10 ft) and if the number of conductors does not exceed four.
~~Exception No. 5:~~ (4) Adjustment factors shall not apply to Type AC cable or to Type MC cable without an overall outer jacket under the following conditions:
~~(1)~~ (a) Each cable has not more than three current-carrying conductors.
~~(2)~~ (b) The conductors are 12 AWG copper.
~~(3)~~ (c) Not more than 20 current-carrying conductors are bundled, stacked, or supported on "bridle rings."
A 60 percent adjustment factor shall be applied where the current-carrying conductors in these cables that are stacked or bundled longer than 600 mm (24 in.) without maintaining spacing exceeds 20.
Substantiation: This revision will change the exceptions into positive rules and comply with the TCC request to convert exceptions into positive text

wherever possible.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-61 Log #3869 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(2)(a))

Submitter: Mike Weitzel, Bechtel
Recommendation: Insert one sentence of new text in just before the last sentence of the paragraph.

310.15(B)(2)(a)

(a) More than Three Current Carrying Conductors in a Raceway or Cable. Where the number of... existing text... shall be enclosed as shown in Table 310.15(B)(2)(a) The allowable ampacity of additional conductors installed in a raceway intended for future use shall be reduced in accordance with Table 310.15(B)(2)(a). Each current carrying conductor of a paralleled set of conductors shall be counted as a current carrying conductor.

Substantiation: Additional "spare" conductors in a raceway where more than three current carrying conductors are installed impede the dissipation of heat in the conductors as required in 300.17 and should be counted when adjusting the ampacity of the current carrying conductors. These conductors are not in use presently, but may be placed in use in the future and should be either counted as current carrying, have their future use identified with a tag that clarifies that they are for other use - such as remote-control or signaling per 725.58, for example, or be removed.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel has addressed the submitter's recommendation through Proposal 6-57, which addresses the total number of conductors in a raceway or cable without reference to "current carrying".

Recommendation: Revise text to read as follows:

310.15 Ampacities for Conductors Rated 0–2000 Volts.

(B) Tables. *[main portion of 310.15(B) unchanged by this Proposal]*

(2) Adjustment Factors.

(a) *More Than Three Current-Carrying Conductors in a Raceway or Cable.* Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(2)(a). Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.

FPN No. 1: See Annex B, Table B.310.11, for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

FPN No. 2: See 366.23(A) for adjustment factors for conductors in sheet metal auxiliary gutters and 376.22(B) for adjustment factors for conductors in metal wireways.

Exception No. 1: Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the ~~derating~~ adjustment factors shown in Table 310.15(B)(2)(a) shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).

Exception No. 2: *[unchanged by this Proposal]*

Exception No. 3: ~~Derating~~ Adjustment factors shall not apply to conductors in nipples having a length not exceeding 600 mm (24 in.).

Exception No. 4: ~~Derating~~ Adjustment factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3.05 m (10 ft) and if the number of conductors does not exceed four.

[remainder of 310.15(B) unchanged by this Proposal]

Table 310.15(B)(2)(a) Adjustment Factors for More Than Three Current-Carrying Conductors in a Raceway or Cable

[Table 310.15(B)(2)(a) title shown for CMP reference. Table 310.15(B)(2)(a) unchanged by this Proposal]

Substantiation: Correlation issue. Also to improve *Code* readability. Table 310.15(B)(2)(a) referenced from here uses the specific term "adjustment factors", not the unspecific generalization "derating factors".

366.23(A) and 376.22(B) for the 2008 *NEC*® had been revised [Proposal 8-127/Log #2243 and Proposal 8-157/Log #2754, respectively] from the inconsistent term "correction factors" and imprecise term "derating factors", respectively, to "adjustment factors", the term specifically used in Table 310.15(B)(2)(a). Per the Substantiation of Proposal 8-157, Accepted In Principle by Code Panel 8, trade persons were being confused by the designation inconsistency with other ampacity-modifying factors used elsewhere in the *Code*.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(2) Adjustment Factors.
(a) More than Three Current-Carrying Conductors in a Raceway or Cable. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(2)(a). Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.

Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the ~~derating~~ adjustment factors shown in Table 310.15(B)(2)(a) shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).

FPN No. 1: See Annex B, Table B.310.11, for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

FPN No. 2: See 366.23(A) for adjustment factors for conductors in sheet metal auxiliary gutters and 376.22(B) for adjustment factors for conductors in metal wireways.

The following adjustments shall be permitted for the conductors and installation methods listed in (1) through (4):

(1) For conductors installed in cable trays, the provisions of 392.11 shall apply.

(2) ~~Derating~~ Adjustment factors shall not apply to conductors in nipples having a length not exceeding 600 mm (24 in.).

(3) ~~Derating~~ Adjustment factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3.05 m (10 ft) and if the number of conductors does not exceed four.

(4) Adjustment factors shall not apply to Type AC cable or to Type MC cable without an overall outer jacket under the following conditions:

(a) Each cable has not more than three current-carrying conductors.

(b) The conductors are 12 AWG copper.

(c) Not more than 20 current-carrying conductors are bundled, stacked, or supported on "bridle rings."

A 60 percent adjustment factor shall be applied where the current-carrying conductors in these cables that are stacked or bundled longer than 600 mm (24 in.) without maintaining spacing exceeds 20.

Panel Statement: The panel accepts the proposed text change of "derating" to "adjustment,"but the change should be made to the accepted text from Proposal 6-60.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-63 Log #3063 NEC-P06 **Final Action: Accept**
(310.15(B)(2)(a) Exception No. 3)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
Exception No. 3: Derating factors shall not apply to conductors in raceways ~~nipples~~ having a length not exceeding 600 mm (24 in.).
Substantiation: There is much debate as to whether or not a nipple can be a raceway that is not straight. This proposal clarifies that any raceway less than 24 in. is exempt from the ampacity adjustments required by this section.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the proposed text change but the change should be incorporated to the changes made by proposal 6-60.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

KENT, G.: I agree with the action, but would have preferred having left the word 'nipple' and added the words 'and raceways'.

6-64 Log #2312 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(a), Exception No. 6)

Submitter: Mike Green, Municipality of Anchorage
Recommendation: Add Exception No. 6 to read as follows:

Exception No. 6: Where the load is divided among multiple conductors of the same circuit and phase supplying different loads, they shall be permitted to be counted as one conductor for derating purposes where all of the conductors are identified by circuit.

Substantiation: This proposal is based on the same principal that allows the neutral of single phase multi-wire branch circuits to be ignored when counting current carrying conductors.

Since the heat produced in a conductor is the square of the current, the total heat will always be reduced when the current is divided among multiple conductors. Requiring the conductors to be identified by circuit is necessary to verify the proper application of the exception.

Luminaires have become so efficient that dozens of them can be supplied by a single 20 amp branch circuit and new energy codes will require more appropriate control of individual areas resulting in control panels with many switch legs from the same circuit. This exception will reduce the unnecessary oversizing of conductors in raceways connected to those panels and to enclosures with multiple switches.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the submitter's substantiation. There was no evidence of any need or problem addressed by the substantiation. Conductors connected to the same circuit and supplying different loads are, in fact, current-carrying conductors and need to be counted when applying 310.15(B)(2)(a).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-65 Log #2228 NEC-P06 **Final Action: Reject**

(Table 310.15(B)(2)(a), FPN No. 1, and Table 310.11)

Submitter: Stephen E. Ormsby, Ormsby Electric, Inc.

Recommendation: Revise text to read as follows:

Table 310.15(B)(2)(a) ~~FPN No. 1, Table B.310.11~~ (Annex B).

Substantiation: There is no definition of load diversity. The improper application of Table B.310.11 has caused many problems. Designers and installers are using this section of the code with their own interpretation of what load diversity is. Conduits and wireways are overfilled and extreme heating is taking place. With the higher insulation values of conductors and applying adjustment factors, it is not necessary to include load diversity in Annex B.

Panel Meeting Action: Reject

Panel Statement: The submitter provided no documented substantiation. The absence of a definition of load diversity is not adequate substantiation to remove the FPN.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-66 Log #2751 NEC-P06 **Final Action: Accept**

(310.15(B)(2)(c))

Submitter: Travis Lindsey, Travis Lindsey Consulting Services

Recommendation: Revise text to read as follows:

310.15(B)(2)(c) ~~Conduits~~ <u>Circular Raceways</u> Exposed to Sunlight on Rooftops

Where conductors or cables are installed in ~~conduits~~ <u>circular raceways</u> exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and Table 310.18.

Substantiation: This proposal is intended to clarify the use of the term "conduit", as used in the accepted 2008 NEC proposal, to include all types of circular raceways. Original testing was performed using electrical metallic tubing and other raceways. The term "conduit" is not defined in the NEC. This proposal will ensure that both of these constructions are understood to be included. The term circular raceways will cover all wiring methods tested.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 2

Explanation of Negative:

HUDDLESTON, JR., R.: The Panel should have rejected this Proposal. If changes were needed to include EMT as conduit, a Proposal should have been submitted to Panel 8 to mention the very common trade name of EMT (thinwall conduit).

HUNTER, R.: The research isn't complete and has had no insulation failures reported. It has not had third party substantiation, and has been very limited as to type of wiring methods tested. There are other wiring methods which may be used on rooftops that haven't been addressed. Inspectors who I checked with that work in the southwestern United States haven't witnessed any rooftop failures due to insulation deterioration.

Comment on Affirmative:

KENT, G.: The submitter needed a broader range of test to eliminate 'cables'

6-67 Log #2820 NEC-P06 **Final Action: Reject**

(310.15(B)(2)(c))

Submitter: Travis Lindsey, Travis Lindsey Consulting Services

Recommendation: Revise text to read as follows:

310.15(B)(2)(c) Conduits <u>and Cables</u> Exposed to Sunlight on Rooftops.

Where conductors <u>in conduits or cables are installed</u> ~~or cables are installed in conduits~~ exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and Table 310.18.

Substantiation: Recent research shows that where cables were installed over roof surfaces, these cables exhibited similar characteristics due to solar heat gain to that of Electrical Metallic Tubing and other raceways previously tested.

Please see the documentation I have provided.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The term "cables" is too general for this requirement. The testing described in the substantiation was performed using MC cable only, and not other types of cable. Testing on MC cables is not representative of all cables. In order for the term "cables" to be added at this stage, testing would have to be completed on all types of cables. Otherwise, the proposal would need to be more specific.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 2

Explanation of Negative:

FRIEDMAN, S.: This proposal should have been "Accept". The submitter of this proposal is the same person that submitted the 2008 proposal to require ambient temperature correction for conductors in *conduits* on rooftops. The Panel accepted that proposal although not all conduits were tested. This cycle, the Panel rejected this proposal to include cables because not all cables were tested. The submitter's substantiation states that *"temperatures inside RNC raceways tend to be hotter than in EMT raceways and that black MC cables are comparable to RNC, except directly on the roof where the MC is hotter."* These two contrary actions improperly impose different restrictions on different types of wiring methods, which according to the substantiation, are subject to the same need for ambient temperature correction.

ZIMNOCH, J.: This should have been an Accept in Principle and changed to "Type MC cables" in lieu of "cables" since data was submitted for Type MC cables.

6-68 Log #3149 NEC-P06 **Final Action: Reject**

(Table 310.15(B)(2)(c))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered relative to the use of the terms "conduit" and "raceway" and correlated with the action taken on Proposal 6-66.

This action will be considered by the panel as a public comment.

Submitter: Richard E. Loyd, Sun Lakes, AZ

Recommendation: Revise as follows:

Table 310.15(b)(2)(c) Ambient Temperature Adjustment for <u>Conductors in</u> ~~Conduits~~ <u>Raceways or Cables</u> ~~E~~ exposed to Sunlight On or Above Rooftops

Distance Above Roof to Bottom of ~~Conduit~~ <u>raceway or cable</u>

Substantiation: The title indicates adjustment of the conduit, but it should apply to the enclosed conductors and not the wiring method. This proposal is to clarify the intent of the Table. I have added "cables" since the same problems from temperature increase exists in all raceways and cables as it does for conduits, direct sunlight will radiate the same temperature increase in all enclosures both metallic and nonmetallic.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation was submitted to support the inclusions of "raceways'" as a general term versus 'conduits' nor to include "cables".

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

ZIMNOCH, J.: The panel was correct in rejecting the term "raceway as no data was submitted for this installation type.

6-69 Log #3334 NEC-P06 **Final Action: Reject**

(310.15(B)(2)(c))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered relative to the use of the terms "conduit" and "raceway" and correlated with the action taken on Proposal 6-66.

This action will be considered by the panel as a public comment.

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise:

Conduits Exposed to Direct Sunlight on Rooftops. Where ~~conductors or~~ cables or conductors ~~are~~ installed in ~~conduits~~ <u>raceways or other enclosures, or in cable trays</u>, exposed to direct sunlight on or above roof tops the adjustments shown in Table 310.15(B)(2)(c) shall be added...(remainder unchanged).

Substantiation: This provision should not be limited to conductors or cables installed in conduits. Conductors in other enclosures are also affected by direct sunlight.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation was submitted to support the inclusions of "raceways" as a general term versus "conduits'" nor to include "enclosures" or "cable trays".

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

ZIMNOCH, J.: See My Affirmative with Comment on 6-68.

6-70 Log #4090 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c) and FPN, and Table 310.15(B)(2)(c) and FPN)

Note: This proposal is reported as "Reject" as it did not receive the 2/3 affirmative vote.
TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Delete Section 310.15(B)(2)(c) and associated FPN. Delete Table 310.15(B)(2)(c) and associated FPN.
Substantiation: The 2008 NEC adopted the text under (c) because of testing performed in the Nevada desert in the heat of the summer by the Copper Development Association, which indicated that wiring in conduits that run across rooftops can get warm. It mandates adjustments to the ambient temperature correction factors found at the bottom of Table 310.16. No actual field data was provided which indicated that wiring was being damaged due to rooftop conduit installations - only simulated test data was provided. The study was based on a limited range of conduit sizes and only included individual conductors inside the conduit - no multi-conductor cable was tested. Roof pitch and roof color were not considered. Despite the limitations of the testing that was conducted by an organization that directly benefitted form the results, the Proposal that the panel accepted in the 2005 cycle requires adjusting the ampacity of conductors within 1/2 in. of roofs to 33 percent of the Table 310.16 ampacity. 33 percent! This is despite the fact that no evidence was provided to indicate that this was a problem in the "real world". None of the tests were independently verified, so the organization that directly benefitted from larger copper conductors provided the testing data, and the Code Panel accepted it. In essence, the new text changes the long established definition of ambient temperature with no real justification, as there were no examples given to the Panel during the 2005 cycle where real world failures had occurred in roof top installations due to overheating.
Panel Meeting Action: Reject
Panel Statement: Technical substantiation was provided during the 2008 code cycle to support the ambient adjustment factors to conduit exposed on rooftops. This testing proved to the panel's satisfaction that the adjustments are required. The testing was based on the temperature readings, not on the location. The adjustment factors noted are based on raised ambient temperatures based on the tables. It is the elevated ambient temperature that affects the long-term aging of the conductor. Additional testing and technical substantiation has been provided in Proposal 6-67 during the 2011 cycle to support the application of the adjustment factors.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:
HUDDLESTON, JR., R.: The Panel should have accepted this Proposal, and realized that the decision in the last cycle to include additional temperature correction factors for conduits installed above rooftops was based on research paid for by the Copper Development Association, the organization who benefits most from the larger conductors it requires. Panel decisions should always be based on research performed by non-partial, independent laboratories and preferably Nationally Recognized Testing Laboratories.
HUNTER, R.: I agree with the submitter's substantiation.
MCCLUNG, L.: Oppose the Panel Action with the following comment:
Test data provided only a single data point and does not support industry experience.
Present wording in the Code is adequate to direct the qualified user to make appropriate adjustments to the ampacity for the temperature of its installation (for example, conduits on rooftops). Industrial users have been applying appropriate conductors safely and reliably for many years in these applications. No reputable field failure data was submitted to support the results of the experimental testing. The data submitted to the Panel covered one site specific application where it was recognized that the intense sunlight had immediate effect on the temperature rise in the conduit. Recognizing that the conductor temperature adders found in Table 310.15(B)(2)(c) are based on solar radiation of a single site tested condition, it is conceivable that impingement angle of the sun, roofing material and color, wind speed, atmosphere conditions, etc., will vary with location, thus directly affecting the ambient temperature and its associated ampacity. Additional site testing should be performed before making such a drastic change to the Code (i.e., a 60 A load that has normally been wired using a #6 AWG, 90 Deg C wire would require a #2 AWG, 90 Deg C wire). Such a drastic change would result in a mismatch of conductor and terminal sizing unless a reducer lug or splice is inserted at or prior to the termination
WALL, C.: I am voting negative. Based on the submitted substantiation, I would like to see peer review and tabulation or real world failures that justify the use of the temperature adjustment factors for conductors in conduit on roof tops.
Comment on Affirmative:
CLINE, S.: The work done in the past cycle by both the submitter and by the panel was lengthy and detailed, and the decision arrived at was carefully thought out. Nothing given by the submitter justifies changing it.
ZIMNOCH, J.: See My Affirmative with Comment on 6-68.

6-71 Log #461 NEC-P06 **Final Action: Accept in Principle in Part**
(310.15(B)(2)(c) and Table 310.15(B)(2)(c))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 6-66.
This action will be considered by the panel as a public comment.
Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise text to read as follows:
(c) ~~Conduits~~Raceways and Cables Exposed to Sunlight on Rooftops. For~~Where~~ conductors ~~or cables are~~ installed in raceways and cables ~~conduits~~ exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and Table 310.18.
Note: The following changes are proposed to the Table:
Table 310.15(B)(2)(c) Ambient Temperature Adjustment for Raceways and Cables ~~Conduits~~ Exposed to Sunlight On or Above Rooftops
Distance Above Roof to Bottom of Raceways or Cables~~Conduit~~.
Substantiation: As presently worded, this section and Table only applies to conduits; however, the section mentions conductors and cables. The requirement should apply consistently to raceway and cable systems - not just conduits. At least that would appear to be the original intent of the proposal and the section. Since this code section was new to the '08 NEC, not including all raceways and cables was likely an oversight. Obviously, the ambient conditions on the conductor in the given location should be similar regardless of if the conductors are installed in a raceway or cable system. For consistency, the requirements of this section and Table should apply to all raceway and cable systems installed exposed to direct sunlight on or above rooftops.
Panel Meeting Action: Accept in Principle in Part
The panel accepts the deletion of "where" but makes a substitution of "when" rather than "for".
The panel rejects all other proposed changes.
Panel Statement: No technical substantiation was submitted to support the inclusions of "raceways and cables" as a general term versus "conduits" nor to include "cables". The change from "where" to "when" complies with the NEC Style Manual.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
ZIMNOCH, J.: See My Affirmative with Comment on 6-68.

6-72 Log #462 NEC-P06 **Final Action: Accept in Principle in Part**
(310.15(B)(2)(c) and Table 310.15(B)(2)(c))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 6-66.
This action will be considered by the panel as a public comment.
Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise text to read as follows:
(c) ~~Conduits~~Raceways and Cables Exposed to Sunlight on ~~Rooftops~~Outdoor Surface. For~~Where~~ conductors ~~or cables are~~ installed in raceways and cables~~conduits~~ exposed to direct sunlight on ~~or above rooftops~~outdoor surfaces, the adjustments shown in Table 310.15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and Table 310.18.
Table 310.15(B)(2)(c) Ambient Temperature Adjustment for Raceways and Cables~~Conduits~~ Exposed to Sunlight On ~~or Above Rooftops~~Outdoor Surfaces
Distance ~~Above Roof~~From Outdoor Surface to Bottom of Raceways or Cables~~Conduit~~.
Substantiation: As presently worded, this section and Table only applies to conduits; however, the section mentions conductors and cables. The requirement should apply consistently to all raceway and cable systems — not just conduits. At least that would appear to be the original intent of the proposal and the section. Since this code section was new to the '08 NEC, not including all raceways and cables was likely an oversight. Obviously, the ambient conditions on the conductor(s) in the given location should be similar regardless of if the conductors are installed in a raceway or cable system. For consistency, the requirements of this section and Table should apply to all raceway and cable systems installed exposed to direct sunlight on or above rooftops. An additional change to this section and table recommends that the requirement apply to all raceways and cables installed outdoors exposed to sunlight. Common sense would seem to dictate that a raceway or cable installed on the side of a building wall or on a concrete surface at grade level would be subject to similar ambient temperature conditions as those installed on a rooftop. The same justification that was used to require this change in the code for conduits on a rooftop location can be used for an outdoor location. Solar exposure basically has the same effect on a raceway or cable regardless of the location being a rooftop or exterior (outdoor) wall location. This change is also intended to promote consistency in the application of the requirement.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the deletion of "where" but makes a substitution of "when" rather than "for". The panel rejects all other proposed changes.

Panel Statement: No technical substantiation was submitted to support the inclusions of "raceways and cables" as a general term versus "conduits" nor to include "cables" or "outdoor surfaces". The term 'outdoor surfaces' is too all-inclusive. The change from "where" to "when" complies with the NEC Style Manual.

ZIMNOCH, J.: See My Affirmative with Comment on 6-68.

6-73 Log #2242 NEC-P06 **Final Action: Reject**

(310.15(B)(2)(c) and Table 310.15(B)(2)(c))

Submitter: Richard E. Loyd, Sun Lakes, AZ

Recommendation: Revise as follows:

(c) Conduits <u>or cables</u> ~~E~~ <u>exposed</u> to Sunlight on Rooftops. Where conductors are installed in conduits <u>or cables</u> exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and Table 310.18, and, Table 310.15(B)(2)(c) Ambient Temperature Adjustment for Conduits <u>or cables</u> <u>E</u>-exposed to Sunlight On or Above Rooftops. Distance Above Roof to Bottom of Conduit <u>or Cable.</u>

Substantiation: The fire and safety issues related to exposure to direct sunlight are identical for both wiring methods. Cables exposed to sunlight on rooftops cannot dissipate heat as well as a conduit since the inside of conduit contains room for air movement whereas the cable does not. Also, many cables designed for outdoor use have an impervious nonmetallic jacket which will exacerbate the dissipation of heat further.

The change will eliminate an inconsistency in requirements and will assure safe performance of these circuits located on rooftops.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation was submitted to support the inclusion of "cables" as a general term in addition to "conduits".

Submitter: James M. Imlah, City of Hillsboro

Recommendation: Revise text to read as follows:

Exception No. 2: For conductors installed in cable trays, the provisions of 392.~~11~~ <u>64, and conductors with cablebus the provisions of 370.4(B)</u> shall apply.

Substantiation: This change of the reference 392.11 (ampacity) to 392.22 is due to a rewrite for he cable tray article and if accepted will be the new number identifier. For the change to add cablebus is a result if conductors that are supported on blocks and maintaining spacing the same rules for conductor ampacity can be applied that are allowed for cable tray installations. There would also be no necessity for derating due to design that maintains a minimum one conductor spacing from surrounding conductors.

Panel Meeting Action: Accept in Part

The panel accepts the change of reference 392.11 to 392.64 and rejects all other proposed changes.

Panel Statement: This panel action is subject to acceptance of the Section 392 rewrite by Panel 8. The additional phrase is unnecessary in the exception because the cablebus case is covered in 310.15(B)(2)(a).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-79 Log #4743 NEC-P06 **Final Action: Reject**
(310.15(B)(2) Exception No. 4)

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
Exception No. 4: Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid polyvinyl chloride ~~nonmetallic~~ conduit (PVC), high density polyethylene conduit (HDPE), or reinforced thermosetting resin conduit (RTRC) having a length not exceeding 3.05 m (10 ft) and if the number of conductors does not exceed four.
Substantiation: This is an addition from the result of the 2008 NEC adding of new code articles for each of the specific nonmetallic raceways and the conditions for their intended use. Remove the reference of “nonmetallic” and add in each of the specific raceway types. Non-metallic conduit now has four different types of raceways and not all non-metallic raceway types would be acceptable in all locations.
Panel Meeting Action: Reject
Panel Statement: This section does not determine the type of conduit to be used. It references adjustments for the conductors within them. The present language deals with all types of rigid nonmetallic conduits and adding the specific types, as proposed by the submitter, is not necessary.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-80 Log #265 NEC-P06 **Final Action: Accept**
(310.15(B)(2)(a) Exceptions)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise the exceptions to 310.15(B)(2)(a) as shown:
In Exceptions No. 1, 3, and 4, change “derating” to “adjustment” with the appropriate capitalization.
Exception No. 5(3) Not more than 20 current-carrying conductors are installed without maintaining spacing, ~~bundled~~ stacked, or supported on “bridle rings.”
In the last paragraph of Exception No. 5, change as follows: “A 60 percent adjustment factor shall be applied where the current-carrying conductors in these cables that are stacked or ~~bundled~~ installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) ~~without maintaining spacing~~ exceeds 20.”
Substantiation: Table 310.15(B)(2)(a) provides “adjustment” factors rather than “derating” factors and the change in terminology will provide consistency with the table titles.
This change in terminology from “bundled” clarifies the intent without changing any requirements and eliminates the confusion of multiple definitions of “bundled” used in other sections of the Code. It is also consistent with similar changes made in the 2008 Code.
Panel Meeting Action: Accept
Panel Statement: The changes are intended to be editorial only for clarification, without change to the requirements.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-81 Log #3335 NEC-P06 **Final Action: Reject**
(310.15(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: except as otherwise provided in Table 310.21,
Substantiation: Correlation with Table 310.21.
Panel Meeting Action: Reject
Panel Statement: 310.15(B)(3) applies when bare or covered conductors are installed with insulated conductors. Table 310.21 applies to bare or covered conductors in free air and does not include insulated conductors.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-82 Log #415 NEC-P06 **Final Action: Reject**
(310.15(B)(3)(b))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change “per” to “for each”.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The panel does not understand the proposal since 310.15(B)(3)(b) does not appear in the 2008 NEC. The submitter agrees with this action.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-83 Log #999 NEC-P06 **Final Action: Reject**
(310.15(B)(3) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add Exception: This provision shall not apply to overhead spans of open individual conductors installed in accordance with minimum spacings between conductors specified in 225.14 or Table 230.5(C).
Substantiation: Open individual conductors in free air should be excluded.
Panel Meeting Action: Reject
Panel Statement: 310.15(B)(3) applies when bare or covered conductors are installed with insulated conductors and does not apply to overhead spans of open individual conductors. Specifically, open individual conductors in free air are already excluded in this section.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-83a Log #CP602 NEC-P06 **Final Action: Accept**
(310.15(B)(6))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 6-85.
This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 6,
Recommendation: Revise text as follows:
(6) 120/240-Volt, Single-Phase Dwelling Services and Feeders.
(a) For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(6), shall be permitted as 120/240-volt, single-phase, service-entrance conductors and service-lateral conductors~~, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder between the main disconnect and the panelboard that supplies, either by branch circuits or by feeders, or both, all loads that are part or associated with the dwelling unit~~.
(b) ~~The f~~Feeder conductors ~~to~~ for a dwelling unit, after adjustments and corrections, shall not be required to have an ~~allowable~~ ampacity rating greater than the Table 310.15(B)(16) allowable ampacity of ~~their~~ the service~~-entrance~~ conductors.
(c) The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.
Substantiation: Based on the substantiations provided in proposals 6-88, 6-90, 6-91, and 6-92, the Panel developed this proposal to revise section 310.15(B)(6) and clarify the intent of the requirements for feeder sizing and improve readability. In addition, note that the table numbering in the new text reflects actions taken by the Panel on proposal 6-52.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
CLINE, S.: The Chairman realizes that he missed a catch he should have made:
The change of 6-83a, requires that the title and heading of Table 310.15(B)(6) be edited. The text of the change eliminates the direct connection of using Table 310.15(B)(6) to size feeders. Therefore the terms “ and Feeders” in the title, and “ or Feeder” in the heading should be deleted.
The end of the first sentence of the table title should read: “... Single-Phase Dwelling Services.”
The left-column heading of the table should read: “Service Rating (Amperes)”
In addition, since the connection from the text to the table is specific to new list item (a) {rather than the whole of 310.(B)(6)}, “(a)” should be added to the name to become: Table 310.15(B)(6)(a). This change requires that the table’s name in the text in (a) of the Proposal action itself also needs to be edited from Table 310.15(B)(6) to Table 310.15(B)(6)(a).
These changes are believed to be editorial only, and staff may be able to make the corrections on their own, but your evaluation is requested. Thank you.
THOMPSON, J.: Agree with the intent to resolve the concerns contained in proposals 6-88, 90, 91 and 92. However, it is not clear that 83a accomplishes the intention and should be further reviewed during the comment stage.

6-84 Log #226 NEC-P06 **Final Action: Reject**
(310.15(B)(6))

Submitter: Don A. Hursey, Durham County Inspections Department
Recommendation: Also include "120/208 volt, 4 wire three phase for single family dwelling services and feeders.
Substantiation: Many services for multifamily apartment buildings have 120/208 volt 3 phase services.
Panel Meeting Action: Reject
Panel Statement: The original data that was used to establish 310.15(B)(6), formally Note 3, was actual utility company data for 120/240 volt 3-wire single phase systems. It established that the conductors specified in the table could be used on a calculated dwelling unit load as shown. The submitter has not provided any technical data to show that this is true for 120/208 4-wire three phase systems.
Finally, the submitter did not follow the correct procedure and did not submit specific language to the Panel.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-85 Log #1695 NEC-P06 **Final Action: Accept in Principle in Part**
(Table 310.15(B)(6))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 6-83a.
This action will be considered by the panel as a public comment.
Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise text to read as follows:
310.15 Ampacities for Conductors Rated 0-2000 Volts.
(B) Tables.
(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and 4-wire Feeders. For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(6), are permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service-lateral conductors, and 4-wire feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with ~~or without~~ an equipment grounding conductor. [the remainder is unchanged].
Substantiation: By adding the term "4-wire" before the word "feeders" in the title and adding "4-wire" before the words "feeder conductors" in the first paragraph, it will be clear that feeders between a pole service and a dwelling are not permitted to be 3-wire.
Delete the words "or without" before the phrase "an equipment grounding conductor". This will correlate with the 4-wire reference added to the previous text.
Panel Meeting Action: Accept in Principle in Part
1. Revise text to read as follows:
310.15 Ampacities for Conductors Rated 0-2000 Volts.
(B) Tables.
(6) 120/240-Volt~~, 3-Wire,~~ Single-Phase Dwelling Services and Feeders. For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(6), are permitted as 120/240-volt~~, 3-wire,~~ single-phase service-entrance conductors, service-lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable ~~with or without an equipment grounding conductor.~~ [the remainder is unchanged].
2. Delete "3-wire" from title of Table 310.15(B)(6).
Panel Statement: The panel is of the opinion that it is not necessary to add the words "4-wire" before the word "feeder" in the paragraph because the requirements found in 250.32 mandate whether 3 or 4 wires are required to be installed. In addition, the phrase "3-wire" is not needed because it is not required to describe the service.
The panel does agree that the word "without" should be deleted. However, the panel believes the entire phrase "with or without an equipment grounding conductor" that appears after the word "cable" should be eliminated.
The title of Table 310.15(B)(6) removes the phrase "3-wire" to correlate with the changes in the section.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-86 Log #1732 NEC-P06 **Final Action: Reject**
(310.15(B)(6))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Recommendation: Insert after the second sentence, which ends with "... associated with the dwelling unit." "Use of paralleled conductors as a substitute for the conductor sizes shown in this table, or to supply larger service or feeder loads than those shown in this table, shall not be permitted. The feeder conductors to a dwelling unit shall not be required...".
Substantiation: This change would clearly declare that Table 310.15(B)(6) cannot be adapted to suit the user's design preferences.
310.4 tells us that paralleling conductors is allowable, under certain conditions. But it does not tell us what changes take place, when we do so. It is commonly presumed that two parallel conductors (In separate raceways) will have twice the ampacity of either conductor alone. But, Table 310.15(B)(6) is not about ampacity. The values for amperes shown in the left-hand column are not ampacity values, but rather are load values.
Table 310.15(B)(6) allows for the use of conductors in situations that exceed their ampacity values as given in Table 310.16. For example, a 2/0 copper conductor with 75C insulation has an ampacity of 175 amps, yet it can be used for a 200 amp service. That represents a 25 amp difference between the conductor's ampacity and the load it will carry. That difference becomes 50 amps, when you use two in parallel. Absent any proof that the additional burden will not harm the conductor, and particularly noting that the user has no knowledge of the design basis that lies behind this Table, the user should not be allowed to presume that a pair of 2/0 conductors will be sufficient for a service of 400 amps.
Panel Meeting Action: Reject
Panel Statement: The submitter is incorrect in his assumption that the conductors in 310.15 (B)(6) are not permitted to be paralleled in accordance with 310.4. The conductor ampacities listed in 310.15(B)(6) are based on the diversity of the total load of an individual dwelling. This means that the conductors of a 120/240-volt, single-phase dwelling service or feeder with a calculated load of 200 amps will never carry 200 amps. Due to this fact, the language and table in 310.15(B)(6) will permit the use of a 2/0 conductor, which has an ampacity of 175 amps in the 75 degree C column. The same theory applies to the conductors of a service or feeder with a calculated load of 400 amps. Section 310.15(B)(6) will permit the use of a 400 kcmil conductor that would only have an ampacity of 335 amps in the 75 degree C column to be used for a 400 amp service or feeder. When two 2/0 conductors are installed in parallel for the same 400 amp installation the combined ampacity is 350 amps, which is 15 amps more than that of a 400 kcmil conductor.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-87 Log #2317 NEC-P06 **Final Action: Reject**
(310.15(B)(6))

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Delete subsection 310.15(B)(6) including the table.
Substantiation: The ampacities allowed in this subsection have become the general rule for conductor ampacity in most peoples minds and has been modified over the last several code cycles to clarify when table 310.15(B)(6) applies and when it doesn't. The source of confusion is the basic concept that a conductor can have two different ampacities based on load diversity. That idea defies physics and common sense. A conductor's ampacity should only be based on the temperature rating of the insulation and terminations and those conditions that affect heat dissipation. Load diversity affects the calculated load not the conductor ampacity. This proposal has a companion proposal to Article 220 which would reduce the load calculation by 10% as an alternative to this table.
Panel Meeting Action: Reject
Panel Statement: The language in this section, along with the table, has been in the code for many years and, as the submitter states, has been modified to provide more clarity over the past several cycles. When appropriately applied, there has been no evidence that the sizing of the conductors shown in the table creates a problem. Table 310.15(B)(6) deals with service loads, not with ampacities.

Ballot Results: Affirmative: 11

6-88 Log #3064 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(6))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service-lateral conductors, and feeder conductors that serve as the main power feeder(s) to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder between the main disconnect and the panelboard(s) ~~that supplies, either by branch circuits or by feeders, or both, all loads that are part or associated with the dwelling unit~~. The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.
Substantiation: This proposal changes this section back to the 2005 code language. Requiring the feeder to serve the entire load in order to use this section simply does not make sense. For example, consider a 200A service for a dwelling. If the installation consists of a single 200A breaker, 200A feeder and 200A panel, the user can use this section. If the air conditioners for this house are removed from the 200A panel and put outside at the service equipment, there is now less load on the feeder conductors, yet the according to the 2008 revision to this rule, I must now make the conductors larger to serve a smaller load! Obviously this doesn't make sense.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 6-83a.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-89 Log #3493 NEC-P06 **Final Action: Reject**
(Table 310.15(B)(6))

Submitter: Mike Theisen, Midwestern Electrical Seminars
Recommendation: Delete Type SE cable and USE from the heading of the table in order to correlate with the 2008 NEC changes to Article 338.

Table 31015(B)(6) Conductor Types and Sizes for 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. Conductor Types RHH, RHW, RHW-2, THHN, THHW, THW, THW-2, THWN, THWN-2, XHHW, XHHW-2, ~~SE, USE, USE 2.~~

Substantiation: In Table 310.16, the 60 degree “C” ampacity of Type SE cables and USE conductors is substantially lower than the ampacities permitted when applying Table 310.15(B)(6). Considering that interior feeders can be routed within insulating material, just makes a bad situation worse. 338.10(B)(4) requires interior installation of Type SE cable to comply with Part II of Article 334, which limits the ampacity of the cable to the 60 degree “C” column in Table 310.16. 338.12(B)(1) prohibits USE for interior wiring and where USE cable is installed underground they must comply with Part II of Article 340, which limits the ampacity of the USE cable to the 60 degree “C” column in Table 310.16.
Panel Meeting Action: Reject
Panel Statement: Service-entrance cables are listed and designed for the types that are proposed to be rejected. The substantiation for this proposal is incorrect and is not justified.
SE, USE, -2 are rated based on the insulation of the internal conductors. The internal conductors are rated a minimum of 75C. The surface of the SE is marked with the type letter NEC designations of the individual conductors so that they will always be either 75C or 90C (USE-2 is 90C minimum) (SE and USE is 75C minimum).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-90 Log #3920 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(6))

Submitter: George M. Stolz, II, Pierce, CO
Recommendation: Revise text as follows:

Conductors shall be permitted to be connected to equipment rated according to Table 310.15(B)(6) when the installation complies with all of the following conditions:

(a) The supply is a single phase, 120/240 Volt, 3 wire system.

(b) The conductors are installed for one-family, two-family, and multifamily dwellings.

(c) The conductors are either service laterals, service entrance conductors, or feeders.

(d) The conductors serve as the main power supply of an individual dwelling unit.

(e) If the conductors are a feeder, the feeder shall exist between the main disconnect and the panelboard that supplies 100% of the load of the dwelling unit. This panelboard may supply that load either by branch circuits or by feeders, or both,

The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity greater than their service entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, 230.42 are met.

Substantiation: As the text currently stands, the first sentence of this section is very difficult to read, containing 56 words separated by no less than nine commas. This section is packed with various requirements. It would be much clearer to understand, and more readily and accurately applied in a list format. It is very easy to misapply this section as it currently stands. In addition: All circuits on the planet have “either an equipment grounding conductor or no equipment grounding conductor”, so mentioning an EGC is just filler, unless the panel is aware of a third option I’m missing. All chapter 3 wiring methods are either raceways or cables, so that language adds nothing to this requirement either, and has been intentionally omitted. The term “main power feeder” hit the dumpster when grouped with service conductors in list item (c) to reduce confusion. “All” was replaced by “100%” to strengthen the sentiment of the panel in the last cycle. “...are part or associated with...” was not really necessary, in that the dwelling unit is what is diversifying our load - if a dwelling unit serves an ancillary structure, it really has no bearing on the application of this section. Please accept this proposal at least in part, as a list form will greatly clarify this section.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 6-83a.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-91 Log #4478 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(6))

Submitter: Christel K. Hunter, Alcan Cable
Recommendation: Revise text to read as follows:
~~(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service-lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder between the main disconnect and the panelboard that supplies, either by branch circuits or by feeders, or both, all loads that are part or associated with the dwelling unit. The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.~~
(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders.

For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors as listed in Table 310.15(B)(6), shall be permitted for the following installations:

a) 120/240-volt, 3-wire, single-phase service-entrance conductors, service-lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor.

b) For application of this section, the main power feeder shall be the feeder between the main disconnect and the panelboard that supplies, either by branch circuits or by feeders, or both, all loads that are part or associated with the dwelling unit.

c) Feeder conductors associated with a dwelling unit that do not meet the definition of a main power feeder shall not be required to have an allowable ampacity rating greater than the service-entrance or service lateral conductors serving the dwelling.

d) The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.

Substantiation: The changes in 310.15(B)(6) in the 2008 NEC, combined with new ampacity restrictions for service-entrance cable used as interior wiring, have led to a great deal of confusion among installers and inspectors. Much larger wire sizes are being required for single family dwelling feeders than have ever been needed, with no evidence of increased safety. This includes installations with multiple panels, feeders to accessory buildings, etc. This language would make it clear that these feeders do not have to be larger than the service-entrance conductors, which some inspectors have been requiring based on the new language.
Panel Meeting Action: Accept in Principle

6-92 Log #3480 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(6) Exception (New))

Submitter: Danny Thomas, Henderson, NC
Recommendation: Add text to read as follows:

(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service-lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder between the main disconnect and the panelboard that supplies, either by branch circuits or by feeders, or both, all loads that are part or associated with the dwelling unit. The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.

<u>Exception: The sizing of conductors for this feeder shall be permitted to be used if a specific load is removed from the main power feeder and connected to its own overcurrent protective device within the service equipment or sub-panel where the main power feeder is supplied from.</u>

Substantiation: As 310.15(B)(6) reads right now I can take a specific load such as an air conditioner, heat, well pump, or other equipment off of the main power feeder and connect this equipment to its own overcurrent device and not be allowed to use Table 310.15(B)(6), which would actually reduce the load on this feeder.

If this equipment were required to be connected to its own overcurrent protective device where the main power feeder is supplied from, then that would ensure that we do not have multiple power feeders.
Panel Meeting Action: Accept in Principle

Panel Statement: See Panel action on 6-83a.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-93 Log #2465 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: Paul G. Cardinal, Shell
Recommendation: Add new text to read as follows:
(7) Ampacity for kcmil Conductor Sizes Not In Tables. Ampacities for conductors with kcmil sizes other than those shown in the tables may be interpolated based on ampacities of kcmil sizes numerically preceding and following intermediate kcmil size by means of the following general formula:

$I_n = I_p + ((k_n - k_p)*((I_f-I_p)/(k_f-k_p)))$

Where:
I_n = conductor ampacity in Amps
I_p = ampacity in Amps of conductor that would precede intermediate kcmil size in table
I_f = ampacity in Amps of conductor that would follow intermediate kcmil size in table
k_n = kcmil size of conductor for which ampacity will be determined
k_p = kcmil size of conductor that would precede intermediate kcmil size in table
k_f = kcmil size of conductor that would follow intermediate kcmil size in table
Substantiation: Ampacities for cables with intermediate kcmil sizes based on standards from Sub Sea or the railroad industry are absent from NEC tables. Manufacturers typically provide ampacity ratings based on interpolation of NEC tables, however, the only NEC compliant method of determining ampacity for conductor sizes not in tables is under engineering supervision in 310.15(C). The proposed code change will allow electricians to use intermediate kcmil sizes per manufacturers recommendation without need for engineering support.
Cables with flexible stranding that might generically be referred to as DLO cables are UL listed with the Type Name of RHW-2 enabling use under Article 310, Conductors for General Wiring. Cable flexibility is beneficial for connection of large diameter cables in such applications such as Uninterruptible Power Supplies (UPS), backup generators, isolation switches and wind turbines. Ease of bending avoids scrapes and cuts to hands that inevitably occur during the installation of large diameter cables with standard stranding.
The kcmil sizes of these cables follow guidelines of the American Association of Railroads (AAR). The sizes such as 535 kcmil, fail to match sizes shown in NEC tables such as Table 310.16. At the present time, the only option for determination of cable ampacity is under engineering supervision using the calculation in 310.15(C). Rather than forcing the calculation of 310.15(C), many AHJs already allow ampacity calculation as suggested in this proposal. Those who govern by the letter of the law, however, make it very difficult for electricians to take advantage of the safety benefits of flexible cable.
Panel Meeting Action: Reject
Panel Statement: Article 310 deals with conductors for general wiring, not conductors or cables for specific use as described in the proposal. If a manufacturer recommends a specific type of cable, they most likely have an engineer on staff that could calculate the ampacity of that size conductor. An AHJ could also grant special permission based on information supplied by the manufacturer.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-94 Log #3684 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: Richard F. VanWert, Middle Department Inspection Agency
Recommendation: Add the following new text:
310.15(B)(7) Derated conductors shall be so identified in the enclosure from which the branch circuit originates. Marking shall be by marking, tagging or other approved methods.
Substantiation: Once a branch circuit is de-rated and installed, personnel who follow up will and have erroneously installed a larger OCPD to solve a tripping problem.
Panel Meeting Action: Reject
Panel Statement: It must be assumed that persons who perform maintenance on electrical systems are qualified to do so and follow code requirements. Identification of specific ampacity by means of marking, tagging, or other methods is not required.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-95 Log #288 NEC-P06 **Final Action: Accept**
(310.15(C))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “formula” to “equation” in the first sentence and in the FPN.
Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematical expression.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-96 Log #629 NEC-P06 **Final Action: Accept**
(310.15(C))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In the first paragraph, change “formula” to “equation”.
Immediately following the square root in the equation, add “x 103 amperes”. Delete ΔTD from the equation and the explanation of terms.
The specific descriptive variables in the equation and the explanation of terms should be changed from upper case to lower case subscripts as shown:

from:	to:
TC	*Tc*
TA	*Ta*
RDC	*Rdc*
YC	*Yc*
RCA	*Rca*

The equation should be revised to read:

$$I = \sqrt{\frac{T_c - T_a}{R_{dc}\left(1+Y_c\right)R_{ca}}} \times 10^3 \text{amperes}$$

Delete: “FPN: See Annex B for example of formula applications.”
Substantiation: This proposal will provide correct terminology and accuracy in the equation and be consistent with industry usage of the equation. Similar proposals are being submitted for 310.60(C)(4) and 310.60(D).
The term “formula” normally refers to a chemical composition whereas the term “equation” refers to a mathematical expression.
The variables should appear in regular size text accompanied by subscripts that identify the specific variable. For example, “*T*” designates a temperature variable and the subscripts “*c*” and “*a*” designate whether it is the conductor temperature or the ambient temperature.
This equation originally appeared in the *Transactions of the American Institute of Electrical Engineering, Vol. 76, 1957* and the result of the equation provides kiloamperes. Adding the 103 multiplier will provide an ampacity value rather than a kiloampere value and be consistent with the use of amperes throughout the Code. This equation also appears as Equation 9 on page Intro-39 of *IEEE STD 835 – 1994, IEEE Standard Power Cable Ampacity Tables*.
The dielectric loss temperature rise (ΔTD) was deleted since the dielectric loss is negligible for single circuit extruded dielectric cables rated below 46kV (see page Intro-2 of *IEEE STD 835 – 1994, IEEE Standard Power Cable Ampacity Tables*) and this NEC section is only applicable to conductors rated 0-2000 Volts.
The FPN was deleted since Annex B does not contain any application examples of the equation in 310.15(C). The only equations and examples in Annex B are associated with Table B.310.11 and relate to adjustment factors for more than three conductors in a raceway or cable with load diversity. FPN No. 1 to Table 310.15(B)(2)(a) correctly directs the user to Annex B.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-97 Log #2457 NEC-P06 **Final Action: Accept**
(310.15(C))

Submitter: Peter Pollak, Pollak & Associates
Recommendation: Delete:
1. Delta TD from the equation
2. Delta TD = dielectric loss temperature rise
Substantiation: The dielectric loss temperature rise is not a factor for the cable insulation materials and voltages permitted in the Code. It is only a factor in high voltage utility power cable, which is why it was covered in the IEEE paper published by Messrs. Neher –McGrath in 1957. Delta TD should never have been included when the Neher-McGrath approach to calculating ampacities was adopted by the Code since the Code does not apply to electric utility cables.

Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 6-96.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-98 Log #325 NEC-P06 **Final Action: Reject**
(310.15(D))

Submitter: Alireza Daneshpooy, Exponent
Recommendation: Proposal to include a table of allowable continuous ampacity for copper/aluminum busbar. No such table is currently included in the NEC. Similar tables are suggested by DIN 43 671 and IEC. This requires much effort once such a need is accepted by NFPA. In that case, I am willing to participate in its development.
Substantiation: Busbar allowable current is not addressed even marginally in the NEC code, which leaves their rating open to interpretation especially in the switchgear industry. The existing code only requires rigid and firm installation, and protection from physical damage.
Panel Meeting Action: Reject
Panel Statement: Article 310 addresses conductors for general wiring and does not cover busbar. No specific recommendation was provided by the submitter as required by NFPA regulations.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-99 Log #633 NEC-P06 **Final Action: Accept**
(Table 310.16)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting relative to the proposed column headings for (4) and (7).
This action will be considered by the panel as a public comment.
Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: Revise Table 310.16 only as shown below. The remainder of the Table remains unchanged.

Table 310.16

Size AWG or kcmil	60ºC (140ºF)	75ºC (167ºF)	90ºC (194ºC)	60ºC (140ºF)	75ºC (167ºF)	90ºC (194ºC)
	COPPER			ALUMINUM OR COPPER-CLAD ALUMINUM		
14	~~20~~ 15					
12	~~25~~ 20			~~20~~ 15		
8				~~30~~ 35		
6						~~60~~ 55
3			~~110~~ 115			
1			~~150~~ 145			
300				~~190~~ 195		~~255~~ 260
600	~~355~~ 350					
700				~~310~~ 315		~~420~~ 425
800						~~450~~ 445
1500	~~520~~ 525					
2000	~~560~~ 555					

Substantiation: Acceptance of this proposal will harmonize the ampacity values between NEC Table 310.16 and CEC Tables 2 and 4 with technically substantiated values.

The ampacities for both copper and aluminum conductors with a conductor temperature rating of 75ºC are identical between the NEC and CEC.

The ampacities for conductors with temperature ratings of 60ºC and 90ºC were calculated from the 75ºC values using the equation shown on the pages provided as supporting material that also contain supporting tables. The equation is defined in the following standards:

IEEE Std 835-1994, IEEE Standard Power Cable Ampacity Tables, Section 3.4.2 Adjustment for change in maximum conductor temperature or temperature due to dielectric loss.

AIEE-IPCEA Power Cable Ampacities, 1962 (AIEE Pub. No. S-135-1 / IPCEA Pub. No. P-46-426) Volume 1 – Copper Conductors, Adjustment for Change in Parameters, page III.

60ºC copper conductor temperature – There are only two differences (5 amps) in ampacities between the NEC and the CEC and the CEC matches the rounded calculated values on these two conductor sizes. There are three values where the NEC and CEC agree but all three differ from the rounded calculated values by 5 amps. A proposal is also being submitted to correct the CEC on the five minor deviations.

90ºC copper conductor temperature – There are only two differences (5 amps) in ampacities between the NEC and the rounded calculated ampacities. The CEC is lower on all values and a proposal is being submitted to correct the CEC to agree with the rounded calculated values and the revised NEC. The CEC agrees with the values in the 1978 NEC.

60ºC aluminum conductor temperature – There are three differences (5 amps) in ampacities between the rounded calculated ampacities, and the NEC and the CEC have the same values for these three sizes (8 & 4/0 AWG and 700 kcmil). On 12 AWG, the NEC is 5 amps higher (20 vs 15 amps) than the rounded calculated value and the CEC. A proposal is also being submitted to revise the CEC on the four sizes to agree with the rounded calculated values and the revised NEC.

90ºC aluminum conductor temperature – There are four differences (5 amps) in ampacities between the NEC and the rounded calculated ampacities. The CEC is lower on all values and a proposal is being submitted to correct the CEC to agree with the rounded calculated values and the revised NEC. The CEC agrees with the values in the 1978 NEC.

The 5 amp differences in ampacities between the rounded calculated values and the NEC are most likely due to rounding when the NEC table was revised in 1981. The supporting material for that revision no longer exists.

This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr
Mark Earley	Steve Douglas
Christel Hunter	Duncan Dunshire
Alan Manche	David Mascarenhas
David Mercier	Robert Nelson
Jeff Sargent	Shawn Paulsen
John Stacey	Tim Pope
John Thompson	Doug Reith
	Brian Savaria
	Ark Tsisserev

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:
WALL, C.: I am voting negative. The proposed ampacity for types TW and UF, AWG 14 and 12 copper, 60o C in table 310.16 are 25% and 20% less, respectively, than those presently in the table, which has been in use for years without documented problems. Application of adjustment and correction factors to these lower ampacities might require larger conductors and is an unjustified change in requirements only for harmonization. The substantiation was based solely on calculations; there have been no reports of problems in the field that would justify these ampacity reductions. Adjustment Factors in Table 310.15(B)(2)(a) and Correction Factors in Table 310.16 already limit the ampacity for conditions of use; additionally, 240.4(D) limits the ampacity of AWG 14 and 12 copper by limiting the maximum overcurrent protection for these conductors. Without documented field verification of issues with the present conductor ratings, the substantiation submitted does not justify this drastic reduction in ampacity.

Additionally, there are typo-graphical errors in the proposed table heading. Columns 4 and 7 show 194o C and should show 194o F.

6-100 Log #636 NEC-P06 **Final Action: Accept in Principle**
(Table 310.16)

Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: Revise the Correction Factors Table at the bottom of Table 310.16 to read as shown below. The added or revised rows are underlined.

Substantiation: Correlation issue. 18 AWG Copper and 16 AWG Copper were added for the 2008 *NEC*® to 240.4(D) fixed amperages for small conductor sizes corresponding to use based on *NFPA 79* and *NEC*® Article 670, *UL508*, *UL508A* (*NEC*® Article 409) and circuits in *NEC*® Articles 725 and 760.

Substantiation: If the Proposal to add a new 310.15(B)(2) is accepted, this Proposal should be accepted in Principle and refer to the Panel Action on Proposal 310.15(B)(2) (New).

Acceptance of this revised table will harmonize the ampacity correction factors for various ambient temperatures between the NEC and the CEC.

The equation in 310.60(C)(4) was used to calculate the ampacity temperature correction factors for various ambient air temperatures based on the conductor temperature ratings in the table. The term Δ*TD* was deleted since it is not necessary to include it for cables rated below 46kV; the temperature rise due to dielectric heating is insignificant compared to the conductor losses. This equation appears in 3.4.1 of *IEEE STD 835, IEEE Standard Power Cable Ampacity Tables*.

Since the NEC is used internationally, the lower three ambient temperature ranges were added to provide the appropriate ampacity correction factors for colder regions and the 81C-85C range was added to complete the table and address high ambient temperature applications. The temperature ranges for 61C-80C were changed from 10C to 5C since the differences in the correction factors are significant and it provides consistent temperature ranges throughout the Table. The correction factors for the ambient temperature ranges in the existing table remain the same.

This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr
Mark Earley	Steve Douglas
Christel Hunter	Duncan Dunshire
Alan Manche	David Mascarenhas
David Mercier	Robert Nelson
Jeff Sargent	Shawn Paulsen
John Stacey	Tim Pope
John Thompson	Doug Reith
	Brian Savaria
	Ark Tsisserev

6-101 Log #738 NEC-P06 **Final Action: Accept**
(Table 310.16)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add one asterisk following EACH of "18" and "16" in the leftmost column to the footnote at the bottom of the Table referencing 240.4(D)

Partial Table shown:

Size AWG or kcmil	
18*	
16*	
14*	
12*	
10*	
8	
6	
71–80	

* See 240.4(D).

6-102 Log #1491 NEC-P06 **Final Action: Accept**
(Table 310.16)

Submitter: Darryl Hill, Wichita Electrical JATC / Rep. IBEW LU #271
Recommendation: Add an asterisk next to 18 AWG and 16 AWG in the first column of this table.

18*
16*

Substantiation: Currently, there are asterisks next to 14, 12 and 10 AWG conductors which refer the user to Section 240.4(D) for small conductors for the requirements on the overcurrent protection that shall not be exceeded. Due to the code change that occurred in the 2008 cycle that added 18 and 16 AWG conductors to small conductors, this was not reflected back on Table 310.16. This change would add clarity and uniformity to these requirements that now exist for 14 through 10 AWG conductors for 18 and 16 AWG conductors also.
Panel Meeting Action: Accept
Panel Statement: The panel action is the same as Proposal 6-101.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-103 Log #2959 NEC-P06 **Final Action: Accept in Principle in Part**
(Table 310.16)

Submitter: Paul A. Keleher, Paul Keleher Electrical Services
Recommendation: Revise text of Table 310.16 as follows:

See Table 310.16 on page 360

Substantiation: This proposal adds 4 new rows (new data entries underlined) to the top of the CORRECTION FACTOR section of Table 310.16 so the CORRECTION FACTOR table extends the covered range of temperatures downward to freezing (0 degrees C (32 deg F)).

The explanatory information at the top of Table 310.16 explains that the ampacities shown in the Table are based on an ambient temperature of 30 C (86 F). The CORRECTION FACTOR section of Table 310.16 recognizes the established ambient by displaying the unity value of "1.00" indicating no compensation required for all temperature ratings in the row designated in the end columns as including 30C (86 F) ambient temperature. The Table presently recognizes that increased ambient temperature reduces conductor ampacity by the factors shown. The Table also recognizes the relative gain in ampacity for ambient temperatures lower than the ambient, but only as far as 21C (70F).

This proposal will modify the CORRECTION FACTOR section of the Table to recognize the further increase in ampacity created by even lower ambient temperatures. The proposed modification assumes that the further incremental increases in ampacity being proposed will be valid if the proposed increases are in the same proportion as the Table in its present form calculates incremental increases or decreases in ampacity for the ambient temperatures presently covered by the Table.

This modification to the Table will recognize the cooling effect of the earth on underground conductors, for example, or the similar effect of other conditions of installation where a lower ambient temperature will have a cooling effect on the operating temperature of conductors.
Panel Meeting Action: Accept in Principle in Part
The panel accepts the addition of three additional lower temperature rows but does not accept the proposed first row. The panel accepts in principle the correction factors.

Panel Statement: The panel accepts in principle the addition of correction factors for lower temperatures. See Panel action on Proposal 6-100.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-104 Log #3775 NEC-P06 **Final Action: Accept in Part**
(Table 310.16)

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Revise text to read as follows:

"Allowable Ampacities of Insulated Conductors Rated ~~0 Through~~ Up to and Including 2000 Volts, 60°C Through 90°C (140°F Through 194°F), Not More Than three Current-Carrying Conductors in Raceway, Cable, or Earth (Directly Buried), Based on an Ambient Temperature Range of 26°C (78°F) to 30°C (86°F)".

Substantiation: a) No insulated cable is rated at zero (0) volts.

b) The temperature "Correction Factors" at the bottom of Table 310.16 in the range of 26°C (78°F) to 30°C (86°F) each have a multiplier for table ampacity of 1.00.

Panel Meeting Action: Accept in Part

The panel accepts the deletion of "0 through" and the addition of "Up to and Including" but does not accept the other proposed changes.

Revise text to read as follows:

"Allowable Ampacities of Insulated Conductors Rated ~~0 Through~~ Up to and Including 2000 Volts, 60°C Through 90°C (140°F Through 194°F), Not More Than three Current-Carrying Conductors in Raceway, Cable, or Earth (Directly Buried), Based on Ambient Temperature of 30°C (86°F)".

Panel Statement: The panel agrees with (a) in the substantiation. The second revision would not add any additional clarity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-105 Log #3766 NEC-P06 **Final Action: Accept in Principle**
(Table 310.16 and 310.17)

Submitter: Ted "Smitty" Smith, Electrical Experts Consulting
Recommendation: Add new text to read as follows:

**See 110.14(C)

Add double asterisk to top of tables immediately after table titles and then add the proposed text to the bottom of both tables.

Substantiation: 110.14(C) temperature limitations for terminations has requirements for determining which conductor we can use and also which temperature column on the table must be used to determine ampacity. As an instructor of journeyman, master electricians and apprentices I can tell you that many electricians, including electrical inspectors, are not aware of or using these requirements. Just as we added the asterisk to make sure everyone followed 240.4(D) I believe we need to draw attention to 110.14(C) so that the conductors are protected from long term temperature exposure at their terminations.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel agrees with the submitter that some electricians are not aware of the requirements of 110.14(C) when it comes to applying the ampacities of the tables. The panel is of the opinion that the action taken in Proposal 6-51 meets the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-106 Log #634 NEC-P06 **Final Action: Accept**
(Table 310.17)

Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: Revise Table 310.17 only as shown below. The remainder of the Table remains unchanged.

	60ºC (140ºF)	75ºC (167ºF)	90ºC (194ºC)	60ºC (140ºF)	75ºC (167ºF)	90ºC (194ºC)
Size AWG or kcmil	COPPER			ALUMINUM OR COPPER-CLAD ALUMINUM		
10						~~40~~ 45
6						~~80~~ 85
4						~~110~~ 115
3/0						~~275~~ 270
300			~~505~~ 500			
600					~~540~~ 545	
700			~~855~~ 850			~~675~~ 670
900			~~985~~ 980			~~785~~ 790
1250						~~960~~ 965
1500						~~1075~~ 1070
2000						~~1335~~ 1295

Substantiation: Acceptance of this proposal will harmonize the ampacity values between NEC Table 310.17 and CEC Tables 1 and 3 with technically substantiated values.

The ampacities for copper conductors with conductor temperature ratings of 60ºC and 75ºC are identical between the NEC and CEC for sizes 6 AWG and larger. The proposed revisions in the 90C copper column are based on the rounded calculated values and will provide consistency with all the other values in the Table. The differences in ampacity between the two Codes for 10 AWG and smaller is due to the fact that the CEC includes in the table the values that the NEC includes in a footnote.

The change in the ampacity from 540 to 545 amps for 600 kcmil aluminum at 75C is a correction. In the 1978 and previous editions of the Code, the ampacity was 545. It appears that a typographical error occurred in the 1981 Code where the value was changed from 545 to 540 amps. There was no proposal, comment or panel action to make such a change. All of the other ampacities for 6 AWG and larger are identical between the 1978 and 1981 Codes. This error was never discovered and has been perpetuated in subsequent Codes.

The ampacities for 60ºC and 75ºC are identical except for sizes 14, 12, and 8 AWG. No changes are proposed for NEC Table 310.17. A proposal will be submitted to revise the ampacities for these three sizes, where necessary, in CEC Table 1.

The ampacities for conductors with a temperature rating of 90ºC were calculated from the 75ºC values using the equation shown on the attached page, also see supporting tables. The equation is defined in the following standards:

IEEE Std 835-1994, IEEE Standard Power Cable Ampacity Tables, Section 3.4.2 Adjustment for change in maximum conductor temperature or temperature due to dielectric loss.

AIEE-IPCEA Power Cable Ampacities, 1962 (AIEE Pub. No. S-135-1 / IPCEA Pub. No. P-46-426) Volume 1 – Copper Conductors, Adjustment for Change in Parameters, page III.

90ºC copper conductor temperature – There are only three differences (5 amps) in ampacities between the NEC and the rounded calculated ampacities. The CEC is lower on all values and a proposal is being submitted to correct the CEC to agree with the rounded calculated values and the revised NEC. The existing CEC ampacities agree with the values in the 1978 NEC.

