2010 Annual Revision Cycle

National Electrical Code® Committee Report on Proposals

This Report contains the proposed amendments for the 2011 National Electrical Code® for public review and comment prior to October 23, 2009, and for consideration at the NFPA June 2010 Association Technical Meeting

NOTE: The proposals contained in this NEC Report on Proposals (ROP) and the comments addressed in a follow-up NEC Report on Comments (ROC) will be presented for action when proper Amending Motions have been submitted to the NFPA by the deadline of May 7, 2010. The June 2010 NFPA Conference and Expo will be held June 7-10, 2010 at the Mandalay Bay Convention Center, Las Vegas, NV. During the Conference and Expo, the Association Technical Meeting (Tech Session) will be held on June 9-10, 2010. For more information on the new rules and for up-to-date information on schedules and deadlines for processing NFPA Documents, check the NFPA website (www.nfpa.org) or contact NFPA Standards Administration.

Information on NFPA Codes and Standards Development

I. Applicable Regulations. The primary rules governing the processing of NFPA documents (codes, standards, recommended practices, and guides) are the NFPA *Regulations Governing Committee Projects (Regs)*. Other applicable rules include NFPA *Bylaws*, NFPA *Technical Meeting Convention Rules*, NFPA *Guide for the Conduct of Participants in the NFPA Standards Development Process*, and the NFPA *Regulations Governing Petitions to the Board of Directors from Decisions of the Standards Council*. Most of these rules and regulations are contained in the *NFPA Directory*. For copies of the *Directory*, contact Codes and Standards Administration at NFPA Headquarters; all these documents are also available on the NFPA website at "www.nfpa.org."

The following is general information on the NFPA process. All participants, however, should refer to the actual rules and regulations for a full understanding of this process and for the criteria that govern participation.

II. Technical Committee Report. The Technical Committee Report is defined as "the Report of the Technical Committee and Technical Correlating Committee (if any) on a document. A Technical Committee Report consists of the Report on Proposals (ROP), as modified by the Report on Comments (ROC), published by the Association."

III. Step 1: Report on Proposals (ROP). The ROP is defined as "a report to the Association on the actions taken by Technical Committees and/or Technical Correlating Committees, accompanied by a ballot statement and one or more proposals on text for a new document or to amend an existing document." Any objection to an action in the ROP must be raised through the filing of an appropriate Comment for consideration in the ROC or the objection will be considered resolved.

IV. Step 2: Report on Comments (ROC). The ROC is defined as "a report to the Association on the actions taken by Technical Committees and/or Technical Correlating Committees accompanied by a ballot statement and one or more comments resulting from public review of the Report on Proposals (ROP)." The ROP and the ROC together constitute the Technical Committee Report. Any outstanding objection following the ROC must be raised through an appropriate Amending Motion at the Association Technical Meeting or the objection will be considered resolved.

V. Step 3a: Action at Association Technical Meeting. Following the publication of the ROC, there is a period during which those wishing to make proper Amending Motions on the Technical Committee Reports must signal their intention by submitting a Notice of Intent to Make a Motion. Documents that receive notice of proper Amending Motions (Certified Amending Motions) will be presented for action at the annual June Association Technical Meeting. At the meeting, the NFPA membership can consider and act on these Certified Amending Motions as well as Follow-up Amending Motions, that is, motions that become necessary as a result of a previous successful Amending Motion. (See 4.6.2 through 4.6.9 of *Regs* for a summary of the available Amending Motions and who may make them.) Any outstanding objection following action at an Association Technical Meeting (and any further Technical Committee consideration following successful Amending Motions, see *Regs* at 4.7) must be raised through an appeal to the Standards Council or it will be considered to be resolved.

VI. Step 3b: Documents Forwarded Directly to the Council. Where no Notice of Intent to Make a Motion (NITMAM) is received and certified in accordance with the Technical Meeting Convention Rules, the document is forwarded directly to the Standards Council for action on issuance. Objections are deemed to be resolved for these documents.

VII. Step 4a: Council Appeals. Anyone can appeal to the Standards Council concerning procedural or substantive matters related to the development, content, or issuance of any document of the Association or on matters within the purview of the authority of the Council, as established by the *Bylaws* and as determined by the Board of Directors. Such appeals must be in written form and filed with the Secretary of the Standards Council (see 1.6 of *Regs*). Time constraints for filing an appeal must be in accordance with 1.6.2 of the *Regs*. Objections are deemed to be resolved if not pursued at this level.

VIII. Step 4b: Document Issuance. The Standards Council is the issuer of all documents (see Article 8 of *Bylaws*). The Council acts on the issuance of a document presented for action at an Association Technical Meeting within 75 days from the date of the recommendation from the Association Technical Meeting, unless this period is extended by the Council (see 4.8 of *Regs*). For documents forwarded directly to the Standards Council, the Council acts on the issuance of the document at its next scheduled meeting, or at such other meeting as the Council may determine (see 4.5.6 and 4.8 of *Regs*).

IX. Petitions to the Board of Directors. The Standards Council has been delegated the responsibility for the administration of the codes and standards development process and the issuance of documents. However, where extraordinary circumstances requiring the intervention of the Board of Directors exist, the Board of Directors may take any action necessary to fulfill its obligations to preserve the integrity of the codes and standards development process and to protect the interests of the Association. The rules for petitioning the Board of Directors can be found in the *Regulations Governing Petitions to the Board of Directors from Decisions of the Standards Council* and in 1.7 of the *Regs*.

X. For More Information. The program for the Association Technical Meeting (as well as the NFPA website as information becomes available) should be consulted for the date on which each report scheduled for consideration at the meeting will be presented. For copies of the ROP and ROC as well as more information on NFPA rules and for up-to-date information on schedules and deadlines for processing NFPA documents, check the NFPA website (www.nfpa.org) or contact NFPA Codes & Standards Administration at (617-984-7246).

National Electrical Code® Committee Report on Proposals

This *Report on Proposals* is published for public review and comment prior to consideration at the NFPA June 2010 Association Technical Meeting in Las Vegas, NV, June 7–10.

All members and others interested are urged to read this Report and submit their comments on the forms provided in the Report prior to the end of the comment period, which closes October 23, 2009.

Each comment received on or before the closing date of the comment period will be considered and acted upon by the National Electrical Code Committee. The results of the committee action will be published in the *National Electrical Code® Committee Report on Comments,* which will be available to all who request it. Announcement of its availability will be made in *NFPA News.* Commentors will receive notification of the availability of the Report.

Following the publication of the ROC, there is a period during which those wishing to make proper Amending Motions on the Technical Committee Reports must signal their intention by submitting a Notice of Intent to Make a Motion. Documents that receive notice of proper Amending Motions (Certified Amending Motions) will be presented for action at the annual June Association Technical Meeting. At the meeting, the NFPA membership can consider and act on these Certified Amending Motions as well as Follow-up Amending Motions, that is, motions that become necessary as a result of a previous successful Amending Motion. (See 4.6.2 through 4.6.9 of *Regs* for a summary of the available Amending Motions and who may make them.) Any outstanding objection following action at an Association Technical Meeting and any further Technical Committee consideration following successful Amending Motions, (see *Regs* at 4.7) must be raised through an appeal to the Standards Council or it will be considered to be resolved.

Providing at least one NITMAM has been certified, the *National Electrical Code® Committee Report on Proposals* and the *National Electrical Code® Committee Report on Comments* will be presented at the June 2010 Association Technical Meeting for action. An amendment to the National Electrical Code Technical Committee Report will not be considered at the meeting unless it is one that is a certified NITMAM.

FORM FOR COMMENT FOR 2011 NATIONAL ELECTRICAL CODE®

INSTRUCTIONS — PLEASE READ CAREFULLY

Type or print **legibly** in **black** ink. Use a separate copy for each comment. Limit each comment to a **SINGLE** section. All comments **must be received by NFPA by 5 p.m., EDST, Friday, October 23, 2009**, to be considered for the 2011 National Electrical Code. Comments received after 5:00 p.m., EDST, Friday, October 23, 2009, will be returned to the submitter. If supplementary material (photographs, diagrams, reports, etc.) is included, you may be required to submit sufficient copies for all members and alternates of the technical committee.

For technical assistance, please call NFPA at 1-800-344-3555.

FOR OFFICE USE ONLY

Log #: ______

Date Rec'd: ______

Please indicate in which format you wish to receive your ROP/ROC ☐ **electronic** ☐ **paper** ☐ **download**

(Note: If choosing the download option, you must view the ROP/ROC from our website; no copy will be sent to you.)

Date 2/1/200X **Name** John B. Smith **Tel. No.** 253-555-1234

Company ABC Electric Company **Email**

Street Address 9 Seattle St. **City** Tacoma **State** WA **Zip** 98402

If you wish to receive a hard copy, a street address MUST be provided. Deliveries cannot be made to PO boxes.

Please indicate organization represented (if any) National Electrical Contractors Association

1. **Section/Paragraph** 210-60(A)

2. **Comment on Proposal No. (from ROP):** 70-8

3. **Comment recommends (check one):** ☐ new text ☒ revised text ☐ deleted text

4. **Comment (include proposed new or revised wording, or identification of wording to be deleted):** [Note: Proposed text should be in legislative format; i.e., use underscore to denote wording to be inserted (<u>inserted wording</u>) and strike-through to denote wording to be deleted (~~deleted wording~~).]

Guest rooms <u>or guest suites</u> ~~meeting the definition of a dwelling unit~~ <u>provided with permanent provisions for cooking</u> shall have receptacle outlets installed in accordance with all of the applicable rules in 210.52.

5. **Statement of Problem and Substantiation for Comment:** (Note: State the problem that would be resolved by your recommendation; give the specific reason for your Comment, including copies of tests, research papers, fire experience, etc. If more than 200 words, it may be abstracted for publication.)

The existing language is modified to eliminate confusion between the electrical and building codes as to the precise definition of these types of accommodations.

6. **Copyright Assignment**

(a) ☒ **I am the author of the text or other material (such as illustrations, graphs) proposed in the Comment.**

(b) ☐ **Some or all of the text or other material proposed in this Comment was not authored by me. Its source is as follows:** (please identify which material and provide complete information on its source)

I hereby grant and assign to the NFPA all and full rights in copyright in this Comment and understand that I acquire no rights in any publication of NFPA in which this Comment in this or another similar or analogous form is used. Except to the extent that I do not have authority to make an assignment in materials that I have identified in (b) above, I hereby warrant that I am the author of this Comment and that I have full power and authority to enter into this assignment.

Signature (Required) ______

Note: An NEC preprint incorporating the proposed changes published in the ROP may be downloaded from NFPA's (and NEC's) website, www.nfpa.org.

COMMITTEE MEMBER CLASSIFICATIONS[1,2,3,4]

The following classifications apply to Committee members and represent their principal interest in the activity of the Committee.

1. M Manufacturer: A representative of a maker or marketer of a product, assembly, or system, or portion thereof, that is affected by the standard.

2. U User: A representative of an entity that is subject to the provisions of the standard or that voluntarily uses the standard.

3. IM Installer/Maintainer: A representative of an entity that is in the business of installing or maintaining a product, assembly, or system affected by the standard.

4. L Labor: A labor representative or employee concerned with safety in the workplace.

5. RT Applied Research/Testing Laboratory: A representative of an independent testing laboratory or independent applied research organization that promulgates and/or enforces standards.

6. E Enforcing Authority: A representative of an agency or an organization that promulgates and/or enforces standards.

7. I Insurance: A representative of an insurance company, broker, agent, bureau, or inspection agency.

8. C Consumer: A person who is or represents the ultimate purchaser of a product, system, or service affected by the standard, but who is not included in (2).

9. SE Special Expert: A person not representing (1) through (8) and who has special expertise in the scope of the standard or portion thereof.

NOTE 1: "Standard" connotes code, standard, recommended practice, or guide.

NOTE 2: A representative includes an employee.

NOTE 3: While these classifications will be used by the Standards Council to achieve a balance for Technical Committees, the Standards Council may determine that new classifications of member or unique interests need representation in order to foster the best possible Committee deliberations on any project. In this connection, the Standards Council may make such appointments as it deems appropriate in the public interest, such as the classification of "Utilities" in the National Electrical Code Committee.

NOTE 4: Representatives of subsidiaries of any group are generally considered to have the same classification as the parent organization.

Rep. TC on Airport Facilities

CODE-MAKING PANEL NO. 15

Articles 517, 518, 520, 522, 525, 530, 540

Donald J. Talka, *Chair*
Underwriters Laboratories Inc., NY [RT]

James R. Duncan, Sparling Electrical Engineering & Technology Consulting, WA [U]
Rep. Institute of Electrical & Electronics Engineers, Inc.
Ronald E. Duren, PacifiCorp, WA [UT]
Rep. Electric Light & Power Group/EEI
Douglas S. Erickson, American Society for Healthcare Engineering, VI [U]
Rep. American Society for Healthcare Engineering
Mitchell K. Hefter, Entertainment Technology/Philips, TX [IM]
Rep. Illuminating Engineering Society of North America
(Vote Limited to 518, 520, 525, 530, 540)
Kim Jones, Funtastic Shows, OR [U]
Rep. Outdoor Amusement Business Association, Inc.
(Vote Limited to 525)
Edwin S. Kramer, Radio City Music Hall, NY [L]
Rep. International Alliance of Theatrical Stage Employees
(Vote Limited to 518, 520, 525, 530, 540)
Larry Lau, US Department of Veterans Affairs, DC [U]
(Vote Limited to 517, 518)
Dennis W. Marshall, D & L Electric Company, TX [IM]
Rep. Independent Electrical Contractors, Inc.
Eugene E. Morgan, County of Clackamas, Oregon, OR [E]
Rep. International Association of Electrical Inspectors
Hugh O. Nash, Jr., Nash Lipsey Burch, LLC, TN [SE]
Rep. TC on Electrical Systems
Bruce D. Shelly, Shelly Electric Company, Inc., PA [IM]
Rep. National Electrical Contractors Association
Michael D. Skinner, CBS Studio Center, CA [U]
Rep. Alliance of Motion Picture and Television Producers
(Vote Limited to 518, 520, 525, 530, 540)
Kenneth E. Vannice, Leviton Manufacturing Company Inc., OR [M]
Rep. US Institute for Theatre Technology
(Vote Limited to 518, 520, 525, 530, 540)
Michael Velvikis, High Voltage Maintenance Corporation, WI [IM]
Rep. InterNational Electrical Testing Association
Andrew White, IBEW Local Union 3, NY [L]
Rep. International Brotherhood of Electrical Workers
James L. Wiseman, Square D Company/Schneider Electric, TN [M]
Rep. National Electrical Manufacturers Association

Alternates

James L. Brown, Detroit Edison, DTE Energy, MI [UT]
(Alt. to Ronald E. Duren)
Rep. Electric Light & Power Group/EEI
Matthew B. Dozier, IDesign Services, TN [U]
(Alt. to James R. Duncan)
Rep. Institute of Electrical & Electronics Engineers, Inc.
Samuel B. Friedman, General Cable Corporation, RI [M]
(Alt. to James L. Wiseman)
Rep. National Electrical Manufacturers Association
Stephen M. Lipster, The Electrical Trades Center, OH [L]
(Alt. to Andrew White)
Rep. International Brotherhood of Electrical Workers
Joseph P. Murnane, Jr., Underwriters Laboratories Inc., NY [RT]
(Alt. to Donald J. Talka)
Marcus R. Sampson, Minnesota Department of Labor & Industry, MN [E]
(Alt. to Eugene E. Morgan)
Rep. International Association of Electrical Inspectors
James C. Seabury, III, Enterprise Electric, LLC, TN [IM]
(Alt. to Dennis W. Marshall)
Rep. Independent Electrical Contractors, Inc.
Steven R. Terry, Electronic Theatre Controls Inc., NY [M]
(Alt. to Kenneth E. Vannice)
Rep. US Institute for Theatre Technology
(Vote Limited to 518, 520, 525, 530, 540)

CODE-MAKING PANEL NO. 16

Articles 770, 800, 810, 820, 830

Ron L. Janikowski, *Chair*
City of Wausau, Wisconsin, WI [E]
Rep. International Association of Electrical Inspectors

Donna Ballast, dbi, TX [M]
Rep. Telecommunications Industry Association
George Bish, MasTec, Inc., dba Advanced Technologies, NC [IM]
Rep. Satellite Broadcasting & Communications Association
J. Robert Boyer, GE Security, NJ [M]
Rep. National Electrical Manufacturers Association
James E. Brunssen, Telcordia, NJ [U]
Rep. Alliance for Telecommunications Industry Solutions
Gerald Lee Dorna, Belden Wire & Cable Co., IN [M]

NFPA Electrical Engineering Division Technical Staff

William Burke, Division Manager
Mark W. Earley, Chief Electrical Engineer
Ernest W. Buss, Senior Electrical Engineer
Paul Choiniere, Senior Electrical Specialist
Mark Cloutier, Senior Electrical Engineer
Christopher Coache, Senior Electrical Engineer
Jean O'Connor, Electrical Projects Specialist and Support Supervisor
Lee Richardson, Senior Electrical Engineer
Richard Roux, Senior Electrical Specialist
Jeffrey Sargent, Senior Electrical Specialist

These lists represent the membership at the time each Committee was balloted on the text of this report. Since that time, changes in the membership may have occurred. A key to classifications is found at the front of the document.

Committee Scope: This Committee shall have primary responsibility for documents on minimizing the risk of electricity as a source of electric shock and as a potential ignition source of fires and explosions. It shall also be responsible for text to minimize the propagation of fire and explosions due to electrical installations.

9-1 Log #614g NEC-P09 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms "high voltage" and "medium voltage" to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Reject
Panel Statement: The terms "high voltage" and "medium voltage" are used in many US and international standards, but the definitions of these terms are inconsistent within these standards. Defining these terms in NFPA 70 will merely add another set of definitions to the wide array of definitions already in existence. Currently, 490.2 defines high voltage as more than 600 V, nominal. For the purposes of the requirements in NFPA 70, this definition is adequate, since "over 600-volt" installations, such as "medium voltage" and "high voltage" systems, are treated similarly throughout the NEC with respect to installation requirements.
It is also noted that the submitter did not specify where and in what form the revisions should be made.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-1 Log #4917 NEC-P01 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user ease, make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The proposal does not contain proposed text for the change, including the wording to be added or substantiation of the proposal as required by 4.3.3 of the NFPA Regulations Governing Committee Projects. The panel notes that those articles already provided with diagrams are more complex than most others where the existence of a diagram makes sense and provides guidance; however, most articles do not require diagrams.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-1 Log #4917a NEC-P02 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: Those articles already provided with diagrams are more complex than most others where the existence of a diagram makes sense and provides guidance. However, most articles do not need or require diagrams. This proposal does not recommend specific code text as is required by section 4.4.3(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

3-1 Log #4917b NEC-P03 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: Adding a diagram statement to every article in the NEC would not be effective since most articles in the NEC are not complex enough to require these diagrams. 90.1(C) already states that the NEC is not intended as an instruction manual for untrained persons. In addition, there were no actual diagrams provided which is a violation of Section 4.3.3(C) of the NFPA Regulations Governing Committee Projects since the submitter did not provide the recommended text for proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-1 Log #4917c NEC-P04 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

5-1 Log #4917d NEC-P05 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided proposed text for this proposal, including the wording to be added, revised (and how revised), or deleted in accordance with 4.3.3(c) of the NFPA Regulations Governing Committee Projects. Also, the submitter has not provided a statement of the problem or substantiation for the proposal in accordance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

6-1 Log #4917e NEC-P06 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided the recommended diagram required to address the proposed change in accordance with 4.3.3 of the Regulations Governing Committee Projects. There is currently no table 430.8 in the 2008 edition of the National Electrical Code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

7-1 Log #4917f NEC-P07 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The panel is not clear on what the submitter is requesting. There is no Table 430.8 in the 2008 code. Article 430 has many different parts for motors so the diagram there is needed to identify which part of the code applies. That is not the case here.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

8-1 Log #4917g NEC-P08 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: Diagrams are not useful or practical for all articles. Submitter does not provide proposed diagrams, just a concept.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-1 Log #4917i NEC-P10 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided text to be added after the scope of each article. This proposal does not meet the requirements of 4.3.3(c) of the Regulations Governing Committee Projects as follows:
4.3.3 Content of Proposals. Each Proposal shall be submitted to the Council Secretary and shall include the following:
(c) Proposed text of the Proposal, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

11-1 Log #4917j NEC-P11 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: It is assumed that the submitter is referring to Figure 430.1 on page 70-299. The panel agrees that Figure 430.1 is an excellent format to help guide users through the complexities of Article 430. However, the purview of Panel 11 in addition to Article 430 is Articles 409, 440, 460, and 470. These articles are mostly short in nature and would not benefit from a figure similar to Figure 430.1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-1 Log #4917k NEC-P12 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: Those articles already provided with diagrams are more complex than most others where the existence of a diagram makes sense and provides guidance. However, most articles do not need or require diagrams.
The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

13-1 Log #4917l NEC-P13 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided text or an example to be added after the scope of each article. This proposal does not meet the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-1 Log #4917m NEC-P14 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a complete proposal and, thus, the proposal does not fulfill the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects. Additionally, CMP-14 does not agree that these articles require tables as this proposal attempts to do.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-1 Log #4917n NEC-P15 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The proposal is not in compliance with 4.3.3 of the Regulations Governing Committee Projects.
The diagram/table idea works well for motor feeders, circuits and protection. However, the chart concept doesn't fit well with the special occupancies and provisions of Chapter 5. The proposal is incomplete in that it doesn't provide a substantiation as to what function this diagram would serve.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

16-1 Log #4917o NEC-P16 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not supplied any figures for the panel to consider and the type of figure suggested is inappropriate for CMP-16 articles.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

17-1 Log #4917p NEC-P17 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The articles covered by CMP-17 include many different types of installations within each article. The NEC already has a systematic methodology of uniform section numbering. This type of table works well with motors, since it only addresses a single type of equipment. The panel does not agree that this proposal will improve the usability of the articles covered by CMP-17.
The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-1 Log #4917q NEC-P18 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the NFPA Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted for suggested diagram table.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

19-1 Log #4917r NEC-P19 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: Specific proposals have not been submitted for articles under the responsibility of CMP-19. There does not appear to be a table layout in 430.8 so the submitter's intent is not clear.
Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

1-2 Log #614 NEC-P01 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms “high voltage” and “medium voltage” to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Reject
Panel Statement: The terms low voltage, medium voltage, and high voltage may apply in different contexts as they relate to systems and equipment addressed throughout the scope of the NEC. These different contexts are reflected in different standards and in the nature of the requirements within the NEC. For example, IEEE 100, The Authoritative Dictionary of IEEE Standards Terms, indicates that: “low voltage” can mean either 24 volts or less, supplied from a transformer, converter, or battery, or a class of nominal system voltages 1000 or less; “medium voltage” can mean either 601 to 15,000 V, or a class of nominal system voltages greater than 1000 V and less than 100,000 V, and “high voltage” can mean either a class of nominal system voltages equal to or greater than 100,000 V and equal to or less than 230,000 V or voltage levels that are greater than 1000 V.
The proposal is not consistent with ANSI/NEMA C84.1, Electric Power Systems and Equipment – Voltage Ratings, and with many product standards such as ANSI/UL 347, Safety of High Voltage Industrial Control Equipment, or ANSI/UL 60947-1, Safety of Low-Voltage Switchgear and Controlgear.
The panel concludes that acceptance of the proposal would not provide benefit and would confuse users of the NEC because of the various definitions are in use.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-2 Log #614a NEC-P02 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms “high voltage” and “medium voltage” to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Reject
Panel Statement: The terms “high voltage” and “medium voltage” are used in many US and international standards, but the definitions of these terms are inconsistent within these standards. Defining these terms in NFPA 70 will merely add another set of definitions to the wide array of definitions already in existence. Currently, 490.2 defines High Voltage as more than 600 V, nominal. For the purposes of the requirements in NFPA 70, this definition is adequate, since “over 600 volt” installations, such as “medium voltage” and “high voltage” systems, are treated similarly throughout the NEC with respect to installation requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-2 Log #614b NEC-P04 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms “high voltage” and “medium voltage” to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Reject
Panel Statement: The proposal does not contain any actual proposed language and lacks any specific requirement and thus does not comply with the NEC Style Manual. These terms are not used in the Articles under CMP 4.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

5-2 Log #614c NEC-P05 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms “high voltage” and “medium voltage” to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided proposed text for this proposal, including the wording to be added, revised (and how revised), or deleted in accordance with 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

6-2 Log #614d NEC-P06 **Final Action: Reject**
(Entire Document)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as “Reject” to correlate with the actions of other Code-Making Panels throughout the document on related proposals.
Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms “high voltage” and “medium voltage” to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Accept in Principle in Part
Add new definitions to Article 100 as follows:
<u>**Voltage, Low.** A class of nominal system voltages not exceeding 2,000 volts.</u>
<u>**Voltage, Medium.** A class of nominal system voltages over 2,000 Volts but not exceeding 69 kV.</u>
Panel Statement: Low voltage should include up to and including 2,000 volts since 328.2 defines Type MV medium voltage cable as rated 2001 volts or higher. The separation at 69 kV is consistent with IEEE Std 100, IEEE Standard Dictionary of Electrical and Electronic Terms. The panel does not accept the proposed definition for high voltage as it does not fit the panel’s work.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
PICARD, P.: There is not a definition for Low Voltage/High Voltage that encompasses all applications within the Code. If needed, definitions should be included in applicable sections of the Code not in Article 100.
THOMPSON, J.: This proposal should be reviewed by the TCC to determine the impact on other areas of the Code and the actions taken by other CMPs that received this same proposal. The use of Low and Medium Voltage differ throughout the Code. This includes Articles 110, 411, 490, 517, 551, 552 and to some degree, 830, all of which are beyond the scope of CMP6.

7-2 Log #614e NEC-P07 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms “high voltage” and “medium voltage” to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Reject
Panel Statement: Submit this proposal to the TCC awaiting the action of CMP-1. The panel does not have a preference. Medium voltage maximum of 100 kv is too high. See also Article 328.2 for medium voltage cable definition.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

8-2 Log #614f NEC-P08 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms “high voltage” and “medium voltage” to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Reject
Panel Statement: Will not add clarity to the NEC. The code has established nominal voltages and terminology that is well recognized in the industry.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-2 Log #614h NEC-P10 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Change terms "high voltage" and "medium voltage" to correlate with new proposed definitions in Article 100.
This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.
Panel Meeting Action: Reject
Panel Statement: This proposal suggests action but lacks specific text and is in violation of 4.3.3 of the Regulations Governing Committee Projects. The recommendation is contingent on the acceptance of proposal 1-109 which intends to add new definitions for "Voltage, Low, Voltage, Medium and Voltage, High." The global implications of such a change would require task group action to correlate the use of these terms throughout the document. CMP-10 requests that the TCC direct CMP-1 to comment on this proposal and a task group be formed if necessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
COOK, D.: I agree with the Panel action and statement. I also realize current text and requirements in Article 240 and most of the NEC is not based on "Low", "Medium", or "High" voltage, but primarily based on installations 600 volts, nominal, or less and installations over 600 volts. Acceptance of proposed definitions in Article 100 would not create a correlation problem in Article 240. Acceptance of the proposed definitions in Article 100, assuming they correlate with other ANSI standards related to "Low", "Medium", and "High" voltage installations, has the potential to provide useful guidance for those installations when they are part of premises wiring. In that case, I would be supportive of adding the definitions and allowing NEC Committees the opportunity to develop NEC requirements for premises wiring at voltage levels that are standardized with other ANSI standards.

Ballot Results: Affirmative: 14

1-3 Log #2245 NEC-P01 **Final Action: Reject**
(Entire Document)

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector
Recommendation: Revise text to read as follows:
For example: Instead of ~~50 mm~~ it should read 5 cm.
Substantiation: The proposed revision is to promulgate the International System and the proper usage of that system in a broad manner. For example, in engineering related areas, drawings are often in millimeters rather than centimeters. Contrarily, groups dealing with consumer issues may give preference to centimeters. Thus, avoiding the large numbers in millimeters such as "600 mm" that would become "60 cm". Practical for the end user and would save a decimal for every millimeter figure in the standard.
Panel Meeting Action: Reject
Panel Statement: The proposal conflicts with 3.2.7.6 of the NEC Style Manual, which requires dimensions less than 1 m to be expressed in mm.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-3 Log #3922 NEC-P08 **Final Action: Reject**
(Entire Document)

Submitter: Goran Haag, Champion Fiberglass, Inc.
Recommendation: Add new text to read:
Everywhere "Type RTRC marked with the suffix -XW" is mentioned, add "Type RTRC marked with the suffix –PW".
Substantiation: Champion Fiberglass, Inc. is submitting to Underwriters Laboratories data for fact finding study for a new conduit made from a different wall thickness compared to the RTRC XW conduit. This conduit has the same or higher impact and compression strength as Schedule 80 PVC and should therefore qualify for all instances where Schedule 80 PVC is approved (as well as RTRC XW).
Panel Meeting Action: Reject
Panel Statement: Proposers should identify by section with proposed text where revisions are to be made within the code. Panel review of the fact finding report will be required prior to consideration of a proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

11-160 Log #4917h NEC-P11 **Final Action: Reject**
(Entire Document)

Submitter: Caleb M. Ferris, Chadwick Electric
Recommendation: Add a diagram table after the scope of each article similar to the one in Article 430.
Substantiation: For NEC user cost make the table layout diagram in 430.8 standard throughout the code.
Panel Meeting Action: Reject
Panel Statement: Those articles already provided with diagrams are more complex than most others where the existence of a diagram makes sense and provides guidance. However, most articles do not need or require diagrams. This proposal does not recommend specific code text as is required by 4.4.3(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 90 — INTRODUCTION

1-4 Log #2325 NEC-P01 **Final Action: Reject**
(90.1)

Submitter: Thomas J. Conlan, The Electrician Incorporated
Recommendation: Revise text as follows:
The purpose of this code is the practical safeguarding of persons**, life** and property from hazards arising from the use of electricity.
Substantiation: Life is really living matter, that should be added to the purpose of this code because Life is addressed to Animal Life not limited to pets and farm animals; and Plant Life is not limited to Agricultural and Greenhouse vegetation. Let's not segregate animal and plant life, include what is to be safeguarded and that the NFPA does recognize ALL LIFE. The NFPA should not ignore this area especially in this day and age.
Panel Meeting Action: Reject
Panel Statement: The use of the word "life" in the sentence would include all living things (matter). The purpose of the code is not the practical safeguarding of all living matter. The "practical safeguarding" is specific to "persons and property." Including the word "life" in the sentence would be a major divergence from the purpose of the NEC.
In addition, the submitter has not provided substantiation as required by 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-5 Log #592 NEC-P01 **Final Action: Reject**
(90.1(A))

Submitter: Teri Dwyer, Wyoming, MN
Recommendation: Add new text as follows:
90.1 Purpose.
(A) Practical Safeguarding. The purpose of this Code is to establish the minimum requirements for the practical safeguarding of persons and property from hazards arising from the use of electricity.
Substantiation: By adding this language, it will make it explicitly clear that the NEC is a minimum standard. It has always been implied that it is a minimum standard, however, I do not believe the current text states that the NEC is in fact a minimum standard. This language would also bring the purpose of the NEC to closely resemble the purpose or intent of other model codes.
Panel Meeting Action: Reject
Panel Statement: The submitter's intent is stated in 90.1(B) that reads: "This *Code* contains provisions that are considered necessary for safety."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-6 Log #1536 NEC-P01 **Final Action: Reject**
(90.1(A))

Submitter: Richard Hollander, City of Tucson
Recommendation: Revise text as follows:
90.1 Purpose.
(A) Practical Safeguarding. The purpose of this Code is to establish the minimum requirements for the practical safeguarding of persons and property from hazards arising from the use of electricity.
Substantiation: By adding this language, it will make it explicitly clear that the NEC is a minimum standard. It has always been implied that it is a minimum standard, however, I do not believe the current text states that the NEC is in fact a minimum standard. This language would also bring the purpose of the NEC to closely resemble the purpose or intent of other model codes.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-7 Log #4886 NEC-P01 **Final Action: Reject**
(90.1(B), FPN)

TCC Action: The Technical Correlating Committee directs that this proposal be referred to the NEC Technical Correlating Committee Usability Task Group for information.
Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Revise text as follows:
FPN: Hazards often occur because of overloading of wiring systems by methods or usage not in conformity with this Code. This occurs because initial wiring did not provide for increases in the use of electricity. An initial adequate installation, ~~and reasonable provisions for system changes provide for future increases in the use of electricity~~ provisions for future increases in the use of electricity, and plans and specifications that provide ample space in raceways, spare raceways, and additional spaces allow for future increases in electric power and communications circuits. Distribution centers located in readily accessible locations provide convenience and safety of operation.
Substantiation: Revise to include the text from 90.8(A). I also submitted a proposal to delete 90.8(A).
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the submitter did not provide adequate technical substantiation.
There are a number of sections in the NEC that do not contain "enforceable" requirements. (See Section 90.6 for an example.) Fine print notes per the requirements of 90.5(C), can contain "references to other Standards, references to related sections of this Code, or information related to a code rule,...". Sections such as 90.8(A) and (B) effect none of these actions and are not required to be in the form of a fine print note.
The panel requests that the NEC Technical Correlating Committee refer this proposal to the Technical Correlating Committee Usability Task Group for information.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: When considering as a whole what the submitter is attempting to do with this proposal and other associated proposals, the proposed change makes sense and should have been accepted. As the panel has noted, there are several code section that do not contain "enforceable" requirements. As such, there is no basis for maintaining unenforceable text in the code. If necessary, unenforceable text should be in the form of a "FPN." Although the submitter has not provided sufficient substantiation for the proposed change, moving the text into an existing FPN makes sense, as it cleans up the text in Article 90 and makes it easier to follow and understand the Introduction. As a note, due to panel action on Proposal 1-43, the word "communication" has changed to the plural "communications".

1-8 Log #593 NEC-P01 **Final Action: Reject**
(90.1(C))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text as follows:
(C) Intention. ~~This Code is not intended as a design specification or an instruction manual for untrained persons.~~ The Code is intended for use in the design and/or installation and maintenance of electrical systems and equipment. The rules in the Code are intended for application by users such as inspection authorities exercising legal jurisdiction over electrical installations, property insurance inspectors, designers and engineers, other qualified persons and organizations working to achieve minimum electrical safety requirements in electrical systems design and installation.
FPN: This Code is not intended as a design specification or an instruction manual for untrained persons.
Substantiation: This proposal is an effort to improve usability and clarity by changing negative text to positive text. The existing text has been relocated to a new FPN following the new text that describes how the Code is intended to be applied, rather than how it is not intended. Subdivision (C) is titled "Intention" yet the current text indicates only what is not intended from the NEC. This proposal does not seek any technical revision and is not intended to exclude any entity that uses the NEC on a voluntary or mandatory basis. The proposal simply transforms the explanatory information in the 2008 NECH into positive text in order to describe the intent of the Code. The second sentence list is left open-ended by including the words "such as" in the text in an effort to not exclude any current or potential users.
Panel Meeting Action: Reject
Panel Statement: The proposal does not enhance clarity or usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
ANTHONY, M.: This proposal is one of a group of proposals which, if taken as a whole and accepted, would get us closer to harmonization of the NEC and the NESC – a shared goal that is in the interest of both groups and in the interest of the industry at large. Unfortunately, the NEC development process does not make it easy to make the simultaneous and coordinated changes necessary for the harmonization we all want. Therefore the explanation of how we hope to help the harmonization process please refer to our comment on Proposal 1-17.
LABRAKE, JR., N.: Proposal 1-8 should have been accepted-in-principle. Refer to my ballot statement on Proposal 1-9.
MCMAHILL, L.: This proposed change should have been accept in principle. The submitter was simply attempting to change the paragraph into positive text. So, minor adjustments to the text should have been made. The first sentence should have been revised to read: "The Code is intended for use in the installation and maintenance of electrical systems and equipment." The last sentence should have been revised by deleting: "in electrical systems design and installation." It should be clear that the code is not intended to be a design specification. In addition, the NEC Style Manual, Annex B, recommends avoiding the use of "and/or." The deleted text is superfluous.

1-9 Log #3127 NEC-P01 **Final Action: Reject**
(90.1(C))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Revise 90.1(C) as follows:
(C) Intention. The Code is intended for use in the design and/or installation and maintenance of electrical systems and equipment. The rules in the Code are intended for application to electrical installations and communications systems on the load side of the service point. The Code is intended to be applied to installations by users such as inspection authorities exercising legal jurisdiction over, property insurance inspectors, designers and engineers, and other qualified persons and organizations working to achieve electrical safety in electrical systems design and installation.
FPN: This Code is not intended as a design specification or an instruction manual ~~for untrained persons~~.
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". Several companion proposals regarding this subject are submitted to 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.

Specifically, the rationale for this change is to state what the Code intends in positive language and that the document does not depend on this statement for only untrained persons. Also, see the narrative in front of the 2008 NEC Handbook.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the proposal does not enhance clarity or usability.

In addition, the panel concludes that this is a scope statement. 90.2 already addresses the scope and that should not be repeated in a different form in 90.1(C).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: This proposal is one of a group of proposals which, if taken as a whole and accepted, would get us closer to harmonization of the NEC and the NESC – a shared goal that is in the interest of both groups and in the interest of the industry at large. Unfortunately, the NEC development process does not make it easy to make the simultaneous and coordinated changes necessary for the harmonization we all want. Therefore the explanation of how we hope to help the harmonization process, refer to our comment on Proposal 1-17.

LABRAKE, JR., N.: Proposal 1-9 should have been accepted-in-principle. The text could be revised as follows to meet the intent of the Panel's discussion regarding scope statements.
90.1(C) Intention. This Code applies to the design and installation of electrical and communications systems and equipment on the premises wiring side of the service point. This Code is not intended as a design specification or an instruction manual for untrained persons.

In addition, refer to my ballot statement on Proposal 1-29.

1-10 Log #4520 NEC-P01 **Final Action: Reject**
(90.1(C))

Submitter: Medard Kopczynski, Town of Keene / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:

(C) ~~Intention~~ Limits. This Code is not intended as a design specification or an instruction manual for untrained persons.
Substantiation: Note: This proposal was developed by the proponent as a member of the Building Code Development Committee (BCDC) with the committee's endorsement.

This term is more definitive than the current title because the provision is actually a limit rather than an intention.
Panel Meeting Action: Reject
Panel Statement: "Intention" is the purpose or goal of the NEC or what is to be accomplished or attained. The word "Limits" implies a boundary, something that restrains, or confines.

Changing the word to "Limits" would imply that there are no other limits to the NEC, except those stated in 90.1(C), which certainly is not the case.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-11 Log #4782 NEC-P01 **Final Action: Reject**
(90.1(C))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text as follows:

(C) Intention. ~~This Code is not intended as a design specification or an instruction manual for untrained persons.~~ The Code is intended for use in the design and/or installation and maintenance of electrical systems and equipment. The rules in the Code are intended for application to electrical installations and communications systems on the load side of the service point. The Code is intended to be applied to installations by users such as inspection authorities exercising legal jurisdiction over property insurance inspectors, designers and engineers, and other qualified persons and organizations working to achieve electrical safety in electrical systems design and installation.
FPN: This Code is not intended as a design specification or an instruction manual for untrained persons.
Substantiation: This proposal is an effort to improve usability and clarity by changing negative text to positive text. The existing text has been relocated to a new FPN following the new text that describes how the Code is intended to be applied, rather than how it is not intended. Subdivision (C) is titled "Intention" yet the current text indicates only what is not intended from the NEC. This proposal does not seek any technical revision and is not intended to exclude any entity that uses the NEC on a voluntary or mandatory basis. The proposal simply transforms the explanatory information in the 2008 NECH into positive text in order to describe the intent of the Code. The second sentence list is left open-ended by including the words "such as" in the text in an effort to not exclude any current or potential users.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the proposal does not enhance clarity or usability.

The panel also concludes that the second sentence is a scope statement. 90.2 already addresses the scope, which should not be repeated in a different form in 90.1(C).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1
Explanation of Negative:

LABRAKE, JR., N.: Proposal 1-11 should have been accepted-in-principle. Refer to my ballot statement on Proposal 1-9.
Explanation of Abstention:

ANTHONY, M.: Although the existing language is efficient, it is cast in negative language. This proposal puts the purpose of the NEC in positive language, a shared objective. Our interest group would object to the inclusion of the word "maintenance" however. While there are passages in the NEC would contain references to maintenance practice, we would prefer that maintenance be covered in NFPA 70B.

We encourage the submitter to revise the proposal by removing references to the maintenance aspect of the NEC, add language that emphasizes that the NEC is to be used by trained persons only, clear up the redundancy cited by the panel. Periodic re-consideration of the scope of the NEC is to be welcomed as an indication of dynamic thinking.

1-12 Log #3128 NEC-P01 **Final Action: Reject**
(90.2)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Add the following text and illustration to 90.2 Scope:
90.2 Scope. The following is a general illustration of where utility electric supply and premises wiring meet for what is covered by this Code and what is not covered.

See page 17 for Figure 90.2.

Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.

*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

ILLUSTRATION
UTILITY ELECTRIC SUPPLY AND
PREMISES WIRING

Figure 90.2

Specifically, the rationale for this change is to add an illustrative figure to 90.2 to provide visual clarity where the NEC applies to premises wiring meeting the supply facilities under exclusive control of utilities at the service point and to separately derived systems that are not connected to a service point. The location of the service point and utility equipment to provide electric service to premises wiring is dependent upon the governmental or regulated serving utility's local requirements or those of a private utility under governmental oversight or conditions of service (e.g. tariffs with service applications).

Panel Meeting Action: Reject

Panel Statement: The proposal does not enhance clarity or usability. Proposed Figure 90.2 does not apply to all installations and does not clarify exclusive control.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

ANTHONY, M.: The proposal enhances clarity and usability. Any shortcomings in applicability are no greater in magnitude than the shortcomings of the figure at the head of Article 430. The figure clarifies exclusive control. The figure clarifies "exclusive control" in less than 1000 words.

BARRIOS, L.: The panel action should have been to Accept in Principle. The drawing is a good representation of the Service Point definition and shows that this point is not defined by a specific piece of equipment like a disconnecting means, but will change depending on the utility/constomer arrangements. The coverage of the Code and where it applies versus the NESC is a complex one. Even though this figure may not perfectly apply to all examples, it is better than what we have available today. The figure should be shown as a FPN so that it is not considered mandatory text.

LABRAKE, JR., N.: Proposal 1-12 should have been <u>accepted-in-principle</u>. The concept of the figure in this proposal discussed in the panel was thought to be more appropriate as Annex material or as an example in Chapter 9 of the Code. The terms "line side" and "load side" were discussed as more appropriate for equipment termination and in the context of this illustration, "load side" should be referred to as the "NEC side." The Panel should have considered this as a new Annex for "information on premises wiring meeting the utility electric supply." In addition, refer to my ballot statement on Proposal 1-29.

The illustration should be placed in a new informative Annex "TBD" titled "General Information Regarding Utility Electric Supply to Premises Wiring" as follows:

<u>Annex "TBD": "General Information Regarding Utility Electric Supply to Premises Wiring"</u>

<u>1. The following is a general illustration of where utility electric supply and premises wiring meet for what is covered and what is not covered by this Code as described in 90.2. Local conditions of service may locate the utility metering at any point on either side of the service point; see 90.2(B)(5). Conditions of electric service are based on governmental laws or regulations that determine the utility authority to provide electric service under their tariffs. These conditions of electric service affect the location of the service point and facilities under the local serving utility's exclusive control.</u>

See page 19 for Figure 90.2.

Comment on Affirmative:

MCCARVER, R.: ATIS votes to affirm the Panel 1 action on this proposal chiefly because the proposal ignores communications installations. The concept of a service point does not apply, or applies differently to communications systems than to a power utility interface. ATIS constituents are users of both the NEC and the National Electrical Safety Code (NESC). There is value in more clearly defining the relationship of the two codes and, where they overlap, ensuring that consistent and safe practices are followed regardless of which code is used. Panel 1 considered a number of proposals which attempted to accomplish these clarifications. There were similar proposals for the recently completed NESC cycle. Many of these were accepted in the NESC, but none before Panel 1 were accepted at the ROP meeting. ATIS urges those who have not supported the concept of harmonizing the two standards to reconsider and recognize the value of clearly defining the relationship between the NEC and NESC. Many of the arguments asserted have little bearing on safety.

1-13 Log #4507 NEC-P01 **Final Action: Reject**
(90.2)

Submitter: Jim Muir, Washington County Building Services / Rep. Building Code Development Committee (BCDC)

Recommendation: Revise text to read as follows:

90.2 Scope

(A) ~~Covered~~ <u>Applicability</u>. This Code <u>shall apply to</u> ~~covers~~ the installation… (balance remains the same)

(B) ~~Not Covered~~ <u>Non-Applicability</u>. This is Code ~~does not cover~~ <u>shall not apply to</u> the following: (balance remains the same).

Substantiation: Note: This proposal was developed by the proponent as a member of the Building Code Development Committee (BCDC) with the committee's endorsement.

Other NFPA codes and standards use the term "applicability" or a similar form of "applicability" to describe what is encompassed or not encompassed by the Code. The term "covered" in the electrical code usually refers to encasing material over conductors.

Panel Meeting Action: Reject

Panel Statement: The word "cover" is used properly as a transitive verb to describe the scope. The substantiation does not identify a problem as per the NFPA Regulations Governing Committee Projects section 4.3.3(D).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-14 Log #225 NEC-P01 **Final Action: Reject**
(90.2(A))

Submitter: Joseph A. Tedesco, Boston, MA

Recommendation: Revise as follows:

90.2 Scope (A) Covered. This code covers the installation <u>and use</u> of electrical...no change.

Substantiation: See 110.3(B) Installation <u>and Use</u>.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation does not account for the fact that 110.3(B) refers only to listed equipment.

See the NFPA Regulations Governing Committee Projects Section 4.3.3 that states that proposals must include a statement of the problem and substantiation for the proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

HICKMAN, P.: We conclude that the submitter's reference to 110.3(B) was offered as an example of where "and use" is used to substantiate the recommendation and agree with the submitter that the scope of the document should include "and use" since the NEC does cover use as well as installation.

MCMAHILL, L.: This proposal should have been accepted. Although the submitter did not provide clear substantiation for the proposed change, it is apparent that parallel structure from one code section to another is the intent. By accepting the change, parallel structure would have been attained.

1-15 Log #3129 NEC-P01 **Final Action: Reject**
(90.2(A))

Submitter: Neil F. LaBrake, Jr., National Grid USA

Recommendation: Revise 90.2(A) as follows:

(A) Covered. This Code covers <u>requirements of</u> the installation of electrical conductors, equipment, and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways for the following <u>premises wiring systems</u>:

Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.

*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (<u>http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006</u> and <u>http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf</u>) pertaining to this issue.

Specifically, the rationale for this change is to add the term "premises wiring" to parallel the scope of the NESC where it applies to "supply" facilities. This provides for distinction between premises wiring and supply side facilities relative to the service point as defined in both the NEC and NESC. Correlation is made with the added text to the informational notes to 2007 NESC Rules 011B and 011C.

Panel Meeting Action: Reject

Panel Statement: The proposed changes do not add clarity to the existing scope statement in 90.2(A).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: The addition of the phrase "premises wiring" <u>does</u> add clarity, in our view.

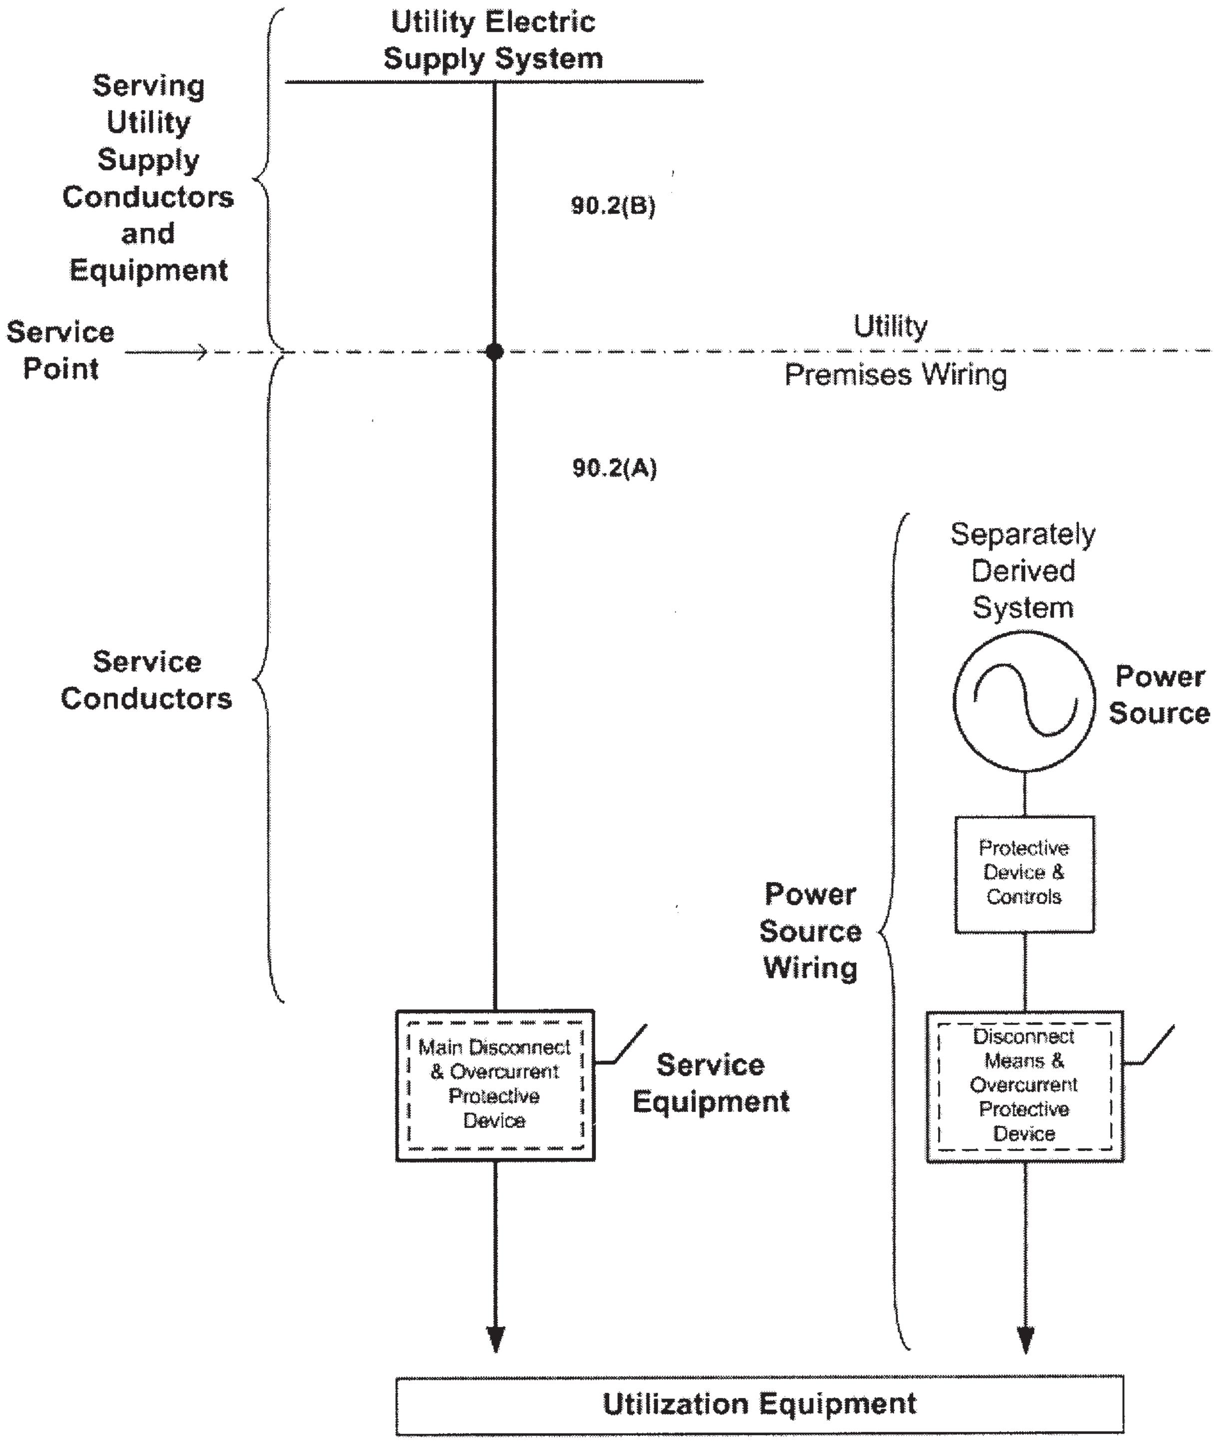

ILLUSTRATION
UTILITY ELECTRIC SUPPLY AND
PREMISES WIRING

Figure 90.2

LABRAKE, JR., N.: Proposal 1-15 should have been accepted-in-principle. Based on discussion in the Panel, the text "covers requirements of" could be changed to "establishes requirements for" to provide the clarity the Panel seeks. The addition of the text "premises wiring systems" in the proposal provides for clear understanding that the itemized list that follows pertain what is covered by the NEC. In addition, refer to my ballot statement on Proposal 1-29.