90ºC aluminum conductor temperature – There are eight differences (5 amps) in ampacities between the NEC and the rounded calculated ampacities. In addition, the value for 2000 kcmil is inconsistent with all the other rounded calculated values in the table and the proposed revision will make the value consistent with all of the other sizes. The CEC is lower on all values and a proposal is being submitted to correct the CEC to agree with the rounded calculated values and the revised NEC. The existing CEC ampacities agree with the values in the 1978 NEC.

The 5 amp differences in ampacities between the rounded calculated values and the NEC are most likely due to rounding when the NEC table was revised in 1981. The supporting material for that revision no longer exists.

This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr
Mark Earley	Steve Douglas
Christel Hunter	Duncan Dunshire
Alan Manche	David Mascarenhas
David Mercier	Robert Nelson
Jeff Sargent	Shawn Paulsen
John Stacey	Tim Pope
John Thompson	Doug Reith
	Brian Savaria
	Ark Tsisserev

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

81-85	—	—	0.29	—	—	0.29	177-185

Substantiation: If the Proposal to add a new 310.15(B)(2) is accepted, this Proposal should be accepted in Principle and refer to the Panel Action on Proposal 310.15(B)(2) (New).

Acceptance of this revised table will harmonize the ampacity correction factors for various ambient temperatures between the NEC and the CEC.

The equation in 310.60(C)(4) was used to calculate the ampacity correction factors for various ambient air temperatures based on the conductor temperature ratings in the table. The term Δ*TD* was deleted since it is not necessary to include it for cables rated below 46kV; the temperature rise due to dielectric heating is insignificant compared to the conductor losses. This formula appears in 3.4.1 of *IEEE STD 835, IEEE Standard Power Cable Ampacity Tables*.

Since the NEC is used internationally, the lower three ambient temperature ranges were added to provide the appropriate ampacity correction factors for colder regions and the 81C-85C range was added to complete the table and address high ambient temperature applications. The temperature ranges for 61C-80C were changed from 10C to 5C since the differences in the correction factors are significant and it provides consistent temperature ranges throughout the Table. The correction factors for the ambient temperature ranges in the existing table remain the same.

This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr

Ballot Results: Affirmative: 11

6-108 Log #739 NEC-P06 **Final Action: Accept**
(Table 310.17)

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Add one asterisk following EACH of "18" and "16" in the leftmost column to the footnote at the bottom of the Table referencing 240.4(D)

Partial Table shown:

Size AWG or kcmil	
18*	
16*	
14*	
12*	
10*	
8	
6	
71–80	

* See 240.4(D).

Substantiation: Correlation issue. 18 AWG Copper and 16 AWG Copper were added for the 2008 *NEC*® to 240.4(D) fixed amperages for small conductor sizes corresponding to use based on *NFPA 79* and *NEC*® Article 670, *UL508*, *UL508A* (*NEC*® Article 409) and circuits in *NEC*® Articles 725 and 760.

Panel Meeting Action: Accept
Panel Statement: The action taken is consistent with panel actions on Proposals 6-101 and 6-102.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-109 Log #1113 NEC-P06 **Final Action: Reject**
(Table 310.17)

Submitter: Jim Egan, Kyocera Solar Inc
Recommendation: Revise text to read as follows:
Extend / continue the "correction factors" for 90°C conductor ampacity in ambient temperature to reflect the temperature rating of the conductor. Currently, the 90°C column has a correction factor that stops at 80°C; leaving a 9 degree discrepancy. A 90°C conductor does, in fact, have ampacity between 81°C through 90°C.
Substantiation: There is no clarification or note in the NEC to address the 9 degree discrepancy or omission in the ampacity table(s). Since ***Table 310.17*** stops at 80°C, the 9 degree temperature omission is left up to inspectors and contractors to interpret and argue this issue in the field. This issue has arisen primarily due to photovoltaic module installation. Photovoltaic modules are sold with factory installed 90°C USE-2 or RHHW-2 single insulated conductors. These modules are sometimes installed close to roof surfaces with little airflow (Building Integrated Photovoltaics), trapping heat under the module where the conductors are located. Therefore the conductor may be exposed to ambient temperatures in excess of 80°C. Article 690 doesn't address this issue either. Table 310.16 has the same issue although it is for cables or conductors installed in raceways.
Using information supplied by two separate cable manufacturers and the formula located in ***310.15(C) Engineering Supervision,*** conductors rated at 90°C have been calculated to have current carrying capacity up to 115°C. By extending ***Table 310.17 Correction Factors*** to include ambient temperature between 81°C through 90°C, the NEC can prevent many uncertain scenarios in the photovoltaic industry for inspectors, manufacturers and installers.
Panel Meeting Action: Reject
Panel Statement: No specific values were proposed by the submitter. This is against 4.3.3 of the Regulations Governing Committee Projects.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-110 Log #1492 NEC-P06 **Final Action: Accept**
(Table 310.17)

Submitter: Darryl Hill, Wichita Electrical JATC / Rep. IBEW LU #271
Recommendation: Add an asterisk next to 18 AWG and 16 AWG in the first column of this table.
18*
16*
Substantiation: Currently, there are asterisks next to 14, 12 and 10 AWG conductors which refer the user to Section 240.4(D) for small conductors for the requirements on the overcurrent protection that shall not be exceeded. Due to the code change that occurred in the 2008 cycle that added 18 and 16 AWG conductors to small conductors, this was not reflected back on Table 310.17. This change would add clarity and uniformity to these requirements that now exist for 14 through 10 AWG conductors for 18 and 16 AWG conductors also.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-111 Log #3776 NEC-P06 **Final Action: Accept in Part**
(Table 310.17)

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Revise text to read as follows:
"Allowable Ampacities of Single-Insulated Conductors Rated ~~0 Through~~ Up to and Including 2000 Volts in Free Air, Based on an Ambient Air Temperature Range of 26°C (78°F) to 30°C (86°F)".
Substantiation: a) No insulated cable is rated at zero (0) volts.
b) The temperature "Correction Factors" at the bottom of Table 310.17 in the range of 26°C (78°F) to 30°C (86°F) each have a multiplier for table ampacity of 1.00.
Panel Meeting Action: Accept in Part
Panel accepts the deletion of '0 through' and the addition of 'Up to and Including', but does not accept the other proposed changes.
Revise text to read as follows:
"Allowable Ampacities of Single-Insulated Conductors Rated ~~0 Through~~ Up to and Including 2000 Volts in Free Air, Based on Ambient Temperature of 30°C (86°F)".
Panel Statement: The Panel agrees with (a) in the substantiation. The other revisions would not add any additional clarity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-112 Log #4753 NEC-P06 **Final Action: Reject**
(Table 310.17)

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Delete Table 310.17 in it's entirety
Substantiation: Section 110.14(C)(1) requires that equipment termination provisions shall be based on Table 310.16. All conductors must be terminated on equipment whether it's in a splicing device or some other equipment. There is no practical use for Table 310.17
Panel Meeting Action: Reject
Panel Statement: Table 310.17 provides the allowable ampacities of insulated conductors in free air. These ampacities would be permitted if the conductors are terminated on busbar or if a transition splice to a larger conductor is made prior to the termination.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-113 Log #638 NEC-P06 **Final Action: Accept in Principle**
(Table 310.18)

Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: Revise the Correction Factors Table at the bottom of Table 310.18 by adding 4 rows at the top of the table so the table reads as shown below. All of the other factors remain as shown in the 2008 NEC.

CORRECTION FACTORS

81-85	—	0.32	—	0.32	177-185

Substantiation: If the Proposal to add a new 310.15(B)(2) is accepted, this Proposal should be accepted in Principle and refer to the Panel Action on Proposal 310.15(B)(2) (New).

Acceptance of this revised table will harmonize the ampacity correction factors for various ambient temperatures between the NEC and the CEC.

The equation in 310.60(C)(4) was used to calculate the ampacity correction factors for various ambient air temperatures for the conductor temperature ratings in the table. The term Δ*TD* was deleted since it is not necessary to include it for cables rated below 46kV; the temperature rise due to dielectric heating is insignificant compared to the conductor losses. This equation also appears in 3.4.1 of *IEEE STD 835, IEEE Standard Power Cable Ampacity Tables*.

Since the NEC is used internationally, the three lower ambient temperature ranges were added to provide the appropriate ampacity correction factors for colder regions and the 81-85C range was added to complete the table and address high ambient temperature applications. Except as noted in the next paragraph, the correction factors for the ambient temperature ranges in the existing table remain the same.

The Ambient Temperature (ºC) column ranges for 61C-80C were revised from 10C to 5C to provide consistent temperature ranges throughout the Table. The Ambient Temperature (ºF) column was revised to be continuous and consistent with Tables 310.16 through 310.19.

Ballot Results: Affirmative: 11

6-122 Log #630 NEC-P06 **Final Action: Accept**
(310.60(C))

Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: Revise the second sentence in 310.60(C) as follows:
"Ampacities for ~~at~~ ambient temperatures other than those specified ~~shown~~ in the ampacity tables shall be ~~determined by the formula~~ corrected in accordance with 310.60(C)(4)."
Revise 310.60(C)(4) as indicated, revise the equation and explanation of terms to read as shown, and add a new Table 310.60(C)(4).
(4) Ambient Temperature Correction ~~Ambients Not in Tables~~. Ampacities ~~at~~ for ambient temperatures other than those specified ~~shown~~ in the ampacity tables shall be corrected in accordance with Table 310.60(C)(4) or shall be permitted to be calculated using ~~determined by means of~~ the following equation ~~formula~~:

$$I' = I\sqrt{\frac{T_c - T_a'}{T_c - T_a}}$$

where:
I' = ampacity corrected for ambient temperature
I = ampacity shown in the table
Tc = temperature rating of the conductor (ºC)
Ta' = new ambient temperature (ºC)
Ta = ambient temperature used in the table (ºC)

Table 310.60(C)(4) Ambient Temperature Correction Factors

For ambient temperatures other than 40ºC (104ºF), multiply the allowable ampacities specified in the ampacity tables by the appropriate factor shown below.			
Ambient Temperature (ºC)	Temperature Rating of Conductor 90ºC	Temperature Rating of Conductor 105ºC	Ambient Temperature (ºF)
10 or less	1.26	1.21	50 or less
11-15	1.22	1.18	51-59
16-20	1.18	1.14	60-68
21-25	1.14	1.11	69-77
26-30	1.10	1.07	78-86
31-35	1.05	1.04	87-95
36-40	1.00	1.00	96-104
41-45	0.95	0.96	105-113
46-50	0.89	0.92	114-122
51-55	0.84	0.88	123-131
56-60	0.77	0.83	132-140
61-65	0.71	0.78	141-149
66-70	0.63	0.73	150-158
71-75	0.55	0.68	159-167
76-80	0.45	0.62	168-176
81-85	0.32	0.55	177-185
86-90	—	0.48	186-194
91-95	—	0.39	195-203
96-100	—	0.28	204-212

For correlation with the addition of this table, the following changes are required:

In Tables 310.67 through 310.76, add an asterisk at the end of the each table title and add the following footnote to each Table:
"* Refer to 310.60(C)(4) for the ampacity correction factors where the ambient air temperature is other than 40ºC (104ºF)."
Substantiation: Acceptance of this revised table will harmonize the ampacity correction factors for various ambient temperatures between the NEC and the CEC and will not prevent any user from continuing to calculate the ampacities.
This proposal will provide correct terminology in the equation and be consistent with industry usage of the equation.
The term "formula" normally refers to a chemical composition whereas the term "equation" refers to a mathematical expression.
The variables in the equation should appear in regular size text accompanied by subscripts that identify the specific variable. For example, "*T*" designates a temperature variable and the subscripts "*c*" and "*a*" designate whether it is the conductor temperature or the ambient temperature.
The revised equation in the Proposal was used to calculate the ampacity correction factors for various ambient air temperatures for the conductor temperature ratings in the tables. The dielectric loss temperature rise variable ΔTD was deleted from the equation since it is not necessary to include it for cables rated below 46kV; the temperature rise due to dielectric heating is insignificant compared to the conductor losses. This equation also appears in 3.4.1 of *IEEE STD 835, IEEE Standard Power Cable Ampacity Tables*.
Since the NEC is used internationally, the lower ambient temperatures were included to provide the appropriate ampacity correction factors for colder regions.
This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr
Mark Earley	Steve Douglas
Christel Hunter	Duncan Dunshire
Alan Manche	David Mascarenhas
David Mercier	Robert Nelson
Jeff Sargent	Shawn Paulsen
John Stacey	Tim Pope
John Thompson	Doug Reith
	Brian Savaria
	Ark Tsisserev

Panel Meeting Action: Accept

6-123 Log #1629 NEC-P06 **Final Action: Accept in Principle**
(310.60(C) and Tables 310.67 through 310.86)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "Table 310.67 through Table 310.86" to "Table 310.60(C)(1) through Table 310.60(C)(10)".
In 310.60(C)(1), change "Table 310.69, Table 310.70, Table 310.81, and Table 310.82" to "Table 310.60(C)(3), Table 310.60(C)(4), Table 310.60(C)(15), and Table 310.60(C)(16)".
In the title of Figure 310.60, change "Table 310.77 Through Table 310.86" to "Table 310.60(C)(11) Through Table 310.60(C)(20)".
Change title of "Table 310.67" to "Table 310.60(C)(1)".
Change title of "Table 310.68" to "Table 310.60(C)(2)".
Change title of "Table 310.69" to "Table 310.60(C)(3)".
Change title of "Table 310.70" to "Table 310.60(C)(4)".
Change title of "Table 310.71" to "Table 310.60(C)(5)".
Change title of "Table 310.72" to "Table 310.60(C)(6)".
Change title of "Table 310.73" to "Table 310.60(C)(7)".
Change title of "Table 310.74" to "Table 310.60(C)(8)".
Change title of "Table 310.75" to "Table 310.60(C)(9)".
Change title of "Table 310.76" to "Table 310.60(C)(10)".
Change title of "Table 310.77" to "Table 310.60(C)(11)".
Change title of "Table 310.78" to "Table 310.60(C)(12)".
Change title of "Table 310.79" to "Table 310.60(C)(13)".
Change title of "Table 310.80" to "Table 310.60(C)(14)".
Change title of "Table 310.81" to "Table 310.60(C)(15)".
Change title of "Table 310.82" to "Table 310.60(C)(16)".
Change title of "Table 310.83" to "Table 310.60(C)(17)".
Change title of "Table 310.84" to "Table 310.60(C)(18)".
Change title of "Table 310.85" to "Table 310.60(C)(19)".
Change title of "Table 310.86" to "Table 310.60(C)(20)"
Substantiation: This revision will bring the Code into compliance with 2.3.1 of the NEC Style Manual which states "Tables and figures shall be referenced in the text and shall be designated by the number of the *NEC* rule in which they are referenced.
Proposals are also being submitted to correlate all the references to these Tables throughout the Code.

Panel Meeting Action: Accept in Principle

Change “Table 310.67 through Table 310.86” to “Table 310.60(C)(67) through Table 310.60(C)(86)”.

In 310.60(C)(1), change “Table 310.69, Table 310.70, Table 310.81, and Table 310.82” to “Table 310.60(C)(69), Table 310.60(C)(70), Table 310.60(C)(81), and Table 310.60(C)(82)”.

In the title of Figure 310.60, change “Table 310.77 Through Table 310.86” to “Table 310.60(C)(77) Through Table 310.60(C)(86)”.

Change title of “Table 310.67” to “Table 310.60(C)(67)”.
Change title of “Table 310.68” to “Table 310.60(C)(68)”.
Change title of “Table 310.69” to “Table 310.60(C)(69)”.
Change title of “Table 310.70” to “Table 310.60(C)(70)”.
Change title of “Table 310.71” to “Table 310.60(C)(71)”.
Change title of “Table 310.72” to “Table 310.60(C)(72)”.
Change title of “Table 310.73” to “Table 310.60(C)(73)”.
Change title of “Table 310.74” to “Table 310.60(C)(74)”.
Change title of “Table 310.75” to “Table 310.60(C)(75)”.
Change title of “Table 310.76” to “Table 310.60(C)(76)”.
Change title of “Table 310.77” to “Table 310.60(C)(77)”.
Change title of “Table 310.78” to “Table 310.60(C)(78)”.
Change title of “Table 310.79” to “Table 310.60(C)(79)”.
Change title of “Table 310.80” to “Table 310.60(C)(80)”.
Change title of “Table 310.81” to “Table 310.60(C)(81)”.
Change title of “Table 310.82” to “Table 310.60(C)(82)”.
Change title of “Table 310.83” to “Table 310.60(C)(83)”.
Change title of “Table 310.84” to “Table 310.60(C)(84)”.
Change title of “Table 310.85” to “Table 310.60(C)(85)”.
Change title of “Table 310.86” to “Table 310.60(C)(86)”.

Panel Statement: The panel accepts the identification change with the modification that the end parenthetic number is to match the existing suffix number of the table.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-124 Log #351 NEC-P06 **Final Action: Accept**
(310.60(C)(2)(b))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change “per” to “for each”.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-125 Log #286 NEC-P06 **Final Action: Accept**
(310.60(C)(4))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “formula” to “equation” in the first sentence.
Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematical expression, which follows.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-126 Log #291 NEC-P06 **Final Action: Reject**
(310.60(C)(4))

TCC Action: The Technical Correlating Committee directs that this proposal be reported as “Reject” as there is no second sentence.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “formula” to “equation” in the second sentence.
Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematical expression and 310.60(C)(4) contains a mathematical expression.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-127 Log #631 NEC-P06 **Final Action: Accept**
(310.60(C)(4))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 310.60(C)(4) as follows:
(4) ~~Ambients Not in Tables~~ Ambient Temperature Correction. Ampacities for ~~at~~ ambient temperatures other than those shown in the ampacity tables shall be ~~determined by means of~~ permitted to be calculated using the following ~~formula~~ equation:
Revise the equation and the explanation of terms to read as follows:

$$I' = I\sqrt{\frac{T_c - T_a'}{T_c - T_a}}$$

where:
I’ = ampacity corrected for ambient temperature
I = ampacity shown in the table for Tc and Ta.
Tc = temperature rating of conductor (ºC)
Ta’ = actual ambient temperature (ºC)
Ta = ambient temperature used in the table (ºC)

Substantiation: This proposal will provide correct terminology in the equation, be consistent with industry usage of the equation and correlate with other industry standards. Similar proposals are being submitted for 310.15(C) and 310.60(D).
The equation in 310.60(C)(4) may be used to calculate the ampacity for various ambient temperatures other than those specified in the Ampacity Tables. This equation appears in 3.4.1 on page Intro-10 of *IEEE STD 835 – 1994, IEEE Standard Power Cable Ampacity Tables*.
The dielectric loss temperature rise (ΔTD) was deleted since the dielectric loss is negligible for single circuit extruded dielectric cables rated below 46kV (see page Intro-2 of *IEEE STD 835 – 1994, IEEE Standard Power Cable Ampacity Tables*). 310.60 is applicable to conductors rated 2001-35,000 Volts and adjusts the ampacity for ambient temperatures other than those shown in the Tables for conductors rated up to 35,000 V.
The term “formula” normally refers to a chemical composition whereas the term “equation” indicates a mathematical expression.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-128 Log #264 NEC-P06 **Final Action: Accept**
(310.60(D))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “formula” to “equation” in the first sentence and in the FPN.
Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematic expression, which is included in the section.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-129 Log #632 NEC-P06 **Final Action: Accept**
(310.60(D))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise the first paragraph in 310.60(D) as shown:
(D) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated ~~by means of~~ using the following general ~~formula~~ equation:
Immediately following the square root in the equation, add “x 103 amperes”.
The specific descriptive variables in the equation and the explanation of terms should be changed from upper case to lower case subscripts as shown:

from:	to:
TC	*Tc*
TA	*Ta*
ΔTD	*ΔTd*
RDC	*Rdc*
YC	*Yc*
RCA	*Rca*

The equation and explanation of terms will then read as follows:

$$I = \sqrt{\frac{T_c - (T_a + \Delta T_d)}{R_{dc}(1 + Y_c)R_{ca}}} \times 10^3 \text{amperes}$$

where:
Tc = conductor temperature in °C
Ta = ambient temperature in °C
ΔTd = dielectric loss temperature rise
Rdc = dc resistance of conductor at temperature Tc
Yc = component ac resistance resulting from skin effect and proximity effect
Rca = effective thermal resistance between conductor and surrounding ambient

Delete "FPN: See Annex B for examples of formula applications."

Add FPN following the explanation of terms to read:

"FPN: The dielectric loss temperature rise (ΔTd) is negligible for single circuit extruded dielectric cables rated below 46 kV."

Substantiation: This proposal will provide correct terminology and accuracy in the equation and be consistent with industry usage of the equation. Similar proposals are being submitted for 310.15(C) and 310.60(C)(4).

The term "formula" normally refers to a chemical composition whereas the term "equation" refers to a mathematical expression.

The variables should appear in regular size text accompanied by subscripts that identify the specific variable. For example, "*T*" designates a temperature variable and the subscripts "*c*" and "*a*" designate whether it is the conductor temperature or the ambient temperature.

This equation originally appeared in the *Transactions of the American Institute of Electrical Engineering, Vol. 76, 1957* and the result of the equation provides kiloamperes. Adding the 103 multiplier will provide an ampacity value rather than a kiloampere value and be consistent with the use of amperes throughout the Code. This equation also appears as Equation 9 on page Intro-39 of *IEEE STD 835 – 1994, IEEE Standard Power Cable Ampacity Tables*.

The existing FPN was deleted since Annex B does not contain any application examples of the equation in 310.60(D). The only equations and examples in Annex B are associated with Table B.310.11 and relate to adjustment factors for more than three conductors in a raceway or cable with load diversity. FPN No. 1 to Table 310.15(B)(2)(a) correctly directs the user to Annex B.

The new FPN was added to advise the user that the dielectric loss temperature rise (ΔTd) is negligible for single circuit extruded dielectric cables rated below 46kV (see page Intro-2 of *IEEE STD 835 – 1994, IEEE Standard Power Cable Ampacity Tables*). 310.60 is applicable to conductors rated 2001-35,000 Volts. The variable ΔTd is included in the equation for those large industrial and institutional users who may use the equation to calculate ampacities for 46 kV, 69 kV, or 138 kV.

ARTICLE 312 — CABINETS, CUTOUT BOXES, AND METER SOCKET ENCLOSURES

9-24 Log #2988 NEC-P09 **Final Action: Reject**
(312)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename and relocate the title of Part I as follows:
ARTICLE 312 Cabinets, Cutout Boxes, and Meter Socket Enclosures
I. Scope and General
312.1 Scope.
This article covers the installation and construction specifications of cabinets, cutout boxes, and meter socket enclosures.
~~I. Installation.~~
Substantiation: 312.1 doesn't fall under any Part of the Article. The proposed renaming and relocation of Part I provides consistency with Article 314, and puts the scope in Part I.
Panel Meeting Action: Reject
Panel Statement: CMP-9 acknowledges the anomaly of a scope statement outside of any enumerated part of a multipart article, but does not believe the proposal contributes to usability or clarity. CMP-9 recognizes that scope provisions, as well as style issues, are the province of the TCC and requests advice from the TCC as to whether a scope section outside of any enumerated article part should be relocated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-25 Log #4496 NEC-P09 **Final Action: Reject**
(312.2, FPN (New))

Submitter: Andrew C. Shinn, Randolph Community College
Recommendation: Add new FPN as follows: For conductors and cables installed, see 310.8
Substantiation: This new Fine Print Note should refer the installer to the proper conductors and cables to be used for wet locations.
Panel Meeting Action: Reject
Panel Statement: CMP-9 is unaware of any lack of understanding in the field as to the requirements for conductor installations in wet locations, particularly in light of recent clarifications made in Article 300, such as 300.9.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-26 Log #3478 NEC-P09 **Final Action: Reject**
(312.5(C))

Submitter: Danny Thomas, Henderson, NC
Recommendation: Revise text to read as follows:
(C) Cables. Where cable is used, each cable shall be secured to the cabinet, cutout box, or meter socket enclosure.
Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter the top or bottom of a surface-mounted enclosure through one or more nonflexible raceways not less than 450 mm (18 in.) and not more than 3.0 m (10 ft) in length, provided all of the following conditions are met:
Substantiation: Entering the bottom of a surface-mounted enclosure has been a common practice for many years when upgrading an electrical service for an existing house. The electrician is able to bring the branch-circuit cables out much easier from the crawl space of a dwelling rather than from the attic. There are other code rules that would protect non-metallic raceways from physical damage if this became an issue.
Panel Meeting Action: Reject
Panel Statement: The exception was written to allow such installations only at the top of the enclosure as the panel noted this limitation would assure that the outer raceway termination wouldn't be readily accessible (A98 ROC – 9-44). A rule written to address this concern, along with revision to part (b), penetration of a structural framing member, may be considered.
CMP-9 notes that a substantially equal installation to that cited in the substantiation can be performed under current NEC provisions using a raceway through the floor and terminating at a pull or junction box in the crawl space with the branch circuits entering through that pull box.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BELISLE, R.: The panel substantiation hinges on the probability of the raceway terminating in a readily accessible location. There is no proof provided by the CMP that every raceway leaving the bottom of an enclosure would terminate in a readily accessible location. The rules that are currently in effect for a raceway going up would also apply in the case of a downward installation, therefore no justification to reject this proposal was provided. The panel also cited concerns over penetrating a structural framing member, while current NEC text only disallows penetrating a structural ceiling, not stating concern with all structural members. Entry into a crawl space would most likely not penetrate a structural ceiling.

9-27 Log #352 NEC-P09 **Final Action: Reject**
(312.6 Exception)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise Exception as follows:
Exception: Wire-bending space in enclosures for motor controllers with provisions for one or two wires attached to a ~~per~~ terminal shall comply with 430.10(B).
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
CMP-9 recognizes that this is a style question that should be uniform across the NEC, and therefore within the province of the TCC. CMP-9 recommends that the word "per" remain in the NEC in its present usage, and as clearly allowed in all other NFPA standards as exemplified in the NFPA Manual of Style. CMP-9 is also concerned that subtle unintended differences may creep in through the revision process. This proposal is a case in point. It addresses the minimum sizing of motor terminal housings, which must be determined at the time of manufacture, and not at the time of field installation. The wording of the proposal, however, by using the verb "attached", suggests this to be a field issue and not a manufacturing issue. The proposal could be reworded to eliminate this possible misinterpretation, but it is far better to leave the existing wording in place.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-28 Log #431 NEC-P09 **Final Action: Reject**
(Table 312.6(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Revise multi-column heading from "Wires per Terminal" to "Number of Wires Attached to the Terminal".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-27.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-29 Log #432 NEC-P09 **Final Action: Reject**
(Table 312.6(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Revise multi-column heading from "Wires per Terminal" to "Number of Wires Attached to the Terminal".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-27.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-30 Log #947 NEC-P09 **Final Action: Reject**
(312.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Cabinets and cutout boxes shall have ~~sufficient~~ free space in accordance with Table 314.16(B) and to accommodate all conductors installed in them without damage to the conductors ~~crowding~~.
Substantiation: Edit. Proposal is more specific. "Crowding" is subjective as is "sufficient" which is a term to be avoided per the Style Manual. Conductors larger than 6 AWG are covered by 312.6.
Panel Meeting Action: Reject
Panel Statement: This rule does not reference 314.16 because the majority of applications do not involve wiring (6 AWG and smaller) covered by the prescriptive requirements in that section. Although 312.6 has a major impact on enclosure sizes, it is directly related to terminations and not numbers of conductors at a particular cross-section. This rule provides a basis for enforcement by an AHJ in the event that the dimensions met the prescriptive requirements of 312.6 and yet the fill was judged excessive in a particular case. CMP-9 would need to see actual substantiation of field problems with this wording to justify changing it.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-31 Log #327 NEC-P09 **Final Action: Reject**
(312.8)

Submitter: Joe Tedesco, Tedesco Electrical Code Consultants, Inc.
Recommendation: Add the following sentence:
Utilization equipment shall be permitted to be installed in a cabinet by special permission where it does not make contact with any of the branch circuit, feeder, or service conductors.
Substantiation: This will permit utilization equipment that utilizes electric energy for electronic, electromechanical, chemical, heating, lighting or similar purposes to be installed in the cabinet.
Panel Meeting Action: Reject
Panel Statement: The installations that would be permitted by this proposal would result in obstructions within cabinets that could not be evaluated by qualified testing laboratories in the process of evaluating equipment, such as panelboards, that would be installed in the associated cabinet. Pull boxes are available for these purposes, and when terminations are made, 312.6 and its associated tables provide the required dimensions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-32 Log #331 NEC-P09 **Final Action: Accept in Principle**
(312.8)

Submitter: Paul J. Cormier, Worcester Electrician School
Recommendation: Revise as follows:
312.8 ~~Enclosures for switches or overcurrent devices.~~ Conductors, splices and taps within enclosures for switches or overcurrent devices.
Substantiation: The existing heading does not effectively describes the content of the article.
Panel Meeting Action: Accept in Principle
Refer to the action on Proposal 9-34 for the final wording of the title, which fully addresses the concerns of this proposal.
Panel Statement: CMP-9 agrees that the section should be retitled.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-33 Log #332 NEC-P09 **Final Action: Accept in Principle in Part**
(312.8)

TCC Action: The Technical Correlating Committee understands that the panel action does not accept the proposed wording.
Submitter: Paul J. Cormier, Worcester Electrician School
Recommendation: Revise as follows:
Enclosures for switches or overcurrent devices shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches or overcurrent devices, unless associated with the enclosure and adequate space for this purpose is provided.
Substantiation: Too often you can shut down the power to an enclosure with switches or overcurrent devices to comply with NFPA 70E only to find live wiring not associated with said control panel occupying the same space.
Panel Meeting Action: Accept in Principle in Part
Accept the principle that energized conductors within such an enclosure and unassociated with its principal function are a potential hazard. Reject the limitation presented in this proposal that prohibits any such conductors.
Panel Statement: The final wording to address the concern is found in the panel action on Proposal 9-34.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-34 Log #3758 NEC-P09 **Final Action: Accept in Principle**
(312.8)

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise 312.8 to read as follows:
312.8 Enclosures for Switches or Overcurrent Devices. The wiring space of enclosures for switches or overcurrent devices shall ~~not be used as junction boxes, auxiliary gutters, or raceways~~ be permitted for conductors feeding through, spliced, or tapping off to other enclosures, switches or overcurrent devices where both of the following conditions are met: ~~, unless adequate space for this purpose is provided. The conductors shall not fill the wiring space at any cross section to more than 40 percent of the cross-sectional area of the space, and the conductors, splices, and taps shall not fill the wiring space at any cross section to more than 75 percent of the cross-sectional area of that space.~~
1. The total of all conductors installed at any cross section of the wiring space does not exceed 40 percent of the cross-sectional area of that space.
2. The total area of all conductors, splices, and taps installed at any cross section of the wiring space does not exceed 75 percent of the cross-sectional area of that space.
Substantiation: This revision is suggested for usability. The current text has a first sentence that says you cannot use the space unless adequate space is provided and then the adequate space is described in the second sentence.
It would appear to be much more straightforward to simply state the rule to indicate that you can do feed-thru conductors, splices or taps if you meet specific requirements. The recommended revision changes the main paragraph to state that you can feed-thru, splice or tap provided you meet the two conditions. The two conditions specified are the two conditions from the existing text, but stated as a list.
Two minor editorial tweaks are made in the first sentence by adding the word "spliced" between "feeding through" and "or tapping off" and by adding the word "enclosures" before "switches or overcurrent devices". Adding "spliced" makes the text consistent with the area requirement that talks about conductors, splices and taps. Adding "enclosures" simply recognizes that the feed-thru or tap conductor may go to another switch or overcurrent device inside the same enclosure or it may go to another enclosure.
Panel Meeting Action: Accept in Principle
Revise 312.8 to read as follows:
312.8 ~~Enclosures for Switches or Overcurrent Devices.~~ Switch and Overcurrent Device Enclosures with Splices, Taps, and Feed-Through Conductors. The wiring space of enclosures for switches or overcurrent devices shall ~~not be used as junction boxes, auxiliary gutters, or raceways~~ be permitted for conductors feeding through, spliced, or tapping off to other enclosures, switches, or overcurrent devices where all of the following conditions are met: ~~, unless adequate space for this purpose is provided. The conductors shall not fill the wiring space at any cross section to more than 40 percent of the cross-sectional area of the space, and the conductors, splices, and taps shall not fill the wiring space at any cross section to more than 75 percent of the cross-sectional area of that space.~~
(1) The total of all conductors installed at any cross section of the wiring space does not exceed 40 percent of the cross-sectional area of that space.
(2) The total area of all conductors, splices, and taps installed at any cross section of the wiring space does not exceed 75 percent of the cross-sectional area of that space.
(3) A warning label is applied to the enclosure that identifies the closest disconnecting means for any feed-through conductors.
Panel Statement: The panel action accepts the proposal and also addresses the recommendations contained in Proposals 9-32 and 9-33.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-35 Log #3862 NEC-P09 **Final Action: Reject**
(312.8)

Submitter: Mike Theisen, Midwestern Electrical Seminars
Recommendation: Revise text as follows:
312.8 Enclosures for Switches or Overcurrent Devices.
Enclosures for switches or overcurrent devices shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches or overcurrent devices, unless adequate space for this purpose is provided. The conductors, splices, and taps shall not fill the wiring space at any cross section to more than 40 percent of the cross-sectional area of the space~~, and the conductors, splices, and tape shall not fill the wiring space of any cross section to more than 75 percent of the cross sectional area of that space.~~
Substantiation: Conduit fill is limited to 40% of the conduit area where more than list 2 conductors are installed. These same over heating issues are applicable to the wiring space inside enclosures that house switches or overcurrent devices.
Panel Meeting Action: Reject
Panel Statement: The 40 percent limitation for wire fill in a raceway or for wiring space within these enclosures does not address heating and is excessive for tap devices that can be serviced in place. No substantiation has been presented that demonstrates that the current 75 percent limitation is technically incorrect or is causing difficulties in the field.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-36 Log #4610 NEC-P09 **Final Action: Accept**
(312.10(B) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following new subsection to 312.10, renumbering the present 312.10(B) and 312.10(C) as 312.10(C) and 312.10(D) respectively:
(B) Enclosure Edges. All sharp edges of metal enclosures within the scope of this article that are subject to hand contact during customary installation activity shall, at the time of manufacture, be protected or shall be de-burred and rounded to minimize the risk of injury.
Substantiation: This proposal incorporates by this reference all technical substantiation provided in the 2008 cycle relative to Proposal 9-81 and Comment 9-42. The proposal is being made to rebut the position of the TCC that resulted in the rejection of this action in the 2008 cycle on the basis that it contained "unenforceable and vague terminology, such as "during customary installation activity" and "at the time of manufacture, be protected."
This action is to occur in Part II of the article, covering construction specifications. Parts of articles that include these parts are collections of policy statements by the NEC Committee that provide the basis for specific requirements developed as part of the product standard development process. We need go no further than the other lettered paragraphs in the proposed section to illustrate this principle. Current Part (A) requires protection against corrosion inside and out; how is this more enforceable? Current Part (B) requires "ample strength and rigidity"; how is this less vague? The phrase "at the time of manufacture" effectively mandates that this become a subject for the product standard. The fact is that without product standards the North American safety system falls apart.
It would indeed be possible to write very specific rules, and they would not be pretty. We could access CPSC medical research and discover what radius (in microns, of course) of curvature on a raw edge of what degree of angle constitutes a cut hazard, and perhaps even make a stab at refining that number to account for the fact that most electricians have pretty tough skin on their hands. Where in the NEC does such a rule exist in a construction specification part of an article? Nowhere. The submitter has great confidence that if this policy direction becomes part of the NEC, the standards developers and the manufacturers will come up with something appropriate.
This issue has come up many times over the years, and CMP 9 has deferred to the product standards over and again, and nothing has taken place. This submitter is the senior member on CMP 9, and during the proposal period warned the NEMA and UL representatives that this was a recurring issue and that patience was running out. Nothing happened. The submitter of Comment 9-42, in his activities with the JATC, noted at the comment meeting that the problem among his members was so routine and severe that they were issuing gloves to avoid cuts on the metal edges. Enough is enough. This submitter, a working electrician 40 hours a week, wears the substantiation for this proposal in the form of scar tissue on his hands.
This proposal has no delayed effective date. The manufacturers have had their three years; if they promise to take this seriously then a date can be set as part of the comment period. The policy decision should stand.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:
BREITKREUTZ, B.: UL already has a manufacturing standard for sharp edges. Also, sharp edges may be de-burred or rounded in the field if desired. Installers should wear gloves when handling metal enclosures.
COGHILL, P.: Product Standards have requirements which address sharp edges. This matter should be raised to the STP for the appropriate product standard.
OSBORNE, R.: Panel members agree that the concern with sharp edges is one to be addressed by the product standards. Requirements exist in the Standards, and members of the panel were encouraged to participate in the Standards process if they believed requirements were in need of revision. As a result of discussions during the last Code cycle, all members were extended an invitation to join Standards Technical Panels, and encouraged to file field complaints so problems could be identified and addressed. No members choose to accept this invitation, and, no field reports related to this issue have been filed. Properly documented field complaints can be used to identify whether a problem is specific to an industry, a manufacturer, or a specific factory. Multiple field complaints for a specific category and/or specific issue can be used to identify a systemic problem and may used to develop proposals to a standard or revisions to a certification program.
It should also be noted that what constitutes a sharp edge is subjective, and with any subjective requirement, the code user is placed at a disadvantage when applying the requirements. Additionally, the ability of the AHJ to decide on the approval of equipment is already provided in 90.4. Should inspectors conclude that sufficiently sharp edges exist on equipment, they can reject the installation citing 90.4.
It is suggested that panel members refocus their efforts and address this concern in the proper forum rather than introducing requirements that are misplaced.
RUPP, B.: The substantiation for this proposal states that this issue has come up repeatedly over the years yet NEMA manufacturers of this equipment and UL representatives have no documented incidents or field complaints dealing with this issue. This lack of evidence and factual substantiation supports NEMA's position that this requirement is adequately addressed in the standards covering these products and is not needed within the installation code. In addition, the submitter's substantiation states that "The proposal is being made to rebut the position of the TCC…" yet none of the objectionable wording previously identified by the TCC has been changed in this proposal.
NEMA manufacturers continue to encourage their customers to provide feedback when their products cause injuries. Also, UL actively solicits participation on the technical panels of the product standards to affect changes where necessary.
Comment on Affirmative:
BELISLE, R.: It is essential that it be noted in accepting this proposal, that a clarification be made regarding product standards. Current product standards only address that sharp edges shall not be sufficiently sharp to cause a risk of injury in normal "*maintenance or use*." This proposal intentionally identifies the edges of concern as those that are "subject to hand contact during customary **installation** activities." This is clearly different than the requirements in existing standards and most definitely needed to address the status of the current industry problems regarding injuries.
HARTWELL, F.: Although the issues raised in this proposal are frequently reserved for product standards, the NEC does enter this arena if the product standards consistently fail to adequately address a safety concern. The boilerplate about no sharp edges in UL67 is not adequate, as a generation of electricians will attest. In the 1996 NEC cycle (Proposal 9-55) CMP 9 rejected a proposal on this subject, saying "This is an issue better left to product standards and testing laboratories." In the 2002 NEC cycle CMP 9 rejected another proposal on this subject, saying "Product standards provide requirements and test for sharp edges. Problems should be directed to manufacturers or follow-up service departments of the various testing laboratories." There have been general discussions during other cycles as well. CMP 9 has shown great patience for the usual process, and the voices of the panel members who actually install this equipment clearly support the argument that electricians are still getting injured in significant numbers. This proposal should remain accepted in order to add the voice of the NFPA process to the standard manufacturing protocols. No harm should befall equipment manufacturers, who will all be impacted equally because the relevant enclosures differ little across the various brands. If this adds even a dollar to the cost of an enclosure (likely a high number), it will be money well spent, and an expense the industry can and should afford.
YOUNG, R.: The ACC supports having enclosures with no sharp edges; however, it will be difficult for inspectors and users to determine edges are too sharp without a reference to a product standard or listing or other specific testing means that defines a test method and pass/fail requirements.

ARTICLE 314 — OUTLET, DEVICE, PULL, AND JUNCTION BOXES, CONDUIT BODIES; FITTINGS; AND MANHOLES

9-37 Log #3065 NEC-P09 **Final Action: Accept**
(314.5)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Delete the following text:
~~314.5 Short-Radius Conduit Bodies.~~
~~Conduit bodies such as capped elbows and service-entrance elbows that enclose conductors 6 AWG or smaller, and are only intended to enable the installation of the raceway and the contained conductors, shall not contain splices, taps, or devices and shall be of sufficient size to provide free space for all conductors enclosed in the conduit body.~~
Substantiation: This is a companion proposal to move this text to section 314.16(C)(2). This proposal should only be accepted if that proposal is accepted as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-38 Log #2961 NEC-P09 **Final Action: Reject**
(314.15)

Submitter: Paul A. Keleher, Paul Keleher Electrical Services
Recommendation: Revise text as follows:
In damp or wet locations, boxes, conduit bodies and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the box, conduit body or fitting. Boxes, conduit bodies and fittings installed in wet locations shall be listed as watertight ~~for use in wet locations~~.
Substantiation: The requirements of sections 230.54(C), 230.54(F) and 230.54(G), are all intended to keep water from entering an overhead service at the service head. In their present wording, these sections rely on the positioning and arrangement of conductors, fittings and attachments to prevent the entry of water into a service raceway or cable. There is evidence to indicate that these requirements are not sufficient not sufficient to keep water from penetrating service raceways and cables at the service head.
Photographs taken by the submitter of installations that are fully compliant with these requirements are attached to this proposal as evidence of their failure to keep water from entering service equipment. The pictures illustrate a fully compliant installation which, when discovered 5 years after installation, had active water flowing inside the raceway onto the service terminals as shown in the pictures.
Service head fittings generally available for installation under these sections, when installed per their listing instructions, do not provide any seal against water penetration between the individual service conductors where the service conductors protrude from the service head to the point-of-attachment, or in the case of service cables, where the jacketed cable enters the service head.
Since Sections 230.54(A) and 230.54(B) require service heads for raceways and cable to comply with the requirement for fittings in 314.15, the proposed change to 314.15 would require the listing requirements of products intended for installation under these sections to include testing that meets the definition in Section 100 of "watertight" (Constructed so that water will not enter the enclosure under specified test conditions.).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP-9 is not convinced that the supplemental information provided with this proposal adequately substantiates the proposed requirement, which would compel changes to certain product standards. The service head in the photograph does not point down and is therefore improperly installed. In addition, the LB below the meter socket does not appear to have a weep hole (although this is not completely clear) and if this is the case, the installation is in violation of 230.53. Had the raceway been arranged to drain, the water would never have reached the panel.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-39 Log #3648 NEC-P09 **Final Action: Reject**
(314.16)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
314.16 Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies.
Boxes and conduit bodies enclosing conductors 4 AWG or larger shall ~~also~~ comply with the provisions of 314.28.
Substantiation: There are no volumes 314.16 that let you apply the in this section to conductors #4 and larger. The only rules that apply to these larger conductors are the ones found in 314.28.
Panel Meeting Action: Reject
Panel Statement: Although there are no prescriptive requirements in this section that apply to large conductors, the parent language about sufficient size does apply.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-40 Log #433 NEC-P09 **Final Action: Reject**
(Table 314.16(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise Table title as follows:
Table 314.16(B) Volume Allowance Required for Each ~~per~~ Conductor
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
This revision will also correlate with the heading over the last two columns in the Table.
The Index will need to be corrected to reflect this change.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-27.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-41 Log #3910 NEC-P09 **Final Action: Reject**
(314.16(B)(2))

Submitter: Andrew Darois, David Kramer Electric
Recommendation: Revise text as follows:
Clamps in molded plastic boxes that are built in shall not be counted.
Substantiation: These boxes are made with the clamps. Their volume is calculated taking into account the clamps. Some inspectors will have you count the clamps.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is inaccurate. The total cubic inches for nonmetallic boxes is determined with the internal cable clamps removed prior to the determination by the third-party testing agency. The requirement to take a single volume allowance for cable clamps is based on the fact that the clamps reduce the usable volume in the box when the box is wired. A molded clamp will reduce the usable volume when it is employed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-42 Log #179 NEC-P09 **Final Action: Reject**
(314.16(B)(4))

Submitter: Eric W. Dougan, Louis Perry and Associates
Recommendation: Add new text to read as follows:
"For GFCI receptacles or dimmer switches a triple volume allowance, in accordance with Table 314.16(B), shall be made for each device based on the largest conductor connected to the device."
Substantiation: If the minimum calculated box size (based on existing volume allowances per NEC) is used for GFCIs and dimmers installation is difficult trying to push device back into box after wiring.
Panel Meeting Action: Reject
Panel Statement: The volume requirements were increased years ago to accommodate larger devices because the decision as to what actual device would be used in a particular box was frequently made long after the rough inspection and the walls being closed in. The substantiation for this proposal could be considered in the context of partially reversing that former change and only applying a double allowance to GFCIs and dimmers, but it is not sufficient to require a triple allowance for these devices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-43 Log #241 NEC-P09 **Final Action: Reject**
(314.16(B)(4))

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Revise as follows:
A device or utilization equipment wider than a single 50 mm (2 in.) ~~device box as described in Table 314.16(A)~~ shall have double volume allowances provided for each gang of box required for mounting.
Substantiation: The change to the 2008 NEC, requiring additional device or equipment fill allowances, appears to be related to the width of the device or utilization equipment rather than the width of the box. While the width of the box can be used to determine the width of the device or equipment, a direct reference to the device or equipment seems less complicated.
Panel Meeting Action: Reject
Panel Statement: The requirement is based whether the device will fit in a single-gang device box with a nominal dimension of 50 mm (2 in.). Therefore, the rule does relate to the width of the installed devices, but in the context of how many gangs are required to accommodate them. If a two-gang box is required to support the device, then a fill allowance based on two devices is to be applied. Since some nonmetallic boxes are just enough larger to cause questions on certain devices, CMP-9 decided to specify the metal boxes covered in the table as the reference. These boxes are not exactly 50 mm (2 in.) wide, which is why the metric linear dimensions in the table are hard conversions. Since this rule concerns a linear measurement, the reference to the table is the only appropriate measurement. Note that the volumes in the table

are exact, and those metric conversions are soft conversions accordingly.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-44 Log #723 NEC-P09 **Final Action: Reject**
(314.16(B)(4))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
314.16 Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies.
Boxes and conduit bodies shall be of sufficient size to provide free space for all enclosed conductors. In no case shall the volume of the box, as calculated in 314.16(A), be less than the fill calculation as calculated in 314.16(B). The minimum volume for conduit bodies shall be as calculated in 314.16(C).
The provisions of this section shall not apply to terminal housings supplied with motors or generators.
FPN: For volume requirements of motor or generator terminal housings, see 430.12.
Boxes and conduit bodies enclosing conductors 4 AWG or larger shall also comply with the provisions of 314.28.
(B) Box Fill Calculations. The volumes in paragraphs 314.16(B)(1) through (B)(5), as applicable, shall be added together. No allowance shall be required for small fittings such as locknuts and bushings.
(4) Device or Equipment Fill. For each yoke or strap containing one or more devices or equipment, a double volume allowance in accordance with Table 314.16(B) shall be made for each yoke or strap based on the largest conductor connected to a device(s) or equipment supported by that yoke or strap. A device or utilization equipment wider than a single 50 mm (2 in.) device box as described in Table 314.16(A) shall have double volume allowances provided for each gang required for mounting. <u>No additional volume allowance shall be required for connectorized terminations where those connectorized terminations for each device are terminated at that device. Where a device intended for connectorized terminations has yet to be installed or has been removed but its connectorized terminations are installed within the box, a double volume allowance shall be provided in anticipation of the device to be installed.</u>
[remainder of 314.16 unchanged by this Proposal]
Substantiation: A number of Listed devices are being provided with connectorized termination to speed installation (and subsequent replacement) and to minimize exposure to damage by the work of other trades during construction. Some examples are SNAPconnect™ by Hubbell, Quick-Tech™ by Bryant Electric, PlugTail™ by Pass & Seymour, and Lev-Lok by Leviton. There has been confusion by some electrical inspectors trying to treat the connectorized termination as YET ANOTHER device WITHIN the same device box gang in terms of volume allowances. The connectorized termination is to be regarded as part of the device when the device is installed and the connectorized termination is terminated in the device, since the mated combination consumes equivalent wiring volume to a typical terminated device having more traditional terminals (wire-binding screws, wiring clamp terminals, push-in pressure terminals, etc.). When the installed connectorized termination is left unterminated to a device and available for future termination, it should be regarded as consuming the wiring volume equivalent to the mated combination of the device and connectorized termination that could be eventually installed.
Although the examples of devices cited all employ a single connectorized termination for each device, it's readily foreseeable that some of such devices could employ multiple or modularly interlocked connectorized terminations for each device.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP-9 agrees with the submitter that no additional volume allowances need be provided for this method beyond the double allowance now in the NEC. The terminating equipment is no different than a twist-on wire connector or a locknut or bushing [see 314.16(B)], and the wiring tails are plainly exempt by 314.16(B)(1). No change in the NEC is required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-45 Log #3798 NEC-P09 **Final Action: Reject**
(314.16(B)(4))

Submitter: Ted "Smitty" Smith, Electrical Experts Consulting
Recommendation: Add text to read as follows:
Device or Equipment Fill. For each yoke or strap containing one or more devices or equipment, a double volume allowance in accordance with Table 314.16(B) shall be made for each yoke or strap based on the largest conductor connected to a device(s) or equipment supported by that yoke or strap. A device or utilization equipment wider than a single 50 mm (2 in) device as described in Table 314.16(A) shall have double volume allowances provided for each gang required for mounting. <u>A GFCI or AFCI duplex receptacle shall have three volume allowances provided for each GFCI or AFCI duplex receptacle installed in a box.</u>
Substantiation: With the new exceptions to 210.12 AFCI receptacles are now becoming available and GFCI receptacles of course have been in use for many years. The AFCI and GFCI receptacles are significantly larger than a standard device that is mounted on a single yoke. All field electricians have recognized this for many years and yet the CMP has been reluctant to allow changes to box fill requirements based on this. By requiring one additional volume allowance for these larger than normal receptacles we will be making the installations a little safer by giving these larger receptacles the room they need, we will be sizing the boxes larger, thereby reducing the damage to conductors and devices and reducing the heat in the box.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-42.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-46 Log #3799 NEC-P09 **Final Action: Reject**
(314.16(B)(4))

Submitter: David Filipiak, Sky Electric, Inc.
Recommendation: Add text to read as follows:
"...each gang required for mounting. <u>If a device is larger than 4.5 cubic in. (i.e., GFCI receptacles) in overall size a triple volume allowance in accordance with Table 314.16(B) shall be made for each yoke or strap based on the largest conductor connected to a device."</u>
Substantiation: Duplex GFCI receptacles on average are 1.85 times the size of a standard NEMA 5-15 duplex receptacle thus the need for a larger device box. A larger device box will allow the conductors attached to a GFCI receptacle the ability to be installed in a neat and workmanlike manner
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-42.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-47 Log #3496 NEC-P09 **Final Action: Reject**
(314.16(B)(4) Exception)

Submitter: Jeff Iott, Masco Corp.
Recommendation: Add an Exception to 314.16(B)(4):
<u>Exception: Listed devices and equipment wider than a single 50 mm (2 in.) device box that are marked with the cubic in. volume that they occupy within device boxes shall have their volume deducted based on their markings.</u>
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: Current product standards do not require the devices to be marked with their volume. Without substantiation, it is difficult to determine the intent of the submitter. Technical substantiation is required by the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-48 Log #3066 NEC-P09 **Final Action: Accept**
(314.16(C)(2))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Relocate the existing text of 314.5 to 314.16(C)(2) as follows.
(2) With Splices, Taps, or Devices. Only those conduit bodies that are durably and legibly marked by the manufacturer with their volume shall be permitted to contain splices, taps, or devices. The maximum number of conductors shall be calculated in accordance with 314.16(B). Conduit bodies shall be supported in a rigid and secure manner.
<u>Short radius conduit bodies such as capped elbows and service-entrance elbows that enclose conductors 6 AWG or smaller, and are only intended to enable the installation of the raceway and the contained conductors, shall not contain splices, taps, or devices and shall be of sufficient size to provide free space for all conductors enclosed in the conduit body.</u>
Substantiation: The rules for splicing conductors in conduit bodies should be in one section, not scattered throughout the article. A companion proposal to delete 314.5 will be made for correlation.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-49 Log #3887 NEC-P09 **Final Action: Reject**
(314.17(A))

Submitter: Jose Casillas, E Light Electric Services
Recommendation: Revise text as follows:
(A) Openings to be closed. Openings through which conductors enter shall be adequately (~~closed~~) (sealed).
Substantiation: Closed can mean anything, but sealed gives a better understanding and is safer as far as fire dangers. You can open and close a door, but to seal it is a lot better.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided to actually seal such an opening around a wiring entry. Boxes frequently have mounting holes or weep holes and these are not required to be sealed. Additional substantiation would need to be provided to support the argument that wiring entries should require

more complete closures.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-50 Log #2070 NEC-P09 **Final Action: Reject**
(314.17(B))

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Revise text to read as follows:

(B) Metal boxes, <u>enclosures</u>, and conduit bodies. Where raceway or cable is installed with metal boxes, <u>enclosures</u>, or conduit bodies, <u>not extending more than 3/4 in. beyond the fitting</u>, the raceway or cable shall be secured to such boxes, <u>enclosures</u>, and conduit bodies.

Substantiation: The NM cable sheath is being left more than 3 in. beyond the fittings, clamps, and the like, at different lengths in all types of equipment and enclosures leaving an unprofessional installation, adding heat, smoke, fuel to these enclosures increasing a type of fireload.
Panel Meeting Action: Reject
Panel Statement: The solution is in the wording of 300.14, because the 6-in. rule only begins where at the point where the sheath of a cable ends. The additional sheath as described in the substantiation, together with the conductors, may well overcrowd the box and as such would violate the first sentence of 314.16. CMP-9 prefers to not set a specific limit on permitted sheath length. At 314.17(B), this would only apply to metal boxes. Type NM cable is used quite often with nonmetallic boxes.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-51 Log #4612 NEC-P09 **Final Action: Reject**
(314.17(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the existing text and replace it with the following:

(D) Protection During Construction. Where outlet or device boxes are secured in place prior to the application of the surface finish and arranged for flush mounting in drywall, the open fronts shall be covered to prevent conductor damage during the surface application construction activities with protective plates identified for this purpose and marked “Not for Permanent Installation.”

Substantiation: The existing text, covering 4 AWG and larger conductors, add nothing to NEC requirements and can be deleted. The new text responds to an informal reconsideration of Proposals 3-32, 3-35, 3-36, and 9-38, and also Comments 3-8, 3-11, 3-13, 3-14, 3-15, 3-16, and 3-17 by a task group. The public is invited to review that material as part of its review of any action taken on this proposal. The intent is to respond to the prior substantiation with a requirement that reaches the source of the problem, and goes no further.

The reported problems that are of concern to this submitter focus on actual damage to conductors inflicted by pin routers run to let boxes into the finished dry wall sheet. The operator cannot see conductors within the box during the application of this tool. If the wires are anywhere near the forward edge of the box they will be damaged as the drywall sheet assumes its final position and the router plunges ahead. Other substantiation pointed to mud in boxes requiring time to clean out, but these problems are not safety issues; a little patience at the finish wiring stage will correct the problems.

A cut conductor, however, is another matter. The economic incentive for avoiding/disguising compliance with 300.14, which could often involve removing numerous sheets of drywall to rewire the box if enough additional cable is not available outside the box, is often extremely significant. If it occurs there is a genuine safety concern. We are long past the days when dry wall installers cut box openings by marking the location and cutting away from the box.

This proposal is limited to flush drywall applications where the box is secured as a rough opening. It does not apply to any other wall treatment. It does not apply to old work boxes. It does not apply to surface installations. The submitter intends this requirement to apply only to those instances where actual and not easily correctable damage to wiring occurs. The proposal also does not specify the material from which the protective plates must be made, or the thickness of the materials chosen. If reports come in of routers routinely penetrating nonmetallic covers, then CMP 9 would need to consider limiting the choice of materials, but that would drive up costs and should await actual loss reports. For now, whatever products a manufacturer is comfortable putting out on a cut sheet is sufficient. A listing requirement seems excessive at this time.

Panel Meeting Action: Reject
Panel Statement: No substantiation was provided to delete the existing text other than the submitter’s personal opinion that the existing text “add nothing to NEC requirements.”

Protection of all electrical equipment is important during construction. The panel agrees that electrical equipment of all types (i.e., including the various boxes covered by Article 314) are vulnerable as noted in the substantiation. The use of protective cover plates is permitted today, but is not the sole method for ensuring damage is not encountered and that the integrity of the electrical equipment and connections are maintained in accordance with 110.12(B). Prescriptive requirements should not be imposed, but rather a focus on compliance of the final installation.

While these covers may provide an alternative method to protecting conductors from damage and foreign material, they could create an enforcement and inspection problem by possibly requiring an additional rough inspection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-52 Log #1535 NEC-P09 **Final Action: Reject**
(314.17(E) or 314.26)

Submitter: Carlo Compagnone, Jr., Compa Covers, Inc.
Recommendation: Add new text as follows:

The open front of both metal and nonmetallic electrical device boxes shall be temporarily covered to protect insulated electrical conductors from physical damage or deterioration due to power routers, plaster, paint spray guns, spray foam insulation, and other potential damage during construction. The covers shall be clearly marked “Not For Permanent Installation”.

Substantiation: Leaving the front end of an electrical box open during the preliminary stages of construction results in exposed wires. This allows electrical wiring to be vulnerable to be cut or damaged during construction with power routers along with plaster filled boxes and overspray from paint guns and spray foam insulation guns, which in the end will leave a poor and unsafe working environment. Having a temporary cover on an electrical box is most of all a safety factor. Such covers will prevent build up of debris and puts a stop to unauthorized personnel tampering with wiring during the time of construction.

I have also submitted this proposal to Code-Making Panel 3 for 300.4(G).

Note: Supporting material is available for review at NFPA Headquarters.

Ballot Results: Affirmative: 12

9-55 Log #4806 NEC-P09 **Final Action: Reject**
(314.22)

Submitter: Leo F. Martin, Jr., Martin Electrical Code Consultants
Recommendation: Revise text to read as follows:

314.22 Add an additional sentence to read <u>Length of free conductor shall be in accordance with 300.14.</u>

Substantiation: It is necessary for maintenance that sufficient access to splices be permitted without dismantling the wiring system to gain access.
Panel Meeting Action: Reject
Panel Statement: Nothing in this rule makes 300.14 inapplicable, and therefore the applicability of 300.14 need not be restated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-56 Log #4744 NEC-P09 **Final Action: Accept in Principle**
(314.23(E) Exception)

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
(E) Raceway Supported Enclosure, Without Devices, Luminaires, or Lampholders. An enclosure that does not contain a device(s) other than splicing devices or support a luminaire(s), lampholder, or other equipment and is supported by entering raceways shall not exceed 1650 cm3 (100 in.3) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. Each conduit shall be secured within 900 mm (3 ft) of the enclosure or within 450 mm (18 in.) of the enclosure if all conduit entries are on the same side.
Exception: Rigid metal, intermediate metal, or rigid polyvinyl chloride nonmetallic conduit (PVC), reinforced thermosetting resin conduit (RTRC) or electrical metallic tubing shall be permitted to support a conduit body of any size, including a conduit body constructed with only one conduit entry, provided the trade size of the conduit body is not larger than the largest trade size of the conduit or electrical metallic tubing.
Substantiation: This is an addition from the result of the 2008 NEC adding of new code articles for each of the specific nonmetallic raceways and the conditions for their intended use. Remove the reference of "nonmetallic" and add in each of the specific raceway types. Non-metallic conduit now has four different types of raceways and not all non-metallic raceway types would be acceptable in all locations.
Panel Meeting Action: Accept in Principle
Revise the exception to read as follows:
Exception: The wiring methods listed in (1) through (5) shall be permitted to support a conduit body of any size, including a conduit body constructed with only one conduit entry, provided the trade size of the conduit body is not larger than the largest trade size of the conduit or tubing.
(1) Intermediate metal conduit, Type IMC
(2) Rigid metal conduit, Type RMC
(3) Rigid polyvinyl chloride conduit, Type PVC
(4) Reinforced thermosetting resin conduit, Type RTRC
(5) Electrical metallic tubing, Type EMT.
Panel Statement: CMP-9 agrees with the technical merit of the proposal. However, the resulting sentence will be too long to be easily understood. The panel action creates a list format, presented in the Chapter 3 article order.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-56a Log #CP900 NEC-P09 **Final Action: Accept**
(314.24)

Submitter: Code-Making Panel 9,
Recommendation: Revise 314.24 to read as follows:
314.24 Depth of Boxes. Outlet and device boxes shall have sufficient depth to allow equipment installed within them to be mounted properly and without likelihood of damage to conductors within the box.
(A) Outlet Boxes Without Enclosed Devices or Utilization Equipment. Outlet boxes that do not enclose devices or utilization equipment shall have a minimum internal depth of 12.7 mm (½ in.).
(B) Outlet and Device Boxes With Enclosed Devices or Utilization Equipment. Outlet and device boxes that enclose devices or utilization equipment shall have a minimum internal depth that accommodates the rearward projection of the equipment and the size of the conductors that supply the equipment. The internal depth shall include, where used, that of any extension boxes, plaster rings, or raised covers. The internal depth shall comply with all applicable provisions of (1) through (5).
(1) Large Equipment. Boxes that enclose devices or utilization equipment that projects more than 48 mm (1 7/8 in.) rearward from the mounting plane of the box shall have a depth that is not less than the depth of the equipment plus 6 mm (1/4 in.).
(2) Conductors Larger Than 4 AWG. Boxes that enclose devices or utilization equipment supplied by conductors larger than 4 AWG shall be identified for their specific function.
Exception to (2): Devices or utilization equipment supplied by conductors larger than 4 AWG shall be permitted to be mounted on or in junction and pull boxes larger than 1650 cm3 (100 in.3) provided the spacing at the terminals meets the requirements of 312.6.
(3) Conductors 8, 6, or 4 AWG. Boxes that enclose devices or utilization equipment supplied by 8, 6, or 4 AWG conductors shall have an internal depth that is not less than 52.4 mm (2 1/16 in.).
(4) Conductors 12 or 10 AWG. Boxes that enclose devices or utilization equipment supplied by 12 or 10 AWG conductors shall have an internal depth that is not less than 30.2 mm (1 3/16 in.). Where the equipment projects rearward from the mounting plane of the box by more than 25 mm (1 in.), the box shall have a depth not less than that of the equipment plus 6 mm (¼ in.).
(5) Conductors 14 AWG and Smaller. Boxes that enclose devices or utilization equipment supplied by 14 AWG or smaller conductors shall have a depth that is not less than 23.8 mm (15/16 in.).
Exception to (1) through (5): Devices or utilization equipment that is listed to be installed with specified boxes shall be permitted.
Substantiation: CMP 9 agrees with the many proposals submitted to add devices to the requirements in this section. This proposal returns this language (with the order changed slightly to agree with the current organization of the section) to that accepted by CMP 9 during the proposal stage of the 2008 NEC cycle as submitted by its task group (see Proposal 9-52 for that cycle). Upon reconsideration, CMP 9 finds no reason to exclude devices from the requirements presented here. A conductor pinned against the back wall of a box, particularly if forced against an inwardly-punched knockout or a poorly finished mounting hole, will be subject to insulation failure just as surely as if it were pinched by utilization equipment.
CMP 9 notes that its task group that generated the original 2008 proposal included a device manufacturer representative. That task group took care to review the box depths provided and compare them with wire dimensions in Table 5 of Chapter 9 and many actual representative device sizes. CMP 9 now concludes that the dimensions chosen will not adversely impact customary installation practice.
CMP 9 solicits industry comments that provide specific evidence of specific installation problems related to these dimensions for review at its December meeting.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-57 Log #1824 NEC-P09 **Final Action: Accept in Principle in Part**
(314.24)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: MINIMUM DEPTHS and WIDTHS OF BOXES. Boxes shall have a depth and width to allow conductors and other equipment to be installed in them without damage, and shall comply with applicable provisions of 314.16.
(A) BOXES WITHOUT ENCLOSED EQUIPMENT (other than splicing devices. No box shall have an internal depth of less than 23.8 mm (15/16 in.) and not less than 6 mm (1/4 in.) greater than the device or equipment contained. The internal depth shall be permitted to include that of any extension box, plaster ring, or raised cover. The internal depth shall comply with all applicable provisions of (C)(1) through (C)(5).
(1) CONDUCTORS LARGER THAN 4 AWG. Boxes that enclose conductors larger than 4 AWG shall comply with applicable provisions of 314.16 and 314.28.
(2) CONDUCTORS of 8, 6, or 4 AWG. Boxes that enclose conductors of 8,6, or 4 AWG shall have an internal depth that is not less than 52.4 mm (2-1/16 in.).
(3) CONDUCTORS 10 awg OR SMALLER. Boxes that enclose conductor 10 AWG or smaller shall have an internal depth of not less than 30.2 mm (1 3/16 in). Where the box also encloses equipment (other than splicing devices) the box shall have an internal depth not less than the equipment plus 6 mm (1/4 in.).
Substantiation: Edit. "Sufficiently: and "properly" are subjective and terms to be avoided per the Style Manual. Applicable provisions of 314.16 apply. "Outlet" and "device" are superfluous, covered in the title of this article. "Boxes" covers various uses and types. Splicing devices should be excluded. Equipment may be other than utilization equipment (that which does not utilize power) such as a switching device. The 1/4 in. clearance should also apply to width and whether or not equipment projects 1-7/8 in. rearward. Boxes that enclose 4 AWG or larger conductors whether or not connected to equipment within the box should comply with 314.16 and 314.28, which apply. (C)(5) should include all conductors smaller than 10 AWG.
Panel Meeting Action: Accept in Principle in Part
Accept in principle the concept of adding devices to the coverage provided by this section, as addressed in panel proposal 9-56a. Reject the depth modifications from current requirements.
Panel Statement: The depth modifications oversimplify the requirements and eliminate ceiling pans entirely.

9-74 Log #690 NEC-P09 **Final Action: Reject**
(314.26 (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Add new text to read as follows:

314.26 Conductors Inside Electrical Boxes. Conductors inside electrical boxes, subject to physical damage from router bits, sheetrock saws, and knives, and nonconductive coatings, such as drywall mud, paint, lacquer and enamel shall be protected during the construction process by means of a rigid cover, plate, or insert of a thickness and strength as to prohibit penetration by the above mentioned items.

Substantiation: This proposal is the revised language from Comment 3-8, Log #1837 as accepted in principle by CMP-3 during the 2008 NEC cycle. This comment had been held by direction of the TCC pending review and correlation by a Task Group. The Task Group consisting of Robert McCulllough, Chair CMP-9, Fred Hartwell CMP-9, Rod Belisle CMP-9, Louis Barrios CMP-1, Ken Boyce CMP-1, Sandy Egesdal CMP-3, and Ray Keden CMP-3, concluded that jurisdiction of this issue should rest with CMP-9. Accordingly, this is being submitted to CMP-9 as a proposal so the technical merits can be afforded full public review.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-51.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-75 Log #3121 NEC-P09 **Final Action: Reject**
(314.27)

TCC Action: The Technical Correlating Committee directs Code-Making Panel 9 to reconsider the proposal and act on its merits.

The Technical Correlating Committee directs that the Chairs of Code-Making Panels 9 and 18 establish a Task Group to review Proposals 9-75 and 18-130 with regard to application within their respective articles.

This action will be considered by Code-Making Panel 9 as a public comment.
Submitter: Patricia Barron, Safety Quick Light
Recommendation: Revise text as follows:
(A) At every outlet used exclusively for lighting, the box shall be designed or installed <u>supplied with a receptacle, specifically designed for luminaires, allowing for mechanical support and providing electrical connection to the branch circuit</u> so that a luminaire may be attached

(D) <u>Outlet boxes shall be supplied with a receptacle specifically designed for ceiling-suspended (paddle) fans allowing for mechanical support and providing electrical connection to the branch circuit so that a ceiling-suspended fan may be attached.</u>
Substantiation: <u>Statement Of Problem</u> – There are many cases of electrocutions and accidents that occur during installations of luminaires and ceiling fans, that result in a significant amount of **injuries, including death**.
<u>Substantiation for Proposal</u> - There is a receptacle and plug system available designed for **safe** installation of luminaires and ceiling fans that enables luminaires to be simply plugged "in" or "out" **without touching any wires.** This type of system will **save lives** and substantially **reduce or eliminate electrocutions or accidents** caused during installation of light fixtures or even when replacing light bulbs. If the outlet box is supplied with the safety receptacle, luminaires for ceiling or wall become plug "in" to install and "out" to remove **safely and simply** without touching wires. Luminaires can be unplugged from the branch circuit when changing bulbs or maintenance and plugged in safely when done. **There are cases of death and severe injury even** when changing light bulbs. This type of luminaire receptacle and plug system will **save lives and prevent injuries and needs** to be implemented into the code. Please refer to attached report outlining cases of electrocution.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The installation of luminaires and ceiling suspended paddle fans is not under the jurisdiction of CMP-9. Article 314 covers the specification and installation of outlet boxes for support of fixtures and ceiling-suspended paddle fans.

Luminaires installed in accordance with the NEC do not pose a safety hazard. The product is currently permitted by the code; however, insufficient technical substantiation has been provided to warrant mandatory use in all occupancies and applications.

Principal responsibility for this concept rests with CMP-18 and Article 410.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-76 Log #3346 NEC-P09 **Final Action: Reject**
(314.27)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (A) and substitute:

Boxes in or on a ceiling or other overhead structure used as support for luminares, lampholders, or other equipment shall be identified for the purpose and for a maximum weight of 23 kg (50 lbs). Boxes on a wall or other vertical member and used for support luminares, lampholders or other equipment shall be identified for the purpose and marked to indicate the maximum weight that is to be supported if more than 23 kg (50 lbs). Every box used for such support shall have provisions for attachment and support of the equipment.

Exception: A luminaire, lampholder, or other equipment weighing not more than 3 kg (6 lbs) shall be permitted to be supported by a box in or on a vertical member provided the equipment is secured to the box or plastering with no fewer than two No. 6 or larger machine screws.
Substantiation: Boxes that are overhead but not in a ceiling should be included. Present literal wording requires the box to (actually) support a luminaire weighing 50 lbs. Only boxes used for support should be covered by these provisions, and equipment other than luminaries and lampholders should be included in the rule and exception, such as CCTV cameras, signaling apparatus, occupancy sensors, exit signs, etc.

If this proposal is accepted (E) becomes superfluous.
Panel Meeting Action: Reject
Panel Statement: Most wall-mounted fixtures do not require a box rated for 23 kg (50 lb). Therefore, there is no reason to increase the requirements. Present text requires the boxes to be marked to indicate the maximum weight of the luminaire that is permitted to be supported if other than 23 kg (50 lb). Boxes with a 23 kg (50 lb) rating are required to have the marking on the smallest unit carton by the product standard. The requirement in the exception to only mount the box on a framing member is unsubstantiated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-77 Log #3905 NEC-P09 **Final Action: Accept in Principle**
(314.27)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by providing more description of "designed for the purpose."

This action will be considered by the panel as a public comment.
Submitter: Bradford D. Rupp, Allied Moulded Products, Inc.
Recommendation: Revise text as follows:

(A) Boxes at Luminaire Outlets. Outlet boxes or fittings designed for the support of luminaires and installed as required by 314.23 shall be permitted to support a luminaire ~~weighing 23 kg (50 lb) or less. Boxes used at luminaire or lampholder outlets in a ceiling shall be designed for the purpose and shall be required to support a luminaire weighing a minimum of 23 kg (50 lb)~~.
<u>(1) Luminaire Outlets in the Wall.</u> Boxes used at luminaire or lampholder outlets in a wall shall be designed for the purpose and shall be marked to indicate the maximum weight of the luminaire that is permitted to be supported by the box in the wall, if other than 23 kg (50 lb). ~~At every outlet used exclusively for lighting, the box shall be designed or installed so that a luminaire may be attached.~~

<u>Exception: A wall-mounted luminaire weighing not more than 3 kg (6 lb) shall be permitted to be supported on other boxes or plaster-rings that are secured to other boxes provided the luminaire or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.</u>

<u>(2) Luminaire Outlets in the Ceiling.</u> At every outlet used exclusively for lighting, the box shall be designed or installed so that a luminaire may be attached. Boxes ~~used at luminaire or lampholder outlets in a ceiling shall be designed for the purpose and~~ shall be required to support a luminaire weighing a minimum of 23 kg (50 lb). A luminaire that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box unless the outlet box is listed and marked for the maximum weight to be supported.

~~(B) Maximum Luminaire Weight. Outlet boxes or fittings designed for the support of luminaires and installed are required by 314.23 shall be permitted to support a luminaire weighing 23 kg (50 lb) or less. A luminaire that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box unless the outlet box is listed and marked for the maximum weight to be supported.~~
Substantiation: This proposal is not intended to change the requirements for outlet boxes that support luminaires. It is only attempting to clarify the text by aligning the requirements with the specific applications and eliminating the redundancy within the text. This change also eliminates 314.27(B) Maximum Luminaire Weight, which is confusing since the requirements in the section do not address the subject of the title.
Panel Meeting Action: Accept in Principle

Revise text to read as follows and re-letter subsequent paragraphs accordingly:

(A) Boxes at Luminaire Outlets. Outlet boxes or fittings designed for the support of luminaires and installed as required by 314.23 shall be permitted to support a luminaire.
(1) Luminaire Outlets in the Wall. Boxes used at luminaire or lampholder outlets in a wall shall be designed for the purpose and shall be marked on the interior of the box to indicate the maximum weight of the luminaire that is permitted to be supported by the box in the wall, if other than 23 kg (50 lb).
Exception: A wall-mounted luminaire weighing not more than 3 kg (6 lb) shall be permitted to be supported on other boxes or plaster-rings that are secured to other boxes provided the luminaire or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

(2) Luminaire Outlets in the Ceiling. At every outlet used exclusively for lighting, the box shall be designed or installed so that a luminaire may be attached. Boxes shall be required to support a luminaire weighing a minimum

of 23 kg (50 lb). A luminaire that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box unless the outlet box is listed and marked for the maximum weight to be supported.

Panel Statement: The panel action reinserts language that was included in the CMP 9 action on the 2008 cycle Proposal 9-56 but that was omitted from the first printing of the 2008 NEC in error. If the marking were on the outside of the box, it would be impossible to judge on a final inspection if a wall finish is applied. Luminaire selections are frequently made after the rough inspection is performed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-78 Log #1783 NEC-P09 **Final Action: Reject**

(314.27(A))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete text and substitute: Boxes installed on a horizontal support and used for the support of luminaires, lampholders, or the equipment shall be identified for the purpose and for support of a weight of 23 kg (50 lb). Boxes installed on a vertical support and used for the support of luminaries, lampholders or other equipment shall be identified for the purpose and marked to indicate the maximum weight to be supported if greater than 23 kg (50 lb).

Substantiation: The provisions should only apply where boxes are used for the support of equipment. Luminaires and other equipment may be supported independently and connected to the outlet by flexible cord, cable, or raceway. "Identified for the purpose" makes the last sentence superfluous. Anecdote: I once had the Los Angeles City Electrical Testing Laboratory test the support strength of a steel box cover attached to a 4 in. steel octagon box with two 8-32 machine screws. The cover bent and pulled off one screw at the screw slot at a weight of 353 lb but the screws remained intact. This indicated to me that support of the box itself is the critical factor.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 9-76.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-79 Log #4823 NEC-P09 **Final Action: Reject**

(314.27(A))

Submitter: David Zinck, Newburyport, MA Wiring Inspector

Recommendation: Revise text to read as follows:

(A) Boxes at Luminaire Outlets

Boxes used at luminaire or lampholder outlets ~~in a ceiling~~ shall be designed for the purpose ~~and shall be required to support a luminaire weighing a minimum of 23kg (50 lb). Boxes used at a luminaire or lampholder outlets in a wall shall be designed for the putpose and shall be marked to indicate the maximum weight of the luminaire that is permitted to be supported by the box in the wall, if other than 23kg (50lb)~~. At every outlet used exclusively for lighting, the box shall be designed or installed so that a light fixture may be attached.

Substantiation: My proposal restores the article to the 2005 NEC. The problem with this requirement is that it paints the world with a wide, one size fits all paintbrush. The original substantiation for this change in 2005 was that the homeowner "might" take down the fixture that the electrician installs and install a heavier one. How is it good code to hold an electrician responsible today for what a homeowner may or may not do 5 or 10 years later? If you check you will find that even most of the the simple nail-on non-metallic boxes are rated 50 lbs. (Would anyone ever hang a 50 lb. fixture from one of these?) So you could say, because of this, what is the harm in having the rule? If that were the only case than you could say what is the need?

Why should the box for a plastic lampholder in the basement, which weighs less than the light bulb being screwed into it be rated 50 lbs?

Far worse than that are light fixtures that are snaked in. What if the electrician is snaking in a light in a plaster & lathe ceiling? Should he be required to put in a paddlefan support assembly for a light that might weigh 2 lbs or less? Is the paddlefan assembly kit rated 50 lbs? What about a ceiling that has 3/8 sheetrock over 1' square tiles (popular in the 50's) which has 3/4 " furring strips over a plaster and split planking ceiling? What 50 lb rated assembly are we going to require him to use here?

Every inspector should except anything that is installed in keeping with it's UL listing. There is no way that his "gut feel" in the field is going to be better than UL's listing that is earned after hundreds of manhours of testing. In Massachusetts we take it one step further. It is mandated in 90.4 that an inspector **WILL** accept anything installed in keeping with its UL listing. Pass & Seymore has and old work non metallic box with swing out tabs that is UL listed for a fixture I believe up to 10 lbs Another old work box with a springy bracket that I checked is rated 15 lbs. I am sure that there are many more from several manufacturers. The point that I am making is that 90.7 implies that an inspector should accept UL listed items, 90.4 in Mass. mandates that we will accept the above mentioned boxes, and Article 314.27 demands that we do not accept them. Two articles in direct conflict.

When you think of all the possible ceiling luminaire installations, 314.27 is too restrictive and too short sighted for all of the possible applications and shod be changed back to the 2005 wording.

Panel Meeting Action: Reject

Panel Statement: Past revisions confirmed the panel's position that boxes rated for installation in a ceiling to support luminaires should be rated for the support of luminaires rated 50 lb or less. Listings do exist that rate (and mark) the boxes for lower values, and the standard used to evaluate these boxes allows for this type of product. A proposal has been submitted to the UL Standards Technical Panel to revise requirements to ensure compliance with the 2008 code. Similar to the NFPA process for revising the NEC, standards revisions do require time and may lag behind revisions to the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-80 Log #724 NEC-P09 **Final Action: Reject**

(314.27(B))

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Add text to read as follows:

314.27 Outlet Boxes.

(A) Boxes at Luminaire Outlets. *[unchanged by this Proposal]*

(B) Maximum Luminaire Weight. Outlet boxes or fittings designed for the support of luminaires and installed as required by 314.23 shall be permitted to support a luminaire weighing 23 kg (50 lb) or less. A luminaire that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box<u>,</u> unless the outlet box is listed and marked for the maximum weight to be supported <u>and the luminaire does not exceed the maximum weight marking of the outlet box</u>.

[remainder unchanged by this Proposal]

Substantiation: Not enforceable by the AHJ, due to Boolean logic failure. The conditional portion of the second sentence is one criterion short of a complete pass/fail test. As 314.27(B) is presently worded, a luminaire could weigh 100 lbs [the luminaire "weighs more than 23 kg (50 lb)"] and the outlet box could be "marked for the maximum weight to be supported" of 80 lbs and STILL the luminaire could be inadequately left NOT SUPPORTED INDEPENDENTLY nor supported by an outlet box of the PROPER weight capacity.

Panel Meeting Action: Reject

Panel Statement: Although this section of the code does not expressly limit the luminaire weight, the weight must not exceed the rating of the box because 110.3(B) makes that limitation enforceable. Therefore, the additional text is not required. See also the panel action and statement on Proposal 9-77.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-81 Log #1157 NEC-P09 **Final Action: Reject**

(314.27(D))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise text to read as follows:

(D) Boxes at Ceiling-Suspended (Paddle) Fan Outlets. Outlet boxes or outlet box systems used as the sole support of a ceiling-suspended (paddle) fan shall be listed, shall be marked by their manufacturer as suitable for this purpose, and shall not support ceiling-suspended (paddle) fans that weigh more than 32 kg (70 lb). For outlet boxes or outlet box systems designed to support ceiling-suspended (paddle) fans that weigh more than 16 kg (35 lb), the required marking shall include the maximum weight to be supported.

<u>Where two or more separate switched, ungrounded conductors are provided to a ceiling mounted outlet box, in single or multi-family dwellings, the outlet box or outlet box system shall be listed for sole support of a ceiling-suspended (paddle) fan.</u>

Substantiation: Many new homes are built with multiple wired switches that accommodate future installation of fans with luminaire kits. Since standard luminaires are installed in standard boxes, the homeowner, when replacing the luminaire with a fan, very likely will not know to replace the standard box with a ceiling box rated for support of a fan and luminaire kit.

The revised language limits this requirement to single or multi-family dwellings. The practice of supplying a ceiling box with two switches is a common practice in new construction. For example, a standard ceiling box listed for luminaires is installed in a bedroom when a ceiling fan is not supplied by the builder. Two switches are wired to the box. One of the switches is connected to the luminaire and the other switch is not connected. When the homeowner decides over a period of time to replace the luminaire with a ceiling fan and light kit and connect both switches, they will not be aware of the required markings for a ceiling fan box and will mount the ceiling fan to the standard ceiling box. Ceiling fan assemblies are often located over the bed.

There is no requirement anywhere in the NEC for a ceiling box rated for ceiling fan support when a fan is not installed. Today, when the homebuilder does not supply a fan, they are neither obligated nor required to install a fan rated ceiling box. The proposed text fixes this problem and addresses a safety issue to protect homeowners and their children from injury, fire or shock. Ceiling fan boxes are also required to be tested and listed for luminaire support per UL 514A and UL 514C.

Panel Meeting Action: Reject

Panel Statement: The proposal does not take into consideration the physical location of a box where locating a ceiling-suspended (paddle) fan would be impractical. There are numerous reasons to install multiple switched conductors to the outlet box location that would not involve the installation of a ceiling-

suspended (paddle) fan. There are also other accepted methods of installing a ceiling-suspended (paddle) fan that does not utilize a fan brace box.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
RUPP, B.: NEMA acknowledges the need to refine this proposal to address the examples cited by the panel while continuing to assert that the practice of installing "spare" circuit conductors in locations such as a bedroom lights without installing an outlet box or system designed to support a fan is a potential safety issue and should be addressed.
Comment on Affirmative:
LEMAY, T.: There are many reasons for installing two or more separately switched ungrounded conductors to a ceiling mounted outlet box. A few examples are dual level switching of multiple lamp or multiple ballasted luminaries, control of an outlet "down stream" from the referenced lighting outlet or having a spare controlled ungrounded circuit conductor in a light outlet for extension to a load in another part of the room at a later time.
To speculate that having two or more separately switched ungrounded conductors present in ceiling mounted outlet box as being a reason to require this outlet box to be a ceiling fan rated box does not, in itself, provide substantiation for an additional code requirement.

9-82 Log #6 NEC-P09 **Final Action: Reject**
(314.27(D) Exception (New))

NOTE: This proposal appeared as Comment 9-33 on Proposal 2-265 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 2-265 was:
Revise as follows:
Other than Dwelling Units: For attics and ~~underfloor~~ under floor spaces containing equipment requiring servicing, ~~such as heating, air-conditioning, and refrigeration equipment,~~ at least one lighting outlet containing a switch or controlled by a wall switch shall be installed in such spaces. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.
FPN: Examples of equipment requiring servicing may include but are not limited to heating, air-conditioning, refrigeration, power supplies and transformers used for signage.
Submitter: Alan Halbert, EE Products Inc.
Recommendation: Add a new exception to read:
314.27(D) Boxes at Ceiling-Suspended (Paddle) Fan Outlets. Outlet boxes or outlet box systems used as the sole support of a ceiling suspended (paddle) fan shall be listed, shall be marked by their manufacturers as suitable for this purpose, and shall not support ceiling-suspended (paddle) fans that weigh more than 32 kg (70 lb). For outlet boxes or outlet box systems designed to support ceiling-suspended (paddle) fans that weight more than 16 kg (35 lb), the required marking shall include the maximum weight to be supported.
Exception: For outlet box systems that are not subject to national testing standards and install through the interior of the outlet box, the system shall not be required to be listed.
Substantiation: The substantiation for this comment is provided in the abstract received by NFPA as supporting Material.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Boxes that support ceiling-suspended (paddle) fans are required to be listed to ensure that they can withstand the dynamic forces imparted by a fan. Since the intent of this product is to use the mounting bosses of non-rated outlet boxes to support the fan, it should be tested and marked with the catalog numbers of specific outlet boxes.
CMP-9 understands that the subject of this proposal is the proposed exception to 314.27(D).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-83 Log #3349 NEC-P09 **Final Action: Accept in Part**
(314.28(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A), delete "required to be".
In (1) and (2), add "or conduit body" after "box" in the first sentence.
Substantiation: Insulation, whether required or not, serves various purposes, including protection of the conductor from moisture and likelihood of short circuit and should be protected from damage. The requirements of (1) and (2) should also specifically apply to conduit bodies, as indicated in the heading.
Panel Meeting Action: Accept in Part
Accept the inclusion of the words "or conduit body" in (A)(1) and (A)(2). Reject the deletion of the words "required to be " from (A).
Panel Statement: Conductors that are not required to be insulated could be installed as bare conductors by right. If the decision is made for whatever design reasons to employ insulated conductors, no hazard results from incidental insulation damage during the installation process. Many grounding electrode conductors, the usual application of this provision, are installed using insulated conductors for no better reason than they happened to be available. In other cases the decision is deliberate, but related to environmental conditions where they emerge from the conduit system. In either case the withdrawal of the permission granted in the 2008 cycle would be excessive.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-84 Log #353 NEC-P09 **Final Action: Reject**
(314.28(A)(2) Exception)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise Exception as follows:
Exception: Where a raceway or cable entry is in the wall of a box or conduit body opposite a removable cover, the distance from that wall to the cover shall be permitted to comply with the distance required for one wire attached to a ~~per~~ terminal in Table 312.6(A).
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-27.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-85 Log #3667 NEC-P09 **Final Action: Reject**
(314.28(A)(2) Exception)

Submitter: Mark Smythe, Smythe Electric Inc.
Recommendation: Revise text as follows:
314.28(A)(2) ~~Exception~~ Exception No. 1
Exception No. 2: Where a single row of raceways or cables enters the wall of a box, and leaves the box through a wall opposite a removable cover, and the distance between raceways enclosing the same conductors is not less than 6 times the trade size of the largest raceway, the distance between the raceways inside the box and the opposite wall of the box would not be required to be increased for the additional entries in the same row.
Substantiation: Example: An installation where conduits enter the bottom of a pull box, and leave the back of the box opposite a removable cover. As long as the raceways enclosing the same conductors were spaced at least 6 times the diameter of the largest raceway as currently required by 314.28(A)(2), there would be no reason to increase the dimension of the box above the conduits exiting the back of the box. This additional space would not be utilized by the conductors. I have encountered a few installations similar to this and I have a hard time justifying requiring the installer to increase the box dimensions by adding the additional raceways as is currently required in this situation.
Panel Meeting Action: Reject
Panel Statement: The conductors must still be manipulated during the installation process and multiple sets of conductors entering the same wall decrease the room to apply cable bending tools or other installation procedures as successive sets are installed. It should be noted that this rule originally required a summation of all conduit entries on a single wall even if they occupied multiple rows. The decision to grant limited relief by taking a row at a time was controversial at the time but seems to be working well. CMP-9 is reluctant to further decrease the sizing on these pull boxes without more compelling substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-86 Log #3155 NEC-P09 **Final Action: Reject**
(314.28(A)(3))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Revise to read:
"Boxes or conduit bodies of dimensions less than those required in 314.28(A)(1) and (A)(2), including the Exception, shall be permitted...".
Substantiation: There are existing conduit bodies that are acceptable because they are listed for and are permanently marked with the maximum number and maximum size of conductors permitted by 314.28(A)(3), but are considered by some to not be acceptable because their dimension from the entry opposite to the removable cover does not comply with Table 312.6(A) called out in the Exception.
Panel Meeting Action: Reject
Refer to the action on Proposal 9-83, which inserted the words "or conduit body into the parent language of both (1) and (2).
Panel Statement: The exception applies as written and replaces the required dimension from opposite a removable cover with the Table 312.6(A) distance. This will now very clearly apply to conduit bodies, as is already expressly stated in the exception. CMP-9 agrees that such conduit bodies are acceptable, but finds the wording sufficiently obvious that no further changes in code wording are required. In fact, conduit bodies could almost never be used with large conductors without applying the exception.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-87 Log #577 NEC-P09 **Final Action: Accept in Principle**
(314.28(E))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by providing a title for 314.28(E)(5).

This action will be considered by the panel as a public comment.

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Add new text as follows:
(B) Power Distribution Block. Power distribution blocks shall be permitted for connections of conductors in sizes 4 AWG or larger where installed in metal boxes and the installation complies with (1) through (4).
(1) Installation. Power distribution blocks installed in metal boxes shall be listed.
(2) Size. In addition to the sizing requirement in 314.28(A), the power distribution block shall be installed in a metal box with dimensions not smaller than specified in the installation instructions of the power distribution block.
(3) Wire Bending Space. Wire bending space at the terminals of power distribution blocks shall comply with 312.6(B).
(4) Live Parts. Power distribution blocks shall not have uninsulated live parts exposed within a metal box, whether or not the box cover is installed.
Substantiation: This proposal seeks provisions in Article 314 that recognize the installation of power distribution blocks as a termination or connection means for conductors contained within a metal box. Similar provisions already exist in Article 376 for wireways, but since these types of connections could also be made in a box, the NEC should include similar rules in Article 314. The proposal seeks to limit the use of power distribution blocks to sizes 4 AWG or larger to place inherent limitations on the box size where they would be permitted. The panel may wish to include additional allowances for power distribution blocks in smaller boxes that are addressed in Table 314.16(A).
Panel Meeting Action: Accept in Principle
Add new text as follows:
(E) Power Distribution Block. Power distribution blocks shall be permitted in pull and junction boxes over 1650 cm3 (100 in.3) in size for connections of conductors where installed in metal boxes and the installation complies with (1) through (5).
Exception: Equipment grounding terminal bars shall be permitted in smaller enclosures.
(1) Installation. Power distribution blocks installed in metal boxes shall be listed.
(2) Size. In addition to the overall size requirement in the first sentence of 314.28(A)(2), the power distribution block shall be installed in a metal box with dimensions not smaller than specified in the installation instructions of the power distribution block.
(3) Wire Bending Space. Wire bending space at the terminals of power distribution blocks shall comply with 312.6.
(4) Live Parts. Power distribution blocks shall not have uninsulated live parts exposed within a metal box, whether or not the box cover is installed.
(5) Where the pull or junction boxes are used for conductors that do not terminate on the power distribution block(s), the through conductors shall be arranged so the power distribution block terminals are unobstructed following installation.
Panel Statement: CMP-9 agrees that this is a reasonable use for pull and junction boxes but wishes to reserve the practice for larger enclosures. Boxes of this size need not be limited to 4 AWG and larger conductors. In addition, these involve terminations, and the only sizing rule is the one for splices in 314.38(A)(2). Since pull and junction boxes are routinely capable of entry from multiple directions, the correct spacing from terminal to enclosure wall may qualify for the less conservative values in Table 312.6(A), and there is no reason to exclude those dimensions if they would apply. The exception provides for commonly used equipment grounding terminal bars. Finally, if the pull or junction box also includes through conductors, access to the distribution blocks should be maintained to terminals can be torqued or tested safely and without relocating or damaging the through conductors. The panel action editorially corrects the proposed (B) reference to (E).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HARTWELL, F.: CMP 9 inadvertently omitted a title for Paragraph (5) that will be required to comply with NEC Style Manual provisions. I would suggest "Through Wiring" as a suitable title for this provision.

9-88 Log #1696 NEC-P09 **Final Action: Accept**
(314.30(D))

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise the text in 314.30(D) as follows:
314.30 Handhole Enclosures.
(D) Covers. Handhole enclosure covers shall have an identifying mark or logo that prominently identifies the function of the enclosure, such "electric." Handhole enclosure covers shall require the use of tools to open, or they shall weigh over 45 kg (100 lb). Metal covers and other exposed conductive surfaces shall be bonded in accordance with 250.92~~(A)~~ if the conductors in the handhole are service conductors, or in accordance with 250.96(A) if the conductors in the handhole are feeder or branch-circuit conductors.
Substantiation: By deleting the reference to 250.92 part (A) which is general requirements for bonding of services, and referencing the entire 250.92 without being specific to (A), the actual methods of bonding at the service found in part (B) would be included in this requirement.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-89 Log #1049 NEC-P09 **Final Action: Reject**
(314.40(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
~~A~~ An identified means shall be provided in each metal box for the connection of ~~an~~ a wire-type equipment grounding conductor. The means shall be permitted to be a tapped hole ~~or equivalent~~ with at least two machine screw threads or a hole for a nut and bolt connection. Identified grounding clips shall be permitted.
Substantiation: The provision is apparently for wire type conductors since connection of metal raceways and cables provide a grounding means. "Equivalent" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The requirement as presently stated, occurring in the construction portion of the article, is a sufficient policy statement for a rule that will be implemented through the product standard. CMP-9 does not wish to further constrain the product standard revision process in this subject area. An identified grounding clip is not equivalent to a tapped hole.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-90 Log #4611 NEC-P09 **Final Action: Accept**
(314.40(D) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following new subsection to 314.40, renumbering the present 314.40(D) as 314.40(E):
(D) Enclosure Edges. All sharp edges of metal pull and junction boxes over 1650 cm^3 (100 $in.^3$) in size that are subject to hand contact during customary installation activity shall, at the time of manufacture, be protected or shall be de-burred and rounded to minimize the risk of injury.
Substantiation: This proposal incorporates by this reference all technical substantiation provided in the 2008 cycle relative to Proposal 9-81 and Comment 9-42. The proposal is being made to rebut the position of the TCC that resulted in the rejection of this action in the 2008 cycle on the basis that it contained "unenforceable and vague terminology, such as "during customary installation activity" and "at the time of manufacture, be protected."
This action is to occur in Part III of the article, covering construction specifications. Parts of articles that include these parts are collections of policy statements by the NEC Committee that provide the basis for specific requirements developed as part of the product standard development process. We need go no further than the other lettered paragraphs in the proposed section in the companion proposal to this one aimed at 312.10 to illustrate this principle. Current Part (A) of that section requires protection against corrosion inside and out; how is this more enforceable? Current Part (B) of that section requires "ample strength and rigidity"; how is this less vague? The phrase "at the time of manufacture" effectively mandates that this become a subject for the product standard. The fact is that without product standards the North American safety system falls apart.
It would indeed be possible to write very specific rules, and they would not be pretty. We could access CPSC medical research and discover what radius (in microns, of course) of curvature on a raw edge of what degree of angle constitutes a cut hazard, and perhaps even make a stab at refining that number to account for the fact that most electricians have pretty tough skin on their hands. Where in the NEC does such a rule exist in a construction specification part of an article? Nowhere. The submitter has great confidence that if this policy direction becomes part of the NEC, the standards developers and the manufacturers will come up with something appropriate.
This issue has come up many times over the years, and CMP 9 has deferred to the product standards over and again, and nothing has taken place. This submitter is the senior member on CMP 9, and during the proposal period warned the NEMA and UL representatives that this was a recurring issue and that patience was running out. Nothing happened. The submitter of Comment 9-42, in his activities with the JATC, noted at the comment meeting that the problem among his members was so routine and severe that they were issuing gloves to avoid cuts on the metal edges. Enough is enough. This submitter, a working electrician 40 hours a week, wears the substantiation for this proposal in the form of scar tissue on his hands.
This proposal has no delayed effective date. The manufacturers have had their three years; if they promise to take this seriously then a date can be set as part of the comment period. The policy decision should stand.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4

Explanation of Negative:

BREITKREUTZ, B.: See my Explanation of Negative Vote on Proposal 9-36 (Log #4610).

COGHILL, P.: See my Explanation of Negative on Proposal 9-36 (Log #4610).

OSBORNE, R.: See negative comment on Proposal 9-36.

RUPP, B.: The substantiation for this proposal states that this issue has come up repeatedly over the years yet NEMA manufacturers of this equipment and UL representatives have no documented incidents or field complaints dealing with this issue. This lack of evidence and factual substantiation supports NEMA's position that this requirement is adequately addressed in the standards covering these products and is not needed within the installation code. In addition, the submitter's substantiation states that "The proposal is being made to rebut the position of the TCC…" yet none of the objectionable wording previously identified by the TCC has been changed in this proposal. NEMA manufacturers continue to encourage their customers to provide feedback when their products cause injuries. Also, UL actively solicits participation on the technical panels of the product standards to affect changes where necessary

Comment on Affirmative:

HARTWELL, F.: Refer to my Comment on Affirmative Vote for Proposal 9-36; the same arguments apply to large pull boxes covered here.

YOUNG, R.: The ACC supports having pull and junction boxes with no sharp edges; however, it will be difficult for inspectors and users to determine edges are too sharp without a reference to a product standard or listing or other specific testing means that defines a test method and pass/fail requirements.

9-91 Log #3348 NEC-P09 **Final Action: Reject**
(314.42)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Covers of outlet boxes and conduit bodies having ~~holes~~ openings through which flexible cord pendants ~~may~~ pass shall be provided with ~~approved~~ identified bushings or connectors, or shall have smooth, well-rounded surfaces on which the cord may bear. Where individual conductors pass through a metal cover or enclosure a separate hole equipped with ~~a~~ an identified bushing of ~~suitable~~ insulating material shall be provided for each conductor. ~~Such separate holes shall be connected by a slot as required by 300.20.~~

FPN: See 300.20(B).

Substantiation: Edit. "May" and "suitable, are subjective and terms to be avoided per the Style Manual. The provision should apply where pendants are actually installed. Openings "may" accommodate pendants, but be closed with plugs or seals.

Panel Meeting Action: Reject

Panel Statement: CMP-9 believes the AHJ is qualified to determine the suitability of a bushing, and therefore "approved" is the appropriate standard for product acceptance in this case. There has been no substantiation to support the elimination of the slotting requirement that correlates with 300.20.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-92 Log #3347 NEC-P09 **Final Action: Accept in Principle**
(314.70)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Where pull or junction boxes, or conduit bodies are used...(remainder unchanged).

Substantiation: Edit. The requirements should be specifically applicable to conduit bodies since 314.1 includes conduit bodies used as pull or junction, boxes but does not make a conduit body a box.

Panel Meeting Action: Accept in Principle

I. Revise 314.70 to read as follows:

314.70 General

(A) Pull and Junction Boxes. Where pull and junction boxes are used on systems over 600 volts, the installation shall comply with the provisions of Part IV and with the following general provisions of this article:

(1) Part I, 314.2; 314.3; and 314.4

(2) Part II, 314.15; 314.17; 314.20; 314.23(A), (B), or (G); 314.28(B); and 314.29

(3) Part III, 314.40(A) and (C); and; 314.41

(B) Conduit Bodies. Where conduit bodies are used on systems over 600 volts, the installation shall comply with the provisions of Part IV and with the following general provisions of this article:

(1) Part I, 314.4

(2) Part II, 314.15; 314.17; 314.23(A), (E), or (G); and 314.29

(3) Part III, 314.40(A); and 314.41

(C) Handhole Enclosures. Where handhole enclosures are used on systems over 600 volts, the installation shall comply with the provisions of Part IV and with the following general provisions of this article:

(1) Part I, 314.3; and 314.4

(2) Part II, 314.15; 314.17; 314.23(G); 314.28(B); 314.29; and 314.30

***

II. Revise 314.71 to read as follows:

314.71. Size of Pull and Junction Boxes, Conduit Bodies, and Handhole Enclosures. Pull and junction boxes and handhole enclosures shall provide adequate space and dimensions for the installation of conductors, and they shall comply with the specific requirements of this section. Conduit bodies shall be permitted provided they meet the dimensional requirements for boxes.

***

III. Change the title of Part IV to read "Pull and Junction Boxes, Conduit Bodies, and Handhole Enclosures for Use on Systems over 600 Volts, Nominal."

Panel Statement: The applicable requirements for conduit bodies in the general part of the article differ from those for conduit bodies and need to be listed separately. The action taken meets the submitter's intent. In addition, CMP-9 has added coverage for handhole enclosures. This was overlooked when handhole enclosures were added to Article 314.

Number Eligible to Vote: 12

9-93 Log #3244 NEC-P09 **Final Action: Accept**
(314.72(D))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text as follows:

Boxes and conduit bodies shall be installed so that the ~~wiring is~~ conductors are accessible without removing any fixed part of the building or structure.

Substantiation: Edit. Conduit bodies and structures other than buildings should be included.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-94 Log #713 NEC-P09 **Final Action: Reject**
(314.72(E))

Submitter: Joe Tedesco, Boston, MA

Recommendation: New FPN: NFPA 70E-2009, Standard for Electrical Safety in the Workplace, covers arc flash hazard analysis, 130.3.

Substantiation: NFPA 70E does not require signs reading: "DANGER HIGH VOLTAGE KEEP OUT".

Panel Meeting Action: Reject

Panel Statement: The warning is directed in part at unqualified persons who are not necessarily employees covered by NFPA 70E. The substantiation does not support the positioning of the note in this location.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 320 — ARMORED CABLE: TYPE AC

7-3 Log #4533 NEC-P07 **Final Action: Accept**
(320.2.Armored Cable, Type AC)

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revised text as follows:

320.2 Definition.

Armored Cable, Type AC. A fabricated assembly of insulated conductors in a flexible interlocked metallic armor ~~enclosure~~. See 320.100.

Substantiation: The present definition incorrectly used the word "enclosure." That term is defined in Article 100 as, "The case or housing of apparatus, or the fence or walls surrounding an installation to prevent personnel from accidentally contacting energized parts or to protect the equipment from physical damage."

Other proposed changes to the definition are intended to be editorial in nature and more accurately describe the product.

Panel Meeting Action: Accept

Panel Statement: Enclosure as defined in Article 100 does not apply to cable. This is a better description.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-4 Log #1526 NEC-P07 **Final Action: Reject**
(320.2.Armored Cable, Type AC.)

Submitter: Stanley Kaufman, CableSafe, Inc.

Recommendation: Revise text as follows:

320.2 Definition.

Armored Cable, Type AC. A fabricated assembly of insulated conductors, with or without optical fiber members, in a flexible metallic enclosure. See 320.100.

Substantiation: Article 330 explicitly mentions optical fibers in the definition of Metal Clad Cable.

"330.2 Definition.

Metal Clad Cable, Type MC. A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic sheath."

Since Armored Cables can also contain optical fibers, this proposal would add optical fibers to the definition of Armored Cable also.

Panel Meeting Action: Reject

Panel Statement: Section 770.3(A) permits composite cables and requires that they be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable. Adding text to permit optical fiber members in the cable article is redundant.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-5 Log #2667 NEC-P07 **Final Action: Reject**
(320.10)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise first sentence:

Type AC cable shall only be permitted as follows:

Substantiation: Edit. Present wording is not a requirement: 90.5(B) states "shall be permitted" identifies actions allowed but not required, therefore, other use except as covered in 360.12 is not limited.

Panel Meeting Action: Reject

Panel Statement: Addition of the word "only" would conflict with the FPN at the end of 320.10. Uses permitted correctly identifies common uses but does not limit other applications as long as 320.12 is not violated. Uses permitted is not intended to be an all-inclusive list.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-6 Log #1796 NEC-P07 **Final Action: Accept in Principle in Part**
(320.10(1))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: For ~~feeders and branch~~ circuits in both exposed and concealed ~~work~~ installations.

Substantiation: Edit. The type of circuits is irrelevant; "feeders and branch circuits" doesn't include signal and control circuits.

Panel Meeting Action: Accept in Principle in Part

Accept in part the change of "work" to "installations". Revise to read "For feeders and branch circuits and control circuits in both exposed and concealed installations."

Panel Statement: The term "installations" is more appropriate. Since Type AC cable is rated 600V, it would not normally be used for signal circuits. Use of the term "circuits" would imply that it could be used for other applications such as service entrance.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-7 Log #533 NEC-P07 **Final Action: Reject**
(320.12)

Submitter: Joseph Penachio, Northeast Metro Tech H.S.

Recommendation: Revise text to read as follows:

(1) Services

(2) Where subject to ~~physical~~ damage.

(3) In damp or wet locations.

(4) In air voids of masonry block or tile walls where such walls are exposed or subject to excessive moisture or dampness.

(5) Where exposed to corrosive fumes or vapors.

(6) Embedded in plaster finish or brick or other masonry in damp or wet locations.

Substantiation: 230.43 services doesn't list AC as one of the wiring methods, and 320.10 doesn't list it as being permitted.

Adding services as (1) in the list of uses not permitted would clearly state that AC is not permitted in a clear positive text conforming with the new style format. Damage is damage so deleting the word physical doesn't change the text or intent of the code.

Panel Meeting Action: Reject

Panel Statement: The present wording is clear. Section 230.43 does not list type AC as an acceptable wiring method for service installations. This proposed language would be in conflict with section 3.3.5 of the NEC Style Manual. The striking of the term physical from 320.12(1) is also not appropriate and would conflict with the general provision of 3.2.5.5 of the NEC Style Manual.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-8 Log #1763 NEC-P07 **Final Action: Reject**
(320.12(1))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: (1) Where likely to be subject to physical damage which impairs its functional capabilities.

Substantiation: One reason for using this wiring method is to provide a degree of physical protection for contained conductors which should not preclude use where damage which may occur is negligible. "Damage" is not defined; a small dent is damage. Much such damage does not affect conductors, grounding, or other functions.

Panel Meeting Action: Reject

Panel Statement: The proposed language does not add clarity to the existing language. The use of the term "likely" is unenforceable and vague and does not comply with 3.2.1 of the NEC Style Manual. The cable is not permitted to be installed where it is exposed to physical damage. Addition of the phrase "which impairs its functional capabilities" is subjective and vague and does not comply with 3.2.1 of the NEC Style Manual.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-9 Log #4534 NEC-P07 **Final Action: Reject**
(320.12(1))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise text as follows:

320.12 Uses Not Permitted.

Type AC cable shall not be used as follows:

(1) Where likely to be damaged where installed ~~subject to physical damage~~

(2) through (5) unchanged.

Substantiation: It can be safely said that all wiring methods are "subject to physical damage." This phrase is far too general and subjective. At times, opponents of cable wiring methods use the simple statement in the present Code rule as license to unreasonably restrict the use of Type AC cables. All wiring methods should be installed in a manner and location so the wiring method is not expected to be damaged in ordinary use. For example, wiring installed in walls, ceilings and floors in compliance with 300.4 can be reasonably expected to be isolated from physical damage in ordinary building operations. Can the cables be damaged in an unexpected event such as cutting a hole in the wall with a reciprocating saw to make a door opening? Certainly. However that is not likely to happen in normal building operation.

Listed Type AC cables are subject to extensive testing as prescribed in UL 4, the product safety standard. This testing ensures Type AC cables are suitable to be installed in most all ordinary locations.

The term "likely" is used in many NEC sections such as providing a condition the event or condition will occur such as: "… likely to become energized …", "… maximum fault current likely to be imposed …", "… not likely to be damaged …", "…equipment likely to be disconnected for repairs or replacement …", "… not likely to stretch during or after installation …" and "… conduct safely any fault current likely to be imposed".

Panel Meeting Action: Reject

Panel Statement: The proposed language does not add clarity to the existing language. The use of the term "likely" is unenforceable and vague and does not comply with 3.2.1 of the NEC Style Manual. The cable is not permitted to be installed where it is exposed to physical damage.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

STRANIERO, G.: The term "likely" is used 99 times throughout the NEC. Section 3.2.1 of the NEC Style manual states that the terms contained in Table 3.2.1, including the word "likely" shall be reviewed in context, and, if the resulting requirement is unenforceable or vague, the term shall not be used. In this instance the use of the term is not unenforceable or vague.

Comment on Affirmative:

HUNTER, C.: While the rejection of the word "likely" is appropriate, the submitter brings up valid concerns. The Panel should form a task force to consider revising or defining what "subject to physical damage" really means.

7-10 Log #1805 NEC-P07 **Final Action: Accept in Principle in Part**
(320.12(1) and (3))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: (1) Where likely to be subject to physical damage

Revise: (3) Where likely to be subject to corrosive agents. ~~vapors~~

Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is a term used in many sections. Corrosive liquids and solids should be included.

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

(4) Where exposed to corrosive conditions.

Panel Statement: See panel statement on Proposal 7-8 for the part not accepted. The panel has revised the wording of submitter's (3) and numbered it (4) as it appears in the code. The panel accepts in principle the term "agents" to include corrosive liquids and solids but changes the term to "conditions" to be all inclusive.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-11 Log #4535 NEC-P07 **Final Action: Reject**
(320.15)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise as follows:
320.15 Exposed Work.
Exposed runs of cable, except as provided in 300.11(A), shall closely follow the surface of the building finish or of running boards. Exposed runs shall also be permitted to be installed on the underside of joists where supported at each joist and located so as not likely to be damaged where installed ~~subject to physical damage~~.
Substantiation: It can be safely said that all wiring methods are "subject to physical damage." This phrase is far too general and subjective. At times, opponents of cable wiring methods use the simple statement in the present Code rule as license to unreasonably restrict the use of Type AC cables. All wiring methods should be installed in a manner and location so the wiring method is not expected to be damaged in ordinary use. For example, the exposed wiring covered by the present rule can be reasonably expected to be isolated from physical damage in ordinary building operations. Can the cables be damaged in an unexpected event such as using the cables to support other objects or persons? Certainly. However that is not likely to happen in normal building operation.

Listed Type AC cables are subject to extensive testing as prescribed in UL 4, the product safety standard. This testing ensures Type AC cables are suitable to be installed in most all ordinary locations.

The term "likely" is used in many NEC sections such as providing a condition the event or condition will occur such as: "… likely to become energized …", "… maximum fault current likely to be imposed …", "… not likely to be damaged …", "…equipment likely to be disconnected for repairs or replacement …", "… not likely to stretch during or after installation …" and "… conduct safely any fault current likely to be imposed".
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-9.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
STRANIERO, G.: See my reason for negative vote on 7-9.

7-12 Log #1542 NEC-P07 **Final Action: Reject**
(320.17)

Submitter: Richard Hollander, City of Tucson
Recommendation: Revise text as follows:
320.17 Through or Parallel to Framing Members. Type AC cable shall be protected in accordance with 300.4(A), (B)(2), (C), and (D) where installed through or parallel to framing members.
Substantiation: To correlate with code change Proposal 300.4(B)(2).
Panel Meeting Action: Reject
Panel Statement: 300.4(B)(2) is specifically limited to nonmetallic sheathed cable and electrical nonmetallic tubing and is not applicable to Type AC cable. The submitter did not provide any technical substantiation and there is no documented history of failure with the permitted installation of Type AC cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-13 Log #4536 NEC-P07 **Final Action: Accept in Principle in Part**
(320.23)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal concerning the use of the word "when" since the NEC Style Manual considers "when" as a condition of time.
This action will be considered by the panel as a public comment.
Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text as follows:
320.23 In Accessible Attics.
Type AC cables in accessible attics or roof spaces shall be installed as specified in 320.23(A) and (B).
(A) Cables ~~Where~~ Run Across the Top of Framing Members ~~Floor Joists~~.
In attics and roof spaces that are accessible, cables that are installed within 2.1 m (7 ft) above the framing members such as ceiling or floor joists shall be protected by substantial guard strips that are at least as high as the cable if the cable is: ~~Where~~
(1) run across the top of framing members ~~floor joists, or within 2.1 m (7 ft) of floor or floor joists~~
(2) across the face of rafters or studding, ~~in attics and roof spaces that are accessible, the cable shall be protected by substantial guard strips that are at least as high as the cable~~.
If ~~Where~~ this space is not accessible by permanent stairs or ladders, protection shall only be required within 1.8 m (6 ft) of the nearest edge of the scuttle hole or attic entrance.
(B) Cable Installed Parallel to Framing Members. If ~~Where~~ the cable is installed parallel to the sides of framing members such as rafters, studs, ~~or~~ ceiling or floor joists, neither guard strips nor running boards shall be required, and the installation shall also comply with 300.4(D).
Substantiation: This proposal intends editorial improvements rather than substantive changes. The term "framing members" is a much more accurate term for this section as often the joists that serve as the lower level of the attic are referred to as ceiling joists and not floor joists. Floor joists support the floor and not the attic or roof. The issues become clearer when the attached drawing is observed.

In addition, the sentence is proposed to be restructured for ease of reading and understanding.

Correcting this section is important since other articles, such as Articles 330 and 334 refer to this section rather than stating their own rule.

Here is a list of other sections that use the term "framing members:"
250.2 Ground-Fault Current Path FPN
300.4(D)
314.23(D)(1)
410.36(B)

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
320.23 In Accessible Attics.
Type AC cables in accessible attics or roof spaces shall be installed as specified in 320.23(A) and (B).
(A) Cables ~~Where~~ Run Across the Top of Floor Joists.
When ~~where~~ run across the top of floor joists, or within 2.1 m (7 ft) of floor or floor joists
across the face of rafters or studding, the cable shall be protected by substantial guard strips that are at least as high as the cable.
If ~~Where~~ this space is not accessible by permanent stairs or ladders, protection shall only be required within 1.8 m (6 ft) of the nearest edge of the scuttle hole or attic entrance.
(B) Cable Installed Parallel to Framing Members. When ~~Where~~ the cable is installed parallel to the sides of rafters, studs, ~~or~~ ceiling or floor joists, neither guard strips nor running boards shall be required, and the installation shall also comply with 300.4(D).
The panel rejects all remaining changes by the submitter.
Panel Statement: The addition of the word "cable" modified the title of (A) to be consistent with the title of (B). In second sentence of (A), the panel accepts the change of the word "where" to "If". The panel agrees with the removal of ~~in attics and roof spaces that are accessible,~~ in (A), since the phrase already appears in 320.23.
The panel agrees with the change from "or" to "ceiling or " in (B).
The panel accepted in principal the changing of "where" to "when" instead of "if". Both words comply with 3.3.4 of the NEC Style Manual.
The panel rejects the use of "framing member" as a general term since the current text is more descriptive for this application. Remaining changes do not provide additional clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
NIELSEN, D.: The proposed changes of "Where" replaced with "When" or "If" does not increase safety. The present code uses "Where" to indicate location. The change to "If" and "When" sets text to be time dependent. "Where" subject to physical damage is used throughout the code. This could be progressive to other parts of the code where "Where" is currently used. This change has potential to allow the opportunity for the user to be subjective in applying "If" and/or "When" the situation presents itself and not absolute in every location.

7-14 Log #2635 NEC-P07 **Final Action: Reject**
(320.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: SECURING and SUPPORTING.
(A) GENERAL. Type AC cable shall be secured to supports by staples, cable ties, straps, hangers or other fittings identified for the use and installed so as not to damage the cable.
(B) SPECIFIC Except as provided in (C) and 392.8(B) Type AC cable shall be secured to supports within 300 mm (12 in.) of terminations and at intervals not exceeding 1.4 m (4-$^1/_2$ ft). Runs secured in place through openings in framing members shall be considered supported.
FPN: See 300.4.
(C) UNSUPPORTED CABLES. Type AC cable shall be permitted to be unsupported where the cable complies with any of the following:
(1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical and the cable is fastened to supports at the point where it becomes accessible.
(2) Is not more than 600 mm (2 ft) in length where flexibility is necessary.

(3) No change.

(4) Intermediate support shall not be required where the cable is not more than 300 mm (12 in.) in length between enclosures secured in place and connected to threaded hubs or openings or through a knockout with no segments larger than the cable connector or with reducing washers larger than the largest knockout segment and the cable is bonded by identified means.

Substantiation: Securing and supporting are not necessarily the same. 392.8(B) should be noted as an "otherwise provided". "Terminations" replaces a laundry list of boxes, outlets, cabinets, etc. Runs through framing members should be secured in place (by size of opening, fasteners, protection plates). Support by openings in bar joists, for example do not provide in-place securement. Vertical runs through framing members provide support where cables are fastened, just as where vertical cables are fastened to the side of studs. A common accepted practice is to weave vertical cables in and out of openings in metal studs. Flexibility is sometime required at other than terminations, such as where crossing an expansion joint. Proposal provides for no intermediate support similar to 342.30(C) 344.30(C), and 352.30(C).

Panel Meeting Action: Reject

Panel Statement: The revision of the article does not improve existing language.

The submitter has not presented this proposal in accordance with the NFPA Regulations Governing Committee Projects, adopted by the Board of Directors. Furthermore, the referral to terminating and the deletion of the list of outlet box, junction box, cabinet, and fittings does not improve clarity and is considered more subjective then the current text. The removal of the reference to horizontal runs in the present subpart (B) would allow vertical runs of cable to be weaved though successive openings without mechanical support where the run is parallel to framing members.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-15 Log #2636 NEC-P07 **Final Action: Reject**

(320.30)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete and substitute: SECURING and SUPPORTING.

(A) GENERAL. Type AC cable shall be secured to supports by staples, cable ties, straps, hangers or other fittings identified for the use and installed so as not to damage the cable. Exception: Cables installed in raceway.

(B) SPECIFIC. Except as provided in (C) and 392.8(B) Type AC cable shall be secured to supports within 300 mm (12 in.) of terminations and at intervals not exceeding 1.4 m (4-$^1/_2$ ft). Runs secured in place through openings in framing members shall be considered supported.

FPN: See 300.4.

(C) UNSUPPORTED CABLES. Type AC cable shall be permitted to be unsupported where the cable complies with any of the following:

(1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical and the cable is fastened to supports at the point where it becomes accessible.

(2) Is not more than 600 mm (2 ft) in length where flexibility is necessary.

(3) No change.

(4) Intermediate support shall not be required where the cable is not more than 300 mm (12 in.) in length between enclosures secured in place and connected to threaded hubs or openings or through a knockout with no segments larger than the cable connector or with reducing washers larger than the largest knockout segment and the cable is bonded by identified means.

Substantiation: Securing and supporting are not necessarily the same. 392.8(B) should be noted as an "otherwise provided". "Terminations" replaces a laundry list of boxes, outlets, cabinets, etc. Runs through framing members should be secured in place (by size of opening, fasteners, protection plates). Support by openings in bar joists, for example do not provide in-place securement. Vertical runs through framing members provide support where cables are fastened, just as where vertical cables are fastened to the side of studs. A common accepted practice is to weave vertical cables in and out of openings in metal studs. Flexibility is sometime required at other than terminations, such as where crossing an expansion joint. Proposal provides for no intermediate support similar to 342.30(C) 344.30(C), and 352.30(C).

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 7-14.

Number Eligible to Vote: 14

ARTICLE 324 — FLAT CABLE CONDUCTOR: TYPE FCC

Ballot Results: Affirmative: 14

7-16 Log #1046 NEC-P07 **Final Action: Accept in Principle in Part**

(320.30(B) and (C))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise texts:

(B) Unless otherwise ~~provided~~ permitted Type AC cable shall be secured to supports within 300 mm (12 in.) of every ~~outlet~~ box, ~~junction box,~~ cabinet, or fitting, and at intervals not exceeding 1.4 m (4$^1/_2$ ft) ~~where installed on or across framing members~~.

(C) Unless otherwise ~~provided~~ permitted Type AC cable shall be secured and supported at intervals not exceeding 1.4 m (4$^1/_2$ ft). ~~Horizontal~~ In other than vertical runs Type AC cable installed in accordance with applicable provisions of 300.4 (A) or (B) and securely fastened within 300 mm (12 in.) of terminations shall be considered supported where such support does not exceed 1.4 m (4$^1/_2$ ft) intervals.

Substantiation: "Provided" is not clear whether it is a Code provision or act of the installer. A reference to 300.4 provides clarity and other provisions as is done in 334.30(A) and specifies fastening within 12 in. of terminations.

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

(B) Securing. Unless otherwise permitted ~~provided,~~ Type AC cable shall be secured within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting and at intervals not exceeding 1.4 m (41/2 ft) where installed on or across framing members.

(C) Supporting. Unless otherwise permitted ~~provided~~, Type AC cable shall be supported at intervals not exceeding 1.4 m (41/2 ft).

Panel Statement: The panel has replaced the word "provided" with "permitted" to increase clarity and consistency with the support and securing requirements of this section. The remaining language of this section is unchanged. See panel action to Proposal 7-14.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-17 Log #3234 NEC-P07 **Final Action: Reject**

(320.30(B) Exception (New))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add new text as follows:

Exception: Type AC cable shall not be required to be securely fastened in place where installed in cable trays except as required in 392.8(B).

Substantiation: Provision should be made for cable tray installation.

Panel Meeting Action: Reject

Panel Statement: The exception is not required because provisions are in 320.10(2) and installation requirements are in Article 392.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-18 Log #2173 NEC-P07 **Final Action: Accept in Principle**

(320.80)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: The term "adjustment factor" should be used throughout this section. It appears that "adjustment factor" and "derating factor" mean the same thing, so only one term should be used.

Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a), and the term "corrected" is the term used for temperature in 310.16.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel accepts the change from derating to adjustment. See committee action and statement on Proposal 7-19.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-19 Log #2989 NEC-P07 **Final Action: Accept in Principle**

(320.80)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise text to read as follows:

(A) Thermal Insulation. Armored cable installed in thermal insulation shall have conductors rated at 90°C (194°F). The ampacity of cable installed in these applications shall be that of 60°C (140°F) conductors. The 90°C (194°F) rating shall be permitted to be used for ampacity adjustment and correction ~~derating~~ purposes, provided the final calculated ~~derated~~ ampacity does not exceed that for a 60°C (140°F) rated conductor.

Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a), and the term "corrected" is the term used for temperature in 310.16.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(A) Thermal Insulation. Armored cable installed in thermal insulation shall have conductors rated at 90°C (194°F). The ampacity of cable installed in these applications shall not exceed that of a 60°C (140°F) rated conductor. The 90°C (194°F) rating shall be permitted to be used for ampacity adjustment and correction calculations; however the ampacity shall not exceed that for a 60°C (140°F) rated conductor.

Panel Statement: The text has been rearranged to improve clarity.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-20 Log #3514 NEC-P07 **Final Action: Accept**

(320.80)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise 320.80 as shown:

"320.80 Ampacity. The ampacity shall be determined in accordance with ~~by~~ 310.15."

Substantiation: More appropriate text and consistency with 320.80(B).

Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-21 Log #4613 NEC-P07 **Final Action: Reject**
(320.80(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the last sentence, which reads: "The 90°C (194°F) rating shall be permitted to be used for ampacity derating purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor."
Substantiation: The ampacity of conductors within wiring methods embedded in thermal insulation should always be 90°C and the section does require this, but any derating for mutual conductor heating or ambient temperature effects should begin in the 60°C column or the results will exceed the likely ampacity of the conductors and create violations of 310.10. Refer to the submitter's proposal on 334.80 for an extensive discussion of the reasons for this, which are not repeated here to conserve space.
Panel Meeting Action: Reject
Panel Statement: 334.112 requires conductors insulated for 90C. Derating from 90C is appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-22 Log #1527 NEC-P07 **Final Action: Reject**
(320.82 (New))

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Add new text as follows:
320.82 Optical Fibers. When a Type AC Cable contains optical fibers, the installation of the optical fibers shall be in accordance with 770.133.
Substantiation: Section 770.133 contains the installation rules for optical fibers in composite optical fiber cables. Reference to Article 770 is necessary because Section 770.3(A) states:
"(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable."
Article 770 has definitions for optical fiber cables:
"Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering."
"Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors."
Panel Meeting Action: Reject
Panel Statement: The installation requirements for optical fibers with electrical conductors are covered in 770.133. Section 90.3 provides for the modification of Chapter 3 wiring methods as amended by Chapter 7. Adding the installation requirement of 770.133 to the cable article is redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-23 Log #3515 NEC-P07 **Final Action: Accept in Principle**
(320.120)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Delete text to read as follows:
320.120 Marking. The cable shall be marked in accordance with 310.11, ~~except that Type AC shall have ready identification of the manufacturer by distinctive external markings on the cable sheath throughout its entire length~~
Substantiation: A cable sheath normally refers to a nonmetallic jacket or covering. Type AC cable does not have either. Interlocking metal tape is the outer construction material. There is no mention of a sheath in Part III of Article 320 nor in the UL Green Book.
Panel Meeting Action: Accept in Principle
Only change "sheath" to "armor." Do not delete any other text.
Panel Statement: This change is to correlate with the wording in 320.100.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 322 — FLAT CABLE ASSEMBLIES: TYPE FC

7-24 Log #981 NEC-P07 **Final Action: Accept in Principle in Part**
(322.12(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
(1) Where likely to be subject to corrosive agents ~~vapors or liquids~~ unless ~~suitable~~ identified for the location.
Substantiation: Edit. Liquids and solids should be included. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
(1) Where exposed to corrosive conditions unless suitable for the application.
Panel Statement: See panel statement on Proposal 7-10 for not accepting the words "likely to be". The "accept in principal" part changes the term corrosive agents to corrosive conditions.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-25 Log #3156 NEC-P07 **Final Action: Accept in Principle**
(322.12(3))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 322.12, delete ~~(3) In any hazardous (classified) location.~~
Renumber 322.12(4) as 322.12(3).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations. In fact, the present text conflicts with 501.10(B)(3) which states "Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations."
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(3) In any hazardous (classified) location except as specifically permitted by other articles in this *Code.*
Panel Statement: Revising (3) provides the user with the information that the use of this cable is not generally permitted in hazardous locations but provides the information that the user should check in Chapter 5 to see if and where it is permitted. The additional added phrase preserves the responsibility for CMP-14 to authorize its use where appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 324 — FLAT CABLE CONDUCTOR: TYPE FCC

7-26 Log #2666 NEC-P07 **Final Action: Reject**
(324.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Use of FCC systems shall be permitted only for general purpose and appliance circuits and for individual circuits.
Substantiation: Present wording is not a requirement: 90.5(B) states "shall be permitted" identifies actions allowed but not required, therefore, present wording does not limit other uses. 322.10 and others use the word "only".
Panel Meeting Action: Reject
Panel Statement: 322.10, Type FC, is a unique construction and is limited to very specific uses permitted. Type FCC is a more general wiring method and is permitted in more applications except as limited by 324.12. Uses permitted correctly identifies common uses but does not limit other applications as long as 324.12 is not violated. Uses permitted is not intended to be an all-inclusive list.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-27 Log #3157 NEC-P07 **Final Action: Accept in Principle**
(324.12(3))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 324.12, delete ~~(3) In any hazardous (classified) location,~~
Renumber 324.12(4) as 324.12(3).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations. In fact, the present text conflicts with 501.10(B)(3) which states "Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations."
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 7-25.

7-28 Log #2665 NEC-P07 **Final Action: Reject**
(326.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Type IGS cable shall only be permitted for use underground, including direct burial in the earth, as the following:
Substantiation: Edit. Present wording is not a requirement; 90.5(B) states "shall be permitted" identifies actions allowed but not required, therefore, present working does not limit other use.
Panel Meeting Action: Reject
Panel Statement: Uses Permitted correctly identifies common uses but does not limit other applications as long as 326.12 is not violated. Uses Permitted is not intended to be an all-inclusive list.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-29 Log #1056 NEC-P07 **Final Action: Accept**
(326.10(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
(3) Service lateral conductors.
Substantiation: It seems reasonable to include service lateral conductors as a use for IGS cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-30 Log #1973 NEC-P07 **Final Action: Accept**
(326.10(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: (3) Service-lateral conductors.
Substantiation: Underground service lateral conductors should be included.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-31 Log #354 NEC-P07 **Final Action: Accept**
(326.112)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise second sentence as follows:
The nominal gas pressure shall be 138 kPa gauge ~~(20 pounds per square inch gauge)~~ (20 pounds/square inch gauge).
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 328 — MEDIUM VOLTAGE CABLE: TYPE MC

7-32 Log #4763a NEC-P07 **Final Action: Reject**
(328.2.Medium Voltage Cable, Type MV)

Submitter: Steven Bruno, Sabic Industrial Plastics
Recommendation: Add new text to read as follows:
Put high voltage and medium voltage in definitions for clarity because I consider medium voltage of 2001 to be high voltage.
A companion proposal has been sent to CMP 9 for 490.2.
Substantiation: Article 328 and Article 490 are confusing to the electrical industry.
Panel Meeting Action: Reject
Panel Statement: The submitter has not cited a standard, which supports his philosophy that 2001 volts is considered as high voltage. The term high voltage is not presently in Article 328. No specific text was provided as required by NFPA regulations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-33 Log #267 NEC-P07 **Final Action: Accept in Principle**
(328.10)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal relative to the text of the second sentences in both (3) and (6).
This action will be considered by the panel as a public comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change the exception following (3) to a permissive code rule and number as (4):
Renumber (4) through (6) as (5) through (7).
Change exception following existing (6) to a permissive code rule and number as (8).
The text in the two exceptions will remain exactly the same when they are made permissive rules.
Substantiation: These two changes will comply with 3.1.4 of the NEC Style Manual. Both exceptions comply with the requirements for a permissive code rule and do not conflict in any way with any of the other list items since each defines specific additional requirements.
Panel Meeting Action: Accept in Principle
In (3) delete the word "exception" and put the exception text as a second sentence in (3).
In (6) delete the word "exception" and put the exception text as a second sentence in (6).
Panel Statement: The panel has revised the text of (3) and (6) and has rejected the renumbering.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-34 Log #2561 NEC-P07 **Final Action: Accept in Principle**
(328.10)

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text as follows:
328.10 Uses Permitted. Type MV cable shall be permitted for use on power systems rated ~~up to 35,000~~ 0 through 35,000 volts nominal as follows:
Substantiation: This change would clarify the intent that 35,000 is included in the wording. In addition, the revised wording would be consistent with the comment on affirmative from Proposal 2-326 Log #2153 from the 2008 ROP.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
328.10 Uses Permitted. Type MV cable shall be permitted for use on power systems rated up to and including 35,000 volts nominal as follows:
Panel Statement: Lower range of 0 volts conflicts with the definition in 328.2. The panel agrees that 35,000 volts should be included.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-35 Log #2664 NEC-P07 **Final Action: Reject**
(328.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Type MV cable shall only be permitted for use on power systems rated up to not more than 35,000 volts nominal, as follows:
Substantiation: Edit. Present wording is not a requirement; 90.5(B) states "shall be permitted" identifies actions allowed but not required, therefore, other use except as covered in 328.12 is not prohibited.
Panel Meeting Action: Reject
Panel Statement: Addition of the word "only" would conflict with the FPN at the end of 328.10. Uses Permitted correctly identifies common uses but does not limit other applications as long as 328.12 is not violated. Uses Permitted is not intended to be an all-inclusive list.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-36 Log #4803 NEC-P07 **Final Action: Reject**
(328.14 (New))

Submitter: William Laidler, Hanover, MA
Recommendation: Add text to read as follows:
328.14 Cable Installation. Type MV cable shall be installed by qualified persons with documented training and experience in the installation of such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation.
Substantiation: This new section will ensure that only qualified people install type MV cable. The installation of any type of conductors or cable requires a certain amount of expertise and experience. When it comes to the installation of MV cables, installers are often under the misconception that these cables can be installed like any other conductor or cable and that is not true. The manufacturers provide various recommendations on cable-pulling tensions, sidewall bearing pressures, and bending radius for the cable that should be followed when medium voltage cables are installed to insure the cable is not damaged during the installation. Many will reference IEEE 576 which is the recommended practice of installing and splicing medium voltage power cables in commercial and industrial locations. These facts, along with the fact that many installations' specifications require the cable be tested before it is energized to detect any damage the cable may have sustained during the installation process, provide more evidence that the installation must be done

by qualified people. The language that I have proposed is already used in the NEC in Articles 215 and 685 requiring that only qualified people perform this specific task and that evidence of their training be documented and a permanent record be kept.
Panel Meeting Action: Reject
Panel Statement: "Qualified person" is already defined in Article 100. Workmanship is a requirement of 110.12.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LA DART, S.: The panel should accept this proposal.
Type MV cable "pulling" is not the same as pulling routine building wire. If a MV cable is damaged during the pull, the cable will most likely fail. This is a safety issue.
Qualified people know the importance of limiting tension and drag on cables, when pulling them into raceways. Knowing the inside diameter of the raceway, and comparing it to the diameter of the cables establishes a very important "ratio" with which cable manufacturers insist must be complied.
As cables are pulled through bends in raceways, the pressure that is exerted between the cable and the wall of the raceway is referred to as "sidewall bearing pressure". Exceeding this pressure will crush the cable's sidewalls.
A cable's minimum bending radius is directly related to its construction and directly affects cable insulation. Over bending the cables will damage the insulation, which also leads to failure.
There is also a "consumer" issue. Many installations are improperly made, and the cable performs quite well for a period of time; however, the cable prematurely fails as a result of damage that has gone undetected.
There are several other factors that must be considered for the proper installation of MV cable. Most contractors already insist on having qualified people make the installation.
Mr. Laidler's substantiation is "step-for-step" with many of the warnings that appear in trade magazine articles, some of which were written by H.R. Stewart, IEEE XPLORE. If the panel is unwilling to accept the new text, then the panel should, at a minimum: "Accept a FPN that would read: MV Cable should be installed by Qualified persons, in accordance with IEEE 576.
Comment on Affirmative:
SCHUMACHER, D.: I agree with the vote to reject, the panel does not have the authority to say who is, or is not qualified to work on any system, or wiring method.
SMITH, M.: I feel that this would not be able to be enforced by the inspectors, nor would the electrical contractors be able to identify that the end user will have this information on site.

ARTICLE 330 — METAL CLAD CABLE: TYPE MC

7-37 Log #4176 NEC-P07 **Final Action: Reject**
(330.2.Metal Clad, Cable, Type MC-R and 330.116)

Submitter: Richard Temblador, Southwire Company
Recommendation: Add following text to 330.2:
Metal Clad Cable, Type MC-R. A listed factory assembly of one or more insulated conductors with or without optical fiber members enclosed in a smooth or corrugated metallic sheath of sufficient size and mechanical integrity to allow for conductor replacement.
Add following text to 330.116:
Sheath of Type MC-R Cable: Type MC-R shall be constructed from a continuous smooth or corrugated metallic sheath. Supplemental protection of an outer covering of corrosion-resistant material shall be permitted and shall be required where such protection is needed. The number of conductors shall not exceed that permitted by the percentage fill in Table 1, Chapter 9. The armor shall meet the physical performance requirements for FMC or LFMC.
Substantiation: A feature that is commonly requested is the ability to replace conductors in Type MC Cable. This proposed design continues to provide the benefits of Type MC Cable with the added ability of replacing conductors after installation while maintaining the integrity of the armor and conductors.
Panel Meeting Action: Reject
Panel Statement: This type of raceway is more appropriately within the scope of CMP-8. This applies more to flexible raceways than cables. Standardized trade sizes, fittings, and installation requirements are a few of the issues the panel thought needed more investigation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-38 Log #3265 NEC-P07 **Final Action: Reject**
(330.4 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows;
330.XX LISTED Type MC cable and associated fittings shall be listed.
Substantiation: Edit. Many wiring methods are required to be listed and that should apply to Type MC cable.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation is provided to require listing
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-39 Log #262 NEC-P07 **Final Action: Accept**
(330.10(11) b.)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 330.10(A)(11) b. as follows:
b. A ~~lead sheath or~~ moisture-impervious jacket is provided under the metal covering.
Substantiation: Since lead is not environmentally friendly it is not commonly used anymore and should be deleted from the code. Deletion of the lead sheath has no significant impact on the use of Type MC cable since it is very easy to comply with a., b. (as modified), or c.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-40 Log #3158 NEC-P07 **Final Action: Accept in Principle**
(330.10(A)(9))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 330.10(A), delete ~~(9) In hazardous (classified) locations as permitted~~
Renumber 330.10(A)(10), (11), and (12) as 330.10(A)(9), (10), and (11), respectively.
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations. Additionally, in this particular instance, the present text is incomplete.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(9) In hazardous (classified) locations ~~as permitted~~ where specifically permitted by other articles in this *Code.*
Panel Statement: Revising (9) provides the user with the information that the use of Type MC cable is permitted in some hazardous locations and directs the user to check in Chapter 5 to see if and where it is permitted. The additional added phrase preserves the responsibility for CMP-14 to authorize its use where appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-41 Log #1055 NEC-P07 **Final Action: Accept**
(330.10(A)(12))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "neutral" to "grounded".
Substantiation: The grounded conductor of a 4-wire delta connected system (not a neutral) should be included.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-42 Log #1054 NEC-P07 **Final Action: Reject**
(330.12(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
Where likely to be subject to physical damage.
Substantiation: "Likely" is defined as such a nature or circumstance as to make something probable and is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-43 Log #4537 NEC-P07 **Final Action: Reject**
(330.12(1))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise existing text of the 2008 NEC as follows:
330.12 Uses Not Permitted.
Type MC cable shall not be used under either of the following conditions:
(1) Where likely to be damaged at the location where installed ~~subject to physical damage~~
(2) Unchanged.
Substantiation: It can be safely said that all wiring methods are "subject to physical damage." This phrase is far too general and subjective. At times, opponents of cable wiring methods use the simple statement in the present Code rule as license to unreasonably restrict the use of Type MC cables. All wiring methods should be installed in a manner and location so the wiring method is not expected to be damaged in ordinary use. For example, wiring

installed in walls, ceilings and floors in compliance with 300.4 can be reasonably expected to be isolated from physical damage in ordinary building operations. Can the cables be damaged in an unexpected event such as cutting a hole in the wall with a reciprocating saw to make a door opening? Certainly. However that is not likely to happen in normal building operation.

Listed Type MC cables are subject to extensive testing as prescribed in UL 1569, the product safety standard. This testing ensures Type MC cables are suitable to be installed in most all ordinary locations and in those hazardous locations as prescribed in other locations in the Code.

The term "likely" is used in many NEC sections such as providing a condition the event or condition will occur such as: "… likely to become energized …", "… maximum fault current likely to be imposed …", "… not likely to be damaged …", "…equipment likely to be disconnected for repairs or replacement …", "… not likely to stretch during or after installation …" and "… conduct safely any fault current likely to be imposed".

Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-9.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
STRANIERO, G.: See my reason for negative vote on 7-9.

7-44 Log #1543 NEC-P07 **Final Action: Reject**
(330.17)

Submitter: Richard Hollander, City of Tucson
Recommendation: Revise text as follows:
330.17 Through or Parallel to Framing Members. Type MC cable shall be protected in accordance with 300.4(A), (B)(2), (C), and (D) where installed through or parallel to framing members.
Substantiation: To correlate with code change Proposal 300.4(B)(2).
Panel Meeting Action: Reject
Panel Statement: 300.4(B)(2) is specifically limited to nonmetallic sheathed cable and electrical nonmetallic tubing and is not applicable to Type MC cable. The submitter did not provide any technical substantiation, and there is no documented history of failure with the permitted installation of Type MC cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-45 Log #3677 NEC-P07 **Final Action: Reject**
(330.17)

Submitter: Richard F. VanWert, Middle Department Inspection Agency
Recommendation: Revise text as follows:
...with 300.4(A), (B), (C) and (D) where, etc.
Substantiation: 300.4(B) certainly needs to be included in the list of places where MC must be protected. Eight MC cables installed through one factory- or field-punched holes definitely need protection from the drywall screws being installed.
Panel Meeting Action: Reject
Panel Statement: 300.4(B) is specifically limited to nonmetallic sheathed cable and electrical nonmetallic tubing and is not applicable to Type MC cable. The submitter did not provide any technical substantiation, and there is no documented history of failure with the permitted installation of Type MC cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-46 Log #3813 NEC-P07 **Final Action: Reject**
(330.25 (New))

Submitter: Ryan Savary, Houde Electric
Recommendation: Add a new Section 330.25, to read similar to Article 320.1:.
Exposed Work. Exposed runs of MC on the underside of joists shall be supported at intervals not exceeding 36 in.
Substantiation: The way this article is written now, you can run MC on the underside of joists, secured at intervals not exceeding 6 in. If you support mc on the underside of joists in 6 ft intervals you will have a sag. If you secured the MC in 3 ft intervals the cable could follow the structure better and would be less subject to physical damage.
AC cable and mc are similar, why such a difference in securing, every joint verses every 6 ft.
Panel Meeting Action: Reject
Panel Statement: The code is a minimum standard. It is permissible to support any wiring method at intervals closer than minimum requirements established.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-47 Log #1986 NEC-P07 **Final Action: Reject**
(330.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete present (A), (B), (C) and substitute:
(A) General. Except as provided in 300.30(D) or where installed in a cable tray or raceway, Type MC cable shall be supported and secured by staples, cable ties, straps, hangers, or other fittings identified for the use, installed so as not to damage the cable, at intervals not exceeding 1.8m (6ft). Cables containing four or fewer conductors not larger than AWG and not installed in a raceway or cable tray shall be secured at supports within 300 mm (12 in) of every cable termination.
(B) Through Openings and Notches. Cables installed in accordance with 300.4 shall be acceptable where supported and secured in accordance with this section.
(C) Unsupported Cables. Type MC cable shall be permitted without intermediate support or attachment where the cable
(1) Is fished between access points through concealed spaces in finished buildings and structures and the cable is supported and secured where it becomes accessible or,
(2) Is not more than 1.8m (6 ft) in length from the last point of support or cable connection to luminaires or other electrical equipment and the cable and terminations are within an accessible ceiling.
Substantiation: Edit. Supporting and securing are essentially the same thing except that notches in wood and openings through metal framing members such as studs and bar joists provide support but not necessarily securement required by (A). Openings in bar joists are not "holes". Cables run vertically in and out of openings in metal studs are well supported and commonly installed in that fashion. The last sentence of present (D)(2) is superfluous. Reference to 300.4 alerts Code users to other pertinent provisions.
Panel Meeting Action: Reject
Panel Statement: The proposed change to this section does not improve the clarity or consistency. For supporting and securing of MC cable...".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-48 Log #4777 NEC-P07 **Final Action: Reject**
(330.30)

Submitter: Rocky Dippel, Mesquite, NV
Recommendation: To add - 330.30(D)(3) Where flexibility is necessary from the last point of cable support, after installation, the lengths shall not exceed the following:
(1) 900 mm (3 ft) for metric designators 16 through 35 (trade sizes $^1/_2$ in. through $1^1/_4$ in.)
(2) 1200 mm (4 ft) for metric designators 41 through 53 (trade sizes $1^1/_2$ in. through 2 in.)
(3) 15900 mm (5 ft) for metric designators 63 (trade sizes $2^1/_2$ in.) and larger.
Substantiation: To qualify proper support of MC cables where the cable is typically used in commercial and industrial applications. Cables exiting cable trays, and motor terminal housings provide a unique condition where flexibility is necessary. Mechanical vibration and maintenance would be such examples. This added verbage would clarify to AHJ's the intent of relaxing the existing code requirements as they are now written.
The change is based upon verbage found at 350.30(A) Example No.2. This is a common problem regarding MC-HL.
Panel Meeting Action: Reject
Panel Statement: This proposal would only apply to #10 or smaller with four or fewer conductors required to be supported within 12 in. of every box, cabinet, fitting or other cable termination. All other constructions are only required to be supported every 6 ft. Therefore, the proposed language is not applicable and furthermore does not clearly correlate how to apply trade size dimensions to cables.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-49 Log #3880 NEC-P07 **Final Action: Reject**
(330.30(B))

Submitter: Aaron Blanco, E Light Electric Services
Recommendation: Revise text as follows:
Unless otherwise provided, cables shall be secured at intervals not exceeding 1.8 m (6 ft). Cables containing four or fewer conductors sized 10 AWG or smaller shall be secured within ~~300 mm (12 in.)~~ 450 mm (18 in.) of every box cabinet fitting or other cable termination.
Substantiation: We have found that often when installing multiple MC cables into a box that the strapping becomes difficult if all the MC cables are run in the same direction from the same side of the box. This can sometimes cause added stress to the cables when meeting the current requirements. The revised text will allow additional flexibility to the installer, not reduce the safety of the installation and allow strapping in a manner that does not stress the cables.
Panel Meeting Action: Reject
Panel Statement: The 12 in. distance is consistent throughout the entire document. This requirement prevents undue stress on the point of transition

where a cable is terminated or enters a mechanical sleeve (e.g., raceway). The submitter has not presented documentation that a greater distance to the first support will provide the same level of support.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-50 Log #3882 NEC-P07 **Final Action: Reject**
(330.30(B))

Submitter: Gary Tanner, E Light Electric Services
Recommendation: Revise text as follows:
Exception 1: Where an obstruction prevents supporting with in 900 mm (12 in.) it is permissible to secure the cable with 1800 mm (24 in.) of the box luminaire, or other termination point.
Substantiation: This will allow supporting of the MC cable in a safe manner in those circumstances where a support strap cannot be added with 12 in.
Panel Meeting Action: Reject
Panel Statement: The 12 in. distance is consistent throughout the entire document. This requirement prevents undue stress on the point of transition where a cable is terminated or enters a mechanical sleeve (e.g., raceway). The submitter has not presented documentation that a greater distance to the first support will provide the same level of support.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-51 Log #3885 NEC-P07 **Final Action: Reject**
(330.30(B))

Submitter: Stephen Schwengel, E Light Electric Services
Recommendation: Revise text as follows:
Unless otherwise provided, cables shall be secured at intervals not exceeding 1.8 m (6 ft). Cables containing four or fewer conductors sized no larger than 10 AWG shall be secured within ~~300 mm (12 in.)~~ <u>450 mm (18 in.)</u> of every box, cabinet fitting or other cable termination.
Substantiation: When making installations in fight areas or above ceilings there is often not enough space to make the support within 12 in. Allowing this to be expanded 18 inches will allow more flexibility in these circumstances and not reduce the safety of the installation. The current requirements sometimes cause the MC cable to be bent in ways that could damage the MC cable during installation.
Panel Meeting Action: Reject
Panel Statement: The 12 in. distance is consistent throughout the entire document. This requirement prevents undue stress on the point of transition where a cable is terminated or enters a mechanical sleeve (e.g., raceway). The submitter has not presented documentation that a greater distance to the first support will provide the same level of support.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-52 Log #928 NEC-P07 **Final Action: Reject**
(330.30(D)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text to read as follows:
(3) Is not more than 300 mm (12 in.) in length between boxes, cabinets, or other enclosures securely fastened in place, and securely fastened to the enclosure. Where cables are attached at knockouts with segments larger than the cable connector, reducing washers larger than the largest knockout segments shall be installed and the cable shall be bonded to the enclosure by identified means.
Substantiation: If the provisions of 342.30(C), 344.30(C), and 352.30(C) are deemed necessary, a similar provision should be in this article.
Panel Meeting Action: Reject
Panel Statement: The substantiation references do not apply to this wiring method. No technical documentation or history of failure was provided.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

Ballot Results: Affirmative: 14

7-54 Log #1632 NEC-P07 **Final Action: Accept**
(330.80(B)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In (2), change “Table 310.67 and Table 310.68” to “Table 310.60(C)(1) and Table 310.60(C)(2)”.
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.67 through 310.86 as Tables 310.60(C)(1) through 310.60(C)(20) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Accept
Panel Statement: Subject to action by Panel 6 and any correlation of table numbering by the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-55 Log #1528 NEC-P07 **Final Action: Reject**
(330.82 (New))

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Add new text as follows:
<u>**320.82 Optical Fibers.** When a Type AC Cable contains optical fibers, the installation of the optical fibers shall be in accordance with 770.133.</u>
Substantiation: Section 770.133 contains the installation rules for optical fibers in composite optical fiber cables. Reference to Article 770 is necessary because Section 770.3(A) states:
“(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable.”
Article 770 has definitions for optical fiber cables:
“Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering.”
“Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors.”
Panel Meeting Action: Reject
Panel Statement: The installation requirements for optical fibers with electrical conductors are covered in 770.133. Section 90.3 provides for the modification of Chapter 3 wiring methods as amended by Chapter 7. Adding the installation requirement of 770.133 to the cable article is redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-56 Log #1053 NEC-P07 **Final Action: Reject**
(330.100)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. The referenced sections already apply per 90.3.
Panel Meeting Action: Reject
Panel Statement: There is no section 330.100.

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (1) and substitute: Where likely to be subject to physical damage which impairs its intended functions.
Revise (2): Where likely to be exposed to conditions ~~that are destructive agents~~ that are destructive to the metallic sheath unless additional identified protection is provided.
Substantiation: Underground runs are covered in 332.10 (10) Bare copper conductors are permitted in corrosive areas such as pools, in concrete, in earth, and in open air where mildly corrosive agents are not destructive. Additional protection should be identified for the use. There are degrees of physical damage; a slight ding, dent, or nick which doesn't impair watertightness, grounding, or damage conductors is damage, but doesn't impair the functional qualities. "Likely" is defined as such a nature or circumstance as to make something probable and is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposals 7-8 and 7-10. The proposal does not add clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-62 Log #2686 NEC-P07 **Final Action: Reject**
(332.12(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
(3) Where likely to be exposed to physical damage unless protected by identified means.
Substantiation: Type MI cable is resistant to be not impervious to physical damage. "Likely" is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: The language in 332.12(2) addresses the submitter's concerns.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-63 Log #1544 NEC-P07 **Final Action: Reject**
(332.17)

Submitter: Richard Hollander, City of Tucson
Recommendation: Revise text as follows:
332.17 Through or Parallel to Framing Members. Type MI cable shall be protected in accordance with 300.4(A), (B)(2), (C), and (D) where installed through or parallel to framing members.
Substantiation: To correlate with code change Proposal 300.4(B)(2).
Panel Meeting Action: Reject
Panel Statement: 300.4(B)(2) is specifically limited to nonmetallic sheathed cable and electrical nonmetallic tubing and is not applicable to Type MI cable. The submitter did not provide any technical substantiation, and there is no documented history of failure with the permitted installation of Type MI cable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-64 Log #2628 NEC-P07 **Final Action: Reject**
(332.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Type MI cable shall be ~~supported and~~ secured to supports by staples, cable ties, straps, hangers or ~~similar~~ other identified means ~~designed~~ and installed so as not to damage the cable at intervals not exceeding 1.8 m (6 ft).
(A) ~~HORIZONTAL~~ RUNS THROUGH HOLES AND NOTCHES. ~~In other than horizontal runs~~, Cables installed in accordance with 300.4 shall be considered supported if secured in place and such support does not exceed 1.8 m (6 ft) intervals.
(B) UNSUPPORTED CABLE. Type MI cable shall be permitted to be ~~unsupported~~ without intermediate support where:
(1) The cable is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical provided the cable is fastened to supports where the cable becomes accessible.
(2) The cable is not more than 1.8 m (6 ft) in length between enclosures secured in place, and connected to threaded hubs or openings or through a knockout with no segments larger than the cable connector, or with reducing washers larger than the largest knockout segment and the cable is bonded by identified means.
Delete (C).
Substantiation: Support and securing are not necessarily the same. Cables in vertical runs through holes and notches are supported when fastened to such support by the size of the hole, protection plates or fasteners, as required by the first paragraph and is no different than a vertical run secured to the side of a stud. Runs through large openings such as with bar joists provide support but not securement in place.
(B) should provide a provision similar to those for RMC, IMC, EMT RNMC.
(C) is superfluous; 392.8(B) already applies.
Panel Meeting Action: Reject
Panel Statement: The proposed revision of this section does not improve clarity of the existing language. The is no technical data in the substantiation to support such a broad change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-65 Log #2639 NEC-P07 **Final Action: Reject**
(332.30 and Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Type MI cable shall be ~~supported and~~ secured to supports by staples, straps... (remainder unchanged).
Add: Exception: Where installed in cable trays 392.8(B) shall apply.
Delete (C).
Substantiation: Edit. Fastening means should be clearly indicated to be at required support intervals.
Present (C) should be an exception to the first paragraph as 392.8(B) does not modify the first paragraph.
See (90.3) but merely specifies what it is to be used for support.
Panel Meeting Action: Reject
Panel Statement: See the panel statement to Proposal 7-64.
Supporting and securing are distinctly different requirements and are independent of one another. 392.30(C) already addresses installation of Type MI cable in cable tray and is positive code text rather than an exception as recommended in the NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-66 Log #883 NEC-P07 **Final Action: Reject**
(332.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
Type MI cable shall be permitted without intermediate support if not more than 1.8 m (6 ft) in length between boxes, cabinets or other enclosures. Where the cable is attached at knockouts with segments larger than the cable connectors, reducing washers larger than the largest knockout segments shall be installed and the cable shall be bonded to the enclosure by identified means.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: See committee action and statement on Proposal 7-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-67 Log #922 NEC-P07 **Final Action: Reject**
(332.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text to read as follows:
Type MI cable shall be permitted without intermediate support if not more than 1.8 m (6 ft) in length between boxes, cabinets or other enclosures. Where the cable is attached at knockouts with segments larger than the cable connectors, reducing washers larger than the largest knockout segments shall be installed and the cable shall be bonded to the enclosure by identified means.
Substantiation: If the provisions of 342.30(C), 344.30(C) and 352.30(C) are deemed necessary, a similar provision should be in this article.
Panel Meeting Action: Reject
Panel Statement: The substantiation references do not apply to this wiring method. No technical documentation or history of failure was provided.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-68 Log #4811 NEC-P07 **Final Action: Reject**
(332.31)

Submitter: Leo F. Martin, Jr., Martin Electrical Code Consultants
Recommendation: Add a fine print note to follow 332.31 as follows:
FPN: NFPA 20-2007 standard for the installation of Stationary pumps for fire protection provides information on installation of fire pump controllers in 9.3.7.3.
Substantiation: To make the NEC more user friendly by making Code users aware that cutting slots or rectangular cutouts in a fire pump controller are not permitted.
Panel Meeting Action: Reject
Panel Statement: The section reference to NFPA 20 provided in the proposed language does not correlate with the substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-69 Log #1229 NEC-P07 **Final Action: Reject**
(332.40(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
The conductors extending beyond the sheath shall be provided with an <u>identified fitting and</u> insulating material for the <u>ungrounded and grounded circuit conductors</u>.
Substantiation: The fitting and insulating material should be suitable for the use and color coded.
Panel Meeting Action: Reject
Panel Statement: The conductor extending beyond the sheath is bare and is intended for termination in a device. Additional text regarding the type of conductor does not add clarity and is not needed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-70 Log #4614 NEC-P07 **Final Action: Reject**
(332.80)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise by rewriting 332.80 as follows:
332.80. Ampacity. The ampacity of multiconductor Type MI cable shall be determined in accordance with 310.15. The ampacity of Type MI cable installed in cable tray shall be determined in accordance with 392.11. The ampacity of single-conductor Type MI cable shall be determined by (A) or (B).
(A) Maintained Spacing. Where the circuit groupings of Type MI cable required by 332.31 are installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall be permitted to be determined by Table 310.17. The installation shall comply with (1), (2), and (3).
(1) Heat Dissipation. At each point of cable termination at an enclosure, the bundles shall be spread so each cable has a maintained spacing from adjacent cables of not less than one cable diameter for a distance of not less than 450 mm (18 in.) and not more than 750 mm (30 in.).
(2) Adjacent Ampacities. The ampacity determined under this procedure shall not be used to establish temperature ratings of conductors at terminations. The provisions of 310.15(A)(2) Exception shall not apply.
(3) End Seal. The conductor temperature at the end seal fitting shall not exceed the listed temperature rating of the end seal fitting.
(B) Spacing Not Maintained. Where the spacing in (A) is not maintained, the ampacity shall be determined using a method that does not rely on the ampacities of single conductors run in free air.
Substantiation: The NEC has to recognize that the cables are operating above 90°C under these conditions, admittedly harmless to the MI cable, but which need to correlate with 110.14(C), and 310.15(A)(2) and its exception. Some MI cable folks have told the submitter that they are relying on that exception to get them into an enclosure with terminations based on free-air temperatures over the run. That only works if the cable actually operates under free air conditions. For example, suppose the cable ran unbundled (not allowed; this is only for discussion). Then, for a 75°C allowable termination, the submitter agrees that you could use the 75°C column of Table 310-17. However, you can't run the cable unbundled. Furthermore, product standards almost universally rely on Table 310-16 to provide enough headroom in conductor sizing to allow for the conductor to function as a heat sink from the device. Therefore:
1) The cable must be unbundled for some distance, which the Code needs to specify upon due input from third parties, sufficient to allow the elevated temperature within the bundle to fall to the point where the end seals aren't affected. I have heard 1 ft as a number OK for 90°C end seals and somewhat greater for lower rated seals. Probably 2 ft is a good number, one that makes intuitive sense to users based on the nipple rule; this comment uses a range with that number in the middle.
2) The exception to 310.15(A)(2) relies on a length of higher ampacity (= cooler wires) to act as a heat sink for lower ampacity (= hotter wires) areas along the run. In this unique case if someone applies this exception to the conductors in the panelboard they would inadvertently be doing the reverse, that is, attempting to use hotter conductors as a heat sink for cooler conductors. Therefore this rule has to clearly stipulate how the allowable ampacity tables intersect with termination requirements.
Panel Meeting Action: Reject
Panel Statement: The current language in 332.80 already states that the temperature rating of the fittings, terminations, and equipment shall not be exceeded.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-71 Log #1616 NEC-P07 **Final Action: Accept**
(332.80(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In the last line, change "Table 310.17" to "Table 310.15(B)(2)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Accept
Panel Statement: Subject to action by Panel 6 and any correlation of table numbering by the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 334 — NONMETALLIC-SHEATHED CABLE: TYPE NM, NMC, AND NMS

7-72 Log #3870 NEC-P07 **Final Action: Reject**
(334)

Submitter: Mike Weitzel, Bechtel
Recommendation: Delete "NMC" in title of Article and elsewhere in Articles including its definition.
Types NM, ~~NMC~~, and NMS
Substantiation: What is Type NMC cable. Is it even manufactured any more? It is my understanding that Type UF is used in place of it. Perhaps it is time to delete this all together.
Panel Meeting Action: Reject
Panel Statement: This product is still being manufactured.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-73 Log #1529 NEC-P07 **Final Action: Reject**
(334.2.Nonmetallic-Sheathed Cable)

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Revise text as follows:
334.2 Definitions.
Nonmetallic-Sheathed Cable. A factory assembly of two or more insulated conductors, with or without optical fiber members, enclosed within an overall nonmetallic jacket.
Type NM. Insulated conductors, with or without optical fiber members, enclosed within an overall nonmetallic jacket.
Type NMC. Insulated conductors enclosed, with or without optical fiber members, within an overall, corrosion resistant, nonmetallic jacket.
Type NMS. Insulated power or control conductors, with or without optical fiber members, with signaling, data, and communications conductors within an overall nonmetallic jacket.
Substantiation: Article 330 explicitly mentions optical fibers in the definition of Metal Clad Cable.
"330.2 Definition.
Metal Clad Cable, Type MC. A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic sheath."
Since Armored Cables can also contain optical fibers, this proposal would add optical fibers to the definition of Armored Cable also.
Panel Meeting Action: Reject
Panel Statement: Section 770.3(A) permits composite cables and requires that they be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable. Adding text to permit optical fiber members in the cable article is redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-74 Log #2651 NEC-P07 **Final Action: Reject**
(334.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete: "except as prohibited in 334.10(A)" in (A)(2) and (B)(1).
Substantiation: Edit. Section 334.10(A) covers uses permitted and doesn't "prohibit", merely refers to 334.12 which covers uses not permitted.
Panel Meeting Action: Reject
Panel Statement: 334.10(3) defines the type of structure construction where Type NM Cable may be used. The uses permitted and not permitted apply to the installation methods within those structures.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-75 Log #3466 NEC-P07 **Final Action: Accept in Principle**
(334.10)

Submitter: John I. Williamson, Maple Grove, MN
Recommendation: Revise NEC 334.10 as follows:
334.10 Uses Permitted.
Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:
(1) One- and two-family dwellings and their accessory, utility, miscellaneous, incidental, secondary, or similar structures.
(2) Multifamily dwellings permitted to be of Types III, IV, and V construction except as prohibited in 334.12.
(3) Other structures permitted to be of Types III, IV, and V construction except as prohibited in 334.12. Cables shall be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.
Substantiation: The proposed wording will clarify that Type NM cable(s) are also permitted to be used in private garages, accessory buildings, storage sheds, or similar structures that are incidental, supplemental, or secondary in nature to one- and two-family dwellings. Lacking this clarification, inspectors have been considering such accessory structures as "Other structures" and attempting to enforce the rules in 334.10(3), whereby cables are required to be installed behind a rated thermal barrier material. Under normal circumstances, an uninhabitable accessory building should not be required to comply with rules that are more restrictive than what is required for a habitable building. If warranted, due to special circumstances and on a case-by-case basis, the inspector would retain the authority outlined in Article 110 to consider certain structures as "Other structures" under 334.10(3).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 7-77.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LA DART, S.: See comment 7-77.

7-76 Log #2783 NEC-P07 **Final Action: Accept in Principle**
(334.10(1))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise (1) of 334.210 as shown:
(1) One- and two-family dwellings and their including their accessory structures.
Substantiation: To permit the use of NM cable in garages and sheds without being concealed in a thermal barrier and having a 15 minute finish rating.
NM cable is already permitted in attached garages, attics and unfinished basements without a finish rating/thermal barrier.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 7-77.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LA DART, S.: See comment 7-77.

7-77 Log #3789 NEC-P07 **Final Action: Accept**
(334.10(1))

Submitter: James Grant, Rochester, NH
Recommendation: Revise text to read as follows:
334.10 Uses Permitted.
Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:
(1) One- and two-family dwellings and their accessory structures.
Substantiation: With the present language an attached garage could utilize NM as an exposed wiring method. A detached garage, three ft away from the main dwelling, could not utilize NM as an exposed wiring method. The use of these accessory structures that are incidental to a dwelling unit normally do not change whether it is or is not attached to the structure. The requirement to add a 15-minute rated thermal barrier for dwelling unit's accessory structures is excessive.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LA DART, S.: The panel should reject this proposal, or accept in principal, in part. It would be acceptable to add "garages and storage sheds" to the text, but to allow Type NM cable to be installed in "ALL" accessory buildings creates a safety issue. Some of the accessory buildings would include children's play-houses, pool houses, game rooms, etc. The wiring method should be protected in these types of structures.

7-78 Log #4615 NEC-P07 **Final Action: Accept in Principle in Part**
(334.10(3) Exception No. 1 and No. 2 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee
Recommendation: Insert two exceptions after (3) to read as follows:
Exception No. 1 to (2) and (3): For buildings or structures required to be of Type I or Type II construction, Type NM, Type NMC, and Type NMS cables shall be permitted to be used, provided that where so applied in buildings or structures exceeding three stories above grade, circuits run in Type NM, NMC, or NMS cable shall not leave the floor or dwelling unit from which the circuits originate.
Exception No. 2 to (3): For detached buildings that are accessory structures to dwelling occupancies, Type NM, Type NMC, and Type NMS cables shall be permitted to be used without concealment.
Substantiation: The first proposed exception is well familiar to CMP 7 as the high-rise exception that has been a landmark feature of the Massachusetts Electrical Code for over thirty years. We are aware of and understand the Standards Council decision relative to the use of Type NM cable, however, we are choosing to take this opportunity to place on the record a simple datum: During the time Massachusetts has chosen to not follow the NEC limitations regarding occupancy prohibitions with respect to this wiring method, no loss experience has yet been documented with respect to the use of this wiring method in occupancies where the NEC disallows it that is traceable to the choice of wiring method.
Further, we note some concern in the industry regarding seeming changes in the character of this wiring method over the intervening thirty years with respect to the robustness of its construction. We want to take this opportunity to remind CMP 7 that this should not drive decisions regarding acceptable occupancy classifications. Article 334, like many articles, contains a "construction specifications" part over which the code making panel retains plenary authority to drive changes in the ability of a wiring method to withstand physical damage. We invite CMP 7 to exercise that authority instead of placing arbitrary limits on occupancy limitations. Such changes would be squarely within the parameters that supported the decision of the Standards Council with respect to the use of this wiring method.

The second proposed exception is new in this code cycle, and we request that CMP 7 look at this on its own merits. The literal text of the existing NEC requires that NM cables run in a detached garage or other residential outbuilding be concealed behind a thermal barrier. This is plainly excessive, and entirely unsupported by any of the substantiation on which the Standards Council based its decision in the 2002 NEC cycle. We are aware of a number of states that have removed this inadvertent requirement, which goes far beyond the most restrictive occupancy limitations ever suggested for this wiring method. For example, it is more limiting than the three-story limitation imposed in the 1970s, or even the one- and two-family dwelling limitation suggested by some at that time.
Panel Meeting Action: Accept in Principle in Part
The Panel rejects exception No. 1. The panel accepts submitter's Exception No. 2 in principal.
Panel Statement: The panel rejects Exception 1. Reference to local codes is inappropriate since they are not nationally recognized. Installation practices vary throughout the country. See panel action on Proposal 7-77 for the part accepted in principal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-79 Log #1697 NEC-P07 **Final Action: Accept in Principle**
(334.10(5) (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal concerning the use of the word "when" since the NEC Style Manual considers "when" to be a condition of time.
This action will be considered by the panel as a public comment.
Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Add text [formerly found in the exception to 334.12(A)] in a new 334.10(5).
334.10 Uses Permitted.
(5) Type NM, NMC, and NMS cable shall be permitted in Type I and II construction when installed within raceways permitted to be installed in Type I and II construction.
Substantiation: This change is editorial in nature and the use of positive language is preferable to exceptions and it is easier to find acceptable wiring methods under "Uses Permitted" than under the heading "Uses Not Permitted".
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Add text [formerly found in the exception to 334.12(A)] in a new 334.10(5).
334.10 Uses Permitted.
(5) Type I and II construction when installed within raceways permitted to be installed in Type I and II construction.
Panel Statement: Acceptance is consistent with the Technical Correlating Committee request to change exceptions into positive code text provided there is no technical change to the code. Proposal 7-82 correlates 334.12(A) Exception with this proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-80 Log #2409 NEC-P07 **Final Action: Reject**
(334.10(5))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Add: (5) As temporary wiring system as defined in 590.4(C).
Substantiation: When looking for how to use non-metallic sheathed cable you turn to Article 334. There are referrals to permit the use of non-metallic sheathed cable for hazardous locations and places of assembly, i.e. 334.12(A)(4)(5)(10). There is no mention of use for temporary wiring. By placing a new (5) under 334.10, you would understand that non-metallic sheathed cable can be used as temporary wiring.
Panel Meeting Action: Reject
Panel Statement: Article 590 permits NM and NMC but not NMS for temporary wiring.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-81 Log #3332 NEC-P07 **Final Action: Reject**
(334.10(A)(1), (B)(1), and (C)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "except as prohibited by 334.10(C).
Substantiation: Edit. Superfluous: Already covered in 334.12 "uses not permitted". 334.10(C) does not prohibit; only references a section which does.
Panel Meeting Action: Reject
Panel Statement: The panel understands the proposal refers to 334.10(3) rather than 334.10(C). Section 334.10(3) defines the type of structure construction where Type NM cable may be used. The uses permitted and not permitted apply to the installation methods within those structures.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-82 Log #1698 NEC-P07 **Final Action: Accept**
(334.12)

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Delete the Exception to 334.12(A)(1) and move that text to a new 334.10(5) as positive text because it is a use that is permitted. See companion proposal for 334.10(5).
334.12 Uses Not Permitted.
(A) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be permitted as follows:
(1) In any dwelling or structure not specifically permitted in 334.10(1), (2), and (3).
~~Exception: Type NM, NMC, and NMS cable shall be permitted in Type I and II construction when installed within raceways permitted to be installed in Type I and II construction.~~
Substantiation: This change is editorial in nature and the use of positive language is preferable to exceptions and it is easier to find acceptable wiring methods under "Uses Permitted" than under the heading "Uses Not Permitted".
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 7-79.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-83 Log #4497 NEC-P07 **Final Action: Reject**
(334.12(4) Exception (New))

Submitter: Dennis A. Portillo, Randolph Community College
Recommendation: Add new text as follows:
334.12 Uses Not Permitted.
(B) Types NM and NMS. Types NM and NMS cables shall not be used under the following conditions or in the following locations:
(4) In wet or damp locations
<u>Exception to 4: NM cable shall be permitted to be installed in an approved enclosure that is installed in a wet location</u>
Substantiation: This new exception will make it clear that the NM cable used to supply current to an air conditioner disconnect located on the side of a dwelling is compliant. This type of installation is done everyday without any problems as well as for outside panels.
Panel Meeting Action: Reject
Panel Statement: The existing permitted uses in 334.10 lists uses permitted unless so restricted by 334.12.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-84 Log #3852 NEC-P07 **Final Action: Accept**
(334.12(A)(1) Exception)

Submitter: Bill McGovern, City of Plano
Recommendation: Delete text as follows:
~~*Exception: Type NM, NMC, and NMS cable shall be permitted in Type I and II construction when installed within raceways permitted to be installed in Type I and II construction.*~~
Substantiation: Substantiation for allowance of NM, NMC, and NMS cable being permitted to be installed in Types I and II construction during the previous edition (ROP 7-51) was for the allowance of a hybrid cable on the market consisting of power, communications and signaling conductors under a common jacket. This type of cable was to be used under Article 780 Closed-Loop and Programmed Power Distribution which was removed from the 2008 NEC. NM cable is not designed nor was it intended to be installed in raceways, in long runs consisting up to 4-90 degree angle bends between junction boxes. Attempting to pull NM cable into metal raceways will lead to damage of the jacket and possibly the conductors themselves. There will also be misapplication of this exception leading to NM cable being installed in those types of construction without raceways of any kind and without inspection may lead to a shock and or fire hazard.
Panel Meeting Action: Accept
Panel Statement: The panel does not agree with the substantiation. Evidence has not been provided that pulling NM cable into metal raceways will lead to damage of the jacket or conductors. Also see panel action and statement on Proposals 7-79 and 7-82.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-85 Log #3160 NEC-P07 **Final Action: Accept in Principle**
(334.12(A)(10))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 333.12(A), delete ~~(10 In hazardous (classified) locations, except where permitted by the following:~~
~~a. 501.10(B)(3)~~
~~b. 502.10(B)(3)~~
~~c. 504.20~~

Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations. Additionally, in this instance, the references are incomplete, as 503.10(A)(3) and 505.15(C)(1)(h) are missing.

Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.

Panel Meeting Action: Accept in Principle

Revise all of (10) to read as follows:

(10) In hazardous (classified) locations except where specifically permitted by other articles in this *Code.*

Panel Statement: Revising (10) provides the user with the information that the use of nonmetallic-sheathed cable is generally not permitted in hazardous locations and directs the user to check in Chapter 5 to see if and where it is permitted. The additional added phrase preserves the responsibility for CMP-14 to authorize its use where appropriate. The proposed refers to 334.12(A)(10).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-86 Log #1762 NEC-P07 **Final Action: Reject**

(334.12(A)(11) (New))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add: (11) Where likely to be subject to physical damage.

Substantiation: Edit. This is a standard provision for many wiring methods. 334.15(B) only applies to exposed work.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 7-8.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-87 Log #1947 NEC-P07 **Final Action: Reject**

(334.12(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete "or damp".

Substantiation: This not permitted use would prevent installation in many basements and crawl spaces. Damp locations are not likely to be detrimental to the plastic jacket. 334.16 indicates cables are moisture resistant which implies they are suitable for damp locations. 334.10(A) permits installation in voids of masonry and tile blocks which may be damp.

Panel Meeting Action: Reject

Panel Statement: Types NM and NMS are only permitted in "normally dry" locations; Type NMC is the only construction permitted in "dry, moist, damp, or corrosive locations".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-88 Log #2626 NEC-P07 **Final Action: Reject**

(334.12(B)(4))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

In wet ~~or damp~~ locations.

Substantiation: The jacket of NM cable is not seriously affected by dampness. Many basements and crawl spaces may be only occasionally damp and prohibit the wide present use of NM cable in these locations. Type NM cable is permitted in normally dry locations per 334.10(B) which infers it may be used in occasionally wet or damp locations.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 7-87.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-89 Log #2663 NEC-P07 **Final Action: Reject**

(334.12(B)(4))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise:

In wet ~~or damp~~ locations <u>unless enclosed in weatherproof enclosures</u>.

Substantiation: Present wording appears to prohibit installation in weatherproof enclosures such as panelboards, for switches and receptacles installed in wet locations. 334.16 indicates NM and NMS cables are moisture resistant.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 7-83 and 7-87.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-90 Log #4774 NEC-P07 **Final Action: Reject**

(334.12(B)(4))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety

Recommendation: Add text to read as follows:

(4) In wet or damp locations <u>except as permitted as follows:</u>

<u>(a) May terminate in an enclosure that is listed for use in wet or damp locations.</u>

Substantiation: As the code stands now we can not terminate in panel boards, safety switches, and luminaires in outside locations as the interior of these are wet or damp locations.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 7-83.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-91 Log #4494 NEC-P07 **Final Action: Reject**

(334.12(B)(4) Exception (New))

Submitter: Dennis W. Morgan, II, Randolph Community College

Recommendation: Add new text as follows:

334.12 Uses Not Permitted.

(B) Types NM and NMS cables shall not be used under the following conditions or in the following locations:

(4) In wet or damp locations

<u>Exception to 4: NM shall be permitted to be installed in a rain tight enclosure in a wet location</u>

Substantiation: By adding the exception it would allow NM cable to be installed to supply a 3R disconnect for equipment installed outdoors such as air conditioner disconnects on dwelling units. The installation of NM cables to the air conditioner disconnects and meter combos have been a standard of practice throughout America for years. This also would be in line with the verbiage found in 300.9 which does not mention enclosures.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 7-83.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-92 Log #2332 NEC-P07 **Final Action: Accept**

(334.15(B))

Submitter: David Nemchik, Medina County Building Department [Ohio]

Recommendation: Revise text as follows:

(B) Protection from Physical Damage

[note: second paragraph]

Type NMC cable installed in shallow chases or grooves in masonry, concrete, or adobe, shall be protected in accordance with the requirements in 300.4~~(E)~~<u>(F)</u> and covered with plaster, adobe, or similar finish.

Substantiation: When 330.4 was amended for the 2008 code cycle, this reference was not properly updated.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-93 Log #3479 NEC-P07 **Final Action: Accept**

(334.15(B))

Submitter: Danny Thomas, Henderson, NC

Recommendation: Revise text to read as follows:

Type NMC cable installed in shallow chases or grooves in masonry, concrete or adobe, shall be protected in accordance with the requirements in 300.4~~(E)~~ (F) and covered with plaster, adobe or similar finish.

Substantiation: 300.4 is a reference for "Cables and Raceways Installed Under Roof Decking." The correct code reference is the one noted in my proposal.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-94 Log #3927 NEC-P07 **Final Action: Accept**

(334.15(B))

Submitter: Goran Haag, Champion Fiberglass, Inc.

Recommendation: Add new text to read as follows:

Everywhere Schedule 80 PVC is mentioned, "Type RTRC marked with the suffix -XW" should also be included.

Substantiation: For the NEC 2008, Type RTRC marked with the suffix –XW and Schedule 80 PVC were added as sufficient for Class I Division 2 installations. The Type RTRC marked with the suffix –XW were "forgotten" at some places in the NEC, needs to be corrected.

Panel Meeting Action: Accept

Panel Statement: The panel accepted the two locations to add this phrase, but wants a comma following the phrase.

According to the 2008 UL white book under file card DZKT, Reinforced thermosetting resin conduit is Listed in trade sizes 1/2 to 6 in. -------XW-type reinforced thermosetting resin conduit is Listed for aboveground use and is suitable for use wherever IPS, ID, RTRC 40, and RTRC 80 conduit may be used. The marking ''AG, XW, RTRC'' identifies conduit suitable for use where exposed to physical damage in accordance with the NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-95 Log #7 NEC-P07 **Final Action: Reject**
(334.15(C))

NOTE: This proposal appeared as Comment 7-36 on Proposal 7-63 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 7-63 was:
Revise text to read as follows:
(C) In Unfinished Basements. Where the cable is run at angles with joists in unfinished basements, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable installed on the walls of an unfinished basement shall be protected from physical damage. Where NM cable is used on a wall of an unfinished basement it shall be permitted to be installed in a listed conduit or tubing or protected by other approved means. Conduit or tubing shall ~~utilize~~ be provided with a ~~nonmetallic~~ suitable bushing or adapter at the point the cable enters the raceway. The NM cable sheath shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (1/4 in.). The cable shall be secured within 300 mm (12 in.) of the point where the conduit enters the conduit or tubing. Metal conduit and tubings and metal outlet boxes shall be grounded.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise panel third sentence:
NM cable installed on the wall of a ~~an unfinished~~ basement or garage shall be permitted...(remainder unchanged).
Substantiation: While this is apparently not prohibited by present code and has been a common practice, it is worthwhile as clarification. However, it should not be limited to unfinished basements. It is applicable to garage walls, finished walls etc., where NM cable is permitted.
Panel Meeting Action: Reject
Panel Statement: No substantiation for additional text and 334.15(B) provides protection from physical damage.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-96 Log #1289 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
Raceway conductor fill requirements (shall) (shall not) apply.
Substantiation: Proposal is intended to clarify whether fill requirements are intended to apply.
Panel Meeting Action: Reject
Panel Statement: Submitter did not provide specific recommendation. Note 9 of Table 1 Chapter 9 instructs the installer to consider multiconductor cables as a single conductor. The xxx.22 section of all the raceway articles instructs the installer to adhere to the percentage of fill requirements found in Table 1 of Chapter 9.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-97 Log #2349 NEC-P07 **Final Action: Accept in Principle**
(334.15(C))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal relative to the NEC Style Manual on writing exceptions as positive text.
This action will be considered by the panel as a public comment.
Submitter: Julian R. Burns, Quality Power Solutions, Inc.
Recommendation: Add new text as follows:
(C) In Unfinished Basements and Crawl Spaces. Where cable is run at angles with joists in unfinished basements and crawl spaces, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable installed on the wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing or shall be protected in accordance with 300.4. Conduit or tubing shall be provided with a suitable insulating bushing or adapter at the point the cable enters the raceway. The NM cable sheath shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (¼ in.). The cable shall be secured within 300 mm (12 in.) of the point where the cable enters the conduit or tubing. Metal conduit, tubing, and metal outlet boxes shall be connected to an equipment grounding conductor.
New Exception:
Exception No. 1: Where the height of a crawl space does not exceed 1.4m (4½ ft) it shall be permissible to secure NM cables, that run at angles with joist, to the bottom edge of joist. NM cables run within 2.1m (7 ft) of crawl space access shall comply with 320.23.
Substantiation: The CMP's requirement to include a crawl space area into the same requirements as an unfinished basement has placed electricians into harms way. There have been instances within our state where electricians have been hurt trying to bore out joist in crawl spaces as low as 24 in. above ground. This requirement does not provide any degree of protection of cables. Also, where joist have been bored out for the installation of NM cables, the cables have been damaged by the unskilled labor installing insulation in the crawl space. They have pulled (yanked) the NM cables down to get the insulation between the joist.
Panel Meeting Action: Accept in Principle
Accept the new text in (C) and revise the exception as follows:
Exception: Where the height of a crawl space does not exceed 1.4 m (4 1/2 ft), it shall be permissible to secure nonmetallic-sheathed cables, installed at angles to the joists, to the bottom edge of joists. Nonmetallic-sheathed cable installed within 2.1 m (7 ft) of crawl space access shall be protected by substantial guard strips that are at least as high as the cable.
Panel Statement: NM was changed to "nonmetallic-sheathed cable" to permit all three Types NM, NMC, and NMS.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
HINRICHS, J.: The submitter has not provided any technical information to support this change. He only indicates that someone may become injured. Many crafts may have occasion to go into a crawl space, in order to perform installations or maintenance. If what the submitter is suggesting regarding the installation of NM Cable is accepted, the cable will be more susceptible to damage than if it were run as required by the 2008 edition of the NEC. In addition, the installer also will continue to have to crawl under the building, to install the NM Cable.
LA DART, S.: The panel should reject this proposal. The current code text requires the cables to be run through "bored holes". The reason for this method of installation is to protect the cables from physical damage. The current code text should remain.
The acceptance of this proposal will create a "safety issue". The allowance to run exposed cables across the face of framing members in a "crawl space" will subject the cables to physical damage. It is important to understand that the new rule would apply to each and every installation, and it is equally important to be able to envision the endless possibilities of what could be placed within the crawl space.
Crawl Spaces are often times used for storage areas and are filled to capacity with "stuff" that could easily snag and damage the fragile cable's insulation. This would create a "shock hazard". Remember, we should consider all of "the conditions of use" that could occur in ALL crawl spaces.
Additionally, the code will continue to allow the cables to be run at angles with framing members, (as the crow flies). Now you have cables "crossing over" one another, exposed----And resembling a spider's web. Is this "neat and workmanlike"?
The practice of recessing cables within the protective cavity of framing members should continue. This protects the cables from stored equipment, and other essential items, such as duct-work, other piping, etc., and most importantly---It protects service technicians from possibly coming into contact with an energized piece of equipment, due to the fact that it is being energized by a bare, ungrounded, damaged conductor.

7-98 Log #2456 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: Gerald Horn, Spencer Research & Development dba/J-Horn Electric Inc.
Recommendation: Revise text to read as follows:
Smaller cable shall be run either through bored holes in joist or on running boards or through a listed device designed to support NM cable installed perpendicular to the joist. This device is attached to the bottom of each joist and must be installed within 6 in. of either side of the center support beam of the basement or crawl space.
Substantiation: This listed device would put less stress on the NM cable sheath, would not weaken the wood ceiling joist and will save time and expense for the installer.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: "Stackers" are covered by the words "…or similar fittings designed and installed so as not to damage the cable" in 334.30. It is not necessary to list in the code every possible means of securing and supporting nonmetallic-sheathed cable.
Stackers are permitted to be used within the cavity between joists, installed so that the cables are parallel to the joist, but not below the joist.
Smaller cable sizes are more susceptible to physical damage than the larger sizes. Accordingly, the code specifies the requirements for additional physical protection required for the smaller cables, and requires that any cables

approved by the code to be run at angles with joists.

In addition, submitter did not note the revisions in the submittal.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-99 Log #2707 NEC-P07 **Final Action: Accept in Part**
(334.15(C))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal identifying the part of the proposal that was rejected.

This action will be considered by the panel as a public comment.

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete portion beginning with the third sentence and substitute:

That portion of nonmetallic-sheathed cable installed on the wall of an unfinished basement or crawl space shall be installed in an identified conduit, electrical metallic tubing, electrical nonmetallic tubing, flexible nonmetallic tubing, surface metal raceways or surface nonmetallic raceways,or shall be protected by other identified means. Where the raceway does not terminate in a box or other enclosure, an insulating bushing shall be provided where the nonmetallic cable enters the raceway. Where the raceway terminates in a box or other enclosure the cable sheath shall extend in the box or enclosure not less than 6 mm (1/4 in.). Where the raceway is connected to a box or other enclosure the provisions of 250.86 Exception No. 2 shall not apply.

FPN: See Notes 5 and 9 of Chapter 9 Table 1 for calculation of raceway conductor fill.

Substantiation: The provisions should also apply to NMC and NMS cables, be a requirement and include crawl spaces. Raceways should be identified for the use. Insulating fittings are not necessary where the cable enters a raceway from a box or enclosure to which the raceway is connected. Securing of cable is covered by 334.30. A metal raceway may be perceived covered by Exception No. 2 for 250.86 which doesn't seem appropriate for raceways that are not "isolated" (without a connection to a box or other enclosure). The proposed FPN would be helpful for this installation.

Panel Meeting Action: Accept in Part

Replace all references to NM cable with the word nonmetallic-sheathed cable.

Panel Statement: Reference to NM cable includes Type NM, Type NMC, and Type NMS, but for clarity it changes NM to "nonmetallic-sheathed cable" so it includes all three types. The panel agrees with the grounding issues because it is essential to this location and type of installation. The last sentence of the paragraph covers grounding issues sufficiently.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-100 Log #4161 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: Ron B. Chilton, North Carolina Department of Insurance

Recommendation: Delete text as follows:

(C) In Unfinished Basements ~~and Crawl Spaces.~~ Where cable is run at angles with joists in unfinished basements and crawl spaces, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable installed on the wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing or shall be protected in accordance with 300.4. Conduit or tubing shall be provided with a suitable insulating bushing or adapter at the point the cable enters the raceway. The NM cable sheath shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (1/4 in.). The cable shall be secured within 300 mm (12 in.) of the point where the cable enters the conduit or tubing. Metal conduit, tubing, and metal outlet boxes shall be connected to an equipment grounding conductor.

Substantiation: Although an added measure of protection for the cable during time of construction, after the building is complete and other construction trades are not installing other systems, there is no reason the cable should be exposed to damage just as reasonably as the roof shouldn't leak and cause a wet location. There have been, however, many recorded accidents injuring Electricians, as well as Plumbing and Mechanical installers, finding the necessity to lay on the earth, holding a drill or sawzall, or other electrical tool, dragging an extension cord in the crawl space as opposed to instances of damage to cable after installation in a crawl space. (Record of incident in North Carolina included as example - the example was not received at NFPA). This requirement unnecessarily exposes workers to the greater chance or possibility of electrical shock. By character unfinished basements are intended for ready access and, therefore, subject to high incidence of exposure that can subject the wiring system to damage. Conversely, the crawl spaces have limited access and are generally used for only servicing equipment and possibly some limited storage. The existing protections required by 334.15 have been effective and reliable for years prior to the addition of crawl spaces to 334.15(C).

Panel Meeting Action: Reject

Panel Statement: Section 334.15(C) does apply to crawl spaces. See panel action and statement on Proposal 7-97.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

LA DART, S.: See negative comment on 7-97.

7-101 Log #4855 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: John Steinke, Amish Electric

Recommendation: Delete entire paragraph, and rewrite to read:

(C) In Unfinished Basements and Crawl Spaces:

(1)(a) It shall be permitted to run cables either through joists, or to secure them to the lower face of the joists. Where cables pass through holes, either a chamfered edge, or a bushing, will be used to protect the cables from abrasion. Where the cables are attached to the lower face of the joist, and the joists are 24", or less, on center, it shall be sufficient to attach the cables at each joist. Where the joists are farther apart, running boards shall be used to provide additional support.