1-16 Log #3131 NEC-P01 **Final Action: Reject**
(90.2(A), FPN (New))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Add new FPN to 90.2(A) following new item (5) as follows:
FPN: See Figure 90.2 for information on the load side of the service point that 90.2(A) lists as covered by this Code.
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.
*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change is to add a new fine print note to 90.2(A) for referring to the proposed new illustration on 90.2 of what is covered by the NEC similar to the FPN in 250.1 to reference Figure 250.1.
Panel Meeting Action: Reject
Panel Statement: The FPN reference to Figure 90.2 is unnecessary due to the action taken on Proposal 1-12.

See the panel action and statement on Proposal 1-12.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: Please refer to comment on Proposal 1-12.

LABRAKE, JR., N.: Proposal 1-16 should have been accepted-in-principle. The concept of the figure in Proposal 1-12 discussed in the panel was thought to be more appropriate as Annex material or as an example in Chapter 9 of the Code. The Advisory Note reference proposed would refer to the new Annex based on my ballot statement on Proposal 1-12 if the Panel accepted-in-principle. In addition, refer to my ballot statement on Proposal 1-29.

1-17 Log #3446 NEC-P01 **Final Action: Reject**
(90.2(A)(2), FPN (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Add the following Fine Print Note to 90.2(A)(2):

(2) Yards, lots, parking lots, carnivals, and industrial substations
FPN: ANSI C2-2007, *National Electrical Safety Code* contains information useful for meeting the intent of the NEC as indicated in fine print notes (FPN) herein.
Substantiation: Edison Electric Institute agrees with Code Making Panel 1's statement to reject Proposal 1-4 in the A2007 NEC ROP on page 70-3 and Mr. LaBrake's Explanation of Negative to accept Comment 1-1 in the A2007 NEC ROC *. The Fine Print Note in 90.2(A)(2) needs to be reinstated which is designed to provide information and let the user of the NEC know about the NESC, which adds clarity to the National Electrical Code.
* Refer to the NFPA 2007 Annual Meeting Transcript (http://www.nfpa.org/assets/files/PDF/CodesStandards/A07TranscriptFinal.pdf) pertaining to this issue in Code Making Panel 1 of NFPA 70.

This Fine Print Note provides a correlation reference with the NESC. See second sentence of Rule 011A in the 2007 NESC.

This is a companion proposal to the proposed addition to 90.2(C) and definition of "supervised installation" in Article 100.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not enhance clarity or usability. In addition, the panel reaffirms its action and position on Comment 1-1 in the 2007 Annual Revision Cycle Report on Comments.

The panel reaffirms acceptance of the substantiation of Mr. Pauley in that comment and continues to conclude that the proposed FPN does add confusion when one considers that the NEC is an enforcement document that is adopted by practically all jurisdictions in the US. The proposed fine print note reference as a source from the NEC implies that it is capable of being used without interfering with the use of the NEC, and that the code loses nothing by deleting the reference, but has increased confusion/conflict with the reference included.

The submitter has not addressed any of these issues. Insufficient substantiation has been provided to substantiate this fine print note referencing the NESC. NFPA and IEEE appointed a task group to address correlation issues between the NEC and NESC and no consensus has been reached.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: Many colleges and universities have complicated relationships with municipal and investor-owned power utilities. Most have "systems-within-a system" that form a microgrid; with wiring and equipment on either side of a boundary governed by standard easement and right-of-way agreements. Safety concerns along this boundary typically involve area lighting, emergency power sources, site placement of transformers and generators and alternative energy sources, metering, operation and maintenance of high voltage overhead and underground supply at the service point.

But the problem is neither purely technical nor is it one that can be solved by individual point solutions. A cut from the 2009 version of ANSI's Essential Requirements: Due Process Requirements for American National Standards is shown below for the committee's consideration:
2.4 Coordination and harmonization
Good faith efforts shall be made to resolve potential conflicts between and among existing American National Standards and candidate American National Standards.

2.4.1 Definition of Conflict

Conflict within the ANS process refers to a situation where, viewed from the perspective of a future implementer, the terms of one standard are inconsistent or incompatible with the terms of the other standard such that implementation of one standard under terms allowable under that standard would preclude proper implementation of the other standard in accordance with its terms.
2.4.2 Coordination/Harmonization

ANSI-Accredited Standards Developers shall make a good-faith effort to resolve potential conflicts and to coordinate standardization activities intended to result in harmonized American National Standards Note that clause 4.2.1.3.4 *Withdrawal for Cause* provides a mechanism by which an interested party may at any time request the withdrawal of an existing ANS.. A "good faith" effort shall require substantial, thorough and comprehensive efforts to harmonize a candidate ANS and existing ANSs. Such efforts shall include, at minimum, compliance with all relevant sections of these procedures See, for example, clauses 2.1, 2.4. 2.5, 2.6 and 4.3.. Developers shall retain evidence of such efforts in order to demonstrate compliance with this requirement to the satisfaction of the appropriate ANSI body.

Many colleges and universities are running "utility-like" enterprises and many are their own inspection authority. State utility regulations are uneven and not ready for a "one-size-fits-all" safety rule for the type of electrical installations that will be possible in distributed resource power delivery regimes. There may also be a tendency to retard innovation in alternative energy technologies in which many APPA member institutions are engaged.

One of the problems with this NEC-NESC scope debacle is that a solution to it might not provide a perceptible business benefit until something bad happens -- or is prevented from happening. Protecting electricians, and the public in general, requires a great deal of non-technical thought in addressing the feelings of individual organizations and the community at large. Keeping the lines of communication open to all stakeholders can bring unanticipated returns.

We hope to see the Task Group develop clear, bright-line recommendations for solutions that are sustainable, that can be flexible and relevant as the US power infrastructure evolves. While there may be no standard approach to tackling group issues, APPA will work with all stakeholders to inspire questions and answers, to create receptivity to new ideas, and to seek value beyond pure compliance.

LABRAKE, JR., N.: Proposal 1-17 should have been accepted-in-principle. The panel statement and the discussion during the meeting raised several common issues that need further discussion and a reconsideration of the panel action.

1. The first of these is the common panel statement that "the proposal does not enhance clarity or usability." This misses the whole point of why this was even submitted. The NEC and the NESC are both ANSI safety codes when used within their context. The purpose of this proposal was not to change the Code but to harmonize the NEC with the NESC at their common point. As such, this proposal does not necessarily "enhance the clarity or usability" of the Code but taken as a whole and in interaction with other codes such as the NESC, it does. The clarity and usability they provide is delineating a clear and distinct line between the applicability of the NEC and the NESC.

2. The second issue in the panel statement related to a reaffirmation of the Substantiation in Mr. Pauley's Comment and that a reference to another Code creates a source of confusion. We disagree. The Panel statement for Proposal 1-4 for the A2007 NEC ROP states that "The FPN provides the user of the Code an applicable resource that can be adopted by governmental bodies to

cover industrial substations or multibuilding complexes." It further states that "ANSI C2 provides the specific information for these installations." To remove this FPN would also remove a source of information for the installation of these industrial substations or multibuilding complexes, resulting in a less safe installation. Here's an example: the NEC requires bonding of metal structural items that are "likely to be energized." Obviously, that would include fences around substations. Except that in the case of an underground installation, there would be no requirement in the NEC. However, there is one in the NESC; Rule 110A1.

3. The Panel mistakenly added the panel statement that the "NESC-NEC Ad Hoc Task Group did not reach consensus" onto Proposal 1-17 that is technically not one of the Ad Hoc proposals, although included with this topic but stands on its own separate substantiation. Even if that statement applied to this Proposal and was true, every public proposal received from an individual could conceivably be rejected for that reason. At the IAEI Section meetings several proposals were voted on to submit to the International Office for submission, which were only required to meet a <u>MAJORITY VOTE</u> in order to be accepted. So, in light of the Panel statement this has little bearing for the proposal to be publicly reviewed on its own merit.

1-18 Log #718 NEC-P01 **Final Action: Reject**
(90.2(A)(3))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
90.2 Scope.
(A) Covered. This *Code* covers the installation of electrical conductors, equipment, and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways for the following:
(3) Installations of conductors and equipment that connect to<u>, have been disconnected from, and are capable of being connected to</u> the supply of electricity<u>, including those abandoned and those identified for future use.</u>
Substantiation: Correlation issue. Requirements for installed but abandoned (unidentified) conductors, cables and equipment, as well as conductors, cables and equipment identified for future use, abound throughout the Code but fall outside of its Scope.
By use of only the present verb tense of "connect" in 90.2(A)(3), the Scope of the Code covers only installed conductors and equipment PRESENTLY connected to the electric supply, yet portions of the Code address conductors, equipment, and raceways that have been ABANDONED and that have been IDENTIFIED for FUTURE USE. As examples, see definitions and requirements in 90.8(A), 640.2, 640.6(C), 645.2, 645.5(F), 645.5(G), 725.2, 725.25, 800.2, 800.25, 820.2, 820.25, 830.2, 830.25, 374.7, 408.7, and 110.14(B) ["*… the free ends of conductors …*"].
Panel Meeting Action: Reject
Panel Statement: According to the submitter's substantiation, the proposal's prescriptive requirements are in the specific code sections applicable to wiring, equipment, and special conditions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-19 Log #3632 NEC-P01 **Final Action: Reject**
(90.2(A)(3))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Revise 90.2(A)(3) as follows:
(3) Installations of conductors and <u>utilization</u> equipment that connect to the supply of electricity <u>at the service point or part of a separately derived system where there is no service point</u>
<u>*FPN*: The Institute of Electrical and Electronics Engineers, Inc. ANSI C2-2007, *National Electrical Safety Code* contains information covering the supply of electricity and street and area lighting under the exclusive control of utilities for utility facilities and functions of generation, transmission, and distribution of electricity, lumens, communication signals, and communication data located on the line side of the service point.</u>
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)FPN new, 90.2(B) FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.
This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.
* Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.
Specifically, the rationale for this change is to add the text "at the service point or part of a separately derived system" to correlate with the scope of the NESC where the NESC covers utility facilities and functions up to the service point. This provides for distinction between premises wiring and supply side facilities relative to the service point as defined in both the NEC and NESC. The added fine print note provides a correlation reference with the NESC regarding equipment that could be on private property that are under the exclusive control of the utility. See Rule 011C and informational notes to Rules 011B and 011C in the 2007 NESC.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not enhance clarity or usability. In addition, the panel reaffirms its action and position on Comment 1-1 in the 2007 Annual Revision Cycle Report on Comments.
The submitter has not addressed any of these issues.
See the panel statement on Proposal 1-17.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
ANTHONY, M.: Please refer to comment on Proposal 1-17.
BARRIOS, L.: Since electrical installations in the US must be installed in accordance with the NEC or the NESC, depending on the location of the installation in relation to the service point, it is appropriate for the NEC to reference the NESC, and likewise for the NESC to reference the NEC. The NESC provides important installation requirements on the utility side of the service point. The panel action should have been to Accept in Part, accepting re-inserting the FPN reference to the NESC in 90.2(A)(3) but not the remainder of the proposal.
LABRAKE, JR., N.: Proposal 1-19 should have been <u>accepted</u>. Refer to my ballot statements on Proposals 1-17 and 1-29.

1-20 Log #3130 NEC-P01 **Final Action: Reject**
(90.2(A)(5) (New))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Add new 90.2(A)(5) as follows:
<u>(5) Supervised installations of</u>
<u>a. underground mines and self-propelled mobile surface mining machinery and its attendant electrical trailing cable where not covered by other regulations, or</u>
<u>b. a campus arrangement, or</u>
<u>c. an industrial complex, or</u>
<u>d. utility interactive systems that are not under the exclusive control of utilities.</u>
<u>*FPN*: Supervised installations have conditions of maintenance and engineering supervision to ensure that only qualified persons monitor and service the system.</u>
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents *. A companion proposal regarding "mining installations" is submitted to 90.2(B)(2).
*Refer to the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 in Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (<u>http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006</u> and <u>http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf</u>).
Specifically, the rationale for this change is that the new text provides for distinction between premises wiring and supply side facilities in mining areas relative to the service point as defined in both the NEC and NESC. This clarifies where the NEC applies to equipment installed within premises wiring where restricted access is supervised. A new fine print note is added to describe "supervised installation" in clarifying its meaning. Other regulations such as MSHA would apply to mining operations and this is covered in a companion proposal to 90.2(B)(2).
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the existing 4 items in 90.2(A)(1), (2), (3), and (4).
The code is applicable in accordance with the provisions in 90.2(A)(1), (2), (3), and (4) whether the facility is "supervised" or "unsupervised".
The submitter provided inadequate substantiation for this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Campus environments need to recover economies of scale. The single building-single system model does not suit our industry well enough. A definition of supervised installation will permit more effective risk characterization and realize the economies of scale which are present in campuses – groups of buildings – that are under a single management.

LABRAKE, JR., N.: Proposal 1-20 should have been accepted-in-principle. Based on the Panel discussion, in this proposal's text item (a), "not covered by other regulations" could have an Advisory Note to clarify these such as associated with 30CFR Parts 56, 57, 75, and 77 in the U.S. In addition, refer to my ballot statements on Proposals 1-17 and 1-29.

1-21 Log #627 NEC-P01 **Final Action: Reject**
(90.2(A)(5) and (6))

Submitter: Teri Dwyer, Wyoming, MN
Recommendation: Add new text to read as follows:

(5) Existing Electrical Installations.
Existing electrical installations that do not comply with the provisions of this Code shall be permitted to be continued in use provided the existing installation was code compliant at the time of original installation, or the authority having jurisdiction determines that the lack of conformity with this code presents an imminent danger to occupants. Where changes are required for correction of hazards, a reasonable amount of time shall be given for compliance, depending on the degree of the hazard.
(6) Additions, Alterations, or Repairs.
Additions, alterations, or repairs to any building, structure, or premises shall conform to that required of a new building without requiring the existing building to comply with all the requirements of this Code provided the existing installation was code compliant at the time of original installation. Additions, alterations, installations, or repairs shall not cause an existing building to become unsafe or to adversely affect the performance of the building as determined by the authority having jurisdiction. Electrical wiring added to an existing service, feeder, or branch circuit shall not result in an installation that violates the provisions of the Code in force at the time the additions are made.
Substantiation: The majority of this language exists in the 2005 NEC Annex G.80.9. Since it is in Annex G it is not enforceable unless specifically adopted. Putting this in the body of the NEC will provide the AJH code language that is enforceable and applicable with existing installations, additions, alterations or repairs. Currently, there is no language in the NEC to address the situation an electrical inspector often finds himself or herself in, while performing an inspection they observe violations of the NEC that is outside the scope of the permitted work that they are there to inspect. Most inspectors will address the code violations with the contractor and building owner, however, unless there is a local ordinance, legally the inspector is powerless to require compliance.

The other model codes have similar language:

06 IRC R102.7.1 Additions, alterations or repairs.

Additions, alterations or repairs to any structure shall conform to the requirements for a new structure without requiring the existing structure to comply with all of the requirements of this code, unless otherwise stated. Additions, alterations or repairs shall not cause an existing structure to become unsafe or adversely affect the performance of the building.

06 IBC 102.6 Existing structures.

The legal occupancy of any structure existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically covered in this code, the International Property Maintenance Code or the International Fire Code, or as is deemed necessary by the building official for the general safety and welfare of the occupants and the public.

06 IMC 102.2 Existing Installations.

Except as otherwise provided for in this chapter, a provision in this code shall not require the removal, alteration or abandonment of, nor prevent the continued utilization and maintenance of, a mechanical system lawfully in existence at the time of the adoption of this code.

06 IPC 102.2 Existing Installation.

Plumbing systems lawfully in existence at the time of the adoption of this code shall be permitted to have their use and maintenance continued if the use, maintenance or repair is in accordance with the original design and no hazard to life, health or property is created by such plumbing system.b
Panel Meeting Action: Reject
Panel Statement: 90.2 relates to what is covered and not covered by the NEC.

The proposed text more appropriately belongs in Annex H – Administration and Enforcement. Annex H can be adopted by the local jurisdiction adopting the NEC, if administrative and enforcement provisions are not already in place.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:

ANTHONY, M.: We agree with the panel statement that this language is better placed as a proposal for Annex H. It can be a model for adopting jurisdictions. At the state level there would be time needed for digestion.

I disagree with the panel statement, however; that this material is not suitable for 90.2. My concern is for how this plays out at state building commissions. I encourage the submitter to re-craft and submit in the ROC stage.

1-22 Log #1537 NEC-P01 **Final Action: Reject**
(90.2(A)(5) and (6))

Submitter: Richard Hollander, City of Tucson
Recommendation: Add new text as follows:

(5) Existing Installations.

Existing electrical installations that do not comply with the provisions of this Code shall be permitted to be continued in use provided the existing installation was code compliant at the time of original installation, or the authority having jurisdiction determines that the lack of conformity with this Code presents an imminent danger to occupants. Where changes are required for correction of hazards, a reasonable amount of time shall be given for compliance, depending on the degree of the hazard.

(6) Additions, Alterations, or Repairs.

Additions, alterations, or repairs to any building, structure, or premises shall conform to that required of a new building without requiring the existing building to comply with all the requirements of this Code provided the existing installation was code compliant at the time of original installation. Additions, alterations, installations, or repairs shall not cause an existing building to become unsafe or to adversely affect the performance of the building as determined by the authority having jurisdiction. Electrical wiring added to an existing service, feeder, or branch circuit shall not result in an installation that violates the provisions of the Code in force at the time the additions are made.
Substantiation: The majority of this language exists in the 2008 NEC Annex H 80.9. Since it is in Annex H, it is not enforceable unless specifically adopted. Putting this in the body of the NEC will provide the AHJ code language that is enforceable and applicable with existing installations, additions, alterations or repairs. Currently, there is no language in the NEC to address the situation an electrical inspector often finds himself or herself in, while performing an inspection they observe violations of the NEC that is outside the scope of the permitted work that they are there to inspect. Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:

ANTHONY, M.: Please refer to my statement on Proposal 1-21.

1-23 Log #3137 NEC-P01 **Final Action: Reject**
(90.2(B), FPN (New))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Add Fine Print Note to 90.2(B) following 90.2(B)(5):
FPN: See Figure 90.2 for information on the line side of the service point that 90.2(B) lists as not covered by this Code.
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.
*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.

asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change is to add a new fine print note to 90.2(B) for referring to the proposed new illustration on 90.2 of what is not covered by the NEC similar to the FPN in 250.1 to reference Figure 250.1.

Panel Meeting Action: Reject

Panel Statement: The FPN reference to Figure 90.2 is unnecessary due to the action taken on proposal 1-12.

See the panel action and statement on proposal 1-12.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Proposal 1-12.

LABRAKE, JR., N.: Proposal 1-23 should have been accepted-in-principle. The concept of the figure in Proposal 1-12 discussed in the panel was thought to be more appropriate as Annex material or as an example in Chapter 9 of the Code. The Advisory Note reference proposed would refer to the new Annex based on my ballot statement on Proposal 1-12 if the Panel accepted-in-principle. In addition, refer to my ballot statement on Proposal 1-29.

1-24 Log #3132 NEC-P01 **Final Action: Reject**
(90.2(B)(1))

Submitter: Neil F. LaBrake, Jr., National Grid USA

Recommendation: Revise 90.2(B)(1) as follows:

(B) Not Covered. This Code does not cover the following:

(1) Installations in ships, watercraft other than floating buildings, railway rolling ~~stock~~ equipment, aircraft, or automotive vehicles other than mobile homes and recreational vehicles

Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents *. A companion proposal regarding "railway rolling stock equipment" is submitted to 90.2(B)(3).

*Refer to the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 in Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf).

Specifically, the rationale for this change is to correlate the term "railway rolling equipment" according to the 2007 NESC Rule 011.D.

Panel Meeting Action: Reject

Panel Statement: The proposal does not enhance clarity or usability.

The term "railway rolling equipment" is undefined. There is insufficient substantiation provided indicating that the term "railway rolling stock" is not the term in common use.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-25 Log #3133 NEC-P01 **Final Action: Reject**
(90.2(B)(2))

Submitter: Neil F. LaBrake, Jr., National Grid USA

Recommendation: Revise 90.2(B)(2) as follows:

(2) Installations underground in mines and self-propelled mobile surface mining machinery and its attendant electrical trailing cable where covered by governmental regulations

Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents *. A companion proposal regarding "mining installations" is submitted to 90.2(A)(5).

*Refer to the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 in Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf).

Specifically, the rationale for this change is to clarify that these installations where not covered by the NEC are covered elsewhere such as by the Mine Safety Health Administration (MSHA). Where these other regulations do not exist for mining operations, a companion proposal to 90.2(A)(5) is made for the NEC to cover these installations.

Panel Meeting Action: Reject

Panel Statement: The recommendation does not enhance clarity or usability. The submitter did not provide sufficient substantiation specific to this issue.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LABRAKE, JR., N.: Proposal 1-25 should have been accepted-in-principle. Based on the Panel discussion, in this proposal's new text, "where covered by governmental regulations" could have an Advisory Note to clarify these such as associated with 30CFR Parts 56, 57, 75, and 77 in the U.S. In addition, refer to my ballot statements on Proposals 1-17 and 1-29.

1-27 Log #3135 NEC-P01 **Final Action: Reject**
(90.2(B)(4) and (5), FPN)

Submitter: Neil F. LaBrake, Jr., National Grid USA

Recommendation: Revise the Fine Print Note to 90.2(B)(4) and (5) as follows:

FPN to (4) and (5): Examples of utilities may include those public or private entities that are typically designated or recognized by governmental law or regulation by public service/utility commissions and that install, operate, and maintain electric supply (such as generation, transmission, or distribution systems) or communication systems (such as telephone, CATV, Internet, satellite, or data services) to the service point. Utilities may be subject to compliance with codes and standards covering their regulated activities as adopted under governmental law or regulation. Additional information can be found through consultation with the appropriate governmental bodies, such as state regulatory commissions, the Federal Energy Regulatory Commission, and the Federal Communications Commission. Exclusive control generally covers installation, ownership, restricted access, operation, and maintenance by qualified and authorized persons. Restricted access covers areas where exclusive control is maintained.

Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.

*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change is:

1. To add "public or private" to correlate with 2007 NESC Rule 011A. A private utility is one that is under governmental oversight such as rural electric cooperatives based on the May 11, 1935, Roosevelt signed Executive Order No. 7037 establishing the Rural Electrification Administration (REA) and subsequently in 1994, transferred to a new agency, the Rural Utilities Service (RUS). The added text "to the service point" is to correlate with the scope of the NESC where the NESC covers utility facilities and functions up to the service point. Utilities operating under the NESC are required to maintain control over the supply system up to the service point to assure that:

a. The system is engineered to meet the requirements of expected conditions and

b. The personnel installing, maintaining, and operating the system and its components are qualified to do so, adequately supervised under good engineering practice and use appropriate tools and safe work procedures, as specified in the NESC rules.

2. To add the last 2 sentences to describe the meaning of exclusive control and restricted access.

Panel Meeting Action: Reject

Panel Statement: The recommendation does not enhance clarity or usability, the submitter did not provide adequate substantiation specific to this proposal to warrant the change, and the NESC/NEC task group was unable to reach consensus.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: This proposal is one of a group of proposals which, if taken as a whole and accepted, would get us closer to harmonization of the NEC and the NESC – a shared goal that is in the interest of both groups and in the interest of the industry at large. Unfortunately, the NEC development process does not make it easy to make the simultaneous and coordinated changes necessary for the harmonization we all want. Therefore the explanation of how we hope to help the harmonization process, refer to our comment on Proposal 1-17.

Coupled with terms like supervised installation, area lighting, premises wiring and others submitted by the Edison Electric Institute and the American Public Power Assocations, we have a complete body of thought regarding NESC and NEC boundary issues.

LABRAKE, JR., N.: Proposal 1-27 should have been accepted-in-principle. The Panel was concerned that the last sentence added to the Fine Print Note contains mandatory text. This could have been changed by the Panel for example as “Restricted access generally covers areas that are separated from public access by a spatial or physical barrier, such as an equipment enclosure, and that are accessible only under exclusive control.” In addition, refer to my ballot statements on Proposals 1-17 and 1-29.

Comment on Affirmative:

FISKE, W.: It is important for panel 1 to continue to reject the proposal. There is confusion over the divisions between NEC and NESC, utility and non-utility work as it is. Thus far, every NEC proposal advanced has been unhelpful at best when it comes to removing the confusion. The extent of the confusion was illustrated by a paper on arc-flash hazards published in the November/December 2008 issue of IEEE Transactions on Industry Applications. In the article, the authors suggested outsourcing high-energy maintenance work to one’s electric utility “because electric utilities are exempt from compliance with the NEC, Article 90.2(B)(5)(c).” If any change is needed in 90.2(B)(5), it is one containing a clear statement that the requirements of the NEC apply to all in its scope, regardless of the work “normally” performed by any given worker or organization. This may be abundantly clear to CMP-1 members, but it is obviously not clear to all Code users, including some electrical safety specialists.

MCCARVER, R.: ATIS votes to affirm the Panel 1 action on this proposal because the concept of a service point does not apply to communications systems or applies differently than to a power utility interface. In addition, exclusive control does not always imply ownership. See my comment on Proposal 1-12.

1-28 Log #2079 NEC-P01 **Final Action: Reject**
(90.2(B)(4), FPN (New))

Submitter: Steve C. Dryden, Poole Fire Protection, Inc. / Rep. NFPA TC on Telecommunications

Recommendation: Add a new FPN.

For information on cable and equipment requirements in telecommunications facilities not covered by this code, see NFPA 76, Standard for the Fire Protection of Telecommunications Facilities.

Substantiation: The typical facility that qualifies for the exemption from the NEC because it is an installation of “communications equipment under the exclusive control of communications utilities located outdoors or in building spaces used exclusively for such installations” is a facility that provides telecommunications services. Fire resistance requirements for cables and equipment in these exempt facilities are covered by NFPA 76, Standard for the Fire Protection of Telecommunications Facilities. The NFPA Technical Committee on Telecommunications is responsible for NFPA 76. This proposal was developed by the Technical Committee at a pre-ROP meeting and is being submitted by the chairman on behalf of the Technical Committee.

Panel Meeting Action: Reject

Panel Statement: 90.2(A) and (B) address what is covered and not covered in the NEC; FPNs are informational and unenforceable in the NEC.

In addition, NFPA 76 is specific to fire protection of telecommunications facilities; NFPA 76 does not apply to telecommunications rooms used to provide private telecommunications services.

Code-Making Panel 1 has determined that the FPN is unnecessary.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-29 Log #3136 NEC-P01 **Final Action: Reject**
(90.2(B)(5))

Submitter: Neil F. LaBrake, Jr., National Grid USA

Recommendation: Revise 90.2(B)(5) and add new second paragraph and fine print note as follows:

(5) Installations under the exclusive control of an electric utility where such installations

a. Are for utility facilities and functions for the purpose of communications, metering, generation, control, transformation, transmission or distribution of electric energy, lumens, communications data, or signals, or

b. Are street and area lights providing a supply of lumens where these facilities are supplied by underground or overhead conductors, or

~~a.~~c. Consist of service drops or service laterals, and associated metering~~, or~~

~~b. Are located in legally established easements or rights-of-way designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction for such installations, or~~

~~c. Are on property owned or leased by the electric utility for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy.~~

The locations of utility supply conductors and equipment on the line side of the service point are: on property owned or leased by the electric utility; or in legally established easements or rights-of-way; or by other agreements (written or by condition of service) that are either designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction, or governing bodies where unregulated. Agreements include locating utility supply facilities where typical easements or rights-of-way are unobtainable on property for Federal Lands, Native American Reservations through the U.S. Department of the Interior Bureau of Indian Affairs, military bases, lands controlled by port authorities and State agencies and departments, and lands owned by railroads.

FPN: See ANSI C2-2007, *National Electrical Safety Code* for information that covers utility street and area lighting that are a lighting distribution system under the exclusive control of utilities providing lumens on public or private property.

Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees’ Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under “other agreements”. I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment. Please refer to my attached report “*Supporting the Change to 90.2(B)(5) of the 2008 NEC*” on this activity dated Nov. 4, 2008; Adobe document file name: “Report of Support to Change NEC90_2_B_5 LaBrake_11 04 2008.pdf”.

This is the main action to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words “or by other agreements” as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.

*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the following is the rationale for this change:

1. The list items are for installation types and correlate with what is covered by Rule 011A, B, and C in the 2007 NESC. The new second paragraph separates the location aspect of the original 90.2(B)(5)(b) and (c). Refer to companion proposal to 90.2 adding a new Figure 90.2 to illustrate the covered and not covered areas by the NEC.

2. New text item 90.2(B)(5)a is added to correlate with Rules 011A and 011B in the 2007 NESC. Included lumens as a service supplied by a utility. This addition improves the description of the act of what is being controlled exclusively under utilities. It is noted that NESC rules cover the lower voltage wiring within a supply station installed and/or maintained under the exclusive control of utilities that is necessary for the operation of the supply station and is not to be associated with utilization wiring relative to the NEC.

3. New text item 90.2(B)(5)b is added to correlate with Rule 011C in the 2007 NESC.

4. Existing text item 90.2(B)(5)a becomes 90.2(B)(5)c for listing clarity and to follow the sequence from supply to service point. This follows the illustration diagram proposed as Figure 90.2 in a companion proposal.

5. The new second paragraph separates the utility exclusively controlled items from the 2008 NEC 90.2(B)(5) for those situations associated with property locations and provides for distinction between premises wiring and supply side facilities relative to the service point as defined in both the NEC and NESC. This new paragraph incorporates text from former 90.2(B)(5)b and 90.2(B)(5)c and clarifies by correcting a grammatical error in the 2008 NEC from the addition of the word "or" between "easements" and "rights-of-way". The final text item in this new paragraph's first sentence appropriately associates text that is specific only to "other agreements" and

· Provides clear and unambiguous text for 90.2(B)(5) with respect to utility installations where easements and rights-of-way cannot legally be obtained for their installations on the line side of the service point.

· Recognizes that there are areas in which an easement or right-of-way cannot legally be obtained and provides text to permit "other agreements" under the utility's conditions of service (e.g. tariffs with service applications) for those installations. A list in the second sentence is provided to aid the code user in determining where this permission will apply.

· The list identifies where easements or rights-of-way cannot be obtained from entities such as Federal Lands (e.g., military bases, National Parks, National Forests, National Battlefields, Bureau of Land Management property), local agencies (e.g., Port Districts and Airport Authorities), Native American Sovereign Lands/Indian Reservations (through the U.S. Department of the Interior Bureau of Indian Affairs), lands controlled by State agencies and departments, and lands owned by railroads.

· These agreements can be recognized for the location of electric facilities by and under the exclusive control of utilities on property by the proper Federal and State authorities having jurisdiction. This is the prime concern that this proposed change to 90.2(B) will correct the problem affecting the utilities' provision to supply electricity according to the National Electrical Safety Code (NESC) on those properties mentioned above as identified in the adoption process of the 2008 NEC.

6. Governing bodies where not regulated refers to a private utility that is under governmental oversight such as rural electric cooperatives based on the May 11, 1935, Roosevelt signed Executive Order No. 7037 establishing the Rural Electrification Administration (REA) and subsequently in 1994, transferred to a new agency, the Rural Utilities Service (RUS).

7. By accepting the new second paragraph, substantial problems can be avoided for electric utilities and their customers where certain entities do not grant easements or allow rights-of-way to utility supply facilities. Conflicts would have to be resolved at regulatory bodies, the state, or local jurisdictional level through local revision of the NEC scope in its adoption process if this change is not accepted. As such, confusion can be and is generated in the field regarding installations where legally acquired easements and rights-of-way cannot be obtained.

8. The added fine print note to 90.2(B)(5) is to clarify the intent how this area lighting term is used in 2007 NESC Rule 011C. Adding this fine print note to 90.2(B)(5) in the NEC will provide for correlation with both the NEC and the NESC documents' purpose and scope sections. Area lighting is provided by utilities on public and private property where there may not be a premises wiring system involved and, therefore, no service point. A new definition of "area lighting" is being proposed in the NESC at this time.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that the recommendation does not enhance clarity or usability and reaffirms its action and position on Comment 1-1 in the 2007 Annual Revision Cycle Report on Comments relative to adding a FPN reference to the NESC.

The submitter has not adequately addressed any of these issues. Sufficient substantiation has not been provided to substantiate this specific recommendation.

NFPA and IEEE appointed a Task Group to address correlation issues between the NEC and the NESC and no consensus was reached.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Proposal 1-27.

LABRAKE, JR., N.: Proposal 1-29 should have been <u>accepted-in-principle</u>. This proposal was one of a group of proposals that were intended to clarify and delineate a clear and distinct line between the applicability of the NEC and the NESC. It is important to note that this proposal's substantiation refers to a report that was attached to Proposal 1-107, which provides much of the supporting rationale to make the change. The Panel should have considered revising the text to note that other agreements are written and incorporate the style shown in Proposal 1-30 and the concept of outside a building introduced in Proposal 1-31.

The panel statement and the discussion during the meeting raised several common issues that need further discussion and a reconsideration of the panel action.

1. The first of these is the common panel statement that "the proposal does not enhance clarity or usability." This misses the whole point of why these were even submitted. The NEC and the NESC are both ANSI safety codes when used within their context. The purpose of these proposals was not to change the Code but to harmonize the NEC with the NESC <u>at their common point</u>. As such, each individual proposal does not necessarily "enhance the clarity or usability" of the Code but taken as a whole and in interaction with other codes such as the NESC, they do. This was the purpose of stating that they were part of a group in the substantiation and reviewing them as a CMP-1 Task Group beforehand. The clarity and usability they provide is delineating a clear and distinct line between the applicability of the NEC and the NESC.

2. The second common panel statement was a lack of substantiation. This is a somewhat inaccurate statement and, as I pointed out to the full panel in our discussion, there were 29 pages of substantiation after proposal 1-107 that pertained to all companion proposals: 1-9, -12, -15, -16, -19, -20, -23, -24, -25, -26, -27, -29, -79, -104, and -107 and 4-7, 4-14, and 4-18. In addition, several proposals by other submitters are included with this topic and stand on their own separate substantiations.

3. The next commonly stated panel statement was that the "NESC-NEC Ad Hoc Task Group did not reach consensus." While true, this should not be considered a strong reason for rejection and it was not stated as such in this proposal's substantiation. If that is true, every public proposal received from an individual could conceivably be rejected for that reason. At the IAEI Section meetings several proposals were voted on to submit to the International Office for submission, which were only required to meet a <u>MAJORITY VOTE</u> in order to be accepted. So, in light of the Panel statement this has little bearing for the proposal to be publicly reviewed on its own merit.

But ignoring that part, these proposals were submitted without consensus (but a majority viewpoint) of the NESC-NEC Ad Hoc Task Group in order to start the process of harmonization. The timing of this was such that the NEC ROP and ROC period for this cycle will take place between the NESC equivalent periods. The NESC proposals related to this harmonization were submitted to meet a July 17, 2008 deadline and the NESC cycle was discussed with the Panel where the public comment period on NESC proposals is Sep. 2009-May 2010. The conjunction of these dates, because of the dissimilar revision schedules of the two documents, will not occur again until the revisions for the 2026 NEC (and the 2027 NESC). Losing this opportunity will not eliminate the possibility of harmonization but it will significantly slow the process.

There were also issues raised during the discussion of these Proposals that need further review. The first is the statement, said many times, that "utilities could use the NEC and, by the way, why don't they?" It just isn't that simple.

1. Both the NEC and the NESC create a safe installation <u>within the context of each code</u>. But moving from one to the other is a dangerous task. As was said in Jim Pauley's Comment 1-1 (Proposal 1-4) for the A2007 NEC ROC, there are conflicts between the two codes. Here's an example: the NEC requires bonding of metal structural items that are "likely to be energized." Obviously, that would include fences around substations. Except that in the case of an underground installation, there would be no requirement in the NEC. However, there is one in the NESC; Rule 110A1.

2. So the next question is "why not incorporate those aspects into the NEC?" This gets to the heart of the differences between the two codes. The NESC is less of a prescriptive document than the NEC. Adding just a part of one document into the other alters the context of each code and, as noted earlier, each is a safe code <u>within</u> the context of that code. The context includes not just the sections of each code but also the work practices and construction standards used to achieve the required safety.

The next issue raised was the question of "where is the problem?" or "what is restricted?"

1. As was noted in the panel discussion, "other agreements" was accepted in the A2001 NEC ROC. The panel statement for Comment 1-26a (Proposal 1-10) that placed those words in the 2002 NEC states "The wording was added to identify access by easements, rights-of-way or by other agreements associated with the authority of public service commissions, utility commissions, or other regulatory agencies having jurisdiction is to clarify that those agencies generally have authority over those types of installations and establish the rules under which they are governed." Further the Panel stated "The utility industry's right to produce and distribute electrical energy using NESC rules or whether this industry should be prohibited or excluded from installing any type of lighting has never been an NEC issue."

2. The comment that removed the phrase "other agreements" in the A2007 NEC ROC took that phrase away from its context of association with regulatory bodies that govern utilities and mandate the codes they follow in the installation, operation, design, and maintenance of those facilities. The result is an "out of context" interpretation that contains extreme statements. As was noted in the ballot for Comment 1-3 (Proposal 1-5) in the A2007 NEC ROC, "The commenter's claim that `the use of the term "or by other agreement" is in essence, a total exemption of the NEC for utilities" is not true." The ballot further explains that the agreements referred to are from regulatory agencies. In other words, the substantiation for the removal was taken out of context.

3. Additionally, the 2008 NEC has not been in effect in many locations for a long enough time for the removal of this phrase to be a problem. The best that can be done is list specific instances where the problem might occur depending on local interpretation. And that points out why these were submitted in the first place: <u>the need to clarify where the dividing line is</u>.

Therefore, 90.2(B)(5) should then read as follows with a new item 90.2(B)(6):

(5) Installations under the exclusive control of an electric utility where such installations

a. Are for utility facilities and functions for the purpose of communications, metering, generation, control, transformation, transmission or distribution of electric energy, lumens, communications data, or signals, or

b. Are for street and area lights providing a supply of lumens where these facilities are supplied by underground or overhead conductors, or

c. Consist of service drops or service laterals, and associated metering.

(6) Locations of utility supply conductors and equipment on the line side of the service point that are an integral part of the exclusive control of an electric utility where such installations

a. Are on property owned or leased by the electric utility, or

b. Are located in legally established easements or rights-of-way, or

c. Are located by other agreements, written or by condition of service, that meet the requirements that are either designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction, or governing bodies where unregulated, provided further that such installations are outside a building or terminate immediately inside a building wall. Agreements include locating utility supply facilities where typical easements or rights-of-way are unobtainable on property for Federal Lands, Native American Reservations through the U.S. Department of the Interior Bureau of Indian Affairs, military bases, lands controlled by port authorities and State agencies and departments, and lands owned by railroads.

Advisory Note: See ANSI C2-2007, *National Electrical Safety Code* for information that covers utility street and area lighting that are a lighting distribution system under the exclusive control of utilities providing lumens on public or private property.

Comment on Affirmative:

FISKE, W.: See my Comment on Affirmative on Proposal 1-27 (Log #3135).

MCCARVER, R.: See my Affirmative with Comment on Proposal 1-12.

SASSAMAN, H.: The NEC should apply to installations on the load side of the service point regardless of who does the work. The NESC should apply to the supply side of the service point regardless of who does the work. The term "other agreements" is ambiguous and has significant potential for resulting in a hole in the Code that utilities or other entities might use an excuse or exemption from complying with the NEC for installations that otherwise would be required to.

1-30 Log #3444 NEC-P01 **Final Action: Reject**
(90.2(B)(5))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise 90.2(B)(5) as follows in a new 90.2(B)(5) and new 90.2(B)(6):

(5) Installations under the exclusive control of an electric utility where such installations

a. Are for utility facilities and functions for the purpose of communications, metering, generation, control, transformation, transmission or distribution of electric energy, lumens, communications data, or signals, or

b. Are street and area lights providing a supply of lumens where these facilities are supplied by underground or overhead conductors, or

~~a.~~c. Consist of service drops or service laterals, and associated metering.~~, or~~

~~b. Are located in legally established easements or rights-of-way designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction for such installations, or~~

~~c. Are on property owned or leased by the electric utility for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy.~~

(6) Locations of utility supply conductors and equipment on the line side of the service point that are an integral part of the exclusive control of an electric utility where such installations

a. Are on property owned or leased by the electric utility, or

b. Are located in legally established easements or rights-of-way, or

c. Are located by other agreements, written or by condition of service, that are either designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction, or governing bodies where unregulated. Agreements include locating utility supply facilities where typical easements or rights-of-way are unobtainable on property for Federal Lands, Native American Reservations through the U.S. Department of the Interior Bureau of Indian Affairs, military bases, lands controlled by port authorities and State agencies and departments, and lands owned by railroads.

Substantiation: Overview

Generally, most electric utility installations' generation, transmission and distribution (including lighting and metering) are covered by the National Electrical Safety Code (NESC). However, electrical installations in office buildings, warehouses, vehicle garages, etc. are covered by the National Electrical Code (NEC). In the 2008 NEC revision process, the NEC Committee changed the portions of the NEC that discuss what is covered by the NEC and what is not-covered.

The 2008 NEC revision, of which the EEI opposed *, could be very detrimental to the electric utility. This causes some installations that were typically done according to the NESC to be required under the NEC. The issues surround the removal of language that electric utility installations made in accordance with "other agreements" that are recognized by public utility or public service commissions could be done under the NESC and removal of references to the NESC for certain medium and high voltage installations that are not adequately addressed in the NEC. The members of the NEC consensus body were concerned with work being done by utilities in some isolated cases on the customer side of the service point and that the "other agreements" language clearly refers only to the utility or supply side of the service point. EEI is working with its electric utility representatives and other interests to resolve this conflict in the purpose and scope of the NEC and the NESC.

* Refer to the NFPA 2007 Annual Meeting Transcript (http://www.nfpa.org/assets/files/PDF/CodesStandards/A07TranscriptFinal.pdf) pertaining to this issue in Code Making Panel 1 of NFPA 70.

The Issue

A major concern for electric utilities is the NEC 2008 version of Section 90.2(B)(5). This section has been revised and omits language that excludes utilities from permitting to locate and build transmission and distribution lines to serve customers that do not have formal easement or rights-of-ways contracts. These customers include various federal lands, Native American sovereign lands and Indian reservations, and lands controlled by State or Local Agencies and Departments or railroads. The exclusion of the term "other agreements", removes one of the primary ways utilities get permission to locate and construct lines that serve these customers. This change to the 2008 NEC places facilities covered by the term "other agreements" under NEC jurisdiction. This same section in the 2005 NEC and previous versions of the Code recognized that rights-of-ways, easements and "other agreements" are not covered by the NEC but these facilities are governed by the National Electrical Safety Code (NESC) subject to state commission oversight.

To the extent a utility needs to rely on the right-of-way provision, rights-of-way are typically granted directly by landowners and are not usually "designated" or even necessarily formally "recognized" by state commissions or other regulatory agencies. The NEC does not cover transmission and distribution facilities under the exclusive control of utilities. However, other types of facilities that might affect the utility by the change of wording in 90.2(B)(5) include area lighting, such as street and parking lot lighting, and other utility-installed facilities that have been viewed as utility-controlled for safety purposes but might not be part of a T&D system. This has been brought to question by other NEC interest groups regarding demarcation of responsibilities of utilities providing supply services on private property.

The Impact

The National Electrical Code typically does not cover supply system wiring, since utility wiring falls under another code (the National Electrical Safety Code.) The NEC affects utilities at the "service point" where the utility wiring meets the "customer" wiring. The wording of the Code is very critical to electric utilities, since it can affect the connected loads and other requirements on the utility.

The term "other agreements" omitted in the 2008 NEC results in confusion as to whether the NEC applies to utility facilities on lands of various federal, native American sovereign and Indian reservations, and controlled by State or Local Agencies and Departments or railroads and subject these agreements to an additional layer of NEC requirements over the NESC requirements thereby creating the potential for duplication and conflict between the Code provisions.

Actions

Where the 2008 NEC is adopted as currently written, it will be substantially more complicated for utilities to obtain permission to construct lines that serve customers on Federal lands, Indian lands and Port Authorities, and may make it impossible for utilities to serve these customers.

The 2008 NEC language affects every state and every local authority that does not grant easements or rights-of-ways for their land. For some utilities providing area lighting to customers who request, this area lighting under the exclusive control of the utility would require easements that were formerly covered under service agreements.

At a minimum, the 2008 NEC language can delay construction and raise the overall cost to customers with no increase in safety or reliability. At a maximum, the NEC language can cause customers to be denied service because there is no way to locate and build utility lines to serve them. Thus consumers/customers can be harmed by undue electric service delays and extra costs incurred to address this confusion in establishing rights-of-way for the electric utility equipment on customer property.

EEI is moving forward with educating and informing utilities and their trade allies about responsibilities on either side of the service point and specific related codes at Local and National Levels. Mr. Neil LaBrake, Jr. of National Grid who represents EEI in the NEC Committee made a presentation to the Eastern Section IAEI on "Where the Utility Supply and Premises Wiring Meet" at their 2008 Annual Meeting. The presentation was well received by inspectors, installers, and designers who attended.

EEI continues to seek to clarify the Scopes of both the National Electrical Code and National Electrical Safety Code and supports the "good faith" effort of the NFPA/IEEE NESC-NEC Committees Ad Hoc Task Group. This support is sought to provide a resolution to certain conflicts in scopes regarding electric utility installations, large industrial installations and installations of high voltage wiring and systems of large multi-building complexes claimed to be covered by both NESC and NEC documents.

Specifically, the rationale for change in this proposal is:

1. Separate the installation and location aspects of exclusively controlled utility wiring and equipment presently confusing the list items in 90.2(B)(5).

2. Clarifying the text in the NEC to correlate with what is covered by Rule 011A, B, and C in the 2007 NESC.

3. Including lumens as a service supplied by a utility, which improves the description of the act of what is being controlled exclusively under utilities.

4. That NESC rules cover the lower voltage wiring within a supply station

installed and/or maintained under the exclusive control of utilities that is necessary for the operation of the supply station and is not to be associated with utilization wiring relative to the NEC.

5. Clarifying text item 90.2(B)(5)a to become 90.2(B)(5)c for listing clarity and to follow the sequence from supply to service point.

6. Providing new section 90.2(B)(6) associates those situations with property locations and distinguishes between premises wiring and supply side facilities relative to the service point as defined in both the NEC and NESC.

7. New text item 90.2(B)(6)a is from former 90.2(B)(5)c, which is clarified by this new section's main sentence and proposed list item 90.2(B)(5)a.

8. New text item 90.2(B)(6)b is from former 90.2(B)(5)b, which is clarified by correcting a grammatical error in the 2008 NEC from the addition of the word "or" between "easements" and "rights-of-way".

9. New text item 90.2(B)(6)c appropriately associates text that is specific only to "other agreements" under written form or condition of service such as by tariff for service applications. The list in the second sentence of new 90.2(B)(6)c identifies where easements or rights-of-way cannot be obtained from entities such as Federal Lands (e.g., military bases, National Parks, National Forests, National Battlefields, Bureau of Land Management property), local agencies (e.g., Port Districts and Airport Authorities), Native American Sovereign Lands/Indian Reservations (through the U.S. Department of the Interior Bureau of Indian Affairs), lands controlled by State agencies and departments, and lands owned by railroads. These agreements can be recognized for the location of electric facilities by and under the exclusive control of utilities on property by the proper Federal and State authorities having jurisdiction. This is the prime concern that this proposed change to 90.2(B) will correct the problem affecting the utilities' provision to supply electricity according to the National Electrical Safety Code (NESC) on those properties mentioned above as identified in the adoption process of the 2008 NEC.

This is a companion proposal to the proposed addition of a new definition "exclusive control of utility" in Article 100.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that the recommendation does not enhance clarity or usability.

Sufficient substantiation has not been provided to substantiate this specific recommendation.

NFPA and IEEE appointed a Task Group to address correlation issues between the NEC and the NESC and no consensus was reached.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Proposal 1-17.

BARRIOS, L.: During the 2008 Code cycle, Panel 1 removed the phrase "other agreements" because it was vague and unenforceable. The submitter has provided clarification of what "other agreements" cover in this proposal.

LABRAKE, JR., N.: Proposal 1-30 should have been accepted-in-principle. The Panel should have considered revising the text to note that other agreements are written and incorporate the Advisory Note information shown in Proposal 1-29 and the concept of outside a building introduced in Proposal 1-31. The Panel mistakenly added the reason that the "NESC-NEC Ad Hoc Task Group did not reach consensus" onto Proposal 1-30 that is technically not one of the Ad Hoc proposals, although included with this topic but stands on its own separate substantiation. In addition, refer to my ballot statement on Proposal 1-29.

Comment on Affirmative:

SASSAMAN, H.: The NEC should apply to installations on the load side of the service point regardless of who does the work. The NESC should apply to the supply side of the service point regardless of who does the work. The term "other agreements" is ambiguous and has significant potential for resulting in a hole in the Code that utilities or other entities might use an excuse or exemption from complying with the NEC for installations that otherwise would be required to.

1-31 Log #4575 NEC-P01 **Final Action: Reject**
(90.2(B)(5)(b))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise to read as follows:

Are located in legally established easements, rights of way, or by other agreements either designated by or recognized by public service commissions, or other regulatory agencies having jurisdiction for such installations, provided further that such installations are outside a building or terminate immediately inside a building wall, or...".

Substantiation: This proposal reverts this language to the 2005 wording, but with a proviso that should prevent the objections raised in support of the 2008 proposal. The proviso language comes from 90.2(C) which is the traditional boundary beyond which variances from NEC rules must only issue under 90.4. The current NEC wording is flawed both procedurally and technically.

It is procedurally flawed because it is beyond the scope of the NEC. When this sort of lighting is installed, it is on the line side of any service point. It will never be maintained by the owner, nor either will it be accessed or maintained by an electrical contractor unless that contractor has a subcontracting relationship with the electric utility that owns the luminaire. Therefore, it is beyond the scope of the NEC. The NEC cannot simply decide, on its own initiative, to expand its reach without a corresponding revision of the scope of the NESC. That is not happening.

It is technically flawed because it ignores the consequences of utility ownership of the luminaires. Utility ownership of this lighting follows dictates of the NESC, in all 50 states and in foreign countries under comparable regulation. To assert a safety issue on this lighting is to assert a deficiency in the NESC. Such a deficiency might be evident from loss experience, but no loss experience was cited to support the NEC proposal and comment. That leaves engineering analysis.