(1)(b) Where entry to the space is by permanent stairway, and the space is at least 6 ft tall, continuously, as measured from the entry point, cables run overhead shall be provided with either additional support or protection. Such protection may be by enclosing the cables within a ceiling, running them between piping, enclosing them within a conduit or raceway, or mounting them to running boards.

(1)(c) It shall be permitted to protect cables by running them through conduit. Where cables are protected by running through conduit, entry to the conduit shall have a bushing or fitting to protect the cable from abrasion. Cables shall be secured within 12" of entry to the conduit. The conduit shall be supported within 12" of each end, and with no more than 4-1/2 ft. between supports. Where there are no splices or connections to the cables it shall not be required to bond the raceway or conduit to the equipment grounding conductor. Conduit and raceway fill shall be calculated as if each cable were a single round conductor, with a diameter equal to the greatest dimension of the cable.

Substantiation: The section, as currently worded, is illogical, contradictory, and overly broad.

The practice of using running boards to protect overhead cables has classically been illustrated with the example of someone hanging laundry from the cables. Requiring running boards was asserted to protect the cables from this.

The fault in this logic is that cables run through joists are not so protected, and just as easy to attach a clothes hanger from. At least in this case, the cables are supported at every joist - typically less than 2 ft. With running boards, there is no requirement for the attachments of the cable to the running boards to be lass the 4 ft.

Requiring the use of running boards also encouraging bundling - while the use of cable support "trees" might provide a method.

The section also does not distinguish between a space that can only be wriggled through on your belly, and a space you can walk through. One is not likely to be hanging laundry in an 18" space, with an access hatch that you must crawl through. All jesting aside, building codes typically require 'habitable' spaces to be 6 ft tall, or taller.

Finally, there is the common issue of running cables through pipe for protection. While this certainly is done in other places than basements, it is hoped that this proposed change will provide some more general guidelines, as well bring this section in accord with the previous section (334.15B) which does NOT require such protection to be bonded.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 7-97, which is acceptable to the panel and covers this issue. The product standard addresses installation through bored holes. Remaining proposal recommendations are addressed elsewhere in the code.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

7-102 Log #2347 NEC-P07 **Final Action: Reject**
(334.15(D))

Submitter: Julian R. Burns, Quality Power Solutions, Inc.

Recommendation: Revise text to read as follows:

(C) In Unfinished Basements ~~and Crawl Spaces.~~ Where cable is run at angles with joists in unfinished basements ~~and crawl spaces,~~ it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable installed on the wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing or shall be protected in accordance with 300.4. Conduit or tubing shall be provided with a suitable insulating bushing or adapter at the point the cable enters the raceway. The NM cable sheath shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (¼ in.). The cable shall be secured within 300 mm (12 in.) of the point where the cable enters the conduit or tubing. Metal conduit, tubing, and metal outlet boxes shall be connected to an equipment grounding conductor.

New 334.15(D):

(D) Crawl Spaces. Where the height of the crawl space does not exceed 1.4m (4½ ft) it shall be permissible to secure NM cables, that run at angles with joist, to the bottom edge of joist. NM cables run within 2.1 m (7 ft) of crawl space access shall comply with 320.23.

Substantiation: The CMP's requirement to include a crawl space area into the same requirements as an unfinished basement has placed electricians into harms way. There have been instances within our state where electricians have been hurt trying to bore out joist in crawl spaces as low as 24 in. above ground. This requirement does not provide any degree of protection of cables. Also, where joist have been bored out for the installation of NM cables, the cables have been damaged by the unskilled labor installing insulation in the crawl space. They have pulled (yanked) the NM cables down to get the insulation between the joist.
Panel Meeting Action: Reject
Panel Statement: The remainder of (C) applies to crawl spaces and was not added to (D) in the proposal. See panel action and statement on Proposal 7-97.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-103 Log #2625 NEC-P07 **Final Action: Reject**
(334.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete all but (C) and substitute: SECURING and SUPPORTING. Nonmetallic-sheathe cables shall be secured to supports by staples, cable ties, straps, hangers, or other identified fittings installed so as not to damage the cable. Flat cable shall not be stapled on edge.

Exception No. 1: Fasteners shall not be required for cables in raceways or other enclosures.

Exception No. 2 Fasteners shall not be required for continuous runs in cable trays except as required in 392.8.

FPN: See 314.17(C) for cables terminated in nonmetallic boxes.

(A) SPECIFIC. Except as otherwise provided, nonmetallic-sheathed cables shall be secured to supports at intervals not exceeding 1.4 m (4 1/2 ft) and within 300 mm (12 in.) of terminations. Runs of cables through openings or notches in framing members in accordance with 300.4 shall be considered supported where secured in place.

(B) UNSUPPORTED CABLES. Nonmetallic-sheathed cables shall be permitted without intermediate support where the cable:

(1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable, and the cable is securely supported at the point(s) where it becomes accessible

(2) Is not more than 1.4 m (4 1/2 ft) from the last point of support to the point of connection to a luminaire or other electrical equipment within an accessible space above the ceiling or attached to the ceiling.

(3) Is not more than 300 mm (12 in.) in length between enclosures fastened in place, and connected to threaded hubs or openings, or through a knockout with no segments larger than the cable connector, or with reducing washers larger than the largest knockout segments.

Substantiation: Securing and supporting are not necessarily the same; cable laid on the floor is supported.: Termination replaces a laundry list of boxes, cabinets, and fittings. The provision should correlate with 314.17(C) and 392.8(B). Vertical runs through framing members provide support where cables are secured (per the first sentence) just as vertical runs are secured to the side of a stud. Reference to 314.17(C) should be made. Proposal is similar to 342.30(C), 344.30(C), and 352.30(C).
Panel Meeting Action: Reject
Panel Statement: The proposed change to this section does not improve the clarity or consistency for supporting and securing of NM cable. See panel statement on Proposal 7-14.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-104 Log #3233 NEC-P07 **Final Action: Reject**
(334.30 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add an Exception as follows:

Exception: Nonmetallic-sheathed cable shall ot be required to be securely fastened in place where installed in cable trays except as required in 392.8(B).

Substantiation: Provision should be made for cable tray istallation.
Panel Meeting Action: Reject
Panel Statement: The exception is not required because provisions are in 334.10(4) and installation requirements are in Article 392.

Ballot Results: Affirmative: 14

7-105 Log #921 NEC-P07 **Final Action: Reject**
(334.30(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text to read as follows:

(3) If not more than 300 mm (12 in.) in length between boxes, cabinets, or other enclosures securely fastened in place and securely fastened to the enclosure. Where the cable is attached at knockouts with segments larger than the cable connector reducing washers larger than the largest knockout segment shall be installed.

Substantiation: If the provisions of 342.30(C), 344.30(C) and 352.30(C) are deemed necessary, a similar provision should be in this article.
Panel Meeting Action: Reject
Panel Statement: The substantiation references do not apply to this wiring method. No technical documentation or history of failure was provided.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-106 Log #1701 NEC-P07 **Final Action: Reject**
(334.30(C))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 8 for action in Article 342.
Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise 344.30(C) as follows:

(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, Type IMC shall be permitted to be unsupported where the raceway is not more than <u>5 ft or 20 times the trade size, whichever is less,</u> ~~450 mm (18 in.)~~ and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.

Substantiation: The proposed revision will make the unsupported length, between enclosures, dependent on the raceway OD, which is a factor in how well a given raceway will resist bending.
Panel Meeting Action: Reject
Panel Statement: The panel is not sure what the submitter is proposing. Article 334 addresses NM cable; however, the recommendation specifies Type IMC. 334.30(B) addresses unsupported cables; however, the recommendation addresses 334.30(C), which is Wiring Device Without a Separate Outlet Box.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-107 Log #324 NEC-P07 **Final Action: Reject**
(334.80)

Submitter: Gaylord Poe, Inspection Bureau, Inc.
Recommendation: Revise as follows:

334.80 Ampacity. The ampacity of Types NM, NMC, ~~and~~ NMS, <u>and SE</u> cable shall be determined in accordance with 310.15. The ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The ~~90°C (194°F)~~ <u>listed</u> rating <u>of the conductors</u> shall be permitted to be used for ampacity derating purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor. The ampacity of Types NM, NMC, ~~and~~ NMS<u>, and SE</u> cable installed in cable tray shall be determined in accordance with 392.11.

Substantiation: Type SE cable needs to be included in the first paragraph of 334.80 to coincide with the change made to 338.10(B)(4)(a) in NEC 2008. There is much confusion regarding the ampacity of Type SE cable used for interior wiring, 338.10(B)(4)(a) states that SE cable "shall comply with the installation requirements of Part II of Article 334." but the only reference to ampacity in Part II of Article 334 is in 334.80. The first paragraph of 334.80 should include Type SE cable if the intent of 338.10(B)(4)(a) is that Type SE cable used as interior wiring is also subject to the 60°C (140°F) conductor temperature rating.
Panel Meeting Action: Reject
Panel Statement: Article 334 is for NM cable; it is inappropriate to include SE in this section. SE ampacity is covered in Article 338.
338.10(B)(4)(a) stipulates that Type SE cable installed in interior installations shall comply with Part II of Article 334. Part II includes 334.80, Ampacity, so it already applies.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-108 Log #2174 NEC-P07 **Final Action: Accept in Principle in Part**
(334.80)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:

334.80 Ampacity.

The ampacity of Types NM, NMC, and NMS cable shall be determined in accordance with 310.15. The ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The 90°C (194°F) rating shall be permitted to be used for ampacity <u>adjustment and correction</u> ~~derating~~ purposes, provided the final <u>calculated</u> ~~derated~~ ampacity does not exceed that for a 60°C (140°F) rated conductor. The ampacity of Types NM, NMC, and NMS cable installed in cable tray shall be determined in accordance with 392.11.

Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a). The term "correction" is used in 310.16.
Panel Meeting Action: Accept in Principle in Part
Revise first paragraph as follows:

334.80 Ampacity.

The ampacity of Types NM, NMC, and NMS cable shall be determined in accordance with 310.15. The allowable ampacity shall not exceed that of a 60°C (140°F) rated conductor. The 90°C (194°F) rating shall be permitted to be

used for ampacity adjustment and correction calculations, provided the final ampacity does not exceed that for a 60°C (140°F) rated conductor. The ampacity of Types NM, NMC, and NMS cable installed in cable tray shall be determined in accordance with 392.11.
Panel Statement: The panel accepted "adjustment and correction" in place of "derating" but did not accept "calculated". The text has been rearranged to improve clarity. See committee action on Proposal 7-19.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-109 Log #2752 NEC-P07 **Final Action: Accept**
(334.80)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Recommendation: Revise text to read as follows:
334.80 Ampacity.
Where more than two NM cables containing two or more current-carrying conductors are installed without maintaining spacing between cables through the same opening in wood framing that is to be sealed with ~~fire or draft stopped using~~ thermal insulation, caulk or sealing foam, the allowable ampacity of each conductor shall be adjusted in accordance with Table 310.15(B)(2)(a) and the provisions of 310.15(A)(2), Exception shall not apply.
Substantiation: The terms fire-stopped and draft stopped are industry terms which are used in specific building code applications. The use of these terms is not standard, therefore a different term is used to reduce confusion over application and provide an easier more universal interpretation of the language. Changing the language does not change the scope of application for this code section.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-110 Log #2990 NEC-P07 **Final Action: Accept in Principle in Part**

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-111 Log #4616 NEC-P07 **Final Action: Reject**
(334.80)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee
Recommendation: Delete the second paragraph and revise the first paragraph to read as follows:
334.80 Ampacity. Type NM, NMC, and NMS cable shall have conductors rated at 90°C (194°F). Where installed in thermal insulation, the ampacity of conductors shall be that of 60°C (140°F) conductors. The ampacity of Types NM, NMC, and NMS cable installed in cable tray shall be determined in accordance with 392.11.
Substantiation: Thermal insulation severely degrades the ampacity of conductors. Mid-length conductor derating, whether as a consequence of the ambient temperature notes to Table 310.16, etc., or mutual conductor heating issues covered in 310.15(B)(2)(a), assumes free dissipation of heat from the raceway or cable assembly involved. If that assumption is invalid, then the calculations are invalid. This is true for all wiring methods.
We are aware that CMP 7 reviewed, as a key factor in the revision to 338.10(B)(4)(a), the NEMA research for the 1987 cycle (Proposal 4-97), which showed the cable jacket of 2/3 AWG SEU cable "completely charred" as well as adjacent "charred wood members" when embedded in thermal insulation (specifically, when covered with 7 inches of cellulose insulation) and subjected to currents corresponding to their Table 310.16 ampacities. Similar cables exceeded their temperature ratings when drawing only two-thirds of their table ampacities. The term "final derated ampacity" in this context is meaningless. Ampacity is the continuous current carrying ability of a wire under conditions of use. It is determined by thermodynamics. If the use impedes free circulation of air, then the ampacity is reduced to whatever it is.
If there are no thermal impediments to air circulation, then it is appropriate to allow the 90°C number for derating purposes. If installed in thermal insulation, start with the 60°C number, just as was the case for armored cable prior to the 2005 NEC.
The data in the 1987 NEMA proposal illustrates this principle nicely, since the experimental parameters allow for a very close inference as to the actual effect of thermal insulation on ampacity, at least for 2 AWG aluminum cable assemblies with nonmetallic sheaths. From that experimental data, it is obvious that the true ampacity of 2 AWG XHHW Aluminum made up as Type SE cable is about 60 amperes when it is embedded in cellulose insulation. In fact, the ampacity is even lower because the test set-up used only two current-carrying conductors and comparable table listings are based on three conductors. The table ampacity of the 90°C (XHHW) individual conductors of the SE cable make-up, starting in the 60°C column is 75 amperes. Even this number is much higher than the actual ampacity as determined by test under the specified conditions of use.
The current NEC does not account for this hazard because it allows code users to start their derating calculations in the 90°C column, and bundle many conductors together or run through high-temperature ambients, all apparently valid according to traditional procedures. Suppose, for example, cables accounting for nine 12 AWG current-carrying conductors are bundled [The applicability of 310.15(B)(2)(a) has always been assumed in these arguments, and now is specifically mandated by the third paragraph] through attic floor joists with an assigned design temperature of 45°C. The resulting ampacity (assuming THHN conductors) would appear to be 30A x 0.7 x 0.87 = 18A. The 60°C ampacity of 12 AWG conductors is 25A. Since the calculation result (18A) does not exceed 25A, it appears to be allowed by the NEC, but is it technically correct?
This conclusion is, in fact, incorrect. This calculation does not take into account the effect of thermal insulation. The more technically correct answer is given by the armored cable rules in the 2002 and prior editions of the NEC: Begin with the 60°C column: 25A x 0.7 x 0.71 = 12A. There is no consistent percent multiplier that can be applied to correct for thermal insulation. Because heat dissipation has to account for I^2R losses, which are usually much higher for larger cables expected to carry much more current, one can't confidently predict the exact ampacity of a given application. However, one can predict with confidence that the thermal insulation effect will be significant. The 60°C rule provides a prescriptive approximation of how to counteract the effects of thermal insulation. It probably overstates the result in the smallest sizes of conductors, and understates it in the larger sizes, but it is the only readily available option at this time.
Not only does the NEC wording understate the hazard with respect to the use of Type NM cable where embedded in thermal insulation, it perversely overstates the hazard where thermal insulation is not involved. A 90°C conductor running through open floor joists does not need to be reduced to a 60°C conductor at any stage of an ampacity calculation. Although this is a distinction largely (but certainly not entirely) without a difference for common branch-circuit applications due to the operation of 240.4(D), it is a major issue for larger circuits.
This section now governs the interior branch-circuit and feeder applications of Type SE cable, which is now taken at the 60°C column value as the upper final ampacity limit in all instances. This is appropriate for embedment in insulation, but far too low for most common applications for those cables. For example, traditional 4/0 Al XHHW SER cable (180A nominal ampacity for terminations; 205A for derating start point; 150A for final ampacity) must now be taken as a 150A cable for a cable that has been an industry workhorse for 200A feeders (200A being the next higher standard size above the 75°C column). NEC users have been alarmed to find out their 200A cable just lost 25% of its ampacity. The 150A number is completely defensible for 4/0 Al cabling in insulation. The 200A number is perfectly defensible for the same cable run across or through open floor joists. This proposal fully addresses both the understatement of ampacity on open runs and the overstatement of ampacity on runs embedded in thermal insulation.
The second paragraph is deleted because there is no loss experience known to the Committee on this point, perhaps because of the more conservative start point for derating in accordance with this proposal wording that has applied consistently in Massachusetts for many years now.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the submitter's proposed language for the first paragraph in 334.80 since the existing language was based on the recognition that NM cable is often installed or embedded in thermal insulation. The panel rejects the deletion of the second paragraph since local practice is not justification for national code rules, and the submitter did not provide sufficient proof to counter the research presented in previous code cycles. The submitter refers to a NEMA research document multiple times. This research was not available to the panel, nor is there any record of it being reviewed in the 2008 code cycle.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-112 Log #1530 NEC-P07 **Final Action: Reject**
(334.82 (New))

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Add new text as follows:
334.82 Optical Fibers. When a Nonmetallic-Sheathed Cable contains optical fibers, the installation of the optical fibers shall be in accordance with 770.133.
Substantiation: Section 770.133 contains the installation rules for optical fibers in composite optical fiber cables. Reference to Article 770 is necessary because Section 770.3(A) states:
"(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable."
Article 770 has definitions for optical fiber cables:
"Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering."
"Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors."
Panel Meeting Action: Reject
Panel Statement: The installation requirements for optical fibers with electrical conductors are covered in 770.133. Section 90.3 provides for the modification of Chapter 3 wiring methods as amended by Chapter 7. Adding the installation requirement of 770.133 to the cable article is redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-113 Log #174 NEC-P07 **Final Action: Reject**
(334.101 (New))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Add new text to read:
334.101 Hybrid NM and Communications Cables. The construction of hybrid NM and communications cables shall comply with Part III of this article and also comply with 800.179(I).
Substantiation: Acceptance of this proposal will bring about correlation with Article 800. Section 800.179 is shown below.
(I) Hybrid Power and Communications Cables. Listed hybrid power and communications cables shall be permitted where the power cable is a listed Type NM or NM-B conforming to the provisions of Article 334, and the communications cable is a listed Type CM, the jackets on the listed NM or NM-B and listed CM cables are rated for 600 volts minimum, and the hybrid cable is listed as being resistant to the spread of fire.
FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Flame Tray Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.
Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.
Panel Meeting Action: Reject
Panel Statement: Section 90.3 provides that Chapter 3 requirements do not apply to Chapter 8 unless specifically referenced. The installation requirements for listed hybrid power and communications cables are covered in 800.179. A correlating reference in Article 334 is not needed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-114 Log #58 NEC-P07 **Final Action: Reject**
(334.104(C))

Note: This Proposal appeared as Comment 7-45 on Proposal 7-78 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 7-78 was:
Revise as follows:
334.116 Sheath. The outer sheath of nonmetallic-sheathed cable shall comply with 334.116(A), (B), and (C).
(A) Type NM. The overall covering shall be flame retardant and moisture resistant.
(B) Type NMC. The overall covering shall be flame retardant, moisture resistant, fungus resistant, and corrosion resistant.
(C) Type NMS. The overall covering shall be flame retardant and moisture resistant. The sheath shall be applied so as to separate the power conductors from the communications and signaling conductors. The signaling conductors shall be permitted to be shielded. An optional outer jacket shall be permitted.
~~**FPN: For composite optical cable, see 770.9 and 770.133.**~~
334.117 Optical Fibers. Optical fibers shall be permitted in the construction of Nonmetallic-Sheathed Cables.

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Continue to accept this proposal in principle in part by modifying the action as shown.
(C) Optical Fibers. Optical fibers shall be permitted in Type NMS ~~cable as permitted in 770.9(C) and 770.113~~.
Substantiation: Panel 16 action on proposal 16-36 eliminated section 770.9(C).
Panel 16 action on proposals 16-51 and 16-60 modified section 770.113. Section 770.13, currently and as modified by proposals 16-51 and 16-60, has no requirements dealing with composite optical fiber cable. Section 770.113 requires the use of listed optical fiber cables with an exception for a limited length of unlisted outside plant cable to enter the building.
Panel Meeting Action: Reject
Panel Statement: Section 770.3(A) permits composite cables and requires that they be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable. Adding text to permit optical fiber members in the cable article is redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 336 — POWER AND CONTROL TRAY CABLE: TYPE TC

7-115 Log #1531 NEC-P07 **Final Action: Reject**
(336.2.Power and Control Tray Cable, Type TC.)

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Revise text as follows:
336.2 Definition.
Power and Control Tray Cable, Type TC. A factory assembly of two or more insulated conductors, with or without optical fiber members and with or without associated bare or covered grounding conductors, under a nonmetallic jacket.
Substantiation: Article 330 explicitly mentions optical fibers in the definition of Metal Clad Cable.
"330.2 Definition.
Metal Clad Cable, Type MC. A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic sheath."
Since Armored Cables can also contain optical fibers, this proposal would add optical fibers to the definition of Armored Cable also.
Panel Meeting Action: Reject
Panel Statement: Section 770.3(A) permits composite cables and requires that they be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable. Adding text to permit optical fiber members in the cable article is redundant.
Number Eligible to Vote: 14

7-117 Log #1946 NEC-P07 **Final Action: Reject**
(336.10(7))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (7) Where not likely to be subject to physical damage...(remainder unchanged).
Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-118 Log #4088 NEC-P07 **Final Action: Reject**
(336.10(7))

Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Revise text to read as follows:
In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is continuously supported and protected against physical damage using mechanical protection, such as struts, angles, or channels, Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use with the marking Type TC-ER shall be permitted ~~between a cable tray and the utilization equipment or device~~ to be exposed. The cable shall be secured at intervals not exceeding 1.8 m (6 ft). Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable. In cables containing conductors sized 6 AWG or smaller, the equipment grounding conductor shall be provided within the cable or, at the time of installation, one or more insulated conductors shall be permanently identified as an equipment grounding conductor in accordance with 250.119(B).
Substantiation: There is no technical reason to restrict the use of TC-ER cable to only between the cable tray and utilization equipment. As long as the cable is continuously supported and protected against physical damage, it should be permitted to be used between pieces of utilization equipment.
Panel Meeting Action: Reject
Panel Statement: Type TC-ER cable is not permitted to be installed as exposed runs in unlimited lengths. The cable is primarily designed to be installed in cable tray and as permitted in 336.10.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
RUNYON, G.: The panel should have accepted this proposal. It specifies that the cable must be protected which is the main concern of the panel members. There is no technical reason that TC-ER cannot be safely installed outside of a cable tray. The panel should allow this type of installation that provides a cost effective method without compromising safety.

7-119 Log #3681 NEC-P07 **Final Action: Reject**
(336.10(7) Exception)

Submitter: Richard F. VanWert, Middle Department Inspection Agency
Recommendation: Revise text as follows:
Exception: The cable shall be mechanically supported where exiting the cable tray using a strain relief or similar means to ensure that the minimum bending radius is not exceeded.
Substantiation: More direction is needed to clarify the requirements of the new exception that was new in the 2008 NEC.
Panel Meeting Action: Reject
Panel Statement: The last sentence in 336.10(7) Exception contains the requirement but does not specifically define what to use. The user has the flexibility to select the appropriate means to comply with the requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-120 Log #4389 NEC-P07 **Final Action: Accept**
(336.12)

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
336.12 Uses Not Permitted.
Type TC tray cable shall not be installed or used as follows:
(1) Installed where it will be exposed to physical damage
(2) Installed outside a raceway or cable tray system, except as permitted in 336.10(4) and 336.10(7)
(3) Used where exposed to direct rays of the sun, unless identified as sunlight resistant
(4) Direct buried, unless identified for such use
Substantiation: 336.10(4) permits the use of Power and Control Tray Cable Type TC to be supported by a messenger wire outdoors. This appears to conflict with 336.12(2) where it is not allowed to be installed outside of a raceway or cable tray system except as permitted in 336.10(7).
Panel Meeting Action: Accept

(336.82 (New))

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Add new text as follows:
336.82 Optical Fibers. When a Type TC Cable contains optical fibers, the installation of the optical fibers shall be in accordance with 770.133.
Substantiation: Section 770.133 contains the installation rules for optical fibers in composite optical fiber cables. Reference to Article 770 is necessary because Section 770.3(A) states:
"(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable."
Article 770 has definitions for optical fiber cables:
"Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering."
"Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors."
Panel Meeting Action: Reject
Panel Statement: The installation requirements for optical fibers with electrical conductors are covered in 770.133. Section 90.3 provides for the modification of Chapter 3 wiring methods as amended by Chapter 7. Adding the installation requirement of 770.133 to the cable article is redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-125 Log #4320 NEC-P07 **Final Action: Reject**
(336.100)

Submitter: Robert L. Seitz, Artech Engineering
Recommendation: Revise text as follows:
A metallic sheath or armor as defined in 330.116 shall not be permitted either under or over the non metallic jacket. Metallic shield(s) shall be permitted over groups of conductors, under the outer jacket, or both. A braided or basket weave armor shall be permitted beneath the outer jacket.
Substantiation: There is need for an additional cable construction for use in industrial establishments that provides additional durability and benefit of a flexible metallic armor beneath the outer jacket. The existing restriction against

armor in Tray Cable only references the types of armor described for MC cable in Article 330. The intent is to have a range of cable construction available that Shipboard Cable (IEEE 1580 and UL 1309) for shipboard and offshore applications. The allowance for a braided armor for tray cable should in no way compromise tray cable installations.
Panel Meeting Action: Reject
Panel Statement: The prohibition of a metallic sheath or armor on Type TC cable was intentional to provide a distinct construction difference between Type MC cable and Type TC cable based on the permitted installation uses of each cable type. Applications cited are outside scope of the NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-126 Log #4321 NEC-P07 **Final Action: Reject**
(336.118)

Submitter: Robert L. Seitz, Artech Engineering
Recommendation: Add the following new text:
336.118 Braided Armor. The armor shall be constructed of 0.32 mm diameter +- 0.01 mm, forming a basket weave that shall firmly grip the cable. Percent coverage should be between 88% and 94%.
Substantiation: A companion proposal that permits a braided construction to 336.100 has been submitted by this author. This proposal would provide guidance for the construction of the braided armor. The intent is to provide a construction that is the same as for Shipboard cable as described in IEEE 1580 or UL 1309 without specifically referencing or copying from those documents.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-125.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 338 — SERVICE-ENTRANCE CABLE: TYPES SE AND USE

7-127 Log #1286 NEC-P07 **Final Action: Reject**
(338.3 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
338. XX Raceway Conductor Fill. Where enclosed in a raceway, conductor fill requirements shall apply.
Substantiation: Where a short section of raceway is used for protection, conductor fill requirements are often overlooked.
Panel Meeting Action: Reject
Panel Statement: Note 9 of Table 1 in Chapter 9 instructs the installer to consider multiconductor cables as a single conductor. The xxx.22 section of all the raceway articles instructs the installer to adhere to the percentage of fill requirements found in Table 1 of Chapter 9.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-128 Log #2597 NEC-P07 **Final Action: Reject**
(338.10(4)() and (b) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new exception for (a) and (b): Service -entrance cable installed in cable trays shall not be required to be fastened in place except as specified in 392.8(B).
Substantiation: Edit. Provision should be made for cable tray installation.
Panel Meeting Action: Reject
Panel Statement: The exception is not required because 338.10(B)(4) refers the user back to 334.10(4) for installation requirements of SE cable. Cable tray installation requirements are in Article 392. The exception is not required.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-129 Log #920 NEC-P07 **Final Action: Reject**
(338.10(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text to read as follows:
"...and the insulation complies with applicable provisions of Article 334.
Substantiation: Edit. It is assumed that Article 334 should apply.
Panel Meeting Action: Reject
Panel Statement: The insulation requirements for NM cable are contained in UL 719 and the insulation requirements for SE Cable are contained in UL 854. The requirements are not the same in the two standards.
There is no requirement that the insulation on service-entrance cable comply with 334.112. Also, 4.1.1 of the NEC Style Manual states that references shall not be made to an entire article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-130 Log #1285 NEC-P07 **Final Action: Reject**
(338.10(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Insert "or bonding" between "grounding" and "purposes".
Substantiation: The uninsulated conductor may be used for bonding, for example where connecting two metal enclosure suitable for use as equipment grounding conductors.
Panel Meeting Action: Reject
Panel Statement: The original language was introduced to clarify that the bare conductor of a Type SE Cable shall only be used as a equipment grounding conductor for branch circuits and feeders. Article 100 does provide a distinction between the function of equipment grounding and bonding.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-131 Log #1943 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In the heading, change "GROUNDED" TO "GROUNDING"...
Substantiation: Edit. The text relates to equipment grounding (conductor) which is not the same as "grounded" (system) conductor.
Panel Meeting Action: Accept in Principle
Revise heading of 338.10(B)(2) to read as follows:
Use of Uninsulated Conductor.
Panel Statement: Depending on the use of SE cable, the bare conductor may be used as a grounded or grounding conductor. The permissive language of 338.10(B)(2) establishes a condition where the bare conductor may be used for branch circuit applications.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-132 Log #1699 NEC-P07 **Final Action: Accept**
(338.10(B)(2) Exception)

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Clarify the Exception to 338.10(B)(2) by adding the text as follows:
338.10 Uses Permitted.
(B) Branch Circuits or Feeders.
(2) Grounded Conductor Not Insulated. Type SE service-entrance cable shall be permitted for use where the insulated conductors are used for circuit wiring and the uninsulated conductor is used only for equipment grounding purposes.
Exception: In existing installations, u~~U~~ninsulated conductors shall be permitted as a grounded conductor in accordance with 250.32 and 250.140 where the uninsulated grounded conductor of the cable originates in service equipment, and 225.30 through 225.40.
Substantiation: Since feeders are now required to be 4-wire, it would not be practical, for example, to install a new feeder under 250.32 with an uninsulated grounded conductor. The added text will correlate with the new requirement for feeders and accommodate the previously code compliant 3-wire feeders in existing installations.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-133 Log #451 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(4))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.
This action will be considered by the panel as a public comment.
Submitter: Richard W. Likes, L & F Electric
Recommendation: Add new text to read as follows:
Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 334, excluding 334.80.
Substantiation: SE cable has always had this exception. If the manufactures have changed the insulation on the wire, it should reflect on the temperature/ampacity chart. This is just raising the cost of wire by having to use a larger size. Has the NEC been wrong for all these years?
Panel Meeting Action: Accept in Principle
Accept inserted text. plus Insert language: "Where installed in thermal insulation, the ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The 90°C (194°F) rating shall be permitted to be used for ampacity adjustment and correction purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor."
Panel Statement: The panel recognizes that SE cable is listed to 75C. The panel also recognizes that installation in thermal insulation can decrease the ampacity of a cable assembly.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 10 Negative: 4

Explanation of Negative:

HINRICHS, J.: The information provided CMP-7 during the 2008 NEC code cycle, was indicative that this product was manufactured similar to NM Cable, and was subject to the same installation concerns as NM Cable during electrical installations within thermal insulation, or when "bundled". The submitter has not supplied any technical documentation to indicate why this requirement should be removed.

LA DART, S.: The panel should reject this proposal. This is a safety issue. Type SE Cable should continue to comply with the requirements of 334.80. Panel 7 reviewed substantiation that showed the results of normal loading of conductors, when the conductors were run through thermal insulation.

Insulation degradation will occur as a result of the lack of heat dissipation through a thermal barrier. Both types, "NM and SE Cable", are similar in construction. Both are required to have a 90 degree C. rating. The performance rating for both cables, when placed in thermal insulation will be the same, therefore, 334.80 should apply.

MERCIER, C.: The language proposed by the Panel falls short when SE cables are installed as branch circuits in that it does not require all of the ampacity adjustment requirements found in 334.80.

STRANIERO, G.: The panel action to permit the 90C rating to be used for ampacity adjustment and correction factors should be rejected. Type NM cable has this provision because the insulated conductors are required to be rated 90C. The insulated conductors in SE cable are not required to be rated 90C and are typically rated 75C as indicated in the panel statement. Permitting the 90C rating to be used for ampacity adjustment and correction factors for Type SE is not appropriate.

Comment on Affirmative:

HUNTER, C.: While the panel's action is a reasonable compromise to address concerns about wiring methods (including SE) in thermal insulation, there was no substantiation presented in either the 2008 or 2011 Code cycle to warrant the ampacity restrictions placed on this wiring method in the 2008 NEC.

7-134 Log #2401 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(4)(a))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.

This action will be considered by the panel as a public comment.

Submitter: Julian R. Burns, Quality Power Solutions, Inc.

Recommendation: Revise text to read as follows:

(4) Installation Methods for Branch Circuits and Feeders.

(a) Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 334<u>, excluding 334.80</u>.

Substantiation: CMP 7 removed the text without any technical merit. Even the UL listing of SE type cable is a minimum of 75 degree Centigrade and can be higher if so marked by the manufacturer (See the copy from the UL White Book that I have Provided). The manufactures of Type SE cable also acknowledge that the rating of their cable is 75°C and the conductors are rated 90°C in a dry location. Typical terminations for circuit breakers and wiring devices are rated at 75°C thus there is no valid technical merits to limit the ampacity of SE Type cable to the 60°C as set forth in 334.80. The substantiation that Mr. Hartwell gave during the 2008 NEC process was based on a NEMA test in 1987, this was 20+ years ago. Technology has progressed and insulation compounds have been improved, also the substantiation that Mr. Daly gave had no merit at all it was just a statement.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 7-133.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 4

Explanation of Negative:

HINRICHS, J.: The information provided CMP-7 during the 2008 NEC code cycle, was indicative that this product was manufactured similar to NM Cable, and was subject to the same installation concerns as NM Cable during electrical installations within thermal insulation or when "bundled". The submitter has not provided information to the contrary, that the concerns mentioned in 7-133 are not valid.

LA DART, S.: See comment on 7-133.

MERCIER, C.: See My Explanation of Negative on 7-133.

STRANIERO, G.: See my reason for negative vote on proposal 7-133.

Comment on Affirmative:

HUNTER, C.: See 7-133.

MERCIER, C.: See My Explanation of Negative on 7-133.

STRANIERO, G.: See my reason for negative vote on proposal 7-133.

Comment on Affirmative:

HUNTER, C.: See 7-133.

7-136 Log #3815 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(4)(a))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.

This action will be considered by the panel as a public comment.

Submitter: Christel K. Hunter, Alcan Cable

Recommendation: Add new text to read as follows:

(4) Installation Methods for Branch Circuits and Feeders

(a) Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Parts I and II of Article 334, <u>excluding 334.80</u>.

Substantiation: In the 2008 NEC, the underlined text was deleted. There was no technical, experimental or field evidence substantiation given for this change. The effect is to limit the temperature rating of the SE cable assembly to 60°C, even though SE cable is listed to be used up to 75°C. NM cable and SE cable are listed to different standards, UL 719 for NM and UL 854 for SE.

In the 1999 NEC, a similar restriction was made, and the panel's action for the 2002 NEC (May 2001 ROC 7-98)

"was to correct an inadvertent correlation oversight. No technical substantiation has been provided to equate the ampacity requirements of Types NM and SE cables."

Once again,no technical substantiation has been provided, and yet the panel changed the ampacity restrictions in the 2008 NEC.

The research performed decades ago that resulted in the limitation of NM cable to 60C may or may not still be valid, but it does not and never has applied to SE cable. Insulations and installations have changed over the years, so perhaps it is time to update the research on these wiring methods. Until new evidence and adequate substantiation is available for evaluation, it is inappropriate to change the application of a cable assembly that has been used successfully and safely for decades.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 7-133.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 4

Explanation of Negative:

HINRICHS, J.: See my Explanation of Negative on Proposal 7-134 (Log #2401).

HUNTER, C.: Please see my comment on 7-133.

7-137 Log #1944 NEC-P07 **Final Action: Reject**
(338.12(A)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (1) Where likely to be subject to physical damage.
Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-138 Log #1971 NEC-P07 **Final Action: Reject**
(338.100)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last part: Type SE or USE cable containing two or more conductors shall be permitted to have one conductor uninsulated where used as a grounded service conductor or equipment grounding or bonding conductor, unless otherwise provided in this Code.
Substantiation: There should be restructions on the use of the uninsulated conductor.
Panel Meeting Action: Reject
Panel Statement: The use of uninsulated conductors is and has been addressed throughout the NEC. This section covers the construction of the cable and its makeup. The use of the cables is covered in Part II Installations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 340 — UNDERGROUND FEEDER AND BRANCH-CIRCUIT CABLE: TYPE UF

7-139 Log #1533 NEC-P07 **Final Action: Reject**
(340.2. Underground Feeder and Branch-Circuit Cable, Type UF)

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Revise text as follows:
340.2 Definition.
Underground Feeder and Branch-Circuit Cable, Type UF. A factory assembly of one or more insulated conductors, with or without optical fiber members, with an integral or an overall covering of nonmetallic material suitable for direct burial in the earth.
Substantiation: Article 330 explicitly mentions optical fibers in the definition of Metal Clad Cable.
"330.2 Definition.
Metal Clad Cable, Type MC. A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic sheath."
Since Armored Cables can also contain optical fibers, this proposal would add optical fibers to the definition of Armored Cable also.
Panel Meeting Action: Reject
Panel Statement: Section 770.3(A) permits composite cables and requires that they be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable. Adding text to permit optical fiber members in the cable article is redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-140 Log #1942 NEC-P07 **Final Action: Reject**
(340.12(7))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (7) Where likely to be subject to physical damage.
Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-141 Log #3161 NEC-P07 **Final Action: Accept in Principle**
(340.12(7))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 340.12, delete ~~(7) In any hazardous (classified) location, except as otherwise permitted in this Code.~~
Renumber 340.12(8), (9), (10), and (11) as 340.12(7), (8), (9), and (10) respectively.
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(7) In hazardous (classified) locations except as specifically permitted by other articles in this *Code*.
Panel Statement: Revising (7) provides the user with the information that the use of this cable is not generally permitted in hazardous locations but provides the information that the user should check in Chapter 5 to see if and where it is permitted. The additional added phrase preserves the responsibility for CMP-14 to authorize its use where appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-142 Log #1525 NEC-P07 **Final Action: Reject**
(340.82 (New))

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Add new text as follows:
340.82 Optical Fibers. When a Type UF Cable contains optical fibers, the installation of the optical fibers shall be in accordance with 770.133.
Substantiation: Section 770.133 contains the installation rules for optical fibers in composite optical fiber cables. Reference to Article 770 is necessary because Section 770.3(A) states:
"(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable."
Article 770 has definitions for optical fiber cables:
"Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering."
"Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors."
Panel Meeting Action: Reject
Panel Statement: The installation requirements for optical fibers with electrical conductors are covered in 770.133. Section 90.3 provides for the modification of Chapter 3 wiring methods as amended by Chapter 7. Adding the installation requirement of 770.133 to the cable article is redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 342 — INTERMEDIATE METAL CONDUIT: TYPE IMC

8-13 Log #1761 NEC-P08 **Final Action: Reject**
(342.11 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: 342.11 USE NOT PERMITTED. Where likely to be subject to physical damage which impairs its functional capabilities.
Substantiation: This wiring method is damage resistant, but not impervious to damage. "Damage" is not defined; a small dent is damage but does not impair grounding, watertightness, or inserting or withdrawing conductors. This wiring method can be damaged by backhoes, jackhammers, impacts by vehicles and other sources.
Panel Meeting Action: Reject
Panel Statement: Suggested language is subjective and unenforceable.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-14 Log #3317 NEC-P08 **Final Action: Reject**
(342.12 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: 342.XX Uses not permitted. Intermediate metal conduit shall not be used where likely to be subject to physical damage.
Substantiation: No wiring method is immune to physical damage.
Panel Meeting Action: Reject
Panel Statement: This adds a limitation that is without technical merit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-15 Log #233 NEC-P08 **Final Action: Reject**
(342.14)

Submitter: Kevin Daye Hanson, Columbus, OH
Recommendation: Revise as follows:
To ensure bonding, where practicable, dissimilar metals in contact anywhere in the system shall be avoided ~~to~~ eliminating the possibility of galvanic action.
Substantiation: We have a few inspectors who use this to say that aluminum MC cable cannot rest against metal sprinkler pipe. Some are also saying that our aluminum flexible metal conduit cannot be up against the duct work which extends from the unfinished ceiling to the furnace which stands alone on the floor.
Panel Meeting Action: Reject

Panel Statement: The implication is that galvanic action only has a deleterious effect on bonding. While bonding is an aspect damage to the raceway wall itself is also of consideration.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-16 Log #355 NEC-P08 **Final Action: Accept**
(342.28)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise second sentence as follows:
Where conduit is threaded in the field, a standard cutting die with a taper of 1 in 16 ~~(¾ in. taper per foot)~~ (¾ in. taper/foot) shall be used.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
DABE, J.: The term "per" appears in the NEC 180 times. The term has been in existence since 1580, and has a very understandable meaning "for each, for every". There is no reason it can not appear in a standard.

8-17 Log #4745 NEC-P08 **Final Action: Accept in Principle**
(342.30(A))

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
342.30 Securing and Supporting.
IMC shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 342.30(A) and (B), or permitted to be unsupported in accordance with 342.30(C).
(A) Securely Fastened.
(1) Each IMC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination.
(2) Fastening shall be permitted to be increased to a distance of 1.5 m (5 ft) where structural members do not readily permit fastening within 900 mm (3 ft).
(3) Where approved, conduit shall not be required to be securely fastened within 900 mm (3 ft) of the service head for above-the-roof termination of a mast.
Substantiation: This is an update from the style manual to provide a list of all of the requirements for securely fastened and part (A) of this section. Part (B) of this same section has already done in a list type format. There is no other changes made to this section and does not change the sections intent. Makes it easier for site & write by having more specific itemization of securing IMC.
Panel Meeting Action: Accept in Principle
Revise 342.30(A) to read as the following:
342.30 Securing and Supporting.
IMC shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 342.30(A) and (B), or permitted to be unsupported in accordance with 342.30(C).
(A) Securely Fastened. IMC shall be secured in accordance with one of the following:
(1) IMC shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination.
(2) Where structural members do not readily permit fastening within 900 mm (3 ft), fastening shall be permitted to be increased to a distance of 1.5 m (5 ft).
(3) Where approved, conduit shall not be required to be securely fastened within 900 mm (3 ft) of the service head for above-the-roof termination of a mast.
Panel Statement: CMP-8 is in agreement with submitter; editorial changes were made for clarity and in accordance with style manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-18 Log #1991 NEC-P08 **Final Action: Reject**
(342.30(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Exposed vertical risers from ~~industrial~~ fixed machinery or fixed equipment in industrial or commercial occupancies shall be permitted to be supported at intervals not exceeding 6m (20 ft) if the conduit is unbroken or intermediate connections are threaded. ~~made up with threaded couplings~~ and the conduit securely fastened and supported at the top and bottom of the riser, and no other means of intermediate support is ~~readily available~~ exists.
Substantiation: Conduit is available in 20 ft. lengths and couplings may not be required. All fittings should be threaded, such as a T conduit body which is commonly installed near the bottom of the riser above a floor flange where the conduit terminates, where wiring is tapped to equipment. Since there is no requirement for supervision or qualified personnel, this provision should not be limited to industrial premises. This installation is commonly employed in supermarkets, homeowner supply stores, plant nurseries, and other premises.
Panel Meeting Action: Reject
Panel Statement: CMP-8 recognizes that not all industrial machinery is fixed in place and has rejected similar proposals in the past. Conduit shall be in a continuous length when installed. If this cannot be achieved then threaded couplings are permitted to be used. This section does not address the termination of the conduit into a conduit body. Section 342.30(B)(3) is not limited to industrial premises.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-19 Log #1852 NEC-P08 **Final Action: Reject**
(342.30(B)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Runs of IMC shall be permitted to be supported by openings or notches in framing members where support and fastening comply with this section.
FPN: See 300.4.
Substantiation: Whether, vertical or horizontal, runs can be supported by holes and notches and other openings. Support is not necessarily the same as fastening. This section requires fastening at specified intervals which applies and not negated where support is by holes, notches or other openings. This fastening is necessary especially where IMC is run through large openings in bar joists or metal studs vertical runs of Type AC and MC cables through openings in metal studs are commonly installed and accepted. Reference to 300.4 is pertinent to this section. Vertical runs on the side of studs are supported because they are required to be fastened.
Panel Meeting Action: Reject
Panel Statement: This section applies only to horizontal runs of conduit and allows the openings through framing members to "support" the conduit. Vertical runs of conduits shall be "supported" and "securely fastened".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-20 Log #1920 NEC-P08 **Final Action: Reject**
(342.30(B)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Superfluous. This particular type of support is not prohibited by this section. Other specific support such as by messenger wire, direct burial, or embedment in concrete is not noted as a special type of support. Installation through holes and notches is covered by 300.4. The provision doesn't correlate with (B)(2).
Panel Meeting Action: Reject
Panel Statement: This section applies only to horizontal runs of conduit and allows the openings through framing members to "support" the conduit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-21 Log #697 NEC-P08 **Final Action: Reject**
(342.30(C))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
342.30 Securing and Supporting.
IMC shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 342.30(A) and (B), or permitted to be unsupported in accordance with 342.30(C).
(A) Securely Fastened. *[unchanged by this Proposal]*
(B) Supports. *[unchanged by this Proposal]*
(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, Type IMC shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
FPN: An example of an oversized knockout is a field-fabricated knockout where minor tool misalignment or tool drift during fabrication results in an enclosure or box hole larger than that permitted by the product Listing standard for a factory-fabricated knockout in Listed equipment.
Substantiation: Requirements in existing 250.97 Exception and requirements added to the 2008 *NEC*® in 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C) are predicated upon whether or not the knockout opening is oversized or not. "Oversized knockouts", however, are not defined either dimensionally or descriptively, nor are they defined comparatively to standard, NON-oversized knockouts, which are also undefined dimensionally either directly in the *NEC*® or indirectly by reference to other standards.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-24a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-22 Log #1700 NEC-P08 **Final Action: Reject**
(342.30(C))

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise 342.30(C) as follows:
(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, Type IMC shall be permitted to be unsupported where the raceway is not more than 5 ft or 20 times the trade size, whichever is less, ~~450 mm (18 in.)~~ and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The proposed revision will make the unsupported length, between enclosures, dependent on the raceway OD, which is a factor in how well a given raceway will resist bending.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-24a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-23 Log #3067 NEC-P08 **Final Action: Reject**
(342.30(C))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(C) Unsupported Raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered,~~ Type IMC shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This code rule is overly restrictive.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-24a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-24 Log #3627 NEC-P08 **Final Action: Reject**
(342.30(C))

Submitter: David A. Williams, Delta Township
Recommendation: Revise text to read as follows:
(C) Unsupported Raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered~~, Type IMC shall be permitted to be unsupported where the raceway is not more than ~~450 mm (18 in.)~~ 900 mm (3 ft) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The change for the 2008 code is too restrictive. Under the provisions of 342.30(A), we could have concentric or eccentric knockouts in a raceway installation and still not provide support for up to five ft from the enclosure. The metal deck roof areas allowing you to go up to five ft are more subject to vibration than switchboard or panelboard installations.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-24a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-24a Log #2200 NEC-P08 **Final Action: Accept**
(342.30(C))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this provision. Also, delete the clause "or permitted to be unsupported in accordance with 342.30(C)" from the last sentence of 342.30.
Substantiation: The concept of a special support rule for short lengths of raceway run between enclosures of various sorts was added to the 2008 NEC for the first time in the history of the NEC with negligible technical substantiation and no evidence of loss experience, and remains at variance from routine trade practice. The existence of a coupling now immediately provokes a support requirement, even on a 6-inch and a 4-inch long heavy-wall 4 trade size steel nipples put together to make an 11-inch (approx.) combined raceway. A 90 degree sweep roughly 2 trade size or larger (any centerline length over 18 in.) now requires intermediate support. The literal text now requires support to structure on a 3-in. nipple if even one of its ends "encounters" a concentric knockout.
Although there are those who believe the new rule simply offers limited relief from a rule that required all raceways to be independently supported, routine field experience throughout the history of rigid raceway wiring methods does not substantiate such assertions. We are unaware of any significant attempts to require supports on short nipples. All rigid raceways under NEC rules must be listed, including their couplings; is it conceivable that a coupling between two segments of a short (3 ft or less) nipple so seriously degrades the stability of the raceway that such a support is needed? Concentric knockouts in enclosures are reviewed as part of the UL 50 process, and as anyone working these enclosures recently should be aware, those standards have been strengthened and these knockouts are now more robust than in previous decades; is this the time to require even more support?
Raceways generally require support within 3 ft of terminations, and when the entire length is just that long or shorter, no additional support should be needed. In effect, the locknuts and bushings or connectors and locknuts at each end are supports. This is not a new concept for the NEC: CMP 7 just added the wording "(wiring method) fittings shall be permitted as a means of cable support" in a number of cable articles. If carried to its logical conclusion and routinely enforced (however unlikely), this new support rule will likely drive the market in the direction of cabled wiring methods without any technical justification.
It should be remembered that supports to structure are not infallible. Many raceways hang from threaded rod of indefinite length every 10 ft or so and within 3 ft (5 ft. in some cases) of enclosures, depending on the specific rules for the size and character of the supported raceway. Such support clearly meets the rules in this section, but would it add anything to a nipple between enclosures? Further, even when rigid supports such as one-hole clips are used, the raceway beyond the last clip can have an indefinite number of couplings and enter the center knockout of an indefinite number of concentric knockouts; how is this arrangement so inherently more secure than a nipple between enclosures? This new NEC provision was without precedent, and addressed a nonexistent problem.
Panel Meeting Action: Accept
Panel Statement: CMP-8 does not necessarily agree with the submitter's substantiation. Securement requirements are found in 342.30(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: IEEE does not agree with the concluding statement in submitter's substantiation that "This new NEC provision (in the 2008 NEC)… addressed a non-existent problem." During the 2008 NEC cycle Panel 8 fully considered the need for adding the section which the submitter proposes to delete. The Panel determined that the present language was needed to clarify that short nipples do not require additional support and that this was not universally understood by AHJ's, especially in remote & rural areas.
Comment on Affirmative:
DABE, J.: The base rule under.30(A) for IMC, RMC, PVC, RTRC, and EMT, remains in force. The conduit systems shall be securely fastened within 3 feet between termination points.

8-25 Log #1318 NEC-P08 **Final Action: Accept in Principle in Part**
(342.46)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wires from abrasion unless the design of the box, fitting, or enclosure ~~is such to afford equivalent~~ provides such protection.
Substantiation: Edit. "Equivalent" is subjective, undefined and a term to be avoided.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wires from abrasion unless the box, fitting, or enclosure is designed to provide this protection.
Panel Statement: CMP-8 accepts the submitter's suggestion to remove the word "equivalent" and has edited to meet the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 344 — RIGID METAL CONDUIT: TYPE RMC

8-26 Log #4617 NEC-P08 **Final Action: Reject**
(344.6 Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the following exception:
Exception: RMC made from red brass shall be permitted to be approved.
Substantiation: This proposal has been made in a more extensive form previously; this proposal only covers red brass. While the submitter was revising the American Electricians' Handbook and again while revising the National Electrical Code Handbook for the same publisher (McGraw-Hill), he made a survey of all manufacturing listees in the UL category "Rigid Nonferrous Metallic Conduit (DYWV)". None of those listees report production of listed red brass heavy wall conduit. CMP 8 has responded to prior submittals on this point with assertions that listed products are available, but this submitter has been unable to substantiate that point. At best it is almost impossible to find and has been so for decades.
This is why 680.23(B)(2)(a) specifically allows brass conduit to be approved and not listed, thereby constituting a deliberate Chap. 6 amendment of this Chapter 3 rule. Some plumbing supply houses carry heavy wall red brass pipe, often in 12-ft lengths, that takes a conventional pipe thread extremely well, and

is a very robust product with an extremely smooth interior that, if anything, is somewhat more difficult to bend than IMC or RMC. Lack of heavy foot pressure with excessive force on the handle won't kink the product, but will bend the bender handle. Approval is at the discretion of the local inspector, but this product should certainly be recognized until a listed alternative becomes more available.
Panel Meeting Action: Reject
Panel Statement: Red Brass conduit is required to be listed. Product standards and the follow-up services NRTLs utilize for a listed product insures the performance of the product in the field and meets the panel's intent. However, where necessary, the AHJ by special permission may waive specific requirements in this code per 90.4.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-27 Log #1950 NEC-P08 **Final Action: Reject**
(344.10(A)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: Aluminum RMC shall be permitted where ~~judged suitable for the environment~~ identified for the use.
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual. Who is to be the judge? Environment may not be deemed to include uses.
Panel Meeting Action: Reject
Panel Statement: Characteristics of aluminum are such that its condition of use is predicated on being used where not subject to excessive corrosion or being protected with supplementary corrosive protection. Current language is compatible with 300.6.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-28 Log #3316 NEC-P08 **Final Action: Reject**
(344.12 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: 344.XX Uses not permitted. Rigid metal conduit shall not be used where likely to be subject to physical damage.
Substantiation: No wiring method is immune to physical damage.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-14.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-29 Log #232 NEC-P08 **Final Action: Reject**
(344.14)

Submitter: Kevin Daye Hanson, Columbus, OH
Recommendation: Revise as follows:
To ensure bonding, where practicable, dissimilar metals in contact anywhere in the system shall be avoided ~~to~~ eliminating the possibility of galvanic action.
Substantiation: We have a few inspectors who use this to say that aluminum MC cable cannot rest against metal sprinkler pipe. Some are also saying that our aluminum flexible metal conduit cannot be up against the duct work which extends from the unfinished ceiling to the furnace which stands alone on the floor.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-15.

8-30 Log #356 NEC-P08 **Final Action: Accept**
(344.28)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise second sentence as follows:
Where conduit is threaded in the field, a standard cutting die with a 1 in 16 taper (¾ in. taper/foot) ~~(¾-in. taper per foot)~~ shall be used.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
DABE, J.: See my statement for 8-16.

8-31 Log #2657 NEC-P08 **Final Action: Reject**
(344.30(A) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Fastening shall not be required where installed in continuous runs in cable trays except as required in 392.8(B).
Substantiation: The provision should address installations in cable trays.
Panel Meeting Action: Reject
Panel Statement: Section 392.6(J) requires raceways to be secured to the cable tray per the appropriate raceway article. Section 392.8(B) applies to cable only.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-32 Log #1990 NEC-P08 **Final Action: Reject**
(344.30(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Exposed vertical risers from ~~industrial~~ fixed machinery or fixed equipment in industrial or commercial occupancies shall be permitted to be supported at intervals not exceeding 6m (20 ft) if the conduit is unbroken or intermediate connections are threaded. ~~made up with threaded couplings~~ and the conduit securely fastened and supported at the top and bottom of the riser, and no other means of intermediate support ~~is readily available~~ exists.
Substantiation: Conduit is available in 20 ft. lengths and couplings may not be required. All fittings should be threaded, such as a T conduit body which is commonly installed near the bottom of the riser above a floor flange where the conduit terminates, where wiring is tapped to equipment. Since there is no requirement for supervision or qualified personnel, this provision should not be limited to industrial premises. This installation is commonly employed in supermarkets, homeowner supply stores, plant nurseries, and other premises.
Panel Meeting Action: Reject
Panel Statement: CMP-8 recognizes that not all industrial machinery is fixed in place and has rejected similar proposals in the past. Conduit shall be in a continuous length when installed. If this cannot be achieved then threaded couplings are permitted to be used. This section does not address the termination of the conduit into a conduit body. Section 344.30(B)(3) is not limited to industrial premises.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-33 Log #1909 NEC-P08 **Final Action: Reject**
(344.30(B)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete last sentence and substitute: Runs of RMC shall be permitted to be supported by openings or notches in framing members where support and fastening comply with this section.
FPN: See 300.4.
Substantiation: Whether vertical or horizontal, runs can be supported by holes and notches and other openings. Support is not necessarily the same as fastening. This section requires fastening at specified intervals which applies and not negated where support is by holes, notches or other openings. This fastening is necessary especially where RMC is run through large openings in bar joists or metal studs. Vertical runs of Type AC and MC cables through openings in metal studs are commonly installed and accepted. Reference to 300.4 is pertinent to this section. Vertical runs on the side of studs are supported because they are required to be fastened.

(344.60)

Submitter: Anthony C. Gradi, Pease Development Authority
Recommendation: Delete the following text:
~~Rigid metal conduit is permitted to be an equipment ground.~~
Substantiation: In the event that the conduit sustains physical damage, the equipment and ground are rendered useless.
Panel Meeting Action: Reject
Panel Statement: Rigid conduit system is tested and listed for grounding. RMC complies with Article 250 for grounding. The submitter provided no technical substantiation to prove otherwise. RMC is permitted for use where subject to physical damage. Any damaged RMC should be replaced.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: The IEEE believes this proposal should be "accepted". Industry experience indicates that, for several reasons including the one presented by the proposal submitter, metallic conduit systems do not always provide adequate equipment grounding. As a result, ANSI/IEEE Standard 142-2007 (the "Green Book"), section 2.2.3, recommends installation of a separate equipment grounding conductor (EGC) in conduit.
With regard to the Panel statement that RMC is tested and listed for grounding, there does not appear to any reference to a test method for establishing the adequacy of RMC as an equipment grounding conductor in the UL White Book either in the section on RMC or in the White Book NEC Correlation Index. Further, if there is such a UL test described elsewhere, the current level used and resulting voltage drop would both be of interest as factors in determining the suitability of RMC as an EGC for all installations.
Finally, if the proposed change is ultimately accepted it would have to be correlated with other sections of the NEC that presently recognize RMC as a grounding means. Similarly, Article 342 for IMC would require revision. (See also my Comments on Proposal 8-129).

ARTICLE 348 — FLEXIBLE METAL CONDUIT: TYPE FMC

8-40 Log #182 NEC-P08 **Final Action: Reject**
(348.9)

Submitter: Franklin H. King, Eugene, OR
Recommendation: When depth gage tubing cutters are used to cut EMT conduit there is no reduction to the internal diameter of the pipe. The code should read"

" When depth gauge tubing cutters are used to sever EMT pipe, there need be no reduction of wire pull into the pipe."

Substantiation: The code implies that the wire fill of a conduit cut with a tubing cutter must comply to the rule of wire fill for flexible conduit using an inside connector. Refering to page 70/595 in the 2001 issue Proposal Report. (Listed as a request by Franklin H. King)
Panel Meeting Action: Reject
Panel Statement: The code does not require a wire fill reduction when conduit or tube cutters are used. The panel recognizes that the proposal is intended for EMT and not FMC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

LOYD, R.: I believe this proposal was meant for Section 358.9. It is not appropriate to place cutting requirements in the Code as that is a workmanship issue. Reaming is required in 358.28(A) which would resolve the submitter's concern.

8-41 Log #3162 NEC-P08 **Final Action: Reject**
(348.12(4))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 348.12, delete ~~(4) In any hazardous (classified) location except as permitted by other articles in this Code~~

Renumber 348.12(5), (6), and (7) as 348.12(4), (5), and (6), respectively.

Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.

Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.

Panel Meeting Action: Reject
Panel Statement: The reference to the NEC Style Manual 2.2.1 (scope of an article) has no applicable relationship to the argument made by the submitter. The reference to the NEC Style Manual 4.1.2 (other references), "Use references to other NEC rules to avoid repeating a requirement", supports the reference to other articles of the code. CMP-8 has not attempted to determine which wiring methods shall be allowed in hazardous locations, but instead has informed the user that other articles will determine the use of this wiring method in hazardous locations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-42 Log #1760 NEC-P08 **Final Action: Reject**
(348.12(7))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Where <u>likely to be</u> subject to physical damage <u>which impairs its functional capabilities.</u>
Substantiation: One reason for using this wiring method is protection of conductors from damage. It can sustain some damaging force such as a small dent which doesn't damage conductors, affect grounding or insertion or withdrawal of conductors.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-13.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-43 Log #2756 NEC-P08 **Final Action: Reject**
(348.20(A)(2))

Submitter: Rich Wolfe, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:

348.20 Size.

(A) Minimum. FMC less than metric designator 16 (trade size 1/2) shall not be used unless permitted in 348.20(A)(1) through (A)(5) for metric designator 12 (trade size 3/8).

(1) For enclosing the leads of motors as permitted in 430.245(B)

(2) <u>Only when exposed to physical damage,</u> in lengths not in excess of 1.8 m (6 ft), for any of the following uses:

a. For utilization equipment

b. As part of a listed assembly

c. For tap connections to luminaires as permitted in 410.117(C)

(3) For manufactured wiring systems as permitted in 604.6(A)

(4) In hoistways as permitted in 620.21(A)(1)

(5) As part of a listed assembly to connect wired luminaire sections as permitted in 410.137(C).

Substantiation: If 3/8 in. flex is not exposed to physical damage, it should be allowed to be used in lengths longer than 6 ft. There are applications in the field where a longer length of flex is needed and the trade size of 1/2 in. flex is too large for the tight areas where the flex is needed to be routed. Also, if the 3/8 in. flex is used for tap conductors for a luminaire above a ceiling, the length should be allowed to go beyond 6 ft if needed. AC and MC cable does not have any length restrictions either.
Panel Meeting Action: Reject
Panel Statement: FMC is not acceptable for use in areas of physical damage. See Section 348.12(7).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-44 Log #2537 NEC-P08 **Final Action: Accept**
(348.30)

Submitter: Marcus R. Sampson, Lysistrata Electric
Recommendation: Revise text to read as follows:

348.30 Securing and Supporting.

FMC shall be securely fastened in place and supported in accordance with 348.30(A) and (B).

(A) Securely Fastened. FMC shall be securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 ft).

Exception No. 1: Where FMC is fished between access points through concealed spaces in finished buildings or structures and supporting is ~~impractical~~ impracticable.

Substantiation: The term "impractical" is not an enforceable term. Who determines whether secure support is practical? The installer or the end-user or the inspector? Where support is "impracticable" the installer should look to, and the inspector should allow, this exception.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-45 Log #2656 NEC-P08 **Final Action: Reject**
(348.30 Exception No. 5 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Exception No. 5: Fastening shall not be required where installed in continuous runs in cable trays except as required in 392.8(B).
Substantiation: The provision should address installations in cable trays.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-31.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-46 Log #2892 NEC-P08 **Final Action: Reject**
(348.30(A) Exception (New))

Submitter: Jerry Grant, Plainfield, IL
Recommendation: Add new text to read as follows:

Exception: <u>Where raceways measure lengths equal to or less than the lengths described in exception No.2, fastening shall not be required.</u>

Substantiation: This is a clarification of the text. The text is often applied in this manner in the field.
Panel Meeting Action: Reject
Panel Statement: Exception No. 2 is acceptable only when flexibility is necessary after installation and is not a general rule. Technical substantiation is needed to consider such a revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-47 Log #2895 NEC-P08 **Final Action: Accept in Principle**
(348.30(A) Exception No. 2)

Submitter: Jerry Grant, Plainfield, IL
Recommendation: Add new text to read as follows:

Exception: Where flexibility is necessary after installation, lengths shall not exceed<u>, measuring from the last fastener of the raceway,</u> the following:

Substantiation: This is clarification of the text. The text is often applied in this manner in the field.
Panel Meeting Action: Accept in Principle

Revise Section 348.30(A) Exception 2 to read as follows:

Exception No. 2: Where flexibility is necessary after installation, lengths from the last point where the raceway is securely fastened shall not exceed the following:

(1) 900 mm (3 ft) for metric designators 16 through 35 (trade sizes 1/2 through 11/4)

(2) 1200 mm (4 ft) for metric designators 41 through 53 (trade sizes 11/2 through 2)
(3) 1500 mm (5 ft) for metric designators 63 (trade size 21/2) and larger.
Panel Statement: Panel changes made for clarity reasons.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-48 Log #2658 NEC-P08 **Final Action: Reject**
(348.30(A) Exception No. 5 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Exception No. 5: Fastening shall not be required where installed in continuous runs in cable trays except as required in 392.8(B).
Substantiation: The provision should address installations in cable trays.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-31.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-49 Log #3235 NEC-P08 **Final Action: Reject**
(348.30(B) Exception No. 5 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows:
Exception No. 5 FMC shall not be required to be securely fastened in place where installed in cable trays except as required in 392.8(B).
Substantiation: Provision should be made for cable tray installation.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-31. CMP-8 recognizes that the submitter probably meant 348.30(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-50 Log #1948 NEC-P08 **Final Action: Accept in Part**
(348.42)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: ~~COUPLINGS and~~ CONNECTORS. Angle connectors shall not be ~~used for~~ concealed ~~raceway installations~~.
Substantiation: Edit. Present wording implies that a concealed raceway terminated flush with a wall cannot be extended with an angle connector. The text does not relate to couplings.
Panel Meeting Action: Accept in Part
Keep the title as Coupling and Connectors
Delete “used for” and “raceway installations”
Revise text as follows:
COUPLINGS and CONNECTORS. Angle connectors shall not be ~~used for~~ concealed ~~raceway installations~~.
Panel Statement: Submitter’s substantiation is correct but titles of sections have been harmonized with other raceway sections.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
LOYD, R.: There are no couplings made for flexible metal conduit the submitter is correct. Although the titles in each like section in chapter 3 are harmonized it does not make sense to list something that is not appropriate.

8-51 Log #2345 NEC-P08 **Final Action: Reject**
(348.60)

Submitter: David Mercier, Southwire Company
Recommendation: Revise the first sentence of 348.60:
“Where used to connect equipment where flexibility is required <u>to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement</u> after installation, an equipment grounding conductor shall be installed.”
Substantiation: The purpose of this change is to clarify the use of the term “flexibility” with respect to using an equipment grounding conductor in flexible metal conduit, to ensure the integrity of the ground path. Installed flexible conduit which is connected to equipment which may be moved or subject to vibration can compromise continuity of the ground path. A companion proposal has been submitted to panel 5 for 250.118(5)(d).
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Acceptance of the proposed language will better clarify the meaning of the “flexibility” that FMC is suitable to provide. And, while it is understood that the NEC is not a design guide, inclusion of the proposed language will also aid in facilitating responsible engineering designs seeking compliance with the intent of the NEC. Installation and definition of the equipment grounding conductor is covered under CMP-5 responsibility and acceptance of the proposed revision by CMP-8 should be correlated with CMP-5.

ARTICLE 350 — LIQUIDTIGHT FLEXIBLE METAL CONDUIT: TYPE LFMC

8-52 Log #3163 NEC-P08 **Final Action: Reject**
(350.10(2))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 350.10(2), delete ~~by 501.10(b), 502.10, 503.10, and 504.20 and in other hazardous (classified) locations where specifically approved, and~~
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-53 Log #976 NEC-P08 **Final Action: Reject**
(350.10(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
For direct burial <u>in earth or embedded in concrete</u> ~~where~~ <u>if</u> listed and marked for the purpose.
Substantiation: Edit. It is not clear whether direct burial is intended to include embedment in concrete.
Panel Meeting Action: Reject
Panel Statement: As the Code is currently written, LFMC is not approved for concrete encasement. The proposal does not supply the technical substantiation to revise this section. Section 356.10(7) for LFNC was revised for the 2008 NEC and clearly states that LFNC is acceptable for concrete encasement and what connectors are permitted to be used.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-54 Log #4173 NEC-P08 **Final Action: Reject**
(350.10(4))

Submitter: David Mercier, Southwire Company
Recommendation: Add new text as follows:
<u>(4) Type LFMC as a listed manufactured prewired assembly, metric designator 16 through 103 (trade size 1/2 through 4) conduit.</u>
Substantiation: This change would expand the use of prewired assemblies to allow conductors sized large enough for feeder applications.
Panel Meeting Action: Reject
Panel Statement: Technical substantiation was not provided that unlimited lengths and sizes can be transported and stored safely without damage to the enclosed conductors prior to the installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BERMAN, R.: This proposal should be accepted. Safe transportation and storage is not an issue unique to that of listed prewired assemblies and is important for all electrical equipment to be installed in accordance with the NEC. If electrical equipment is damaged prior to installation, it should not be used in accordance with NEC Section 110.12(B).
Listed prewired assemblies are comprised of listed components that could be field assembled and inspected by an AHJ, but are assembled in the factory prior to field installation.

8-55 Log #1759 NEC-P08 **Final Action: Reject**
(350.12(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Where <u>likely to be</u> subject to physical damage <u>which impairs its functional capabilities.</u>
Substantiation: One reason for using this wiring method is to provide a degree of physical protection for contained conductors which should not preclude use where damage which may occur is negligible. “Damage” is not defined; a small dent is damage, but unless it affects watertight integrity it has not impaired functional capabilities.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-13.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-56 Log #2634 NEC-P08 **Final Action: Reject**
(350.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise texts: LFMC shall be securely fastened in place to supports by ~~an approved~~ identified means within 300 mm (12 in.) of terminations. ~~Each box, cabinet, conduit body or other conduit termination and shall be supported and secured~~ at intervals not to exceed 1.4 m (4-1/2 ft).

Exception No. 1: Where LFMC is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical provided the conduit is securely fastened to supports where it becomes accessible.

Exception No. 2 and 3 no change.

Exception No. 4: Lengths within an accessible ceiling not exceeding 1.8 m (6 ft) from the last point of support where the raceway is securely fastened for connections to luminaries or other equipment within an accessible ceiling or mounted on the surface of the ceiling.

Add: Exception No. 5: Intermediate support shall not be required where the raceway is not more than 300 mm (12 in.) in length between enclosures secured in place and connected to threaded hubs or openings or through a knockout with no segments larger than the raceway connector, or with reducing washers larger than the largest knockout segment and the raceway is bonded with a bonding jumper.

Exception No. 6: Where installed in cable trays the provisions of 392.8(B) shall apply.

Substantiation: Fastening should be to supports, which is not specifically required. “Termination” eliminates some wordage.

Exception No. 4 should also apply to surface mounted equipment.

Exception No. 5 is similar to provisions for unsupported raceways in other articles.

Section 392.8(B) should apply where the conduit is installed in cable tray.

Panel Meeting Action: Reject
Panel Statement: “Securely Fastened” is not restricted to supports only. Securing to concrete walls, cable trays, and other approved means are acceptable whether it is fished, exposed, or concealed.
Not all securely fasten means are “identified”.
The Panel finds the wordage useful for the user.
Exception 4 applies to raceways within an accessible ceiling only. It is recognized that a degree of concealment is present and the luminaire would be installed in the ceiling grid.
Proposed Exception 6 is unacceptable since Section 392.6(J) requires raceways to be secured to the cable tray per the appropriate raceway article. Section 392.8(B) applies to cable only.
Additional change does not improve the usability of the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-57 Log #919 NEC-P08 **Final Action: Reject**
(350.30 Exception No. 5 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add a new Exception No. 5: Intermediate support shall not be required if the conduit is not more than 300 mm (12 in.) in length between boxes, cabinets, or other enclosures securely fastened in place and securely fastened to the enclosure. Where conduit is attached at knockouts larger than the conduit connector, reducing washers larger than the largest knockout segment shall be installed and the conduit shall be bonded to the enclosure by approved means.
Substantiation: If the provisions of 342.30(C), 344.30(C) and 352.30(C) are deemed necessary, a similar provision should be in this article.
Panel Meeting Action: Reject
Panel Statement: The provision for shorter lengths of conduits between terminations applied to “rigid conduits” only. There was not a substantiation to allow flexible conduits or tubings to be allowed for the same provision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-58 Log #2655 NEC-P08 **Final Action: Reject**
(350.30 Exception No. 5 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Exception No. 5: Fastening shall not be required where installed in continuous runs in cable trays except as required in 392.8(B).
Substantiation: The provision should address installations in cable trays.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-31.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-59 Log #2890 NEC-P08 **Final Action: Reject**
(350.30(A) Exception (New))

Submitter: Jerry Grant, Plainfield, IL
Recommendation: Add new text to read as follows:

Exception: At hookups for machines, machine tools and utilization equipment, if secure fastening is not available, strain relief within 12 inches of the raceway connector shall be sufficient.

Substantiation: Secure fastening is not always available at all hookups for machines, machine tools and utilization equipment. This would provide an alternate method of compliance and help maintain the connection between the raceway and connector.
Panel Meeting Action: Reject
Panel Statement: The proposal does not improve clarity or content.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-60 Log #2893 NEC-P08 **Final Action: Reject**
(350.30(A) Exception (New))

Submitter: Jerry Grant, Plainfield, IL
Recommendation: Add new text to read as follows:

Exception: Where raceways measure lengths equal to or less than the lengths described in exception No.2, fastening shall not be required.

Substantiation: This is clarification of the text. The text is often applied in this manner in the field.
Panel Meeting Action: Reject
Panel Statement: Exception No. 2 is acceptable only when flexibility is necessary after installation and is not a general rule. Technical substantiation is needed to consider such a revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-61 Log #2896 NEC-P08 **Final Action: Accept in Principle**
(350.30(A) Exception No. 2)

Submitter: Jerry Grant, Plainfield, IL
Recommendation: Add new text to read as follows:

Exception: Where flexibility is necessary after installation, lengths shall not exceed, measuring from the last fastener of the raceway, the following:

Substantiation: This is clarification of the text. The text is often applied in this manner in the field.
Panel Meeting Action: Accept in Principle

Revise Section 350.30(A) Exception 2 to read as follows:

Exception No. 2: Where flexibility is necessary after installation, lengths from the last point where the raceway is securely fastened shall not exceed the following:

(1) 900 mm (3 ft) for metric designators 16 through 35 (trade sizes 1/2 through 11/4)

(2) 1200 mm (4 ft) for metric designators 41 through 53 (trade sizes 11/2 through 2)

(3) 1500 mm (5 ft) for metric designators 63 (trade size 21/2) and larger

Panel Statement: Panel changes made for clarity reasons.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-62 Log #1908 NEC-P08 **Final Action: Reject**
(350.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete last sentence and substitute: Runs of LFMC shall be permitted to be supported by openings or notches in framing members where support and fastening comply with this section.

FPN: See 300.4.

Substantiation: Whether vertical or horizontal, runs can be supported by holes and notches and other openings. Support is not necessarily the same as fastening. This section requires fastening at specified intervals which applies and not negated where support is by holes, notches or other openings. This fastening is necessary especially where LFMC is run through large openings in bar joists or metal studs. Vertical runs of Type AC and MC cables through openings in metal studs are commonly installed and accepted. Reference to 300.4 is pertinent to this section. Vertical runs on the side studs are supported because they are required to be fastened.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-19.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-63 Log #2602 NEC-P08 **Final Action: Reject**
(350.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Runs of LFMC shall be permitted in accordance with 300.4 where in compliance with 350.30(A).
Substantiation: Other than horizontal runs can be supported by framing members by the opening or protection plate and where secured, just as where run on the side of a stud. Fastening should be required where the opening provides support, but is large as in bar joists which provide support, but not securement in place.
Panel Meeting Action: Reject
Panel Statement: Section 300.4 deals with protection of conductors from physical damage, not securing or supporting.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-64 Log #1949 NEC-P08 **Final Action: Accept in Part**
(350.42)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: ~~COUPLINGS AND~~ CONNECTORS. Angle connectors shall not be ~~used for~~ concealed ~~raceway installations~~.
Substantiation: Edit. Present wording implies that a concealed raceway terminated flush with a wall cannot be extended with an angle connector. The text does not relate to couplings.
Panel Meeting Action: Accept in Part
Keep the title as Coupling and Connectors
Delete "used for" and "raceway installations"
Revise text as follows:
Couplings and Connectors. Angle connectors shall not be ~~used for~~ concealed ~~raceway installations~~.
Panel Statement: Submitter's substantiation is correct but titles of sections have been harmonized with other raceway sections.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
LOYD, R.: There are no couplings made for Liquidtight flexible metal conduit the submitter is correct. Although the titles in each like section in chapter 3 are harmonized it does not make sense to list something that is not appropriate.

8-65 Log #2346 NEC-P08 **Final Action: Reject**
(350.60)

Submitter: David Mercier, Southwire Company
Recommendation: Revise the first sentence of 350.60:
"Where used to connect equipment where flexibility is required <u>to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement</u> after installation, an equipment grounding conductor shall be installed."
Substantiation: The purpose of this change is to clarify the use of the term "flexibility" with respect to using an equipment grounding conductor in liquidtight flexible metal conduit, to ensure the integrity of the ground path. Installed liquidtight flexible conduit which is connected to equipment which may be moved or subject to vibration can compromise continuity of the ground path. A companion proposal has been submitted to panel 5 for 250.118(6)(e).
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Acceptance of the proposed language will better clarify the meaning of the "flexibility" that LFMC is suitable to provide. And, while it is understood that the NEC is not a design guide, inclusion of the proposed language will also aid in facilitating responsible engineering designs seeking compliance with the intent of the NEC. Installation and definition of the equipment grounding conductor is covered under CMP-5 responsibility and acceptance of the proposed revision by CMP-8 should be correlated with CMP-5.

ARTICLE 352 — RIGID NONMETALLIC CONDUIT: TYPE RNC

8-66 Log #2175 NEC-P08 **Final Action: Accept**
(352.2.Rigid Polyvinyl Chloride Conduit (PVC))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
352.2 Definition.
Rigid Polyvinyl Chloride Conduit (PVC). A rigid nonmetallic conduit ~~(RNC)~~ of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables...
Substantiation: The reference to "RNC" is not needed, as it is not used anywhere in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-67 Log #2991 NEC-P08 **Final Action: Accept**
(352.2.Rigid Polyvinyl Chloride Conduit (PVC))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
352.2 Definition.
Rigid Polyvinyl Chloride Conduit (PVC). A rigid nonmetallic conduit ~~(RNC)~~ of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.
Substantiation: The reference to "RNC" is not needed, as it is not used anywhere in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-67a Log #CP800 NEC-P08 **Final Action: Accept**
(352.10)

Submitter: Code-Making Panel 8,
Recommendation: Revise 352.10 to add a new section "I"
(I) Insulation Temperature Limitations. Conductors or cables rated at a temperature higher than the listed temperature rating of PVC conduit shall be permitted to be installed in PVC conduit, provided the conductors or cables are not operated at a temperature higher than the listed temperature rating of the PVC conduit.
Delete section 352.12 (E) and the exception in it's entirety
~~(E) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the PVC conduit listed operating temperature rating.~~
~~Exception: Conductors or cables rated at a temperature higher than the PVC conduit listed temperature rating shall be permitted to be installed in PVC conduit, provided they are not operated at a temperature higher than the PVC conduit listed temperature rating.~~
Substantiation: Moving the conductor operating temperature requirements makes it clear for the code user that conductors marked with a rated temperature higher than that of the raceway can be used when the conductors are operated within the raceway temperature rating. The exception was redundant to the current requirement in the uses not permitted. This proposal removes the exception per the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-68 Log #2768 NEC-P08 **Final Action: Accept**
(352.10(G))

Submitter: Tom Whorley, CANTEX, Inc.
Recommendation: Revise text as follows:
Underground Installations. For underground installations, ~~homogenous and nonhomogenous~~ PVC shall be permitted for direct burial and underground encased in concrete. See 300.5 and 300.50.
Substantiation: The terms "homogenous" and "nonhomogenous" are confusing, making the code more difficult to understand. Terms "homogenous" and "nonhomogenous" are not defined in Article 100. Terms "homogenous" and "nonhomogenous" are not used in any other sections of Article 352.
The removal of the two terms does not change the meaning or application of this section of the code. As written, this statement leads one to believe that nonhomogenous PVC can only be used in underground applications and this is not the case.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-69 Log #3164 NEC-P08 **Final Action: Reject**
(352.12(A))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 352.12, delete ~~(A) Hazardous (Classified) Locations. In any hazardous (classified) location, except as permitted by other articles of this Code.~~

Renumber 352.12(B), (C), and (D) as 352.12(A), (B), and (C,) respectively.
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.

Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.

Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
352.12(D) ~~**Ambient Temperatures.** Where subject to ambient temperatures in excess of 50°C (122°) unless listed otherwise.~~
<u>**Operating Temperature.** Where any combination of ambient and conductor temperature produces an operating temperature in excess of that for which the material is listed.</u>
~~**(E) Insulation Temperature Limitations** For conductors or cables operating at a temperature higher than the PVC conduit listed operating temperature rating. Exception: Conductors or cables rated at a temperature higher than the PVC conduit listed temperature rating shall be permitted to be installed in PVC conduit, provided they are not operated at a temperature higher than the PVC conduit listed temperature rating.~~
Substantiation: The NEC style manual rule concerning use of exceptions states: “Exceptions to *NEC* rules shall be used sparingly. If used, exceptions shall convey alternatives or differences to a basic code rule.” As written, this exception does not convey alternatives or differences, it just gives an example of an installation that would be allowed under the basic rule. The basic code rule prohibits conductors or cables (regardless of their insulation temperature rating) from operating at a higher temperature than the PVC conduit listed operating temperature rating. The proposed new wording consolidates the ambient and insulation temperature limitations into one sentence and eliminates the need for the exception. This is the same wording found currently in 350.12 and would provide consistency with the other articles addressing the operating temperatures of raceways. Similar proposals are submitted for: 353.12, 355.12, and 362.12.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel statement on 8-67a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-72 Log #1687 NEC-P08 **Final Action: Accept in Principle**
(352.12(E) Exception)

Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
352.12
(E) Insulation Temperature Limitations For conductors or cables operating at a temperature higher than the PVC conduit listed operating temperature rating.
~~Exception~~ <u>FPN:</u> Conductors or cables rated at a temperature higher than the PVC conduit listed temperature rating shall be permitted to be installed in PVC conduit, provided they are not operated at a temperature higher than the PVC conduit listed temperature rating.
Substantiation: The NEC style manual rule concerning use of exceptions states: “Exceptions to *NEC* rules shall be used sparingly. If used, exceptions shall convey alternatives or differences to a basic code rule.” As written, this exception does not convey alternatives or differences, it just gives an example of an installation that would be allowed under the basic rule. The basic code rule prohibits conductors or cables (regardless of their insulation temperature rating) from **operating** at a higher temperature than the PVC conduit listed operating temperature rating. The exception should be deleted or changed to a fine print note.
Similar proposals are submitted for: 353.12(5), 355.12(E), and 362.12(4).
Panel Meeting Action: Accept in Principle

8-73 Log #2654 NEC-P08 **Final Action: Reject**
(352.30(A) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Exception: Fastening shall not be required where installed in continuous runs in cable trays except as required in 392.8(B).
Substantiation: The provision should address installations in cable trays.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-31.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-74 Log #1849 NEC-P08 **Final Action: Reject**
(352.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete last sentence.
Substantiation: Superfluous. This particular type of support is not prohibited by this section. Other specific support such as by messenger wire, direct burial, or embedment in concrete is not noted as a special type of support. Installation through holes and notches is covered by 300.4.
Panel Meeting Action: Reject
Panel Statement: See committee statement on Proposal 8-20.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-75 Log #1850 NEC-P08 **Final Action: Reject**
(352.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete the last sentence.
Substantiation: Superfluous. This particular type of support is not prohibited by this section. Other specific support such as by messenger wire, direct burial, or embedment in concrete is not noted. Installation through holes and notches is covered by 300.4. Support requirements of this section already apply whether or not by holes or notches.
Panel Meeting Action: Reject
Panel Statement: See committee statement on Proposal 8-20.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-76 Log #1919 NEC-P08 **Final Action: Reject**
(352.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: ~~Horizontal~~ Runs of PVC conduit shall be permitted to be supported by openings ~~through~~ in framing members ~~at intervals not exceeding those in Table 352.30 and securely fastened within 900 mm (3 ft) of terminations shall be permitted~~ where support and fastening comply with this section.
FPN: See 300.4.
Substantiation: Whether vertical or horizontal, runs can be supported by holes and notches and other openings. Support is not necessarily the same as fastening. This section requires fastening at specified intervals which applies and not negated where support is by holes, notches or other openings. This fastening is necessary especially where PVC is run through large openings in bar joists or metal studs. Vertical runs of Type AC and MC cables through openings in metal studs are commonly installed and accepted. Reference to 300.4 is pertinent to this section.
Panel Meeting Action: Reject
Panel Statement: See panel actions and statements on Proposals 8-19 and 8-63.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-77 Log #699 NEC-P08 **Final Action: Reject**
(352.30(C))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
352.30 Securing and Supporting.
PVC conduit shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 352.30(A) and (B), or permitted to be unsupported in accordance with 352.30(C).
(A) Securely Fastened. *[unchanged by this Proposal]*
(B) Supports. *[unchanged by this Proposal]*
(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, PVC conduit shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
FPN: An example of an oversized knockout is a field-fabricated knockout where minor tool misalignment or tool drift during fabrication results in an enclosure or box hole larger than that permitted by the product Listing standard for a factory-fabricated knockout in Listed equipment.
Substantiation: Requirements in existing 250.97 Exception and requirements added to the 2008 *NEC*® in 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C) are predicated upon whether or not the knockout opening is oversized or not. “Oversized knockouts”, however, are not defined either dimensionally or descriptively, nor are they defined comparatively to standard, NON-oversized knockouts, which are also undefined dimensionally either directly in the *NEC*® or indirectly by reference to other standards.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-78.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-78 Log #2202 NEC-P08 **Final Action: Accept**
(352.30(C))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this provision. Also, delete the clause “or permitted to be unsupported in accordance with 352.30(C)” from the last sentence of 352.30.
Substantiation: The concept of a special support rule for short lengths of raceway run between enclosures of various sorts was added to the 2008 NEC for the first time in the history of the NEC with negligible technical substantiation and no evidence of loss experience, and remains at variance from routine trade practice. The existence of a coupling now immediately provokes a support requirement, even on a 6-inch and a 4-inch long heavy-wall 4 trade size steel nipples put together to make an 11-inch (approx.) combined raceway. A 90 degree sweep roughly 2 trade size or larger (any centerline length over 18 in.) now requires intermediate support. The literal text now requires support to structure on a 3-in. nipple if even one of its ends “encounters” a concentric knockout.

Although there are those who believe the new rule simply offers limited relief from a rule that required all raceways to be independently supported, routine field experience throughout the history of rigid raceway wiring methods does not substantiate such assertions. We are unaware of any significant attempts to require supports on short nipples. All rigid raceways under NEC rules must be listed, including their couplings; is it conceivable that a coupling between two segments of a short (3 ft or less) nipple so seriously degrades the stability of the raceway that such a support is needed? Concentric knockouts in enclosures are reviewed as part of the UL 50 process, and as anyone working these enclosures recently should be aware, those standards have been strengthened and these knockouts are now more robust than in previous decades; is this the time to require even more support?

Raceways generally require support within 3 ft of terminations, and when the entire length is just that long or shorter, no additional support should be needed. In effect, the locknuts and bushings or connectors and locknuts at each end are supports. This is not a new concept for the NEC: CMP 7 just added the wording “(wiring method) fittings shall be permitted as a means of cable support” in a number of cable articles. If carried to its logical conclusion and routinely enforced (however unlikely), this new support rule will likely drive the market in the direction of cabled wiring methods without any technical justification.

It should be remembered that supports to structure are not infallible. Many raceways hang from threaded rod of indefinite length every 10 ft or so and within 3 ft (5 ft. in some cases) of enclosures, depending on the specific rules for the size and character of the supported raceway. Such support clearly meets the rules in this section, but would it add anything to a nipple between enclosures? Further, even when rigid supports such as one-hole clips are used, the raceway beyond the last clip can have an indefinite number of couplings and enter the center knockout of an indefinite number of concentric knockouts; how is this arrangement so inherently more secure than a nipple between enclosures? This new NEC provision was without precedent, and addressed a nonexistent problem.
Panel Meeting Action: Accept
Panel Statement: CMP-8 does not necessarily agree with the submitter’s substantiation. Securement requirements are found in 352.30(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: See my explanation of negative vote on Proposal 8-24a.
Comment on Affirmative:
DABE, J.: See my statement for 8-24(a).

8-79 Log #3069 NEC-P08 **Final Action: Reject**
(352.30(C))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(C) Unsupported Raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered,~~ PVC conduit shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceway shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This requirement is overly restrictive.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-78.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-80 Log #3629 NEC-P08 **Final Action: Reject**
(352.30(C))

Submitter: David A. Williams, Delta Township
Recommendation: Revise text to read as follows:
(C) Unsupported Raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered~~, Type PVC shall be permitted to be unsupported where the raceway is not more than ~~450 mm (18 in.)~~ 900 mm (3 ft) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The change for the 2008 code is too restrictive. Under the provisions of 352.30(A,) we could have concentric or eccentric knockouts in a raceway installation and still not provide support for up to five ft from the enclosure. The metal deck roof areas allowing you to go up to five ft are more subject to vibration than switchboard or panelboard installations.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-78.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-81 Log #4618 NEC-P08 **Final Action: Reject**
(352.44)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Expansion fittings for PVC conduit shall be provided to compensate for thermal expansion and contraction where the length change will exceed, in accordance with Table 352.44, 3 mm (1/8 in) at securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.
Substantiation: The main problem with the existing wording is that one cannot assume the problem is only between two securely mounted boxes, etc. If that is the case, then the panel approach (1/4 inch) is fine because the box at each end only moves 1/8 inch. Suppose, however, the conduit 90's away from a brick inside corner on the left to a box on the right. The left side cannot move, so how much distance is allowed for the box? The full 1/4-inch will break the supports free of the box, as the submitter has verified by test. The proposed wording is silent on this common occurrence. Another related problem in the wording concerns boxes mounted on either end of reverse 90's or the like. The conduit may expand and contract over its length much more than 1/4 inch and not put very much pressure on the boxes at all.

The point is, how much displacement should any fixed termination tolerate? The rule should be written to prevent, under any circumstances, RNC movement that will tend to displace a securely fastened item more than 1/8-inch due to field temperature fluctuation. CMP 8 has seen this proposal before in various forms, and has failed to respond to the central technical issue: How is ¼-in. of movement a tolerable length of movement when it occurs entirely at a single raceway/enclosure interface? Again, this submitter has bench tested enclosures with this degree of expansive movement (or contraction force on cooling) and the results are not acceptable.
Panel Meeting Action: Reject
Panel Statement: The current language of this section has for several cycles adequately conveyed the requirement. In addition, there is not enough technical substantiation to revise the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-82 Log #2152 NEC-P08 **Final Action: Reject**
(352.46)

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Revise text as follows:
Where a conduit <u>terminates or</u> enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.
Substantiation: Conduit that stubs up or enters an enclosure without a bushing or adapter are denting, cutting or even skinning the insulation off the conductors or cables. The edge of the conduits are damaging the conductors on wire pulls occasionally stripping the insulation as it continues into the PVC.
Panel Meeting Action: Reject
Panel Statement: The code text as written already ensures that the PVC conduit even as a stub up would require a bushing or equivalent to protect the conductors from abrasion. The submitter's concern is already covered in section 300.15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-83 Log #1317 NEC-P08 **Final Action: Reject**
(352.48 and Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
~~All joints between lengths of conduits and between conduits and couplings~~ <u>in a run of conduit</u> shall be made by ~~an approved method~~ <u>identified means and adhesives</u>.
Exception: An adhesive shall not be provided for the movable part of an expansion fitting.
Substantiation: "Approved" is not the same as "identified" and present text does not require an adhesive.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the submitter that "approved" does not mean "Identified" as defined in Article 100. It is the intent of the panel to have PVC conduit joints acceptable to the authority having jurisdiction. In addition, PVC joints are usually solvent cemented and do not use "adhesives".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-84 Log #1866 NEC-P08 **Final Action: Reject**
(352.60)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Where equipment grounding is ~~required~~ <u>provided</u>, a separate equipment grounding conductor shall be installed in the conduit.
Exceptions No. 1 and 2 no change.
Add: Exception No. 3: Where an equipment bonding jumper is installed in parallel with the conduit.
Substantiation: Where for example a PVC conduit is interposed in a run of RMC used as an equipment grounding conductor, a bonding jumper should be acceptable. The requirement should apply where grounding is done by choice; 356.60 uses the term "or installed".
Panel Meeting Action: Reject
Panel Statement: The current language of this section adequately conveys the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-85 Log #3618 NEC-P08 **Final Action: Reject**
(352.120)

Submitter: Terrence V. Wendt, City of Omaha
Recommendation: Add new text to read as follows:
Each length of RNC shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21. The type of material shall also be included in the marking unless it is visually identifiable. <u>Schedule 40 RNC shall have a continuous white stripe down its entire length and Schedule 80 RNC shall have a continuous black stripe down its entire length.</u>
Substantiation: As an inspector, it's very hard to tell the difference between Schedule 80 and 40 when installed and only required to be marked every 10 ft. When installed above ground its usually in shorter pieces which end up with no markings. Requiring continuous colored stripes would make identification quick and reliable.
Panel Meeting Action: Reject
Panel Statement: The marking requirements for Rigid PVC conduit are found in Underwriters Laboratories Inc., Standard UL651. Schedule 40 and Schedule 80 PVC conduit are currently marked with the words "Schedule 40" or "Schedule 80" every 10 ft. The panel recognizes that a proposal to UL 651 to address this issue has been submitted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BURNS, J.: **Panel action should have been Accept in Principle and Part and wording should be;**
<u>Schedule 40 RNC shall have a continuous</u> ~~white~~ <u>identifiable stripe down its entire length.</u> ~~and Schedule 80 RNC shall have a continuous black stripe down its entire length.~~
I understand the panel's statement that the UL "White Book" does address the marking requirements, however the NEC in Section 352.120 also address "Marking". It is not clear or for certain that UL 651 standard will make any changes requiring manufactures to identify the different types of RNC and it is a problem and concern in the electrical industry that after installation the differentiation between Schedule 40 and Schedule 80 cannot be determined.
DABE, J.: Whether it is a white or black stripe, or some other form of identification there is a need for a quick and reliable means of telling schedule 40 from schedule 80 PVC.

ARTICLE 353 — HIGH DENSITY POLYETHYLENE CONDUIT: TYPE HDPE CONDUIT

8-85a Log #CP801 NEC-P08 **Final Action: Accept**
(353.10)

Submitter: Code-Making Panel 8,
Recommendation: Revise 353.10 to add a new section 6.
(6) Conductors or cables rated at a temperature higher than the listed temperature rating of HDPE conduit shall be permitted to be installed in HDPE conduit, provided the conductors or cables are not operated at a temperature higher than the listed temperature rating of the HDPE conduit.
Delete section 353.12 (5) and the exception in it's entirety
~~(5) For conductors or cables operating at a temperature higher than the HDPE conduit listed operating temperature rating~~
~~Exception: Conductors or cables rated at a temperature higher than the HDPE conduit listed temperature rating shall be permitted to be installed in HDPE conduit, provided they are not operated at a temperature higher than the HDPE conduit listed temperature rating.~~

Substantiation: Moving the conductor operating temperature requirements makes it clear for the code user that conductors marked with a rated temperature higher than that of the raceway can be used when the conductors are operated within the raceway temperature rating. The exception was redundant to the current requirement in the uses not permitted. This proposal removes the exception per the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-86 Log #918 NEC-P08 **Final Action: Reject**
(353.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
The use of HDPE conduit shall be ~~permitted under~~ limited to the following conditions: (remainder unchanged).
Substantiation: Edit. "Permitted" does not impose any requirements. See 90.5(B).
Panel Meeting Action: Reject
Panel Statement: "Shall be permitted" is an acceptable term used in accordance with 90.5(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-87 Log #3165 NEC-P08 **Final Action: Reject**
(353.12(3))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 353.12, delete ~~(3) In any hazardous (classified) location, except as permitted by other articles in this Code.~~
Renumber 353.12(4) and (5) as 353.12(3) and (4,) respectively.
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-88 Log #1711 NEC-P08 **Final Action: Accept in Principle**
(353.12(4) and (5))

TCC Action: The Technical Correlating Committee understands that the panel statement should refer to Proposal 8-85a.
Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
353.12(4) ~~Where subject to ambient temperatures in excess of 50°C (122°) unless listed otherwise.~~ Where any combination of ambient and conductor temperature produces an operating temperature in excess of that for which the material is listed.
~~(5) For conductors or cables operating at a temperature higher than the HDPE conduit listed operating temperature rating. Exception: Conductors or cables rated at a temperature higher than the HDPE conduit listed temperature rating shall be permitted to be installed in HDPE conduit, provided they are not operated at a temperature higher than the HDPE conduit listed temperature rating.~~
Substantiation: The NEC style manual rule concerning use of exceptions states: "Exceptions to *NEC* rules shall be used sparingly. If used, exceptions shall convey alternatives or differences to a basic code rule." As written, this exception does not convey alternatives or differences, it just gives an example of an installation that would be allowed under the basic rule. The basic code rule prohibits conductors or cables (regardless of their insulation temperature rating) from operating at a higher temperature than the HDPE conduit listed operating temperature rating. The proposed new wording consolidates the ambient and insulation temperature limitations into one sentence and eliminates the need for the exception. This is the same wording found currently in 350.12 and would provide consistency with the other articles addressing the operating temperatures of raceways. Similar proposals are submitted for: 352.12, 355.12, and 362.12.

8-90 Log #4619 NEC-P08 **Final Action: Accept**
(353.24)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the following additional sentence: "For conduits of metric designators 129 and 155 (trade sizes 5 and 6) the allowable radii of bends shall be in accordance with specifications provided by the manufacturer."
Substantiation: This wiring method is now permitted in the larger trade sizes, but Table 354.24 stops at metric designator 103 (trade size 4). This proposal provides a method of addressing this lack of correlation.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-91 Log #1047 NEC-P08 **Final Action: Reject**
(353.60 Exception No. 3 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
GROUNDING. Where equipment grounding is provided, ~~required~~ a separate grounding conductor shall be installed in the conduit.
Exception No. 1: The equipment grounding conductor shall be permitted ~~to be run separately from the conduit where sued for grounding dc circuits as permitted~~. Installed in accordance with 250.134.
Exception No. 2: No change.
Exception No. 3: An equipment grounding conductor shall not be required where an equipment bonding conductor is installed in parallel with the conduit.
Substantiation: The provision should apply where grounding is done by choice and not required. Proposed Exception No. 1 revision eliminates unnecessary wording; 250.134 applies to equipment grounding not circuit grounding. A bonding jumper should be permitted in lieu of an equipment grounding conductor where it complies with the Code.
Panel Meeting Action: Reject
Panel Statement: The current language of this section adequately conveys the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-92 Log #1067 NEC-P08 **Final Action: Reject**
(353.100)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. This section is essentially a definition covered by 353.2. "Sufficient" is subjective and a term to be avoided per the Style Manual. 353.6 requires listing which should be enough to cover the requirements of this section. It is difficult to determine future conditions of loading. Other wiring methods require to be listed generally do not specify such particulars.
Panel Meeting Action: Reject
Panel Statement: The language used in Section 353.100 is prudent for the development of the product standards. Similar language is used in Section 352.100 for PVC conduit and 355.100 for Type RTRC conduit.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-94 Log #2778 NEC-P08 **Final Action: Reject**
(354.26)

Submitter: Travis Kummer, Kummer Electric LLC
Recommendation: Delete text as follows:
~~354.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between termination points.~~
Substantiation: Since NUCC is a listed factory assembly with the conductors already installed in the raceway, there should be no requirement for the maximum number of bends between termination points such as there is not for AC or /MC cables. In short, the conductor are already installed and do not have to be pulled in.
Panel Meeting Action: Reject
Panel Statement: For NUCC conductors must be able to be removed and replaced at a later date. The requirement for the number of bends is needed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 355 — REINFORCED THERMOSETTING RESIN CONDUIT: TYPE RTRC

8-95 Log #2176 NEC-P08 **Final Action: Accept**
(355.2.Reinforced Thermosetting Resin Conduit (RTRC))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
355.2 Definition.
Reinforced Thermosetting Resin Conduit (RTRC). A rigid nonmetallic conduit ~~(RNC)~~ of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.
Substantiation: The reference to "RNC" is not needed, as it is not used anywhere in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-96 Log #2992 NEC-P08 **Final Action: Accept**
(355.2.Reinforced Thermosetting Resin Conduit (RTRC))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
355.2 Definition.
Reinforced Thermosetting Resin Conduit (RTRC). A rigid nonmetallic conduit ~~(RNC)~~ of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.
Substantiation: The reference to "RNC" is not needed, as it is not used anywhere in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-96a Log #CP802 NEC-P08 **Final Action: Accept**
(355.10)

Submitter: Code-Making Panel 8,
Recommendation: Revise 355.10 to add a new section "I"
(I) Insulation Temperature Limitations. Conductors or cables rated at a temperature higher than the listed temperature rating of RTRC conduit shall be permitted to be installed in RTRC conduit, provided the conductors or cables are not operated at a temperature higher than the listed temperature rating of the RTRC conduit.
Delete section 355.12 (E) and the exception in it's entirety
~~(E) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the RTRC listed operating temperature rating.~~
~~Exception: Conductors or cables rated at a temperature higher than the RTRC listed temperature rating shall be permitted to be installed in RTRC, provided they are not operated at a temperature higher than the RTRC listed temperature rating.~~
Substantiation: Moving the conductor operating temperature requirements makes it clear for the code user that conductors marked with a rated temperature higher than that of the raceway can be used when the conductors are operated within the raceway temperature rating. The exception was redundant to the current requirement in the uses not permitted. This proposal removes the exception per the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-97 Log #2659 NEC-P08 **Final Action: Reject**
(355.10(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: RTRC shall only be permitted in walls, floors, and ceilings.
Substantiation: Edit. This provision is not a requirement per 90.5(B).
Panel Meeting Action: Reject
Panel Statement: RTRC is not restricted to concealed applications "only". 355.10(F) permits RTRC to be used exposed. The addition of the word "only" would confuse the user.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-98 Log #1340 NEC-P08 **Final Action: Accept in Principle**
(355.10(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
RTRC shall be permitted for exposed work ~~where not subject to physical damage if~~ identified for such use.
Substantiation: Physical damage is covered by Uses not Permitted. Is RTRC.
Panel Meeting Action: Accept in Principle
Revise text to read as follows, keeping the word "if":
RTRC shall be permitted for exposed work ~~where not subject to physical damage~~ if identified for such use.
Panel Statement: The panel concludes that they have met the submitter's intent without removing the word "if".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-99 Log #3167 NEC-P08 **Final Action: Reject**
(355.12(A))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 355.12, delete ~~(A) Hazardous (Classified) Locations~~
~~(1) In any hazardous (classified) location, except as permitted by other articles in this Code~~
~~(2) In Class 1, Division 2 locations, except as permitted in 501.10(B)(3)~~
Renumber 355.12(B), (C), (D), (E), and (F) as 355.12(A), (B), (C), (D), and (E).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-100 Log #1712 NEC-P08 **Final Action: Accept in Principle**
(355.12(D) and (E))

TCC Action: The Technical Correlating Committee understands that the panel statement should refer to Proposal 8-96a.
Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
355.12(D) ~~**Ambient Temperatures.** Where subject to ambient temperatures in excess of 50°C (122°) unless listed otherwise.~~
<u>**Operating Temperature.** Where any combination of ambient and conductor temperature produces an operating temperature in excess of that for which the material is listed.</u> ~~**(E) Insulation Temperature Limitations** For conductors or cables operating at a temperature higher than the RTRC listed operating temperature rating. Exception: Conductors or cables rated at a temperature higher than the RTRC listed temperature rating shall be permitted to be installed in RTRC, provided they are not operated at a temperature higher than the RTRC listed temperature rating.~~
Substantiation: The NEC style manual rule concerning use of exceptions states: “Exceptions to *NEC* rules shall be used sparingly. If used, exceptions shall convey alternatives or differences to a basic code rule.” As written, this exception does not convey alternatives or differences, it just gives an example of an installation that would be allowed under the basic rule. The basic code rule prohibits conductors or cables (regardless of their insulation temperature rating) from operating at a higher temperature than the RTRC listed operating temperature rating. The proposed new wording consolidates the ambient and insulation temperature limitations into one sentence and eliminates the need for the exception. This is the same wording found currently in 350.12 and would provide consistency with the other articles addressing the operating temperatures of raceways. Similar proposals are submitted for: 352.12, 353.12, and 362.12.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel statement on 8-67a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(355.12(E) Exception)

TCC Action: The Technical Correlating Committee understands that the panel statement should refer to Proposal 8-96a.
Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
355.12
(E) Insulation Temperature Limitations For conductors or cables operating at a temperature higher than the RTRC listed operating temperature rating.
~~Exception~~ <u>FPN:</u> Conductors or cables rated at a temperature higher than the RTRC listed temperature rating shall be permitted to be installed in RTRC, provided they are not operated at a temperature higher than the RTRC listed temperature rating.
Substantiation: The NEC style manual rule concerning use of exceptions states: “Exceptions to *NEC* rules shall be used sparingly. If used, exceptions shall convey alternatives or differences to a basic code rule.” As written, this exception does not convey alternatives or differences, it just gives an example of an installation that would be allowed under the basic rule. The basic code rule prohibits conductors or cables (regardless of their insulation temperature rating) from **operating** at a higher temperature than the RTRC listed operating temperature rating. The exception should be deleted or changed to a fine print note.
Similar proposals are submitted for: 352.12.(E), 353.12(5), and 262.12(4).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel statement on 8-67a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-102 Log #1339 NEC-P08 **Final Action: Reject**
(355.22)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
The number of conductors, <u>cables, and flexible cords</u> shall not exceed that permitted by the percentage fill specified in Table 1 Chapter 9.
Delete the last sentence.
Substantiation: The provision should include single and multiconductor cables. Flexible cords should be included. Notes 5 and 9 to Table 1 refer to multiconductor cables and flexible cord.
Panel Meeting Action: Reject
Panel Statement: Cables are permitted to be installed per the second sentence (right after the sentence with the proposed revision) of 355.22. Note 5 of Table 1 in Chapter 9 refers to cables only and does not apply to flexible cords. Note 9 does reference flexible cord, but a proposal with the technical substantiation to support the addition of cords to 355.22 has not been submitted nor submitted to the other raceway articles.
Flexible cords are not permitted to be installed in raceways “except as otherwise permitted in this code” per Section 400.8(6).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-103 Log #2623 NEC-P08 **Final Action: Reject**
(355.30(A) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows:
<u>Exception: Fastening shall not be required where installed in continuous runs in cable trays except as required in 392.8(B).</u>
Substantiation: The provision should address installations in cable trays.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-31.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-104 Log #700 NEC-P08 **Final Action: Reject**
(355.30(C))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
355.30 Securing and Supporting.
RTRC shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 355.30(A) and (B), or permitted to be unsupported in accordance with 355.30(C).
(A) Securely Fastened. *[unchanged by this Proposal]*
(B) Supports. *[unchanged by this Proposal]*
(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, RTRC shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
<u>FPN: An example of an oversized knockout is a field-fabricated knockout where minor tool misalignment or tool drift during fabrication results in an enclosure or box hole larger than that permitted by the product Listing standard for a factory-fabricated knockout in Listed equipment.</u>
Substantiation: Requirements in existing 250.97 Exception and requirements added to the 2008 *NEC*® in 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C) are predicated upon whether or not the knockout opening is oversized or not. “Oversized knockouts”, however, are not defined either dimensionally or descriptively, nor are they defined comparatively to standard, NON-oversized knockouts, which are also undefined dimensionally either directly in the *NEC*® or indirectly by reference to other standards.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-105.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-105 Log #2203 NEC-P08 **Final Action: Accept**
(355.30(C))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this provision. Also, delete the clause "or permitted to be unsupported in accordance with 355.30(C)" from the last sentence of 355.30.
Substantiation: The concept of a special support rule for short lengths of raceway run between enclosures of various sorts was added to the 2008 NEC for the first time in the history of the NEC with negligible technical substantiation and no evidence of loss experience, and remains at variance from routine trade practice. The existence of a coupling now immediately provokes a support requirement, even on a 6-inch and a 4-inch long heavy-wall 4 trade size steel nipples put together to make an 11-inch (approx.) combined raceway. A 90 degree sweep roughly 2 trade size or larger (any centerline length over 18 in.) now requires intermediate support. The literal text now requires support to structure on a 3-in. nipple if even one of its ends "encounters" a concentric knockout.

Although there are those who believe the new rule simply offers limited relief from a rule that required all raceways to be independently supported, routine field experience throughout the history of rigid raceway wiring methods does not substantiate such assertions. We are unaware of any significant attempts to require supports on short nipples. All rigid raceways under NEC rules must be listed, including their couplings; is it conceivable that a coupling between two segments of a short (3 ft or less) nipple so seriously degrades the stability of the raceway that such a support is needed? Concentric knockouts in enclosures are reviewed as part of the UL 50 process, and as anyone working these enclosures recently should be aware, those standards have been strengthened and these knockouts are now more robust than in previous decades; is this the time to require even more support?

Raceways generally require support within 3 ft of terminations, and when the entire length is just that long or shorter, no additional support should be needed. In effect, the locknuts and bushings or connectors and locknuts at each end are supports. This is not a new concept for the NEC: CMP 7 just added the wording "(wiring method) fittings shall be permitted as a means of cable support" in a number of cable articles. If carried to its logical conclusion and routinely enforced (however unlikely), this new support rule will likely drive the market in the direction of cabled wiring methods without any technical justification.

It should be remembered that supports to structure are not infallible. Many raceways hang from threaded rod of indefinite length every 10 ft or so and within 3 ft (5 ft. in some cases) of enclosures, depending on the specific rules for the size and character of the supported raceway. Such support clearly meets the rules in this section, but would it add anything to a nipple between enclosures? Further, even when rigid supports such as one-hole clips are used, the raceway beyond the last clip can have an indefinite number of couplings and enter the center knockout of an indefinite number of concentric knockouts; how is this arrangement so inherently more secure than a nipple between enclosures? This new NEC provision was without precedent, and addressed a nonexistent problem.
Panel Meeting Action: Accept
Panel Statement: CMP-8 does not necessarily agree with the submitter's substantiation. Securement requirements are found in 355.30(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: See my explanation of negative vote on Proposal 8-24a.
Comment on Affirmative:
DABE, J.: See my statement for 8-24(a).

8-106 Log #3070 NEC-P08 **Final Action: Reject**
(355.30(C))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(C) Unsupported Raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered,~~ Type RTRC shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This requirement is overly restrictive.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-105.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-107 Log #3630 NEC-P08 **Final Action: Reject**
(355.30(C))

Submitter: David A. Williams, Delta Township
Recommendation: Revise text to read as follows:
(C) Unsupported Raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered~~, Type RTRC shall be permitted to be unsupported where the raceway is not more than ~~450 mm (18 in.)~~ 900 mm (3 ft) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The change for the 2008 code is too restrictive. Under the provisions of 355.30(A), we could have concentric or eccentric knockouts in a raceway installation and still not provide support for up to five ft from the enclosure. The metal deck roof areas allowing you to go up to five ft are more subject to vibration than switchboard or panelboard installations.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-105.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 356 — LIQUIDTIGHT FLEXIBLE NONMETALLIC CONDUIT: TYPE LFNC

8-108 Log #4175 NEC-P08 **Final Action: Accept**
(356.10(6))

Submitter: David Mercier, Southwire Company
Recommendation: Revise text to read as follows:
(6) Type LFNC-B as a listed manufactured prewired assembly, metric designator 16 through ~~27~~ 103 (trade size 1/2 through ~~1~~ 4) conduit.
Substantiation: This change would expand the use of prewired assemblies to allow conductors sized large enough for feeder and service applications.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
DABE, J.: More information is needed about product before blanket inclusion.
GRIFFITH, M.: The panel should have "Rejected" this proposal for consistency with Panel Action on Proposal 8-54.

8-109 Log #1757 NEC-P08 **Final Action: Reject**
(356.12(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Where likely to be subject to physical damage which impairs its functional capabilities.
Substantiation: One reason for using this wiring method is to provide a degree of physical protection for contained conductors which should not preclude use where damage which may occur is negligible. "Damage" is not defined; a small dent is damage, but unless it affects watertight integrity or other function it has not impaired functional capabilities.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-13.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-110 Log #3168 NEC-P08 **Final Action: Reject**
(356.12(5))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 356.12, delete ~~(5) In any hazardous (classified) location, except as permitted by other articles in this Code.~~
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating CommitteeC is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-111 Log #1338 NEC-P08 **Final Action: Reject**
(356.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete the first sentence.
Substantiation: Superfluous; already covered by the second paragraph which has no limitation of "flexibility". Additionally, a bonding jumper may be installed in parallel with the LFNC to connect together two equipment grounding conductors such as RMC which negates the need for an EGC in the conduit.
Panel Meeting Action: Reject
Panel Statement: First sentence of 356.30 directs users to one of the four options and is necessary. Section 356.30 deals with securing and supporting, not flexibility or grounding.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-112 Log #931 NEC-P08 **Final Action: Reject**
(356.30(5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new (5): Intermediate support shall not be required if the conduit is not more than 300 mm (12 in.) in length between boxes, cabinets, or other enclosures securely fastened in place, and securely fastened to the enclosures. Where conduit is connected at knockouts with segments larger than the conduit, reducing washers larger than the largest knockout segment shall be installed.
Substantiation: If the provisions of 342.30(C), 344.30(C), and 352.30(C) are deemed necessary, a similar provision should apply for Type AC cable.
Panel Meeting Action: Reject
Panel Statement: The provision for shorter lengths of conduits between terminations applies to "rigid conduits" only. There was not a substantiation to allow flexible conduits or tubings to be allowed for the same provision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-113 Log #2624 NEC-P08 **Final Action: Reject**
(356.30 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add to first paragraph:
Exception: Fastening shall not be required where installed in continuous runs in cable trays except as required in 392.8(B).
Substantiation: The provision should address installations in cable trays.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-31.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 358 — ELECTRICAL METALLIC TUBING: TYPE EMT

8-114 Log #874 NEC-P08 **Final Action: Reject**
(358.10(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "severe".
Substantiation: Permitted use should not be limited to corrosive conditions which are "severe" which is subjective and not defined. Present literal wording does not cover areas which are less than severely corrosive, but can cause damage and the requirement for protection should apply to those areas.
Panel Meeting Action: Reject
Panel Statement: The current text reflects the panel's understanding of the proper use of EMT. The determination between corrosive influences and severe corrosive influences remains with the authority having jurisdiction. EMT is provided with corrosion protection in accordance with the listing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-115 Log #1258 NEC-P08 **Final Action: Reject**
(358.10(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part of text: "... and judged suitable identified for the condition."
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-116 Log #3649 NEC-P08 **Final Action: Reject**
(358.10(C))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Relocate 358.10(C) and its FPN to 358.30.
Substantiation: 358.10(C) has nothing to do with the permitted uses for EMT. This rule belongs 358.30, the section for securing and supporting.
Panel Meeting Action: Reject
Panel Statement: "Wet locations" belongs as an approved use for EMT. Section 358.10(C) expands on the use by indicating that the accessories used with EMT in a wet location shall be of approved materials.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-117 Log #3169 NEC-P08 **Final Action: Reject**
(358.12(4))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 358.12, delete ~~(4) In any hazardous (classified) location except as permitted by the other articles in this Code~~
Renumber 358.12(5) and (6) as 358.12(4) and (5,) respectively.
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-118 Log #3471 NEC-P08 **Final Action: Reject**
(358.17)

Submitter: David E. Watters, H. F. Lenz Company
Recommendation: Add the following text:
Ampacity of Conductors: The ampacity adjustment factors in 310.15(B)(2) shall apply to conductors installed in Electrical Metallic Tubing.
(A) Raceway Fill: Raceways filled with 20 or more conductors loaded to 50% capacity or more shall be limited to a maximum fill capacity of 35%.
Substantiation: Testing was performed on $1\frac{1}{2}$ in. Electrical Metallic Tubing, in free air, at Nationally Recognized Testing Laboratories. The ETL SEMKO Laboratory was used to test 20 Active conductors at 50% load capacity, and the OnSpex Laboratory was used to test 30 Active conductors at 45% capacity. In both cases, the conductors were loaded to the limits allowed by Table 310.15(B)(2). In both cases, at least one of the conductors, within the raceway, exceeded the 90° temperature limitation of the insulation. Both tests failed according to the reports I have provided. For these reasons, additional loading or raceway fill restrictions should be applied, and we recommend approval of the code changes listed above.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: No substantiation that 35 percent fill would solve the alleged problem described by the submitter
This proposal is based on two tests where only one test was at both maximum ampacity and maximum fill. A more complete series of tests on all standard EMT sizes, and their various fill and current-carrying conductor adjustment factors is required for consideration of this proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-119 Log #3898 NEC-P08 **Final Action: Reject**
(358.30(A))

Submitter: Anatoliy Yefremenkov, E Light Electric Services
Recommendation: Revise text as follows:
EMT shall be securely fastened in place at least every 3 m (10 ft). Supports shall be placed so that at least one support is within 900 mm (3 ft) of each coupling. In addition, each EMT run between termination points shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box cabinet, conduit body or other tubing termination
Substantiation: Very often we experience shorts in conductors where EMT has come apart at the coupling after installation. By requiring a support within 3 ft of each coupling we can help ensure that EMT does not separate over time and protect the conductors from shorts and arcing.
Panel Meeting Action: Reject
Panel Statement: The submitter has given no substantiation for the proposal, only an anecdotal statement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-120 Log #2630 NEC-P08 **Final Action: Reject**
(358.30(A) Exception No. 3 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Exception No. 3: Fastening shall not be required where installed in continuous runs in cable trays except as required in 392.8(B).
Substantiation: The provision should address installations in cable trays.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-31.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-121 Log #1907 NEC-P08 **Final Action: Reject**
(358.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: ~~Horizontal~~ Runs of EMT shall be permitted to be supported by openings or notches ~~through~~ in framing members ~~at intervals not exceeding those in Table 352.30(B) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.~~ where support and fastening comply with this section.
FPN: See 300.4.
Substantiation: Whether vertical or horizontal, runs can be supported by holes and notches and other openings. Support is not necessarily the same as fastening. This section requires fastening at specified intervals which applies and not negated where support is by holes, notches or other openings. This fastening is necessary especially where EMT is run through large openings in bar joists or metal studs. Vertical runs of Type AC and MC cables through openings in metal studs are commonly installed and accepted. Feference to 300.4 is pertinent to this section. Vertical runs on the side of the studs are supported because they are required to be fastened.
Panel Meeting Action: Reject
Panel Statement: See panel actions and statements on Proposals 8-19 and 8-63.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-122 Log #3895 NEC-P08 **Final Action: Reject**
(358.30(B))

Submitter: Michael Arledge, E Light Electric Services
Recommendation: Revise text as follows:
Horizontal funs of EMT supported by openings through framing members, concrete walls, or other substantial construction components at intervals not greater than 3 m (10 ft) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.
Substantiation: If we can use framing member as support means then why do we limit it to just framing members. We should apply the allowances to anything in the building that can substantially support the conduit.
Panel Meeting Action: Reject
Panel Statement: Present language is clear and adequately covers the intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

358.30 Securing and Supporting.
EMT shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 358.30(A) and (B), or permitted to be unsupported in accordance with 358.30(C).
(A) Securely Fastened. *[unchanged by this Proposal]*
(B) Supports. *[unchanged by this Proposal]*
(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, EMT shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
FPN: An example of an oversized knockout is a field-fabricated knockout where minor tool misalignment or tool drift during fabrication results in an enclosure or box hole larger than that permitted by the product Listing standard for a factory-fabricated knockout in Listed equipment.
Substantiation: Requirements in existing 250.97 Exception and requirements added to the 2008 *NEC*® in 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C) are predicated upon whether or not the knockout opening is oversized or not. “Oversized knockouts”, however, are not defined either dimensionally or descriptively, nor are they defined comparatively to standard, NON-oversized knockouts, which are also undefined dimensionally either directly in the *NEC*® or indirectly by reference to other standards.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-124 Log #1702 NEC-P08 **Final Action: Reject**
(358.30(C))

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise 358.30(C) as follows:
(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, Type IMC shall be permitted to be unsupported where the raceway is not more than 5 ft or 20 times the trade size, whichever is less, ~~450 mm (18 in.)~~ and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The proposed revision will make the unsupported length, between enclosures, dependent on the raceway OD, which is a factor in how well a given raceway will resist bending.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-125 Log #2204 NEC-P08 **Final Action: Accept**
(358.30(C))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this provision. Also, delete the clause “or permitted to be unsupported in accordance with 358.30(C)” from the last sentence of 358.30.
Substantiation: The concept of a special support rule for short lengths of raceway run between enclosures of various sorts was added to the 2008 NEC for the first time in the history of the NEC with negligible technical substantiation and no evidence of loss experience, and remains at variance from routine trade practice. The existence of a coupling now immediately provokes a support requirement, even on a 6-inch and a 4-inch long heavy-wall 4 trade size steel nipples put together to make an 11-inch (approx.) combined raceway. A 90 degree sweep roughly 2 trade size or larger (any centerline length over 18 in.) now requires intermediate support. The literal text now requires support to structure on a 3-in. nipple if even one of its ends “encounters” a concentric knockout.

Although there are those who believe the new rule simply offers limited relief from a rule that required all raceways to be independently supported, routine field experience throughout the history of rigid raceway wiring methods does not substantiate such assertions. We are unaware of any significant attempts to require supports on short nipples. All rigid raceways under NEC rules must be listed, including their couplings; is it conceivable that a coupling between two segments of a short (3 ft or less) nipple so seriously degrades the stability of the raceway that such a support is needed? Concentric knockouts in enclosures are reviewed as part of the UL 50 process, and as anyone working these enclosures recently should be aware, those standards have been strengthened and these knockouts are now more robust than in previous decades; is this the time to require even more support?

Raceways generally require support within 3 ft of terminations, and when the entire length is just that long or shorter, no additional support should be needed. In effect, the locknuts and bushings or connectors and locknuts at each end are supports. This is not a new concept for the NEC: CMP 7 just added the wording “(wiring method) fittings shall be permitted as a means of cable support” in a number of cable articles. If carried to its logical conclusion and routinely enforced (however unlikely), this new support rule will likely drive the market in the direction of cabled wiring methods without any technical justification.

It should be remembered that supports to structure are not infallible. Many raceways hang from threaded rod of indefinite length every 10 ft or so and within 3 ft (5 ft. in some cases) of enclosures, depending on the specific rules for the size and character of the supported raceway. Such support clearly meets the rules in this section, but would it add anything to a nipple between enclosures? Further, even when rigid supports such as one-hole clips are used, the raceway beyond the last clip can have an indefinite number of couplings and enter the center knockout of an indefinite number of concentric knockouts; how is this arrangement so inherently more secure than a nipple between enclosures? This new NEC provision was without precedent, and addressed a nonexistent problem.
Panel Meeting Action: Accept
Panel Statement: CMP-8 does not necessarily agree with the submitter’s substantiation. Securement requirements are found in 358.30(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: See my explanation of negative vote on Proposal 8-24a.
Comment on Affirmative:
DABE, J.: See my statement for 8-24(a).