The entire premise behind allowing the NESC, substantially different from the NEC, to apply to utility work is a simple one: The organizational permanence, engineering supervision, and workforce training in the utility environment is fundamentally different than for premises wiring. Therefore, different standards can be applied to installations under their exclusive control.

Criticizing the lack of separate equipment grounding (per NESC) or the lack of a service disconnect, or the lack of overcurrent protection out of this context, for example, has as much consistency as criticizing a major industrial occupancy for running a medium-voltage transformer with 250% secondary protection. Now, the industrial occupancy traded off a reduction in secondary protection for enhanced supervision. Is it unsafe? If improperly supervised for the foreseeable future, yes. If properly supervised as contemplated in Table 450.3(A), no. Therefore, is it less safe than the normal 125%? It is plainly acceptable under the terms of our consensus installation standard.

Here's the real point: It's only less safe if you ignore the operational context. That sort of trade-off occurs all over the NEC. By now we're used to it. Similarly, is a street light grounded to the grounded conductor unsafe? If it isn't exclusively under the control of utility personnel for the foreseeable future, yes. If properly operated and controlled as contemplated in the NESC, no. As long as the utilities play by the rules, there is no safety issue, and that is undoubtedly why no loss experience was cited in the 2008 NEC proposal substantiation.

The following drawing, of an actual installation in the submitter's jurisdiction, conclusively demonstrates the problems with the current wording. If CMP 1 chooses to reject this proposal, the submitter expects to read the panel statement with great interest in the hope of learning exactly why the luminaire nearest the drug store, but not the other three luminaires, presents such a hazard that the NEC would try to overturn established utility practice going back over a century. This is not the time, and there is no credible substantiation for the NEC to continue a jurisdictional battle for supremacy with another ANSI standard, and the consequences of continuing the fight on these terms may prove dire indeed for NFPA.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The recommendation does not enhance clarity or usability. The panel reaffirms its action on Comment 1-3 of the 2007 Annual Revision Cycle Report on Comments.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

ANTHONY, M.: This proposal essentially restores previous language that, as far as I have been able to determine, has not caused a problem for either the minority or majority on this issue. As best as I can tell, neither side has presented much in the way of case history where this jurisdictional issue had reached the courts. There was a great deal of anecdotal evidence of third party electrical contractors – working under contract for utilities – that were ignoring NEC installation rules in area lighting, generator, and metering projects. But none have reached the courts.

This proposal is one of a group of proposals which, if taken as a whole and accepted, would get us closer to harmonization of the NEC and the NESC – a shared goal that is in the interest of both groups and in the interest of the industry at large. Unfortunately, the NEC development process does not make it easy to make the simultaneous and coordinated changes necessary for the harmonization we all want.

Some insight into the significance of harmonization of the NEC and NESC for the last mile of power distribution can be found in a document prepared by the National Association of Regulatory Utility Commissioners (NARUC). This document recognizes both documents thus:

NESC: The National Electric Safety Code provides the foundation by which utilities
install electric power systems to meet safety guidelines. Many States require the utilities
to comply with the NESC and other States have their own version of the NESC.

NEC: The National Electric Code establishes the safety standard for non-Company
electrical systems. Many States and localities have their own variation of the NEC.

It is in our interest to resolve this with acceptance of this proposal, or have a third-party resolve it for us. Whenever we hit brick walls like this we should be innovating; innovation in processes, installation best practices or innovation in electrical products themselves. Innovation is a slow process of accretion--building small insight upon interesting fact upon tried-and-true process—that eventually percolates within hard work over time.

LABRAKE, JR., N.: Proposal 1-31 should have been accepted-in-principle. The Panel should have considered revising the text to note that other agreements are written and incorporate the Advisory Note information shown in Proposal 1-29 and the concept of outside a building introduced in this proposal. In addition, refer to my ballot statement on Proposal 1-29.

MCCARVER, R.: The Panel has ignored the arguments in the substantiation of the proposal. The action on Comment 1-3 in the 2008 cycle was a simple accept with a statement the the panel did not necessarily agree with the commenter's substantiation. There is nothing in the panel action on this proposal that addresses the technical merit of its substantiation.

1-32 Log #153 NEC-P01 **Final Action: Accept**
(90.2(B)(5), FPN to (4) and (5))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Change "communication" to "communications".
Substantiation: Section 3.3.3 of the NEC Style Manual States: "**3.3.3 Plural.** Unless referring to a single item of equipment, references to electrical components and parts shall be plural rather than singular. This results in greater consistency and makes it clear that the *NEC* provision refers to *all* components or parts of a given type or class." Changing "communication" to "communications" will correlate with the title of Chapter 8, "Communications Systems"**.**
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-33 Log #1454 NEC-P01 **Final Action: Accept in Principle**
(90.2(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

The authority having jurisdiction for enforcing this Code may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utility that are used to connect the utility supply system to the service ~~entrance~~ conductors of the premises served, provided such installations are outside a building or structure or terminate immediately after emergence into the building or structure.

Substantiation: Edit. The responsibility of the AHJ is already defined in the definition of AHJ. The FPN to the definition of Service-Entrance Conductors, Underground System indicates there may be no service-entrance conductors. The provision should also cover structures which are not deemed "buildings". "Inside a building wall" does not allow for conductors that are on the surface. "After emergence into the building or structure" will allow for conductors covered by 230.6. Service lateral conductors may not be under exclusive control of the utility.
Panel Meeting Action: Accept in Principle

Revise the existing code text to read as follows:

"**(C) Special Permission.** The authority having jurisdiction for enforcing this *Code* may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used to connect the electric utility supply system to the service conductors of the premises served, provided such installations are outside a building or structure, or terminate within service equipment at a location inside nearest the point of entrance of the service conductors."

Panel Statement: The revised wording meets the intent of the submitter and more closely correlates with the existing text in 230.70(A)(1).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

MCMAHILL, L.: The text "within service equipment" and "or terminate within service equipment at a location inside... " should not have been included in the sentence. Understandably, not all service conductors terminate "within service equipment". Some service conductors terminate in vaults or auxiliary gutters. By removing this text, the section will more closely correlate with the existing text in Section 230.70(A)(1).

1-34 Log #3448 NEC-P01 **Final Action: Reject**
(90.2(C))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise 90.2(C) to add a new second paragraph as follows:
(C) Special Permission. The authority having jurisdiction for enforcing this *Code* may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used to connect the electric utility supply system to the service entrance conductors of the premises served, provided such installations are outside a building or terminate immediately inside a building wall.

Within this Code's requirements, other codes and standards and good engineering practice can be recognized by the authority having governmental jurisdiction to apply to specific systems having supervised installation that are under engineering supervision and the control of qualified persons authorized by a regulating or controlling body, such as those associated with an industrial complex or utility interactive system.

Substantiation: Edison Electric Institute bases this proposal on Code Making Panel 1's statement to reject Proposal 1-4 in the A2007 NEC ROP on page 70-3 and Mr. LaBrake's Explanation of Negative to accept Comment 1-1 in the A2007 NEC ROC *.
* Refer to the NFPA 2007 Annual Meeting Transcript (http://www.nfpa.org/assets/files/PDF/CodesStandards/A07TranscriptFinal.pdf) pertaining to this issue in Code Making Panel 1 of NFPA 70.

This proposed second paragraph to 90.2(C) provides for reference in the NEC such as to the NESC for more information to cover special systems such as those 1000 volts and greater. The NESC can cover industrial complexes and utility interactive systems (such as lightly regulated generation plants). See 2007 NESC Rule 011A, second sentence. Refer to companion proposals for a FPN to 90.2(A) and defined term of "supervised installation" in Article 100. Having the Fine Print Note in 90.2(A)(2) reinstated provides information to let the user of the NEC know about the NESC, which adds clarity to the National Electrical Code.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not enhance clarity or usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

ANTHONY, M.: We disagree with the committee's judgment regarding clarity and usability. The work of the task groups produced a recommendation that is clear to us.

BARRIOS, L.: The proposed language introduces latitude for AHJ's to accept other based codes and standards and sound engineering judgement for facilities having competent engineering staff overseeing the design, installation and operation of the facilities. The panel action should have been Accept in Principle and revised to read as follows "The authority having jurisdiction for enforcing this Code can recognize other codes and standards and good engineering practice to specific systems having supervised installations that are under engineering supervision and the control of qualified persons authorized by a regulating or controlling body, such as those associated with an industrial complex or utility interactive system".

LABRAKE, JR., N.: Proposal 1-34 should have been accepted-in-principle. The text "can be recognized" can be changed to "shall be permissible" to be in accordance with 3.1.2 of the NEC Style Manual.

The panel statement "the proposal does not enhance clarity or usability" misses the whole point of why this was even submitted. The NEC and the NESC are both ANSI safety codes when used within their context. The purpose of these proposals was not to change the Code but to harmonize the NEC with the NESC at their common point. As such, this proposal probably does not necessarily "enhance the clarity or usability" of the Code but taken as a whole and in interaction with other codes such as the NESC, it does.

Both the NEC and the NESC create a safe installation within the context of each code. But moving from one to the other is a dangerous task. As was said in Jim Pauley's Comment 1-1 (Proposal 1-4) for the A2007 NEC ROC, there are conflicts between the two codes. Here's an example: the NEC requires bonding of metal structural items that are "likely to be energized." Obviously, that would include fences around substations. Except that in the case of an underground installation, there would be no requirement in the NEC. However, there is one in the NESC; Rule 110A1. There are differences between the two codes. The NESC is less of a prescriptive document than the NEC. Adding just a part of one document into the other alters the context of each code and each is a safe code within the context of that code. The context includes not just the sections of each code but also the work practices and construction standards used to achieve the required safety. Thus, the need for prescriptive text in 90.2(C) in the NEC to provide the enforcer of the NEC the means to use the NESC or other related industry standards where additional information is able to be used.

1-35 Log #4565 NEC-P01 **Final Action: Reject**
(90.3)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
90.3 Code Arrangement.

This Code is divided into the introduction and nine chapters, as shown in Figure 90.3. Chapters 1, 2, 3, and 4 apply generally; Chapters 5, 6, ~~and~~ 7 and 8 apply to special occupancies, special equipment, ~~or other~~ special conditions or communications systems. These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, ~~and~~ 7 and 8 for the particular conditions.
~~Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8.~~
Chapter 9 consists of tables.

Annexes are not part of the requirements of this Code but are included for informational purposes only.
The same changes are needed in Figure 90.3, as shown below.

Chapter 1 – General Chapter 2 - Wiring and Protection Chapter 3 - Wiring Methods and Materials Chapter 4 - Equipment for General Use	Applies Generally to All Electrical Installations
Supplements or Modifies Chapters 1 through 4	Chapter 5 - Special Occupancies Chapter 6 - Special Equipment Chapter 7 - Special Conditions Chapter 8 – Communications Systems
~~Chapter 8 - Communications Systems~~	~~Chapter 8 is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8.~~
Chapter 9 – Tables	Applicable as Referenced
Annex A through Annex H	Informational only; not mandatory

Substantiation: It is important to make this change because the safety implications of the wiring in Chapter 8 should be discussed at a level that exceeds that of CMP 16, which has total responsibility now (subject, of course, to the oversight of the Technical Correlating Committee). One example to consider is grounding of wires, cables and conductors, which is addressed, of course, in Article 250, which Chapter 8 does not need to follow. The wiring covered by Chapter 8 is often not low voltage wiring and it is inappropriate that Chapter 2, for example, should not apply. Chapter 8 should become a special condition type of chapter, just like Chapters 5 through 7.

In many ways, the responsibility of overall requirements for Chapter 8 wiring (which is, indeed, low voltage wiring, in most cases, albeit not in all cases) is not that different from the responsibility of overall requirements for Chapters 5, 6, and 7, and therefore wiring and communications systems should be treated the same way as the "special occupancies", "special equipment" and "special conditions" systems. In fact, communications systems could easily be considered special equipment just like the equipment in Chapter 6.

When chapter 8 was initially being treated differently, it was thought that it would include only low voltage wiring. However, there are now "medium power wiring" systems in articles 800, 820 and 830, as well as in articles 725, 760 and 770. Thus, there is actually less difference between the wiring systems of articles 725, 760 and 770 and those of articles 800, 820 and 830 than is apparent initially. In fact, network-powered broadband communications systems can have up to 150 V and should be required to meet all grounding requirements of article 250, rather than having a selection of rules made in article 820: this is a worker safety issue.

The proposed wording is consistent with CMP 1 suggestions when a similar proposal was introduced for the 2008 NEC. Proposals are also being made to chapter 8 articles (800, 820 and 830), but it is important to ensure that proper guidance for wiring systems is given throughout the NEC so that Chapter 8 does not stand in a vacuum.

I understand that the responsibility for scopes belongs to the NEC Technical Correlating Committee, but this is being brought to the NEC TCC attention for CMP 1 and TCC action.

Panel Meeting Action: Reject

Panel Statement: While the panel is not opposed to the principle brought forth by the proposal, the submitter has made no correlating proposals to Code-Making Panel 16 relative to this proposal's substantiation. The submitter's proposals 16-139, 16-250, and 16-319 agree that "Chapter 8 is independent of Chapters 1 through 4".

The proposed application of Chapters 1-7 to communications systems would be expected to have a significant impact on these installations that has not been justified by the proposal.

The panel requests that the Technical Correlating Committee forward this proposal to Code-Making Panel 16 for information.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ANTHONY, M.: This proposal could have been an Accept in Principle in Part. Consider the following change:

90.3 Code Arrangement.

This Code is divided into the introduction and nine chapters, as shown in Figure 90.3. Chapters 1, 2, 3, and 4 apply generally; Chapters 5, 6, ~~and~~ 7 and 8 apply to special occupancies, special equipment, ~~or other~~ special conditions or communications systems. These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, and 7 for the particular occupancies, equipment, conditions , or systems.

Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8.

Chapter 9 consists of tables.

Annexes are not part of the requirements of this Code but are included for informational purposes only.

This proposal makes an important distinction for telecommunications professionals in the education facilities industry.

Comment on Affirmative:

MCCARVER, R.: As with a similar proposal from the previous Code cycle, the Panel action to reject this proposal is correct. Once again, there is no compelling reason to change the Code arrangement relative to Chapter 8. Communications systems are different from power systems, and many of the requirements of Chapters 1 through 7 make no sense if applied to communications systems. Panel 16 has exercised proper care and diligence in maintaining requirements for communications systems. There is no evidence that the subject matter should be discussed at any level other than Panel 16. It remains true that, where appropriate, parts of the Code outside Chapter 8 are referenced there. This arrangement has been shown over the years to be a reasonable and effective one as evidenced by a lack of reported safety issues in these installations. In order to accept the proposal, each and every requirement of Chapters 1 through 7 would have to be considered for application to communications systems. The magnitude of this task and the confusion that would follow are not warranted by any arguments in this substantiation. The Panel 1 statement says that the Panel does not oppose the principle of this proposal, but it should oppose the principle of taking action where none is warranted and that would detract from Code clarity and usability.

1-36 Log #171 NEC-P01 **Final Action: Reject**
(90.4)

Submitter: Felix Giannini, Lexco, Inc.
Recommendation: Changes to Article 90.4: FROM:
90.4 Enforcement. This Code is intended to be suitable for ~~mandatory application by governmental bodies,~~ including...
TO:
90.4 Enforcement. This Code is intended to be suitable for adoption by a Governing Authority (A duly elected legislative body empowered to enact legislation in behalf of the Local, State, Federal or National government to which it has been elected), including...
Substantiation: It is my proposal to change "governmental bodies" to Governing Authority". This seems to be a problem throughout many of the NFPA publications -- reference The Life Safety Code Handbook - 2003 edition and LIFE SAFETY CODE 101 2003, the NFPA 72, National Fire Alarm Code 2007 as well as NEC 2005. In the NEC 2005, reference is made to the "governmental bodies" in Section 90.4 Enforcement, however, I can find no other reference or definition as to what the "governmental bodies" are in that code book. This creates confusion with respect to the term "Governing Authority" used in the other above referenced code books. I believe that a definition should be included in the Definitions Section 100 too, so as to make the term clear and perhaps legally effective, this should be addressed in any and all other codes that use that term as well as similar terms.
Panel Meeting Action: Reject
Panel Statement: The governmental bodies referred to are merely those who enact and apply the code. It is not within the purview of the code to define who those bodies are.
A governmental body applying the NEC is not necessarily elected.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: The panel should have accepted the change of the text to read "adoption by a Governing Authority". The term "Governing Authority" is used in several other codes and standards, and the Governing Authority is generally the person, organization, agency or entity responsible for adopting codes and standards. Such person, organization, agency or entity may or may not be an elected legislative body.

1-37 Log #4521 NEC-P01 **Final Action: Reject**
(90.4)

Submitter: Medard Kopczynski, Town of Keene / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
90.4 Enforcement.
This Code is ~~intended to be suitable for mandatory application~~ mandatory and shall be enforced by governmental bodies that exercise legal jurisdiction over electrical installations, including signaling and communications systems, and for use by insurance inspectors. The authority having jurisdiction ~~for enforcement of the Code has the responsibility for making~~ ~~has the authority to interpretations of~~ has the authority to interpret the rules, ~~for deciding on the approval of~~ to approve equipment and materials, and ~~for granting the~~ to grant special permission ~~contemplated in a number of the rules~~ as required by this Code.
~~By special permission, the authority having jurisdiction may waive specific requirements in this Code or permit alternative methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.~~
~~This Code may require new products, constructions, or materials that may not yet be available at the time the Code is adopted. In such event, the authority having jurisdiction may permit the use of the products, constructions, or materials that comply with the most recent previous edition of this Code adopted by the jurisdiction.~~
(A) Equivalency. Nothing in this Code shall prohibit methods of construction, materials, and designs not specifically prescribed in this Code where equivalent alternatives are approved by the authority having jurisdiction.
(B) Approval of Alternatives. Alternative systems, methods, or devices approved as equivalent by the authority having jurisdiction shall be recognized as being in compliance with this Code.
(C) Tests. Whenever the authority having jurisdiction determines that there is insufficient evidence of proof of equivalency with the prescribed requirements of this Code, the authority having jurisdiction shall be authorized to require tests showing proof of equivalency. Tests required by the authority having jurisdiction shall be provided by the owner at no expense to the jurisdiction. Tests shall be conducted as specified in this Code or, where test methods are not specified in this Code, they shall be conducted as required by the authority having jurisdiction.
(D) Approval. The authority having jurisdiction shall determine whether the proposed alternate methods of construction, materials, and designs are at least equivalent to the prescribed requirements of this Code.
Substantiation: Note: This proposal was developed by the proponent as a member of the Building Code Development Committee (BCDC) with the committee's endorsement.
The revision to the first sentence deletes the term "intended to be suitable" because it is not enforceable code language. The revision to the second sentence clarifies the provision by eliminating the word "responsible". The AHJ is responsible for enforcing this Code, and the Code should "authorize" the AHJ to interpret the code, approve equipment and materials, and grant special permission.
The last paragraph, which addresses equivalency, has been deleted and replaced with equivalency provisions that are found in other NFPA codes, such as NFPA 5000 and NFPA 101. The proposed text is more concise and offers the AHJ and the users the ability to use alternates, with more specific guidance. This gives the AHJ the authority to approve alternates and to back their decisions with scientific tests to prove equivalency.
Panel Meeting Action: Reject
Panel Statement: Not all governmental bodies adopt the NEC; therefore, the code cannot be mandatory in all cases.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-37a Log #CP100 NEC-P01 **Final Action: Accept**
(90.5)

TCC Action: It was the action of the Technical Correlating Committee that the term "FPN" be revised to appear as "Informational Note" globally.
In addition, all Annexes will become "Informative Annexes".
Submitter: Code-Making Panel 1,
Recommendation: Revise the wording in the existing code to read as follows:
90.5 Mandatory Rules, Permissive Rules, and Explanatory Material.
(A) Mandatory Rules. Mandatory rules of this Code are those that identify actions that are specifically required or prohibited and are characterized by the use of the terms shall or shall not.
(B) Permissive Rules. Permissive rules of this Code are those that identify actions that are allowed but not required, are normally used to describe options or alternative methods, and are characterized by the use of the terms shall be permitted or shall not be required.
(C) Explanatory Material. Explanatory material, such as references to other standards, references to related sections of this Code, or information related to a Code rule, is included in this Code in the form of Advisory Notes. Advisory Notes are informational only and are not enforceable as requirements of this Code.
Brackets containing section references to another NFPA document are for informational purposes only and are provided as a guide to indicate the source of the extracted text. These bracketed references immediately follow the extracted text.
Advisory Note: The format and language used in this Code follows guidelines established by NFPA and published in the NEC Style Manual. Copies of this manual can be obtained from NFPA.
(D) Informative Annexes. Non-mandatory information relative to the use of the NEC is provided in informative annexes. Informative annexes are not part of the enforceable requirements of the NEC, but are included for information purposes only."
In addition, the panel intends that the words "Fine Print Note" and "FPN" be changed to "Advisory Note" throughout the entire code and that all "Annexes" be identified as "Informative Annexes".
Substantiation: These revisions will more clearly delineate the adoptable and enforceable requirements of the NEC.
"Fine print" refers to a type size, rather than clearly portraying its advisory nature. The NEC contains notes that are enforceable requirements of the code, such as table notes. "Fine print" in some legal documents does not necessarily make the text unenforceable requirements. This change will make the advisory nature of these notes clear.
Many standards now contain normative and informative annexes. Normative annexes are requirements and informative annexes are not. With this new trend in standards, this change in the NEC would clarify the nature of these annexes.
Code-Making Panel 1 recommends that the Technical Correlating Committee correlate the necessary editorial revisions throughout the Code and consider the need to revise the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-38 Log #4829 NEC-P01 **Final Action: Reject**
(90.5)

Submitter: T. David Mills, T. David Mills Associates
Recommendation: Add the following text to the first paragraph:
Fine print notes are also used to refer to an informative annex where a list of reference documents is maintained to minimize the duplication of FPNs referencing other documents. These FPNs utilize a number contained in a set of braces { } which represents the document reference position in the list.
Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.

I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.
Panel Meeting Action: Reject
Panel Statement: Fine print notes and annexes are in accordance with the National Electrical Code Style Manual Sections 4.2 and 2.1.6, respectively. The National Electrical Code Style Manual is the responsibility of the NEC Technical Correlating Committee.
The proposed language is redundant to the first sentence in 90.5(C), which specifically states that FPNs may include references to other standards.
The panel disagrees that adding the proposed annex will improve usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-39 Log #4503 NEC-P01 **Final Action: Reject**
(90.5 and 90.6)

Submitter: Bob Foote, Town of Georgetown / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
Consideration should be given to deleting Sections 90.5 and 90.6 and putting the information in a preamble to the code. See the preamble to NFPA 5000 found just in front of Chapter 1. It reads as follows:
"IMPORTANT NOTE: This NFPA document is made available for use subject to important notices and legal disclaimers. These notices and disclaimers appear in all publications containing this document and may be found under the heading "Important Notices and Disclaimers Concerning NFPA Documents." They can also be obtained on request from NFPA or viewed at www.nfpa.org/disclaimers.
NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates that explanatory material on the paragraph can be found in Annex A.
Changes other than editorial are indicated by a vertical rule beside the paragraph, table, or figure in which the change occurred. These rules are included as an aid to the user in identifying changes from the previous edition. Where one or more complete paragraphs have been deleted, the deletion is indicated by a bullet (•) between the paragraphs that remain.
A reference in brackets [ ] following a section or paragraph indicates material that has been extracted from another NFPA document. As an aid to the user, the complete title and edition of the source documents for mandatory extracts are given in Chapter 2 and those for nonmandatory extracts are given in Annex E. Editorial changes to extracted material consist of revising references to an appropriate division in this document or the inclusion of the document number with the division…".
Substantiation: Note: This proposal was developed by the proponent as a member of the Building Code Development Committee (BCDC) with the committee's endorsement.
Both Sections 90.5 and 90.6 are not enforceable code text. They are explanatory information that does not belong in the body of the code as requirements.
Panel Meeting Action: Reject
Panel Statement: This proposal does not contain recommended text as required by Section 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Refer to the panel action and statement on Proposal 1-7.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-40 Log #4522 NEC-P01 **Final Action: Reject**
(90.5(B))

Submitter: Medard Kopczynski, Town of Keene / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
B) Permissive Rules. Permissive rules of this Code are those that identify actions that are allowed but not required, are normally used to describe options or alternative methods, and are characterized by the use of the term should ~~terms shall be permitted or shall not be required.~~
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.
Most, if not all, of the 300 NFPA codes and standards utilize the NFPA official definitions for "Should" which "indicates a recommendation or that which is advised but not required." This will bring the NEC in line with the official definition of "Should" for permissive rules.
Note that the NEC does follow the nomenclature of "shall" for the mandatory rules in section 90.5(A).
Panel Meeting Action: Reject
Panel Statement: The proposed wording is not in accordance with 3.1.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-41 Log #1538 NEC-P01 **Final Action: Reject**
(90.7)

Submitter: Richard Hollander, City of Tucson
Recommendation: Revise text as follows:
90.7 Examination of Equipment for Safety.
For specific items of equipment and materials referred to in this *Code*, examinations for safety made under standard conditions provide a basis for approval where the record is made generally available through promulgation by organizations properly equipped and qualified for experimental testing, inspections of the run of goods at factories, and service-value determination through field inspections. This avoids the necessity for repetition of examinations by different examiners, frequently with inadequate facilities for such work, and the confusion that would result from conflicting reports on the suitability of devices and materials examined for a given purpose.
It is the intent of this *Code* that factory-installed internal wiring or the construction of equipment need not be inspected at the time of installation of the equipment, except to detect alterations or damage, if the equipment has been listed by a ~~qualified electrical~~ nationally recognized testing laboratory that is recognized as having the facilities described in the preceding paragraph and that requires ***sentence cut off***
Substantiation: OSHA requires equipment to be tested by a nationally recognized testing laboratory. Standard – 29 CFR 1910.
Panel Meeting Action: Reject
Panel Statement: "Nationally Recognized Testing Laboratory" is a term specifically defined by OSHA as it relates to workplace safety programs enforced by OSHA, and its use would be inconsistent with 3.2.5.3 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-42 Log #1341 NEC-P01 **Final Action: Reject**
(90.8)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
It is elsewhere provided in this Code that the number of wires and cables ~~circuits~~ be varyingly restricted.
Substantiation: Conductor fill requirements limit the number of wires and cables, but the number of circuits is not specifically limited; it may indirectly limit the number of circuits by limiting the number of conductors or prohibiting a mixture of certain systems.
Panel Meeting Action: Reject
Panel Statement: The term "wires" is a general term that would include "cables". The use of the term "circuits" is appropriate as the Code does limit the number of overcurrent protective devices in one panelboard, for example. The intent is to limit both wires and circuits. Cables contain wires; therefore, the proposed wording is redundant.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: The panel should have accepted the proposal in principle by deleting the words "wires and" from the sentence. The title of the section relates to the number of circuits in enclosures. This change would clarify that other code requirements may limit the number of circuits, such as branch- and feeder-circuits, in panelboards and switchboards.

1-43 Log #150 NEC-P01 **Final Action: Accept**
(90.8(A))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Change "communication" to "communications".
Substantiation: Section 3.3.3 of the NEC Style Manual States: "**3.3.3 Plural.** Unless referring to a single item of equipment, references to electrical components and parts shall be plural rather than singular. This results in greater consistency and makes it clear that the *NEC* provision refers to *all* components or parts of a given type or class." Changing "communication" to "communications" will correlate with the title of Chapter 8, "Communications Systems".
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-44 Log #4887 NEC-P01 **Final Action: Reject**
(90.8(A))

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Deleted the following text:
~~(A) Future Expansion and Convenience. Plans and specifications that provide ample space in raceways, spare raceways, and additional spaces allow for future increases in electric power and communications circuits. Distribution centers located in readily accessible locations provide convenience and safety of operation.~~

Substantiation: The current wording is explanatory material. It is not enforceable code. It seems to be in direct conflict with 90.1(B) & 90.1(C). I also submitted a proposal to amend the FPN following 90.1(B) to include the deleted text from 90.8(A).
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 1-7.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BARRIOS, L.: Section 90.8 should be removed or relocated. It is out of place in Article 90. Sections 90.2-90.9 cover administration of the code such as scope, arrangement, enforcement, explanation of mandatory and permissive material, interpretations, units of measure. 90.8 which covers general information for wiring planning has nothing to do with the objective of administering the code and therefore doesn't belong here.
MCMAHILL, L.: This proposal should have been accepted to work in conjunction with the submitter's proposed change to section 90.1(B), FPN, proposal 1-7.

1-45 Log #4888 NEC-P01 **Final Action: Reject**
(90.8(B))

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Revise text as follows:
90.8(B) Number of circuits in Enclosures. It is elsewhere provided in this Code that the number of wires and circuits confined in a single enclosure be varyingly restricted. ~~Limiting the number of circuits in a single enclosure minimizes the effects from a short circuit or ground fault in on circuit.~~
Add FPN: Limiting the number of circuits in a single enclosure minimizes the effects from a short circuit or ground fault in one circuit.
Substantiation: The deleted text seems more appropriate as explanatory material. It is not enforceable code.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 1-7.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: The submitter is correct. The Panel Statement that refers to Proposal 1-7 does not fully apply.
MCMAHILL, L.: This proposal should have been accepted to work in conjunction with the submitter's proposed changes to sections 90.1(B), FPN, proposal 1-7 and section 90.8(A), proposal 1-44.

1-46 Log #308 NEC-P01 **Final Action: Reject**
(90.10 (New))

Submitter: Joel A. Rencsok, Scottsdale, AZ
Recommendation: Add a new section to read as follows:
90.XX Construction Documents. Electrical construction documents shall be prepared prior to the installation of any electrical work and shall contain all installation requirements contained within this Code. Plans for the electrical installation shall contain the following minimum requirements:
1. A legend of all symbols used.
2. A complete site electrical plan showing locations of utility transformer(s), service entrance equipment, exterior lighting, transformers and all other electrical equipment.
3. A complete floor plan showing the type and layout of all equipment requiring connection to the electrical distribution system, including the type of wiring to be installed.
4. Working space about service equipment, switchboards, panelboards and motor control centers. Reference sections 110.26 and 110.30.
5. All rooms or spaces shall be identified on the plans as to its use.
6. Any area(s) classified as hazardous. Reference section 500.4(A).
7. Any area(s) that is classified for technology equipment. See Article 645.
8. The maximum available fault current that is being supplied by the utility.
9. Fault current calculations from the service point to the lowest rated overcurrent device or equipment. Reference section 110.10.
10. Complete Code load calculations for service equipment, switchboard(s), panelboard(s) and motor control center(s) as computed in accordance with Article 220.
11. The conduit, conductor type and size(s), length, and locations of all service and feeder raceway(s). Reference sections 310.10 and 215.5.
12. The volt-ampere rating of each outlet, the horsepower rating or actual nameplate data of the equipment served.
13. The type and rating of every motor or other equipment-disconnecting device.
14. The kva rating of each transformer, capacitor unit, converter, or similar equipment.
15. Service equipment, switchboard, panelboard and motor control center schedules showing volt-ampere and ampere rating feeder(s), feeder overcurrent device, branch circuit(s), branch circuits overcurrent device, spare devices and future spaces where circuits can be installed.
16. Identification of all circuits as required by sections 110.22 and 408.4.
17. A one-line diagram of the complete electrical distribution system, including service equipment, switchboard(s), panelboard(s), motor control center(s) and other equipment installed showing feeder size(s) and class, type, size and arrangement of all overcurrent device(s) to be installed.
18. The interrupting rating of equipment intended to break current at fault levels. Reference section 110.9.
19. All wiring as required by Article 700.
20. All wiring as required by Article 695.
21. All bonding and grounding as required by Article 250.
Substantiation: Plans are given to electrical contractors, which cannot be installed, to comply with the minimum requirements in this code. This new section addition will help set a minimum standard for plan preparation and will help inspectors inspect the installation. This will also reduce the time for inspections and installation redos.
Panel Meeting Action: Reject
Panel Statement: The list is overly prescriptive and does not necessarily improve the safety of the installation.
The proposal is too encompassing as not all projects necessarily require documents of the nature suggested by the submitter.
The submitter did not provide adequate technical substantiation to warrant the change.
Adding this material may create a conflict with local administrative provisions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: This is a good idea that might find a home in another NFPA document. The submitter should be encouraged to submit a proposal similar to this to other technical committees such as NFPA 70B (Chapter 31), NFPA 5000 (Chapter 1), or NFPA 1 (Chapter 1); for example.

1-47 Log #2330 NEC-P01 **Final Action: Reject**
(90.10)

Submitter: Stephen Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Add new text as follows:
90.10 Acronyms and Abbreviations. The following frequently used acronyms and abbreviations shall be permitted to be used throughout this code.
A) Person or Organization
1) AHJ- Authority Having Jurisdiction
2) NFPA- National Fire Protection Association
3) IEEE- Institute of Electrical & Electronic Engineers
4) UL- Underwriters Laboratories
5) ANSI- American National Standards Institute
6) SI- International System of Units
7) ISA- Instrumentation Systems and Automation Society
B) Raceways
1) EMT- Electrical Metallic Tubing
2) ENT- Electrical Nonmetallic Tubing
3) FMC- Flexible Metal Conduit
4) FMT- Flexible Metallic Tubing
5) IMC- Intermediate Metal Conduit
6) LFMC- Liquidtight Flexible Metal Conduit
7) LFNC- Liquidtight Flexible Nonmetallic Conduit
8) HDPE- High Density Polyethylene Conduit
9) RTRC- Reinforced Thermosetting Resin Conduit
10) RMC- Rigid Metal Conduit
11) PVC- Rigid Polyvinyl Chloride Conduit
C) Devices or Equipment
1) AFCI- Arc-Fault Circuit-Interruptor
2) CB- Circuit Breaker
3) GFCI- Ground-Fault Circuit-Interruptor
4) GFPE- Ground-Fault Protection of Equipment
5) OCPD- Overcurrent Protective Device
6) SPD- Surge-Protective Devices
7) TVSS- Transient Voltage Surge Suppressors
D) Conductors, Special Purpose Single
1) EBJ- Equipment Bonding Jumper
2) EGC- Equipment Grounding Conductor
3) GC- Grounded Conductor
4) GEC- Grounding Electrode Conductor
5) MBJ- Main Bonding Jumper
6) SBJ- System Bonding Jumper
E) Cables & Circuits
1) AC- Armored Cable
2) FC- Flat Cable Assemblies
3) FCC- Flat Conductor Cable
4) IGS- Integrated Gas Spacer Cable
5) MC- Metal-Clad Cable
6) MI- Mineral-Insulated, Metal-Sheathed Cable
7) MV- Medium Voltage Cable
8) NPLFA- Non-Power-Limited Fire Alarm Circuit
9) NM- Nonmetallic-Sheathed Cable
10) NMC- Nonmetallic-Sheathed Cable (Corrosion Resistant)
11) NMS- Nonmetallic-Sheathed Cable with Signaling, Data, &

Communication Conductors
12) NVCC- Nonmetallic Underground Conduit with Conductors
13) ITC- Instrumentation Tray Cable
14) PLFA- Power-Limited Fire Alarm Circuit
15) PLTC- Nonmetallic Sheathed Power-Limited Tray Cable
16) SE- Service-Entrance Cable
17) TC- Power and Control Tray Cable
18) UF- Underground Feeder and Branch-Circuit Cable
19) USE- Underground Service-Entrance Cable

Substantiation: Acronyms are a part of our everyday 21st century life. The 2008 NEC uses them on a limited basis for mostly cables and raceways. According to the style manual 3.2.3 once identified at first use in an article, it can be used throughout that article as an acronym. In NEC 210.12 this is done for AFCI, but not for RMC, IMC, EMT, etc. in the exceptions and not for GFCI in 210.8 or PLTC in 725.2 for some examples. There are many places where acronyms could be used and are not, for instance in article 250 for the various different grounding conductors. We believe that by having one place to identify an acronym and then using them throughout the NEC, we can maintain our understanding of NEC and shorten the NEC by several pages. Some common knowledge acronyms like DC and AWG and some rarely used like CI cable have been left off the list intentionally.
Panel Meeting Action: Reject
Panel Statement: 3.2.3 of the NEC Style Manual already addresses the use of acronyms in the Code and the addition of acronyms to Article 90 is not substantiated or viewed as beneficial to users. The submitter's references to Article 210 and 725 are noted and Code-Making Panel 1 is requesting that the Technical Correlating Committee forward this proposal to Code-Making Panels 2 and 3 for information.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 100 — DEFINITIONS

1-48 Log #489 NEC-P01 **Final Action: Reject**
(100.Abandoned (New))

Submitter: Joe Tedesco, Tedesco Electrical Code Consultants, Inc.
Recommendation: Add new text as follows:
Abandoned. Electrical equipment that is not in use, or terminated at utilization equipment and not identified for future use with a tag.
Substantiation: The term is used in more than 2 places in the NEC. See NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with Section 4.3.3.(d) of the NFPA Regulations Governing Committee Projects.
See the panel statement on Proposal 1-49.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: We agree with the panel action but disagree with the panel statement that cites Section 4.3.3(d) as the reason for the rejection.

1-49 Log #740 NEC-P01 **Final Action: Reject**
(100.Abandoned (New))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
ARTICLE 100 Definitions
I. General
Abandoned (as applied to equipment and wiring methods). Installed but not terminated at equipment other than a connector or not connected to the supply of electricity, and not identified for future use by means specified elsewhere in this *Code*.
Substantiation: *NEC® Manual of Style* 2.2.2.1: Consolidation into a new, single generalized definition in Article 100 of nearly identical definitions appear in multiple Articles, specifically in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2.
NEC® Manual of Style 2.2.2: Code Panel 3 rejected Proposal 3-1 (Log #2673) for a definition of "Abandoned Cable" in 2008 *NEC®* based on the rationale these individual definitions having "subtle differences" in REQUIREMENTS. The specific methods by which identification for future use is achieved are REQUIREMENTS conveyed in the definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 and constitute violations of *NEC® Manual of Style* 2.2.2 ("Definitions shall not contain requirements …"). These similar-but-slightly differentiated REQUIREMENTS in these definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 are REDUNDANT to the actual requirement statements properly located in 640.6(C), 645.5(G), 725.25, 800.25, 820.25, and 830.25, respectively. Unlike rejected Proposal 3-1 (Log #2673) for a definition of "Abandoned Cable" in 2008 *NEC®*, this proposed generalized definition for "Abandoned" in Article 100 omits the specific mention of these individual REQUIREMENTS and relies on 640.6(C), 645.5(G), 725.25, 800.25, 820.25, and 830.25 to continue to provide that REQUIREMENT information.
Although these individual definitions served a valid transitional purpose to support the independent additions of individual requirements in 640.6(C), 645.5(F), 645.5(G), 725.25, 800.25, 820.25, and 830.25, these discrete definitions can be broadly consolidated into a single definition in Article 100 that is not specific to cables. As such, the intent of the Submitter of Comment 3-1 (Log #1435) for 2008 *NEC®* to remove abandoned cable is still achieved and potentially could be expanded as other Proposers and the reviewing Code Panels deem it necessary to encompass other wiring methods or equipment with this generalized definition.
Words regarding the possibility of ceasing connection to an electric supply have been added beyond existing definitions to correlate to 90.2(A)(3), since abandonment entails disconnection from either the terminating equipment or the electric supply (or both).
Companion proposals have been made to delete the corresponding definitions for the various abandoned cables, supply circuits, etc., in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2.
Panel Meeting Action: Reject
Panel Statement: The term "abandoned" is used in several articles, to describe specific cable types. However, some of those articles determine when a cable is not being used differently. The term is also used in three locations to describe an outlet that is no longer in use in floor raceway systems, for example.
Code-Making Panel 3 has noted subtle differences in requirements where the term is used in various parts of the Code. Therefore, broad application of the term is not appropriate in all parts of the Code.
The proposal does not comply with Section 4.3.3.(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: The panel should have accepted in principle this proposal by providing two new definitions for "Abandoned" and by revising the submitter's proposed text as follows:
Abandoned (as applied to equipment). Discontinued normal use and operation of a system or apparatus.
Abandoned (as applied to wiring methods). Conductors or cables that are not terminated at equipment and not identified for future use with a tag.
Comment on Affirmative:
ANTHONY, M.: I agree with the panel action but disagree with the panel statement that cites Section 4.3.3(d) as the reason for the rejection.
4.3.3 Content of Proposals. Each Proposal shall be submitted to the Council Secretary and shall include the following:
(a) Identification of the submitter and his or her affiliation (i.e., TC, organization, company), where appropriate
(b) Identification of the Document, edition of the Document, and paragraph of the Document to which the Proposal is directed
(c) Proposed text of the Proposal, including the wording to be added, revised (and how revised), or deleted
(d) Statement of the problem and substantiation for Proposal
As you can see, the term "substantiation" in item (d) itself is not substantiated.

1-50 Log #808 NEC-P01 **Final Action: Reject**
(100.Abandoned Cable (New))

Submitter: J. L. Richardson, Engineering Services Group, Inc.
Recommendation: Add new text to read as follows:
Abandoned Cable. Installed cable which is not terminated at equipment other than a connector, and is not tagged for future use.
Substantiation: Replaces definitions in source references. Generalizes definition to apply to many types of cables.
Panel Meeting Action: Reject
Panel Statement: The term "abandoned" is used in several Articles, to describe specific cable types. However, some of those Articles determine when a cable is not being used differently.
Code-Making Panel 3 has noted subtle differences in requirements where the term is used in various parts of the code. Therefore, broad application of the term is not appropriate in all parts of the code.
The submitter has not provided the source references as mentioned in the substantiation; therefore, the proposal does not comply with Section 4.3.3.(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: The issue of how we handle abandoned cables and wires has been with us for several code cycles now. The TCC should appoint a task force to pull all the good ideas together and see if it is possible to make some write some practical code from the best of them.

1-51 Log #4519 NEC-P01 **Final Action: Reject**
(100.Accessible (as applied to equipment), Accessible (as applied to wiring methods), Accessible, Readily (Readily Accessible), FPN (New))

Submitter: Salvatore DiCristina, Rutgers, The State University of New Jersey / Rep. Building Code Development Committee (BCDC)
Recommendation: Add a Fine Print Note (FPN) to each of these following definitions to read as follows:
Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.
FPN: The term "Accessible," as used in this code, is not intended to apply to barrier free construction for persons with disabilities.
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.
The use of the term accessible in recent building construction codes implies that features are available to persons with a variety of physical disabilities. Although the NEC has historically used the term accessible to describe the serviceability of equipment and systems, the term now may have unrealistic consequences. For example, I do not believe it is the intent for a person using a wheelchair to be able to approach a roof mounted disconnecting switch. The addition of this Fine Print Note will provide the same results while avoiding conflicts in definitions found in other codes and standards such as NFPA 101, 5000, ADAAG and ICC/ANSI A117.1.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not enhance clarity or usability. In addition, the proposed FPN contains mandatory text. See 3.1.3 in the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: I agree with the panel action but disagree with the panel statement. This proposal does enhance clarity but what is clear is that electrical safety best practice needs to be developed apart from the civil rights legislation that governs accessibility issues.

3-3 Log #113 NEC-P03 **Final Action: Reject**
(100.Air Duct)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Add new definition to read as follows:
Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [90A:3.3.5].
Substantiation: The definition of an air duct is in the definitions section of Articles 800 and 820. The style manual requires that a definition be placed in Article 100 rather than multiple articles. Furthermore, the term "air duct" is used in Article 100 in the definition of a plenum and in sections 250.104(B), 454.58 and 551.56(F) and 552.57(F).
Panel Meeting Action: Reject
Panel Statement: Code-Making Panel 3 recommends that the NEC Technical Correlating Committee assign this definition to the appropriate Panel. The phrase "air duct" is not used in any of the articles under the jurisdiction of Code-Making Panel 3.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
KAHN, S.: The proposer's substantiation is correct - when definitions appear in more than one article, they belong in Article 100. The fact that the term does not appear in articles under the jurisdiction of CMP-3 is irrelevant.

6-3 Log #2458 NEC-P06 **Final Action: Reject**
(100.Ampacity)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Peter Pollak, Pollak & Associates
Recommendation: Revise text to read as follows:
Ampacity. The maximum allowable current, in amperes, that a conductor can carry continuously under the conditions of use without exceeding its temperature rating.
Substantiation: The existing definition doesn't properly define the term ampacity as it includes the entire family of all allowable currents, which is not the intent. For example, the ampacity of a number 14 AWG Cu (12 AWG Al) is 15 amperes. Without the addition of "maximum allowable", the existing definition of ampacity can lead an inexperienced person to think that the ampacity of a number 14 AWG Cu (12 AWG Al) can be: 15, 14, 13, 12,...or 1 ampere(s). In order to be useful, a definition needs to be accurate, rather than assume everyone will understand what is actually meant.
Panel Meeting Action: Reject
Panel Statement: This is not a definition of permissible use. The added text does not clarify or benefit usability. The existing definition is accurate.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:
CLINE, S.: I believe that the action should have been to Accept in Part.
I agree that the term "allowable" is improper within a definition of electrical properties. It is an unnecessary permissible-use term, and adds no clarity.
However, I believe the submitter's logic is correct that the definition is not specific, and therefore not as clear as it would be with the term "maximum"" added. Any current less than the maximum can also be carried "continuously under the conditions of use without exceeding its temperature rating."
As experienced users we all "know" that the term implies the maximum, but there was a time when we didn't know. If your child asked "What is the capacity of this glass?" doesn't your mind immediately go to its maximum capacity?
HUDDLESTON, JR., R.: Adding the words "maximum allowable" before the word "current" in the Article 100 definition of 'Ampacity' makes the definition rigorously correct. When it is stated in Table 310.16 that at 75C, without any adjustments or corrections, a THHW conductor of size 8 AWG has an ampacity of 50 amperes, what is really meant is that the MAXIMUM ALLOWABLE ampacity for this conductor at 75C without any adjustment or correction is 50 amperes. As the definition currently exists (without the words "maximum allowable"), one could say that the ampacity of 8 AWG THHW conductors without any adjustments or corrections could be 10 amperes, 15 amperes, 20 amperes, etc...and this would be correct according to the definition given in Article 100. However, we all know that when we refer to the ampacity of a conductor we really mean how much current can the insulated conductor provide without getting too hot.
HUNTER, R.: In the code we deal with minimums and maximums, this fits well when referring to ampacities.
PICARD, P.: The definition provided by submitter was appropriate; the ampacity is the maximum allowable current.

1-52 Log #692 NEC-P01 **Final Action: Reject**
(100.Arc Flash hazard,Various Definitions)

Submitter: Joseph Tedesco, Boston, MA
Recommendation: ARTICLE 100 Definitions
Add the following as extracted text from NFPA 70E 2009, insert this at the end of each definition: [70E, 2009]
Arc Flash Hazard. A dangerous condition associated with the possible release of energy caused by an electric arc.
FPN No. 1: An arc flash hazard may exist when energized electrical conductors or circuit parts are exposed or when they are within equipment in a guarded or enclosed condition, provided a person is interacting with the equipment in such a manner that could cause an electric arc. Under normal operating conditions, enclosed energized equipment that has been properly installed and maintained is not likely to pose an arc flash hazard.
FPN No. 2: See Table 130.7(C)(9) for examples of activities that could pose an arc flash hazard.
FPN No. 3: See 130.3 for arc flash hazard analysis information.
Arc Flash Hazard Analysis. A study investigating a worker's potential exposure to arc-flash energy, conducted for the purpose of injury prevention and the determination of safe work practices, arc flash protection boundary, and the appropriate levels of PPE.
Arc Flash Suit. A complete FR clothing and equipment system that covers the entire body, except for the hands and feet. This includes pants, jacket, and beekeeper-type hood fitted with a face shield.
Arc Rating. The value attributed to materials that describes their performance to exposure to an electrical arc discharge. The arc rating is expressed in cal/cm2 and is derived from the determined value of the arc thermal performance value (ATPV) or energy of breakopen threshold (EBT) (should a material system exhibit a breakopen response below the ATPV value) derived from the determined value of ATPV or EBT.
FPN: Breakopen is a material response evidenced by the formation of one or more holes in the innermost layer of flame-resistant material that would allow flame to pass through the material.
Balaclava (Sock Hood). An arc-rated FR hood that protects the neck and head except for facial area of the eyes and nose.
Bare-Hand Work. A technique of performing work on energized electrical conductors or circuit parts, after the employee has been raised to the potential of the conductor or circuit part.
Barricade. A physical obstruction such as tapes, cones, or A-frame-type wood or metal structures intended to provide a warning about and to limit access to a hazardous area.
Barrier. A physical obstruction that is intended to prevent contact with

equipment or energized electrical conductors and circuit parts or to prevent unauthorized access to a work area.

Boundary, Arc Flash Protection. When an arc flash hazard exists, an approach limit at a distance from a prospective arc source within which a person could receive a second degree burn if an electrical arc flash were to occur.

Boundary, Limited Approach. An approach limit at a distance from an exposed energized electrical conductor or circuit part within which a shock hazard exists.

Boundary, Prohibited Approach. An approach limit at a distance from an exposed energized electrical conductor or circuit part within which work is considered the same as making contact with the electrical conductor or circuit part.

Boundary, Restricted Approach. An approach limit at a distance from an exposed energized electrical conductor or circuit part within which there is an increased risk of shock, due to electrical arc over combined with inadvertent movement, for personnel working in close proximity to the energized electrical conductor or circuit part.

Conductive. Suitable for carrying electric current.

Conductor, Insulated. A conductor encased within material of composition and thickness that is recognized by this standard as electrical insulation. [70, 2008]

Current-Limiting Overcurrent Protective Device. A device that, when interrupting currents in its current-limiting range, reduces the current flowing in the faulted circuit to a magnitude substantially less than that obtainable in the same circuit if the device were replaced with a solid conductor having comparable impedance.

Cutout. An assembly of a fuse support with either a fuseholder, fuse carrier, or disconnecting blade. The fuseholder or fuse carrier may include a conducting element (fuse link), or may act as the disconnecting blade by the inclusion of a nonfusible member.

Deenergized. Free from any electrical connection to a source of potential difference and from electrical charge; not having a potential different from that of the earth.

Disconnecting (or Isolating) Switch (Disconnector, Isolator). A mechanical switching device used for isolating a circuit or equipment from a source of power.

Electrical Hazard. A dangerous condition such that contact or equipment failure can result in electric shock, arc flash burn, thermal burn, or blast.

FPN: Class 2 power supplies, listed low voltage lighting systems, and similar sources are examples of circuits or systems that are not considered an electrical hazard.

Electrical Safety. Recognizing hazards associated with the use of electrical energy and taking precautions so that hazards do not cause injury or death.

Electrically Safe Work Condition. A state in which an electrical conductor or circuit part has been disconnected from energized parts, locked/tagged in accordance with established standards, tested to ensure the absence of voltage, and grounded if determined necessary.

FPN: For further information, see ANSI/UL 1203-2006, Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.

Exposed (as applied to energized electrical conductors or circuit parts). Capable of being inadvertently touched or approached nearer than a safe distance by a person. It is applied to electrical conductors or circuit parts that are not suitably guarded, isolated, or insulated.

Externally Operable. Capable of being operated without exposing the operator to contact with energized electrical conductors or circuit parts.

Flame-Resistant (FR). The property of a material whereby combustion is prevented, terminated, or inhibited following the application of a flaming or non-flaming source of ignition, with or without subsequent removal of the ignition source.

FPN: Flame resistance can be an inherent property of a material, or it can be imparted by a specific treatment applied to the material.

Fuse. An overcurrent protective device with a circuit-opening fusible part that is heated and severed by the passage of overcurrent through it.

FPN: A fuse comprises all the parts that form a unit capable of performing the prescribed functions. It may or may not be the complete device necessary to connect it into an electrical circuit.

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the normally non–current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.

Incident Energy. The amount of energy impressed on a surface, a certain distance from the source, generated during an electrical arc event. One of the units used to measure incident energy is calories per centimeter squared (cal/cm2).

Insulated. Separated from other conducting surfaces by a dielectric (including air space) offering a high resistance to the passage of current.

FPN: When an object is said to be insulated, it is understood to be insulated for the conditions to which it is normally subject. Otherwise, it is, within the purpose of these rules, uninsulated.

Interrupter Switch. A switch capable of making, carrying, and interrupting specified currents.

FPN: Equipment intended to interrupt current at other than fault levels may have its interrupting rating implied in other ratings, such as horsepower or locked rotor current.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials, and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed. Equipment, materials, or services included in a list published by an organization that is acceptable to the authority having jurisdiction and concerned with evaluation of products or services, that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services, and whose listing states that either the equipment, material, or services meets appropriate designated standards or has been tested and found suitable for a specified purpose.

FPN: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. Use of the system employed by the listing organization allows the authority having jurisdiction to identify a listed product.

Premises Wiring (System). Interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed. This includes: (a) wiring from the service point or power source to the outlets; or (b) wiring from and including the power source to the outlets where there is no service point.

Shock Hazard. A dangerous condition associated with the possible release of energy caused by contact or approach to energized electrical conductors or circuit parts.

Single-Line Diagram. A diagram that shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used in the circuit or system.

Step Potential. A ground potential gradient difference that can cause current flow from foot to foot through the body.

Switchgear, Arc-Resistant. Equipment designed to withstand the effects of an internal arcing fault and that directs the internally released energy away from the employee.

Switchgear, Metal-Clad. A switchgear assembly completely enclosed on all sides and top with sheet metal, having drawout switching and interrupting devices, and all live parts enclosed within grounded metal compartments.

Switchgear, Metal-Enclosed. A switchgear assembly completely enclosed on all sides and top with sheet metal (except for ventilating openings and inspection windows), containing primary power circuit switching, interrupting devices, or both, with buses and connections. This assembly may include control and auxiliary devices. Access to the interior of the enclosure is provided by doors, removable covers, or both. Metal-enclosed switchgear is available in non-arc-resistant or arc-resistant constructions.

Switchboard. A large single panel, frame, or assembly of panels on which are mounted on the face, back, or both, switches, overcurrent and other protective devices, buses, and usually instruments. Switchboards are generally accessible from the rear as well as from the front and are not intended to be installed in cabinets. [70, 2008]

Switching Device. A device designed to close, open, or both, one or more electric circuits.

Touch Potential. A ground potential gradient difference that can cause current flow from hand to hand, hand to foot, or another path, other than foot to foot, through the body.

Unqualified Person. A person who is not a qualified person.

Working On (energized electrical conductors or circuit parts). Coming in contact with energized electrical conductors or circuit parts with the hands, feet, or other body parts, with tools, probes, or with test equipment, regardless of the personal protective equipment a person is wearing. There are two categories of "working on": Diagnostic (testing) is taking readings or measurements of electrical equipment with approved test equipment that does not require making any physical change to the equipment; repair is any physical alteration of electrical equipment (such as making or tightening connections, removing or replacing components, etc.).

Substantiation: The NEC is also used for enforcing electrical safety and the references to these definitions may help the users and industry understand why we have 110.16 and few FPN's that call attention to NFPA 70E, 2004 in the NEC now. If the CMP disagrees, then perhaps an Annex will be considered.

Panel Meeting Action: Reject

Panel Statement: Arc flash hazard is a work practice issue that is addressed in NFPA 70E. NFPA 70 (NEC) is an installation code. Adding an extensive list of definitions from NFPA 70E to the NEC is unnecessary as the proposed definitions are located in Article 100 of NFPA 70E where the terms are used. The proposed terms not defined in NEC Article 100 are not used in the NEC.

Fine Print Note No. 1 in 110.16 provides information relative to where to locate work practices regarding arc flash hazards.

The submitter has not provided sufficient substantiation for the proposed definitions to be included in the NEC as required by the NFPA Regulations Governing Committee Projects, Section 4.3.3(d).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ANTHONY, M.: The substantiation is sufficient. This important material would be better placed in other, related, NFPA electrical documents, however.

2-3 Log #705 NEC-P02 **Final Action: Accept in Principle**
(100.Arc-Fault Circuit Interrupter (AFCI) (New))

Submitter: Nathan Tutt, I.B.E.W. Electrician/Apprentice Instructor
Recommendation: Add new text to read as follows:
Arc-Fault Circuit Interrupter (AFCI). A device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected.
Substantiation: The proper and most useful place for definitions is in Article 100, Part I Definitions.
This definition was found in 210.12(A), note that the NEC Style Manual requires a defined term used in more than one article be defined in Article 100. See 760.121(B), 440.65, or 550.25.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 2-162.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-53 Log #3581 NEC-P01 **Final Action: Reject**
(100.Area Lighting (New))

Submitter: Michael Hyland, American Public Power Association
Recommendation: Add new text as follows:
Area Lighting. A lighting distribution system that provides lumens on public or private property.
FPN: See 90.2(A) where area lighting is not under the exclusive control of utilities. ANSI C2-2007, *National Electrical Safety Code* contains information that covers area lighting under the exclusive control of utilities.
Substantiation: This proposal is developed based upon meetings of a Task Group of the NESC and NEC Committees on July 10th and Sep. 30th, 2008. Subsequently, NESC members of the Task Group provided input to this proposal. Several companion proposals are submitted to Article 100 Definitions for Premises Wiring (Systems) and Premises.
This is an action to harmonize the purpose and scope sections of two ANSI standards, the NEC and the NESC, to mitigate conflicts between documents as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007*. Also, this action resolves the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words “or by other agreements”.
*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.
Specifically, the rationale for this change is that this term is used in 2007 NESC Rule 011C. Adding this new term in the NEC will correlate both the NEC and the NESC documents’ purpose and scope sections.
Area lighting is provided by utilities on public and private property. Neither the public nor the private property is under the exclusive control of the utility as the words imply. Also, there may not be a premises wiring system involved and, therefore, no service point. This new definition is also proposed in the NESC at this time.
Panel Meeting Action: Reject
Panel Statement: The term “area lighting” does not appear in two or more articles in the NEC; therefore, it is inconsistent with Section 2.2.2.1 of the NEC Style Manual.
The proposed definition does not add clarity or usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: I do not agree with the panel statement that cites Section 2.2.2.1 of the NEC Style Manual as a basis for rejection. A simple search on any of the definitions for “duty” (continuous....periodic....varying) will reveal that these terms only appear once in the NEC. The word “abandoned” shows up 19 times in the NEC and yet it does not have a definition. So whether or not a term is defined may have something to do with a diversity of opinion in what “usability” means. While this particular definition may need some sharpening, having a definition for area lighting would help the NESC and NEC harmonize their documents. The use of this term may appear in future versions of the NEC in other articles having to do with luminaires, disconnect switches, services, overcurrent protection, etc.
LABRAKE, JR., N.: Proposal 1-53 should have been accepted. The panel statement that the definition is not used in two or more Articles is true, but as was discussed in the panel, there is no place in the NEC for the definition of terms used in Article 90 such as in other articles in the XXX.2 section. In addition, refer to my ballot statements on Proposals 1-17 and 1-29 and the substantiation in proposal 1-107 regarding the need for defining this term.
Alternatively, the Panel could consider the proposed term in a new informative Annex discussed in my ballot statement on Proposal 1-12 as follows:
Annex “TBD”: “General Information Regarding Utility Electric Supply to Premises Wiring”
2. The following are terms for general understanding of where utility electric supply and premises wiring meet for what is covered and what is not covered by this Code as described in 90.2.
Area Lighting. A lighting distribution system that provides lumens on public or private property.
Advisory Note: See 90.2(A) where area lighting is not under the exclusive control of utilities. ANSI C2-2007, *National Electrical Safety Code* contains information that covers area lighting under the exclusive control of utilities.

18-3 Log #3259 NEC-P18 **Final Action: Reject**
(100.Attachment Plug (Plug Cap) (Plug))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
A device attached to a flexible cord or portable power cable that, by insertion into a receptacle, cord connector body, or flanged surface outlet establishes a connection between the attached flexible cord or portable power cable and the conductors permanently connected to the receptacle, cord connector body, or flanged surface outlet.
Substantiation: Present definition is incomplete, since attachment plugs are also used with the other devices in the proposal.
Panel Meeting Action: Reject
Panel Statement: The term “flanged surface outlet” is not a defined term denoting a specific device. Some flanged surface outlets are a form of a receptacle when constructed using listed receptacle and coverplate. Others may be integrally formed with a coverplate and receptacle permanently attached or may be identified as a “flanged receptacle.” Not all flanged surface outlets are outletbox installed. They can be affixed to a panel or a piece of electrical utilization equipment or can be installed within or on a cabinet, or box but not solely installed in an outletbox.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

1-54 Log #206 NEC-P01 **Final Action: Accept**
(100.Automatic)

Submitter: Glossary of Terms Technical Advisory Committee,
Recommendation: Replace the definition of automatic with the following definition:
Automatic. Performing a function without the necessity of human intervention.
~~Automatic. Self-acting, operating by its own mechanism when actuated by some ipersonal influence, as, for example, a change in current, pressure, temperature, or mechanical configuration.~~
Substantiation: This proposal is intended to generate consistent definitions and minimize the number of duplicate definitions in the NFPA Glossary of Terms in accordance with the scope of the NFPA Glossary of Terms Technical Advisory Committee.
Similar proposals are being submitted to NFPA 70E, 96, 99, 101, 101B, 550 and 901.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-3 Log #2973 NEC-P05 **Final Action: Reject**
(100.Auxiliary Electrode (New))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Add new definition for auxiliary electrode, as follows:
Auxiliary Electrode. Any grounding electrode that is not required by Article 250 or other Articles of this Code.
Substantiation: CMP 5 did the industry a great service when it changed the name “supplementary electrode” to “auxiliary electrode”, removing the confusion between the two. There will, however, continue to be some amount of confusion until the term is defined.
Panel Meeting Action: Reject
Panel Statement: The panel notes that the term used in Section 250.54 is “auxiliary grounding electrode”. The intended use of auxiliary grounding electrodes is clearly described in Section 250.54.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

9-2 Log #2397 NEC-P09 **Final Action: Reject**
(100.Barrier (New))

Submitter: Alberto E. Planas, Planas - Worthy Group, Inc.
Recommendation: Add text to read as follow:
Barrier. A material that blocks or is intended to block passage used in boxes, cables and raceways. Such as Metallic (Galvanized Steel), Nonmetallic (Polymeric Material), Iron (Ferrite or Alpha Iron), Bakelite, Epoxy, Polyimide, Glass Polyester, melamine resin or other insulating material.
Substantiation: There is currently confusion between the authority having jurisdiction and contractors in the field.
Article 100 of the National Electrical Code provides for a definition for a term that is used in two or more articles.
The term “Barrier” is used in the following Sections:
Section 314.28(D) Section 725.136(D)(2)(a)

Section 368.234(B) Section 725.136(G)
Section 404.8(B) Section 727.5 Exception No. 1
Section 406.4(G) Section 760.136(B)
Section 408.3(A)(2) Section 760.136(D)(2)(a)
Section 408.3(A)(3) Exception Section 770.133(A) Exception No. 5
Section 430.97(A) Exception Section 800.133(A)(1)(c) Exception No. 1
Section 504.30(A)(2)(5) Exception Section 820.133(A)(1)(b) Exception No. 1
Section 640.46 Section 830.133(A)(1)(d) Exception No. 1
Section 725.48(B)(4)(1)
Section 725.136(B)

Most codes state that undefined terms, and the meaning of terms not specifically defined in most code documents, shall be defined by collegiate dictionaries in the sense that the context implies.

Merriam-Webster defines "Barrier" as "something material that blocks or is intended to block passage or separates". The technical dictionary describes barriers as "a partition, slab or plate of insulating material placed between blades of switches, wire or conductors in order to separate or insulate them.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 9-8.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-3 Log #2402 NEC-P09 **Final Action: Reject**
(100.Barrier (New))

Submitter: Diane B. Truhlar, Isotec, Inc.

Recommendation: Add text to read as follows:

Barrier. A material that blocks or is intended to block passage used in boxes, cables and raceways. Such as Metallic (Galvanized Steel), Nonmetallic (Polymeric Material), Iron (Ferrite or Alpha Iron), Bakelite, Epoxy, Polyimide, Glass Polyester, melamine resin or other insulating material.

Substantiation: There is currently confusion between the authority having jurisdiction and contractors in the field.

Article 100 of the National Electrical Code provides for a definition for a term that is used in two or more articles.

The term "Barrier" is used in the following Sections:

Section 640.46 Section 830.133(A)(1)(d) Exception No. 1
Section 725.48(B)(4)(1)
Section 725.136(B)

Most codes state that undefined terms, and the meaning of terms not specifically defined in most code documents, shall be defined by collegiate dictionaries in the sense that the context implies.

Merriam-Webster defines "Barrier" as "something material that blocks or is intended to block passage or separates". The technical dictionary describes barriers as "a partition, slab or plate of insulating material placed between blades of switches, wire or conductors in order to separate or insulate them.

Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-8.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-7 Log #2406 NEC-P09 **Final Action: Reject**
(100.Barrier (New))

Submitter: Shannon Eichele, Isotec, Inc.
Recommendation: Add text to read as follows:
Barrier. A material that blocks or is intended to block passage used in boxes, cables and raceways. Such as Metallic (Galvanized Steel), Nonmetallic (Polymeric Material), Iron (Ferrite or Alpha Iron), Bakelite, Epoxy, Polyimide, Glass Polyester, melamine resin or other insulating material.
Substantiation: There is currently confusion between the authority having jurisdiction and contractors in the field.
Article 100 of the National Electrical Code provides for a definition for a term that is used in two or more articles.
The term "Barrier" is used in the following Sections:
Section 314.28(D) Section 725.136(D)(2)(a)
Section 368.234(B) Section 725.136(G)
Section 404.8(B) Section 727.5 Exception No. 1
Section 406.4(G) Section 760.136(B)
Section 408.3(A)(2) Section 760.136(D)(2)(a)

The technical dictionary describes barriers as "a partition, slab or plate of insulating material placed between blades of switches, wire or conductors in order to separate or insulate them.
Panel Meeting Action: Reject
Panel Statement: Based on a presentation by the submitter to CMP-9 at the ROP meeting, it is apparent that the intended subject of this proposal is a flexible material that can be incorporated into a cable assembly. CMP-9 requests that the TCC refer this proposal to CMP-3 and CMP-16 for action in limited energy cable articles for the purposes of qualifying for system separation. Barriers used within the scope of CMP-9 responsibilities are rigid and accord with dictionary definitions, and therefore do not need to be defined in Article 100.
Number Eligible to Vote: 12

Submitter: Douglas Guevara, Isotec, Inc.

Recommendation: Add new text to read as follows:

<u>Barrier. A material that blocks or is intended to block passage used in boxes, cables and raceways. Such as Metallic (Galvanized Steel), Nonmetallic (Polymeric Material), Iron (Ferrite or Alpha Iron), Bakelite, Epoxy, Polyimide, Glass Polyester, melamine resin or other insulating material.</u>

Substantiation: There is currently confusion between the authority having Jurisdiction and contractors in the field.

Article 100 of the National Electrical Code provides for a definition for a term that is used in two or more articles.

The term “Barrier” is used in the following Sections:

Section 314.28(D) Section 725.136(D)(2)(a)
Section 368.234(B) Section 725.136(G)
Section 404.8(B) Section 727.5 Exception No. 1
Section 406.4(G) Section 760.136(B)
Section 408.3(A)(2) Section 760.136(D)(2)(a)
Section 408.3(A)(3) Exception Section 770.133(A) Exception No. 5
Section 430.97(A) Exception Section 800.133(A)(1)(c) Exception No. 1
Section 504.30(A)(2)(5) Exception Section 820.133(A)(1)(b) Exception No. 1
Section 640.46 Section 830.133(A)(1)(d) Exception No. 1
Section 725.48(B)(4)(1)
Section 725.136(B)

Most codes state that undefined terms, and the meaning of terms not specifically defined in most code documents, shall be defined by collegiate dictionaries in the sense that the context implies.

Merriam-Webster defines “Barrier” as “something material that blocks or is intended to block passage or separates”. The technical dictionary describes barriers as “a partition, slab or plate of insulating material placed between blades of switches, wire or conductors in order to separate or insulate them.”

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 9-8.

2-4 Log #584 NEC-P02 **Final Action: Reject**

(100.Bathroom and 210.8(A)(7))

Submitter: Mitch Feininger, North Dakota State Electrical Board

Recommendation: Revise text to read as follows:

Bathroom. An area with a tub or shower and one or more of the following: a basin or toilet./~~laundry, utility, and wet bars/sinks~~ - where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink/

Exception to (7): Receptacles that are not readily accessible.

Substantiation: The intent of this proposal is to address 1/2 baths that have a sink and a stool and are in the same “room” as a laundry room where there is a sink by the stool over 6 ft away from the washing machine. It is highly unlikely that a person using the washing machine in this area will be wet. It also expands CFCI requirements near sinks while excluding refrigerators in kitchens in dwellings.

Panel Meeting Action: Reject

Panel Statement: The submitter’s recommendation adds a requirement to the definition of a bathroom, that does not comply with 2.2.2 of the NEC Manual of Style. Also the Submitter has not substantiated the addition of an exception to 210.8(A)(7). Proposals that address separate sections of the Code should be submitted on separate proposal forms in compliance with the Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-5 Log #2246 NEC-P02 **Final Action: Accept in Principle**

(100.Bathroom)

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector

Recommendation: Add new and delete text to read as follows:

Bathroom. An area including a basin with one or more of the following: a toilet, a tub, ~~or~~ a shower~~.~~<u>, a urinal, a foot bath, or a bidet</u>.

Substantiation: The definition is restrictive to the items that would make a bathroom. The intent of the change is to extend the definition to cover all items that one might encounter in a room that would make a bathroom.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

"**Bathroom.** An area including a basin with one or more of the following: a toilet, a urinal, a tub, a shower, a foot bath, a bidet, or similar plumbing fixtures."

Panel Statement: The panel has accepted the submitter's recommendation in principle and added additional words to include similar plumbing fixtures.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-6 Log #2247 NEC-P02 **Final Action: Accept in Principle in Part**
(100.Bathroom)

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector

Recommendation: Add new and revise text to read as follows:

Bathroom. An area including ~~a basin with one~~ two or more of the following: a basin, a toilet, a tub, ~~or~~ a shower~~.~~, a urinal, a foot bath, or a bidet.

Substantiation: The definition is restrictive to the items that would make a bathroom. The intent of the change is to extend the definition to cover all items that one might encounter in a room that would make a bathroom.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: See panel action and statement on Proposal 2-5. The panel rejects the revised text that would make a basin optional.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-7 Log #3468 NEC-P02 **Final Action: Reject**
(100.Bathroom)

Submitter: James G. Lally, IBEW/NECA Technical Institute

Recommendation: Revise definition as follows:

Bathroom. An area including ~~a basin with one~~ a combination of any two or more of the following: a toilet, a tub, a shower, or a basin.

Substantiation: As an inspector, I see many situations where people remodel or finish older basements that have toilets and showers or tubs and toilets that do not have basins. They put make-up tables in these rooms and are used as bathrooms for practical purposes.

Panel Meeting Action: Reject

Panel Statement: The panel rejects the revised text that would make a basin optional. The proposed text would expand the definition to include many areas that are not considered to be a bathroom and would affect enforceability.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-8 Log #2970 NEC-P02 **Final Action: Reject**
(100.Bedroom (New))

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Add text to read as follows:

ARTICLE 100 Definitions

I. General

Bedroom. A habitable room or space intended primarily for sleeping. In a dwelling unit, a habitable room or space intended or capable of being used primarily for sleeping, even where it serves other uses such as a home office, an entertainment or hobby area, a temporary storage space, or the like for the present occupant(s).

Substantiation: Usability and enforceability of the *Code*. "Bedroom" and "bedrooms" is used without definition throughout the *Code*. The last sentence is included to end disputes as what constitutes a bedroom where the current occupant(s) has converted the room or space for other purposes during that occupancy.

Panel Meeting Action: Reject

Panel Statement: There are a number of different types of rooms specified in the code that have commonly understood meanings, such as sunroom, dining room, living room, family room, etc. The requirements of the code are intended to apply to these rooms in accordance with their use.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

5-4 Log #2928 NEC-P05 **Final Action: Accept**
(100.Bonding Jumper)

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise text to read as follows:

Bonding Conductor or Jumper. A reliable conductor to ensure the required electrical conductivity between metal parts required to be electrically connected.

Substantiation: The term "Bonding Jumper" includes the connotation of being a conductor of short or limited length. These bonding jumpers are most often contained within enclosures or are secured to raceways as where bonding jumpers are secured on the exterior of conduits.

Yet, we find bonding conductors or jumpers of 20 ft or longer in length installed to bond grounding electrodes together as required in Articles 800, 810, 820 and 830. Bonding conductors or jumpers are also installed to bond grounding electrodes together as required in 250.50 and 250.53.

Proposals are made to other sections of the NEC to ensure these bonding conductors are installed properly and are protected from physical damage.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

JOHNSTON, M.: Continue to accept this proposal because it provides the necessary Code-wide consistency in the use of defined words and terms related to grounding and bonding. Including the words "Conductor or" improves clarity and meaning in applications that refer to conductive paths which are often greater in length than bonding jumpers.

5-5 Log #4016 NEC-P05 **Final Action: Accept in Principle**
(100.Bonding Jumper, Equipment)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting and clarify whether it is the Panel's intent to replace the definition "Bonding Jumper-Equipment" with "Supply-Side Bonding Jumper (SSBJ)".

This action will be considered by the panel as a public comment.

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Revise text to read as follows:

Bonding Jumper, Equipment. The connection between two or more portions of the equipment grounding conductor; or a connection from a system bonding jumper and the first disconnecting means of a separately derived system.

Substantiation: The term "equipment bonding jumper" is used in 250.30(A)(2) and is used as a fault carrying conductor for the separately derived system. It is sized by 250.102(C), Table 250.66 or 12.5% not by 250.122 as are equipment grounding conductors.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

Supply-Side Bonding Jumper (SSBJ). A reliable conductor installed on the supply side of a service or separately derived system to ensure the required electrical conductivity between metal parts required to be electrically connected.

Panel Statement: The definition of this conductor is necessary to ensure the proper identification and installation of bonding conductors installed within or on the supply side of service equipment and between the source of a separately derived system and the first disconnecting means. The equipment bonding jumper is sized from Table 250.122 based upon the rating of the overcurrent protective device whereas the size of the bonding jumper for separately derived systems is sized by 250.102(C) from Table 250.66 plus the 12.5% rule. As a result, these terms cannot be combined in one definition.

The panel concludes this action meets the intent of the submitter.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

MELLO, C.: The panel action was supposed to actually create another term and definition of "supply side bonding jumper", and therefore there would be no change to the existing term "bonding jumper – equipment" and the existing definition. The panel action as recorded, "Revise text to read as follows:" would eliminate the present term of "bonding jumper – equipment" and it definition and replace it with the new term "supply side bonding jumper" and the new definition. When done correctly, both terms should be established and defined.

5-6 Log #535 NEC-P05 **Final Action: Reject**
(100.Bonding Jumper, System (New))

Submitter: James W. Moore, Samaritan's Purse World Medical Mission, Gregory P. Bierals

Recommendation: Add new text as follows:

Bonding Jumper, System. The connection between the grounded circuit conductor and the equipment grounding conductor at any single point on a separately derived system from the source to the first system disconnecting means or overcurrent device, or at the source of a separately derived system that has no disconnecting means or overcurrent devices.

Substantiation: This term and definition will correlate with section 250.30(A)(1), which was added in 2005.

Panel Meeting Action: Reject

Panel Statement: The definition of the system bonding jumper is appropriately covered in 250.2.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

2-9 Log #2568 NEC-P02 **Final Action: Reject**
(100.Branch Circuit, Individual)

Submitter: Charles Palmieri, Palmieri Assoc.

Recommendation: Add the following text (as indicated) to the definition; Branch Circuit, Individual. A branch circuit that supplies only one utilization equipment, or a single receptacle.

Substantiation: Duplex receptacles are commonly installed for cord and plug connected appliances, which in many cases (by manufactures standard) require an individual branch circuit. Once the duplex receptacle is installed, the circuit becomes a multi-outlet branch circuit. I am not certain that this was the intent of the manufacturer when it required an individual branch circuit, nor was it the intent of the panel when it adopted the definition of individual branch circuit as it is now written. This issue is further exasperated when one refers to exhibit 100.7 of the 2008 Handbook. The illustration implies that only a single contact device may be installed on a individual branch circuit. If the language is modified as I have proposed, a lot of arguments may be put to rest in the field.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that a single receptacle is required. A receptacle other than a single receptacle could be used, and other means such as configuration or arrangement of the equipment could limit the application to a single utilization equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-10 Log #544 NEC-P02 **Final Action: Reject**
(100.Branch Circuit, Multiwire)

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Revise the definition of Branch Circuit, Multiwire as follows:

Branch Circuit, Multiwire. ~~A branch circuit that consists of two or more ungrounded conductors that have a voltage between them, and a grounded conductor that has equal voltage between it and each ungrounded conductor of the circuit and that is connected to the neutral or grounded conductor of the system.~~ <u>A branch circuit originating from the same panelboard or similar distribution equipment, consisting of a grounded conductor and two or more ungrounded conductors that have a voltage between them and which supply only line-to-neutral loads.</u>

Substantiation: In the scope of Article 100 it states the following:

Part I of this Article contains definitions intended to apply wherever the terms are used throughout this *Code*.

A defined term should be able to be used throughout the *Code* without having to modify its definition.

Section 210.4(A) modifies the definition of the term multiwire branch circuit, by adding the last sentence, "All conductors of a multiwire branch circuit shall originate from the same panelboard or similar distribution equipment".

Section 210.4(C) also modifies the definition by restricting multiwire branch circuits to supply only line-to-neutral loads.

Section 240.15(B)(1) modifies the definition by restricting multiwire branch circuits that serve only single-phase line-to-neutral loads.

Sections 210.4(A)(C) and 240.15(B)(1) does not restrict the modified definition to being used only in those articles and can be used to supplement the weak definition in Article 100 and could be applied throughout the Code.

Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation introduces requirements into the definition of a multiwire branch circuit, that does not comply with 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-11 Log #620 NEC-P02 **Final Action: Reject**
(100.Branch Circuit, Multiwire)

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Revise text to read as follows:

A branch circuit that <u>originates from the same distribution equipment</u> and consists of two or more ungrounded conductors that have a voltage between them, and a grounded <u>neutral</u> conductor that has equal voltage between it and each ungrounded conductor of the circuit <u>that supplies line to neutral loads</u> ~~and that is connected to the neutral or grounded conductor of the system~~.

Substantiation: In the scope of Article 100 it states the following:

Part I of this article contains definitions intended to apply wherever the terms are used throughout this *Code*.

A defined term should be able to be used throughout the *Code* without having to modify its definition.

Section 210.4(A) MODIFIES THE DEFINITION OF THE TERM MULTIWIRE BRANCH CIRCUIT BY ADDING THE LAST SENTENCE, "All conductors of a multiwire branch circuit shall originate from the same panelboard or similar distribution equipment".

Section 210.4(C) also modifies the definition by restricting multiwire branch circuits to supply only line-to-neutral loads.

Section 240.15(B)(1) modifies the definition by restricting multiwire branch circuits that serve only single-phase line-to-neutral loads.

Sections 210.4(A)(C) and 240.15(B)(1) do not restrict the modified definition to being used only in those articles and can be used to supplement the weak definition in Article 100 and could be applied throughout the *Code*.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-2a Log #CP1000 NEC-P10 **Final Action: Accept**
(100.Branch-Circuit Overcurrent Device)

Submitter: Code-Making Panel 10,
Recommendation: Revise text to read as follows:

~~Branch-Circuit~~ **Overcurrent <u>Protective</u> Device<u>, Branch-Circuit</u>.** A device capable of providing protection for service, feeder, and branch circuits and equipment over the full range of overcurrents between its rated current and its interrupting rating. Branch-circuit overcurrent protective devices are provided with interrupting ratings appropriate for the intended use but no less than 5,000 amperes.

Substantiation: This definition is editorially revised to correlate with the Panel Action on Proposals 10-6 & 10-7.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

COOK, D.: I agree with the Panel action to editorially revise terms related to overcurrent devices in order to group those definitions together. See Cook comment on proposal 10-3 for preferred term.

10-3 Log #2735 NEC-P10 **Final Action: Reject**
(100.Branch-Circuit Overcurrent Device)

Submitter: Timothy S. Owens, City of Santa Clara
Recommendation: Revised text as follows:

~~Branch Circuit~~ Overcurrent Device <u>(General)</u>. A device capable of providing protection for service, feeder, and branch circuits and equipment over the full range of overcurrents between its rated current and its interrupting rating. Branch-circuit overcurrent protective devices are provided with interrupting ratings appropriate for the intended use but no less than 5,000 amperes.

Substantiation: The revisions to this definition provide clarity for the user. As currently defined, branch-circuit overcurrent device also covers feeder and service overcurrent devices. However, the term branch-circuit overcurrent device is not used in the NEC when addressing feeder or service overcurrent devices. By removing the specific "Branch Circuit" wording, the definition becomes more general and will apply to all conditions where overcurrent devices are mentioned without causing confusion as to application of the definition.

Panel Meeting Action: Reject
Panel Statement: Clarity would not be improved unless proposals were made and accepted to change all 71 occurrences of "branch circuit device" or similar phrases in the 2008 NEC. "Branch-circuit overcurrent device" occurs 24 times. "Branch-circuit device" occurs 3 times. "Branch-circuit overcurrent protective device" occurs 8 times. "Branch-circuit short-circuit and ground-fault protective device" occurs 31 times. "Branch circuit protective device" occurs 9 times.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

COOK, D.: Submitter's substantiation has merit based on my personal experience with typical industry designers, contractors, installers, and enforcement. The Panel statement identifies a number of places "branch circuit overcurrent device" is used in various ways throughout the NEC. The terms feeder overcurrent device and service overcurrent device are also used multiple times in the NEC. The current Article 100 definition for "branch circuit overcurrent device" seems to apply to all of those overcurrent devices. That seems to provide a basis for accepting the proposal to change the term from "Branch Circuit" to "General". Obviously additional effort would be needed to review the locations throughout the NEC where branch circuit, feeder, or service overcurrent device is used and correlate those terms. Changing the definition to Overcurrent Device (General) using the existing definition would seem to provide clarity for the term. It should be noted the CMP-10 panel action on Proposal 10-72 includes the following text; "containing service or feeder circuit overcurrent devices". Are those "branch circuit" overcurrent devices?

1-55 Log #3841 NEC-P01 **Final Action: Accept in Principle**
(100.Building)

Submitter: Don L. Hamouz, Aurora, CO
Recommendation: Add new text to read as follows:

BUILDING. A structure that stands alone or that is cut off from adjoining structures by firewalls (<u>or fire barriers</u>) with all openings therein protected by approved fire doors.

Substantiation: It has been my experience that Architects and Engineers have difficulty in substantiating this coordination when determining the number of electrical services to a multiple occupancy building(s). This creates interpretational differences between jurisdictions for designers, and contractors, and inspection entities.

The existing language is modified to eliminate confusion between the electrical and building codes as to the precise definition of these types of accommodations. The new language would better accommodate contemporary construction design, and still be in compliance with 2006 IBC Section 508 for "Mixed Use and Occupancy" based on construction types and Separated/Non-separated use.

It would allow a less stringent design for electrical and building codes, while still being economically practical, and still provide fire separation between occupancies that had UL listing certification.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 1-56.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ANTHONY, M.: Our interest group would like to wait for public review of this proposal. Conceptually, it makes sense to harmonize an NEC definition of a building with other NFPA and ANSI documents. Some attention should be given to how this definition affects how power utility tariffs might be written as a consequence of it. As we have seen elsewhere in this code cycle, there is an NEC concept of a building, and then there is a power utility concept of a building. Let's see if public discussion produces new information.

1-56 Log #4502 NEC-P01 **Final Action: Accept in Principle in Part**
(100.Building)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 3, 4, 5, 9, 12, 13, 14, 15, 16, 18, and 19, the Technical Correlating Committee on Building Code (BLD-AAC), and the Technical Committee on Building Construction for information.

Submitter: Bob Foote, Town of Georgetown / Rep. Building Code Development Committee (BCDC)

Recommendation: Revise text to read as follows:

Building. ~~A structure that stands alone or that is cut off from adjoining structures by fire walls with all openings therein protected by approved fire doors.~~ <u>A structure, usually enclosed by walls and a roof, constructed to provide support or shelter. Buildings separated by fire walls and adequate opening protectives shall be considered separate buildings.</u>

Substantiation: Note: This proposal was developed by the proponent as a member of the Building Code Development Committee (BCDC) with the committee's endorsement.

The definition of "building" in the NEC uses the term "structure", which is also defined in the NEC. Based on the definition of "structure" in the NEC, a fence could be considered a "building". The replacement definition for "building" is based on the definition found in NFPA 5000, section 3.3.65. The second sentence of the definition is intended to assist in determining when separate electrical distribution is required.

Panel Meeting Action: Accept in Principle in Part

The panel accepts part of the recommended wording to read as follows:

A permanent structure having a roof and walls that stands alone or that is cut off from adjoining structures by fire walls or fire barriers with all openings therein protected by approved fire doors and used to enclose an occupancy."

The panel rejects the wording "and adequate opening protectives shall be considered separate buildings.

Panel Statement: The panel derived the change to this definition from the NFPA Glossary of Terms and Proposals 1-55 and 1-56 to meet the submitter's concerns.

The panel notes that the NFPA Glossary has a preferred definition for "Building" from NFPA 220: "A permanent structure having a roof and walls and used to enclose an occupancy."

The panel does not accept the addition of the wording "and adequate opening protectives shall be considered separate buildings" because it contains a requirement.

The panel requests that the Technical Correlating Committee refer this proposal to NFPA Technical Committees of 220 and 5000, and also to all NEC Code-Making Panels where the defined term is used.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ANTHONY, M.: Please refer to statement in Proposal 1-55.

6-4 Log #3470 NEC-P06 **Final Action: Reject**
(100.Cable (New))

Submitter: David G. Humphrey, Midlothian, VA

Recommendation: Add text to read as follows:

<u>Cable. A stranded conductor (single-conductor cable) or a combination of conductors insulated from one another (multiple conductor cable).</u>

Substantiation: The term "single conductor cable" is used in this code especially in Article 392. Article 100 has not defined what constitutes a "single conductor cable" since the 1940 edition of the NEC. There is often some user confusion between the term single conductor cable, single conductor, cable assembly etc. This definition will make exactly what is and what is not a "single conductor cable" clear.

Panel Meeting Action: Reject

Panel Statement: The proposed definition is wrong. A conductor need not be insulated to be part of a cable. A single conductor may be stranded or solid. In addition, the word being defined may not be used in the definition.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

8-4 Log #219 NEC-P08 **Final Action: Reject**
(100.Cable Tray)

Submitter: Terry Peters, The Society of the Plastics Industry

Recommendation: Revise as follows:

<u>**Cable Tray.** A support designed expressly for holding wires, cables, and raceways with additional functions as permitted in this *Code*. Cable trays include, but are not limited to the following types, ladder, ventilated, ventilated channel, ventilated trough, solid bottom, solid bottom with solid metal cover, solid channel, steel, aluminum, metallic and nonmetallic.</u>

Substantiation: The term "cable tray" is used throughout the code without a definition. It should be defined. The definition of "raceway" was used as a model in developing this definition.

Panel Meeting Action: Reject

Panel Statement: The definition of a cable tray is included in Section 392.2, the Article that covers cable tray. Adding a definition in Article 100 will not add clarity to the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-5 Log #217 NEC-P08 **Final Action: Reject**
(100.Cable Tray System (New))

Submitter: Terry Peters, The Society of the Plastics Industry

Recommendation: Add new text to read:

<u>**Cable Tray System.** A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.</u>

Substantiation: The term "cable tray system" is used in multiple articles but the definition is in Article 392. The style manual requires that a definition be placed in Article 100. The NEC style manual states:

"2.2.2.1 Article 100. In general, Article 100 shall contain definitions of terms that appear in two or more other articles of the *NEC*."

Panel Meeting Action: Reject

Panel Statement: NEC Style Manual 2.2.2.1 allows the definition to be in Article 392. "Cable tray" is not a generic term, it is a product and the definition more appropriately remains in Article 392 where the rules of installation appear.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

5-7 Log #3640 NEC-P05 **Final Action: Reject**
(100.Common Neutral (New))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Add new text to read as follows:

<u>Common Neutral. A neutral conductor used in a circuit with two or more ungrounded conductors having no potential between them.</u>

Substantiation: The term common neutral is used in Articles 215 and 225. It is not defined in either article and the term needs to be defined for proper understanding of the code rules.

Panel Meeting Action: Reject

Panel Statement: The proposed definition does not add any clarity to the use in those sections cited in the substantiation. The proper usage of a common neutral is adequately covered in 215.4 and 225.7(B). Section 215.4 deals with multiple feeder circuits using one neutral and is not one circuit as implied in the proposed definition.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

6-5 Log #4723 NEC-P06 **Final Action: Reject**
(100.Compact Stranding)

Submitter: Jerry Lee Richardson, ESG

Recommendation: Add the following text to Article 100 as follows:

<u>**Compact Stranding.** Stranded conductor which has been compressed in manufacture to reduce voids.</u>

In Table C.1(A), Table C.2(A), Table C.3(A), Table C.4(A), Table C.5(A), Table C.6(A), Table C.7(A), Table C.8(A), Table C.9(A), and Table C.10(A) delete the following text:

~~Definition: Compact stranding is the result of manufacturing process where the stranded conductor is compressed to the extent that the interstices (voids between strand wires) are virtually eliminated.~~

A companion proposal has been sent to CMP-8 relative to Annex C.

Substantiation: Definitions duplicated in ten tables will be replaced by a single definition in Article 100.

Panel Meeting Action: Reject

Panel Statement: This definition is not necessary in Article 100 based on the NEC Style Manual.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
PICARD, P.: The proposed definition does not add clarity, nor does it adequately define "compact stranding".

8-6 Log #4723a NEC-P08 **Final Action: Reject**
(100.Compact Stranding)

Submitter: Jerry Lee Richardson, ESG
Recommendation: Add the following text to Article 100 as follows:
Compact Stranding. Stranded conductor which has been compressed in manufacture to reduce voids.
In Table C.1(A), Table C.2(A), Table C.3(A), Table C.4(A), Table C.5(A), Table C.6(A), Table C.7(A), Table C.8(A), Table C.9(A), and Table C.10(A) delete the following text:
~~Definition: Compact stranding is the result of manufacturing process where the stranded conductor is compressed to the extent that the interstices (voids between strand wires) are virtually eliminated.~~
A companion proposal has been sent to CMP-6 relative to the definition.
Substantiation: Definitions duplicated in ten tables will be replaced by a single definition in Article 100
Panel Meeting Action: Reject
Panel Statement: This definition is applicable to the use and understanding of the tables in Annex C relative to compact stranding. A reference back to Article 100 would need to be included at each table making the relocation proposed not user friendly.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-57 Log #202 NEC-P01 **Final Action: Reject**
(100.Concealed (as applied to wiring methods))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
"Concealed (as applied to wiring methods). Rendered inaccessible by the structure or finish of the building wires. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them."
Substantiation: The definition of "concealed" needs to be clarified to show that it applies to wiring methods because applying the current definition of concealed to the term "concealed space: can lead to confusion. "Concealed space" is defined in the NFPA Glossary as "That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting."
Panel Meeting Action: Reject
Panel Statement: The proposal is unnecessary. Without exception, all references to "concealed" in the NEC are clear under the existing definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-58 Log #114 NEC-P01 **Final Action: Reject**
(100.Concealed Space)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Add definition to read as follows:
Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1].
Substantiation: The term concealed space is used in 320.30(D)(1), 330.30(D)(1), 332.30(B), 334.30(B), 348.30(A), 350.30(A), 376.10(2), 604.4, 760.53(A)(1), 760.130(B)(1), 770.154(A), 800.154(A) and 820.154(A). This definition is an extract from NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. It is the only definition of concealed space in the NFPA Glossary.
Panel Meeting Action: Reject
Panel Statement: Adding the definition of "Concealed Space" from the NFPA Glossary of terms would add confusion and possibly create a less restrictive code requirement. The code sections noted by the submitter are intended for spaces that are rendered inaccessible by the structure or finish of the building. If the definition of "Concealed Space" were added to the NEC, it would allow suspended ceilings and attic spaces to be considered concealed spaces. This, in turn, would allow the installation of unsupported cables in such spaces. See "Securing and Supporting" requirements in several cable wiring method articles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-59 Log #200 NEC-P01 **Final Action: Reject**
(100.Concealed Space, Nonconcealed Space, FPN)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]
Nonconcealed space. That portion of a building that is not a concealed space.
Substantiation: Sections 320.30(D)(1), 330.30(D)(1), 332.30(B), 334.30(B)(1), 348.30(A) Exception No. 1, 350.30(A) exception No. 1, 376.10(2), 604.4 Exception No. 1, 760.53(A)(1), 760.130(B)(1) deal with wiring in concealed spaces.
Sections 725.154(E)(3), 800.154(C)(3) and 820.154(C)(3) have application requirements for cables in nonconcealed spaces.
Although the terms are widely used, neither concealed spaces nor nonconcealed spaces are defined in the NEC. Utilizing the definition of "concealed" in Article 100 to understand a "concealed space" leads to a misunderstanding of what concealed and nonconcealed spaces are. I have also submitted a proposal to clarify that the definition of "concealed" in Article 100 applies only to wiring methods.
Panel Meeting Action: Reject
Panel Statement: The submitter has not identified a problem or stated how the problem would be resolved by adding the definition. The proposal does not satisfy 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
The word "nonconcealed" implies not a concealed space. The prefix "non" means "not", such as nonmetallic, nonfusible, nonlinear, noncombustible, etc.
See the panel action and statement on Proposal 1-58.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-22 Log #1819 NEC-P09 **Final Action: Reject**
(100.Conduit Body)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first paragraph and substitute: A fitting that provides access to enclosed conductors through a removable cover(s) and is provided with one or more hubs for connection to a wiring method or equipment.
Substantiation: Edit. A conduit body is not necessarily part of a conduit or tubing system. They may be used with cables, cords, or open conductors.
Panel Meeting Action: Reject
Panel Statement: Although a cord might enter a conduit body, the conduit body (if properly used) will be attached to a raceway at another end. Therefore the use described in the substantiation agrees with the definition, and no change is warranted. In addition, the usage of the term 'fitting' is inconsistent with existing product standards.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-12 Log #2007 NEC-P02 **Final Action: Reject**
(100.Connected Load (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows: Connected Load. Electrical equipment that requires current and power (watts or volt-amperes) for its intended function(s) and supplied by an attachment plug and cord or direct connection to supply circuit conductors. A receptacle, cord connector body, or flanged surface outlet is not considered a connected load.
Substantiation: The Code refers to connected load and calculated load without distinction. Some loads are calculated without an actual load being connected, which infers a distinction.
Panel Meeting Action: Reject
Panel Statement: The term "connected load" is well understood and no further clarification is needed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-13 Log #3277 NEC-P02 **Final Action: Reject**
(100.Continuous Load)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
A load other than a motor(s) where the ~~maximum~~ current is ~~expected~~ likely to be continuous for 3 hours or more
Substantiation: Edit. Motor load should be excluded so the 25 percent ampacity factor for continuous load should not be in addition to the 25 percent factor for most motor loads. I have submitted several proposals that will apply the 25 percent factor only to the largest of the largest motor or continuous load which is sufficient to allow for temporary overload or heating effect of continuous load at terminals and overcurrent devices, which are not likely to be simultaneous which will remove what is in effect a double derating. A sign or lighting circuit load where the current is cycled on and off for part of the load

at intervals less than 3 hours will not be a continuous load since the maximum current is not continuous for 3 hours.
Panel Meeting Action: Reject
Panel Statement: Continuous loads are irrespective of the load type. The same requirements should apply to all continuous loads.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-4 Log #1929 NEC-P18 **Final Action: Reject**
(100.Cord Connector (Body))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: CORD CONNECTOR (BODY). A contact device connected to a flexible cord or cable for the attachment of a plug cap or flanged surface inlet.
Substantiation: There is no definition for this device as there is for plug cap and receptacle.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.

No definitive substantiation has been provided that a definition is required or necessary.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

1-60 Log #1451 NEC-P01 **Final Action: Reject**
(100.Disconnecting Means)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

~~A~~ An identified device or group of devices or other identified means by which the conductors of a circuit or equipment can be ~~disconnected~~ isolated from their source of supply.
Substantiation: The device(s) should be suitable for the use; i.e., voltage, current, number of poles, etc. All means of disconnect may not be suitable such as plug/receptacle, terminal lugs, wire connectors, links, etc.
Panel Meeting Action: Reject
Panel Statement: The proposed definition contains the requirement "identified" that is not permitted by 2.2.2. of the NEC Style Manual.

Not all disconnecting means are required to be identified.

No substantiation was provided for inserting "or equipment", or for changing "disconnected" to "isolated".

The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-61 Log #3263 NEC-P01 **Final Action: Reject**
(100.Disconnecting Means)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:

A device, or group of devices, or other means, identified for the purpose with provisions for manual external operation by which a conductor(s) or equipment or both can be disconnected...
Substantiation: Many devices can be a means of disconnection which may not be suitable such as terminal lugs, wire connectors, screws, limit switches, pressure switches, temperature switches, proximity switches, et. Many sections do not indicate a specific type of disconnecting means, and if they do this definition is then modified. This definition does contain requirements as do many definitions, but not in the sense they are Code "rules"; this distinction should be made clear in the Style Manual.
Panel Meeting Action: Reject
Panel Statement: As the submitter of this proposal has noted, the NEC Style Manual Section 2.2.2, prohibits definitions from containing requirements or recommendations.

As proposed, the disconnecting means would need to be identified and externally operable.

In addition, the revised definition would be overly restrictive by requiring that all disconnecting means have "provisions for manual external operation."

This would prohibit disconnecting means from being installed behind covers or electrically actuated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-62 Log #1502 NEC-P01 **Final Action: Reject**
(100.Disconnecting Means Capable of Being Locked in the Open (Off) Position (New))

Submitter: Edward G. Kroth, Verona, WI
Recommendation: Add new text to read as follows:

Disconnecting Means Capable of Being Locked in the Open (off) Position. A disconnecting means is said to be capable of being locked in the open (off) position when the provisions for locking or adding a lock to the disconnecting means remains in place at the switch or circuit breaker whether the lock is installed or not. Note that portable means for adding a lock to the switch or circuit breaker do not meet the standard of this definition and shall not be permitted.
Substantiation: If this definition is accepted, then it would allow the elimination of similar sentences from approximately 27 sections in Chapters 4, 5 and 6. For example, in 430.102(B) Exception the entire 2nd sentence could be removed. Also, as a further example, in Part VI of Article 620 similar sentences could be eliminated five different times in just two pages of NEC text. I realize that the NEC does not need to read like a novel, but I see no reason why needless boring repetition cannot be removed if a simple new definition can suffice. This falls in line with other recent moves towards usability.
Panel Meeting Action: Reject
Panel Statement: The term "disconnecting means" is currently defined in the NEC. Adding an additional definition that is modified by the use of additional text would likely cause confusion for the code user. The proposed definition also includes requirements or recommendations that are in violation of the NEC Style Manual Section 2.2.2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-63 Log #1560 NEC-P01 **Final Action: Reject**
(100.Disconnecting Means, Lockable (New))

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Add a new definition as follows:

Disconnecting Means, Lockable. A disconnecting means with provisions for being locked in the open position by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied.
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
Panel Meeting Action: Reject
Panel Statement: The proposed definition contains multiple requirements, which contradicts 2.2.2. of the NEC Style Manual.

This issue is best handled in other Articles such as Article 110, for example.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-64 Log #768 NEC-P01 **Final Action: Reject**
(100.Distribution Equipment (New))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Add text to read as follows:

Distribution Equipment. Electrical equipment such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that monitors or controls the flow of electricity.
Substantiation: By removing the list from 110.16, naming it, and relocating it in Article 100, we now have a term we can use when we are discussing this category of equipment. As such, all distribution equipment will have to follow the rules for equipment, but not all equipment will have to follow the rules for distribution equipment.
Panel Meeting Action: Reject
Panel Statement: The term "Distribution Equipment" is generally used in Chapters 5, 6, 7 and 8. In other code articles the term is used in the context to designate similar equipment, such as switchboards and panelboards.

The definition may be more appropriately defined within the given Articles based on the context of its use. In addition, not all distribution equipment is intended to monitor or control the flow of electricity. For example, distribution equipment used in theaters and television studios or network-powered broadband communication systems may not necessarily monitor or control the flow of electricity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-65 Log #769 NEC-P01 **Final Action: Reject**
(100.Distribution Equipment (New))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:

Distribution Equipment. Electrical equipment such as switchboards, panelboards, industrial control panels, meter socket enclosures, motor control centers, bus plugs, enclosed disconnect switches, enclosed circuit breakers, and transfer switches that monitors or controls the flow of electricity.
Substantiation: By adding these additional items, we help clarify the type of equipment which falls in this category. See my proposed definition - Distribution Equipment.