8-126 Log #2592 NEC-P08 **Final Action: Reject**
(358.30(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Intermediate support shall not be required where the raceway is not more than 450 mm (18 in.) in unbroken length (without coupling) between enclosures secured in place, and connected to threaded hubs or openings, or through a knockout with no segments larger than the raceway connector or with reducing washers larger than the largest knockout segment and the raceway is bonded by means of a bonding jumper.
Substantiation: Since terminal connections do provide support the provision should address intermediate support. The proposal provides for such installations at cabinets, panelboards, switches, and other enclosures with knockout provisions larger than the raceway which cannot be used with this provision. “Enclosures: covers boxes and other types.”
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-127 Log #3071 NEC-P08 **Final Action: Reject**
(358.30(C))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(C) Unsupported Raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered,~~ Type EMT shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: This requirement is overly restrictive.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-128 Log #3631 NEC-P08 **Final Action: Reject**
(358.30(C))

Submitter: David A. Williams, Delta Township
Recommendation: Revise text to read as follows:
(C) Unsupported Raceways. ~~Where oversized, concentric or eccentric knockouts are not encountered~~, Type EMT shall be permitted to be unsupported where the raceway is not more than ~~450 mm (18 in.)~~ <u>900 mm (3 ft)</u> and remains in unbroken lengths (without coupling). Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The change for the 2008 code is too restrictive. Under the provisions of 358.30(A), we could have concentric or eccentric knockouts in a raceway installation and still not provide support for up to five ft from the enclosure. The metal deck roof areas allowing you to go up to five ft are more subject to vibration than switchboard or panelboard installations.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 8-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-129 Log #237a NEC-P08 **Final Action: Reject**
(358.60)

Submitter: Sprague Owings, Nassau County, Florida
Recommendation: Revise as follows:
~~358.60 Grounding. EMT shall be permitted as an equipment grounding conductor.~~
<u>358.60 Grounding. When equipment grounding is required, a separate equipment grounding conductor shall be installed in the raceway.</u>
Substantiation: As concern grows for having a reliable grounding path (the return of a separate equipment ground to dryers and ranges, etc.) it would seem to follow that it may be time to delete the use of EMT without an equipment ground simply because this use depends on many mechanical connections (each and every connector and coupling). One run of EMT could easily have 10 or more couplings in the run and just one loose screw or compression fitting could jeopardize the ability of the conduit to carry a short back to source. This is not so much a problem with flex or cables where there are only 2 mechanical connections in the path (at the beginning and end of the run.)
I have submitted a companion proposal to 250.118(4).
Panel Meeting Action: Reject
Panel Statement: EMT is tested and listed for grounding. EMT complies with Article 250 for grounding. The submitter provided no technical substantiation to prove otherwise. EMT is not permitted for use where subject to severe physical damage. Any damaged EMT should be replaced.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: The IEEE believes Panel action for this proposal should be to “Accept”. Industry experience indicates that, for several reasons including the one presented by the submitter, metallic conduit systems do not always provide adequate equipment grounding. As a result, ANSI/IEEE Standard 142-2007 (the “Green Book”), section 2.2.3, recommends installation of a separate equipment grounding conductor (EGC) in conduit.
With regard to the Panel statement that EMT is tested and listed for grounding, there does not appear to any reference to a test method for establishing the adequacy of EMT as an equipment grounding conductor in the UL White Book either in the section on EMT or in the NEC Correlation Index. Further, if there is such a UL test, the current level used and resulting voltage drop would both be of interest as factors in determining the suitability of EMT as an EGC for all installations.
Finally, if the proposed change is ultimately accepted it would have to be correlated with other sections of the NEC that presently recognize EMT as a grounding means. Similarly, Article 342 for IMC would require revision. (See also my Comments on Proposal 8-39).

8-130 Log #1506 NEC-P08 **Final Action: Reject**
(358.60)

Submitter: Bill Higgins, Lookout Mtn., GA
Recommendation: Revise text to read as follows:
EMT shall (not) be permitted as an equipment grounding conductor.
Exception No. 1: Where an installation of EMT consists of less than 10 connectors or couplings, from beginning to end.
Substantiation: A long run of EMT depends on too many set screws and locknuts to assure a solid, low-impedance path to ground. Many times I have discovered EMT runs that have accidentally come apart, effectively nullifying the grounding path.
Panel Meeting Action: Reject
Panel Statement: No evidence has been provided that 10 or less couplings or connectors is any safer than a properly installed raceway with more than 10 such fittings. No evidence of raceway failure has been presented; merely a testament to poor installation practice has been submitted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 360 — FLEXIBLE METALLIC TUBING: TYPE FMT

8-131 Log #3893 NEC-P08 **Final Action: Reject**
(360.10(4))

Submitter: Yonas Mebrahtu, E Light Electric Services
Recommendation: Revise text as follows:
FMT shall be permitted to be used for branch circuits as follows: (1) In dry locations (2) Where concealed (3) In accessible locations (4) For system voltages of ~~1000~~ 600 volts maximum.
Substantiation: 600 volts is the divider between Low voltage and Medium voltage. It is commonly used throughout the NEC as the dividing point for voltage limitations. This change will make this provision more in line with the remainder to the NEC.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided to reduce the allowable voltage from 1000 to 600 thereby placing a restriction on the product use without evidence of a safety concern or product failure in the 601 to 1000 volt range.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-132 Log #3170 NEC-P08 **Final Action: Reject**
(360.12(3))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 360.12, delete ~~(3) In hazardous (classified) locations unless otherwise permitted under other articles in this Code.~~
Renumber 360.12(4), (5), and (6) as 360.12(3), (4), and (5), respectively.
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-133 Log #1756 NEC-P08 **Final Action: Reject**
(360.12(5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Where likely to be subject to physical damage which impairs its functional capabilities.
Substantiation: One reason for using this wiring method is to provide a degree of physical protection for contained conductors which should not preclude use where damage which may occur is negligible. "Damage" is not defined; a small dent is damage, but unless it affects watertight integrity or other function it has not impaired functional capabilities.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-13.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-134 Log #2591 NEC-P08 **Final Action: Reject**
(360.12(5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Where likely to be subject to physical damage.
Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is a term used in many sections.
Panel Meeting Action: Reject

8-135 Log #2590 NEC-P08 **Final Action: Reject**
(360.24(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Where FMT is ~~may~~ likely to be infrequently flexed in service after installation.... (remainder unchanged).
Substantiation: Edit. "Likely" is defined as such a nature or circumstances as to make something probable and a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: Suggested language does not add clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-136 Log #1257 NEC-P08 **Final Action: Accept**
(360.40)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by 110.12(A).
Panel Meeting Action: Accept
Panel Statement: The submitter's reference of 110.12(A) is incorrect. Section 314.17(A) mandates that openings through which conductors enter shall be adequately closed. The performance measurement is contained in the UL standard 514B clause 5.4.1.4.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
DABE, J.: 110.12(A) relates to unused openings. Whereas 360.40 refers to the termination of a connection.

8-137 Log #1256 NEC-P08 **Final Action: Reject**
(360.56)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Applicable provisions of 300.15 and other sections already apply.
Panel Meeting Action: Reject
Panel Statement: Section 360.56 is harmonized with the other raceway articles. The panel concludes that the reference is useful to code users.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-138 Log #1255 NEC-P08 **Final Action: Reject**
(360.60)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Already covered in 250.118(7) which applies.
Panel Meeting Action: Reject
Panel Statement: Section 360.60 is harmonized with the other raceway articles. The panel concludes that the reference is useful to code users.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-139 Log #930 NEC-P08 **Final Action: Reject**
(360.62 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows:
360.XX Connections. Where FMT is connected to boxes, cabinets or other enclosures securely fastened in place, at knockouts with segments larger than the tubing, reducing washers larger than the largest knockout segment shall be installed and the tubing shall be bonded to the enclosure by identified means.
Substantiation: Since there are no specific support requirements, the support provided by attachment to enclosures should be specific.
Panel Meeting Action: Reject
Panel Statement: Fittings used with FMT are evaluated and listed for the support of the tubing at termination points.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 362 — ELECTRICAL NONMETALLIC TUBING: TYPE EMT

8-139a Log #CP803 NEC-P08 **Final Action: Accept**
(362.10)

Submitter: Code-Making Panel 8,
Recommendation: Revise 362.10 to add a new section "9"
(9) Conductors or cables rated at a temperature higher than the listed temperature rating of ENT shall be permitted to be installed in ENT, provided the conductors or cables are not operated at a temperature higher than the listed temperature rating of the ENT.
Delete section 362.12 (4) and the exception in it's entirety
~~(4) For conductors or cables operating at a temperature higher than the ENT listed temperature rating~~
~~Exception to (4): Conductors or cables rated at a temperature higher than the ENT listed temperature rating shall be permitted to be installed in ENT, provided they are not operated at a temperature higher than the ENT listed temperature rating.~~
Substantiation: Moving the conductor operating temperature requirements makes it clear for the code user that conductors marked with a rated temperature higher than that of the raceway can be used when the conductors are operated within the raceway temperature rating. The exception was redundant to the current requirement in the uses not permitted. This proposal removes the exception per the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-140 Log #1331 NEC-P08 **Final Action: Reject**
(362.12 (10) and (11))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (10):
where <u>likely to be</u> subject to physical damage.
Add (11):
<u>Where likely to be exposed to chemical or corrosive agents unless identified for the use.</u>
Substantiation: Specific provisions should be provided as they are for other wiring methods.
Panel Meeting Action: Reject
Panel Statement: For revision to 362.12(10) see panel statement on Proposal 8-134. The addition of 362.12(11) was rejected because 362.10(3) already covers the requirement for corrosive agents.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-141 Log #3171 NEC-P08 **Final Action: Reject**
(362.12(1))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 362.12, delete ~~(1) In any hazardous (classified) location, except as permitted by other articles in this Code.~~
Renumber 362.12(2) through (10) as 362.12(1) through (9).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-143 Log #1709 NEC-P08 **Final Action: Accept in Principle**
(362.12(3) and (4))

Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
362.12(3) ~~Where subject to ambient temperatures in excess of 50°C (122°) unless listed otherwise.~~ <u>Where any combination of ambient and conductor temperature produces an operating temperature in excess of that for which the material is listed.</u>
~~**(4)** For conductors or cables operating at a temperature higher than the ENT listed temperature rating. Exception to (4): Conductors or cables rated at a temperature higher than the ENT listed temperature rating shall be permitted to be installed in ENT, provided they are not operated at a temperature higher than the ENT listed temperature rating.~~
Substantiation: The NEC style manual rule concerning use of exceptions states: "Exceptions to *NEC* rules shall be used sparingly. If used, exceptions shall convey alternatives or differences to a basic code rule." As written, this exception does not convey alternatives or differences, it just gives an example of an installation that would be allowed under the basic rule. The basic code rule prohibits conductors or cables (regardless of their insulation temperature rating) from operating at a higher temperature than the ENT listed operating temperature rating. The proposed new wording consolidates the ambient and insulation temperature limitations into one sentence and eliminates the need for the exception. This is the same wording found currently in 350.12 and would provide consistency with the other articles addressing the operating temperatures of raceways. Similar proposals are submitted for: 352.12, 353.12, and 355.12
Panel Meeting Action: Accept in Principle
Panel Statement: See panel statement on 8-139a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Section 366.22 Number of Conductors.
(A) Sheet Metal Auxiliary Gutters. The sum of the cross-sectional areas of all contained conductors at any cross-section of a sheet metal auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the sheet metal auxiliary gutter. The derating factors in Section 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.
<u>Proposed Exception: Where the sum of the cross-sectional areas of all contained conductors at any cross-section of a sheet metal auxiliary gutter does not exceed 20 percent of the interior cross-sectional area of the wireway and when the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of Section 310.15(B)(4), exceeds 30, the application of the adjustment factors set forth in Table 310.15(B)(2)(a) shall not be required for sheet metal auxiliary gutters where all of the following conditions are met:</u>
<u>(1) Labeled metallic devices are inserted in the sheet metal auxiliary gutter that provide elevation, separation, and spacing among the current-carrying conductors by dividing the sheet metal auxiliary gutter into channels. Not more than nine current-carrying conductors shall be placed within a channel.</u>
<u>(2) The metallic devices used for elevation, separation, and spacing shall enable air to flow within and between the channels in order to provide cooling of the current-carrying conductors throughout the length of the sheet metal auxiliary gutter in a manner sufficient to allow the transient and steady-state temperatures of the conductors to remain below the rated temperatures for their insulation as specified in the applicable column of Table 310.16.</u>
<u>(3) The metallic devices used for elevation, separation, and spacing shall provide sufficient support and separation of the current-carrying conductors so that conductors in one channel shall not come into contact with conductors in another channel, except that such conductors may come into contact with conductors in another channel upon entering or exiting the sheet metal auxiliary gutter and conductors within one channel may come into contact with other conductors in the same channel.</u>
<u>(4) The metallic devices used for elevation, separation, and spacing shall be secured so as to prevent movement of the devices and so as to maintain contact with the walls and floor of the sheet metal auxiliary gutter in order to conduct heat to the walls and floor of the sheet metal auxiliary gutter and shall be connected to the sheet metal auxiliary gutter in a manner consistent with the limitations of their labeling.</u>
<u>(5) Where contact between the current-carrying conductors and the edges of the metallic devices used for elevation, separation, and spacing poses the risk of abrasion to the insulation of the conductors, the edges of the devices shall be protected so as to avoid that risk.</u>
Substantiation: The ampacity derating factors of Section 310.15(B)(2)(a) severely limit the ampacities of conductors placed in sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways. This proposal establishes exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17 that allow for the placement of metallic devices to elevate, separate, and space the current-carrying conductors in those raceways so as to increase the number permitted by taking full advantage of the cooling capacity in the entire cross-sectional area of the raceway and the heat conducting properties of the metallic devices. The exception tendered for each of those sections contains five stringent conditions under which the devices may be used for such purpose. The report issued by INTERTEK, ETL SEMKO dated June 4, 2007, that accompanies this proposal provides test results that support the proposal.

I. Introduction:

A. Carl Cardi, III:

Mr. Cardi is presently a city electrical inspector for the city of Columbus, Ohio, a former electrical contractor, and an inventor. He is also President of CVC 1 Limited, LLC, the manufacturer of Cool Wire products.

B. Arnold E. Shaheen, Jr., Esq.:

Mr. Shaheen is counsel for CVC 1 Limited, LLC, and the author of this Proposal. Mr. Shaheen is licensed to practice law in the state of Ohio and received his Juris Doctorate Degree from Capital University in Columbus, Ohio, and a Bachelor of Science Degree in Electrical Engineering from The Ohio State University. Before, during, and after his attending college and law school, Mr. Shaheen also worked from childhood until 1985 in his family's electrical construction business, which engaged in commercial and industrial electrical construction. Between 1971 and 1985, Mr. Shaheen was licensed as an electrical contractor in Columbus, Ohio.

C. The Proposal:

Mr. Cardi has submitted this Proposal in an effort to provide suggested revisions to the National Electric Code ("NEC") that respect the intent and purpose of Section 310.15(B)(2)(a), but which allow for more flexibility in the design of electrical wiring systems that incorporate the use of sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways by allowing for new technologies that provide elevation, separation, and spacing of current-carrying conductors within those wiring systems. In so doing, it is submitted that these new technologies will provide better ambient cooling within those wiring systems by taking full advantage of all of the airspace within their cross-sectional areas as well as the heat conductive properties of the metallic devices that incorporate these new technologies and will allow for the placement of more current-carrying conductors in a raceway than would otherwise be permitted by the application of Section 310.15(B)(2)(a).

II. Heat Generated By Current-Carrying Conductors:

Well known principles of physics that govern the transfer of heat energy establish that heat energy cannot be dissipated without a thermal gradient. The principles of heat transfer are analogous to the concepts of current, resistance, and voltage embodied in Ohm's Law. Heat, like current, cannot flow unless there is a thermal gradient, as in the case of a difference in electrical potential, or voltage, in an electrical circuit. If there is no thermal gradient, or if the heat source is surrounded by insulation, the heat source will not cool or may even grow warmer if the heat source is, itself, a generator of heat energy. When current flows through a wire, the wire becomes a heat source that generates heat energy because the flow of electricity encounters resistance, the degree of which is a function of both the size of the wire and the conductivity of the material from which the wire is manufactured.

From a fire prevention perspective, the danger, of course, is that a wire will become so hot that its insulation degrades resulting in the potential for a short circuit between a bare spot on a current-carrying conductor and a bare spot on another current-carrying conductor or between a bare spot on a current-carrying conductor and the metallic enclosure in which the conductor is placed. Even where adequate overcurrent protection exists, the potential for a fire or for further degradation of the insulation of surrounding conductors exists if the temperature of current-carrying conductors is allowed to rise above the rated temperature limitation of their insulation.

Insulated, current-carrying conductors that are bundled together or which lie in contact with one another, particularly those that are totally surrounded by and in contact with other current-carrying conductors, will rise in temperature because there exists no thermal gradient through which to dissipate the heat. Section 310.10, FPN No.1, subparagraph 4, recognizes this physical phenomenon.

III. Section 310.15(B)(2)(a):

Section 310.15(B)(2)(a) requires that the ampacity derating factors of Table 310.15(B)(2)(a) shall apply to any raceway that contains more than three current-carrying conductors. On its face, Section 310.15(B)(2)(a) was meant to apply to all systems defined as raceways in Article 100. The traditional practice in the electrical industry was to readily apply this section to all forms of conduit. However, confusion arose in the enforcement and application of articles of the NEC that applied to other types of raceways because those articles contained only fill limitations and not ampacity derating requirements. The result, in many cases, was that the fill requirements of a particular article were allowed to trump the requirements of Section 310.15(B)(2)(a) and, thus, create the risk of overheated raceways because of the number of current-carrying conductors placed within them, resulting in the commensurate risk of short circuits and fire.

To resolve the confusion and to better clarify the NFPA's intent regarding the application and enforcement of Section 310.15(B)(2)(a), the 2005 edition of the NEC added ampacity derating requirements within articles pertaining to specific types of raceways. Section 374.17 pertaining to cellular metal floor raceways and Section 390.17 pertaining to underfloor raceways are but two examples.

However, underlying the application and enforcement of Section 310.15(B)(2)(a) is the assumption that the conductors in a raceway will all lie at the bottom of the raceway and in close proximity to or in contact with one another. This assumption fails to take into account the cooling effect that the surrounding ambient **within the raceway** will have when the current-carrying conductors are elevated, separated, and spaced within the raceway nor does it account for the benefit of the heat conductive properties of the metallic devices described in this Proposal.

Many sections of the NEC recognize that spacing promotes the cooling of current-carrying conductors. The requirement to provide spacing between conduits, tubing, or raceways set forth in Section 310.15(B)(2)(b) is one example. The spacing dimensions for electrical ducts depicted in Figure 310.60 of Article 310 and those depicted for single insulated conductors in nonmagnetic underground electrical ducts in FPN Figure B.310.5 of Appendix B are other examples.

However, none of the articles, in their current form, containing sections identified in this Proposal address either the potential benefit of ambient cooling that could be realized by the elevation, separation, and spacing of current-carrying conductors within a raceway or the benefit of the heat conductive properties of the metallic devices described in this Proposal. It is those benefits that this Proposal addresses, while, at the same time, honoring the intent of Section 310.15(B)(2)(a) to prevent the degradation of the insulation of current-carrying conductors due to overheating.

IV. Proposed Changes to Sections 310.15(B)(2)(a), 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17:

This Proposal sets forth exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, each containing five subparagraphs. Those five subparagraphs are discussed in sequence, below:

A. Subparagraph (1):

Metallic devices that provide elevation, separation, and spacing among current-carrying conductors would be allowed in lieu of the application of the derating factors of Table 310.15(B)(2)(a). Those devices would separate raceways into channels, however, no channel would be permitted to hold more than nine conductors, which is the upper limit for the number of conductors to which the 70 percent derating factor of Table 310.15(B)(2)(a) presently applies. This numerical limit recognizes that, even though dividing raceways into channels enables the cooling of current-carrying conductors, there are physical limits to this effect. The devices must be labeled in compliance with the definition of that term as set forth in Article 100 and the requirements of Section 110.3(A)(1) FPN.

B. Subparagraph (2):

The metallic devices that provide elevation, separation, and spacing must also permit convection within a channel and between and among channels such that the transient and steady-state temperatures of the current-carrying conductors within any channel remain below the rated temperature for their insulation as indicated in the applicable column of Table 310.16.

C. Subparagraph (3):

The metallic devices must prevent contact between current-carrying conductors in different channels within the raceway, except at points of egress and ingress. However, because the number of conductors is limited to nine within any given channel, conductors within that channel may be in contact without additional separation within that channel.

D. Subparagraph (4):

The metallic devices must be secured so as to prevent movement of the devices and to maintain contact with the walls and floor of the raceway in order to enable the device to transmit heat away from the current-carrying conductors and to the walls and floor of the raceway so that the raceway may, in turn, transmit the heat either into the air, if the raceway is an auxiliary gutter or wireway, or to concrete, if the raceway is a cellular metal raceway or an underfloor raceway.

E. Subparagraph (5):

In order to prevent abrasion of current-carrying conductors within a channel, this subparagraph provides that all edges of the metallic devices that provide elevation, separation, and spacing of the current-carrying conductors must be protected where those edges would come into contact with the conductors.

F. Section 310.15(B)(2)(a):

The words, "Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, where there is no load diversity...." have been added. This additional language makes explicit that the exceptions to the application of Section 310.15(B)(2)(a) established by this Proposal apply only to the enumerated sections and only when load diversity is not available.

G. Section 366.22(A):

The preamble to the exception for this section limits its applicability in the case of sheet metal auxiliary gutters to situations where the 20 percent fill limitation prescribed for this type of raceway is not exceeded, but where there are more than 30 current-carrying conductors placed within the raceway.

H. Section 366.23(A):

The preamble to the exception for this section mimics the preamble contained in Section 366.22(A), which also applies to sheet metal auxiliary gutters.

I. Section 374.17:

Since the language of this section contains no limitations upon the applicability of Section 310.15(B)(2)(a) to cellular metal raceways, no preamble was necessary. The exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 374.17 and to cellular metal raceways.

J. Section 376.22:

As in the case of sheet metal auxiliary gutters, the preamble to the exception for this section limits its applicability to those instances in which the 20 percent fill limitation is not exceeded, but where there are also more than 30 current-carrying conductors placed within the metal wireway.

K. Section 384.22:

In the case of strut-type channel raceways, the preamble to the exception limits its applicability to those instances in which the percentage fill requirements of Table 384.22 are not exceeded and where the outside diameter dimensions of types and sizes of wire as set forth in the tables in Chapter 9 are met, but where the cross-sectional area of the raceway exceeds 2500mm^2 (4in.^{2}) and where the number of current-carrying conductors in the raceway is greater than 30, but where the cross-sectional area of all current-carrying conductors does not exceed 20 percent of the cross-sectional area of the raceway.

L. Section 386.22:

The preamble to the exception for this section mimics that of Section 384.22 and applies to surface metal raceways.

M. Section 390.17:

As in the case of cellular metal raceways, the exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 390.17 and to underfloor raceways.

V. Test Evidence Submitted In Support of Proposal:

A. Testing Protocol:

Between May 29, 2007, through June 1, 2007, electrical testing involving metallic devices described in this Proposal was performed by INTERTEK, ETL SEMKO of Cortland, New York. Two different types of raceways and two sizes of conductors, 12 AWG THHN and 10 AWG THHN were tested. Testing was performed for the purpose of: (1) measuring the heating of the conductors under the testing protocol; and, (2) to determine how many conductors could be placed within the raceways without the temperature of the conductors exceeding the 90° C limitation of their insulation. Tests for physical abrasion were not conducted.

In the first instance, a 12 in. x 3 in. x 5 ft underfloor raceway was tested under various scenarios in order to determine the conductor temperatures. Similar testing was performed for an 8 in. x 8 in. x 5 ft metallic wireway. The ends of both raceways were stuffed with styrofoam in order to trap heat so as to create a worst-case scenario. Where it was appropriate to do so, both raceways were tested in a double-blind manner, that is, they were tested under the same conditions with and without the metallic devices described in this Proposal.

Constant loading of the conductors in each instance occurred throughout the duration of each test. No unloaded conductors, or fillers, were placed within the raceways. The time period used as a benchmark in order to attain steady-state temperature conditions was three hours. Thermocouples were placed on one conductor in each channel. One thermocouple was used to measure the room ambient.

The graphs indicating the test results show the temperatures measured by the thermocouples along the Y-axis and the time periods for those temperatures along the X-axis. The temperature recording for each conductor is indicated on each graph by a different color of line. The letters, “UF,” noted in the keys for the graphs for the tests denote conductors in the underfloor raceway. The letters, “WW,” denote conductors in the metal wireway. The maximum temperatures that were recorded for each conductor to which a thermocouple was attached are displayed in a table at the bottom of each graph for either one or both raceways, depending upon how each test was conducted.

B. Test Nos. 1 and 10:

In Test No. 1, the underfloor raceway was wired using 81 #12 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used to elevate, separate, and space the conductors. The test load on each of the conductors was 16 amperes. Upon removal of the underfloor raceway cover it was noted that one of the supports had moved. Thus, this test was redone as Test No. 10 only as to the underfloor raceway.

In Test No. 1, the metallic wireway was wired with 90 #12 THHN conductors in 10 groupings of 9 conductors.

In Test No. 1, the temperatures for all conductors for both raceways, after more than 3 hours, remained below 90°C and in a steady-state condition. The ambient temperature remained at approximately 25°C throughout the test.

Test No.1, as to the underfloor raceway, was repeated in Test No. 10. Again, the test results were the same. After more than three hours and in steady-state condition, the temperatures of all of the conductors remained below 90°. The ambient temperature approximated 22°C throughout the test.

During neither Test No. 1 nor Test No. 10 did the temperature of any of the conductors exceed 90°C at any point in time.

C. Test No. 2:

The same test protocol were used in this test as in Test No. 1 for both raceways. However, the metallic devices described in this Proposal were not used. After 91 minutes, in the case of both raceways, the temperatures of the conductors remain in a transient state and on an upward incline towards their 90°C limitation of their insulation. At that point in time, the highest temperature reached by any conductor in the underfloor raceway was 89.24°C and in the metal wireway was 81.97°C.

D. Test No. 3:

In Test No. 3, the underfloor raceway was wired with 81 #12 THHN conductors using a vertical divider system that did not permit air to flow between the divided chambers within the raceway. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes. After only 64 minutes, the temperatures of all of the conductors in the underfloor raceway remained in a transient state and the temperature of one conductor had exceeded the 90°C limitation of its insulation.

E. Test No. 4:

In Test No. 4, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

After more than 3 hours, the highest temperature reached in the underfloor raceway was 60.45°C and in the case of the metal wireway the highest temperature reached was 52.40°C.

F. Test No. 5.

In Test No. 5, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. For both the underfloor raceway and the metallic wireway, the metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

This test demonstrated the upper limit of the cooling effect of the metallic devices described in this Proposal in the case of the underfloor raceway. The transient state temperatures of the underfloor conductors began to approximate 90°C after 33 minutes. At that point the cover of the underfloor raceway was removed.

However, in the case of the metal wireway, the highest temperature of the conductors was 82.03°C in steady-state condition after 190 minutes.

The ambient approximated 22°C throughout the test.

G. Test No. 6:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groups of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

The highest temperature reached by a conductor after 203 minutes was 67.74°C in a steady-state condition. The ambient temperature for the test ranged between 22° and 28°C.

H. Test No. 7:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groupings of 9 conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

After 157 minutes, the temperatures of the conductors remained in a transient state condition. By that time, one of the conductors had reached 89.06°C. The ambient temperature ranged between 22°C and 28°C.

I. Test No. 8:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

After 126 minutes, the temperatures of the conductors in the underfloor raceway remained in a transient condition and were gradually rising. At that point in time the highest temperature for the underfloor conductors was 75.17°C.

After the same time period, the conductors in the wireway, for the most part, remain in a transient condition with the highest temperature recorded at 71.09°C.

The ambient temperature ranged between 22°C and 25°C.

J. Test No. 9:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The graph of the temperatures of the conductors in the two types of raceways demonstrates that the temperatures in both raceways were rising rapidly. Within 14 minutes after the commencement of the test, the highest temperature of a conductor in the underfloor raceway is 97.95°C and for the metal wireway is 93.43°C.

The ambient remained at approximately 22°C throughout the test.

K. Test Conclusions:

The use of the metallic devices described in this Proposal demonstrate a marked decrease in the transient and the steady-state temperatures of the conductors within the limitations of the cooling effects of the devices. This can be readily shown by comparing the test results in Test Nos. 6 and 7, the test results in Test Nos. 4 and 8, and by comparing the test results in Test Nos. 1 and 10 with Test No. 2. Within the limitations of the devices, as demonstrated in Test No. 5 as it relates to underfloor raceways, the 90°C limitations of the conductors' insulation is not exceeded during the three hour protocol for the tests where the devices were used.

VI. Conclusion:

This Proposal provides for exceptions to the applicability of Section 310.15(B)(2)(a) to sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, and underfloor raceways that impose five conditions so as to preserve the intent of that section to prevent thermal degradation of insulation, but yet allow for more current-carrying conductors to be placed within those raceways. Due to the stringent nature of those conditions, the reasons cited in the narrative, above, and the test results supplied with this Proposal, the Proposer requests that the Proposal be approved.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter has provided installation requirements that are not suitable for inclusion into the NEC. The proposal contains terms that are not in accordance with the NEC Style Manual.

The submitter's test data does not support the proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BERMAN, R.: The submitter has proposed a relaxation of required conductor ampacity adjustments where a new wire support system provides separation between conductors and is intended to reduce the heating effect of the wiring at load. This wire support system was proposed for several different types of raceways, including auxiliary gutters in Article 366.

From a technical standpoint, it is agreed that there may be installations where heating can be reduced or application of ampacity adjustment factors can be relaxed. However, in order for this to be demonstrated, specific test data would have to be presented on each raceway proposed, per the submitter's substantiation. The test data provided is extremely limited to only a few tests on underfloor raceway and wireway, and not at full ampacity in accordance with the NEC.

From an installation standpoint, the feasibility of such an installation has not been demonstrated, as it is difficult to imagine how conductors would be laid into each raceway employing the wire support system. It is also difficult to understand how conductors could be removed or new conductors added after installation of the supports. The submitted test data for one of the tests indicates that there was shifting of the wire support system during test, allowing conductors to move in closer proximity to one another.

8-153 Log #2993 NEC-P08 **Final Action: Accept**
(366.22)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise text to read as follows:

366.22 Number of Conductors.

(A) Sheet Metal Auxiliary Gutters. The sum of the cross-sectional areas of all contained conductors at any cross section of a sheet metal auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the sheet metal auxiliary gutter. The <u>adjustment</u> ~~derating~~ factors in 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a).

Panel Meeting Action: Accept

[remainder of 366.22 unchanged by this Proposal]
Substantiation: Correlation issue. Also to improve *Code* readability. Table 310.15(B)(2)(a) referenced from here uses the specific term “adjustment factors”, not the unspecific generalization “derating factors”.
366.23(A) and 376.22(B) for the 2008 *NEC*® had been revised [Proposal 8-127/Log #2243 and Proposal 8-157/Log #2754, respectively] from the inconsistent term “correction factors” and imprecise term “derating factors”, respectively, to “adjustment factors”, the term specifically used in Table 310.15(B)(2)(a). Per the Substantiation of Proposal 8-157, Accepted In Principle by Code Panel 8, trade persons were being confused by the designation inconsistency with other ampacity-modifying factors used elsewhere in the *Code*.
A companion Proposal for 310.15(B)(2)(a) revises its Exceptions to use terminology consistent with its title and Table 310.15(B)(2)(a).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-157 Log #478 NEC-P08 **Final Action: Reject**
(366.23(A))

Submitter: Carl V. Cardi, III, CVC 1 Limited LLC
Recommendation: Add new text to read as follows:
Section 366.23(A) Sheet Metal Auxiliary Gutters - Where the number of current-carrying conductors contained in the sheet metal auxiliary gutter is 30 or less, the correction factors specified in Section 310.15(B)(2)(a) shall not apply. The current carried continuously in bare copper bars in sheet metal auxiliary gutters shall not exceed 1.55 amperes/mm2 (1000 amperes/in.2) of cross section of the conductor. For aluminum bars, the current carried continuously shall not exceed 1.09 amperes/mm2 (700 amperes/in.2) of cross section of the conductor.
<u>Proposed Exception: Where the number of current-carrying conductors, including neutral conductors classified as current-carrying conductors under the provisions of Section 310.15(B)(4), contained in a sheet metal auxiliary gutter exceeds 30 and the sum of the cross-sectional areas of all contained conductors at any cross-section of a sheet metal auxiliary gutter does not exceed 20 percent of the interior cross-sectional area of the sheet metal auxiliary gutter, the application of the adjustment factors set forth in Table 310.15(B)(2)(a) shall not be required where all of the following conditions are met:</u>
<u>(1) Labeled metallic devices are inserted in the sheet metal auxiliary gutter that provide elevation, separation, and spacing among the current-carrying conductors by dividing the sheet metal auxiliary gutter into channels. Not more than nine current-carrying conductors shall be placed within a channel.</u>
<u>(2) The metallic devices used for elevation, separation, and spacing shall enable air to flow within and between the channels in order to provide cooling of the current-carrying conductors throughout the length of the sheet metal auxiliary gutter in a manner sufficient to allow the transient and steady-state temperatures of the conductors to remain below the rated temperatures for their insulation as specified in the applicable column of Table 310.16.</u>
<u>(3) The metallic devices used for elevation, separation, and spacing shall provide sufficient support and separation of the current-carrying conductors so that conductors in one channel shall not come into contact with conductors in another channel, except that such conductors may come into contact with conductors in another channel upon entering or exiting the sheet metal auxiliary gutter and conductors within one channel may come into contact with other conductors in the same channel.</u>
<u>(4) The metallic devices used for elevation, separation, and spacing shall be secured so as to prevent movement of the devices and so as to maintain contact with the walls and floor of the sheet metal auxiliary gutter in order to conduct heat to the walls and floor of the sheet metal auxiliary gutter and shall be connected to the sheet metal auxiliary gutter in a manner consistent with the limitations of their labeling.</u>
<u>(5) Where contact between the current-carrying conductors and the edges of the metallic devices used for separation and spacing poses the risk of abrasion of the insulation of the conductors, the edges of the devices shall be protected so as to avoid that risk.</u>
Substantiation: The ampacity derating factors of Section 310.15(B)(2)(a) severely limit the ampacities of conductors placed in sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways. This proposal establishes exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17 that allow for the placement of metallic devices to elevate, separate, and space the current-carrying conductors in those raceways so as to increase the number permitted by taking full advantage of the cooling capacity in the entire cross-sectional area of the raceway and the heat conducting properties of the metallic devices. The exception tendered for each of those sections contains five stringent conditions under which the devices may be used for such purpose. The report issued by INTERTEK, ETL SEMKO dated June 4, 2007, that accompanies this proposal provides test results that support the proposal.

I. Introduction:

A. Carl Cardi, III:

Mr. Cardi is presently a city electrical inspector for the city of Columbus, Ohio, a former electrical contractor, and an inventor. He is also President of CVC 1 Limited, LLC, the manufacturer of Cool Wire products.

B. Arnold E. Shaheen, Jr., Esq.:

Mr. Shaheen is counsel for CVC 1 Limited, LLC, and the author of this Proposal. Mr. Shaheen is licensed to practice law in the state of Ohio and received his Juris Doctorate Degree from Capital University in Columbus, Ohio, and a Bachelor of Science Degree in Electrical Engineering from The Ohio State University. Before, during, and after his attending college and law school, Mr. Shaheen also worked from childhood until 1985 in his family’s electrical construction business, which engaged in commercial and industrial electrical construction. Between 1971 and 1985, Mr. Shaheen was licensed as an electrical contractor in Columbus, Ohio.

C. The Proposal:

Mr. Cardi has submitted this Proposal in an effort to provide suggested revisions to the National Electric Code (“NEC”) that respect the intent and purpose of Section 310.15(B)(2)(a), but which allow for more flexibility in the design of electrical wiring systems that incorporate the use of sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways by allowing for new technologies that provide elevation, separation, and spacing of current-carrying conductors within those wiring systems. In so doing, it is submitted that these new technologies will provide better ambient cooling within those wiring systems by taking full advantage of all of the airspace within their cross-sectional areas as well as the heat conductive properties of the metallic devices that incorporate these new technologies and will allow for the placement of more current-carrying conductors in a raceway than would otherwise be permitted by the application of Section 310.15(B)(2)(a).

II. Heat Generated By Current-Carrying Conductors:

Well known principles of physics that govern the transfer of heat energy establish that heat energy cannot be dissipated without a thermal gradient. The principles of heat transfer are analogous to the concepts of current, resistance, and voltage embodied in Ohm’s Law. Heat, like current, cannot flow unless there is a thermal gradient, as in the case of a difference in electrical potential, or voltage, in an electrical circuit. If there is no thermal gradient, or if the heat source is surrounded by insulation, the heat source will not cool or may even grow warmer if the heat source is, itself, a generator of heat energy. When current flows through a wire, the wire becomes a heat source that generates heat energy because the flow of electricity encounters resistance, the degree of which is a function of both the size of the wire and the conductivity of the material from which the wire is manufactured.
From a fire prevention perspective, the danger, of course, is that a wire will become so hot that its insulation degrades resulting in the potential for a short circuit between a bare spot on a current-carrying conductor and a bare spot on another current-carrying conductor or between a bare spot on a current-carrying conductor and the metallic enclosure in which the conductor is placed. Even where adequate overcurrent protection exists, the potential for a fire or for further degradation of the insulation of surrounding conductors exists if the temperature of current-carrying conductors is allowed to rise above the rated temperature limitation of their insulation.
Insulated, current-carrying conductors that are bundled together or which lie in contact with one another, particularly those that are totally surrounded by and in contact with other current-carrying conductors, will rise in temperature because there exists no thermal gradient through which to dissipate the heat. Section 310.10, FPN No.1, subparagraph 4, recognizes this physical phenomenon.

III. Section 310.15(B)(2)(a):

Section 310.15(B)(2)(a) requires that the ampacity derating factors of Table 310.15(B)(2)(a) shall apply to any raceway that contains more than three current-carrying conductors. On its face, Section 310.15(B)(2)(a) was meant to apply to all systems defined as raceways in Article 100. The traditional practice in the electrical industry was to readily apply this section to all forms of conduit. However, confusion arose in the enforcement and application of articles of the NEC that applied to other types of raceways because those articles contained only fill limitations and not ampacity derating requirements. The result, in many cases, was that the fill requirements of a particular article were allowed to trump the requirements of Section 310.15(B)(2)(a) and, thus, create the risk of overheated raceways because of the number of current-carrying conductors placed within them, resulting in the commensurate risk of short circuits and fire.

To resolve the confusion and to better clarify the NFPA's intent regarding the application and enforcement of Section 310.15(B)(2)(a), the 2005 edition of the NEC added ampacity derating requirements within articles pertaining to specific types of raceways. Section 374.17 pertaining to cellular metal floor raceways and Section 390.17 pertaining to underfloor raceways are but two examples.

However, underlying the application and enforcement of Section 310.15(B)(2)(a) is the assumption that the conductors in a raceway will all lie at the bottom of the raceway and in close proximity to or in contact with one another. This assumption fails to take into account the cooling effect that the surrounding ambient **within the raceway** will have when the current-carrying conductors are elevated, separated, and spaced within the raceway nor does it account for the benefit of the heat conductive properties of the metallic devices described in this Proposal.

Many sections of the NEC recognize that spacing promotes the cooling of current-carrying conductors. The requirement to provide spacing between conduits, tubing, or raceways set forth in Section 310.15(B)(2)(b) is one example. The spacing dimensions for electrical ducts depicted in Figure 310.60 of Article 310 and those depicted for single insulated conductors in nonmagnetic underground electrical ducts in FPN Figure B.310.5 of Appendix B are other examples.

However, none of the articles, in their current form, containing sections identified in this Proposal address either the potential benefit of ambient cooling that could be realized by the elevation, separation, and spacing of current-carrying conductors within a raceway or the benefit of the heat conductive properties of the metallic devices described in this Proposal. It is those benefits that this Proposal addresses, while, at the same time, honoring the intent of Section 310.15(B)(2)(a) to prevent the degradation of the insulation of current-carrying conductors due to overheating.

IV. Proposed Changes to Sections 310.15(B)(2)(a), 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17:

This Proposal sets forth exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, each containing five subparagraphs. Those five subparagraphs are discussed in sequence, below:

A. Subparagraph (1):

Metallic devices that provide elevation, separation, and spacing among current-carrying conductors would be allowed in lieu of the application of the derating factors of Table 310.15(B)(2)(a). Those devices would separate raceways into channels, however, no channel would be permitted to hold more than nine conductors, which is the upper limit for the number of conductors to which the 70 percent derating factor of Table 310.15(B)(2)(a) presently applies. This numerical limit recognizes that, even though dividing raceways into channels enables the cooling of current-carrying conductors, there are physical limits to this effect. The devices must be labeled in compliance with the definition of that term as set forth in Article 100 and the requirements of Section 110.3(A)(1) FPN.

B. Subparagraph (2):

The metallic devices that provide elevation, separation, and spacing must also permit convection within a channel and between and among channels such that the transient and steady-state temperatures of the current-carrying conductors within any channel remain below the rated temperature for their insulation as indicated in the applicable column of Table 310.16.

C. Subparagraph (3):

The metallic devices must prevent contact between current-carrying conductors in different channels within the raceway, except at points of egress and ingress. However, because the number of conductors is limited to nine within any given channel, conductors within that channel may be in contact without additional separation within that channel.

D. Subparagraph (4):

The metallic devices must be secured so as to prevent movement of the devices and to maintain contact with the walls and floor of the raceway in order to enable the device to transmit heat away from the current-carrying conductors and to the walls and floor of the raceway so that the raceway may, in turn, transmit the heat either into the air, if the raceway is an auxiliary gutter or wireway, or to concrete, if the raceway is a cellular metal raceway or an underfloor raceway.

E. Subparagraph (5):

In order to prevent abrasion of current-carrying conductors within a channel, this subparagraph provides that all edges of the metallic devices that provide elevation, separation, and spacing of the current-carrying conductors must be protected where those edges would come into contact with the conductors.

F. Section 310.15(B)(2)(a):

The words, "Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, where there is no load diversity...." have been added. This additional language makes explicit that the exceptions to the application of Section 310.15(B)(2)(a) established by this Proposal apply only to the enumerated sections and only when load diversity is not available.

G. Section 366.22(A):

The preamble to the exception for this section limits its applicability in the case of sheet metal auxiliary gutters to situations where the 20 percent fill limitation prescribed for this type of raceway is not exceeded, but where there are more than 30 current-carrying conductors placed within the raceway.

H. Section 366.23(A):

The preamble to the exception for this section mimics the preamble contained in Section 366.22(A), which also applies to sheet metal auxiliary gutters.

I. Section 374.17:

Since the language of this section contains no limitations upon the applicability of Section 310.15(B)(2)(a) to cellular metal raceways, no preamble was necessary. The exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 374.17 and to cellular metal raceways.

J. Section 376.22:

As in the case of sheet metal auxiliary gutters, the preamble to the exception for this section limits its applicability to those instances in which the 20 percent fill limitation is not exceeded, but where there are also more than 30 current-carrying conductors placed within the metal wireway.

K. Section 384.22:

In the case of strut-type channel raceways, the preamble to the exception limits its applicability to those instances in which the percentage fill requirements of Table 384.22 are not exceeded and where the outside diameter dimensions of types and sizes of wire as set forth in the tables in Chapter 9 are met, but where the cross-sectional area of the raceway exceeds 2500mm² (4in.²) and where the number of current-carrying conductors in the raceway is greater than 30, but where the cross-sectional area of all current-carrying conductors does not exceed 20 percent of the cross-sectional area of the raceway.

L. Section 386.22:

The preamble to the exception for this section mimics that of Section 384.22 and applies to surface metal raceways.

M. Section 390.17:

As in the case of cellular metal raceways, the exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 390.17 and to underfloor raceways.

V. Test Evidence Submitted In Support of Proposal:

A. Testing Protocol:

Between May 29, 2007, through June 1, 2007, electrical testing involving metallic devices described in this Proposal was performed by INTERTEK, ETL SEMKO of Cortland, New York. Two different types of raceways and two sizes of conductors, 12 AWG THHN and 10 AWG THHN were tested. Testing was performed for the purpose of: (1) measuring the heating of the conductors under the testing protocol; and, (2) to determine how many conductors could be placed within the raceways without the temperature of the conductors exceeding the 90° C limitation of their insulation. Tests for physical abrasion were not conducted.

In the first instance, a 12 in. x 3 in. x 5 ft underfloor raceway was tested under various scenarios in order to determine the conductor temperatures. Similar testing was performed for an 8 in. x 8 in. x 5 ft metallic wireway. The ends of both raceways were stuffed with styrofoam in order to trap heat so as to create a worst-case scenario. Where it was appropriate to do so, both raceways were tested in a double-blind manner, that is, they were tested under the same conditions with and without the metallic devices described in this Proposal.

Constant loading of the conductors in each instance occurred throughout the duration of each test. No unloaded conductors, or fillers, were placed within the raceways. The time period used as a benchmark in order to attain steady-state temperature conditions was three hours. Thermocouples were placed on one conductor in each channel. One thermocouple was used to measure the room ambient.

The graphs indicating the test results show the temperatures measured by the thermocouples along the Y-axis and the time periods for those temperatures along the X-axis. The temperature recording for each conductor is indicated on each graph by a different color of line. The letters, “UF,” noted in the keys for the graphs for the tests denote conductors in the underfloor raceway. The letters, “WW,” denote conductors in the metal wireway. The maximum temperatures that were recorded for each conductor to which a thermocouple was attached are displayed in a table at the bottom of each graph for either one or both raceways, depending upon how each test was conducted.

B. Test Nos. 1 and 10:

In Test No. 1, the underfloor raceway was wired using 81 #12 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used to elevate, separate, and space the conductors. The test load on each of the conductors was 16 amperes. Upon removal of the underfloor raceway cover it was noted that one of the supports had moved. Thus, this test was redone as Test No. 10 only as to the underfloor raceway.

In Test No. 1, the metallic wireway was wired with 90 #12 THHN conductors in 10 groupings of 9 conductors.

In Test No. 1, the temperatures for all conductors for both raceways, after more than 3 hours, remained below 90°C and in a steady-state condition. The ambient temperature remained at approximately 25°C throughout the test.

Test No.1, as to the underfloor raceway, was repeated in Test No. 10. Again, the test results were the same. After more than three hours and in steady-state condition, the temperatures of all of the conductors remained below 90°. The ambient temperature approximated 22°C throughout the test.

During neither Test No. 1 nor Test No. 10 did the temperature of any of the conductors exceed 90°C at any point in time.

C. Test No. 2:

The same test protocol were used in this test as in Test No. 1 for both raceways. However, the metallic devices described in this Proposal were not used. After 91 minutes, in the case of both raceways, the temperatures of the conductors remain in a transient state and on an upward incline towards their 90°C limitation of their insulation. At that point in time, the highest temperature reached by any conductor in the underfloor raceway was 89.24°C and in the metal wireway was 81.97°C.

D. Test No. 3:

In Test No. 3, the underfloor raceway was wired with 81 #12 THHN conductors using a vertical divider system that did not permit air to flow between the divided chambers within the raceway. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes. After only 64 minutes, the temperatures of all of the conductors in the underfloor raceway remained in a transient state and the temperature of one conductor had exceeded the 90°C limitation of its insulation.

E. Test No. 4:

In Test No. 4, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

After more than 3 hours, the highest temperature reached in the underfloor raceway was 60.45°C and in the case of the metal wireway the highest temperature reached was 52.40°C.

F. Test No. 5.

In Test No. 5, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. For both the underfloor raceway and the metallic wireway, the metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

This test demonstrated the upper limit of the cooling effect of the metallic devices described in this Proposal in the case of the underfloor raceway. The transient state temperatures of the underfloor conductors began to approximate 90°C after 33 minutes. At that point the cover of the underfloor raceway was removed.

However, in the case of the metal wireway, the highest temperature of the conductors was 82.03°C in steady-state condition after 190 minutes.

The ambient approximated 22°C throughout the test.

G. Test No. 6:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groups of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

The highest temperature reached by a conductor after 203 minutes was 67.74°C in a steady-state condition. The ambient temperature for the test ranged between 22° and 28°C.

H. Test No. 7:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groupings of 9 conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

After 157 minutes, the temperatures of the conductors remained in a transient state condition. By that time, one of the conductors had reached 89.06°C. The ambient temperature ranged between 22°C and 28°C.

I. Test No. 8:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

After 126 minutes, the temperatures of the conductors in the underfloor raceway remained in a transient condition and were gradually rising. At that point in time the highest temperature for the underfloor conductors was 75.17°C.

After the same time period, the conductors in the wireway, for the most part, remain in a transient condition with the highest temperature recorded at 71.09°C.

The ambient temperature ranged between 22°C and 25°C.

J. Test No. 9:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The graph of the temperatures of the conductors in the two types of raceways demonstrates that the temperatures in both raceways were rising rapidly. Within 14 minutes after the commencement of the test, the highest temperature of a conductor in the underfloor raceway is 97.95°C and for the metal wireway is 93.43°C.

The ambient remained at approximately 22°C throughout the test.

K. Test Conclusions:

The use of the metallic devices described in this Proposal demonstrate a marked decrease in the transient and the steady-state temperatures of the conductors within the limitations of the cooling effects of the devices. This can be readily shown by comparing the test results in Test Nos. 6 and 7, the test results in Test Nos. 4 and 8, and by comparing the test results in Test Nos. 1 and 10 with Test No. 2. Within the limitations of the devices, as demonstrated in Test No. 5 as it relates to underfloor raceways, the 90°C limitations of the conductors’ insulation is not exceeded during the three hour protocol for the tests where the devices were used.

VI. Conclusion:

This Proposal provides for exceptions to the applicability of Section 310.15(B)(2)(a) to sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, and underfloor raceways that impose five conditions so as to preserve the intent of that section to prevent thermal degradation of insulation, but yet allow for more current-carrying conductors to be placed within those raceways. Due to the stringent nature of those conditions, the reasons cited in the narrative, above, and the test results supplied with this Proposal, the Proposer requests that the Proposal be approved.

Note: Supporting material is available for review at NFPA Headquarters.

ARTICLE 368 — BUSWAYS

8-163 Log #1501 NEC-P08 **Final Action: Reject**

(368.2.Busways, Exception No. 1 (New))

Submitter: Tori C. Poppenheimer, Inventive Product Design

Recommendation: Add an exception as indicated:

368.2 Definition.

Busways. A grounded metal enclosure containing factory mounted, bare or insulated conductors, which are usually copper or aluminum bars, rods, or tubes.

Exception No. 1: Polymeric enclosures shall be permitted where internal bonding means are provided.

Substantiation: This brings Busway enclosure materials in line with Article 312 Cabinets, Cutout Boxes, and Meter Socket Enclosures, Section 312.10(C), Article 314 Outlet, Device, Pull, and Junction Boxes; Conduit Bodies; Fittings; and Handhold Enclosures, section 314.3, and Article 366 Auxiliary Gutters, Section 366.2. This exception further correlates Busway enclosure materials with Approved Conduit Systems constructed of nonmetallic materials covered in Articles 352, 353, 354, and 355.

Polymeric enclosures are more resistant to corrosion in wet locations and corrosive environments providing a significant improvement in safety over time. Polymeric enclosures also provide an additional discrete layer of electrical insulation preventing contact with live parts, and allow for greater installation and design flexibility.

Panel Meeting Action: Reject

Panel Statement: The panel notes that busway is defined by the product standard as a "grounded metal enclosure containing factory mounted conductors". The product standard does not include text similar to the proposed exception for polymeric enclosures. The proposer may wish to address this issue with the standards writing organizations. Definitions cannot contain requirements. Submitter did not provide technical substantiation.

Ballot Results: Affirmative: 12

Comment on Affirmative:

BERMAN, R.: As indicated in the Panel Statement, definitions should not contain requirements and the submitter did not provide any technical substantiation to demonstrate that polymeric busways can be installed and used safely. Only generic statements regarding improvement in safety and design flexibility were offered. CMP-8 and the submitter should consider two additional issues: (1) The definition in Section 368.2 presently contains requirements - one being that busways are constructed with grounded metal enclosures. Rather than expanding this requirement, one consideration may be to remove this existing, and incorrectly located, requirement. (2) The panel suggested that the submitter address this issue with the standards writing organization. However, it is noted that Article 368 does not presently require product listing. Furthermore, any proposed revision of the product standard definition to include polymeric busways presents a compliance issue that could permit product listing of a construction that does not comply with the definition for busways as indicated in Section 368.2. If provided with sufficient technical substantiation to accept polymeric busways, CMP-8 revision to this code language is the first step to creating favorable conditions for the Standards Technical Panel to consider revisions to the standard.

8-164 Log #4620 NEC-P08 **Final Action: Accept in Principle**
(368.10(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Retitle this part “(A) Behind Access Panels.”
Substantiation: These applications are not concealed, as the term is defined in Article 100. It is long past the time when this error should have been corrected. This is somewhat different wording that previously proposed.
Panel Meeting Action: Accept in Principle
Revise Title of 368.10(B) to read as follows:
(B) Behind Access Panels.
Remainder of text unchanged.
Panel Statement: Panel recognizes that the wrong section was referenced in the proposal. The panel agrees to change the title of 368.10(B) to “Behind Access Panels.”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-165 Log #1753 NEC-P08 **Final Action: Reject**
(368.12(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Busways shall not be installed where <u>likely to be</u> subject to corrosive <u>agents</u> ~~vapors~~ or ~~severe~~ physical damage <u>which impairs its functional capabilities.</u>
Substantiation: “Severe” is not defined; damage should be that which impairs any of its functional capabilities. A small dent or scratch is damage, but not likely to impair functions. “Likely” is defined as such a nature or circumstance as to make something probable and is a term used in many sections. Corrosive liquids and solids should be included.
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-166 Log #1803 NEC-P08 **Final Action: Reject**
(368.12(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Busways shall not be installed where <u>likely to be</u> subject to ~~severe~~ physical damage or corrosive <u>agents</u>. ~~vapors.~~
Substantiation: “Severe” is subjective and not defined; corrosive solids and liquids should be included. “Likely” is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-167 Log #3172 NEC-P08 **Final Action: Reject**
(368.12(C))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 368.12, delete ~~(C) Hazardous Locations, Busways shall not be installed in any hazardous (classified) location, unless specifically approved for such use,~~
FPN: See 501.10(B)
Renumber 368.12(D) and (E) as 368.12(C) and (D), respectively.
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-168 Log #3237 NEC-P08 **Final Action: Reject**
(368.13 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add the follow text:
Listing. Busways and associated components shall be listed.
Substantiation: Busways are critical components of a wiring system and should be listed, as are many other wiring systems.
Panel Meeting Action: Reject
Panel Statement: Per the 2000 and 2008 ROCs, CMP-8 continues to reaffirm its position that it is not the intent of the panel to require listing of all busways. The submitter has not provided evidence that a safety issue exists that would warrant this additional code requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BERMAN, R.: The Authority Having Jurisdiction does not have the means available to determine the safety of the design, manufacture, installation, and operation of a busway in accordance with NEC Section 110.3(A). Busways and their associated fittings, as with any wiring method, should be evaluated and listed by a nationally recognized third party certification organization. Field fabrication and modification of factory-produced components can also be hazardous and should be properly examined and evaluated by a nationally recognized testing organization.
DABE, J.: The panel should reconsider the listing of Busways. At present we require listing of empty metal conduit, (RMC, IMC, and EMT). Busways are a grounded metal enclosure containing factory mounted, bare or insulated conductors, why would this not be required to be listed.

8-169 Log #4720 NEC-P08 **Final Action: Reject**
(368.44)

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Add new text as follows:
368.44 Expansion Fittings. Flexible or expansion connections shall be provided in long straight runs of bus to allow for temperature expansion or contraction or where the busways run across building vibration joints
Substantiation: It mirrors the over 600 volt requirement of 368.244. It is needed for under 600 volt as well, as the manufacturers require them.
Panel Meeting Action: Reject
Panel Statement: The panel notes that 110.3(B) requires equipment to be installed in accordance with the manufacturers instructions. Such instructions specify if and when expansion joints are required based on the particular construction and type of busway. CMP-8 recognizes that busways rated for over 600 volts are designed and built to a different product standard and may have different installation requirements than low voltage busways.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-170 Log #1871 NEC-P08 **Final Action: Reject**
(368.320(3) and (5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (3): Rated frequency <u>if for alternating current</u>.
Revise (5): Rated ~~60~~ HZ withstand voltage (dry).
Substantiation: Edit. Some busways are used on dc systems and other frequencies.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that adding the term “if for alternating current” does not improve the clarity or usability of the Code. The rated withstand voltage in 368.320(5) is a value determined through testing and does not indicate the operating frequency of the busway.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 370 — CABLEBUS

8-171 Log #3173 NEC-P08 **Final Action: Reject**
(370.3)

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 370.3, first paragraph, delete ~~or hazardous (classified) locations~~
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-172 Log #1617 NEC-P08 **Final Action: Accept**
(370.4(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “Table 310.17” to “Table 310.15(B)(2)”.
Change “Table 310.19” to “Table 310.15(B)(4)”.
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-173 Log #1633 NEC-P08 **Final Action: Accept**
(370.4(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “Table 310.69 and Table 310.70” to “Table 310.60(C)(3) and Table 310.60(C)(4)”.
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.67 through 310.86 as Tables 310.60(C)(1) through 310.60(C)(20) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-174 Log #1870 NEC-P08 **Final Action: Reject**
(370.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change “approved” to “identified”.
Substantiation: Edit. “Approved” is not necessarily the same as “identified”.
Panel Meeting Action: Reject
Panel Statement: Approved is subject to the AHJ. Identification marks may be a method of approval. Listing may be another. Simple identification creates a manufacturers self certification that neither requires AHJ approval or listing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 372 — CELLULAR CONCRETE FLOOR RACEWAYS

8-175 Log #488 NEC-P08 **Final Action: Reject**
(372, 374, 380, 390, and 392)

Submitter: Brenson (Ben) Kingren, Louisville Electrical Joint Apprenticeship Training Committee
Recommendation: Revise text as follows:
Change the article’s sections for Uses Permitted and Uses Not Permitted to reflect.10 for Uses Permitted and.12 for Uses Not Permitted as in other subsequent articles for uniformity.
Substantiation: The above mentioned Articles do not conform to a standard section as elsewhere in the code for Uses Permitted and Uses Not Permitted to conform to what other article’s sections are numbered for the same titles.
Panel Meeting Action: Reject
Panel Statement: The panel would consider proposals that showed the proposed revisions and section renumbering. This is in accordance with the guidelines for Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-176 Log #2669 NEC-P08 **Final Action: Reject**
(372.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows: <u>A</u> transverse metal raceway ~~for electrical conductors~~ providing access to predetermined cells of a precast cellular concrete floor, thereby permitting the installation of electrical conductors <u>and coaxial cables</u> from a distribution center to the floor cells.
Substantiation: Edit. Raceway use is already defined in the definition of raceway. Coaxial cables should be included.
Panel Meeting Action: Reject
Panel Statement: Installation of coaxial cables is covered in Chapter 8.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-177 Log #3174 NEC-P08 **Final Action: Reject**
(372.4(2))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 372.4, delete ~~(2) In any hazardous (classified) location, except as permitted by other articles in this Code.~~
Renumber 372.4(3) as 372.4(2).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-178 Log #4746 NEC-P08 **Final Action: Accept in Principle**
(372.12)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel actions on this proposal to comply with 3.1.3 of the NEC Style Manual regarding mandatory language in Fine Print Notes.
This action will be considered by the panel as a public comment.
Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
372.12 Splices and Taps.
Splices and taps shall be made only in header access units or junction boxes.
<u>FPN:</u> For the purposes of this section, so-called loop wiring (continuous unbroken conductor connecting the individual outlets) shall not be considered to be a splice or tap.
Substantiation: Change this statement to a fine pint note. The language provides clarity but is not enforceable as per 3.5.1 for explanatory information from the NFPA style manual and 3.1.3 of the NEC style manual.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
372.12 Splices and Taps.
Splices and taps shall be made only in header access units or junction boxes.
FPN: For the purposes of this section, so-called loop wiring (continuous unbroken conductor connecting the individual outlets) is not considered to be a splice or tap.
Panel Statement: Panel removed “shall not be” and replaced with “is not” to ensure that a requirement was not placed in a FPN.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
CAMPBELL, D.: I agree with the Panel, however the TCC should review 374.6 and 390.6 to correlate the same FPN change.

8-179 Log #2609 NEC-P08 **Final Action: Reject**
(372.17 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows:
Exception: Where more than one outlet on the same circuit is individually supplied by one set of conductors it shall be permitted to count only the current-carrying conductors of one such set of conductors for the purpose of ampacity adjustment.
Substantiation: The present derating factors discourage installation of individual sets of conductors on the same circuit which reduces voltage drop, increases efficiency and does not increase heating effect. The proposal would encourage compliance with 372.13.
Panel Meeting Action: Reject
Panel Statement: The current text is clear. It is the intent of the panel to have the adjustment factors of 310.15(B)(2) apply to cellular concrete floor raceways.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel action on this proposal should be to "Accept in Principle".
To clarify submitter's intent, the proposed language should have been revised to read – "Add Exception: Where multiple outlets on the same circuit are supplied by separate conductor sets it shall be permitted to count only one such set of current-carrying conductors for the purpose of ampacity adjustment."
To permit such a conductor count for purposes of determining circuit ampacity (adjustment factor) in a raceway is no different than where only current carrying conductors are permitted to be counted in other code sections. See, for example, 392.11(A)(1) & 392.11(B), both of which permit omission of non-load-carrying cable conductors for conductor count in tray and 310.15(B)(4) which permits omission of the non-load-carrying neutral conductor in the conductor count. Further, no additional conductor heating in the same raceway is introduced if the current associated with the circuit is instead assumed to be distributed across the separate conductor sets. In fact, the heating is less in this case since the heating varies as the current magnitude squared and the sum of the current in all sets is limited to the circuit rating. For example, if the total current on a 30 Ampere circuit was assumed to be equally divided between two conductor sets, the total heating would be one-fourth of that seen if the entire 30 Amperes was assumed to be carried by a single set (the set to be counted by this proposal). The adjustment factors of 310.15(B)(2) would still apply according to Panel's stated intent. Only the method of counting conductors would change to become consistent with that permitted elsewhere in the code to accurately recognize the actual current loading of conductors.