This will help us to describe this type of equipment and the special precautions this equipment requires compared to other types of equipment.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-64.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

14-3 Log #1269 NEC-P14 **Final Action: Reject**
(100.Dusttight)

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:
Article 100 Definitions
Dusttight. Constructed so that dust will not enter the enclosing case under specified test conditions.
<u>FPN. See ANSI/ISA-12.12.01-2000, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations.*</u>
Substantiation: A definition of a term that can be further clarified in another standard or publication as stated in 90.5(C), should include that information in a FPN. We have also submitted a proposal to delete repeated definitions and FPN's in 500.2.
Panel Meeting Action: Reject
Panel Statement: This term is used in places other than Chapter 5, where the ISA standard is not the appropriate reference standard. CMP-14 notes that the substantiation reference to 90.5(c) is inappropriate, because it does not state that one can use an FPN to further define the term.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(Note: Sequence 14-4 was not used)

2-14 Log #52 NEC-P02 **Final Action: Accept**
(100.Dwelling Unit)

Note: This Proposal appeared as Comment 1-28 on Proposal 1-27 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-27 was:
Revise text to read:
Dwelling Unit. One or more rooms arranged for ~~the use of one or more individuals living together, providing~~ complete, independent <u>housekeeping purposes, with space for</u> ~~living facilities, including permanent provisions for living;~~ <u>eating, living, and</u> sleeping, ~~eating,~~<u>; facilities for</u> cooking, and <u>provisions for</u> sanitation.
Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: Please reject the original proposal.
Substantiation: The proposed statement in the substantiation that "the definition does not change the intent of any of the codes..." is not correct. Rather, adding the new term "housekeeping purposes" introduces a new concept that is not currently in any of the NFPA standards. Deleting the term "permanent provisions for..." eliminates a long standing clarification for cooking between a portable microwave oven and an installed cook-top in a counter top. Also, the revised definition would now have all guest rooms of hotels and motels and college dormitories as dwelling units. The revised definition does not add clarity to the definition of dwelling unit. Rather, it changes the definition.
Panel Meeting Action: Accept
Panel Statement: The definition of dwelling unit remains as defined in 2008 NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-66 Log #4770 NEC-P01 **Final Action: Reject**
(100.Dwelling, Multifamily)

Submitter: William Benard, Gemini Electric Inc.
Recommendation: Revise text to read as follows:
Dwelling, Multifamily. A building that ~~contains~~ <u>consists solely</u> <u>of</u> three or more dwelling units <u>or other occupancy elements related exclusively to the three or more dwelling occupancies.</u>
Substantiation: The definition of "Dwelling, One-Family" and "Dwelling, Two-Family" include the word: "solely", which excludes any other entity to be within the "buildings" defined. The definition of "Dwelling, Multifamily" does not include such specificity. It can therefore be construed that a "Dwelling, Multifamily" may include other elements of occupancy as long as it contained the minimum "three or more dwelling units." It would therefore be possible for a building with multiple mercantile enterprises to be included within a structure defined as "Dwelling, Multifamily" as long as the building contained three or more dwelling units. This becomes an issue when the term "Multifamily" is employed in section 334.10(2) and 334.12(2) as a means to limit the identified use of a wiring method due to the specific use or purpose of a building. The term "solely" needs to be added to the definition with the option to include ancillary occupancies to a "Dwelling, Multifamily" such as a common meeting room with appurtenant kitchen, exercise rooms, a pool, or spa intended for the exclusive use of the tenants. The extra occupancies would then be included within the scope of "solely". The addition of "<u>or other occupancy elements related exclusively to the three or more dwelling occupancies</u>" would recognize the ancillary elements and still consider the building as "Dwelling, Multifamily."
Panel Meeting Action: Reject
Panel Statement: The existing definition is the preferred definition in the NFPA Glossary of Terms. The definition is used in NFPA Standards 30, 70 and 73, and a similar definition is used in NFPA 72.
The proposed definition would also restrict multifamily dwelling to dwelling units (occupancies) only. This would generally prohibit other types of occupancies within the building or structure. For example, a high-rise condominium building (multifamily dwelling) would be prohibited from having other occupancies, such as retail or assembly occupancies, or a parking garage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-67 Log #706 NEC-P01 **Final Action: Reject**
(100.Effective (New))

Submitter: Billie Van Duyne, I.B.E.W. Electrician/Apprentice Instructor
Recommendation: Add new text to read as follows:
<u>Effective. An installation that facilitates the proper operation of the device(s) and utilization equipment within a given circuit or installation. Producing the desired effect, by taking in account for low impedance, ability to safely carry the maximum currents present, proper ratings for the device(s) for the condition(s) present, proper rating(s) for the utilization equipment(s) for the condition(s) present as well as current and voltage supplied at the utilization equipment(s).</u>
Substantiation: Realizing that the code is not intended to be a training manual for the untrained person(s), often the craftsperson needs to be reminded of what is involved when properly installing a circuit, conduit run, grounding system, etc.
Each installation is different in the field, but to be effective, things like voltage drop, available fault currents, atmospheric conditions, component short circuit current ratings, and other characteristics of the circuit to be protected shall be selected and coordinated to permit the circuit-protective devices used to clear a fault to do so without extensive damage to the electrical components of the circuit. (110.10).
The term "effective" could be used throughout the code to emphasize what is involved with an installation, which can be best determined by the craftsperson present.
Panel Meeting Action: Reject
Panel Statement: The proposed new term is too limiting for broad use in the code -- for example, the term "installation" is used in the definition, but there are other places in the code where the word "effective" is used that do not apply to installations.
The term "effective" is used throughout the code in different contexts.
The need for the proposed definition in Article 100 is not substantiated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-15 Log #3550 NEC-P02 **Final Action: Reject**
(100.Electrical Fault Circuit Interrupter (EFCI) (New))

Submitter: Steven R. Montgomery, 2D2C Inc.
Recommendation: Add new text to read as follows:
<u>Electrical Fault Circuit Interrupter (EFCI). A device intended for the protection of personnel, receptacles, utilization equipment, and cords. The EFCI functions to de-energize the outlet when current or supply voltage is outside established safe limits.</u>
Substantiation: A definition of an Electrical Fault Circuit Interrupter (EFCI) is needed to describe this fire prevention technology presently manufactured by multiple suppliers and under consideration for adoption in several places elsewhere in NFPA 70.
Note that multiple sister proposals have been submitted as a new 210.13, 210.50(C), 406.3(D)(4) and 550.13(A)(4).
Panel Meeting Action: Reject
Panel Statement: There are no product requirements for EFCI protection. The FFIs submitted by CSA and Intertek appear to be test programs designed by the product manufacturer. They conclude that safe plug performs as specified by the manufacturer. A thorough study of wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. Installation of these devices is not currently prohibited by the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-16 Log #2953 NEC-P02 **Final Action: Reject**
(100.Electrical-Fault Circuit-Interrupter (EFCI) (New))

Submitter: Fred W. Brown, HI Electron
Recommendation: Add a new definition: Electrical-Fault Circuit-Interrupter (EFCI). A contact device intended for the protection of personnel, utilization equipment, and cord(s). The EFCI is de-energized without a connected output, and functions to de-energize the outlet when utilization equipment and cord(s) exceeds their rated current or when the supply voltage is outside established safe limits.
Substantiation: Electrical-Fault Circuit-Interrupter (EFCI) senses a lower level of fault and overload current conditions than branch circuit protection devices and AFCIs. The article "Stop Fires Before They Start by Steve Montgomery" points out that EFCI provide protection against over and under voltage, open neutral conductors, high resistance connections, damage wiring, overloading of small appliance cords, etc. that branch circuit overcurrent protection devices and AFCIs might not protect against. Even with the increased sensitive the EFCI they will not be a cause of nuisance tripping. EFCI detect a potential cause of electrical fires and safely segregate it.

Electrical-Fault Circuit-Interrupter (EFCI) uses a relay to normally disconnect electricity at the receptacle sockets. EFCI only turns electricity on at the socket when it detects the insertion of an electrical plug. The detection mechanism is an RFID tag embedded in a device plug or attached to the face of a device plug that complies with the Right Plug standard.

This definition should be included in Article 100 if EFCI proposals are accepted.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-68 Log #1323 NEC-P01 **Final Action: Reject**
(100.Enclosed)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:

Surround by a case, housing, or walls that prevents or minimizes the likelihood of accidental contact with energized parts or to protect equipment from physical damage.
Substantiation: Enclosures do not always prevent accidental contact, otherwise no one would ever be shocked at an enclosed switch, and fences do not always deter people as witnessed by electrocutions of those who climb into high-voltage substations. Enclosures can also prevent or minimize contact by animals.
Panel Meeting Action: Reject
Panel Statement: Entrance through or around a fence and removal of a cover are actions that defeat the safeguards built into the enclosure.

An enclosure such as a housing, fence, or wall, does prevent accidental contact with energized parts, although it may not prevent any possible contact with such parts.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

LABRAKE, JR., N.: I am voting with the panel action and am noting that during the panel discussion of this proposal, the issue of enclosures also providing equipment protection was raised. The following is proposed as an alternate that addresses this question:

Enclosed. Surrounded by a case or housing, fence, or wall(s) designed to protect the contained equipment and limit the likelihood, under normal conditions, of dangerous approach or accidental contact by persons or objects. ~~That prevents persons from accidentally contacting energized parts.~~

1-69 Log #3258 NEC-P01 **Final Action: Reject**
(100.Enclosed)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

Surrounded by a case, housing, fence, or wall(s) that prevents persons, animals, or objects from accidentally contacting energized parts.
Substantiation: Edit. Animals and objects should be included. Objects are included in the definition of Guarded.
Panel Meeting Action: Reject
Panel Statement: It is unreasonable to expect an enclosure to prevent all animals from coming into contact with energized parts (mice for instance).

The submitter has not substantiated a problem with the existing definition, or how the proposed definition alleviates the problem. This does not satisfy 4.3.3(d) of the NFPA Regulations Governing Committee Projects.

The panel does not agree with the submitter that the recommended change is editorial.

See the panel action and statement on Proposal 1-4.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: Generally, all life forms should be afforded reasonable protection from accidentally contacting energized parts. In addition, material things (objects) should be included in the definition. The panel should have revised the definition as follows: Surrounded by a case, housing, fence, or wall(s) that prevents ~~persons from~~ accidentally contacting energized parts.

1-69a Log #3443 NEC-P01 **Final Action: Reject**
(100.Engineering Supervision (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Add the following definition to Article 100:
Engineering Supervision: Technical oversight by an engineer in charge having practical skills for applying scientific principles and practices in the design, construction, maintenance, operation and performance of an installation, equipment, or system.
FPN: By law, many governmental jurisdictions require engineers to be licensed in order to practice to demonstrate their professional service to the protection of public health, safety, and welfare. Engineering Supervision of a structure, equipment, or system installation begins with the initial engineering design, continues with construction and establishment and overseeing of on-going operation and maintenance, and ends with final retirement and removal.
Substantiation: EEI recognizes the need for the term "engineering supervision" to be defined for consistent and uniform application of its meaning used throughout the NEC in articles such as 240, 250, 310, 500, 501, 505, 625, and 708. This is also provided in response to public need as shown in proposals and comments documented in the A2007 NEC ROP and ROC.

Having an engineer overseeing the installation and maintenance of an installation does not eliminate common practice of having technical persons perform and oversee portions of the work according to their individual expertise. All it means is that they will be working under the oversight of an engineer. This brings the NEC in compliance with existing state law and provides an opportunity for the engineer to verify that the correct persons are overseeing each portion of a project.
Information is added in the form of a fine print note relative to what constitutes "expertise" and establishment of credentials and the nature of engineering from beginning to end of a structure, equipment, or system installation.
Panel Meeting Action: Accept in Principle in Part

The panel Accepts in Principle the proposed definition and Rejects the proposed Fine Print Note.
Panel Statement: The panel Accepts in Principle the definition of "Engineering Supervision". See the action taken on Proposal 1-71.

The panel Rejects the FPN because it contains requirements in violation of 3.1.3 of the NEC Style Manual and is unnecessary as it does not enhance clarity or usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 6 Negative: 6
Explanation of Negative:

FISKE, W.: Engineering Supervision is highly situational, and as such does not lend itself to definition. Although the definition accepted by CMP-1 (contained in proposals 1-70 and 1-71) is satisfactory for many situations, there are also many instances of engineering supervision that do not meet the proposed definition. CMP-1 should have given more credence to the comments made by CMP-14 in rejecting a proposed definition of Engineering Supervision in the 2008 Code cycle. Those comments are in the substantiation for 2011 proposals 1-264 and 1-270.

HICKMAN, P.: We are not sure what "technical oversight" means or what "thoroughly familiar with scientific principles" means as it relates to design, construction, maintenance, operation and performance of an installation, equipment or system. We conclude that the recommendation is much too broad for Article 100 and is vague and unenforceable.

HITTINGER, D.: This proposal should be rejected. See my comments on proposal 1-71.

LABRAKE, JR., N.: Proposal 1-69a should have been Accepted-in-Principle with the following revised text:

Engineering Supervision: The technical oversight by an individual having practical skills for applying scientific principles and practices in the design, construction, maintenance, operation and performance of an installation, equipment, or system.
Advisory Note: By law, many governmental jurisdictions require individuals to be licensed in order to practice to demonstrate their professional service to the protection of public health, safety, and welfare.

The Edison Electric Institute recognizes the need for the term "engineering supervision" to be defined for consistent and uniform application of its meaning used throughout the NEC in such articles as 240, 250, 310, 500, 501, 505, 625, and 708. This is also provided in response to public need as shown in proposals and comments documented in the A2007 NEC ROP and ROC.

This brings the NEC into harmony with the laws of many states and provides an opportunity for an engineer to verify that the correct persons are overseeing each portion of a project.

However, in the definition accepted by the Panel, specific text is needed for what is meant by term "thoroughly familiar with" relative to the other terms.

Also, in the proposed text in this Comment, information is contained in the Advisory Note relative to what constitutes "expertise" and establishment of credentials and the nature of engineering from beginning to end of a structure, equipment, or system installation.

MONIZ, G.: See NEMA's statement on Proposal 1-71.

SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. The term should be defines as an action or activity that includes certain measurable criteria or concepts that would demonstrate that the applicable installation or system is under specific and controlled conditions that warrant lessening the general rules when these conditions are met. What constitutes engineering supervision should be described as specific controls or conditions that are established and maintained continuously by qualified persons, which is already defined and fairly well understood.

Comment on Affirmative:

MCMAHILL, L.: The panel should note that with the use of the word "engineer" in the definition it would have contained a requirement.

1-70 Log #459 NEC-P01 **Final Action: Reject**
(100.Engineering Supervision (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Lanny G. McMahill, Phoenix, AZ

Recommendation: Add new definition to Article 100 as follows:

Engineering Supervision: Technical oversight by one thoroughly familiar with scientific principles and practices in the design, construction, maintenance, operation and performance of an installation, equipment or system.

Substantiation: The term engineering supervision is used in several NEC Articles; yet, it is not defined in the NEC. This proposal is intended to provide a definition for the term and to support the work of the NEC Task Group that generated the proposed definition. The need exist to define this term to clarify the intended use in the NEC. The proposed definition as worded clarifies that engineering supervision is technical oversight by someone well versed in engineering principles and practices as it relates to the design, construction, maintenance, etc. of an installation, equipment or system.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 7 Negative: 5

Explanation of Negative:

FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).

HICKMAN, P.: We are not sure what "technical oversight" means or what "thoroughly familiar with scientific principles" means as it relates to design, construction, maintenance, operation and performance of an installation, equipment or system. We conclude that the recommendation is much too broad for Article 100 and is vague and unenforceable.

HITTINGER, D.: This proposal should be rejected. See my comments on proposal 1-71.

MONIZ, G.: See NEMA's statement on Proposal 1-71.

SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. The term should be defines as an action or activity that includes certain measurable criteria or concepts that would demonstrate that the applicable installation or system is under specific and controlled conditions that warrant lessening the general rules when these conditions are met. What constitutes engineering supervision should be described as specific controls or conditions that are established and maintained continuously by qualified persons, which is already defined and fairly well understood.

Comment on Affirmative:

LABRAKE, JR., N.: I am voting with the panel action where it is agreed the definition is needed in Article 100. However, this proposal should be <u>Accepted-in-Principle</u> for other text to be considered. Refer to my ballot statement on Proposal 1-69a.

1-71 Log #528 NEC-P01 **Final Action: Reject**
(100.Engineering Supervision (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Add new text to read as follows:

<u>Engineering Supervision: Technical oversight by one thoroughly familiar with scientific principles and practices in the design, construction, maintenance, operation and performance of an installation, equipment or system.</u>

Substantiation: This proposal was developed by a Task Group formed at the direction of the NEC Technical Correlating Committee to review the term "Engineering Supervision". The Task Group members were: James T. Dollard, Jr. (CMP 10), H. Landis Floyd, II (CMP 1), G. W. Kent (CMP 6), Robert L. LaRocca (CMP 2), Lanny G. McMahill (CMP 1), Gil Moniz (CMP 1), Gregory J. Steinman (CMP 5) and Mike O'Meara (CMP 14).

The Task Group found that the term "Engineering Supervision" appeared in more than two articles of the NEC and in accordance with Section 2.2.2.1 of the NEC Style Manual adding a definition in Article 100 is appropriate and will be of assistance to the Code User. Although the term is used in several Articles, the degree of supervision and the qualifications for those performing "engineering supervision" may differ from Article to Article, but the concept remains the same. The one performing "engineering supervision" has technical oversight and must be thoroughly familiar with scientific principles and practices in the design, construction, maintenance, operation, and performance of an installation, equipment or system. The proposed definition provides the basis for this concept and allows each Code Making Panel using the term to determine the degree of oversight and the qualifications necessary.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 7 Negative: 5

Explanation of Negative:

FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).

HICKMAN, P.: We are not sure what "technical oversight" means or what "thoroughly familiar with scientific principles" means as it relates to design, construction, maintenance, operation and performance of an installation, equipment or system. We conclude that the recommendation is much too broad for Article 100 and is vague and unenforceable.

HITTINGER, D.: This proposal should be rejected. There are many terms used in two or more articles in the Code that are not defined because they are well understood. The concept of adding a general definition for "engineering supervision" was explored during the 2008 Code cycle and even though this definition is not the same content as what was submitted during that cycle, the majority of the Code Making Panels that would be affected by a global definition in Article 100 did not agree with this concept.

Some of the wording in this definition like "Technical oversight" and "thoroughly familiar with scientific principles" as it relates to design, construction, maintenance, operation and performance of an installation, equipment or system is too broad for article 100 and not enforceable. The extent that the term "engineering supervision" is used throughout the Code may have many different implications.

MONIZ, G.: See NEMA's statement on Proposal 1-71.

SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. The term should be defines as an action or activity that includes certain measurable criteria or concepts that would demonstrate that the applicable installation or system is under specific and controlled conditions that warrant lessening the general rules when these conditions are met. What constitutes engineering supervision should be described as specific controls or conditions that are established and maintained continuously by qualified persons, which is already defined and fairly well understood.

Comment on Affirmative:

FLOYD, H.: I agree with the definition, but would have rather seen "engineering" instead of "scientific". Perhaps the requirement not to use the term being defined in the definition is what prevented "engineering" from being used. However, the panel should reconsider if the intent of the Style Guide requirement prohibits the use of "engineering principles", and permits the definition as shown below:

"**Engineering Supervision:** Technical oversight by one thoroughly familiar with the ~~scientific~~ <u>engineering</u> principles and practices in the design, construction, maintenance, operation and performance of an installation, equipment, or system."

LABRAKE, JR., N.: I am voting with the Panel Action where it is agreed the definition is needed in Article 100. However, this proposal should be Accepted-in-Principle for other text to be considered. Refer to my ballot statement on Proposal 1-69a.

1-72 Log #612 NEC-P01 **Final Action: Reject**
(100.Engineering Supervision (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Add new definition:
Engineering Supervision. The direct work by, or under the direct supervision of a qualified, licensed, professional engineer who is engaged primarily in the design or maintenance of electrical installations.
Substantiation: The term "Engineering Supervision" is used many places throughout the Code. Per the Style Manual the term should be included in Art. 100. Ref. Style Manual Section 2.2.2.1: "Article 100. In general, Article 100 shall contain definitions of terms that appear in two or more other articles of the NEC."
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 1-71, which meets the intent of the submitter.
Definitions shall not contain requirements as indicated in 2.2.2. of the NEC Style Manual.
No substantiation was provided to introduce the words "qualified, licensed, professional engineer".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 5
Explanation of Negative:
FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).
HICKMAN, P.: We conclude that the recommendation is much too broad for Article 100 and is vague and unenforceable.
HITTINGER, D.: See my comments on Proposal 1-71.
MONIZ, G.: See NEMA's statement on Proposal 1-71.
SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. The term should be defines as an action or activity that includes certain measurable criteria or concepts that would demonstrate that the applicable installation or system is under specific and controlled conditions that warrant lessening the general rules when these conditions are met. Comment on Affirmative:
LABRAKE, JR., N.: I am voting with the panel action where it is agreed the definition is needed in Article 100. However, other text needs to be considered, refer to my ballot statement on Proposal 1-69a.

1-73 Log #770 NEC-P01 **Final Action: Reject**
(100.Equipment)

TCC Action: The Technical Correlating Committee disagrees with the panel statement.
Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
Equipment. A general term, including ~~material~~, conductors, cables, raceways, boxes, fittings, devices, appliances, luminaires, apparatus, machinery, and the like used as part of, or in connection with, an electrical installation.
Substantiation: By removing the word "material" and replacing it with "conductors, cables, raceways, boxes", we now have a solid definition of what material is. This is just one step in my attempt to change the definition of equipment into something that is clearly understood and defined by other terms in Article 100. Please see my additional changes for this definition.
Panel Meeting Action: Reject
Panel Statement: The proposed changes to the term are too limiting for broad use in the code. Conductors and cable are wiring rather than equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BARRIOS, L.: The panel action should have been to Accept in Part, accepting the deletion of the word "material" and not accepting the remainder of the proposal. The term "material" is too vague and should not be considered as "equipment". For example, pulling compound used to simplify pulling conductors and cable through a conduit could be referred to as material used in the electrical installation, but I'm not sure the compound could be referred to as "equipment".
MCMAHILL, L.: This proposal should have been accepted. The submitter was simply trying to provide examples of "equipment". The word "material" is not the best example of "equipment" as used in the NEC.
Comment on Affirmative:
HICKMAN, P.: We do not necessarily agree with the panel statement.

1-74 Log #771 NEC-P01 **Final Action: Reject**
(100.Equipment)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
Equipment. A general term, including material, fittings, devices, ~~appliances, luminaires, apparatus, machinery,~~ utilization equipment, and the like used as part of, or in connection with, an electrical installation.
Substantiation: By removing the words apparatus and machinery and replacing them with utilization equipment, we now have a list which includes words that are clearly defined in Article 100 (with the exception of material-see my proposal for that change). Since appliances and luminaires are types of utilization equipment, they should be removed to avoid redundancy.
Panel Meeting Action: Reject
Panel Statement: The use of the word "Equipment" in the definition of "Equipment" is not permitted by 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-75 Log #772 NEC-P01 **Final Action: Reject**
(100.Equipment)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
Equipment. A general term, including material, fittings, devices, appliances, luminaires, apparatus, machinery, service equipment, and the like used as part of, or in connection with, an electrical installation.
Substantiation: By adding the term "service equipment" we show that this is a category of equipment which needs to follow all of the general rules for equipment outlined in the code as well as the particular rules that we have for this special type of equipment.
Panel Meeting Action: Reject
Panel Statement: The use of the word "equipment" in the definition of "equipment" is not permitted by 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-76 Log #773 NEC-P01 **Final Action: Reject**
(100.Equipment)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
Equipment. A general term, including material, fittings, devices, appliances, luminaires, apparatus, machinery, power production equipment, and the like used as part of, or in connection with, an electrical installation.
Substantiation: By adding the term "power production equipment" (see my proposal for a new definition-power production equipment), we show that this is another category of equipment which needs to follow the general rules for equipment outlined in the code as well as the particular rules that we have for this special type of equipment.
Panel Meeting Action: Reject
Panel Statement: The use of the word "equipment" in the definition of "equipment" is not permitted by 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-77 Log #774 NEC-P01 **Final Action: Reject**
(100.Equipment)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
Equipment. A general term, including material, fittings, devices, appliances, luminaires, apparatus, machinery, distribution equipment, and the like used as part of, or in connection with, an electrical installation.
Substantiation: By adding the term "distribution equipment" (see my proposal for a new definition-distribution equipment), we show that this is another category of equipment which needs to follow the general rules for all equipment outlined in the code as well as the particular rules that we have for this special type of equipment.
Panel Meeting Action: Reject
Panel Statement: The use of the word "equipment" in the definition of "equipment" is not permitted by 2.2.2 of the NEC Style Manual. The current definition includes distribution equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: The panel should have accepted this proposal in principle. The NEC Style Manual Section 2.2.2 prohibits definitions from containing the term (equipment) being defined. The panel should have followed the submitter's lead by expanding the list of equipment to include the terms "switchboards, panelboards, motor control centers" in lieu of the words "distribution equipment." These equipment terms are clearly defined and understood by industry.

1-78 Log #775 NEC-P01 **Final Action: Reject**
(100.Equipment)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:

Equipment. A general term, including ~~material,~~ conductors, cables, raceways, boxes, fittings, devices, ~~appliances, luminaires, apparatus, machinery,~~ utilization equipment, distribution equipment, service equipment, power production equipment, and the like used as part of, or in connection with, an electrical installation.

Substantiation: Following my recommendations for 5 different changes relating to this definition, as well as 2 new definitions (please see my other proposals), we will end up with this one definition which will clarify what is defined as equipment and allow us to describe rules that relate to all equipment or just one particular category of equipment.
Panel Meeting Action: Reject
Panel Statement: Adding items to a list of examples in a definition does not improve the definition. Adding more examples only raises questions as to why other items that seem to be "equipment" are not included.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: The panel should have accepted this proposal in principle by revising the definition to read: "Equipment. A general term, including ~~material,~~ conductors, cables, raceways, boxes, fittings, devices, appliances, luminaires, apparatus, machinery, switchboards, panelboards, motor control centers and the like used as a part of, or in connection with, an electrical installation."

5-8 Log #1720 NEC-P05 **Final Action: Reject**
(100.Equipotential Plane (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel's 17 and 19 for action to decide whether or not the definition should stay in the individual articles or be moved to Article 100.

This action will be considered by the panel as a public comment.
Submitter: Larry T. Smith, National Electrical Seminars, Inc.
Recommendation: Move the existing definition of equipotential plane from 547.2 to Article 100.

Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.

A companion proposal has been submitted to CMP-19 to move the definition in 547.2 to Article 100.
Substantiation: This term is used in Articles 547, 680, and 682 and should be located in Article 100 in accordance with the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: The proposed term is not used in Articles 200, 250, 280, and 285. The use of the term is in articles under the purview of CMPs 17 and 19. The panel recommends that this proposal be referred to those panels for action.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-9 Log #708 NEC-P05 **Final Action: Reject**
(100.Equipotential Plane (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel's 17 and 19 for action to decide whether or not the definition should stay in the individual articles or be moved to Article 100.

This action will be considered by the panel as a public comment.
Submitter: Teri Dwyer, Wyoming, MN
Recommendation: Revise text to read as follows:

Equipotential Plane. An area where wire mesh or other conductive elements are on, embedded in, or placed under the walk surface within 75 mm (3 in.), bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.

Substantiation: There are currently two definitions of Equipotential Plane in the NEC that contain slightly different terminology. 547.2 allow wire mesh or other conductive elements to be embedded in or placed under concrete without any dimensions as to where the conductive elements are to be placed and is only applicable if concrete is present. How far below the concrete is still going to create a safe equipotential plane? Where 682.2 will allow wire mesh or other conductive elements to be on, embedded in, or placed under the walking surface within 3 in. This definition is not specific to concrete as a walking surface and provides a prescriptive depth that it is to be installed below the area requiring the equipotential plane.

A common definition would not effect the location where the equipotential plane is required to be installed, because 547.10 and 682.33 still identify the required locations. It would benefit the AHJ by creating one definition for a common term.

I have also submitted proposals to 547.2 (CMP-19) and 682.2 (CMP-17) to delete this definition in those sections.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 5-8.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

1-79 Log #3138 NEC-P01 **Final Action: Reject**
(100.Exclusive Control (New))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Add new definition of exclusive control to Article 100 as follows.
Exclusive Control. Generally covers installation, ownership, restricted access, operation, and maintenance by qualified and authorized persons.
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Restricted Access (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.
*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change is to add a new term to be used for both the NEC and the NESC intended to correlate the purpose and scope of both documents and clarify its meaning in 90.2(B)(4) and 90.2(B)(5).
Panel Meeting Action: Reject
Panel Statement: The proposed definition does not define the term. It indicates "generally" what is covered; however, is not a definition. The proposed definition does not add clarity or usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1
Explanation of Negative:

LABRAKE, JR., N.: Proposal 1-79 should have been accepted. The panel statement that the definition is not used in two or more Articles is true, but as was discussed in the panel, there is no place in the NEC for the definition of terms used in Article 90 such as in other articles in the XXX.2 section. In addition, refer to my ballot statements on Proposals 1-17 and 1-29 and the substantiation in proposal 1-107 regarding the need for defining this term.

Alternatively, the Panel could consider the proposed term in a new informative Annex discussed in my ballot statement on Proposal 1-12 as follows:

Annex "TBD": "General Information Regarding Utility Electric Supply to Premises Wiring"
2. The following are terms for general understanding of where utility electric supply and premises wiring meet for what is covered and what is not covered by this Code as described in 90.2.

Exclusive Control. Generally covers installation, ownership, restricted access, operation, and maintenance by qualified and authorized persons.
Explanation of Abstention:

ANTHONY, M.: The use of the word "generally" seems to be a problem. The submitter is encouraged to re-craft the sentence so that it succeeds as a definition. "Exclusive control" is a condition of an installation characterized by its ownership, restricted access, and operation and maintenance by qualified and authorized persons.

1-80 Log #3447 NEC-P01 **Final Action: Reject**
(100.Exclusive Control of Utility (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Add the following definition of exclusive control of utility to Article 100:
Exclusive Control of Utility. Where energized facilities are separated from public access by a spatial or a physical barrier and accessible only to qualified personnel authorized by the serving utility and where the utility is responsible for connection/disconnection of such facilities to/from energized sources of energy or signals.
Substantiation: This is one action toward resolving the present conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007*.
*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.
Specifically, the rationale for this change is to add a definition to a term (exclusive control of utility) used in both the NEC and the NESC intended to correlate the purpose and scope of both documents and clarify its meaning in 90.2(B)(4) and 90.2(B)(5). Refer to a companion proposal to revise 90.2(B)(5).
Panel Meeting Action: Reject
Panel Statement: The proposed definition does not add clarity or usability. The submitter provided inadequate substantiation specific to this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: Adequate substantiation has been provided. The proposed definition adds clarity and usability.

1-81 Log #326 NEC-P01 **Final Action: Reject**
(100.Existing (New))

Submitter: Mario L. Mumfrey, Inspection Bureau Inc.
Recommendation: Existing: An installation of cable(s), raceway(s) and/or equipment that has been previously documented as inspected and approved by the Authority Having Jurisdiction.
Substantiation: In an era where electrical installations may be performed by unskilled and unqualified contractors who may not secure the required inspections, there has been a misinterpretation in the term "existing". A property owner, often a new owner, may not be aware that the electrical work has not had the Final approval. Sometimes, even years later the excuse is explained as this work is existing. We need a clear definition of the term "existing" to show work requiring electrical inspections are only existing after it has been approved by the local authority having jurisdiction and not simply through the passing of time.
Panel Meeting Action: Reject
Panel Statement: The proposed definition contains a requirement, in contradiction to 2.2.2 of the NEC Style Manual.
In addition, the proposed new term contains unenforceable language; see 3.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: A definition of "Existing" currently exists in the NFPA Glossary of Terms. The responsible document is NFPA 101 and the definition has a preferred status. Since the term is used but not clearly defined in the NEC, the panel should have accepted this proposal in principle and used the definition from the Glossary of Terms to read: "Existing. That which is already in existence on the date this edition of the Code goes into effect."

14-5 Log #2823 NEC-P14 **Final Action: Accept**
(100.Explosionproof Apparatus)

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
Explosionproof Equipment ~~Apparatus~~. Equipment ~~Apparatus~~ enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.
FPN: For further information, see ANSI/UL 1203-2006~~1999~~, *Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.*
Substantiation: Equipment is a defined term. Apparatus is included within the definition of equipment. Explosionproof equipment is a commonly used language to describe electrical equipment that is explosion protected by use of an explosionproof enclosure. Explosionproof apparatus is not commonly used. Both terms are found in various places within the Code. This proposal removes this inconsistency and is a companion to proposals in 500.2, and 500.7(A).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

1-82 Log #1969 NEC-P01 **Final Action: Reject**
(100.Externally Operable)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: ~~Capable of~~ Having identified permanent provisions for being manually operated without exposing the operator to contact with live parts.
Substantiation: Edit. Present definition designates equipment that can be operated by external remote control circuit as externally operable, which doesn't seem to be the intent.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation does not indicate how the proposal would solve the alleged problem. The proposal does not satisfy 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
The panel also disagrees that this is an editorial change.
The change from "capable" to the requirement of "identified permanent provisions" would contain a requirement which is not permitted per 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-17 Log #1553 NEC-P02 **Final Action: Reject**
(100.Feeder)

Submitter: Jennie Watkins, I.B.E.W. Local 176/Office Manager
Recommendation: Revise text as follows:
Feeder. All circuit conductors installed between an overcurrent device to an overcurrent device. ~~the service equipment, the source of a separately derived system, or other power supply source and the final branch-circuit overcurrent device.~~
Substantiation: This would be a simple as well as an accurate definition of a feeder.
The way the definition read before, many installers had the misconception that a feeder had to originate in the service or at a separately derived system, when a feeder could be installed between a sub panel and a fused disconnect.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposed text excludes feeders that originate from the source of a separately derived system. The present code text does include feeders originating at an overcurrent device other than in service equipment and does not need to be modified for further clarification.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-83 Log #3582 NEC-P01 **Final Action: Reject**
(100.Field Installed (Field Installation) (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 3, 5, 7, 9, 10, 11, 15, 17, 18, and 19 for information.
Submitter: Chuck Mello, Underwriters Laboratories
Recommendation: Add new text as follows:
Field Installed (Field Installation). Conductors, devices or equipment intended to be assembled and installed at the final utilization site.
Substantiation: The term "Field Installed" is used in the NEC 13 times and the term "Field Installation" is used twice. Different parts of the electrical industry apply different meanings to the term "field installed" and this can lead to confusion when applying the NEC. From a manufacturer's standpoint, "field installed" can be considered as anything done once a product leaves their factory and could include any additional steps with additions at another manufacturer or distributor before the product actually reached the final point of installation. For example a luminaire manufacturer may consider the installation of flexible whips by a distributor before sale to the contractor as a "field installation". The perspective of a certification-testing laboratory is similar. In reviewing each application in the NEC and the context for each usage of these terms, it is clear that "field installed" or "field installation" is meant only for the actions by the installer at the final installation site. This definition is needed to ensure correct interpretation of this term from a Code perspective since the term has different meanings to different users of the Code.
Panel Meeting Action: Reject
Panel Statement: The proposed definition could have unintended consequences as the term is used in several articles throughout the code and, perhaps, not always intended to mean "assembled and installed" at the final utilization site as proposed.
This definition could also create confusion with the phrase "field-assembled", which is also used throughout the Code. At least one of these terms is used in articles under the purview of the following code-making panels: Panels 3, 5, 7, 9, 10, 11, 15, 17, 18, and 19.

The panel is unaware of any wide confusion in the industry with the general use of these terms and a need for a clear definition. Field-installed (Field installation) is applicable to installation regulated by the NEC.

The panel requests that the Technical Correlating Committee forward this proposal to the above-mentioned panels for information.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BOYCE, K.: The proposal should be accepted. Adding the proposed definition will enhance the usability of the Code. This definition would provide practical information related to the use of the terms throughout the Code.

HICKMAN, P.: We support the recommendation in the proposal.

18-5 Log #2337 NEC-P18 **Final Action: Reject**

(100.Fixture (New))

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Add the new term "Fixture" to Article 100 for specific use in the NEC as follows: **Fixture.** A manufactured electrical product securely, and usually permanently, attached or appended to a structure or to another electrical product.

Substantiation: The terms "fixture" and "fixture wire(s)" are used in many places in the code, and yet are not defined anywhere in the code, nor is it included in the current definition of "equipment." With the removal of all reference to "fixture" in Article 410, and in consideration of the use that this term is given throughout Article 402 and also (inferentially) in 552.56(E), as two examples, it is now unclear what this term refers to. By accepting this new definition, the column in Table 402.3, with the heading "Application Provisions," as one example, it will be clear to code users where the wire types included in Article 402 may be utilized. And, that is only one clarification possibility of just one article. This proposed change also intends to enhance code enforceability.

Panel Meeting Action: Reject

Panel Statement: Although the submitter points out a problem in correlation, the solution is not in adding the term "fixture" back into the NEC.

CMP-18 requests the TCC forward this proposal and it be circulated to all panels that still have the term "fixture" in the text for which they are responsible.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

1-84 Log #653 NEC-P01 **Final Action: Reject**

(100.Garage)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 14 for information.

Submitter: Samuel J. Goble, Just Good Electrical Code Training

Recommendation: Revise text to read as follows:

Garage. A building or portion of a building in which one or more self-propelled vehicles can be kept for use, sale, storage, rental, repair, exhibition, ~~or~~, demonstration, or testing and forensic purposes.

Substantiation: Forensic laboratories have advanced to include investigations in vehicles. Government authorities are now building new laboratories to include vehicle bays to perform forensics on vehicles for investigations. In the past, this was done in police garages where this change was not warranted. These vehicles can be dismantled to the frame for investigations. These laboratories will have the same hazards as commercial garages with flammable fuels in the vehicles and should be included in the NEC. Including the word "laboratories" in the garage definition, will include all types of laboratories that do testing and investigations on vehicles.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation does not justify including facilities for forensics testing in Article 511, which would be a consequence of this proposal.

The words "kept" and "repair" in the definition already meet the concerns of the submitter.

The panel requests that the Technical Correlating Committee refer this proposal to Code-Making Panel 14 for information.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: This proposal should have been accept in part. The panel should have accepted the addition of the word "testing." Where a garage is used for forensic purposes, and a hazardous (classified) location exists, NEC Chapter 5 - Special Occupancies is applicable. The definition to read: "Garage. A building or portion of a building in which one or more self-propelled vehicles can be kept for use, sale, storage, rental, repair, testing, exhibition, or demonstration purposes."

1-85 Log #1974 NEC-P01 **Final Action: Reject**

(100.General Purpose (New))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add: GENERAL PURPOSE. Not identified for a specific use or location, such as immersion, embedment, wet location, exposed to weather, hazardous (classified) locations, etc.

Substantiation: "General Purpose" is a phrase used many times in the Code, but undefined. Where this phrase is used, does it exclude a weather proof enclosure installed in a dry interior location.

Panel Meeting Action: Reject

Panel Statement: The recommendation does not enhance clarity or usability. The scope of Article 100 is under the purview of the Technical Correlating Committee, "general" and "purpose" are "commonly defined general terms" that do not need to be defined in Article 100, per the Scope of Article 100.

Published product listings accomplish the submitter's intent.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-86 Log #1476 NEC-P01 **Final Action: Reject**

(100.General Purpose Outlet and General Purpose Receptacle (New))

Submitter: William Q. Cellini, Jr., Ardmore, PA

Recommendation: Add new definitions for the following terms:

(●) General Purpose (GP) Outlet (GPO)

(●) General Purpose (GP) Receptacle (GPR).

Substantiation: These definitions would enhance, clarify and facilitate use of these terms in Articles 210 and 220.

Panel Meeting Action: Reject

Panel Statement: The proposal does not contain recommended text as required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-87 Log #172 NEC-P01 **Final Action: Reject**

(100.Governing Authority (New))

Submitter: Felix Giannini, Lexco, Inc.

Recommendation: Insert in Section 100:

Governing Authority. A duly elected legislative body empowered to enact legislation in behalf of the Local, State, Federal or National government to which it has been elected.

Substantiation: I believe that a definition should be included in the Definitions Section 100 too, so as to make the term clear and perhaps legally effective, this should be addressed in any and all other codes that use that term as well as similar terms.

Panel Meeting Action: Reject

Panel Statement: The governing authorities referred to are merely those who enact and apply the code. It is not within the purview of the code to define who those bodies are.

A governing authority is not necessarily elected.

The term "governing authority" is only used in Annex H, which is included for informational purposes. Inclusion of a definition for this term in Article 100 is unnecessary and not consistent with the intent of Article 100 as outlined in 2.2.2.1 of the NEC Style Manual.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

5-10 Log #3040 NEC-P05 **Final Action: Accept**

(100.Ground Fault (New))

Submitter: Mike Holt, Leesburg, FL

Recommendation: Relocate the definition of ground fault to Article 100, from 250.2.

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the normally non–current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.

Substantiation: The term "ground fault" is used throughout the code, and therefore, should be defined in Article 100.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

2-18 Log #496 NEC-P02 **Final Action: Reject**

(100.Ground-Fault Circuit Interrupter (GFCI))

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Add a hyphen between "Circuit" and "Interrupter" and revise the definition of Ground-Fault Circuit-Interrupter as shown:

Ground-Fault Circuit-Interrupter (GFCI). A device intended for the protection of personnel that functions to de-energize a circuit or portion thereof within an established period of time when a fault current to ground exceeds ~~the values established for a Class A device~~ some predetermined value that is less than that required to operate the overcurrent protective device of the supply circuit. This device will not provide personnel protection from electrocution resulting from line-to-line contact since the nature of line-to-line loads cannot be distinguished.

Delete the FPN.

Substantiation: The revised definition complies with the following sections in the NFPA Manual of Style:

2.3.2.2 Definitions shall be in the format of a bold term followed by the definition phrase to form a single paragraph unit.

2.3.2.3 Definitions shall not contain requirements.

2.3.2.4 References to other documents or sections of a document, notes, lists, footnotes, cautions, warnings, or figures shall not be permitted in definitions.

The revised definition also complies with 2.2.2 of the NEC Style Manual which also states that "Definitions shall not contain requirements or recommendations." While the NEC Style Manual permits Fine Print Notes within the document, it does not specifically authorize their use in definitions so the NFPA Manual of Style governs and it does not authorize the use of FPNs nor multiple paragraphs in definitions.

If it is essential that a Class A GFCI be specified, then it should be done in the main body of the Code since there may be more than one class of GFCIs.

The addition of the hyphen provides consistency throughout the Code and correlates with the IEEE Standard Dictionary of Electrical and Electronics Terms. Additional proposals are being submitted to make similar corrections throughout the Code.

The addition of the last sentence is safety information to the user of the Standard.

This proposal is also intended to generate consistent definitions and minimize the number of duplicate definitions in the NFPA Glossary of Terms.

The proposed wording should meet the intent of 3 preferred and 2 secondary definitions used in 8 NFPA Standards.

Similar proposals are being submitted to NFPA 70B, 70E, 73, 99, 99B, 302, and 1901.

Panel Meeting Action: Reject

Panel Statement: The hyphenation of the term is in accordance with the NEC Style Manual. When the term is used as a noun, only the first pair of words are hyphenated. The panel rejects the deletion of class "A" because there are other classes of GFCI, and the class "A" reference must be maintained in the definition to ensure that a GFCI will function within the prescribed limits. The panel also rejects the addition of the word "fault" because a GFCI trips on any current to ground. The panel rejects the addition of the last sentence because it is explanatory and belongs in the form of an FPN. The panel rejects the deletion of the FPN because it adds clarity.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

3-4 Log #3597 NEC-P03 **Final Action: Reject**

(100.Ground-Fault Circuit Interrupter (GFCI), Portable (as applied to grund-fault circuit interrupters) (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 2 for action.

This action will be considered by Code-Making Panel 2 as a public comment.

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Add text to read as follows:

ARTICLE 100 Definitions

I. General

Ground-Fault Circuit Interrupter (GFCI). A device intended for the protection of personnel that functions to de-energize a circuit or portion thereof within an established period of time when a current to ground exceeds the values established for a Class A device.

FPN: Class A ground-fault circuit interrupters trip when the current to ground is 6 mA or higher and do not trip when the current to ground is less than 4 mA. For further information, see *UL 943, Standard for Ground-Fault Circuit Interrupters*.

Portable (as applied to ground-fault circuit interrupters) A qualifying term indicating that the ground-fault circuit interrupter is intended to protect personnel from fault current to ground on circuits supplied by plug-and-cord-connections or by temporary wiring installations and additionally functions to de-energize a circuit or portion thereof when one or more of the following defects occurs:

the grounded conductor to the power supply is opened

the grounded conductor is transposed with an ungrounded conductor to the power supply

one of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened.

Substantiation: Correlation and enforcement issues regarding GFCI for portable use, and usability of the *Code*. Throughout the *Code*, requirements for GFCI protection of personnel are invoked for circuits supplied by plug-and-cord-connection (mandating GFCI protection integral to the attachment plug itself, built in-line into the power supply cord or into the cord set, or integral to the plug-and-cord-connected equipment or appliance) or for equipment in temporary installations, but it is inconsistent not only in designation but also in clarifying to the AHJ and to the installer alike what exactly is being required above and beyond conventional GFCI protection intended for hard wiring.

For instance, 382.6 (3) mandates a "Level of protection equivalent to a portable GFCI" but nothing in *NEC*® provides an explanation of what "portable GFCI" means. 590.6(A) states that "For the purposes of this section, cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.", again with no indication of what attributes "portable use" encompasses. This absence of specificity will lead to field-made assemblies employing conventional GFCIs that inherently fail to provide GFCI protection of personnel when open or intermittent grounded (neutral) conductors or when transposed ungrounded and grounded conductors are unwittingly encountered.

By contrast, 680.33(B)(3) and 680.33(B)(4) are very specific in stating "A ground-fault circuit interrupter with open neutral conductor protection as an integral part of the assembly" and "The luminaire lamp permanently connected to the ground-fault circuit interrupter with open-neutral protection", respectively, but furnish no information as to how to identify GFCI protection that so complies, making installer compliance and AHJ enforcement difficult tasks.

"Portable GFCIs" are required by the trinational *Standard for Ground-Fault Circuit-Interrupters, NMX-J-520-ANCE-2006* 1, *CSA C22.2 No. 144.1-06* 2, *ANSI/UL943-2005* 3, Clause 6.7.2.1, additionally to de-energize the "load" output contacts and terminals when the defects noted in the proposed addition to the definition occur. When Underwriters Laboratories (in UL product category KCXS) and CSA International (in CSA product class 1451-81) list such products, both certifiers specifically identify these as "portable GFCIs" to differentiate them from other GFCIs. Listed portable GFCIs can be embodied not only as GFCI plugs and in-line GFCI cord sets but even some GFCIs for permanent wiring such as SOME faceless GFCI receptacles can be additionally Listed and identified as portable GFCIs. Listed construction-site portable power-distribution equipment is similarly required by standard *Portable Power-Distribution Equipment, UL1640* 3, Clauses 53.3 - 53.5 and 63.3 - 63.4, to de-energize the "load" output contacts and terminals when those same defects noted in the proposed addition to the definition occur.

1 Asociación de Normalización y Certificación (Association of Standardization and Certification),

2 Canadian Standards Association

3 Underwriters Laboratories Inc.

When conventional GFCIs intended for permanent, inspected hard-wiring are used in what should be portable GFCI applications, where the any of the indicated defect conditions occur, the ground-fault-detection circuitry is NOT powered and the GFCI protection cannot operate but power is nonetheless delivered UNinterrrupted EVEN IN THE PRESENCE OF A GROUND-FAULT. Any GFCI protection the user assumes is present is in fact UNAVAILABLE.

Amongst those NOT directly involved in GFCI manufacture who are nonetheless involved with this *Code*, there is a significant misperception that GFCI protection of personnel will provide a panacea against ALL causes of lethal electric shock. Due to their misunderstanding of the differences between GFCIs for permanent installation and portable GFCIs, a significant number of cord reel manufacturers unwittingly extrapolated their Listings for portable (cord-and-plug-connected) cord reels [having ordinary receptacles as outlet components] and their Listings for HARD-WIRED cord reels acceptably having GFCI receptacles as outlet components, without the overt knowledge of at least two major certifiers, to incorrectly encompass portable (cord-and-plug-connected) cord reels having GFCI receptacles (no open neutral protection) as outlet components where portable GFCI protection (with open neutral protection) was warranted.

It is also common to find cord-and-plug-connected field assemblies employing GFCI receptacles (no open neutral protection) as outlet components rather than portable GFCI protection (with open neutral protection) of the outlets. Some times, these are field repairs misperceived as safety upgrades where conventional receptacles in plug-and-cord-connected equipment are replaced with conventional GFCI receptacles. Furthermore, field repairs of plug-and-cord-connected equipment are occasionally encountered where portable GFCIs (faceless-receptacle-type) have been field-replaced with more-readily available, conventional GFCI receptacles under the mistaken belief that they are equivalent. In either situation, where the indicated defects occur, the user has a false sense of security because power is still delivered.

Companion proposals have been made to 210.8, to 215.9, to 518.3(B)*, and to 590.6.

* NOTE: That 518.3(B) proposal regarding portable GFCI protection is separate from another proposal I submitted for 518.3(B) involving GFCI protection required elsewhere in the *Code*.

Panel Meeting Action: Reject

Panel Statement: The NEC Technical Correlating Committee has assigned certain definitions to panels that have more technical expertise in the use of that term. This proposed change to the definition of GFCI is under the jurisdiction of Code-Making Panel 2, not Code-Making Panel 3.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

2-19 Log #1181 NEC-P02 **Final Action: Reject**

(100.Ground-Fault Circuit-Interrupter (GFCI))

Submitter: James M. Daly, General Cable

Recommendation: Revise text to read as follows:

Add a hyphen between "circuit" and "Interrupter" and revise the definition of Ground-Fault Circuit-Interrupter as follows:

Ground-Fault Circuit-Interruper (GFCI). A device intended for the protection of personnel that functions to de-energize a circuit or portion thereof within an established period of time when a fault current to ground exceeds ~~the values established for a Class A device~~ some predetermined value that is less than that required to operate the overcurrent protective device of the supply circuit. This device will not provide personnel protection from electrocution resulting from line-to-line contact since the nature of line-to-line loads cannot be distinguished.

Delete the FPN.

Substantiation: The revised definition complies with the following sections in the NFPA Manual of Style:

2.3.2.2 Definitions shall be in the format of a bold term followed by the definition phrase to form a single paragraph unit.

2.3.2.3 Definitions shall not contain requirements.

2.3.2.4 References to other documents or sections of a document, notes, lists, footnotes, cautions, warnings, or figures shall not be permitted in definitions.

The revised definition also complies with 2.2.2 of the NEC Style Manual which also states that "Definitions shall not contain requirements or recommendations." While the NEC Style Manual permits Fine Print Notes within the document, it does not specifically authorize their use in definitions so the NFPA Manual of style governs and it does not authorize the use of FPNs nor multiple paragraphs in definitions.

If it is essential that a class A GFCI be specified, then it should be done in the main body of the Code since there may be more than one class of GFCIs.

The addition of the hyphen provides consistency throughout the Code and correlates with the IEEE Standard Dictionary of Electrical and Electronics Terms. Additional proposals are being submitted to make similar corrections throughout the Code.

The addition of the last sentence is safety information to the user of the Standard.

This proposal is also intended to generate consistent definitions and minimize the number of duplicate definitions in the NFPA Glossary of Terms.

The proposed wording should meet the intent of 3 preferred and 2 secondary definitions used in 8 NFPA Standards.

Similar proposals are being submitted to NFPA 70B, 70E, 73, 99, 99B, 302, and 1901.

2-20 Log #3118 NEC-P02 **Final Action: Reject**

(100.Ground-Fault Circuit-Interrupter System, Three-Phase (GFCIS-3Ph) (New))

Submitter: Paul S. Hamer, Chevron Energy Technology Company

Recommendation: Add a new definition:

Ground-Fault Circuit-Interrupter System, Three-Phase (GFCIS-3Ph). A system intended to provide protection of personnel from line-to-ground fault currents on three-phase systems. The system operates to cause a disconnecting means to open all ungrounded conductors of the faulted feeder or branch circuit within an established period of time when a sensed fault current to ground exceeds a current of 6 mA. For secure operation during ground faults, the system: (1) simultaneously processes and discriminates the sensed currents (to ground) of all of the feeder or branch circuits of the service, or of the protected separately-derived system; (2) only initiates disconnection of the circuit that has the highest magnitude of sensed current to ground; and (3) inhibits disconnection of the "non-faulted" circuits at the same time the "faulted" circuit disconnecting means is opened.

FPN No. 1: On three-phase systems that exceeding 150 volts to ground, the capacitive-charging current of a non-faulted individual feeder or branch circuit (a current that is also sensed during a system ground fault) can exceed the 6 mA current threshold for a circuit of normal length. The GFCIS-3Ph discriminates between the capacitive charging current of the "healthy" three-phase feeder or branch circuits during a ground fault, and the genuine ground-fault current on the faulted feeder or branch circuit.

FPN No. 2: The GFCIS-3Ph may also be used to selectively detect and isolate incipient insulation failure of electrical equipment connected to three-phase feeder or branch circuits.

Substantiation: A new definition is required to accompany companion proposals also submitted by me for the GFCIS-3Ph in Articles 210.8(D) and 215.9 (copies attached). See those proposals for details of the system. There is no present NRTL standard for GFCI devices applied above 125 volts to ground; hence the pickup level of 6 mA is defined in the proposed definition. It is expected that a new NRTL (e.g., Underwriters Laboratories) standard will be developed for the GFCIS-3Ph that will establish the required opening time of the disconnecting means of the system, expected to be a inverse-time characteristic between 6 mA and approximately 30 mA, and a definite time (between 0.025 and 0.10 second, depending on the application) for sensed ground-fault currents that exceed 30 mA.

FPN No. 1 is proposed to provide information on how the system functions. FPN No. 2 is proposed to describe an alternate use of the system beyond the primary use for personnel protection.

The basis of this proposal and the associated proposals is "A ground-fault circuit-interrupter method and system for three-phase electrical power systems," for which a U.S. Patent No. 7,301,739 (copy attached) has been granted. Refer to my proposal for 210.8(D) for details of how the system operates and the problem it resolves. Chevron U.S.A., Inc. is the assignee of the patent. If this proposal is accepted for inclusion in the NEC, Chevron U.S.A., Inc. will comply with the NFPA and ANSI Patent Policy; specifically, one of the following:

a) A license will be made available without compensation to the applicants desiring to utilize the license for the purpose of implementing the standard; or

b) A license will be made available to applicants under reasonable terms and conditions that are demonstrably free of any unfair discrimination.

Panel Meeting Action: Reject

Panel Statement: The panel rejects the definition because the panel action on Proposal 2-131 precludes the need for a definition.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

5-11 Log #1868 NEC-P05 **Final Action: Reject**

(100.Grounded Conductor)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise definition: A system or circuit that is intentionally grounded and normally carries current.

Substantiation: Edit. Per definition of "grounded" a conductor connected to ground such as an EGC or GEC is a grounded conductor. Though "normally" is a term to be avoided per the Style Manual, it is used in the definition of "Grounding Conductor, Equipment. PROPOSAL WOULD CLARIFY The term Grounded conductor" used elsewhere in the Code.

Panel Meeting Action: Reject

Panel Statement: The words "and normally carries current" are not valid under all conditions. For example, they do not account for grounded conductors brought to service equipment per 250.24(C) where there are only line-to-line-connected loads supplied. The panel notes there was no technical substantiation provided for the deletion of the term "conductor" from the existing definition. It was also noted this deleted term was not identified in the proposal.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-12 Log #2681 NEC-P05 **Final Action: Reject**

(100.Grounding Conductor)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise:

A conductor used to connect equipment or ~~the grounded~~ a circuit conductor of a wiring system to a grounding electrode(s). ~~or electrodes~~

Substantiation: Edit. A grounded circuit is already connected to earth, per definition of grounded in Article 100.

Panel Meeting Action: Reject

Panel Statement: The panel action on Proposal 5-13 removes this definition.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-13 Log #2929 NEC-P05 **Final Action: Accept**

(100.Grounding Conductor)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase "grounding conductor" and revising it to "grounding electrode conductor."

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Delete the following text:

~~**Grounding Conductor.** A conductor used to connect equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes.~~

Substantiation: This proposal is to delete of the definition and use of the term "grounding conductor" where used in place of the more correct term, "grounding electrode conductor." Coordinating proposals have been made to replace the term "grounding conductor" with "grounding electrode conductor" in Articles 800, 810, 820 and 830. The general locations where "grounding conductor" is used include:

800.100 Cable and Primary Protector Grounding,

810.57 Antenna Discharge Units,

820.100 Cable Grounding, and

830.100 Cable, Network Interface Unit, and Primary Protector Grounding.

Panel Meeting Action: Accept

Panel Statement: Code-Making Panel 5 recommends to the Technical Correlating Committee that a task group consisting of members from CMP-5 and other CMPs impacted by this action be appointed to make recommendations on revising the use of this term where used in articles other than those under the purview of CMP-5. The work of this task group needs to be completed prior to the ROC meeting comment closing date. Based on its action on this proposal, CMP-5 has made proposed revisions where the term "grounding conductor" is used in its articles.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BOWMER, T.: Although the deletion of the term "grounding conductor" is appropriate for articles covered by Panel 5, the term is used over 120 times in Chapter 8 articles covering low power communications circuit and elsewhere in the code. The term "Grounding conductor" has proven a useful and well understood term within the communications articles and a definition should be retained in Article 100. Substitution of "grounding conductor" with "Grounding Electrode Conductor" is not appropriate for all uses in Chapter 8 articles. The definition of grounding conductor" could be modified to make it more specifically applied to communications circuits such as follows : " Grounding Conductor: A conductor used to connect or bond communications equipment or cable shield to a grounding electrode system, or grounding electrode(s). " would meet the needs of Chapter 8.

Comment on Affirmative:

HARDING, G.: Continue to accept the proposal to delete the term "grounding conductor". This deletion is further supported by the panel action at the ROP meeting on proposal 5-18 regarding "Grounding Electrode Conductors". A "grounding conductor", if left in the code, will become a defined conductor that has no practical application. Such an occurrence would create a usability problem for code users trying to find an application for this definition. For correlation with Panel 16, a task group could be selected to ensure there are no issues.

JOHNSTON, M.: Continue to accept the deletion of the defined term "grounding conductor." CMP-5 has responsibility for words and terms related to grounding and bonding as determined in the 2008 NEC cycle. Such words include bonding, grounding, and intersystem bonding termination, which are defined in Article 100 and used in Chapter 8. The term grounding conductor used in Chapter 8 should be revised to "grounding electrode conductor" as recommended in coordinated proposals. The revised definition of the term grounding electrode conductor (resulting from accepted Proposal 5-18) provides justification for changing the term "grounding conductor" to "grounding electrode conductor" where it is used throughout the Chapter 8 Articles. This Proposal is part of a broad effort to improve consistency in the use of defined terms related to grounding and bonding throughout the Code. Coordinated proposals have been provided to adjust rules within Chapter 8 where the term is used. The CMP-5 Chair report to the TCC includes the appropriate recommendation to form a specific Task Group (preferably made up of Panel 5 and Panel 16 members) to ensure that the work of CMP-5 regarding the deletion of the defined term "grounding conductor" and revision to the term "grounding electrode conductor" along with associated coordinated proposals to Chapter 8 Articles are accepted and upheld. Members of CMP-5 also serve on CMP-16 which makes this coordinated effort much more attainable and provides effective communication and coordination between the Panels. Note: Proposals 5-13, 5-15, and 5-18 were all accepted unanimously by CMP-5 during the Panel hearings at Hilton Head, SC in January demonstrating clear consensus relative to these proposed changes.

5-14 Log #2974 NEC-P05 **Final Action: Reject**
(100.Grounding Conductor)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase "grounding conductor" and revising it to "grounding electrode conductor."

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise the definition for grounding conductor, as follows:

Grounding Conductor. A conductor used to connect communications equipment to a grounding electrode, or other equipment to an auxiliary electrode. ~~equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes.~~

Substantiation: The terms "grounding conductor" and "grounding electrode conductor" are so similar that the definitions are not helpful.

Panel Meeting Action: Reject

Panel Statement: The panel action on Proposal 5-13 removes this definition.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

BOWMER, T.: Agree with rejection of this proposal but not for the stated Panel reason. The proposed new language is too vague "... other equipment to an auxiliary electrode..." and may lead to confusion. A revised definition is provided in my negative comment to proposal 5-13 above.

5-15 Log #4185 NEC-P05 **Final Action: Accept**
(100.Grounding Conductor)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase "grounding conductor" and revising it to "grounding electrode conductor."

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Delete text as follows:

~~Grounding Conductor. A conductor used to connect equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes.~~

Substantiation: This definition should be deleted because it is almost identical to the term "Grounding Electrode Conductor". The term Grounding Electrode Conductor should be used as a replacement term.

Panel Meeting Action: Accept

Panel Statement: See the panel statement on Proposal 5-13.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BOWMER, T.: Same negative comment as provided to proposal 5-13 applies to this proposal.

Comment on Affirmative:

HARDING, G.: See My Affirmative with Comment on 5-13.

JOHNSTON, M.: Continue to accept this proposal. See my ballot statement on Proposals 5-13 and 5-18. Note: Proposals 5-13, 5-15, and 5-18 were all accepted unanimously by CMP-5 during the Panel hearings at Hilton Head, SC in January demonstrating clear consensus relative to these proposed changes.

5-16 Log #1146 NEC-P05 **Final Action: Accept in Part**
(100.Grounding Conductor, Equipment (EGC))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise the definition of "Grounding Conductor, Equipment (EGC)" as follows:

The conductive path(s) installed to connect normally non-current carrying metal parts of an individual piece or an assembly of equipment together and to the system grounded conductor or to the grounding electrode conductor, or both.

Substantiation: The current definition, intended to describe a conductive path(s) from a given item of equipment, for instance, a motor frame, to the system grounded conductor or the grounding electrode, or both, is ambiguous in that it can be understood as either the separate conductive path(s) associated with each respective load or control station, or the complete equipment grounding network, i.e. the complete star configuration.

In moving from the former (2005 NEC) operative words "conductor used to connect" to the current operative words, "conductive path installed to connect (plural items) to the system grounded conductor...)", the idea of separate conductive path(s) has been lost. The allowable types of equipment grounding conductors listed in 250.118 are for the respective separate conductive path(s), not the entire equipment grounding network.

Panel Meeting Action: Accept in Part

The panel accepts only the recommendation to revise "path" to "path(s)". The remainder of the definition is to remain as presently used in the 2008 NEC.

Panel Statement: "Equipment" is defined in Article 100 and applies to individual pieces and assemblies. The recommended text "an individual piece or an assembly of" does not improve the understanding of application of this term.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-17 Log #2743 NEC-P05 **Final Action: Accept in Principle**
(100.Grounding Electrode Conductor)

Submitter: Timothy S. Owens, City of Santa Clara

Recommendation: Revise text to read as follows:

Grounding Electrode Conductor (GEC). A conductor used to connect the system grounded conductor or the equipment to a grounding electrode or to a point on the grounding electrode system.

Substantiation: This proposal adds the acronym for the grounding electrode conductor to the title. This acronym is in common use on electrical plans for construction. It is also commonly used in articles and other publications discussing the grounding of electrical systems and equipment. This placement of an acronym is in keeping with the NEC Style Manual.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 5-18.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-18 Log #2930 NEC-P05 **Final Action: Accept in Principle**
(100.Grounding Electrode Conductor)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase "grounding conductor" and revising it to "grounding electrode conductor."

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise text to read as follows:

Grounding Electrode Conductor. A conductor used to connect the system grounded conductor; communications system protectors, discharge units, cables, or network interface units; or ~~the~~ equipment to a grounding electrode or to a point on the grounding electrode system.

Substantiation: This proposal is intended to support the proposed deletion of the definition and use of the term "grounding conductor" where used in place of the more correct term, "grounding electrode conductor." Coordinating proposals have been made to replace the term "grounding conductor" with "grounding electrode conductor" in Articles 800, 810, 820 and 830. The general locations where "grounding conductor" is used include:

800.100 Cable and Primary Protector Grounding,

810.57 Antenna Discharge Units,

820.100 Cable Grounding, and

830.100 Cable, Network Interface Unit, and Primary Protector Grounding.

Panel Meeting Action: Accept in Principle

Revise the recommendation to read:

Grounding Electrode Conductor (GEC). A conductor used to connect the system grounded conductor, equipment, communications system protectors, antenna discharge units, communications cables, or network interface units to a grounding electrode or to a point on the grounding electrode system.

Panel Statement: The recommendation has been editorially revised for clarity. Adding the acronym to the definition title allows the acronym to be used in place of the full term.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

JOHNSTON, M.: Continue to accept this proposal. See my ballot statement on Proposals 5-13 and 5-15. Note: Proposals 5-13, 5-15, and 5-18 were all accepted unanimously by CMP-5 during the Panel hearings at Hilton Head, SC in January demonstrating clear consensus relative to these proposed changes.

5-19 Log #2165 NEC-P05 **Final Action: Accept in Principle**
(100.Grounding Electrode Conductor (GEC))

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise text to read as follows:

Grounding Electrode Conductor (GEC). A conductor used to connect the system grounded conductor or the equipment to a grounding electrode or to a point on the grounding electrode system.

Substantiation: This proposal adds the acronym for the grounding electrode conductor to the title. This acronym is in common use on electrical plans for construction. It is also commonly used in articles and other publications discussing the grounding of electrical systems and equipment. This placement of an acronym is in keeping with the NEC Style Manual.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 5-18.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

1-88 Log #2035 NEC-P01 **Final Action: Reject**
(100.Guarded)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: Covered, fenced, enclosed, or otherwise protected by means of ~~suitable~~ identified covers, casings, barriers, rails, screens, mats, or platforms, or other identified means to ~~remove~~ minimize the likelihood of close approach or contact by unqualified or unauthorized persons, animals, or objects, ~~to a point of danger~~.

Substantiation: Edit. Other identified means not covered should be permitted. Protection can minimize contact, but not always prevent it as witness electrocutions of persons who climb fences at high voltage installations. "To a point of danger", is superfluous and subjective and is not necessary to the provision.

Panel Meeting Action: Reject

Panel Statement: This proposal is not "editorial" and removing "point of danger" will cause the problems the submitter intends to correct regarding fences.

The panel agrees that guarding does not reduce the probability of contact to zero.

The NEC definition of "identified" is quite specific, and there are many effective means of guarding that would not meet the NEC definition of "identified".

Changing "remove" to "minimize" renders "unqualified or unauthorized" superfluous, as contact is controlled according to the risks involved.

The submitter has not substantiated removal of "to a point of danger", as required by 4.3.3(d) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-89 Log #4757 NEC-P01 **Final Action: Reject**
(100.Hallways (New))

Submitter: D. Jerry Flaherty, East Islip, NY

Recommendation: Add new text to read as follows:

Hallways. A walled corridor used exclusively to connect two or more rooms.

Substantiation: 1) Large entrance halls or foyers that are used for entertaining guests meet the definition on a hallway. Since only one receptacle is required in a hallway over 10 feet, usually one one receptacle is provided resulting in wide use of extension cords.

2) The end of habitable rooms with two or more doors at one end meets the definition of a hall and again usually only one receptacle is provided.

Panel Meeting Action: Reject

Panel Statement: "Hallway" is a common and well understood term. Not all hallways connect two or more rooms.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-90 Log #1474 NEC-P01 **Final Action: Reject**
(100.Identified (as applied to equipment))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Recognized as suitable for the specific purpose(s), function(s), use(s), environment(s), application(s), and so forth where specified in a particular Code ~~requirement~~ provision.

Substantiation: Edit. Equipment may, and usually is, suitable for multiple functions, uses, environments, applications, etc. Equipment may be specified in provisions that are not requirements (permitted).

Panel Meeting Action: Reject

Panel Statement: The preferred definition of "identified" is the same in the 2008 NEC and the NFPA Glossary of Terms.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-91 Log #1951 NEC-P01 **Final Action: Reject**
(100.Identified (as applied to equipment))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: Recognizable as ~~suitable~~ intended and made for the specific purpose(s), function(s), use(s), environment(s), application(s), and so forth, in compliance with this Code. ~~where described in a particular Code requirement~~.

Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual. Equipment should also comply with Code provisions whether or not they are "requirements".

Panel Meeting Action: Reject

Panel Statement: The preferred definition of "identified" is the same in the 2008 NEC and the NFPA Glossary of Terms.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-92 Log #1715 NEC-P01 **Final Action: Reject**
(100.In Sight From (New))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission

Recommendation: Add new text as follows:

FPN: See 525.21(A) for disconnect switch location for portable structures of rides, tents, and concessions.

Substantiation: Portable structures are required to have a disconnect switch located "within sight of" and within 1.8 m (6 ft.) of the operator's station instead of 15 m (50 ft.), as the definition normally indicates.

Panel Meeting Action: Reject

Panel Statement: The FPN is unnecessary. See 90.3 Code Arrangement. Chapters 1 through 4 apply except as amended by Chapters 5, 6, and 7 for the particular conditions.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-93 Log #606 NEC-P01 **Final Action: Reject**
(100.Interrupting Capacity (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 4, 10, and 11 for information.

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission

Recommendation: Add new text to read as follows:

Interrupting Capacity. The highest current at rated voltage that an overcurrent or switching device can safely interrupt.

Substantiation: This definition is closely aligned with the IEEE Standard Dictionary of Electrical and Electronic Terms. Due to certain testing procedures (UL 489 and CSA 5), the interrupting capacity of a device may be less than the interrupting rating of the device. It is important that designers and installers be made aware of this difference.

Panel Meeting Action: Reject

Panel Statement: "Interrupting capacity" is used in Section 230.95(B). Inclusion of a definition for this term in Article 100 is unnecessary and not consistent with the intent of Article 100 as outlined in 2.2.2.1 of the NEC Style Manual.

The panel requests that the Technical Correlating Committee refers this proposal to Code-Making Panels 4, 10, and 11 for information relative to using the term "interrupting capacity" instead of "interrupting rating," which is

currently defined in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ANTHONY, M.: The proposal has merit but there is an important clarification to make regarding the use of "capacity" and "rating" that may extent the discussion beyond one code cycle. A definition like this belongs in the NEC but it needs to correlate as closely as possible with ANSI/IEEE/NEMA standards.

10-4 Log #2716 NEC-P10 **Final Action: Accept in Part**
(100.Interrupting Rating)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
The highest current at rated voltage that a device is ~~intended~~ identified as suitable to interrupt under standard test conditions.
Substantiation: "Intended" is not specific, "identified" per Article 100 is more comprehensive and includes other considerations.
Panel Meeting Action: Accept in Part
Revise text to read as follows:
The highest current at rated voltage that a device is ~~intended~~ identified ~~as suitable~~ to interrupt under standard test conditions.
Panel Statement: The panel notes that "as suitable" is redundant as it is part of the definition of "identified" in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MANCHE, A.: NEMA does not support changing the word "intended" to "identified as suitable" in the definition of Interrupting Rating. The present language matches exactly the definition in the UL product standards. The existing NEC words "intended to interrupt" also matches NEC language in 110.9.

5-20 Log #460 NEC-P05 **Final Action: Reject**
(100.Intersystem Bonding Termination)

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise text to read as follows:
Intersystem Bonding Termination. A ~~device~~ conducting object that provides a means for connecting communications system(s) grounding conductor(s) and bonding conductor(s) at the service equipment or at the disconnecting means for buildings or structures supplied by a feeder or branch circuit.
Substantiation: Device is defined as "A unit of an electrical system that carries or controls electric energy as its principal function." An intersystem bonding termination does not carry or control electric energy as its principal function. More appropriately, it is a conducting object or conductor. Although the word conductor may be a better fit in the definition, the words conducting object align with the use of these same words in "Grounding Electrode." A change is in order to eliminate any confusion in the use of the word device in this definition.
Panel Meeting Action: Reject
Panel Statement: The intersystem bonding termination is, in fact, a device in that it provides several points of termination (minimum of 3) to connect the grounding aspects of communications, broadband, or other such systems to the electrical system grounding electrode system.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-21 Log #3041 NEC-P05 **Final Action: Accept in Principle**
(100.Intersystem Bonding Termination)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the submitter's proposed text that did not intend to delete "bonding" from the definition.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
Intersystem Bonding Termination. A device that provides a means for connecting communications system(s) grounding conductor(s) and bonding conductor(s) at or near the service equipment or metering equipment; or at the disconnecting means for buildings or structures supplied by a feeder or branch circuit.
Substantiation: This proposal is intended to address the location of the intersystem bonding termination. As currently written, the definition and the requirement in 250.94 don't comply agree with each other.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
Intersystem Bonding Termination. A device that provides a means for connecting communications system~~(s) grounding conductor(s) and bonding conductor(s) at or near the service equipment, or metering equipment, or at the disconnecting means for buildings or structures supplied by a feeder or branch circuit~~ to the grounding electrode system.
Panel Statement: The action by the panel simplifies the definition, and the panel action on Proposal 5-226 addresses the recommendation to include metering equipment as an acceptable location for the installation of the intersystem bonding termination. The words "or near" are discouraged from use by the NEC Style Manual.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

2-21 Log #1736 NEC-P02 **Final Action: Reject**
(100.Kitchen)

Submitter: Austin Towne, Wichita Electrical JATC
Recommendation: Revise text to read as follows:
Kitchen. An area with a sink and permanent facilities for food preparation and permanent means for cooking equipment.
FPN: Permanent means for cooking equipment would include a means for which a range, oven or counter-mounted cooking unit that may be connected to a supply of power or gas.
Substantiation: This proposal is the work of a task group formed by the 2nd Year Apprenticeship Class 2A of the 2008 year. Jarod Adams, Nathan Free, Scott Hengel, Michael Hilger, Brandon Kupper, Tyler Martin, Josh Riley, Aaron Smith, Austin Towne, and Darryl Hill. This task group has concluded the following substantiation:
Clarification of the kitchen area is needed to prevent confusion caused by the newly defined kitchen with other areas such as break rooms, wet bars or similar locations. We feel that if there is a receptacle installed for a range, counter-mounted cooking unit, or any other permanent type of cooking unit, then this area would be classified as a kitchen, whether or not the actual cooking unit was installed. If there is just a sink and a counter space with no provisions for permanent cooking equipment, then this would not be considered a kitchen and could be considered a break room, wet bar or similar area. A microwave, toaster, or similar appliance that is portable and can be moved form place to place and which may be located in these areas would not change a break room or wet bar into a kitchen. There is confusion when a break area can be classified as a break area or a kitchen and some of this confusion seems to stem from microwaves and similar appliances. The Fine Print Note was added to help clarify this by examples of what permanent means for cooking equipment may include.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the definition as presently written.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-22 Log #2248 NEC-P02 **Final Action: Reject**
(100.Kitchen)

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector
Recommendation: Add new and revise text to read as follows:
Kitchen. An area with a sink and permanent facilities for food preparation and/or cooking.
Substantiation: The intent of this revision is to specify whether a kitchen is an area where you prepare and cook food. Appears that the definition refers to both uses "food preparation" and "cooking" and not just "food preparation" or "cooking". Therefore, if the area is just for "food preparation" and "cooking", then the definition of kitchen does not apply.
Panel Meeting Action: Reject
Panel Statement: The addition of the word "or" allows for many areas that are not intended for kitchen spaces to be treated as such. The present definition is clear and accurately describes areas that are considered to constitute a kitchen by Panel 2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-23 Log #2931 NEC-P02 **Final Action: Accept**
(100.Kitchen)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing definition in Article 100 of the 2008 NEC as follows:
Kitchen. An area with a sink and permanent provisions ~~facilities~~ for food preparation and cooking.
Substantiation: The proposed change will bring the definition into harmony with the definition of "Dwelling Unit" which includes "permanent provisions for cooking." The use of the word "provisions" in the definition recognizes that all kitchen appliances are not "permanent" such as electric ranges that are cord-and-plug connected but yet occupy a dedicated location in the kitchen.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-24 Log #3812 NEC-P02 **Final Action: Reject**
(100.Kitchen)

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Change the definition of "Kitchen" by changing the word "and" to "and/or"
Kitchen. An area with a sink or permanent provisions for food preparation and/or cooking.
Substantiation: The area behind the front counter in a coffee shop, ice cream shop, delicatessen, or similar store usually has a sink, stainless steel counters and working surfaces, tile (grounded) flooring, utilize cord and plug connected blenders, etc., and in all other ways meets the definition of a kitchen except that there are no provisions for *cooking* food. There is food preparation going on, but no actual cooking. Since the hazards associated with electrical installations in these areas do not seems to diminish with the removal of an oven, it makes sense to ensure that the employees of these areas are afforded equal protection as their counterparts in stores with ovens. It also makes enforcement easier for the inspector. Adding "or" does this.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the presence of only a sink constitutes a kitchen. See panel statement on Proposal 2-22.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-25 Log #4382 NEC-P02 **Final Action: Reject**
(100.Kitchen)

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Change the definition of a kitchen. Change the word "and" to "and/or"
Kitchen. An area with a sink and permanent provisions for food preparation and/or cooking.
Substantiation: The area behind the front counter in a coffee shop, ice cream shop, delicatessen, or similar store usually has a sink, stainless steel counters and working surfaces, tile (grounded) flooring, utilize cord and plug connected blenders, etc., and in all other ways meets the definition of a kitchen except that there are no provisions for *cooking* food. There is food preparation going on, but no actual cooking. Since the hazards associated with electrical installations in these areas do not seem to diminish with the removal of an oven, it makes sense to ensure that the employees of these areas are afforded equal protection as their counterparts in stores with ovens. It also makes enforcement easier for the inspector. Adding "or" does this.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-22.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-26 Log #2886 NEC-P02 **Final Action: Reject**
(100.Kitchen (Other than Dwelling Units) (New))

Submitter: Michael K. Anderson, City of Davenport, IA
Recommendation: Add new text to read as follows:
Kitchen (other than dwelling units). An area with a sink and permanent facilities for food preparation and cooking, including adjacent employee areas not partitioned as a separate room.
Substantiation: The definition would extend GFCI protection to receptacles accessible to employees which often are utilized for appliances that can be used throughout the entire kitchen space. Many commercial kitchen configurations have areas only defined by the grouping of specific equipment and not separated by walls or doors, such as an office.
Panel Meeting Action: Reject
Panel Statement: The term "adjacent" is vague and unenforceable.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-94 Log #1441 NEC-P01 **Final Action: Reject**
(100.Lighting Outlet)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete the word "direct".
Substantiation: Edit. "Direct" may be presumed to preclude a plug and cord connector or flanged inlet and indicates the connection permitted by 410.62 (C) is not a lighting outlet.
Panel Meeting Action: Reject
Panel Statement: This proposal would permit any switched receptacle outlet in a dwelling unit with a cord and plug connected luminaire connected to it to qualify as a lighting outlet.
The submitter has not provided substantiation for the presumption that "direct" excludes cord and plug connection. A luminaire can be directly connected to the wiring system via a wiring box or by a dedicated receptacle and cord.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: This proposal should have been accepted. As the submitter has noted, not all lampholders or luminaires directly connect to a lighting outlet. Some connect via a cord- and plug-connection to a receptacle outlet.

1-95 Log #1980 NEC-P01 **Final Action: Reject**
(100.Likely (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new definition as follows: Likely. Of such as nature or circumstance as to make something probable.
Substantiation: Edit. "Likely" is a term used in many sections but not Code-defined; a specific definition would be helpful to Code users.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that the need for a definition of the term "likely" in Article 100 has not been substantiated and would not be consistent with the 3.1.2 of NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-96 Log #2323 NEC-P01 **Final Action: Reject**
(100.Listed)

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Add to the beginning of the first sentence... An independent safety certification of ... (remainder unchanged).
Substantiation: While the term 'Third Party Listed' is well understood within the industry it represents industry jargon to outsiders. The first thing that comes to a business owner's mind when they hear the term 'third party' is in connection to third party checks which creates a negative association to begin with. Whenever you have to explain a term you're automatically on the defensive. Associating the word 'listed' with 'Independent Safety Certification' creates a positive association which needs no explanation and better represents the intent of the requirement. Adding this language to the NEC will help the industry as a whole move away from jargon and toward more easily understood terms.
Panel Meeting Action: Reject
Panel Statement: The term "listed" is an approved definition. See 3.3.6.1 of the NFPA Regulations Governing Committee Projects that states that official definitions shall not be altered unless approved by the Standards Council.
Such altered definitions shall be clear and unambiguous in the context in which it is used. In addition, see the NFPA Glossary of Terms for the official definition of "listed."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-97 Log #2327 NEC-P01 **Final Action: Reject**
(100.Location, Wet)

Submitter: Carl Whitten, University of New Hampshire
Recommendation: Revise text as follows:
Installations underground or in concrete slabs or in masonry that is in direct contact with the earth; in locations subject to saturation with water or other liquids, such as vehicle washing areas; and in unprotected areas exposed to weather.
Substantiation: It would be a better distinction between concrete slabs and masonry to the reader. In reading the definition the interpretation is that concrete slabs in direct contact with the earth. it is not clear as to a concrete slab on the upper floors of a building being considered a wet location.
Panel Meeting Action: Reject
Panel Statement: The present language is grammatically correct. "Concrete slabs" is combined with "masonry" in direct contact with earth.
The proposed revision does not add clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: It may have been more appropriate to accept this proposal in principle. The panel could have clarified the definition by adding a semicolon after the word "underground" and deleting the word "or", or simply add a comma after the word underground. Either change would have addressed the submitter's concern and added clarification as to the intent of the definition.

(Note: Sequence 1-98 was not used)

18-6 Log #2301a NEC-P18 **Final Action: Reject**
(100.Luminaire, Light Emmiting diode (LED) Type and Light-emitting Diode (LED) (New))

Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Add the following 2 new definitions:
(New) Luminaire, light emitting diode (LED) type – A complete lighting unit consisting of an LED light source and power source together with parts to distribute light, to position and protect the light source, and to connect the light source to a branch circuit. The LED light source may be an LED array, an LED module or an LED lamp.

(New) Light-emitting diode (LED) – A solid-state device embodying a p-n junction, emitting optical radiation when excited by an electric current.

A companion proposal for a revision to the definition of Nonlinear Load was forwarded to CMP-1.

Substantiation: The new terms are introduced as they are or will be used in various places in the Code; The definitions are extracted from UL 8750 (Standard for Light Emitting Diode (LED) Light Sources for Use in Lighting Products (proposed)) and they represent terms that have been in industry use.

For the nonlinear load footnote, conventional ballasts, electronic ballasts and electronic LED power drivers are also nonlinear loads. Examples can be given here and removed from other places where the term is used, for example, footnote to Table 520.44, covered in a companion proposal.

Lamps, Self-ballasted, Light-emitting Diode Type, are covered under UL CCN: OOLV.

Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: OOQA2.

"LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ.

LED luminaires are covered under several UL CCNs: IFAM, IFAQ, IFDR, and others.

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.

No definitive substantiation has been provided that a definition is required or necessary.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

11-3 Log #1274 NEC-P11 **Final Action: Reject**
(100.Motor Controller (New))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW

Recommendation: Revise text to read as follows:

Article 100

<u>Motor Controller. A switch or device used to disconnect the electric power to a motor and provide the motor with protection from an overload condition.</u>

<u>FPN: See Part III of Article 430 for alternative methods of overload protection.</u>

Substantiation: The term "motor controller" is used many times throughout the NEC. A very few examples are 424.19, 424.19(A)(1) & (2), 610.43(A), 620.13(B), etc. We believe for proper application of the NEC this terminology needs a concise definition and per the NEC style manual Section 2.2.2.1 needs to be in Article 100.

Panel Meeting Action: Reject

Panel Statement: The definitions of controller as they exist in section 430.2 and Article 100 are adequate when modified by "motor" and substantiation for the change has not been provided. Additionally, not all motor controllers provide motor overload protection.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

18-7 Log #2975 NEC-P18 **Final Action: Reject**
(100.Multioutlet Assembly)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Delete the following text:

~~Multioutlet Assembly. A type of surface, flush, or freestanding raceway designed to hold conductors and receptacles, assembled in the field or at the factory.~~

Substantiation: This definition should be in Article 380.2, for consistency with the other chapter three wiring method articles. A correlating proposal to Article 380 has been made.

Panel Meeting Action: Reject

Panel Statement: "Multioutlet assembly" is not used in any articles under the purview of CMP-18.

CMP-18 requests the TCC to forward this proposal to CMP-8.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

5-21a Log #4576 NEC-P05 **Final Action: Reject**
(100.Neutral)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise as follows:

"The conductor (where one exists) of a polyphase circuit or single-phase three-wire circuit that is intended to have a voltage such that the nominal voltage between it and each of the other conductors are equal, and less than the nominal voltage between any two of the other conductors."

Substantiation: The current NEC definition has one, and only one virtue: it rationalizes trade slang, but only to a point. It does not describe a neutral, because in a two-wire circuit there can be no neutral, regardless of whether the grounded conductor is connected to a neutral point. Further, although most white wires are now neutrals, some are not. A white wire correctly applied as a phase conductor in a corner-grounded system is not a neutral even under the 2008 wording. CMP 5 should go back to what every trade text explained about neutrals prior to 2008, instead of reinforcing the erroneous view that every white wire is a neutral. Just when we were starting to turn the tide in terms of trade education on this point, the 2008 NEC set this educational effort back decades.

Panel Meeting Action: Reject

Panel Statement: The Task Group assigned by the Technical Correlating Committee and CMP-5 reached consensus on the two new definitions "neutral conductor" and "neutral point" in the 2008 NEC cycle resulting from the original efforts to define the term "neutral". No substantiation has been provided that demonstrates an inaccuracy exists or that an improvement is needed to improve application of the current definitions of these terms.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-22 Log #1145 NEC-P05 **Final Action: Reject**
(100.Neutral Conductor)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission

Recommendation: Add text to read as follows:

See 250.186(C) for information on the system neutral conductor for impedance grounded neutral systems.

Substantiation: This conductor, which references the system neutral point to the neutral grounding impedance, is not the neutral conductor that is defined in Article 100, Part I.

Panel Meeting Action: Reject

Panel Statement: This proposed text adds no clarity to an Article 100 definition. Impedance grounded systems are also covered in 250.36 so the proposed reference would only apply to systems over 1000 volts and lead to confusion about systems 1000 volts and less.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-23 Log #2551 NEC-P05 **Final Action: Reject**
(100.Neutral Conductor)

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481 IBEW

Recommendation: Revise text as follows:

Article 100 Definitions

Neutral Conductor...Intended to carry <u>the unbalanced current</u>...".

Substantiation: The definition as stands, does not define the difference between the grounded conductor and a neutral. 220.61(A) states the neutral carries to unbalanced load. Also see: 310.15(B)(4).

Panel Meeting Action: Reject

Panel Statement: The Task Group assigned by the Technical Correlating Committee and CMP-5 reached consensus on the two new definitions "neutral conductor" and "neutral point" in the 2008 NEC cycle resulting from the original efforts to define the term "neutral". No substantiation has been provided that demonstrates an inaccuracy exists or that an improvement is needed to improve application of the current definitions of these terms.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-24 Log #2952 NEC-P05 **Final Action: Reject**
(100.Neutral Conductor)

Submitter: Fred W. Brown, HI Electron

Recommendation: Change the definition of Neutral Conductor to read:

Neutral Conductor. The <u>grounded</u> conductor connected to the neutral point of a system that is intended to carry current under normal conditions <u>and carries the vectorial summation currents of the ungrounded to grounded conductor loads in multiwire branch circuit, feeder, and service entrance conductors</u>.

Substantiation: The use of the terms "grounded conductor" and "neutral conductor" are problematic in nature in the electrical industry. It is a concept that needs to be distinguishing between the two principles in order to properly apply the National Electrical Code. In a single branch circuit which contains an ungrounded conductor (black in color) and a grounded conductor (white in color) the grounded conductor is frequently called a "neutral". In this application, the grounded conductor is not a neutral and leads to miss applications by electricians.

In the past, the electrical industry has envisioned the "neutral" as neutralizing voltages or neutralizing currents. I have seen multiwire branch circuits installations that were installed with six three-phase conductors (two A-phase, two B-phase, and two C-phase conductors) and one grounded conductor all the same size. The electricians were convinced that the grounded conductor would neutralize all the currents.

It is important for the National Electrical Code (NEC) to be technically correct. The current excepted definition of Neutral Conductor (Proposal 5-36 Log #1554) may lend itself to miss application of some of the NEC. By the present accepted definition, when looking at the application of 310.15(B)(4) a neutral conductor may never be counted as a current-carrying conductor.

NEC Panel 2 has found it important to require the grouping and identification of the grouping for ungrounded and grounded conductors of each multiwire branch circuit (Proposal 2-17 Log #3378). The importance of this is found in my definition of neutral conductor, not in fact that the conductor is grounded.

I would encourage the committee to accept this comment.

Panel Meeting Action: Reject

Panel Statement: The Task Group assigned by the Technical Correlating Committee and CMP-5 reached consensus on the two new definitions "neutral conductor" and "neutral point" in the 2008 NEC cycle resulting from the original efforts to define the term "neutral". No substantiation has been provided that demonstrates an inaccuracy exists or that an improvement is needed to improve application of the current definitions of these terms. The submitter's recommended additions are already covered by the existing definition (i.e., normal conditions).

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-25 Log #754 NEC-P05 **Final Action: Reject**

(100.Neutral Point)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission

Recommendation: Revise text to read as follows:

The common point on a wye-connection in a polyphase system or midpoint on a single-phase, 3-wire system, ~~or midpoint on a single-phase portion of a 3-phase delta system,~~ or a midpoint of a 3-wire, direct-current system.

Substantiation: The neutral point of a system is that point where voltages from all other connection points are equal. This is certainly not applicable to 3-phase, 4-wire delta systems.

Panel Meeting Action: Reject

Panel Statement: The interpretation of what a neutral point is in the proposer's substantiation is contrary to the existing NEC definition. The winding of the 3-phase transformer that is midpoint grounded is treated identically to a midpoint grounded single phase transformer and is an appropriate part of the definition. In the single-phase portion of the three-phase, four-wire midpoint grounded delta system the sum of the voltages to neutral is zero as is explained in the existing fine print note.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

1-99 Log #2301 NEC-P01 **Final Action: Accept**

(100.Nonlinear Load)

Submitter: John Marshall, Underwriters Laboratories Inc.

Recommendation: Revise as follows:

(Revised) Nonlinear Load –

"FPN: Electronic equipment, electronic/electric discharge electric-discharge ballasts both inductive and electronic, and light-emitting diode (LED) drivers for lighting,…".

A companion proposal for NEW definitions for "Luminaire, light emitting diode (LED) Type" and "Light-emiting diode (LED)" were forwarded to CMP-18.

Substantiation: The new terms are introduced as they are or will be used in various places in the Code; The definitions are extracted from UL 8750 (Standard for Light Emitting Diode (LED) Light Sources for Use in Lighting Products (proposed)) and they represent terms that have been in industry use.

For the nonlinear load footnote, conventional ballasts, electronic ballasts and electronic LED power drivers are also nonlinear loads. Examples can be given here and removed from other places where the term is used, for example, footnote to Table 520.44, covered in a companion proposal.

Lamps, Self-ballasted, Light-emitting Diode Type, are covered under UL CCN: OOLV.

Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: OOQA2.

"LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ.

LED luminaires are covered under several UL CCNs: IFAM, IFAQ, IFDR, and others.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BARRIOS, L.: Adding additional lighting examples are not necessary to improve the understanding of the term "nonlinear loads". The present FPN includes "electronic equipment, electronic/electric-discharge lighting, adjustable-speed drive systems, and similar equipment" as examples of non-linear loads. The panel action on this proposal establishes a precedence that the development of any new type of lighting or other non-linear load in the future needs to be added to this list. Panel 1 tends to do a good job rejecting the addition of lists when they do not add additional clarity to the Code. The panel's action on this proposal is an exception.

5-26 Log #4506 NEC-P05 **Final Action: Reject**

(100.Objectionable Current (New))

Submitter: Steven F. Wydeveld, Village of Homer Glen / Rep. Building Code Development Committee (BCDC)

Recommendation: Revise text to read as follows:

<u>**Objectionable Current.** Any level of electrical current in any electrical installation that poses an electrical shock or fire hazard and/or impede the ability of the grounding system to perform its intended function in accordance with Section 250.4.</u>

Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.

The term "objectionable current" used in 250.6 is not defined in the NEC. While there is a list of possibilities that may cause objectionable current, this list may not address all the potential causes. This definition intends to define the term and by doing so will more likely address conditions that may cause objectionable currents. Without this definition, it remains unclear what an objectionable current is.

The question was raised on the NEC Plus website in "Cracking the Code" 9/29/07. The question was: "Section 250.6 covers objectionable current over grounding conductors. However, it does not quantify objectionable or guide the user in judging what level of current is objectionable in a given situation. How is an inspector, designer, or facility manager to make the judgment as to whether or not a measured ground conductor current is objectionable?"

The Answer from "Cracking the Code" 9/29/07 was: "Although the Code does not establish a specific level at which current on a grounding conductor is deemed "objectionable," it is clear through the definitions associated with grounding in Article 100 and in 250.2, and by reviewing the requirements of Article 250, that grounding conductors are not intended to be used as a circuit conductor for other than the functions specifically identified in 250.4. Current induced through capacitive coupling is inherent to some electrical installation arrangements, and it is then a function of understanding any associated shock or fire initiation hazards for a given installation that helps define the level of current that becomes objectionable. Therefore, in accordance with 250.6, an "objectionable current" is simply any level of current for a given electrical installation that would pose an electric shock or fire hazard and/or impede the ability of the grounding system to perform its intended functions as specified in 250.4. Some examples of objectionable current are a rise in potential on exposed metal parts not intended to be energized, a situation that poses an electric shock or fire hazard, or a current that interferes with the proper operation of electrical or electronic equipment."

Panel Meeting Action: Reject

Panel Statement: The recommendation does not improve the understanding or application of 250.6. Several elements of the proposed definition such as electric shock or fire hazard are themselves undefined and subject to widely differing interpretation and variation depending on the application. See the panel action and statement on Proposal 5-56.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

4-3 Log #3502 NEC-P04 **Final Action: Accept in Principle**

(100.Overhead Service Conductors (New))

Submitter: James J. Rogers, Bay State Inspectional Agency

Recommendation: Add text to read as follows:

<u>(Overhead Service conductors.) The overhead service conductors between the service point and the first point of connection to the service-entrance conductors at the building or other structure.</u>

Substantiation: This proposal is being submitted by a task group that has been formed by Panel Chair, Ronald Toomer, in response to instructions that were presented to Code-Making Panel 4 by the Technical Correlating Committee as a result of some proposals that were submitted in the last cycle. These proposals spurred some discussion that resulted in differing opinions relative to the use of the term "Service Lateral". The members of the task group are as follows: Larry D. Cogburn, Chair, Robert J. Deaton, James J. Rogers, John A. Sigmund, and John W. Young.

Panel Meeting Action: Accept in Principle

Add new definition as follows: Service Conductors, Overhead: <u>The overhead conductors between the service point and the first point of connection to the service-entrance conductors at the building or other structure.</u>

Panel Statement: The panel defined the overhead conductors provided between the service point and the service entrance conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

1-100 Log #3261 NEC-P01 **Final Action: Reject**

(100.Physical Damage (New))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add definition as follows:

An occurrence that impairs the intended function(s) of equipment or wiring systems.

Substantiation: Physical damage can vary inconsequential such as a nick, scratch, or slight dent or the like. Damage to be concerned with is that which affects safety or functions of equipment such as conductivity, grounding, installation and protection of conductors and equipment, proper operation, waterproof or watertight qualities, and all other intended functions.

Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any evidence that a problem exists with the term as it is currently used in the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-3 Log #767 NEC-P15 **Final Action: Reject**
(100.Power Production Equipment (New))

TCC Action: The Technical Correlating Committee directs that this proposal be forwarded to Code-Making Panel 4 for action in Article 705. This action shall be considered by the panel as a public comment.
Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Add text to read as follows:
Power Production Equipment. The generating source, and all distribution equipment associated with it, that generates electricity from another source such as chemical, wind, solar, or fuel. Examples include such items as generators, solar photovoltaic, and fuel cell systems.
Substantiation: By adding this definition, we show that this is another category of equipment. As such, it will need to follow the general rules for all equipment outlined in the code as well as the particular rules that we have for this special type of equipment.
Panel Meeting Action: Reject
Panel Statement: This is a blanket proposal to introduce a new technical term. As a blanket proposal to Article 100, this proposal does not appear to have been submitted to panel 1. Panel 15 does not have any proposals dealing with the use of this new term.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

2-27 Log #2421 NEC-P02 **Final Action: Reject**
(100.Power Safe Protector (PSP) (New))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
Article 100
DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.
Substantiation: The definition of Power Safe Protector is needed in Article 100 due to several proposals made throughout the code to require Power Safe Protectors. Power Safe Protector devices reduce and/or eliminate electrical hazards not otherwise provided for in the current version of the code.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-71.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-101 Log #3580 NEC-P01 **Final Action: Reject**
(100.Premises (New))

Submitter: Michael Hyland, American Public Power Association
Recommendation: Add new text as follows:
Premises. The land and buildings of a user located on the user side of the ***service point*** (sometimes called the *utility-user network point of demarcation* for communication wiring) to electric supply, communication or signal premises wiring.
Substantiation: This proposal is developed based upon meetings of a Task Group of the NESC and NEC Committees on July 10th and Sep. 30th, 2008. Subsequently, NESC members of the Task Group provided input to this proposal. Another companion proposal is submitted to Article 100 Definitions for Area Lighting (new) and Premises Wiring (Systems).

This is an action to harmonize the purpose and scope sections of two ANSI standards, the NEC and the NESC, to mitigate conflicts between documents as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007*. Also, this action resolves the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words “or by other agreements”.
*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change is necessary to appropriately revise the scope and coverage of the NEC to clearly delineate facilities covered by the NEC versus those covered by the NESC. The new definition of premises support the definition of service point that is currently in both the NEC and the NESC. Emphasis was added in several places by **bolding** or *italicizing* text.

This term is taken primarily from the definition in 800.2 presently in the 2008 NEC. Acceptance of this proposal will necessitate correlation with Article 800’s definition of premises. This definition is also being proposed in the NESC at this time.
Panel Meeting Action: Reject
Panel Statement: The proposed definition does not add clarity or usability. The submitter provided inadequate substantiation specific to this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1
Explanation of Negative:
LABRAKE, JR., N.: Proposal 1-101 should have been accepted-in-principle. The panel statement that the definition does not add clarity or usability nor was there adequate substantiation is incorrect. Further background to support this proposal’s substantiation is referred to my ballot statements on Proposals 1-17 and 1-29 and the substantiation in proposal 1-107 regarding the need for defining “premises”. To address clarity, the proposed definition can be changed to relocate the parenthetical text to an Advisory Note and would read as follows:
Premises. The land and buildings of a user located on the user side of the service point to electric supply, communication or signal premises wiring.
Advisory Note: For communication wiring, service point is sometimes called the utility-user network point of demarcation.
Alternatively, the Panel could consider the proposed term in a new informative Annex discussed in my ballot statement on Proposal 1-12 as follows:
Annex “TBD”: “General Information Regarding Utility Electric Supply to Premises Wiring”
2. The following are terms for general understanding of where utility electric supply and premises wiring meet for what is covered and what is not covered by this Code as described in 90.2.
Premises. The land and buildings of a user located on the user side of the service point to electric supply, communication or signal premises wiring.
Advisory Note: For communication wiring, service point is sometimes called the utility-user network point of demarcation.
Explanation of Abstention:
ANTHONY, M.: This proposal is one of a group of proposals which, if taken as a whole and accepted, would get us closer to harmonization of the NEC and the NESC – a shared goal that is in the interest of both groups and in the interest of the industry at large. Unfortunately, the NEC development process does not make it easy to make the simultaneous and coordinated changes necessary for the harmonization we all want. Therefore the explanation of how we hope to help the harmonization process, refer to our comment on Proposal 1-17.

1-102 Log #3579 NEC-P01 **Final Action: Reject**
(100.Premises Wiring (System))

Submitter: Michael Hyland, American Public Power Association
Recommendation: Revise text to read as follows:
Premises Wiring (System). Interior and exterior wiring, including power, lighting, control, communication and other signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed~~. This includes~~ either (a) ~~wiring~~ from the service point or premises power source to the outlets or (b) where there is no service point, ~~wiring~~ from and including the power source to the outlets ~~where there is no service point~~.
Such wiring does not include wiring internal to appliances, luminaires, motors, controllers, motor control centers, and similar equipment, nor does it include utility equipment and wiring on the utility side of the service point.
Substantiation: This proposal is developed based upon meetings of a Task Group of the NESC and NEC Committees on July 10th and Sep. 30th, 2008. Subsequently, NESC members of the Task Group provided input to this proposal. Other companion proposals are submitted to Article 100 Definitions for Area Lighting (new) and Premises (new).

This is an action to harmonize the purpose and scope sections of two ANSI standards, the NEC and the NESC, to mitigate conflicts between documents as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007*. Also, this action resolves the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words “or by other agreements”.

*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change to revise the definition of Premises Wiring (System) is to support the present definition of service point and help differentiate application of the NESC from that of the NEC. Refer to the companion proposal to add new definition “premises” that is needed with this definition of Premises Wiring. This revised definition is necessary to appropriately revise the scope and coverage of the NEC to clearly delineate facilities covered by the NEC versus those covered by the NESC. The revised definition of premises wiring and new definition of premises support the definition of service point that is currently in both the NESC and the NEC. Emphasis was added in several places by **bolding** or *italicizing* text.

A new definition of Premises Wiring (Systems) is also being proposed in the NESC at this time.
Panel Meeting Action: Reject
Panel Statement: The proposed definition does not add clarity or usability. The submitter provided inadequate substantiation specific to this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1
Explanation of Negative:
LABRAKE, JR., N.: Proposal 1-102 should have been accepted. The proposal does provide clarity and usability for the Code relative to premises wiring beginning where the utility supply ends at the service point. Refer to my ballot statements on Proposals 1-17 and 1-29.
Explanation of Abstention:
ANTHONY, M.: This proposal is one of a group of proposals which, if taken as a whole and accepted, would get us closer to harmonization of the NEC and the NESC – a shared goal that is in the interest of both groups and in the interest of the industry at large. Unfortunately, the NEC development process does not make it easy to make the simultaneous and coordinated changes necessary for the harmonization we all want. Therefore the explanation of how we hope to help the harmonization process, refer to our comment on Proposal 1-17.