ARTICLE 374 — CELLULAR METAL FLOOR RACEWAYS

8-180 Log #3175 NEC-P08 **Final Action: Reject**
(374.3(2))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 374.3, delete ~~(2) In any hazardous (classified) location, except as permitted by other articles in this Code~~
Renumber 374.3(3) as 374.3(2).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-181 Log #8 NEC-P08 **Final Action: Reject**
(374.17)

NOTE: This proposal appeared as Comment 8-68 on Proposal 8-148 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-148 was:
Add a new Exception as follows:
Exception: Where more than one outlet is individually supplied by a set of conductors on the same circuit, it shall be permitted to count only one set of current-carrying conductors of that circuit for derating purposes.
Submitter: John J. Michlovic, H.H. Robertson Floor Systems
Recommendation: Revise text to read as follows:
Ampacity of conductors. The ampacity adjustment factors in ~~310.15(B)(2)~~ Table 374.17 shall apply to conductors installed in cellular metal floor raceways.
Substantiation: ROP 8-148 (Log #1057) seeks an exception to 374.17 so as to eliminate the perceived need to use "loop wiring" and "violate 374.7" in relation to multiple outlets on the same circuit. In lieu of adopting an isolated exception to address the proponent's particular concern, this Comment suggests that NFPA amend 374.17 more comprehensively to establish an ampacity reduction table specifically applicable to cellular metal floor raceways.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The adjustment factors in Article 310 apply to all raceways. Section 374.17 was added as a clarification to indicate that Table 310.15(B)(2)(a) applied to cellular metal floor raceways. Test data provided failed to support the values in the proposed table of adjustment factors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-182 Log #479 NEC-P08 **Final Action: Reject**
(374.17)

Submitter: Carl V. Cardi, III, CVC 1 Limited LLC
Recommendation: Add new text to read as follows:
Section 374.17 Ampacity of Conductors. The ampacity adjustment factors in 310.15(B)(2) shall apply to conductors installed in cellular metal floor raceways.
Proposed Exception: The application of the adjustment factors set forth in Table 310.15(B)(2)(a) shall not be required for cellular metal floor raceways where all of the following conditions are met:
(1) Labeled metallic devices are inserted in the cellular metal floor raceways that provide elevation, separation, and spacing among the current-carrying conductors by dividing the cellular metal floor raceway into channels. Not more than nine current-carrying conductors shall be placed within a channel.
(2) The metallic devices used for elevation, separation, and spacing shall enable air to flow within and between the channels in order to provide cooling of the current-carrying conductors throughout the length of the cellular metal floor raceway in a manner sufficient to allow the transient and steady-state temperatures of the conductors to remain below the rated temperatures for their insulation as specified in the applicable column of Table 310.16.
(3) The metallic devices used for elevation, separation, and spacing shall provide sufficient support and separation of the current-carrying conductors so that conductors in one channel shall not come into contact with conductors in another channel, except that such conductors may come into contact with conductors in another channel upon entering or exiting the cellular metal floor raceway and conductors within one channel may come into contact with other conductors in the same channel.
(4) The metallic devices used for elevation, separation, and spacing shall be secured so as to prevent movement of the devices and so as to maintain contact with the walls and floor of the cellular metal floor raceway in order to conduct heat to the walls and floor of the cellular metal raceway and shall be connected to the cellular metal floor raceway in a manner consistent with the limitations of their labeling.
(5) Where contact between the current-carrying conductors and the edges of the metallic devices used for elevation, separation, and spacing poses the risk of abrasion of the insulation of the conductors, the edges of the devices shall be protected so as to avoid that risk.
Substantiation: The ampacity derating factors of Section 310.15(B)(2)(a) severely limit the ampacities of conductors placed in sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways. This proposal establishes exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17 that allow for the placement of metallic devices to elevate, separate, and space the current-carrying conductors in those raceways so as to increase the number permitted by taking full advantage of the cooling capacity in the entire cross-sectional area of the raceway and the heat conducting properties of the metallic devices. The exception tendered for each of those sections contains five stringent conditions under which the devices may be used for such purpose. The report issued by INTERTEK, ETL SEMKO dated June 4, 2007, that accompanies this proposal provides test results that support the proposal.

I. Introduction:

A. Carl Cardi, III:

Mr. Cardi is presently a city electrical inspector for the city of Columbus, Ohio, a former electrical contractor, and an inventor. He is also President of CVC 1 Limited, LLC, the manufacturer of Cool Wire products.

B. Arnold E. Shaheen, Jr., Esq.:

Mr. Shaheen is counsel for CVC 1 Limited, LLC, and the author of this Proposal. Mr. Shaheen is licensed to practice law in the state of Ohio and received his Juris Doctorate Degree from Capital University in Columbus, Ohio, and a Bachelor of Science Degree in Electrical Engineering from The Ohio State University. Before, during, and after his attending college and law school, Mr. Shaheen also worked from childhood until 1985 in his family's electrical construction business, which engaged in commercial and industrial electrical construction. Between 1971 and 1985, Mr. Shaheen was licensed as an electrical contractor in Columbus, Ohio.

C. The Proposal:

Mr. Cardi has submitted this Proposal in an effort to provide suggested revisions to the National Electric Code ("NEC") that respect the intent and purpose of Section 310.15(B)(2)(a), but which allow for more flexibility in the design of electrical wiring systems that incorporate the use of sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways by allowing for new technologies that provide elevation, separation, and spacing of current-carrying conductors within those wiring systems. In so doing, it is submitted that these new technologies will provide better ambient cooling within those wiring systems by taking full advantage of all of the airspace within their cross-sectional areas as well as the heat conductive properties of the metallic devices that incorporate these new technologies and will allow for the placement of more current-carrying conductors in a raceway than would otherwise be permitted by the application of Section 310.15(B)(2)(a).

II. Heat Generated By Current-Carrying Conductors:

Well known principles of physics that govern the transfer of heat energy establish that heat energy cannot be dissipated without a thermal gradient. The principles of heat transfer are analogous to the concepts of current, resistance, and voltage embodied in Ohm's Law. Heat, like current, cannot flow unless there is a thermal gradient, as in the case of a difference in electrical potential, or voltage, in an electrical circuit. If there is no thermal gradient, or if the heat source is surrounded by insulation, the heat source will not cool or may even grow warmer if the heat source is, itself, a generator of heat energy. When current flows through a wire, the wire becomes a heat source that generates heat energy because the flow of electricity encounters resistance, the degree of which is a function of both the size of the wire and the conductivity of the material from which the wire is manufactured.

From a fire prevention perspective, the danger, of course, is that a wire will become so hot that its insulation degrades resulting in the potential for a short circuit between a bare spot on a current-carrying conductor and a bare spot on another current-carrying conductor or between a bare spot on a current-carrying conductor and the metallic enclosure in which the conductor is placed. Even where adequate overcurrent protection exists, the potential for a fire or for further degradation of the insulation of surrounding conductors exists if the temperature of current-carrying conductors is allowed to rise above the rated temperature limitation of their insulation.

Insulated, current-carrying conductors that are bundled together or which lie in contact with one another, particularly those that are totally surrounded by and in contact with other current-carrying conductors, will rise in temperature because there exists no thermal gradient through which to dissipate the heat. Section 310.10, FPN No.1, subparagraph 4, recognizes this physical phenomenon.

III. Section 310.15(B)(2)(a):

Section 310.15(B)(2)(a) requires that the ampacity derating factors of Table 310.15(B)(2)(a) shall apply to any raceway that contains more than three current-carrying conductors. On its face, Section 310.15(B)(2)(a) was meant to apply to all systems defined as raceways in Article 100. The traditional practice in the electrical industry was to readily apply this section to all forms of conduit. However, confusion arose in the enforcement and application of articles of the NEC that applied to other types of raceways because those articles contained only fill limitations and not ampacity derating requirements. The result, in many cases, was that the fill requirements of a particular article were allowed to trump the requirements of Section 310.15(B)(2)(a) and, thus, create the risk of overheated raceways because of the number of current-carrying conductors placed within them, resulting in the commensurate risk of short circuits and fire.

To resolve the confusion and to better clarify the NFPA's intent regarding the application and enforcement of Section 310.15(B)(2)(a), the 2005 edition of the NEC added ampacity derating requirements within articles pertaining to specific types of raceways. Section 374.17 pertaining to cellular metal floor raceways and Section 390.17 pertaining to underfloor raceways are but two examples.

However, underlying the application and enforcement of Section 310.15(B)(2)(a) is the assumption that the conductors in a raceway will all lie at the bottom of the raceway and in close proximity to or in contact with one another. This assumption fails to take into account the cooling effect that the surrounding ambient **within the raceway** will have when the current-carrying conductors are elevated, separated, and spaced within the raceway nor does it account for the benefit of the heat conductive properties of the metallic devices described in this Proposal.

Many sections of the NEC recognize that spacing promotes the cooling of current-carrying conductors. The requirement to provide spacing between conduits, tubing, or raceways set forth in Section 310.15(B)(2)(b) is one example. The spacing dimensions for electrical ducts depicted in Figure 310.60 of Article 310 and those depicted for single insulated conductors in nonmagnetic underground electrical ducts in FPN Figure B.310.5 of Appendix B are other examples.

However, none of the articles, in their current form, containing sections identified in this Proposal address either the potential benefit of ambient cooling that could be realized by the elevation, separation, and spacing of current-carrying conductors within a raceway or the benefit of the heat conductive properties of the metallic devices described in this Proposal. It is those benefits that this Proposal addresses, while, at the same time, honoring the intent of Section 310.15(B)(2)(a) to prevent the degradation of the insulation of current-carrying conductors due to overheating.

IV. Proposed Changes to Sections 310.15(B)(2)(a), 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17:

This Proposal sets forth exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, each containing five subparagraphs. Those five subparagraphs are discussed in sequence, below:

A. Subparagraph (1):

Metallic devices that provide elevation, separation, and spacing among current-carrying conductors would be allowed in lieu of the application of the derating factors of Table 310.15(B)(2)(a). Those devices would separate raceways into channels, however, no channel would be permitted to hold more than nine conductors, which is the upper limit for the number of conductors to which the 70 percent derating factor of Table 310.15(B)(2)(a) presently applies. This numerical limit recognizes that, even though dividing raceways into channels enables the cooling of current-carrying conductors, there are physical limits to this effect. The devices must be labeled in compliance with the definition of that term as set forth in Article 100 and the requirements of Section 110.3(A)(1) FPN.

B. Subparagraph (2):

The metallic devices that provide elevation, separation, and spacing must also permit convection within a channel and between and among channels such that the transient and steady-state temperatures of the current-carrying conductors within any channel remain below the rated temperature for their insulation as indicated in the applicable column of Table 310.16.

C. Subparagraph (3):

The metallic devices must prevent contact between current-carrying conductors in different channels within the raceway, except at points of egress and ingress. However, because the number of conductors is limited to nine within any given channel, conductors within that channel may be in contact without additional separation within that channel.

D. Subparagraph (4):

The metallic devices must be secured so as to prevent movement of the devices and to maintain contact with the walls and floor of the raceway in order to enable the device to transmit heat away from the current-carrying conductors and to the walls and floor of the raceway so that the raceway may, in turn, transmit the heat either into the air, if the raceway is an auxiliary gutter or wireway, or to concrete, if the raceway is a cellular metal raceway or an underfloor raceway.

E. Subparagraph (5):

In order to prevent abrasion of current-carrying conductors within a channel, this subparagraph provides that all edges of the metallic devices that provide elevation, separation, and spacing of the current-carrying conductors must be protected where those edges would come into contact with the conductors.

F. Section 310.15(B)(2)(a):

The words, "Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, where there is no load diversity...." have been added. This additional language makes explicit that the exceptions to the application of Section 310.15(B)(2)(a) established by this Proposal apply only to the enumerated sections and only when load diversity is not available.

G. Section 366.22(A):

The preamble to the exception for this section limits its applicability in the case of sheet metal auxiliary gutters to situations where the 20 percent fill limitation prescribed for this type of raceway is not exceeded, but where there are more than 30 current-carrying conductors placed within the raceway.

H. Section 366.23(A):

The preamble to the exception for this section mimics the preamble contained in Section 366.22(A), which also applies to sheet metal auxiliary gutters.

I. Section 374.17:

Since the language of this section contains no limitations upon the applicability of Section 310.15(B)(2)(a) to cellular metal raceways, no preamble was necessary. The exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 374.17 and to cellular metal raceways.

J. Section 376.22:

As in the case of sheet metal auxiliary gutters, the preamble to the exception for this section limits its applicability to those instances in which the 20 percent fill limitation is not exceeded, but where there are also more than 30 current-carrying conductors placed within the metal wireway.

K. Section 384.22:

In the case of strut-type channel raceways, the preamble to the exception limits its applicability to those instances in which the percentage fill requirements of Table 384.22 are not exceeded and where the outside diameter dimensions of types and sizes of wire as set forth in the tables in Chapter 9 are met, but where the cross-sectional area of the raceway exceeds 2500mm² (4in.²) and where the number of current-carrying conductors in the raceway is greater than 30, but where the cross-sectional area of all current-carrying conductors does not exceed 20 percent of the cross-sectional area of the raceway.

L. Section 386.22:

The preamble to the exception for this section mimics that of Section 384.22 and applies to surface metal raceways.

M. Section 390.17:

As in the case of cellular metal raceways, the exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 390.17 and to underfloor raceways.

V. Test Evidence Submitted In Support of Proposal:

A. Testing Protocol:

Between May 29, 2007, through June 1, 2007, electrical testing involving metallic devices described in this Proposal was performed by INTERTEK, ETL SEMKO of Cortland, New York. Two different types of raceways and two sizes of conductors, 12 AWG THHN and 10 AWG THHN were tested. Testing was performed for the purpose of: (1) measuring the heating of the conductors under the testing protocol; and, (2) to determine how many conductors could be placed within the raceways without the temperature of the conductors exceeding the 90° C limitation of their insulation. Tests for physical abrasion were not conducted.

In the first instance, a 12 in. x 3 in. x 5 ft underfloor raceway was tested under various scenarios in order to determine the conductor temperatures. Similar testing was performed for an 8 in. x 8 in. x 5 ft metallic wireway. The ends of both raceways were stuffed with styrofoam in order to trap heat so as to create a worst-case scenario. Where it was appropriate to do so, both raceways were tested in a double-blind manner, that is, they were tested under the same conditions with and without the metallic devices described in this Proposal.

Constant loading of the conductors in each instance occurred throughout the duration of each test. No unloaded conductors, or fillers, were placed within the raceways. The time period used as a benchmark in order to attain steady-state temperature conditions was three hours. Thermocouples were placed on one conductor in each channel. One thermocouple was used to measure the room ambient.

The graphs indicating the test results show the temperatures measured by the thermocouples along the Y-axis and the time periods for those temperatures along the X-axis. The temperature recording for each conductor is indicated on each graph by a different color of line. The letters, "UF," noted in the keys for the graphs for the tests denote conductors in the underfloor raceway. The letters, "WW," denote conductors in the metal wireway. The maximum temperatures that were recorded for each conductor to which a thermocouple was attached are displayed in a table at the bottom of each graph for either one or both raceways, depending upon how each test was conducted.

B. Test Nos. 1 and 10:

In Test No. 1, the underfloor raceway was wired using 81 #12 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used to elevate, separate, and space the conductors. The test load on each of the conductors was 16 amperes. Upon removal of the underfloor raceway cover it was noted that one of the supports had moved. Thus, this test was redone as Test No. 10 only as to the underfloor raceway.

In Test No. 1, the metallic wireway was wired with 90 #12 THHN conductors in 10 groupings of 9 conductors.

In Test No. 1, the temperatures for all conductors for both raceways, after more than 3 hours, remained below 90°C and in a steady-state condition. The ambient temperature remained at approximately 25°C throughout the test.

Test No.1, as to the underfloor raceway, was repeated in Test No. 10. Again, the test results were the same. After more than three hours and in steady-state condition, the temperatures of all of the conductors remained below 90°. The ambient temperature approximated 22°C throughout the test.

During neither Test No. 1 nor Test No. 10 did the temperature of any of the conductors exceed 90°C at any point in time.

C. Test No. 2:

The same test protocol were used in this test as in Test No. 1 for both raceways. However, the metallic devices described in this Proposal were not used. After 91 minutes, in the case of both raceways, the temperatures of the conductors remain in a transient state and on an upward incline towards their 90°C limitation of their insulation. At that point in time, the highest temperature reached by any conductor in the underfloor raceway was 89.24°C and in the metal wireway was 81.97°C.

D. Test No. 3:

In Test No. 3, the underfloor raceway was wired with 81 #12 THHN conductors using a vertical divider system that did not permit air to flow between the divided chambers within the raceway. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes. After only 64 minutes, the temperatures of all of the conductors in the underfloor raceway remained in a transient state and the temperature of one conductor had exceeded the 90°C limitation of its insulation.

E. Test No. 4:

In Test No. 4, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

After more than 3 hours, the highest temperature reached in the underfloor raceway was 60.45°C and in the case of the metal wireway the highest temperature reached was 52.40°C.

F. Test No. 5.

In Test No. 5, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. For both the underfloor raceway and the metallic wireway, the metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

This test demonstrated the upper limit of the cooling effect of the metallic devices described in this Proposal in the case of the underfloor raceway. The transient state temperatures of the underfloor conductors began to approximate 90°C after 33 minutes. At that point the cover of the underfloor raceway was removed.

However, in the case of the metal wireway, the highest temperature of the conductors was 82.03°C in steady-state condition after 190 minutes.

The ambient approximated 22°C throughout the test.

G. Test No. 6:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groups of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

The highest temperature reached by a conductor after 203 minutes was 67.74°C in a steady-state condition. The ambient temperature for the test ranged between 22° and 28°C.

H. Test No. 7:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groupings of 9 conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

After 157 minutes, the temperatures of the conductors remained in a transient state condition. By that time, one of the conductors had reached 89.06°C. The ambient temperature ranged between 22°C and 28°C.

I. Test No. 8:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

After 126 minutes, the temperatures of the conductors in the underfloor raceway remained in a transient condition and were gradually rising. At that point in time the highest temperature for the underfloor conductors was 75.17°C.

After the same time period, the conductors in the wireway, for the most part, remain in a transient condition with the highest temperature recorded at 71.09°C.

The ambient temperature ranged between 22°C and 25°C.

J. Test No. 9:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The graph of the temperatures of the conductors in the two types of raceways demonstrates that the temperatures in both raceways were rising rapidly. Within 14 minutes after the commencement of the test, the highest temperature of a conductor in the underfloor raceway is 97.95°C and for the metal wireway is 93.43°C.

The ambient remained at approximately 22°C throughout the test.

K. Test Conclusions:

The use of the metallic devices described in this Proposal demonstrate a marked decrease in the transient and the steady-state temperatures of the conductors within the limitations of the cooling effects of the devices. This can be readily shown by comparing the test results in Test Nos. 6 and 7, the test results in Test Nos. 4 and 8, and by comparing the test results in Test Nos. 1 and 10 with Test No. 2. Within the limitations of the devices, as demonstrated in Test No. 5 as it relates to underfloor raceways, the 90°C limitations of the conductors' insulation is not exceeded during the three hour protocol for the tests where the devices were used.

VI. Conclusion:

This Proposal provides for exceptions to the applicability of Section 310.15(B)(2)(a) to sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, and underfloor raceways that impose five conditions so as to preserve the intent of that section to prevent thermal degradation of insulation, but yet allow for more current-carrying conductors to be placed within those raceways. Due to the stringent nature of those conditions, the reasons cited in the narrative, above, and the test results supplied with this Proposal, the Proposer requests that the Proposal be approved.

8-183 Log #2874 NEC-P08 **Final Action: Reject**

(374.17)

Submitter: John J. Michlovic, H.H. Robertson Floor Systems

Recommendation: Revise text to read as follows:

374.17 Ampacity of Conductors. The Ampacity adjustment factors in 310.15(B)(2)(a) shall NOT apply to conductors installed in Cellular Metal Floor Raceways.

Substantiation: The inclusion of 374.17 in Article 374 in the 2005 NEC signaled a steep decline in the use of this raceway system.

In placing this conduit Ampacity adjustment table in Article 374, Panel-8 members and later, the NFPA Standards Council relied on only one piece of evidence for justification. Under the General Requirements for Article 300 (Wiring Methods) the first sentence states: "This article covers wiring methods for all wiring installations unless modified by other articles."

This one sentence allowed Panel-8 to justify the inclusion of the conduit Ampacity Adjustment Table into Article 374 since cellular Metal Floor Raceway is a "wiring method". Thus, the code writers' desire for a "one size fits all" solution to conductor heating became a convenient reason to misapply the conduit table to all raceways, regardless of size. Since Table 310.15(B)(2)(a) considers only the number of conductors but not the area available within the raceway, it favors small raceways and penalizes larger ones when such raceways compete in the marketplace.

Following is a list of reasons which justify the removal of the conduit Ampacity adjustment table from Article 374 by the addition of the word "not" in the text.

A. There is no evidence of a safety problem nor any record of overheated conductors, fires, or electrocution in any cellular metal floor raceway system over the 77 year span of use of this system in over 100,000 buildings.

This record of safe performance is unmatched by any other building component in the industry.

A code change as devastating as Table 310.15(B)(2)(a) should be based upon a demonstrated safety problem. None has ever existed.

B. In 1956, a comprehensive test program was sponsored by AIEE and performed by four renowned industry experts at Underwriters Laboratories. The resulting report was entitled:

"The heating and mechanical effects of installing insulated conductors in steel raceways".

This report for many years served as the guideline for Ampacity adjustments for small and large raceways. Cellular metal floor raceways were tested along with five (5) other raceway systems.

Page 12 of that report (Attachment #1) shows the conduit conductor fill and corresponding Ampacity reductions which are part of Table 310.15(B)(2)(a) and apply specifically to round steel conduit and not to Cellular Metal Floor Raceway components.

Figure 14 of that report (Attachment #2) shows that no Ampacity reduction was required for cellular metal floor fed by a small header duct with 40 percent conductor fill for at least the first 28 conductors, using 75°C insulation. Today's trench headers can be 10 times as large as header duct and 90°C insulation is commonly used. These two factors would have significantly increased the number of conductors carrying current before Ampacity reductions would apply. This offers further proof that Table 310.15(B)(2)(a) does not apply to Article 374 raceways.

C. As required by the NEC code writers, HH Robertson tested each level of Ampacity reduction in Table 310.15(B)(2)(a) in a Cellular Metal Floor Raceway encased in concrete. These tests (Attachment #3) proved that the "Table" required Ampacity reductions were exceeded at every level of wire fill. This data was later rejected since the tests, run at a Nationally Recognized Testing Laboratory (NRTL), were performed for 3 hrs. (defined as Continuous Load by NEC definitions) while the Code writers "preferred" 24 hour testing.

D. Raceways such as Metal Wireways (Article 376) and Surface Nonmetallic Raceways (Article 388) are permitted 30 current carrying conductors with no Ampacity adjustment yet these raceways can be only 10 percent of the size of a Trench Header commonly used in a Cellular Metal Floor Raceway.

This explains why these raceways fail conductor heating tests run at NRTLs (Attachment #4). The 30 conductor exemption allowed for 6 raceway systems that are smaller in area than a trench header were apparently exempted from Table 310.15(B)(2)(a) without a heating test requirement. NFPA could not supply test data for any of these raceways.

H. H. Robertson has tried in good faith to comply with the code writer's need for test proof of our TIAs but none of the many passing tests have been acceptable. There is undoubtedly an Ampacity reduction table applicable to Article 374 but none submitted to the code writers was acceptable. Therefore, H.H. Robertson is resigned to this Proposal for removal of the Conduit Ampacity table and submits the aforementioned proof that it does not apply to Article 374, and never did. Safety problems with overheating do exist...but with other smaller raceways as shown in Attachment #4.

Panel Meeting Action: Reject

Panel Statement: The submitter has proposed that the ampacity adjustment factors in Table 310.15(B)(2)(a) shall not apply to cellular metal floor raceways. CMP-8 has not been provided with test data using a variety of worst-case scenarios sufficient to support this proposal. CMP-8 would expect to see test data without diversity for representative wire sizes permitted in section 374.4, and conductor types within cellular metal floor raceway installations constructed in accordance with Section 374.5, which allows a maximum number of conductors up to 40 percent of the interior cross-sectional area of the cell or header.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-184 Log #2875 NEC-P08 **Final Action: Reject**
(374.17)

Submitter: John J. Michlovic, H.H. Robertson Floor Systems
Recommendation: Revise text to read as follows:
374.17 Ampacity of Conductors. The Ampacity adjustment factors in 310.15(B)(2)(a) shall apply to conductors installed in cellular metal floor raceways only where the number of conductors in cells or header compartments exceeds 30. The maximum Ampacity reduction shall be 40 percent when conductors fills are 15 percent, or less, of the cross sectional area.
Substantiation: The Ampacity adjustment factors in Table 310.15(B)(2)(a) were derived for conduit and other circular raceways that encapsulate current generated heat. The history of this table is well documented throughout the NEC ROP/ROC comment history and is particularly clear in the 1956 AIEE conductor heating test report. A copy of page 12 (Attachment #1) of that report clearly illustrates the current reduction for 3 to 9 “wire” in conduit in free air.
The application of this table to square and flat bottomed raceways was a quantum leap not justified by test but, rather by a desire for a “one size fits all” solution to current adjustment. This was accomplished by one sentence at the beginning of Article 300 - Wiring Methods which states:
“This article covers wiring methods for all wiring installation unless modified by other articles.” This statement alone allowed Panel-8 to place the conduit Ampacity adjustment table in Article 374.
For 77 years of use in over 100,000 buildings, there have been no reports of conductor overheating, fires, or electrocutions in any cellular metal floor raceway system with no Ampacity adjustment table in place.
In order to reverse the severe impact of the Conduit Table, H.H. Robertson has been required to perform numerous conductor heating tests, all of which justified less restrictive Ampacity reductions than required by Table 310.10(B)(2)(a).
Several other smaller raceway systems are permitted 30 full Ampacity conductors before Ampacity reduction are required. Article 366, Article 376, Article 384, and Article 386 are examples of these exceptions.
The above stated proposal requests that 30 conductors be permitted in cells or trench header compartments since all cells and compartments are larger than the 4 sq in. minimum size required in the four listed Articles. Also, a conductor heating test run at a Nationally Recognized Test Laboratory (NRTL) is supplied for the smallest cell (5.5 in.^{2}) typically used in Article 374 assemblies. This test cell (see Attachment #2) carried 30 conductors at full current for 3 hours (see definition of Continuos Load in Chapter 1 of NEC) without exceeding the allowable temperature for THHN insulation (90°C).
The last sentence of the Proposal requests a 5 percent increase in maximum Ampacity reduction (40 percent vs. 35 percent) and is justified by a decrease in conductor fill from the 40 percent level stated in 374.5 to 15 percent. A test report (Attachment #3) is provided which verifies that a 14 percent wire fill will pass the 40 percent maximum Ampacity reduction criteria.
In summary, the request for 30 non de-rated conductors in Article 374 is conservative compared to other currently listed, but smaller, raceways. The 40 percent maximum Ampacity reduction is also conservative when coupled with the 15 percent maximum conductor fill requirement. NFPA’s desire to include an Ampacity Reduction Table in Article 374 is, therefore, accomplished by the Proposal.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter has proposed that the ampacity adjustment factors in Table 310.15(B)(2)(a) only apply in certain conditions to cellular metal floor raceways. CMP-8 concludes that the test data provided does not correlate with the proposal. As an example, the submitter’s substantiation indicates that a test report (attachment #3) verifies that a 14 percent wire fill will pass a 40 percent maximum ampacity reduction criteria. The test data in attachment #3 shows a wire fill of approximately 5 percent (not 15 percent).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-185 Log #3472 NEC-P08 **Final Action: Reject**
(374.17)

Submitter: David E. Watters, H. F. Lenz Company
Recommendation: ~~**Ampacity of Conductors: The ampacity adjustment factors in 310.15(B)(2) shall apply to conductors installed in cellular metal floor raceways.**~~
Ampacity of Conductors: The ampacity adjustment factors listed in Table 374.17(A) shall apply to cables installed in cellular metal floor raceway headers under the following conditions:
(A) The header has a cross sectional area of at least 30 sq in. with removable metal covers.
(B) All conductors must have a 90°C insulation rating and be evenly distributed and unbundled.
(C) The maximum conductor stacking shall not exceed three layers, and the sum of the cross-sectional area of all contained conductors shall not exceed 15 percent of the interior cross-sectional area of the header.
(D) All branch circuits shall be #10 conductors protected by 30A breakers, or #12 conductors protected by 20A breakers.
(E) All current carrying conductors must originate from the same three phase panel board with 42 or less branch circuits, and with main bussing protected for 225 A maximum.
Cellular Floor Applications that do not meet this criteria, or exceed 85 active conductors, shall comply with Table 310.15(B)(2).

Table 374.17(A) Adjustment Factors for More Than Three Current-Carrying Conductors in a Header

Number of Current Carrying Conductors	Percent of Values in Tables 310.16 through 310.19 as Adjusted for Ambient Temperature if Necessary
4 - 6	80
7 - 24	70
25 - 42	60
43 - 85	50

Substantiation: At least two manufacturers of cellular metal floor systems have indicated that the present requirement of 374.17 has had an adverse affect on their business. The 35% reduction multiplier required by Table 310.15(B)(2) for 41 or more conductors has forced the end user to oversize active conductors installed in trench headers. With the present cost of copper, the requirement to oversize conductors in cellular metal floor raceway systems has made the application of this product cost prohibitive ever since paragraph 374.17 appeared in the 2005 National Electrical Code (NEC). Prior to the 2005 Code, Cellular Metal Floor Trench Headers were installed since the 1930’s with no conductor derating, and no known, verifiable, cable heating problems were reported to the NFPA, during the next 76 years.
The proposed Table 374.17(A) appears in Annex B, of the NEC as Table B.310.11 where diversity restrictions are required if that table is to be used. The conditions listed above imply diversity. For example, a single 225A - 3p - panel board can deliver no more than 16A per conductor on average to 84 active conductors. This condition meets the 50% adjustment requirement listed above for #10 and #12 conductors. The proposed 15% fill limitation, and the three layer stacking limitation will provide an additional reduction in heating. The 30 sq in. cross sectional area requirement, which represents a 20 in. × 1-1/2 in. standard panel board header duct, will also reduce heating by its relatively large cross sectional area. For further substantiation, please refer to the following Table which was developed by UL, when they tested cellular floor systems, and published the results in a 1956 AIEE Report:

CODE REDUCTION FACTORS		
Table XIX		**1956 AIEE Report**
Cellular Metal Floor Raceway System (In Concrete) – 40% raceway fill capacity		
No. of Current-Carrying Conductors (Note 1)	**60°C Conductor Current Reduction Factor**	**75°C Conductors Current Reduction Factor**
6 – 20	72.8%	74.9%
21 – 26	63.2%	62.9%
27 – 54	51.7%	65%
55 – 68	43.7%	53.3%
69 – 122	42.6%	48%
123 – 136	39.3%	47.3%
Notes: 1. Two thirds of the conductors were loaded during the test.		

Since this report was published, the AIEE has changed its name to the Institute of Electrical and Electronic Engineers (IEEE). Cable insulation is readily available at 90°C now, compared to 60°C and 75°C which was commonly used in 1956. One concept has not changed in that two thirds of the conductors are usually active and one third are usually inactive grounding conductors. Considering the fact that the 1956 test utilized a 40% fill instead of a 15% raceway fill, and it used lower temperature wiring than the 90°C proposed, the derate factors are surprisingly similar to the derate factors listed in proposed Table 317.17(A). It is also believed that the present Table B.310.11 originated from various tables published in the 1956 AIEE Report.
In 2006, one of the major manufacturers of Cellular Metal Floor Systems, conducted extensive testing to verify the data in Tables B.310.11, Table 310.15(B)(2), AIEE Table XIX, and proposed Table 374.17(A). Testing was performed at the ETL SEMKO Laboratory and at the OnSpex Laboratory. Both laboratories are Nationally Recognized Testing Laboratories (NRTL) facilities. Testing was done under a variety of conditions above and beyond the requirements of these four tables. The results of these tests are too numerous to be attached to this document, however, they were submitted to NEC Panel No 8 during the calendar year 2006-2007 time frame, and they can be made available if requested and approved. The testing generally proved that all four of these tables are quite conservative and usable for Trench headers with a cross sectional area of at least 25 sq in. Table 310.15(B)(2) is the most conservative based on the fact that 41 conductors were tested with a 60% derating multiplier, which showed no sign of overheating, where Table 310.15(B)(2) requires a 35% derating factor. This proves that Table 310.15(B)(2) is too conservative for Trench Header cable installations, and it has had an adverse affect on suppliers of that product by requiring the conductors to

be oversized in order to meet code. For these reasons, we recommend that the above listed code change proposals be approved.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation was provided for permissions or restrictions included within the proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-186 Log #2608 NEC-P08 **Final Action: Reject**
(374.17 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows:
Exception: Where more than one outlet on the same circuit is individually supplied by one set of conductors it shall be permitted to count only the current-carrying conductors of one such set of conductors for the purpose of ampacity adjustment.
Substantiation: The present derating factors discourage installation of individual sets of conductors on the same circuit which reduces voltage drop, increases efficiency and does not increase heating effect. The proposal would encourage compliance with 374.7.
Panel Meeting Action: Reject
Panel Statement: See committee statement on Proposal 8-179.
Number Eligible to Vote: 12

ARTICLE 376 — METAL WIREWAYS

8-186a Log #CP805 NEC-P08 **Final Action: Accept**
(376.10)

Submitter: Code-Making Panel 8,
Recommendation: Revise 376.10 to read as follows:
376.10 Uses Permitted. The use of metal wireways shall be permitted as follows:
(1) For exposed work
(2) In any hazardous (classified) locations as permitted by other Articles of this Code.
(3) Wet locations, wireways shall be listed for the purpose.
(4) In concealed spaces as an extension to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.
Substantiation: The current text for 376.10 Uses Permitted was revised to address several or incorporate a series of proposals to address the uses permitted for Metal Wireways.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-187 Log #9 NEC-P08 **Final Action: Accept in Principle**
(376.10)

NOTE: This proposal appeared as Comment 8-72 on Proposal 8-157a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-157a was:
Insert a new 376.100 as follows:
376.100 Construction.
(A) Electrical and Mechanical Continuity. Wireways shall be constructed and installed so that adequate electrical and mechanical continuity of the complete system is secured.
(B) Substantial Construction. Wireways shall be of substantial construction and shall provide a complete enclosure for the contained conductors. All surfaces, both interior and exterior, shall be suitably protected from corrosion. Corner joints shall be made tight, and where the assembly is held together by rivets, bolts, or screws, such fasteners shall be spaced not more than 300 mm (12 in.) apart.
(C) Smooth Rounded Edges. Suitable bushings, shields, or fittings having smooth, rounded edges shall be provided where conductors pass between wireways, through partitions, around bends, between wireways and cabinets or junction boxes, and at other locations where necessary to prevent abrasion of the insulation of the conductors.
(D) Covers. Covers shall be securely fastened to the wireway.
Submitter: Nicholas P. Ludlam, FM Approvals
Recommendation: Revise as follows:
376.10 Uses Permitted. The use of metal wireways shall be permitted in the following:
(1) For exposed work.
(2) In concealed spaces as permitted in 376.10(4).
(3) In hazardous (classified) locations as permitted by 501.10(B) for Class I, Division 2 locations; 502.10(B) for Class II, Division 2 locations ~~and~~ 504.20, 505.15(A) and 506.15(A) for intrinsically safe wiring; 505.15(C) for Class I Zone 2 locations; and 506.15(C) for Zone 22. Where installed in wet locations, wireways shall be listed for the purpose.
(4) As extensions to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.
Substantiation: Articles 505 and 506 include additional hazardous classified locations which are not addressed by this wiring technique.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel Proposal 8-186a.
Hazardous locations was revised to utilize harmonized language used in other raceway articles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-188 Log #2668 NEC-P08 **Final Action: Accept in Principle in Part**
(376.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
The use of metal wireways shall only be permitted as follows: ~~in the following~~
Substantiation: Edit. Present wording is not a requirement; 90.5(B) states "permitted" identifies actions allowed but not required. Present wording does not limit use other than specified except as covered in 376.12. 322.10 and others use the word "only" in prescribing wiring methods.
Panel Meeting Action: Accept in Principle in Part
The panel accepts in principle "as follows:" and rejects "only". Uses permitted is not an all inclusive list and the word "only" would make the uses permitted overly restrictive.
Panel Statement: See Panel Proposal 8-186a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-189 Log #3176 NEC-P08 **Final Action: Reject**
(376.10(3))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 376.10, delete ~~(3) In hazardous (classified) locations as permitted by 501.10(B) for Class I, Division 2 locations; 502.10(B) for Class II, Division 2 locations; and 504.20 for intrinsically safe wiring.~~
Relocate "Where installed in wet locations, wireways shall be listed for the purpose." after (1) For exposed work.
Renumber 376.10(4) as 376.10(3).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-190 Log #1794 NEC-P08 **Final Action: Reject**
(376.10(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: See my proposal for 376.12 which, if accepted, incorporates this provision.
Panel Meeting Action: Reject
Panel Statement: See panel proposal 8-186a. The requirement for concealed locations was revised to better describe the uses permitted. CMP-8 disagrees with the submitter that this requirement belongs in uses not permitted per the submitter's companion proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-191 Log #1795 NEC-P08 **Final Action: Reject**
(376.12(3) (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: (3) Where concealed, except unbroken portions not longer than necessary to pass transversely through walls, floors, or other partitions shall be permitted.
Substantiation: Provisions for not permitted use should include concealed installation. Present 376.10(4) does not specifically prohibit concealed installation, merely permission to pass through a wall.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-190 and panel proposal 8-186a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-192 Log #480 NEC-P08 **Final Action: Reject**
(376.22)

Submitter: Carl V. Cardi, III, CVC 1 Limited LLC
Recommendation: Add new text to read as follows:
Section 376.22 Number of Conductors. The sum of the cross-sectional areas of all contained conductors at any cross-section of a wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway. The derating factors in Section 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.
<u>Proposed Exception: Where the sum of the cross-sectional areas of all contained conductors at any cross-section of a metal wireway does not exceed 20 percent of the interior cross-sectional area of the wireway and when the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of Section 310.15(B)(4), exceeds 30, the application of the adjustment factors set forth in Table 310.15(B)(2)(a) shall not be required for metal wireways where all of the following conditions are met:</u>
<u>(1) Labeled metallic devices are inserted in the metal wireway that provide elevation, separation, and spacing among the current-carrying conductors by dividing the metal wireway into channels. Not more than nine current-carrying conductors shall be placed within a channel.</u>
<u>(2) The metallic devices used for elevation, separation, and spacing shall enable air to flow within and between the channels in order to provide cooling of the current-carrying conductors throughout the length of the metal wireway in a manner sufficient to allow the transient and steady-state temperatures of the conductors to remain below the rated temperatures for their insulation as specified in the applicable column of Table 310.16.</u>
<u>(3) The metallic devices used for elevation, separation, and spacing shall provide sufficient support and separation of the current-carrying conductors so that conductors in one channel shall not come into contact with conductors in another channel, except that such conductors may come into contact with conductors in another channel upon entering or exiting the metal wireway and conductors within one channel may come into contact with other conductors in the same channel.</u>
<u>(4) The metallic devices used for elevation, separation, and spacing shall be secured so as to prevent movement of the devices and so as to maintain contact with the walls and floor of the metal wireway in order to conduct heat to the walls and floor of the metal wireway and shall be connected to the metal wireway in a manner consistent with the limitations of their labeling.</u>
<u>(5) Where contact between the current-carrying conductors and the edges of the metallic devices used for elevation, separation, and spacing poses the risk of abrasion to the insulation of the conductors, the edges of the devices shall be protected so as to avoid that risk.</u>
Substantiation: The ampacity derating factors of Section 310.15(B)(2)(a) severely limit the ampacities of conductors placed in sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways. This proposal establishes exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17 that allow for the placement of metallic devices to elevate, separate, and space the current-carrying conductors in those raceways so as to increase the number permitted by taking full advantage of the cooling capacity in the entire cross-sectional area of the raceway and the heat conducting properties of the metallic devices. The exception tendered for each of those sections contains five stringent conditions under which the devices may be used for such purpose. The report issued by INTERTEK, ETL SEMKO dated June 4, 2007, that accompanies this proposal provides test results that support the proposal.

I. Introduction:

A. Carl Cardi, III:

Mr. Cardi is presently a city electrical inspector for the city of Columbus, Ohio, a former electrical contractor, and an inventor. He is also President of CVC 1 Limited, LLC, the manufacturer of Cool Wire products.

B. Arnold E. Shaheen, Jr., Esq.:

Mr. Shaheen is counsel for CVC 1 Limited, LLC, and the author of this Proposal. Mr. Shaheen is licensed to practice law in the state of Ohio and received his Juris Doctorate Degree from Capital University in Columbus, Ohio, and a Bachelor of Science Degree in Electrical Engineering from The Ohio State University. Before, during, and after his attending college and law school, Mr. Shaheen also worked from childhood until 1985 in his family's electrical construction business, which engaged in commercial and industrial electrical construction. Between 1971 and 1985, Mr. Shaheen was licensed as an electrical contractor in Columbus, Ohio.

C. The Proposal:

Mr. Cardi has submitted this Proposal in an effort to provide suggested revisions to the National Electric Code ("NEC") that respect the intent and purpose of Section 310.15(B)(2)(a), but which allow for more flexibility in the design of electrical wiring systems that incorporate the use of sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways by allowing for new technologies that provide elevation, separation, and spacing of current-carrying conductors within those wiring systems. In so doing, it is submitted that these new technologies will provide better ambient cooling within those wiring systems by taking full advantage of all of the airspace within their cross-sectional areas as well as the heat conductive properties of the metallic devices that incorporate these new technologies and will allow for the placement of more current-carrying conductors in a raceway than would otherwise be permitted by the application of Section 310.15(B)(2)(a).

II. Heat Generated By Current-Carrying Conductors:

Well known principles of physics that govern the transfer of heat energy establish that heat energy cannot be dissipated without a thermal gradient. The principles of heat transfer are analogous to the concepts of current, resistance, and voltage embodied in Ohm's Law. Heat, like current, cannot flow unless there is a thermal gradient, as in the case of a difference in electrical potential, or voltage, in an electrical circuit. If there is no thermal gradient, or if the heat source is surrounded by insulation, the heat source will not cool or may even grow warmer if the heat source is, itself, a generator of heat energy. When current flows through a wire, the wire becomes a heat source that generates heat energy because the flow of electricity encounters resistance, the degree of which is a function of both the size of the wire and the conductivity of the material from which the wire is manufactured.
From a fire prevention perspective, the danger, of course, is that a wire will become so hot that its insulation degrades resulting in the potential for a short circuit between a bare spot on a current-carrying conductor and a bare spot on another current-carrying conductor or between a bare spot on a current-carrying conductor and the metallic enclosure in which the conductor is placed. Even where adequate overcurrent protection exists, the potential for a fire or for further degradation of the insulation of surrounding conductors exists if the temperature of current-carrying conductors is allowed to rise above the rated temperature limitation of their insulation.
Insulated, current-carrying conductors that are bundled together or which lie in contact with one another, particularly those that are totally surrounded by and in contact with other current-carrying conductors, will rise in temperature because there exists no thermal gradient through which to dissipate the heat. Section 310.10, FPN No.1, subparagraph 4, recognizes this physical phenomenon.

III. Section 310.15(B)(2)(a):

Section 310.15(B)(2)(a) requires that the ampacity derating factors of Table 310.15(B)(2)(a) shall apply to any raceway that contains more than three current-carrying conductors. On its face, Section 310.15(B)(2)(a) was meant to apply to all systems defined as raceways in Article 100. The traditional practice in the electrical industry was to readily apply this section to all forms of conduit. However, confusion arose in the enforcement and application of articles of the NEC that applied to other types of raceways because those articles contained only fill limitations and not ampacity derating requirements. The result, in many cases, was that the fill requirements of a particular article were allowed to trump the requirements of Section 310.15(B)(2)(a) and, thus, create the risk of overheated raceways because of the number of current-carrying conductors placed within them, resulting in the commensurate risk of short circuits and fire.

To resolve the confusion and to better clarify the NFPA's intent regarding the application and enforcement of Section 310.15(B)(2)(a), the 2005 edition of the NEC added ampacity derating requirements within articles pertaining to specific types of raceways. Section 374.17 pertaining to cellular metal floor raceways and Section 390.17 pertaining to underfloor raceways are but two examples.

However, underlying the application and enforcement of Section 310.15(B)(2)(a) is the assumption that the conductors in a raceway will all lie at the bottom of the raceway and in close proximity to or in contact with one another. This assumption fails to take into account the cooling effect that the surrounding ambient **within the raceway** will have when the current-carrying conductors are elevated, separated, and spaced within the raceway nor does it account for the benefit of the heat conductive properties of the metallic devices described in this Proposal.

Many sections of the NEC recognize that spacing promotes the cooling of current-carrying conductors. The requirement to provide spacing between conduits, tubing, or raceways set forth in Section 310.15(B)(2)(b) is one example. The spacing dimensions for electrical ducts depicted in Figure 310.60 of Article 310 and those depicted for single insulated conductors in nonmagnetic underground electrical ducts in FPN Figure B.310.5 of Appendix B are other examples.

However, none of the articles, in their current form, containing sections identified in this Proposal address either the potential benefit of ambient cooling that could be realized by the elevation, separation, and spacing of current-carrying conductors within a raceway or the benefit of the heat conductive properties of the metallic devices described in this Proposal. It is those benefits that this Proposal addresses, while, at the same time, honoring the intent of Section 310.15(B)(2)(a) to prevent the degradation of the insulation of current-carrying conductors due to overheating.

IV. Proposed Changes to Sections 310.15(B)(2)(a), 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17:

This Proposal sets forth exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, each containing five subparagraphs. Those five subparagraphs are discussed in sequence, below:

A. Subparagraph (1):

Metallic devices that provide elevation, separation, and spacing among current-carrying conductors would be allowed in lieu of the application of the derating factors of Table 310.15(B)(2)(a). Those devices would separate raceways into channels, however, no channel would be permitted to hold more than nine conductors, which is the upper limit for the number of conductors to which the 70 percent derating factor of Table 310.15(B)(2)(a) presently applies. This numerical limit recognizes that, even though dividing raceways into channels enables the cooling of current-carrying conductors, there are physical limits to this effect. The devices must be labeled in compliance with the definition of that term as set forth in Article 100 and the requirements of Section 110.3(A)(1) FPN.

B. Subparagraph (2):

The metallic devices that provide elevation, separation, and spacing must also permit convection within a channel and between and among channels such that the transient and steady-state temperatures of the current-carrying conductors within any channel remain below the rated temperature for their insulation as indicated in the applicable column of Table 310.16.

C. Subparagraph (3):

The metallic devices must prevent contact between current-carrying conductors in different channels within the raceway, except at points of egress and ingress. However, because the number of conductors is limited to nine within any given channel, conductors within that channel may be in contact without additional separation within that channel.

D. Subparagraph (4):

The metallic devices must be secured so as to prevent movement of the devices and to maintain contact with the walls and floor of the raceway in order to enable the device to transmit heat away from the current-carrying conductors and to the walls and floor of the raceway so that the raceway may, in turn, transmit the heat either into the air, if the raceway is an auxiliary gutter or wireway, or to concrete, if the raceway is a cellular metal raceway or an underfloor raceway.

E. Subparagraph (5):

In order to prevent abrasion of current-carrying conductors within a channel, this subparagraph provides that all edges of the metallic devices that provide elevation, separation, and spacing of the current-carrying conductors must be protected where those edges would come into contact with the conductors.

F. Section 310.15(B)(2)(a):

The words, "Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, where there is no load diversity...." have been added. This additional language makes explicit that the exceptions to the application of Section 310.15(B)(2)(a) established by this Proposal apply only to the enumerated sections and only when load diversity is not available.

G. Section 366.22(A):

The preamble to the exception for this section limits its applicability in the case of sheet metal auxiliary gutters to situations where the 20 percent fill limitation prescribed for this type of raceway is not exceeded, but where there are more than 30 current-carrying conductors placed within the raceway.

H. Section 366.23(A):

The preamble to the exception for this section mimics the preamble contained in Section 366.22(A), which also applies to sheet metal auxiliary gutters.

I. Section 374.17:

Since the language of this section contains no limitations upon the applicability of Section 310.15(B)(2)(a) to cellular metal raceways, no preamble was necessary. The exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 374.17 and to cellular metal raceways.

J. Section 376.22:

As in the case of sheet metal auxiliary gutters, the preamble to the exception for this section limits its applicability to those instances in which the 20 percent fill limitation is not exceeded, but where there are also more than 30 current-carrying conductors placed within the metal wireway.

K. Section 384.22:

In the case of strut-type channel raceways, the preamble to the exception limits its applicability to those instances in which the percentage fill requirements of Table 384.22 are not exceeded and where the outside diameter dimensions of types and sizes of wire as set forth in the tables in Chapter 9 are met, but where the cross-sectional area of the raceway exceeds 2500mm² (4in.²) and where the number of current-carrying conductors in the raceway is greater than 30, but where the cross-sectional area of all current-carrying conductors does not exceed 20 percent of the cross-sectional area of the raceway.

L. Section 386.22:

The preamble to the exception for this section mimics that of Section 384.22 and applies to surface metal raceways.

M. Section 390.17:

As in the case of cellular metal raceways, the exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 390.17 and to underfloor raceways.

V. Test Evidence Submitted In Support of Proposal:

A. Testing Protocol

Between May 29, 2007, through June 1, 2007, electrical testing involving metallic devices described in this Proposal was performed by INTERTEK, ETL SEMKO of Cortland, New York. Two different types of raceways and two sizes of conductors, 12 AWG THHN and 10 AWG THHN were tested. Testing was performed for the purpose of: (1) measuring the heating of the conductors under the testing protocol; and, (2) to determine how many conductors could be placed within the raceways without the temperature of the conductors exceeding the 90° C limitation of their insulation. Tests for physical abrasion were not conducted.

In the first instance, a 12 in. x 3 in. x 5 ft underfloor raceway was tested under various scenarios in order to determine the conductor temperatures. Similar testing was performed for an 8 in. x 8 in. x 5 ft metallic wireway. The ends of both raceways were stuffed with styrofoam in order to trap heat so as to create a worst-case scenario. Where it was appropriate to do so, both raceways were tested in a double-blind manner, that is, they were tested under the same conditions with and without the metallic devices described in this Proposal.

Constant loading of the conductors in each instance occurred throughout the duration of each test. No unloaded conductors, or fillers, were placed within the raceways. The time period used as a benchmark in order to attain steady-state temperature conditions was three hours. Thermocouples were placed on one conductor in each channel. One thermocouple was used to measure the room ambient.

The graphs indicating the test results show the temperatures measured by the thermocouples along the Y-axis and the time periods for those temperatures along the X-axis. The temperature recording for each conductor is indicated on each graph by a different color of line. The letters, "UF," noted in the keys for the graphs for the tests denote conductors in the underfloor raceway. The letters, "WW," denote conductors in the metal wireway. The maximum temperatures that were recorded for each conductor to which a thermocouple was attached are displayed in a table at the bottom of each graph for either one or both raceways, depending upon how each test was conducted.

B. Test Nos. 1 and 10:

In Test No. 1, the underfloor raceway was wired using 81 #12 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used to elevate, separate, and space the conductors. The test load on each of the conductors was 16 amperes. Upon removal of the underfloor raceway cover it was noted that one of the supports had moved. Thus, this test was redone as Test No. 10 only as to the underfloor raceway.

In Test No. 1, the metallic wireway was wired with 90 #12 THHN conductors in 10 groupings of 9 conductors.

In Test No. 1, the temperatures for all conductors for both raceways, after more than 3 hours, remained below 90°C and in a steady-state condition. The ambient temperature remained at approximately 25°C throughout the test.

Test No.1, as to the underfloor raceway, was repeated in Test No. 10. Again, the test results were the same. After more than three hours and in steady-state condition, the temperatures of all of the conductors remained below 90°. The ambient temperature approximated 22°C throughout the test.

During neither Test No. 1 nor Test No. 10 did the temperature of any of the conductors exceed 90°C at any point in time.

C. Test No. 2:

The same test protocol were used in this test as in Test No. 1 for both raceways. However, the metallic devices described in this Proposal were not used. After 91 minutes, in the case of both raceways, the temperatures of the conductors remain in a transient state and on an upward incline towards their 90°C limitation of their insulation. At that point in time, the highest temperature reached by any conductor in the underfloor raceway was 89.24°C and in the metal wireway was 81.97°C.

D. Test No. 3:

In Test No. 3, the underfloor raceway was wired with 81 #12 THHN conductors using a vertical divider system that did not permit air to flow between the divided chambers within the raceway. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes. After only 64 minutes, the temperatures of all of the conductors in the underfloor raceway remained in a transient state and the temperature of one conductor had exceeded the 90°C limitation of its insulation.

E. Test No. 4:

In Test No. 4, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

After more than 3 hours, the highest temperature reached in the underfloor raceway was 60.45°C and in the case of the metal wireway the highest temperature reached was 52.40°C.

F. Test No. 5.

In Test No. 5, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. For both the underfloor raceway and the metallic wireway, the metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

This test demonstrated the upper limit of the cooling effect of the metallic devices described in this Proposal in the case of the underfloor raceway. The transient state temperatures of the underfloor conductors began to approximate 90°C after 33 minutes. At that point the cover of the underfloor raceway was removed.

However, in the case of the metal wireway, the highest temperature of the conductors was 82.03°C in steady-state condition after 190 minutes.

The ambient approximated 22°C throughout the test.

G. Test No. 6:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groups of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

The highest temperature reached by a conductor after 203 minutes was 67.74°C in a steady-state condition. The ambient temperature for the test ranged between 22° and 28°C.

H. Test No. 7:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groupings of 9 conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

After 157 minutes, the temperatures of the conductors remained in a transient state condition. By that time, one of the conductors had reached 89.06°C. The ambient temperature ranged between 22°C and 28°C.

I. Test No. 8:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

After 126 minutes, the temperatures of the conductors in the underfloor raceway remained in a transient condition and were gradually rising. At that point in time the highest temperature for the underfloor conductors was 75.17°C.

After the same time period, the conductors in the wireway, for the most part, remain in a transient condition with the highest temperature recorded at 71.09°C.

The ambient temperature ranged between 22°C and 25°C.

J. Test No. 9:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The graph of the temperatures of the conductors in the two types of raceways demonstrates that the temperatures in both raceways were rising rapidly. Within 14 minutes after the commencement of the test, the highest temperature of a conductor in the underfloor raceway is 97.95°C and for the metal wireway is 93.43°C.

The ambient remained at approximately 22°C throughout the test.

K. Test Conclusions:

The use of the metallic devices described in this Proposal demonstrate a marked decrease in the transient and the steady-state temperatures of the conductors within the limitations of the cooling effects of the devices. This can be readily shown by comparing the test results in Test Nos. 6 and 7, the test results in Test Nos. 4 and 8, and by comparing the test results in Test Nos. 1 and 10 with Test No. 2. Within the limitations of the devices, as demonstrated in Test No. 5 as it relates to underfloor raceways, the 90°C limitations of the conductors' insulation is not exceeded during the three hour protocol for the tests where the devices were used.

VI. Conclusion:

This Proposal provides for exceptions to the applicability of Section 310.15(B)(2)(a) to sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, and underfloor raceways that impose five conditions so as to preserve the intent of that section to prevent thermal degradation of insulation, but yet allow for more current-carrying conductors to be placed within those raceways. Due to the stringent nature of those conditions, the reasons cited in the narrative, above, and the test results supplied with this Proposal, the Proposer requests that the Proposal be approved.

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text as follows:
Adjustment Factors. The adjustment factors in 310.15(B)(4) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30 <u>at any cross sectional area of the wireway.</u>
Substantiation: This change would add clarity to the text. As written, it is left to the code user to determine how exactly to count the conductors in the wireway for the purpose of derating. While the proposed wording is explicitly spelled out in 376.22(A), it should also be applied to 376.22(B).
Panel Meeting Action: Reject
Panel Statement: After reviewing the 2005 NEC, which was prior to the separation of the section into two paragraphs, the intent was clear, and the current code correctly reflects that.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-194 Log #3073 NEC-P08 **Final Action: Accept**
(376.22(B))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered by the panel relative to the actions taken on Proposals 6-59, 8-155, 8-194 and 8-204.
The Technical Correlating Committee directs the Chairs of Code-Making Panels 6 and 8 to form a Task Group to correlate Proposals 6-59, 8-155, 8-194 and 8-204, and submit comments, if deemed appropriate.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(B) Adjustment Factors. The adjustment factors in 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30. ~~Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.~~
Substantiation: This is a companion proposal to move this code language to 310.15(B)(2)(a), where it is more appropriate. Similar proposals are made to sections 366.22(A) and 378.22, please correlate the proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 12

8-195 Log #3074 NEC-P08 **Final Action: Reject**
(376.22(B))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(B) Adjustment Factors. The adjustment factors in 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(4), exceeds 30 <u>in any cross-sectional area</u>. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.
Substantiation: This proposal is intended to clarify that the ampacity adjustment provisions apply only to where there are over 30 current carrying conductors in a given cross section of the wireway. A very common installation practice is to convert from a cable wiring method to a raceway wiring method for exposed work. When this occurs, it is not uncommon to have literally hundreds of conductors in a wireway, but only for a few inches. It appears that this is in violation of this section.
Panel Meeting Action: Reject
Panel Statement: See committee statement on Proposal 8-193.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-196 Log #3473 NEC-P08 **Final Action: Reject**
(376.22(B))

Submitter: David E. Watters, H. F. Lenz Company
Recommendation: Revise text as follows:
Adjustment Factors: ~~The adjustment factors in 310.15(B)(2)(a) shall be applied only where the number of current carrying conductors, including neutral conductors classified as current carrying under the provisions of 310.15(B)(4), exceeds 30.~~ <u>The ampacity adjustment factors in 310.15(B)(2) shall apply to conductors installed in Metal Wireways.</u>
Substantiation: Testing was performed on 2.75 in. × 1.5 in. Metal Wireway at Nationally Recognized Testing Laboratories. The ETL SEMKO Laboratory and the OnSpex Laboratory were used to test 30 active conductors at rated capacity as permitted by 376.22(B), and as listed above. In both cases, 24 amps was applied to #10 conductors which is the continuous current limit for a 30 A breaker required by code. In both cases, at least one of the conductors, within the raceway, exceeded the 90°C temperature limitation of the insulation. Both tests failed according to the test reports I have provided. For these reasons, additional loading or raceway fill restrictions should be applied. In particular, the wording which allows 30 conductors to operate without de-rating should be removed. For these reasons, we recommend approval of the code changes listed above.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The tests were incorrect because they were done in a surface metal raceway instead of a metal wireway.

Ballot Results: Affirmative: 12

8-197 Log #4771 NEC-P08 **Final Action: Reject**
(376.22(B))

Submitter: William Benard, Gemini Electric Inc.
Recommendation: Revise text to read as follows:
376.22(B) Adjustment Factors. The adjustment factors in 310.15(B)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying of the wire under the provisions of 310.15(B)(4), exceeds 30 <u>at any cross-section of the wireway</u>. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.
Substantiation: The changes made to the 2008 NEC revised the paragraph in section 376.22 into two sub sections. The revision made changes to the section that identified the two prescriptive measures associated with the section language. The addition of two subsections took away the general concern of conductors in any cross section of the wireway. The “cross section” language now only exists in sub-section: “A) Cross-Sectional Areas of Wireways.” Where subsection, “(B) Adjustment Factors,” does not specifically identify “any cross section of the wireway,” by rule the number of conductors to be considered must be the total counted and not necessarily the amount found in any cross section. It is clear that the intent has always been to limit “any cross section” count of conductors to 30 or fewer but the language no longer supports this intent. The words: “at any cross-section of the wireway” must be added into subsection (B) so that the prescriptive measure applies to the intended concept.
Panel Meeting Action: Reject
Panel Statement: See committee statement on Proposal 8-193.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-198 Log #358 NEC-P08 **Final Action: Reject**
(376.23(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
“...dimensions corresponding to one wire <u>attached to a</u> ~~per~~ terminal in Table 312.6(A) shall apply.”
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-162.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-199 Log #2536 NEC-P08 **Final Action: Reject**
(376.56)

Submitter: Marcus R. Sampson, Lysistrata Electric
Recommendation: Revise text to read as follows:
376.56 Splices, Taps, and Power Distribution Blocks.
(A) Splices and Taps. Splices and taps shall be permitted within a wireway, provided they are accessible. The conductors, including splices and taps, shall not fill the wireway to more than 75 percent of its area at that point.
(B) Power Distribution Blocks.
(1) Installation. Power distribution blocks installed in metal wireways shall be listed.
(2) Size of Enclosure. In addition to the wiring space requirement in <u>376.56(A)</u>, the power distribution block shall be installed in a wireway with dimensions not smaller than specified in the installation instructions of the power distribution block.
(3) Wire Bending Space. Wire bending space at the terminals of power distribution blocks shall comply with <u>312.6(B)</u>.
(4) Live Parts. ~~Power distribution blocks shall not have uninsulated live parts exposed within a wireway, whether or not the wireway cover is installed.~~ <u>Uninsulated live parts shall not be exposed within a wireway.</u>
Substantiation: While the current language does seem to make the point, the multiple negatives are crude and make the language awkward. While the proposed language does not change the requirement, it is a simpler, cleaner way of expressing it.

The requirement should apply to splices, taps AND distribution blocks.

The statement "whether or not the cover is installed" is unnecessary because of the word "within" - if the cover was on, the uninsulated live parts would no longer be "within" the wireway.

Panel Meeting Action: Reject

Panel Statement: Section 376.56(B)(4) pertains to power distribution blocks only and should not be referred to splices and taps. It is the panel's intent that power distribution blocks be insulated whether the cover is on or off of the wireway. This is a safety issue.

Ballot Results: Affirmative: 12

8-200 Log #2605 NEC-P08 **Final Action: Reject**
(376.100(A))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Wireways shall be constructed and installed so that ~~adequate~~ effective electrical and mechanical continuity and mechanical strength of the complete system is ~~secured~~ provided.

Substantiation: Edit. "Adequate" is a term to be avoided per the Style Manual. Mechanical strength is a factor in judging equipment per 110.3.

Panel Meeting Action: Reject

Panel Statement: Proposed changes do not improve clarity or content of existing text.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 378 — NONMETALLIC WIREWAYS

8-201 Log #3177 NEC-P08 **Final Action: Reject**
(378.12(2))

Submitter: A. W. Ballard, Cooper Crouse-Hinds

Recommendation: In 378.12, delete ~~(2) In any hazardous (classified) location, except as permitted by other articles in this Code~~

Renumber 378.12(3), (4) and (5) as 378.12(2), (3), and (4).

Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.

Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-41.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-202 Log #2179 NEC-P08 **Final Action: Accept**
(378.22)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise text as follows:

378.22 Number of Conductors.

The sum of cross-sectional areas of all contained conductors at any cross section of the nonmetallic wireway shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic wireway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

The ~~derating~~ adjustment factors specified in 310.15(B)(2)(a) shall be applicable to the current-carrying conductors up to and including the 20 percent fill specified above.

Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a).

Panel Meeting Action: Accept