1-103 Log #469 NEC-P01 **Final Action: Reject**
(100.Qualified Person)

Submitter: Joseph A. Tedesco, Tedesco Electrical Code Consultants, Inc.
Recommendation: Revise text to read as follows:
"Qualified Person. One who has been trained in the skills, and has knowledge related to the construction and operation of electrical equipment and installations, and has received formal documented and certified safety training to recognize and avoid the hazards involved. In addition, one who is certified and authorized to test, energize, clear, ground, tag, and lockout circuits and equipment in accordance with established safety practices and who is trained in first aid and in the proper care and use of protective equipment, such as rubber gloves, hard hat, safety glasses or face shields, and flash resistant clothing, in accordance with established safety practices."
Substantiation: The definition is inadequate and should be revised to make sure that everyone knows what their responsibilities are when working on electrical systems. NFPA 70E is not adopted by many and parts of it should be an Annex in the NEC.
Panel Meeting Action: Reject
Panel Statement: The proposed definition contains requirements and is, therefore, in conflict with 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-7 Log #220 NEC-P08 **Final Action: Reject**
(100.Raceway)

Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise as follows:
Raceway. An enclosed channel ~~of metal or nonmetallic materials~~ designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this *Code*. Raceways include, but are not limited to, rigid metal conduit, rigid ~~nonmetallic~~ polyvinyl chloride conduit, intermediate metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, high density polyethylene conduit, reinforced thermosetting resin conduit, flexible metallic tubing, flexible metal conduit, electrical nonmetallic tubing, electrical metallic tubing, underfloor raceways, cellular concrete floor raceways, cellular metal floor raceways, surface raceways, wireways, and busways, plenum signaling raceway, riser signaling raceway, general-purpose signaling raceway, plenum optical fiber raceway, riser optical fiber raceway, general-purpose optical fiber cable raceway, plenum communications raceway, riser communications raceway, general-purpose communications raceway, plenum CATV raceway, riser CATV raceway and general-purpose CATV raceway.
Substantiation: The proposed changes updates the list of raceways to include many that were not in existence when the definition of raceway was last revised. Most of these raceways are plastic raceways. The Society of the Plastics Industry would like to see the various types plastic raceways mentioned along with metallic raceways. In the first sentence we propose deleting "of metal or nonmetallic materials" because it adds nothing to the definition. The second sentence of the definition clearly informs the reader what materials are used to manufacture raceways.
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-8 Log #1995 NEC-P08 **Final Action: Reject**
(100.Raceway)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: A pole enclosing conductors is not a raceway.
Substantiation: Present definition includes poles which then applies all applicable provisions for raceways.
Panel Meeting Action: Reject
Panel Statement: Some lighting poles can be a raceway. See 410.30(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-9 Log #2219 NEC-P08 **Final Action: Reject**
(100.Raceway)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Add the auxiliary gutters wiring method to the list of recognized raceways in the second sentence of this definition. "**Raceway.** An enclosed channel of metal or nonmetallic materials designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this code. Raceways include, but are not limited to, rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible conduit, flexible metallic tubing, flexible metal conduit, electrical nonmetallic tubing, electrical metallic tubing, underfloor raceway, cellular concrete floor raceways, cellular metal floor raceways, surface raceways, auxiliary gutters, wireways, and busways."
Substantiation: Clearly, an "auxiliary gutter" is a raceway as defined in the first sentence of "raceway" in Article 100. By **NOT** including this wiring method in the long list of other wiring methods, four of which actually include the word "raceway" as the named wiring method, the question is raised as to why it is NOT considered a raceway. Auxiliary gutters find more frequent use in the electrical industry than some of the other wiring methods included in the list, and its absence from the list potentially creates confusion. Adding it to the list increases code consistency and usability.
Panel Meeting Action: Reject
Panel Statement: While auxiliary gutters are used in some ways like raceways, their restriction of use prevents them from automatically being grouped with raceways. Auxiliary gutters shall be permitted to supplement wiring spaces at meter centers, distribution centers, switchboards, and similar points of wiring systems.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-10 Log #2715 NEC-P08 **Final Action: Reject**
(100.Raceway)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "cablebus" and "auxiliary gutters" or alternatively "cablebus and auxiliary gutters are not raceways".
Substantiation: Since the definitions are not limited to the raceways listed, it leaves cable bus and auxiliary gutters in limbo; they may or may not be considered raceways. They conform to the definition of raceway. If not raceways they are not covered by raceway rules that may apply, e.g., 230.7. Auxiliary gutters are usually listed as wireways, which are raceways. They are, or are not raceways, which should be clearly established. Though cablebus is not totally (solidly) enclosed neither is lighting busway or strut type channel raceway. Panel statement (proposal 8-1 in the 2007 ROP) that cable bus is ordinarily assembled at point of installation is irrelevant since this also applies to conduit, EMT, busways, channel raceway, wireway, surface raceway, underfloor raceway.
Panel Meeting Action: Reject
Panel Statement: While cablebus and auxiliary gutters are used in some ways like raceways, their restriction of use prevents them from automatically being grouped with raceways. Cablebus is ordinarily assembled at the point of installation from the components furnished or specified by the manufacturer, and auxiliary gutters shall be permitted to supplement wiring spaces at meter centers, distribution centers, switchboards, and similar points of wiring systems.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-11 Log #2976 NEC-P08 **Final Action: Reject**
(100.Raceway)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
Raceway. An enclosed channel of metal or nonmetallic materials designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this Code. Raceways include, but are not limited to, rigid metal conduit, reinforced thermosetting resin conduit, rigid polyvinyl chloride conduit ~~rigid nonmetallic conduit~~, intermediate metal conduit, liquidtight flexible conduit, flexible metallic tubing, flexible metal conduit, electrical nonmetallic tubing, electrical metallic tubing, underfloor raceways, cellular concrete floor raceways, cellular metal floor raceways, surface raceways,

wireways, and busways.
Substantiation: This proposal is intended simply to help CMP1 address the changes made in Chapter three of the 2005 cycle.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-7.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-104 Log #3139 NEC-P01 **Final Action: Reject**
(100.Restricted Access (New))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Add new definition of restricted access to Article 100 as follows.
Restricted Access. Areas where exclusive control is maintained.
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Service Drop, Service Lateral, Service Point, and Utilization Equipment.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.
*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change is to add a new term to be used for both the NEC and the NESC intended to correlate the purpose and scope of both documents and to clarify the intent of exclusive control in the example of a utility supply in vaults within buildings.
Panel Meeting Action: Reject
Panel Statement: The proposed definition of "restricted access" does not fit the use of the term used elsewhere in the Code such as 240.6(C) and 708.5, which implies physical measures to prevent access. The submitter provided inadequate substantiation specific for this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: This proposal is one of a group of proposals which, if taken as a whole and accepted, would get us closer to harmonization of the NEC and the NESC – a shared goal that is in the interest of both groups and in the interest of the industry at large. Unfortunately, the NEC development process does not make it easy to make the simultaneous and coordinated changes necessary for the harmonization we all want. Therefore the explanation of how we hope to help the harmonization process, refer to our comment on Proposal 1-17.

LABRAKE, JR., N.: Proposal 1-104 should have been accepted. The panel statement that the definition is not used in two or more Articles is true, but as was discussed in the panel, there is no place in the NEC for the definition of terms used in Article 90 such as in other articles in the XXX.2 section. In addition, refer to my ballot statements on Proposals 1-17 and 1-29 and the substantiation in proposal 1-107 regarding the need for defining this term.

Alternatively, the Panel could consider the proposed term in a new informative Annex discussed in my ballot statement on Proposal 1-12 as follows:

Annex "TBD": "General Information Regarding Utility Electric Supply to Premises Wiring"
2. The following are terms for general understanding of where utility electric supply and premises wiring meet for what is covered and what is not covered by this Code as described in 90.2.

Restricted Access. Areas that are separated from public access by a spatial or physical barrier, such as an equipment enclosure, and that are accessible only under exclusive control.

1-105 Log #3510 NEC-P01 **Final Action: Reject**
(100.Reverse Logic Systems)

Submitter: Chad Gummere, Westminster, CO
Recommendation: Properly identify reverse logic systems that state the system is energized when the disconnecting means represent the system is deenergized.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: The proposal does not contain recommended text to be added or substantiation of the proposal as required by 4.3.3 of the NFPA Regulations Governing Committee Projects.

There is no need for this definition as the term is not used in NFPA 70.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-12 Log #2076 NEC-P08 **Final Action: Reject**
(100.Rigid Nonmetallic Conduit (New))

Submitter: Jim Davis, Eugene, OR
Recommendation: Insert a new definition for "Rigid Nonmetallic Conduit: "A rigid nonmetallic raceway of circular cross section constructed to include applications both aboveground and underground where specific characteristics are met which includes Types PVC and RTRC."
Substantiation: With the new title to Article 352 in the 2008 NEC, and with the addition of new Article 355, the exact meaning of "rigid nonmetallic conduit" and what is referred to by these words is no longer clear. The words "rigid nonmetallic conduit" are used no less than 20 times between Articles 100 and 430 of the 2008 NEC, and it is not clear about which raceway is covered by those references. A word search count was not performed beyond Article 430, but it is certain to appear many times elsewhere in the NEC. This proposed new definition would clarify which wiring methods are discussed in many places in the NEC and would help designers, installers, and inspectors understand the code intent where this reference is made.
Panel Meeting Action: Reject
Panel Statement: CMP-8 identifies each raceway type in the scope of its respective article. A generic definition to more than one article may confuse the users and will not serve any purpose. The definitions and uses permitted for PVC and RTRC belong in Articles 352 and 355 respectively.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-27 Log #2339 NEC-P05 **Final Action: Reject**
(100.Separately Derived System)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise the definition for Separately Derived System as follows: "A premises wiring system ~~whose~~ of which power is derived indirectly from a service or from a source of electric energy or equipment other than a service. Such systems have no direct electrical interconnection of normally current-carrying conductors, including a solidly connected grounded circuit conductor~~, to supply conductors originating in another system~~. Interconnection of bonding conductors is acceptable."
Substantiation: The text revisions of the definition for "Separately Derived System" aligns with the variety of systems intended to be included by this description and clarifies how those systems are to be configured to meet the conditions of this definition. The existing definition seems to suggest that the power consumption for all loads connected to transformers will NOT show up on the utility's billing (service supplied) statement! By adding "indirectly from a service," transformers can legitimately be classified as "separately derived systems." Photovoltaic systems and battery powered systems DO indeed derive their power "from a source of electric energy or equipment other than a service" as the current definition points out. The rewording in the second sentence, attempts to clarify that bonding conductors DO NOT disqualify a system as being "separately derived."
Panel Meeting Action: Reject
Panel Statement: The word "equipment" in the first sentence is intended to incorporate transformers that are connected as separately derived systems. Other changes related to bonding conductors are not considered system conductors so long as a direct connection to the electrical system is not made.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16 Negative: 0

5-28 Log #3260 NEC-P05 **Final Action: Reject**
(100.Separately Derived System)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence as follows:

Such systems shall have no direct circuit conductor connection, including a ~~solidly~~ directly connected grounded circuit conductor, to supply circuit conductors originating inanother system.
Substantiation: Editorial. Direct electrical connection should apply to circuit conductors since a metal raceway or cable between a generator or transformer and another system provides a connection between grounded conductors connected to enclosures of each system, as does grounding electrode conductors connected to the same grounding electrode system.
Panel Meeting Action: Reject
Panel Statement: Connections related to equipment grounding conductors do not violate the definition of a separately derived system so long they do not connect directly to system components. The connection of a grounding electrode conductor is required at the same point as the system bonding jumper and does not create a conflict with the definition.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

4-4 Log #2006 NEC-P04 **Final Action: Reject**
(100.Service Cable)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows: Service conductors made up in multiconductor ~~the~~ form ~~of multiconductor cable~~ or individual conductors.
Substantiation: Edit. "Cable" (not defined) may be single conductor or multiconductor. Service conductors by definition include service laterals and service –entrance conductors which may be individual conductors. Proposal clarifies that "cable" is not intended to be limited to multiconductor types as may be inferred by "form of a cable". Present definition uses the term being defined (cable) in the definition.
Panel Meeting Action: Reject
Panel Statement: The submitter is not correct in the assumption that the current definition does not include all cable types, even those made up of individual single conductors the current definition covers all conductors that are placed together to be used as service cables whether they are single conductors, preformed unjacketed cable assemblies, or jacketed cable assemblies.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: In addition to the Panel Statement the submitter should reference the existing definition of Service-Entrance Cable that is located in Section 338.2 of the NEC.

4-5 Log #447 NEC-P04 **Final Action: Accept in Principle**
(100.Service Drop)

Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
Service Drop. The overhead ~~service~~ conductors from the last pole or other aerial support to and including the splices, if any, connecting to the service-entrance conductors at the building or other structure.
Substantiation: The current definition of Service Drop refers to overhead "*service conductors*". Because "*service conductors*" is also a defined term, ("*The conductors from the service point to the service disconnecting means*"), there can be no NEC defined service drop conductors on the utility side of the service point. This creates a conflict when applying the definitions to the requirements of various code sections that refer to service drops. 230.40 states: "*Each service drop or lateral shall supply only one set of service-entrance conductors*". With the current definition, for example, there is no "service drop" on an overhead service where the service point is at the point of connection to the service entrance conductors at the weather head, and therefore, the requirements of 230.40 do not apply. The same problem exists when trying to enforce the point of attachment and support requirements of 230.26 thru 29. The current definition is also in conflict with 90.2(B)(5)a. This section refers to a service drop that is under the exclusive control of an electric utility. Removing the word "*service*" from the definition of service drop would include the conductors on the utility side of the service point in the definition of service drop, thus allowing us to recognize these conductors as service drop conductors for application of other code requirements. This change would not affect the scope of enforcement of these conductors because 90.2 is very clear that conductors under the exclusive control of an electric utility are not covered by the NEC.
A similar change is being proposed to the definition of "service lateral".
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 4-8.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: See my Explanation of Negative on Proposal 4-8 (Log #3503).

4-6 Log #2556 NEC-P04 **Final Action: Accept in Principle**
(100.Service Drop)

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Revise as follows:
Service Drop: The overhead ~~service~~ conductors from the last pole...
Substantiation: The use of the phrase "service conductors" in the definition of "service drop" is misleading because service conductors, by definition, are on the customer side of the service point. The conductors that extend from the last pole to the weatherhead on a building may or may not be on customer side of the service point.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 4-8.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: See my Explanation of Negative on Proposal 4-8 (Log #3503).

4-7 Log #3140 NEC-P04 **Final Action: Accept in Principle**
(100.Service Drop)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Revise the definition of service drop and add the following new fine print note in Article 100 as follows.
Service Drop. The overhead ~~service~~ conductors between the electric supply or communication line and the building or structure being served ~~from the last pole or other aerial support to and including the splices, if any, connecting to the service-entrance conductors at the building or other structure~~.
FPN: Service drops are typically on the line side of the service point provided by the serving utility's conditions of service. See Figure 90.2 for a general illustration of where utility electric supply and premises wiring meet for what is covered by this Code and what is not covered.
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Lateral, Service Point, and Utilization Equipment.
This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" *.
*Refer to the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 in Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf).
Specifically, the rationale for this change is to provide clarity where the NEC applies to premises wiring meeting the supply facilities under exclusive control of utilities at the service point and to separately derived systems that are not connected to a service point. This proposal correlates the definition of "service drop" with the 2007 NESC same defined term. The service drop is overhead conductors provided by the governmental or regulated serving utility's local requirements or those of a private utility under conditions of service (e.g. tariffs with service applications). As such, premises wiring attaches to a service drop at a service point.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 4-8. The FPN is not necessary.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: See my Explanation of Negative on Proposal 4-8 (Log #3503).

4-8 Log #3503 NEC-P04 **Final Action: Accept in Part**
(100.Service Drop)

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Revise text to read as follows:
Service Drop. (The overhead service conductors between the utility distribution system and the service point for the premises wiring system).
Substantiation: This proposal is being submitted by a task group that has been formed by Panel Chair, Ronald Toomer, in response to instructions that were presented to Code-Making Panel 4 by the Technical Correlating Committee as a result of some proposals that were submitted in the last cycle. These proposals spurred some discussion that resulted in differing opinions relative to the use of the term "Service Lateral". The members of the task group are as follows: Larry D. Cogburn, Chair, Robert J. Deaton, James J. Rogers, John A. Sigmund, and John W. Young.
Panel Meeting Action: Accept in Part
Delete the word "service" between overhead and conductors and omit "for the premises wiring system".
Panel Statement: The definition of service drop is being revised to clearly identify these overhead conductors as being under the exclusive control of a serving utility. The word "service" was removed to harmonize with the definition of service conductors. The remainder of the words after service point were removed for clarity.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.
Comment on Affirmative:
MCDANIEL, R.: I am balloting affirmative with comment on this proposal, however the panel action should have been "Accept in Part and in Principle", to change "utility distribution" system to "utility electric supply" system. The proposed definition of Service Drop should read as follows::
100 Service Drop. The overhead conductors between the utility ~~distribution~~ electric supply system and the service point.

The term "distribution" restricts application of this definition to overhead services supplied from utility distribution systems, which typically operate at voltages up to and including 34.5 kV. The term "distribution" excludes services operating at voltages above 34.5 kV. The term "electric supply" is more general, and will include utility overhead services supplied from both distribution and transmission systems.

4-9 Log #3525 NEC-P04 **Final Action: Accept in Principle**
(100.Service Drop)

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise the existing text of the 2008 NEC as follows:
Service Drop. The overhead service conductors from the service point ~~last pole or other aerial support to and including the splices, if any, connecting~~ to the point of connection to service-entrance conductors at the building or other structure.
FPN: If the service point is at the weatherhead or other point of connection to service-entrance conductors, there may not be a service drop that is covered by the NEC.
Substantiation: This proposed change recognizes that the definition of Service Conductors in Article 100 states "The conductors from the service point to the service disconnecting means." Thus, service drops, if provided, controlled, and maintained by the electric utility, are on the supply side of the "service point" as defined in Article 100 and are not covered by the Code as stated in 90.2(B)(5).
The proposed Fine Print Note will assist the user of the NEC to understand the concepts included in the definition of "service drop."
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 4-8. The FPN is not necessary.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: See my Explanation of Negative on Proposal 4-8 (Log #3503).

4-10 Log #3365 NEC-P04 **Final Action: Reject**
(100.Service Equipment)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main control and cutoff of the supply.
Substantiation: The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." This revised definition, as well as a corresponding proposed change to the definitions of "Service Cable" to "Service-Entrance Cable" and "Service Conductors" to "Service-Entrance Conductors" (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing this definition (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: There are always service conductors but there may not always be service entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: The Panel made several changes in the various definitions and requirements for the installation of conductors involved with bringing power to a building. Most of these changes were made in response to multiple requests to clarify what is utility installed and what is privately installed. These changes should address the concerns of the submitter and add the requested clarification. The submitter is incorrect when stating that under existing code requirements that all service drops and service laterals are installed by utility companies that really depends on which side of the service point they are on. The new definitions clarify that and it is intended that there be plenty of public comment on what the panel has done in an effort to clarify this, some may truly feel that if it ain't broke don't fix it and some may not. Although even under the new definition scheme there will always be service-entrance conductors the definition presented by the submitter does not reflect the new definition scheme.

4-11 Log #4705 NEC-P04 **Final Action: Reject**
(100.Service Equipment, Suitable for (New))

Submitter: Clyde V. Carl, North Carolina Dept. of Administration/State Construction Office
Recommendation: Add new text as follows:
Service Equipment, Suitable for. Equipment that can accommodate not more than six main disconnection devices, each provided with overcurrent protection, and that has a neutral conductor termination point that is insulated from the enclosure.
Substantiation: Common misunderstandings are that service entrance equipment is manufactured with special bracing and that breakers for service entrance equipment are especially listed for use in service entrance equipment. In UL 869A, *Reference Standard for Service Equipment,* fourth edition, one learns in Section 14.2, Insulated neutral, Paragraph 14.2.1, that, "Equipment having a neutral insulated from the enclosure, intended for use as service equipment, and that can accommodate not more than six main disconnecting means shall be marked "Suitable for use as service equipment."
Panel Meeting Action: Reject
Panel Statement: The requirements for equipment to be marked and identified as suitable for use as service equipment are in the product standards. If the equipment is listed and marked then it can be used as service equipment, which is defined.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-12 Log #448 NEC-P04 **Final Action: Accept in Principle**
(100.Service Lateral)

Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
Service Lateral. The underground ~~service~~ conductors between the street main, including any risers at a pole or other structure or from transformers, and the first point of connection to the service-entrance conductors in a terminal box or meter or other enclosure, inside or outside the building wall. Where there is no terminal box, meter, or other enclosure, the point of connection is considered to be the point of entrance of the service conductors into the building.
Substantiation: The current definition of Service Lateral refers to underground "*service conductors*". Because "*service conductors*" is also a defined term, ("*The conductors from the service point to the service disconnecting means*"), there can be no NEC defined service lateral conductors on the utility side of the service point. This creates a conflict when applying the definitions to the requirements of other code sections that refer to service laterals. 230.40 states: "*Each service drop or lateral shall supply only one set of service-entrance conductors*". With the current definition, for example, there is no "*service lateral*" on an underground service where the service point is at the point of connection to the service entrance conductors in a terminal box or meter or other enclosure, and therefore, the requirements of 230.40 do not apply. The current definition is also in conflict with 90.2(B)(5)a. This section refers to a service lateral that is under the exclusive control of an electric utility. Removing the word "*service*" from the definition of service lateral would include the conductors on the utility side of the service point in the definition of service lateral, thus allowing us to recognize these conductors as service lateral conductors for application of other code requirements. This change would not affect the scope of enforcement of these conductors because 90.2 is very clear that conductors under the exclusive control of an electric utility are not covered by the NEC.
A similar change is being proposed to the definition of "service drop".
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 4-15 and 4-16.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: See comments on 4-15 and 4-16.

4-13 Log #2224 NEC-P04 **Final Action: Accept in Principle**
(100.Service Lateral)

Submitter: Allen Forbes, L & A Electric, Inc.
Recommendation: Revise text to read as follows:
Service Lateral. The underground service conductors between the street main, including any risers at a pole or other structure or from transformers, and the ~~first~~ point of connection to the service entrance-conductors in a terminal box or meter or other enclosure, ~~inside or outside~~ at the building wall. Where there is no terminal box, meter or other enclosure, the point of connection is considered

to be the point of entrance of the service conductors into the building.
Substantiation: The existing definition has been misinterpreted when a remote meter or terminal box has been installed. It implies that at the remote meter or terminal box the service lateral ends because this is the "first" point of connection. This change would clarify that the service lateral ends at the building or structure where the service equipment is located.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on proposal 4-15 and 4-16.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: See comments on 4-15 and 4-16.
Comment on Affirmative:
ROGERS, J.: The submitter is referenced to the definition of "Service-Entrance Conductors Underground System" and "Service Lateral" once the service lateral is terminated in any way it ends and the conductors from that point into the service equipment are service-entrance conductors.

4-14 Log #3141 NEC-P04 **Final Action: Accept in Principle**
(100.Service Lateral)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Revise the definition of service lateral and add the following new fine print note in Article 100 as follows.
Service Lateral. The underground ~~service~~ conductors between the utility source of supply~~street main~~, including any risers at a pole or other structure ~~or from transformers~~, and the first point of connection to the service-entrance conductors in a terminal box or meter socket or other enclosure, inside or outside the building wall. Where there is no terminal box, meter socket, or other enclosure, the point of connection is considered to be the point of entrance of the service conductors into the building.
FPN: Service laterals are typically on the line side of the service point provided by the serving utility's conditions of service. See Figure 90.2 for a general illustration of where utility electric supply and premises wiring meet for what is covered by this Code and what is not covered.
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Point, and Utilization Equipment.
This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" *.
*Refer to the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 in Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf).
Specifically, the rationale for this change is to provide clarity where the NEC applies to premises wiring meeting the supply facilities under exclusive control of utilities at the service point and to separately derived systems that are not connected to a service point. The service lateral consists of underground conductors provided by the governmental or regulated serving utility's local requirements or those of a private utility under conditions of service (e.g. tariffs with service applications). As such, premises wiring attaches to a service lateral at a service point.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposals 4-15 and 4-16. The FPN is not necessary.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: See comments on 4-15 and 4-16.

4-15 Log #3504 NEC-P04 **Final Action: Accept in Principle**
(100.Service Lateral)

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Revise text to read as follows:
~~Service Lateral.~~ (Underground Service Conductors.) The underground service conductors between the (service point) ~~street main, including any risers at a pole or other structure or from transformers,~~ and the first point of connection to the service-entrance conductors in a terminal box or meter or other enclosure, inside or outside the building wall. Where there is no terminal box, meter, or other enclosure, the point of connection is considered to be the point of entrance of the service conductors into the building.
Substantiation: This proposal is being submitted by a task group that has been formed by Panel Chair, Ronald Toomer, in response to instructions that were presented to CMP 4 by the TCC as a result of some proposals that were submitted in the last cycle. These proposals spurred some discussion that resulted in differing opinions relative to the use of the term "Service Lateral". This proposal is intended to clarify where the underground service conductors begin and end in reference to the NEC as installed by other than electric utility companies. If these conductors are installed by electric service utility companies by established agreements or easements, then the NEC does not apply and the utility can define these conductors as they see fit. The members of the task group are as follows: Larry D. Cogburn, Chair, Robert J. Deaton, James J. Rogers, John A. Sigmund, and John W. Young.
Panel Meeting Action: Accept in Principle
New Definition: Service Conductors, Underground. The underground conductors between the service point and the first point of connection to the service-entrance conductors in a terminal box, meter or other enclosure, inside or outside the building wall. Where there is no terminal box, meter, or other enclosure, the point of connection is considered to be the point of entrance of the service conductors into the building.
Panel Statement: To define the conductors provided between the service point and the service entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

4-16 Log #3505 NEC-P04 **Final Action: Accept**
(100.Service Lateral)

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Add text to read as follows:
Service Lateral. The underground conductors between the utility distribution system and the service point.
Substantiation: This proposal is being submitted by a task group that has been formed by Panel Chair, Ronald Toomer, in response to instructions that were presented to CMP 4 by the TCC as a result of some proposals that were submitted in the last cycle. These proposals spurred some discussion that resulted in differing opinions relative to the use of the term "Service Lateral". This proposal is intended to clarify where service lateral conductors begin and end in reference to the NEC as installed by electric utility companies. If these conductors are installed by electric service utility companies by established agreements or easements, then the NEC does not apply and the utility can define these conductors as they see fit. The members of the task group are as follows: Larry D. Cogburn, Chair, Robert J. Deaton, James J. Rogers, John A. Sigmund, and John W. Young.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.
Comment on Affirmative:
MCDANIEL, R.: I am balloting affirmative with comment on this proposal, however the panel action should have been "Accept in Principle", to change "utility distribution" system to "utility electric supply" system. The proposed definition of Service Lateral should read as follows:
100 Service Lateral. The underground conductors between the utility ~~distribution~~ electric supply system and the service point
The term "distribution" restricts application of this definition to underground services supplied from utility distribution systems, which typically operate at voltages up to and including 34.5 kV. The term "distribution" excludes services operating at voltages above 34.5 kV. The term "electric supply" is more general, and will include utility underground services supplied from both distribution and transmission systems.

4-17 Log #3526 NEC-P04 **Final Action: Accept in Principle**
(100.Service Lateral)

Submitter: Phil Simmons, Olympia, WA
Recommendation: Revise the existing text of the 2008 NEC as follows:
Service Lateral. The underground service conductors, on the load side of the service point, between the utility supply ~~street main, including any risers at a pole or other structure or from transformers,~~ and the first point of connection to the service-entrance conductors in a terminal box or meter or other enclosure, inside or outside the building wall. This includes conductors from the street main, any risers at a pole or other structure, or from transformers. If ~~Where~~ there is no terminal box, meter, or other enclosure at the load end of the conductors, the point of connection is considered to be the point of entrance of the service conductors into the building.
Substantiation: Since the service lateral is a subset of service conductors, the definition needs to make reference to being on the load side of the "service point." The definition of "Service Conductors" clearly points out the conductors extend from the service point to the service disconnecting means. So, a service lateral that is covered by the Code extends from the service point to the service-entrance conductors, if they exist.
Relocating the phrase on risers at a pole, etc., is for simplicity and clarity.

Other changes are for clarity.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Principle

Panel Statement: The definition of service lateral has been clarified See panel action and statement on Proposals 4-15 and 4-16.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

YOUNG, J.: See comments on 4-15 and 4-16.

4-18 Log #3142 NEC-P04 **Final Action: Accept in Part**
(100.Service Point)

Submitter: Neil F. LaBrake, Jr., National Grid USA

Recommendation: Add the following new text for line and load sides of the service point and fine print notes to the definition of service point in Article 100 as follows. The defined term is reprinted for clarity.

Service Point. The point of connection between the facilities of the serving utility and the premises wiring.

<u>*FPN*: The service point can be described as the point of demarcation between where the serving utility ends and the premises wiring begins. The serving utility generally specifies the location of the service point based on their conditions of service. See Figure 90.2 for a general illustration of where utility electric supply and premises wiring meet for what is covered by this Code and what is not covered.</u>

<u>**Line Side of Service Point.** See definition for "service".</u>

<u>*FPN*: See ANSI C2-2007, *National Electrical Safety Code* for definitions of "lines", "electric supply station", and "electric supply equipment" that further describe a utility supply.</u>

<u>**Load Side of Service Point.** See definitions of "premises wiring (systems)" and "utilization equipment".</u>

Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, and Utilization Equipment.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.

* Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change is to provide clarity where the NEC applies to premises wiring meeting the supply facilities under exclusive control of utilities at the service point and to separately derived systems that are not connected to a service point. The location of the service point and utility equipment to provide electric service to premises wiring is dependent upon the governmental or regulated serving utility's local requirements or those of a private utility under conditions of service (e.g. tariffs with service applications). This revised term is also proposed in the NESC at this time and intended to correlate the purpose and scope of both documents.

Panel Meeting Action: Accept in Part

Accept the first two sentences of the FPN. Reject the remainder of the proposal.

Panel Statement: The first two lines of the proposed FPN adds sufficient clarity. The remainder of the proposal is not needed.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

4-19 Log #3362 NEC-P04 **Final Action: Reject**
(100.Service-Entrance Cable)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.

Substantiation: The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." This revised definition, as well as a corresponding proposed change to the definition of "Service Conductors" to "Service<u>-Entrance</u> Conductors" (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing this definition (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: Not all service cables are service-entrance cables.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-20 Log #3363 NEC-P04 **Final Action: Reject**
(100.Service-Entrance Conductors)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

Service<u>-Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.

Substantiation: The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." This revised definition, as well as a corresponding proposed change to the definition of "Service Cable" to "Service<u>-Entrance</u> Cable" (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing this definition (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: The existing definition for service-entrance conductors is correct.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I agree with the panel action. The submitter is incorrect in the assertion that under current code requirements "service laterals" and "service drop conductors" are always installed by utility companies.

4-20a Log #CP401 NEC-P04 **Final Action: Accept**
(100 Service-Entrance Conductors, Overhead System)

Submitter: Code-Making Panel 4,

Recommendation: Change the definition of Service-Entrance Conductors, Overhead System to read as follows:

The service conductors between the terminals of the service equipment and a point usually outside the building, clear of building walls, where joined by tap or splice to the service drop <u>or overhead service conductors</u>.

Substantiation: The panel is submitting this proposal to harmonize these definitions with the remainder of the changes made to the terms service drop and service lateral.

Panel Meeting Action: Accept

Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

4-20b Log #CP402 NEC-P04 **Final Action: Accept**
(100.Service-Entrance Conductors, Underground System)

Submitter: Code-Making Panel 4,
Recommendation: Change the definition of Service-Entrance Conductors, Underground System to read as follows:
The service conductors between the terminals of the service equipment and the point of connection to the service lateral <u>or underground service conductors</u>.
Substantiation: The panel is submitting this proposal to harmonize these definitions with the remainder of the changes made to the terms service drop and service lateral.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

10-5 Log #2932 NEC-P10 **Final Action: Reject**
(100.Short-Circuit Current Rating)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text to read as follows:
Short-Circuit Current Rating. The prospective symmetrical fault current at a nominal voltage <u>the</u> ~~to which an~~ apparatus or system is <u>rated</u> ~~able~~ to be connected <u>or interrupt</u> without sustaining damage exceeding defined acceptance criteria.
Substantiation: This is intended to be an editorial rather than substantive proposal. It seems the present definition is flawed as it refers to the apparatus or system being "able to be connected" rather than being suitable to interrupt or being rated for the short-circuit current. The fact the equipment can be physically connected to a source of some capacity does not include a requirement that the equipment be rated for the voltage and current it is connected to.
Panel Meeting Action: Reject
Panel Statement: A branch circuit overcurrent protective device has an interrupting rating. A component, such as a contactor, or a system, such as an industrial control panel, has a short-circuit current rating. An overcurrent protective device within a system, such as a circuit breaker in an industrial control panel, has an interrupting rating.
The remaining proposed editorial changes, including the replacement of "able" with "rated", do not improve the clarity or usabliity of this definition as the title of the definition is "Short-Circuit Current Rating".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
COOK, D.: Article 100 includes a separate definition for "interrupting rating". Therefore the proposed text "or interrupt" is not applicable to the definition of short-circuit current rating. However, I believe the other proposed revisions improve clarity. I believe the action should be to accept in part.
HIDAKA, J.: The panel action should have been, "Accept in Principle in Part," and revised the text to delete the word "able" and replace with the word "identified" so the definition would read:
"Short-Circuit Current Rating. The prospective symmetrical fault current at a nominal voltage to which an apparatus or system is ~~able~~ <u>identified</u> to be connected without sustaining damage exceeding defined acceptance criteria."
This is similar to what the panel agreed to do in proposal 10-4 for a substitute of the word "intended" as the word "identified" is already defined in the NEC.
In the same context, "able" should be replaced as it suggests <u>any</u> application where a connection can be made which ignores the rating of the device.
"Identified" is defined as "Recognizable as suitable for the purpose...".

3-5 Log #1002 NEC-P03 **Final Action: Reject**
(100.Signalling Circuit)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
~~A~~ <u>An</u> electrical circuit ~~that energizes~~ <u>whose sole function is to energize</u> signaling equipment.
Substantiation: Edit. Service and feeder conductors also supply current that energizes signaling equipment.
Panel Meeting Action: Reject
Panel Statement: The proposed change is incorrect that the sole function of a "signaling circuit" is to energize signaling equipment. The primary function may be to energize the equipment but the circuit may also provide secondary functions, such as low or high frequency signals with frequency modulation provided on the power circuit.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-6 Log #4699a NEC-P14 **Final Action: Reject**
(100.Supervised Installation (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. Association of Education Facilities Executivies
Recommendation: Define "supervised installation" as follows:
<u>A facility, or portion of a facility where each of the following conditions are met:</u>
<u>(1) Conditions of design and installation are provided under engineering supervision.</u>
<u>(2) Qualified persons with documented training and experience provide maintenance, monitoring, and servicing of the system.</u>
<u>(3) Where electric service and electrical maintenance is continuously provided by a single building management.</u>
A copy of this proposal has also been sent to Code-Making Panel 6.
Substantiation: 1. This definition has been derived from other appearances of the term elsewhere in the NEC. (It is to be distinguished from the technical characteristics of some life safety systems such as supervised sprinkler systems.)
2. Many organizations are reducing first costs by installing less expensive equipment (or systems that require fewer overcurrent devices, for example) so if the first cost has been thrifted, the O and M budget may increase.
3. A single building management may be the Owner, or an Owner's agent, and have an interest in all aspects of electrical safety if the scope of that responsibility can be described in the National Electrical Code.
Panel Meeting Action: Reject
Panel Statement: The term "supervised installation" is not used in Chapter 5 and a definition is, therefore, not necessary. The term is only found in 210.19(B)(2) and 215.2(B)(3). Both of these sections define the term.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

6-7 Log #4699 NEC-P06 **Final Action: Reject**
(100.Supervised Installation (New))

TCC Action: The Technical Correlating Committee understands that this issue was acted on by Code-Making Panel 1 in Proposal 1-105a.
Submitter: Michael A. Anthony, University of Michigan / Rep. Association of Education Facilities Executivies
Recommendation: Define "supervised installation" as follows:
<u>A facility, or portion of a facility where each of the following conditions are met:</u>
<u>(1) Conditions of design and installation are provided under engineering supervision.</u>
<u>(2) Qualified persons with documented training and experience provide maintenance, monitoring, and servicing of the system.</u>
<u>(3) Where electric service and electrical maintenance is continuously provided by a single building management.</u>
A copy of this proposal has also been sent to Code-Making Panel 14.
Substantiation: 1. This definition has been derived from other appearances of the term elsewhere in the NEC. (It is to be distinguished from the technical characteristics of some life safety systems such as supervised sprinkler systems.)
2. Many organizations are reducing first costs by installing less expensive equipment (or systems that require fewer overcurrent devices, for example) so if the first cost has been thrifted, the O and M budget may increase.
3. A single building management may be the Owner, or an Owner's agent, and have an interest in all aspects of electrical safety if the scope of that responsibility can be described in the National Electrical Code.
Panel Meeting Action: Reject
Panel Statement: This issue is not within the scope of Panel 6.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

1-105a Log #4699b NEC-P01 **Final Action: Reject**
(100.Supervised Installation (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. Association of Education Facilities Executivies
Recommendation: Define "supervised installation" as follows:
<u>A facility, or portion of a facility where each of the following conditions are met:</u>
<u>(1) Conditions of design and installation are provided under engineering supervision.</u>
<u>(2) Qualified persons with documented training and experience provide maintenance, monitoring, and servicing of the system.</u>
<u>(3) Where electric service and electrical maintenance is continuously provided by a single building management.</u>
A copy of this proposal has also been sent to Code-Making Panels 6 and 14.
Substantiation: 1. This definition has been derived from other appearances of the term elsewhere in the NEC. (It is to be distinguished from the technical characteristics of some life safety systems such as supervised sprinkler systems.)

2. Many organizations are reducing first costs by installing less expensive equipment (or systems that require fewer overcurrent devices, for example) so if the first cost has been thrifted, the O and M budget may increase.

3. A single building management may be the Owner, or an Owner's agent, and have an interest in all aspects of electrical safety if the scope of that responsibility can be described in the National Electrical Code.

Panel Meeting Action: Reject

Panel Statement: The proposed definition contains requirements or recommendations that violate the NEC Style Manual Section 2.2.2.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: Many Article 100 definitions contain implicit requirements. In this case, the requirements are essentially bulleted, thereby putting the requirements in greater relief. The rhetorical structure of this concept should not take away from its merit, however. The concept of a supervised installation is embedded in many NFPA documents and needs to be integrated into the NEC in order for it to stay in step with the times. This proposal will be revised and resubmitted in the ROC stage.

LABRAKE, JR., N.: Proposal 1-105a should have been accepted-in-principle-in-part. The last part "continuously provided by a single building management" could be accepted and the remainder of the proposal in principle. See my ballot statement for proposal 1-106. In addition, refer to my ballot statements on proposals 1-17 and 1-29 and the substantiation in proposal 1-107 regarding the need for defining "supervised installations".

1-106 Log #3445 NEC-P01 **Final Action: Reject**
(100.Supervised Installation (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Add the following definition of supervised installation to Article 100:

Supervised Installation. Conditions of maintenance and engineering supervision ensure that only qualified persons monitor and service the system.

Substantiation: Edison Electric Institute bases this proposal on Code Making Panel 1's statement to reject Proposal 1-4 in the A2007 NEC ROP on page 70-3 and Mr. LaBrake's Explanation of Negative to accept Comment 1-1 in the A2007 NEC ROC *.

* Refer to the NFPA 2007 Annual Meeting Transcript (http://www.nfpa.org/assets/files/PDF/CodesStandards/A07TranscriptFinal.pdf) pertaining to this issue in Code Making Panel 1 of NFPA 70.

EEI recognizes the need for the term "supervised installation" to clarify its meaning in a companion proposal to revise 90.2(C) with a new second paragraph. Providing a reference in the NEC such as to the NESC for more information to cover special systems such as those 1000 volts and greater will be helpful to the AHJ to use the NESC that can cover industrial complexes and utility interactive systems (such as lightly regulated generation plants). See 2007 NESC Rule 011A, second sentence.

Panel Meeting Action: Reject

Panel Statement: The proposed definition is not consistent with how the term "supervised installation" is used elsewhere in the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: The term "supervised installation" does not appear in the NEC yet. It is being proposed because a common understanding of it will build the foundation for harmonization between the NEC and NESC.

LABRAKE, JR., N.: Proposal 1-106 should have been accepted-in-principle. This proposal should include the last part "continuously provided by a single building management" from proposal 1-105a to the proposed definition as follows:

Supervised Installation. Conditions of maintenance and engineering supervision ensure that only qualified persons monitor and service the system continuously provided by a single building management.

In addition, refer to my ballot statements on proposals 1-17 and 1-29 and the substantiation in proposal 1-107 regarding the need for defining "supervised installations".

Alternatively, the Panel could consider the proposed term in a new informative Annex discussed in my ballot statement on Proposal 1-12 as follows:

Annex "TBD": "General Information Regarding Utility Electric Supply to Premises Wiring"

2. The following are terms for general understanding of where utility electric supply and premises wiring meet for what is covered and what is not covered by this Code as described in 90.2.

Supervised Installation. Conditions of maintenance and engineering supervision ensure that only qualified persons monitor and service the system continuously provided by a single building management.

10-6 Log #2166 NEC-P10 **Final Action: Accept**
(100.Supplementary Overcurrent Protective Device)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise text as follows:

~~Supplementary~~ Overcurrent Protective Device, Supplementary. A device intended to provide limited overcurrent protection for specific applications and utilization equipment such as luminaires and appliances. This limited protection is in addition to the protection provided in the required branch circuit by the branch circuit overcurrent protective device.

Substantiation: The change to the title of this definition will allow for the grouping of all overcurrent devices within the definitions. This provides for increased clarity for the NEC user.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-7 Log #2733 NEC-P10 **Final Action: Accept**
(100.Supplementary Overcurrent Protective Device)

Submitter: Timothy S. Owens, City of Santa Clara

Recommendation: Revise text to read as follows:

~~Supplementary~~ Overcurrent Protective Device, Supplementary. A device intended to provide limited overcurrent protection for specific applications and utilization equipment such as luminaires and appliances. This limited protection is in addition to the protection provided in the required branch circuit by the branch circuit overcurrent protective device.

Substantiation: The change to the title of this definition will allow for the grouping of all overcurrent device definitions. This provides for increased clarity for the NEC user.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-8 Log #2557 NEC-P10 **Final Action: Reject**
(100.Tap Conductor (New))

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute

Recommendation: Add a new definition to Article 100 as follows:

Tap Conductor. A conductor, other than a service conductor, that has overcurrent protection ahead of its point of supply that exceeds the value permitted for similar conductors that are protected as described in 240.4.

Substantiation: The term "tap conductor", as defined in Section 240.2, is used in more than one code article and should, therefore, be defined in Article 100.

Panel Meeting Action: Reject

Panel Statement: The definition of the term "tap conductor" must remain in Article 240. As used in Article 240 the term "tap conductor" is "…a conductor, other than a service conductor, that has overcurrent protection ahead of its point of supply that exceeds the value permitted for similar conductors that are protected as described elsewhere in 240.4."

However the global use of this term does not always address a current carrying conductor. See 250.64(D)(1).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-3 Log #4102 NEC-P12 **Final Action: Accept in Principle**
(100.Uninterruptible Power Supply (New))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with 2.2.2 of the NEC Style Manual.

This action will be considered by the panel as a public comment.

Submitter: Ray Stanko, Underwriters Laboratories, Inc.

Recommendation: Add the following new definition.

Uninterruptible Power Supply. A power supply used to provide alternating current power to a load for some period of time in the event of a utility power failure. In addition, it may provide a more constant voltage and frequency supply to the load, reducing the effects of utility voltage and frequency variations.

Substantiation: The proposed definition is consistent with National Standards for uninterruptible power supply equipment.

Panel Meeting Action: Accept in Principle

Add new definition to Article 100 in alphabetical order to read as follows:

Uninterruptible Power Supply. A power supply used to provide power to a load for some period of time in the event of a power failure. In addition, it may provide a more constant voltage and frequency supply to the load, reducing the effects of voltage and frequency variations.

Panel Statement: CMP-12 edited the submitter's text and deleted "alternating current" and "utility" to not limit the definition to AC or denote that the UPS applies strictly to power loss from the utility.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

1-107 Log #3143 NEC-P01 **Final Action: Reject**
(100.Utilization Equipment)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Recommendation: Revise the definition of utilization equipment in Article 100 as follows.
Utilization Equipment. An electrical installation~~Equipment~~ that uses~~utilizes~~ electric or light energy for electronic, electromechanical, chemical, heating, lighting, testing, communication, signaling, or similar purposes on the premises wiring side of the service point.
Substantiation: As the Edison Electric Institute NESC & NEC representative in meetings of the NESC and NEC Committees' Ad Hoc Task Group on July 10th and Sep. 30th, 2008, I am submitting this proposal based upon discussions in those meetings to mitigate conflicts between the NESC and NEC documents primarily with the location of utility facilities on private property under "other agreements". I facilitated sub-task group teleconference sessions on July 29th, 2008 and September 9th & 15th, 2008 that included Messrs. J. Dollard, IBEW (member of the NESC-NEC Ad Hoc Task Group); P. Hickman, IBEW; and T. Adams, EEI. Subsequently, NESC members of the NESC-NEC Ad Hoc Task Group provided input to this proposal. Several companion proposals regarding this subject are submitted to 90.1(C), 90.2, 90.2(A), 90.2(A)(3), 90.2(A)FPN new, 90.2(B)FPN new, 90.2(B)(5), 90.2(B)FPN to (4) & (5), and Article 100 Definitions for Exclusive Control (new), Restricted Access (new), Service Drop, Service Lateral, and Service Point.

This is one action along with the companion proposals to resolve the ongoing conflict in 90.2(B)(5)b contained in the 2008 NEC caused by the removal of the words "or by other agreements" as encountered in the NFPA Standards Council Appeals Hearings on the 2008 NEC adoption in July 2007 *.
*Refer to Final Decision on Appeal numbers #07-24 (SC# 07-7-39) and #07-7 (SC# 07-7-5-m) in the NFPA archives (http://www.nfpa.org/itemDetail.asp?categoryID=837&itemID=35006 and http://www.nfpa.org/assets/files/PDF/Standards%20Council/TranscriptSCMeetingJuly07.pdf) pertaining to this issue.

Specifically, the rationale for this change is to revise the term to be used for both the NEC and the NESC intended to correlate the purpose and scope of both documents. This clarifies the demarcation point as described in both the NEC and NESC. This revised term is also proposed in the NESC at this time.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposed changes do not add clarity to the existing definition.

While changing "equipment" to "an electrical installation" removes the term "equipment' so that the term isn't used to define itself, an "installation" cannot utilize electric power.

The phrase "or similar purposes" already covers a wide range of applications without having to list more examples.

The NESC/NEC task group did not reach consensus.

The submitter did not provide adequate substantiation specific to this issue.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

LABRAKE, JR., N.: Proposal 1-107 should have been accepted. The panel statement is incorrect and the Submitter's substantiation is in fact contained in the supporting article attached to proposal 1-107, refer to my ballot statements on Proposals 1-17 and 1-29.

1-108 Log #2958 NEC-P01 **Final Action: Reject**
(100.Voltage Drop (New))

Submitter: Paul A. Keleher, Paul Keleher Electrical Services
Recommendation: Add new text as follows:

I. General
Voltage Drop. Voltage-drop is the reduction in circuit voltage created by the connection of an impedance in series with the source. When the added impedance is a known constant, the change in circuit voltage reflects the resistance of the circuit itself between the source of the voltage and the point of the measurement.
Substantiation: Voltage-drop is a concept that is already referenced in this Code, but whose value may be widely misunderstood. The submitter asserts that inclusion of a definition of this concept would benefit users of the Code to design and install circuits whose impedance is suitable for the installation.
Panel Meeting Action: Reject
Panel Statement: The inclusion of common electrical terms is not needed in the NEC. The scope of Article 100 states "it is not intended to include commonly defined terms".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-109 Log #613 NEC-P01 **Final Action: Reject**
(100.Voltage, Low; Voltage, Medium; Voltage, High (New))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Add new definitions to Article 100 as follows:
Voltage, Low. A class of nominal system voltages less than 1,000 V.
Voltage, Medium. A class of nominal system voltages equal to or greater than 1,000 V and less than 100,000 V.
Voltage, High. A class of nominal system voltages equal to or greater than 100,000 V.
Substantiation: These voltages and their associated tolerance limits are listed in ANSI C84.1-1989 for voltages from 120-230,000V and in ANSI C92.2-1987 for voltages above 230 kV, nominal. These classifications are also in accordance with the IEEE Std. 141 (Red Book). Since the NEC is expanding the scope of medium and high voltages, these voltage classifications need to be defined.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-110 Log #4504 NEC-P01 **Final Action: Reject**
(100.Working Space (New))

Submitter: Steven F. Wydeveld, Village of Homer Glen / Rep. Building Code Development Committee (BCDC)
Recommendation: Add new text as follows:
Working Space. An area that provides for clear, unobstructed and safe working conditions about electrical equipment.
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.

Currently there is no definition for "working space", which is a term that is used extensively. It is the goal of this definition to define the purpose of this working space because the dimensions are already addressed in the code. This definition is important because it indicates that the working space needs to be clear, unobstructed and safe. While the use of the term within the NEC does provide dimensions, it does not require the working space to be clear, unobstructed and safe. This allows the code official flexibility in determining appropriate working space regardless of the dimensions. There may be instances where other equipment, including electrical equipment, impedes the "working space".
Panel Meeting Action: Reject
Panel Statement: Working space is currently described by the requirements included in Article 110 and elsewhere in the coode.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: This proposal should have been accept in principle by revising the proposed definition as follows: "Working Space. A clear and unobstructed area that provides for safe working conditions." A definition is needed and the submitter's proposal could have been revised for clarity.

1-110a Log #CP101 NEC-P01 **Final Action: Accept**
(100.Nonautomatic)

Submitter: Code-Making Panel 1,
Recommendation: Change the definition of "Nonautomatic" in Article 100 to read as follows:

Requiring human intervention to perform a function.

Substantiation: This action is being taken in concert with action taken on Proposal 1-54 to correlate the definitions of "automatic" and "non-automatic".
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: The panel should have accepted the definition to read as follows: "Performing a function with the necessity of human intervention." This would have allowed for parallel structure with the definition of "automatic" and would have eliminated the use of the word "requiring" in the definition.

ARTICLE 110 — REQUIREMENTS FOR ELECTRICAL INSTALLATIONS

1-111 Log #1691 NEC-P01 **Final Action: Accept in Principle**
(110.(3)(A)(1), FPN No. 2 (New))

Submitter: William Fiske, Intertek
Recommendation: Change existing FPN to FPN No. 1.

Add new:

FPN No. 2: Special conditions of use and other pertinent information may be marked on the equipment or on an accompanying certificate. A certificate may be issued by the equipment manufacturer or by a listing organization.
Substantiation: The existing FPN addresses suitability of use,but does not alert the user to any special conditions of use that may be essential to safe use or proper functioning of the equipment. Examples of special conditions of use include: elevated or reduced ambient temperatures; stringent power quality requirements; specific types of overcurrent protective devices.

Reference to a certificate is included as US-based standards-developing organizations continue to harmonize IEC standards, which often specify an indication of special conditions of use "on the certificate." CMP-14 has recognized this situation with a Fine Print Note to 500.8(A)(3), new in NEC 2008. Since 60079-series standards are not the only harmonized standards in which such references exist, the proposed FPN is intended to alert all users of the NEC, whether they apply Chapter 5 or not.

It should be noted that the existence of a certificate does not necessarily indicate third-party certification (*i.e.* listing), although some listing agencies do issue certificates.
Panel Meeting Action: Accept in Principle
The panel accepts in principle the proposed FPN by revising and incorporating the text into the existing FPN to read as follows:
FPN: Suitability of equipment use may be identified by a description marked on or provided with a product to identify the suitability of the product for a specific purpose, environment, or application. Special conditions of use and other pertinent information may be marked on the equipment or on an accompanying certificate. Suitability of equipment may be evidenced by listing or labeling.
Panel Statement: The revised wording incorporates the proposed FPN into the existing FPN and meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BOYCE, K.: The proposal should be rejected. The addition of new text in the FPN to address "certificates" is not needed based on the existing text in the FPN and/or 110.3(B). Further, the substantiation for the proposal is flawed. The substantiation is based on the use of certificates for US-harmonized versions of IEC standards, including the US harmonized standard for Electrical Apparatus for Explosive Gas Atmospheres; however, the American National Standard for this equipment, ANSI/UL 60079-1, specifically does not permit the use of certificates.

1-112 Log #765 NEC-P01 **Final Action: Reject**
(110.1)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
110.1 Scope. This article covers the general requirements for the examination, ~~and~~ approval, installation and use of all equipment; access to and spaces about electrical conductors and ~~equipment~~ power production, service, and distribution equipment; enclosures intended for personnel entry; and tunnel installations.
Substantiation: We begin with the rules for all equipment. Then we discuss access to and spaces about specific types of equipment. Obviously, we do not need clearances around fittings and other general items found in the definition of equipment.
Panel Meeting Action: Reject
Panel Statement: The scope statement indicates that the article covers general requirements for electrical installation. Limiting the scope statement to other than general, such as to "power production, service, and distribution equipment", limits the application of the Article. It should also be noted that in accordance with the NEC Style Manual, Section 2.2.1, Article Scope Statements are the responsibility of the Technical Correlating Committee.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-113 Log #2046 NEC-P01 **Final Action: Reject**
(110.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: The conductors and other equipment required or permitted by this Code, and the installation thereof shall be acceptable only if approved.
Substantiation: Edit. Installation is an important part that requires approval.
Panel Meeting Action: Reject
Panel Statement: The proposed changes have not been substantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects. The code only applies to equipment that is installed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-114 Log #490 NEC-P01 **Final Action: Reject**
(110.3)

Submitter: Joe Tedesco, Tedesco Electrical Code Consultants, Inc.
Recommendation: Add new text as follows:
110.3. Unused Electrical Systems and Equipment. Unused electrical equipment left abandoned in place shall be removed or tagged and identified at all termination and junction points as a potential hazard.
FPN: See www.niosh.gov
Substantiation: This problem is worthy of some consideration, because it can lead to an accident! It is time to address this issue without any flimsy excuses!
Panel Meeting Action: Reject
Panel Statement: The proposal has not been substantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Electrical systems that have been abandoned and are not energized pose no electrical hazard. Abandoned conductors are required to be removed because of their fuel loading. This is not the case with most other "equipment".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-115 Log #2324 NEC-P01 **Final Action: Reject**
(110.3(A))

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Delete the last sentence of the fine print note in item 1 and add a new item (8) An independent safety certification as evidenced by listing and labeling by an organization acceptable to the authority having jurisdiction.
Substantiation: Adding this item will help clarify the purpose of listing and labeling to those outside of the industry. The origins of the term 'listed' are obscure and this language is needed to support inspectors when listing is required.
Panel Meeting Action: Reject
Panel Statement: The FPN directs the reader to the definitions of "Approved", "Listed "and "Labeled". The meaning is clear.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-116 Log #1539 NEC-P01 **Final Action: Reject**
(110.3(B))

Submitter: Richard Hollander, City of Tucson
Recommendation: Revise text as follows:
(B) Installation and Use. Listed or labeled equipment shall be installed, and used in accordance with any instructions included in the listing or labeling.
Substantiation: This is a grammatical change to add the comma to clarify the sentence.
Panel Meeting Action: Reject
Panel Statement: The proposed changes are unsubstantiated. The panel contends that the sentence is correct as written.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-117 Log #3154 NEC-P01 **Final Action: Reject**
(110.3(B))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Revise as follows:
~~Listed or labeled e~~ Equipment shall be installed and used in accordance with any instructions included ~~in the listing or labeling~~.
Substantiation: It is not logical to require manufacturers' instructions to be followed only for equipment approved by a third party. To ensure a proper and safe installation, manufacturers' instructions must be followed for all equipment that includes them.
Panel Meeting Action: Reject
Panel Statement: 110.3(B) specifically applies to listed and labeled equipment, which generally require instructions that have been reviewed and addressed as part of the listing or labeling process. For other equipment, the authority having jurisdiction has the authority to require particular installations through the approval process addressed in 110.2.
110.3(A)(1), regarding suitability of equipment, satisfies the concern of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: This proposal should have been accepted. As the submitter has noted, all equipment should be installed in accordance with the manufacturer's instructions to ensure a proper and safe installation.

1-118 Log #3262 NEC-P01 **Final Action: Reject**
(110.3(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
~~Listed or labeled~~ Equipment shall be installed and used in accordance with ~~any~~ the manufacturers instructions, if any, if compatible with this Code, or included in the listing or labeling.
Substantiation: Editorial. The provision should also apply to equipment that is not listed or labeled and only where such instructions do not constitute a Code violation.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-117. The panel does not agree that the proposed change is editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-119 Log #600 NEC-P01 **Final Action: Reject**
(110.3(C))

Submitter: Teri Dwyer, Wyoming, MN
Recommendation: Add new text as follows:
(C) Tests. Whenever there is insufficient evidence of compliance with the provisions of this code, or evidence that a material or method does not conform to the requirements of this code, or in order to substantiate claims for alternative materials or methods, the authority having jurisdiction shall have the authority to require tests as evidence of compliance to be made at no expense to the jurisdiction. Test methods shall be by recognized test standards. In the absence of recognize test methods, the authority having jurisdiction shall approve the testing procedures. Tests shall be performed by an approved agency. Reports of such tests shall be provided to the authority having jurisdiction as proof of equivalency to the requirements of this code.
Substantiation: There currently is no language in the NEC that specifically permits the AHJ to require testing where they may not have the expertise to evaluate equipment to all of the requirements of 110.3(A) and other applicable sections of the NEC. With this type of language which is consistent with language found in both NFPA 5000 and the International Building Code, this provides the AHJ with the tools necessary to require testing of equipment that either is not listed or has been modified after it was listed and the AHJ does not have the expertise to ensure that the minimum requirements of the NEC are complied with. This language would provide the AHJ the ability to require testing at no cost to the AHJ and provide documentation on which the AHJ could base approval or denial of the questioned equipment.
Panel Meeting Action: Reject
Panel Statement: 90.4, 90.7 and 110.3(A)(1) address the concern of the submitter. 90.4 states: "By special permission, the authority having jurisdiction may waive specific requirements in this Code or permit alternative methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety." 110.3(A)(1) states: "Suitability for installation and use in conformity with the provisions of this Code."
These sections allow the Authority Having Jurisdiction to request testing of a product or equipment as deemed necessary. Placing a code requirement for "Tests" in the NEC is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-120 Log #1540 NEC-P01 **Final Action: Reject**
(110.3(C))

Submitter: Richard Hollander, City of Tucson
Recommendation: Add new text as follows:
(C) Tests. Whenever there is insufficient evidence of compliance with the provisions of this code, or evidence that a material or method does not conform to the requirements of this code, or in order to substantiate claims for alternative materials or methods, the authority having jurisdiction shall have the authority to require tests as evidence of compliance to be made at no expense to the jurisdiction. Test methods shall be by recognized test standards. In the absence of recognize test methods, the authority having jurisdiction shall approve the testing procedures. Tests shall be performed by an approved agency. Reports of such tests shall be provided to the authority having jurisdiction as proof of equivalency to the requirements of this code.
Substantiation: There currently is no language in the NEC that specifically permits the AHJ to require testing where they may not have the expertise to evaluate equipment to all of the requirements of 110.3(A) and other applicable sections of the NEC. With this type of language which is consistent with language found in both NFPA 5000 and the International Building Code, this provides the AHJ with the tools necessary to require testing of equipment that either is not listed or has been modified after it was listed and the AHJ does not have the expertise to ensure that the minimum requirements of the NEC are complied with. This language would provide the AHJ the ability to require testing at no cost to the AHJ and provide documentation on which the AHJ could base approval or denial of the questioned equipment.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-119.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-121 Log #2750 NEC-P01 **Final Action: Reject**
(110.3(C))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels, 2, 3, 15 and the Technical Correlating Committee on Safety to Life (SAF-AAC) for information.
Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Recommendation: Add new text to read as follows:
110.3(C). Life Safety Equipment.
Equipment intended to protect building occupants shall be supplied with conductors sized to limit voltage drop to a maximum of 3 percent measured from the source of supply to the equipment and the supplied voltage shall be within the range specified by the equipment manufacturer.
FPN: The equipment covered by this section includes but is not limited to required exit illumination, exit signs, ventilation equipment. alarm systems, generators and elevators.
Substantiation: This proposal includes a new section to applying specifically to electrically supplied life safety equipment. NEC does not presently contain voltage drop maximums for required building life safety equipment although these items of equipment are often required for the protection of life safety. Survey results and other written documentation are included with this proposal.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Article 110 covers general requirements for the examination and approval, installation and use, access to and spaces about electrical conductors and equipment; enclosures intended for personnel entry; and tunnel installations. Voltage drop requirements should not be a general installation requirement in the NEC. If it is important that voltage drop requirements apply to life safety equipment, then those requirements should be addressed in the applicable Articles such as 517, 695, and 700.
There is no definition of what "life safety equipment" the proposal applies to, and the authority having jurisdiction may not be able to approve the proposed requirements in the process of approving the code requirements as "life safety equipment" may be installed at a later time.
The wording "source of supply" is vague.
The panel requests that the Technical Correlating Committee forward this proposal to the appropriate Code-Making Panels, such as 2,13, and 15, and the appropriate NFPA 101 Technical Committee for information.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-122 Log #3042 NEC-P01 **Final Action: Reject**
(110.4)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
110.4 Voltages.
Throughout this Code, the voltage considered shall be that at which the circuit operates. The voltage rating of electrical equipment shall not be less than, or greater than, the nominal voltage of a circuit to which it is connected.
Substantiation: Right now, there appears to be no code rule, other than perhaps 110.3(B), that prohibits installing 240V equipment to a 208V circuit.
Panel Meeting Action: Reject
Panel Statement: The code provides the minimum requirements for the safe installation and use of electricity. If the rating of installed equipment exceeds minimum code requirements, that does not necessarily make it a code violation. Section 110.3(B) does not prohibit installing 240V equipment to a 208V circuit; the same as it does not prohibit installing 480V equipment to a 240V circuit.
The proposed text would prohibit an electrical installation from exceeding minimum code requirements. The proposal would conflict with some product standards, such as fuses that may be used at voltages below their ratings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: There are two broad categories of 250V and 600V class wiring and equipment that seem to address the submitter's concerns.

1-123 Log #923 NEC-P01 **Final Action: Reject**
(110.8)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence as follows: The ~~recognized methods of~~ wiring methods ~~shall be~~ identified for the use shall be permitted to be installed ~~in~~ on any type of ~~building~~ premises or occupancy except as otherwise provided in this Code.
Substantiation: Edit. This code covers wiring that is not in buildings, such as overhead wiring, on poles, other structures such as piers, and underground.
Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 1-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-124 Log #1324 NEC-P01 **Final Action: Reject**
(110.8)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence:
The recognized methods of wiring shall be ~~permitted~~ employed in accordance with applicable provisions of this Code ~~in any type of building or occupancy except as otherwise provided in this Code~~.
Substantiation: "Permitted" per 90.5(B) does not entail any requirement. "In any type of building" implies structures that are not buildings are not included, nor is underground wiring or outside wiring on poles or buildings. Many recognized wiring methods are not suitable for all installations.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-125 Log #1992 NEC-P01 **Final Action: Reject**
(110.8)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Only wiring methods recognized as suitable are included in this Code. Recognized methods of wiring identified for the use shall be permitted in or on any type of building or structure or premises.
Substantiation: Edit. Many wiring methods are permitted but not all are suitable for all applications. Proposal correlates with "uses permitted" and "uses not permitted".
Panel Meeting Action: Reject
Panel Statement: It would be virtually impossible to identify wiring methods as suitable for the use. The NEC states the use(s) for which a given wiring method is suitable, and there are many wiring methods.
The panel does not agree that the proposed wording is editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: This proposal should have been accepted in principle. The submitter is correct in that clarification of this section is need. The NEC covers wiring methods that are not in buildings, such as overhead wiring, wiring on other structures, underground wiring and premises wiring. And not all wiring methods are suitable for the application. The panel should have revised the second sentence of the paragraph to read: "The recognized wiring methods ~~of wiring~~ shall be permitted to be installed in or on any ~~type of~~ building, structure, ~~or~~ occupancy or premises, except as otherwise provided in this *Code*. The revised text would have clarified the code section and met the intent of the submitter.

1-126 Log #2933 NEC-P01 **Final Action: Reject**
(110.9)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise existing text of the 2008 NEC as follows:
110.9 Interrupting Rating.
Except as provided in 240.86, equipment ~~Equipment~~ intended to interrupt current at fault levels shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment.
Substantiation: The provisions for series-combination equipment in 240.86 act as an exception to the general rules in 110.9 so this section needs to be revised to make that accommodation. Section 240.86 recognizes that the short-circuit current available exceeds the interrupting rating of the lower rated circuit breaker of the series-combination.
Panel Meeting Action: Reject
Panel Statement: The situation described by the submitter is adequately addressed by the current provisions of 110.9. New installations are addressed by tested combinations and not a violation of 110.9 because the series rated combination is listed for the AIC. Where an issue occurs after the initial installation (engineered) series ratings such as a larger transformer, this is an issue outside of the control of the initial installation and 240.86 deals with an upgrade (engineered ratings).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: We think the submitter's more specific reference to series-rated breakers in Article 110 is an improvement in the NEC. However, how stating this reference in positive language – rather than as an exception – would also be an improvement on the proposal.

1-127 Log #3279 NEC-P01 **Final Action: Accept**
(110.9)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "sufficient for" to "not less than"
Substantiation: Edit. "Sufficient" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Accept
Panel Statement: The panel understands that both occurrences of the phrase "sufficient for" are to be replaced with "not less than."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-128 Log #651 NEC-P01 **Final Action: Reject**
(110.9, FPN (New))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text to read as follows:
FPN: Providing devices that are capable of interrupting current at fault levels does not assure conductor and equipment protection.
Substantiation: In order to achieve proper conductor and equipment protection, a detailed system analysis must be done to include fault current calculations, determining the operating characteristics of the protective device or system, and then providing conductors and equipment that have suitable short-circuit withstand ratings. The ability to interrupt fault current is important, but the protection scheme goes far beyond this concept.
Panel Meeting Action: Reject
Panel Statement: A FPN is unnecessary as the code requirement is clearly spelled out in 110.10 – Circuit Impedance and Other Characteristics.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-129 Log #617 NEC-P01 **Final Action: Accept in Part**
(110.10)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 5 for comment.
Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission, & Monti Bitker
Recommendation: Revise text to read as follows:
This fault shall be assumed to be either between two or more of the circuit conductors or between any circuit conductor and the equipment grounding conductor, enclosing metal raceway or metal cable tray.
Substantiation: Metallic cable tray is permitted to be used as an equipment grounding conductor in accordance with 392.3(C) and 392.7. Cable tray, whether metallic or nonmetallic is considered to be a wiring or raceway support system and not a raceway. Therefore, this reference should be included in this section.
Panel Meeting Action: Accept in Part
The panel accepts the addition of the word "equipment".
The panel rejects the insertion of the words "or metal cable tray".
Panel Statement: The words "metal cable tray" are unnecessary as cable trays are included in 250.118 as types of equipment grounding conductors - "Cable trays as permitted in 392.3 and 392.7".
The panel requests that the Technical Correlating Committee refer this proposal to Code-Making Panel 5 for comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-130 Log #4403 NEC-P01 **Final Action: Accept in Part**
(110.10)

Submitter: Jay Tamblingson, Rockwell Automation
Recommendation: Revise text as follows:
110.10 Circuit Impedance, Short-Circuit Current Ratings, and Other Characteristics. The branch circuit protective devices, the total impedance, the component and equipment short-circuit current ratings, and other characteristics of the circuit to be protected shall be selected and coordinated to permit the branch circuit protective devices used to clear a fault to do so without extensive damage to the electrical components of the circuit. This fault shall be assumed to be either between two or more of the circuit conductors or between any circuit conductor and the grounding conductor or enclosing metal raceway. Listed products applied in accordance with their listing shall be considered to meet the requirements of this section.
FPN: A component or equipment short-circuit current rating can restrict the specific types and/or sizes of branch circuit protective devices that would be otherwise permitted under this Code.
Substantiation: The 2005 and 2008 NEC added increased requirements for providing marked short-circuit current ratings on both components and equipment (e.g. assemblies of components, panels, machines, etc). The proposed changes provide increased awareness of these ratings to ensure that they are included in the scope of evaluation of an installation.

In addition, many component and equipment short circuit current ratings are contingent on use of specific branch circuit protective devices. The proposed fine print note provides awareness that the size and/or types of branch circuit protective devices may be further restricted from what otherwise may be permitted under other Articles.

Panel Meeting Action: Accept in Part

The panel accepts the addition of "Short -Circuit Current Ratings" in the title.

The panel rejects the addition of the words "and equipment" and the Fine Print Note.

Panel Statement: The portion of the proposal that the panel Rejected does not enhance clarity or the usability of the code.

The proposed Fine print note is covered by the mandatory language in 110.3(A)(1) and 110.3(B).

The components of the circuit includes the equipment used to construct the circuit.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-131 Log #2684 NEC-P01 **Final Action: Accept in Part**
(110.11)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Unless identified for use in the operating environment no conductor or other equipment shall be located in damp or wet locations, where likely to be exposed to gases, fumes, vapors, liquids, solids, temperatures, or other agents ~~that have a deteriorating effect on the conductors or equipment or exposed to excessive temperatures~~ that are likely to cause damage.

FPN No. 1 and 2 no change.

Equipment identified only for indoor use such as "dry" locations Type 1, 2, 5, 12, 12K and/or 13, shall be protected against ~~permanent~~ damage from the weather where exposed to the weather during ~~building~~ construction.

Substantiation: "Likely" is defined as such a nature or circumstance as to make something probable and a term used in many sections. "Excessive" is not defined and difficult to determine. Damage is damage; are there permanent and temporary types? Equipment not suitable for outdoor use or wet locations only need to be protected if exposed to the weather during construction. The provision should apply where the construction does not involve buildings.

Panel Meeting Action: Accept in Part

The panel Accepts the deletion or the words "building" and "permanent".

The panel Rejects the remainder of the proposed text.

Panel Statement: It is the intent of the NEC that equipment be exposed to harmful agents virtually never in its economic life, unless suitable for such exposure. "Likely" means more probable than not. "Likely to be exposed" is far too frequent exposure for ordinary electric equipment.

It is the intent that indoor use equipment be protected from damage during construction, be it temporary or permanent. Ingress of water may be a temporary condition, but it can cause electric shock.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-132 Log #954 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete the first sentence and the fine print note.

Substantiation: Edit. "Neat" and "workmanlike" are subjective and terms to be avoided per the Style Manual and are considered differently in various areas, and do not necessarily have any relationship to safety of installations that comply with applicable provisions of this Code. See 90.1.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that the recommendation does not enhance clarity or usability, that the submitter did not provide adequate technical substantiation, and that the term is not unenforceable or vague after reviewing its use in context as provided for in 3.2.1 of the NEC Style Manual.

The proposed change is not editorial.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-133 Log #2072 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Mark T. Rochon, Peabody, MA

Recommendation: Revise text to read as follows:

Electrical equipment shall be installed in a neat and workmanlike manner, with the installation completed and energized with the proper voltage.

Substantiation: This section needs to be updated for siting uncompleted and improper installations.

Panel Meeting Action: Reject

Panel Statement: The proposal is unsubstantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects. Voltage is already addressed in 110.4, and a complete installation is already addressed in 110.7.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-134 Log #2134 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Kenneth Dale Bristow, Stellar Technologies

Recommendation: Revise text as follows:

110.12 Mechanical Execution of Work, Electrical equipment shall be installed in a safe, neat and workmanlike manner.

Substantiation: This word will augment the purpose of the National Electric Code in the installation of electrical equipment.

Panel Meeting Action: Reject

Panel Statement: Installed in a "safe" manner is a work practice issue and should not be included in an installation code. Safe work practices are addressed in NFPA 70E. In addition, the title of the section is "Mechanical Execution of Work." As such, the addition of the word "safe" does not augment the purpose of the NEC in the installation of electrical equipment.

The concerns of the submitter are adequately addressed by 90.1(B).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-135 Log #3240 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete subsection.

Substantiation: "Neat and workmanlike" is subjective and installations in compliance with this Code relate to safety per 90.1 not appearance. Workmanlike is a term to be avoided per the Style Manual.

Panel Meeting Action: Reject

Panel Statement: The proposal is unsubstantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: This proposal should have been accept in principle. As the submitter has noted, use of the words "neat" and "workmanlike" should be avoided and are generally subjective. To better clarify and perhaps more appropriately, the panel should have replaced these words with "skillful" (accomplished with skill) and "competent" (having requisite or adequate ability or qualities). These words are better understood and more clearly defined. They also reflect the actual intent of the section.

1-136 Log #3879 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Jared Steiner, E Light Electric Services

Recommendation: Revise text as follows:

Electrical equipment shall be installed in a ~~neat~~ orderly and ~~workmanlike~~ professional manner

Substantiation: The words neat and workman like are listed in the Manual of Style as words that are not to be used in the NEC.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that the terms are not unenforceable or vague after reviewing their use in context as provided for in 3.2.1 of the NEC Style Manual.

See the panel statement on Proposal 1-132.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

SASSAMAN, H.: NECA position is to reject any attempt to damage this requirement since it is the basis for the NECA ANSI NEIS family of standards.

1-137 Log #3891 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Ted "Smitty" Smith, Electrical Experts Consulting

Recommendation: Revise text as follows:

Electrical equipment shall be installed in ~~a neat and workman like manner~~ accordance with accepted industry practices and in a manner acceptable to the authority having jurisdiction.

Substantiation: The NEC style manual lists "workman like" and "neat" as words that are not to be used in the NEC. This revision is more in line with the FPN added to the section in previous code cycles and also expands the accepted practices beyond those in the referenced ANSI standard.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 1-136.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

SASSAMAN, H.: NECA position is to reject any attempt to damage this requirement since it is the basis for the NECA ANSI NEIS family of standards.

1-138 Log #3901 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Tedros Habteslassie, E Light Electric Services
Recommendation: Revise text as follows:
Electrical equipment shall be installed in a neat ~~and workman like~~ manner.
Substantiation: The NEC style manual list workmanlike as a word that is not to be used in the NEC due to enforceability issues.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-136.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
SASSAMAN, H.: NECA position is to reject any attempt to damage this requirement since it is the basis for the NECA ANSI NEIS family of standards.

1-139 Log #4567 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner. <u>Removal of abandoned cables and electrical equipment shall also be performed in a neat and workmanlike manner.</u>
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
Substantiation: This proposal recommends added wording to ensure that abandoned cables and electrical equipment are removed appropriately. The section only addresses installation but many sections in the code require removal of cables and equipment and this change is made to point out that similar care must be taken when removing cables. A proposal with alternate language is also being submitted for consideration of CMP 1.
Removal of cables or equipment is required in various sections, including 372.13, 374.7, 390.7, 590.3, 640.6, 645.5, 725.25, 760.3, 760.25, 770.25, 800.25, 820.25, 830.25.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated that a problem exists, or that the problem would be alleviated by removing abandoned cables and equipment neatly. Rather, the panel concludes, that in some cases, abandoned cables and equipment are best left abandoned.
The proposed text is unnecessary as the section more appropriately applies to “Requirements for Electrical Installations” and “Mechanical Execution of Work.”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: This concept is important and is obviously important because the word abandoned cable shows up 19 times in the NEC. Still, we have no definition for it. The submitter is encouraged to consider proposing a new section of the NEC that deals with demolition hazards, workmanlike electrical demolition with emphasis on abandoned cables, and coordination of technical issues with other articles. We are accustomed to thinking of this section as one dedicated to installations; out-of-box-thinking might require us to think of demolition as a type of “constructive” installation.

1-140 Log #3278 NEC-P01 **Final Action: Reject**
(110.12(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Unused openings other than intended for the operation of equipment, those intended for mounting purposes, or those permitted as part of the design for listed equipment, shall be closed <u>by identified means</u> ~~to afford protection substantially equivalent to the wall of the equipment.~~
Substantiation: Edit. “Substantially” and “equivalent” are subjective and terms to be avoided per the Style Manual. The purpose of the requirement is irrelevant to the rule and normally not indicated in Code rules unless necessary.
Panel Meeting Action: Reject
Panel Statement: This proposal is not “editorial.” No technical substantiation has been provided to demonstrate that 110.12(A) is being misinterpreted or misunderstood.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: This proposal should have been accepted in principle and in part. The panel should have accepted in part the addition of the words “by identified means” and in principle the deletion of the word “substantially. The sentence would then read: “(A) Unused Openings. Unused openings, other than those intended for the operation of equipment, those intended for mounting purposes, or those permitted as part of the design for listed equipment, shall be closed to afford protection ~~substantially~~ equivalent to the wall of the equipment <u>or closed by identified means</u>.” This change would have better clarified the intent of the section and eliminated a subjective word.

1-141 Log #3759 NEC-P01 **Final Action: Accept**
(110.12(A))

Submitter: Jebediah J. Novak, Cedar Rapids Electrical JATC / Rep. Int’l Brotherhood of Electrical Workers
Recommendation: Delete the last sentence to this section:
110.12(A) Unused Openings. Unused openings, other than those intended for the operation of equipment, those intended for mounting purposes, or those permitted as part of the design for listed equipment, shall be closed to afford protection equivalent to the wall of the equipment. ~~Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (1/4 in.) from the outer surface of the enclosure.~~
Substantiation: This language is an outdated requirement that should be deleted from the NEC. I have found this requirement as far back as 1965 with no substantiation as to why the requirement exists.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
HICKMAN, P.: We do not believe that adequate substantiation has been submitted to justify the removal of this text.
HITTINGER, D.: This proposal should be rejected. Adequate substantiation was not provided to remove this language from the Code. My research indicates that this requirement first appeared in the 1940 edition of the NEC as a safety issue. A metal plug or plate cannot bond to the non-metallic enclosure and may inadvertently become energized by internal wiring creating a shock hazard. The submitter’s statement that “this language is an outdated requirement with no substantiation as to why the requirement exists” is not justification to remove the requirement.
LABRAKE, JR., N.: Proposal 1-141 should have been <u>rejected</u>. The Submitter’s statement that he was unable to find substantiation for the requirement “as far back as 1965” does not constitute sufficient substantiation for the removal of the requirement. We suggest that a Fact Finding Report be performed to research this requirement. It is also noted that the substantiation for Proposal 9-33 from the A98 NEC ROP revised this requirement with the substantiation that “the rule is to help reduce ‘touch potential’ due to energized conductors contacting the surface plug or cover.”

1-142 Log #4577 NEC-P01 **Final Action: Reject**
(110.12(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the words “or drainage” after “those intended for mounting purposes”.
Substantiation: The list of acceptable openings contains a glaring omission: weep holes, such as those drilled in the heel of an LB to accomplish compliance with the “arranged to drain” mandate in 230.53, as well as numerous other applications. This is particularly urgent where provided in the field and therefore not “part of the design for listed equipment.
Panel Meeting Action: Reject
Panel Statement: This proposal is too restrictive for a wiring method that is covered in only 230.53 to be broadly applied for all electrical installations.
Drainage is typically part of the design of equipment, and are, therefore, covered by 110.12(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-143 Log #4816 NEC-P01 **Final Action: Reject**
(110.12(B))

Submitter: George Ferguson, Technical Education & Safety Institute
Recommendation: Add text to read as follows:
Any person or agent causing a violation of this section shall be responsible for the correction.
FPN: Also see 110.3(B).
Substantiation: Frequently, when an electrical contractor works on a project, violation of 110.12(B) has occurred. The electrical contractor is then expected to absorb the cost of making the correction without compensation.
Panel Meeting Action: Reject
Panel Statement: The NEC is an installation code and does not address contractual or financial issues, or who is responsible for the work.
The panel refers the submitter to the purpose of the NEC as stated in 90.1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ANTHONY, M.: All living documents must visit and revisit their scope in order to retain the status as a consensus document. This is a proposal that challenges our conception of the NEC and, as such, poses particular problems (as we have seen in the scope conflict between the NEC and NESC in Article 90).

Some version of this proposal might find a place in the Administrative Annex in the ROC stage and the submitter is encouraged to try again.

1-144 Log #316 NEC-P01 **Final Action: Reject**
(110.12(C) (New))

Submitter: Sean Staggs, George's Millwright Inc.
Recommendation: Add text to read as follows:
Fasteners for covers and electrical equipment that can only be accessible by people of the electrical trade.
Substantiation: To help prevent unqualified people from gaining access to equipment.
Panel Meeting Action: Reject
Panel Statement: The proposal is unclear as to what specific uses or requirements are being proposed for fasteners and the recommendation is not substantiated. In addition, the proposal is not written in accordance with 3.3.1.2 of the NEC Style Manual.
The NEC is an electrical installation standard and contains no authority within itself. It is the responsibility of the designated authority that adopts the NEC to determine who performs the installation. The NEC itself cannot usurp the authority of these jurisdictions to determine the enforcement and/or administration of the Code.
It is impractical to limit such access.
The proposal would prohibit other than electrical trade people from having access to the equipment, such as a homeowner's panelboard. In addition, the section is addressing mechanical execution of work.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-145 Log #694 NEC-P01 **Final Action: Reject**
(110.12(C) (New))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, *Standard Practices for Good Workmanship in Electrical Contracting*, and other ANSI-approved installation standards.
(A) Unused Openings. *[unchanged by this Proposal]*
(B) Integrity of Electrical Equipment and Connections. *[unchanged by this Proposal]*
(C) Knockouts. Unless prohibited elsewhere in this *Code*, knockouts fabricated in a portion of the wall of an enclosure to provide a hole for the attachment of raceway, a fitting, a cable or an auxiliary device shall resist removal by unaided hand pressure but shall permit removal with tools such as a hammer, screwdriver and pliers at the time of installation. Knockouts for field assembly of standard-size conduits, tubing, and fittings shall be in accordance with Table 110.12(C), exclusive of any residual projections of breakout tabs into the removed knockout hole. Concentric and eccentric knockouts within a simple knockout shall not be larger than metric designator 27 (trade size 1).
Exception: Field-fabricated knockouts shall be permitted to be oversized (larger than the maximum factory-fabricated knockout diameters of Table 110.12(C)). Metallic conduit, metallic tubing or fittings assembled to oversized knockouts in metallic enclosures and boxes shall be bonded in accordance with 250.92(B)(4).
FPN: See 250.97 Exception, 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C).

See Table 110.12(C) on Page 78

Substantiation: Correlation issue. Requirements in existing 250.97 *Exception* and requirements added to the 2008 *NEC*® in 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C) are predicated upon whether or not the field-fabricated knockout opening is oversized or not. (Factory-fabricated knockouts in Listed products are enforced by product standards. Factory-fabricated knockout diameters of unlisted products are enforced only by the manufacturer's quality practices and by the AHJ with defined requirements, provided with this Proposal.) "Oversized knockouts", however, are not defined either dimensionally or descriptively, nor are they defined comparatively to standard, NON-oversized knockouts, which are also undefined dimensionally either directly in the *NEC*® or indirectly by reference to other standards. AHJs and installers are provided no guidance in how to differentiate "oversized knockouts" from knockouts that are not and therefore no guidance as to where the requirements of 250.97 *Exception*, requirements 342.30(C), 344.30(C), 352.30(C), 355.30(C), and 358.30(C) apply to nonconcentric and noneccentric knockouts.
The values for minimum and maximum knockout diameters appear in a number of US, Canadian, and Mexican standards for Metric Designator 16 through 155 (Trade Size 1/2 through 6) and were directly extracted from the trinational standard *Enclosures for Electrical Equipment, Non-Environmental Considerations, NMX-J-023/1-ANCE-2007* 1, *CSA C22.2 No. 94.1-07* 2, *ANSI/UL50-2007* 3, Table D.1.

[1] Asociación de Normalización y Certificación (Association of Standardization and Certification),
[2] Canadian Standards Association
[3] Underwriters Laboratories Inc.

Both the maximum and minimum knockout diameter values are needed to define when knockout diameters are "oversized". An "oversized" knockout sufficiently larger than one Metric Designator/Trade Size's maximum might encroach upon the next size's minimum diameter.
The nominal value for the knockout diameter for Metric Designator 12 (Trade Size 3/8) was directly extracted from standard *Canadian Electrical Code, Part II, General Requirements, CAN/CSA C22.2 No. 0-M91(R2006)* 4, Table 1. The same tolerance as applied to the tabulated nominal knockout diameters in the above reference to arrive at the minimum (-1/64 inch in the lower range) and maximum (+1/32 inch in the lower range) knockout diameters to calculate the for minimum and maximum knockout diameters Metric Designator 12 (Trade Size 3/8). [NOTE: Underwriters Laboratories, CSA International, and other certifiers have long Listed conduit and fittings in this size. This size of conduit and fitting will become more significant with the addition to *NEC*® Tables 310.16 and 310.17 of conductors of 18 AWG and 16 AWG for Article 409 applications and other uses.]
[4] Canadian Standards Association
The minimum values for the diameter of flat area surrounding knockouts for Metric Designator 12 through 155 (Trade Size 3/8 through 6) were also directly extracted from standard *Canadian Electrical Code, Part II, General Requirements, CAN/CSA C22.2 No. 0-M91(R2006)* 4, Table 1. This flat area allows field assembly of the locknut or bushing, inclusive of tool access. For the Code Panel's reference in consideration of these minimum diameters for flat areas for seating of locknuts and bushings, the maximum diameters for locknuts and bushings themselves for Metric Designator 12 through 155 (Trade Size 3/8 through 6) can be found in either trinational standard *Conduit, Tubing, and Cable Fittings, NMX-J-017-ANCE-2004* 5, *CSA C22.2 No. 18.3-04* 6, *ANSI/UL514B-2004* 7, Table 1, or in standard *Fittings, Cast Metal Boxes, and Conduit bodies for Conduit, Electrical Metallic Tubing, and Cable, ANSI/NEMA FB1-2003* 8, Figure 3-4.
[5] Asociación de Normalización y Certificación (Association of Standardization and Certification),
[6] Canadian Standards Association
[7] Underwriters Laboratories Inc.
[8] National Electrical Manufacturers Association

See Table 1 on Page 78

Underwriters Laboratories has previously evaluated concentric and eccentric knockouts (within a larger simple knockout) for the integrity of bonding. Based on that evaluation, concentric and eccentric knockouts are limited in size to Metric Designators less than 35 (Trade Size less than 1-1/4) in UL standard *Metallic Outlet Boxes, UL514A*. Concentric and eccentric knockouts for enclosed distribution equipment Listed by Underwriters Laboratories have that same limitation. The UL testing at those concentric and eccentric knockout sizes also evaluates the resulting surface surrounding the knockout for application of an ordinary (non-bonding type) conduit fitting when the smallest and intermediate size knockouts are removed.
Panel Meeting Action: Reject
Panel Statement: The information being proposed is a product standard concern.
The proposed requirements are unenforceable. To enforce the proposed requirements in Article 110 would require the use of tools to remove unused knockouts from installed equipment, inconsistent enforcement based on individual "hand pressure", and measurement of the dimensions of unused knockouts.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-146 Log #4566 NEC-P01 **Final Action: Reject**
(110.12(C) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Add the following new text:
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
(A) Unused Openings. Unused openings, other than those intended for the operation of equipment, those intended for mounting purposes, or those permitted as part of the design for listed equipment, shall be closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (¼ in.) from the outer surface of the enclosure.
(B) Integrity of Electrical Equipment and Connections. Internal parts of electrical equipment, including busbars, wiring terminals, insulators, and other surfaces, shall not be damaged or contaminated by foreign materials such as paint, plaster, cleaners, abrasives, or corrosive residues. There shall be no damaged parts that may adversely affect safe operation or mechanical strength

Table 110.12(C) Knockout Dimensions

Conduit, Tubing, or Fitting		Knockout Diameter				Diameter of Flat Surface Surrounding Knockouts for Field Assembly of Conduit, Tubing, and Fittings	
		Minimum		Maximum		Minimum	
Metric Designator	Trade Size	mm	in.	mm	in.	mm	in.

of the equipment such as parts that are broken; bent; cut; or deteriorated by corrosion, chemical action, or overheating.
(C) Removal. Removal of abandoned cables and electrical equipment shall also be performed in a neat and workmanlike manner.
Substantiation: This proposal recommends added wording to ensure that abandoned cables and electrical equipment are removed appropriately. The section only addresses installation but many sections in the code require removal of cables and equipment and this change is made to point out that similar care must be taken when removing cables. This is an alternate approach to this new recommendation, which retains the wording of the covering section.
Removal of cables or equipment is required in various sections, including 372.13, 374.7, 390.7, 590.3, 640.6, 645.5, 725.25, 760.3, 760.25, 770.25, 800.25, 820.25, 830.25.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-139.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: See comment on 1-139.

1-147 Log #2713 NEC-P01 **Final Action: Reject**
(110.13)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Electrical equipment shall be firmly secured and supported ~~to the surface on which it is mounted~~ except as otherwise required or permitted in this Code. (remainder unchanged)
Substantiation: Edit. Proposal provides for equipment not surface-mounted, such as suspended luminaries, suspended control stations, suspended busway and cable tray, fished cables and raceways, etc. Equipment should be firmly supported in addition to being firmly attached, which is not necessarily the same.
Panel Meeting Action: Reject
Panel Statement: Securement may be direct or indirect. The proposed change does not improve clarity.
This panel does not agree that the proposal is editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-148 Log #4578 NEC-P01 **Final Action: Accept in Principle**
(110.14)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following text at the end, prior to (A):
"Connectors and terminals for conductors more finely stranded than Class B for aluminum and Class C concentric for copper shall be listed for the specific stranding employed."
Substantiation: This is a companion proposal to one submitted to delete 690.31(F). This issue is far from unique to solar photovoltaic systems, and should reside in Chapter One. The proposed text tracks the UL Guide Card information at "Wire Connectors and Soldering Lugs (ZMVV)." The proposed location, as part of the parent text, reflects the fact that the issue applies to both (A) on terminals and (B) on splices.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 1-149.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MONIZ, G.: See NEMA's statement on Proposal 1-149.

1-149 Log #1739 NEC-P01 **Final Action: Accept in Principle**
(110.14(A))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 4 for information.
Submitter: Robert A. McCullough, Ocean County Construction Insp. Dept.,
Recommendation: Add new last paragraph as follows: Terminals used for flexible, fine-stranded conductors and cables shall be listed and marked for such use.
Substantiation: Provisions for terminating fine-stranded cables were added to Article 690 in the 2008 cycle. There are fine-stranded conductors that are now listed as 310.13 conductors. Fine-stranded conductors are used in applications other than PV, i.e., battery rooms and dock wiring, thus provisions for properly terminating these conductors should be added to the general provisions of the Code.
Panel Meeting Action: Accept in Principle
In the recommended text, change the words "listed and marked" to the word "identified".
Panel Statement: The panel agrees that fine-stranded cable must be connected using proper terminals,\; however, the panel concludes that the submitter has not substantiated the need for terminals that are listed for the purpose.
Review of the Article 100 definitions of "identified" and "listed" makes it clear that identified is the correct term in this section.
The panel does not necessarily agree with all of the submitter's substantiation.
The panel requests that the Technical Correlating Committee refer this proposal to Code-Making Panel 4 for information.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MONIZ, G.: A further definition of what is meant by "fine stranded" must be made for the proposal to be viable.

1-150 Log #3641 NEC-P01 **Final Action: Reject**
(110.14(A))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
110.14(A) Terminals. Connection of conductors to terminal parts shall ensure a thoroughly good connection without damaging the conductors and shall be made by means of pressure connectors (including set-screw type), solder lugs, or splices to flexible leads. Connection by means of wire-binding screws or studs and nuts that have upturned lugs or the equivalent shall not be permitted for conductors larger than 10 AWG. ~~or smaller conductors.~~
Substantiation: There is no reasonable reading of the words "shall be permitted" that can lead the code user to the conclusion that these words actually prohibit the use of these types of connections for conductors larger than #10. The act of specifically permitting something in no way prohibits something else. Section 3.1.2 in the NEC Style Manual says that the words "shall be permitted" are to be used to permit an alternate installation method. The words "shall not" are required to be used to prohibit an installation method per 3.1.1 of the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The general requirement is contained in the first sentence: pressure connectors, solder lugs or splices to flexible leads. The language in the existing second sentence is clear that 10 AWG or smaller is the only exception to the general requirement. Wire-binding screws or studs and nuts with upturned lugs shall be permitted for 10 AWG or smaller conductors.
The existing language is both clear and correct.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-151 Log #2864 NEC-P01 **Final Action: Accept in Principle**
(110.14(A))

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
110.14 Electrical Connections.
Because of different characteristics of dissimilar metals, devices such as pressure terminal or pressure splicing connectors and soldering lugs shall be identified for the material of the conductor and shall be properly installed and used. Conductors of dissimilar metals shall not be intermixed in a terminal or splicing connector where physical contact occurs between dissimilar conductors (such as copper and aluminum, copper and copper-clad aluminum, or aluminum and copper-clad aluminum), unless the device is identified for the purpose and conditions of use. Materials such as solder, fluxes, inhibitors, and compounds, where employed, shall be suitable for the use and shall be of a type that will not adversely affect the conductors, installation, or equipment.
FPN: Many terminations and equipment are marked with a tightening torque.
(A) Terminals. Connection of conductors to terminal parts shall ensure a thoroughly good connection without damaging the conductors and shall be made by means of pressure connectors (including set-screw type), solder lugs, or splices to flexible leads. Connection by means of wire-binding screws or studs and nuts that have upturned lugs or the equivalent shall be permitted for 10 AWG or smaller conductors.
(1) **Flexible, Fine-Stranded Cables**. Flexible, fine-stranded cables shall be terminated only with terminals, lugs, devices, or connectors that are identified and listed for such use.
Substantiation: This was a new item that was added in article 690.31 (F) in the 2008 NEC. The issue is that fine-stranded conductors and jacketed cables are being installed for other installation types where a wide range of flexibility is desired. With the expanded use of fine-stranded cables and conductors being used for welders, cranes, elevators, battery bank connections, computer data cables, UPS cables and many other installations, this requirements needs to be relocated to requirements for electrical installations. As this rule is applied currently within the NEC, only specific applications can require terminations to use devices and equipment rated for these conductor types. This relocated requirement will provide a procedure for identified lugs and terminations providing a safer installation without possible hot spots or cable overheating due to bad or loose lug connections when terminated with acceptable identified crimping tools.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 1-149.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:
MONIZ, G.: See NEMA's statement on Proposal 1-149.

1-152 Log #2217 NEC-P01 **Final Action: Reject**
(110.14(C))

Submitter: Paul Guidry, Fluor Enterprises, Inc
Recommendation: Add new text for Over 600 Volt terminations.
110.14(C)(3) Over 600 Volts up to 35,000 Volts. Unless equipment is listed and marked otherwise, conductor ampacities used in determining equipment termination provisions shall be based on Table 310.81, 90°C, (One circuit, three conductors). Insulated connectors shall not be used.
FPN: Uninsulated wire connectors are rated for general use in circuits up through 2000 V. Uninsulated wire connectors may be used in circuits over 2000 V up through 35,000 V where the effects of corona have been investigated in the end-use application. Uninsulated wire connectors are not marked with a voltage rating.
Substantiation: There are no provisions for temperature ratings as of the 2008 NEC for medium voltage connectors as exists for 600V connectors. Some engineers try to use the 105°C ampacity of medium voltage cables, yet the terminals are only rated 90°C, which brings up the next point. There isn't a reference to which Table ampacity should be used to determine the connector ampacity. I've selected Table 310.88 since this is the highest rated table ampacity and the connectors should be rated for this, otherwise this table cannot be used. I would like to suggest that the panel consult with the testing laboratory representative or appoint a task group on the panel to confirm that this ampacity is acceptable before accepting this proposal.
The information in the proposed FPN is from the 2008 UL White Book, WIRE CONNECTORS AND SOLDERING LUGS (ZMVV), under Voltage Rating.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are already addressed in 110.40 covered by Part III for over 600 volt installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-153 Log #1611 NEC-P01 **Final Action: Reject**
(110.14(C)(1))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "Table 310.16" to "Table 310.15(B)(1)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: Code-Making Panel 1 understands that Code-Making Panel 6 has purview over Article 310.
The panel requests that the Technical Correlating Committee forward this proposal to Code-Making Panel 6 for comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-154 Log #4793 NEC-P01 **Final Action: Reject**
(110.14(C)(1)(a))

Submitter: David Drennan, Thyssen Krupp Krause, Inc.
Recommendation: Revise 110.14(C)(1)(a) to read:
(a) Termination provisions of equipment for circuits rated 100 amperes or less, or marked for ~~14~~ 18 AWG through 1 AWG conductors, shall be used only for one of the following:
The remainder of 110.14 remains the same.
Substantiation: There are 39 references to the use of 18 AWG conductors and 29 references to the use of 16 AWG conductors in the NEC, but there is a lack of direction in 110.14(C)(1)(a) as to the proper application of these smaller conductors. This proposed change rectifies this problem and provides the user with the needed direction.
Panel Meeting Action: Reject
Panel Statement: Except as permitted elsewhere in the NEC, the minimum size conductor for installation is 14 AWG copper (see Table 310.5), and the equipment termination provisions noted in 110.14(C)(1)(a) address the minimum size. In addition, Table 310.16 does not provide an allowable ampacity or temperature rating (termination ampacity) for 60°C (140°F) or 75°C (167°F) 18 and 16 AWG conductors.
Therefore, the proposed change is unnecessary. See 240.4(D) as this section restricts the overcurrent protection for small conductors without regard to equipment termination provisions. Generally, where 18 and 16 AWG conductors are allowed in the NEC, temperature rating and equipment termination provisions are not a concern.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-155 Log #608 NEC-P01 **Final Action: Reject**
(110.14(C)(1)(b)(3))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text to read as follows:
Conductors extended between devices that have terminals rated at different temperatures shall have an ampacity based on the lowest temperature rated terminal.
Substantiation: Devices with different temperature rated terminals are a distinct possibility and conductor ampacity would be affected by making connections to these terminals.
Panel Meeting Action: Reject
Panel Statement: The proposed requirement is currently addressed in 110.14(C) that reads as follows:
"The temperature rating associated with the ampacity of a conductor shall be selected and coordinated so as not to exceed the lowest temperature rating of any connected termination, conductor, or device."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: The submitter's language is clearer and more direct than the existing NEC language. We encourage the submitter to revise and re-submit. Some sentences of the NEC have been group-edited so much over the years that a silver bullet like this is welcome.

1-156 Log #766 NEC-P01 **Final Action: Reject**
(110.15)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
110.15 High-Leg Marking. On a 4-wire, delta-connected system where the midpoint of one phase winding is grounded, only the conductor or busbar having the higher phase voltage to ground shall be durably and permanently marked by an outer finish that is both orange and red in color or by other effective means. Such identification shall be placed at each point on the system where a connection is made if the grounded conductor is also present.
Substantiation: Both red and orange are commonly used and have been used to identify this conductor. It is easy to apply both orange and red tape to a larger wire as well as use an orange wire with a red tracer, or a red wire with an orange tracer on it. This change will allow easy adaptation to any existing projects being remodeled as well as result in conductors that are unique to this particular application.
Panel Meeting Action: Reject
Panel Statement: The color orange is specified for delta-connected 3-phase, 4-wire, high-leg systems. Only the conductor or busbar with the higher voltage to ground is required to be marked by an outer finish that is orange in color.
The color red is not a required marking for ungrounded conductors. See 210.5(C) and 215.12(C) for ungrounded conductor identification requirements.
In addition, the submitter did not provide sufficient substantiation as required by 4.3.3.(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-157 Log #586 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Joe Tedesco, Boston, MA
Recommendation: Delete the following words: "that are in other than dwelling occupancies," so that the text in the 2011 NEC will read as follows:
110.16 Flash Protection. Electrical equipment, such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.
Substantiation: I live in a nine story building that is supplied by a 1000 amp, 208Y/120 volt, 3 phase 4 wire service, that includes electrical switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that often require examination, adjustment, servicing, or maintenance while energized.
Each dwelling unit is supplied by a 125 amp feeder, and has a panelboard installed in a **clothes closet.**
The building was built before the code added the rule in 240.24(D).
Adding a field marking to warn qualified persons of potential electric arc flash hazards where it will be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment **will enhance safety.**
See this video and audio of the equipment room in my building:
http://www.youtube.com/watch?v=HKjAmaH6xxk#
http://www.youtube.com/user/electsafeman

Panel Meeting Action: Reject
Panel Statement: Deleting the dwelling occupancies exemption, as proposed, has not been substantiated.
See the panel action on Proposal 1-162.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HICKMAN, P.: We agree with the recommendation but do not believe that adequate substantiation has been submitted.

1-158 Log #776 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
110.16 Flash Protection. Power production, service, and distribution equipment ~~Electrical equipment such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers,~~ that are in other than dwelling occupancies, and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electrical arc flash hazards.
Substantiation: If we define these items in Article 100, we do not have to have this list here. (Please see my proposed new definitions for "power production equipment" and "distribution equipment".
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation for the proposed change, as required by 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-159 Log #777 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
110.16 Flash Protection. Electrical equipment such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers~~, that are in other than dwelling occupancies, and~~ that are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn ~~qualified persons~~ everyone of potential electrical arc flash hazards.
Substantiation: Where the equipment is located does not diminish the power contained inside of that equipment. It is especially true that in dwelling units, unqualified people might consider doing the work themselves in an attempt to save some money. It is more important to warn unqualified people about the dangers than qualified people. Clearly, the general public is probably less aware of the dangers involved and should be warned.
Panel Meeting Action: Reject
Panel Statement: The field marking requirement is for qualified persons working where exposed to electrical hazards.
See the definition of "Qualified Persons" in Article 100 and the panel action on Proposal 1-157.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HITTINGER, D.: I would support an accept in part. Accept only the deletion of "qualified persons" and insert the word "everyone" so the label warns everyone of a potential hazard. The hazard exists whether the person is qualified or not therefore, the warning would benefit anyone that reads the label. Reject the remainder of the proposed changes.
Comment on Affirmative:
HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted.

1-160 Log #778 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
110.16 Flash Protection. Electrical equipment such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling occupancies, and are likely to require examination, adjustment, servicing, or maintenance ~~while energized~~ shall be field marked to warn qualified persons of potential electric arc flash hazards.
Substantiation: We need to update this to our current understanding of NFPA 70E. Hopefully, people will find very few things that they must do while the equipment is energized. This warning should always be in place even if it is company policy to never work on equipment that is energized.
Panel Meeting Action: Reject
Panel Statement: Removing the words "while energized" would expand the requirement to de-energized equipment without sufficient substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted.

1-161 Log #779 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
1**10.16 Flash Protection.** Power production, service, and distribution equipment ~~Electrical equipment such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling occupancies, and~~ that are likely to require examination, adjustment, servicing, or maintenance ~~while energized~~ shall be field marked to warn ~~qualified persons~~ everyone of potential electrical arc flash hazards.
Substantiation: By adopting all three of the changes that I have submitted for 110.16, we will end up with a very simple, effective statement that clearly warns everyone everywhere that you must be dressed in personal protective equipment around these types of equipment. In the related document, 70E, you have a requirement of having at least a long sleeve cotton shirt on just to turn a breaker off or on even though everything is still closed up.
Panel Meeting Action: Reject
Panel Statement: See the panel statements on Proposals 1-64, 1-158, 1-159, and 1-160.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HITTINGER, D.: I would support an accept in part related to "while energized" and "qualified person" and inserting the word "everyone." Reject the remainder of the proposal.
Comment on Affirmative:
HICKMAN, P.: We would support an accept in part related to "while energized" and "qualified person."

1-162 Log #1591 NEC-P01 **Final Action: Accept**
(110.16)

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Change the words (~~dwelling occupancies~~) to the words (dwelling units).
Substantiation: A dwelling occupancy includes multifamily dwellings. A large multifamily dwelling could have the same or bigger electric service as a commercial office building. The equipment in the office building would require Arc Flash warning labels, while the equipment in the multifamily dwelling would not be required to have the Arc Flash warning labels to be installed. The lack of this additional reminder and warning label, could lead to a catastrophe for the electrical worker in the multifamily dwelling, while the electrician in the office building has the benefit of seeing the warning sign and being reminded of the danger before they work on any equipment. This glaring gap in safety was very evident yesterday when I needed to work on the switchboard of a 480 volt 3 phase 1000KVA 5.89% impedance transformer fed multifamily dwelling! Not one Arc Flash warning label was to be found in this 2 year old building. None were required. That is simply NOT safe enough for this massive amount of energy.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-163 Log #2236 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Revise text to read as follows:
Electrical equipment such as switchboards, panelboards, industrial control panels, meter socket enclosures, motor control centers and multi-meter enclosures at multifamily dwellings.
Substantiation: Including multi-meter enclosures at multi -family dwellings, makes sense, many multi-family dwellings are supplied by services that are 600 amps and more and definitely have potential arc flash hazard and should require the same field applied warning.
Panel Meeting Action: Reject
Panel Statement: The proposal is redundant. 110.16 currently includes meter socket enclosures, without distinguishing between one socket and many.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-164 Log #2878 NEC-P01 **Final Action: Accept in Principle**
(110.16)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal.
This action will be considered by the panel as a public comment.
Submitter: William Gross, Electric Service of Clinton
Recommendation: Revise text to read as follows:
Electrical equipment, such as switchboards, panelboards, industrial control panels, meter sockets enclosures and motor control centers, that are in other than single family dwelling occupancies, and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of the potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment servicing, or maintenance of the equipment.
Substantiation: Large multifamily dwelling buildings have service equipment large enough to warrant field marking this equipment with arc flash warning. The addition of the term "single family" will result in the marking of large multifamily dwelling services and recognition of the potential arc flash hazard of these services and equipment.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel does not intend that the exemption for dwelling units be limited to single family.
See the panel action on Proposal 1-162.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We support the recommendation in the proposal.

1-165 Log #2934 NEC-P01 **Final Action: Accept in Principle**
(110.16)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing text of the 2008 NEC as follows:
110.16 Flash Protection. For other than one and two-family dwellings, electrical ~~Electrical~~ equipment, such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that ~~are in other than dwelling occupancies, and~~ are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.
FPN No. 1: NFPA 70E-2004, Standard for Electrical Safety in the Workplace, provides assistance in determining severity of potential exposure, planning safe work practices, and selecting personal protective equipment.
FPN No. 2: ANSI Z535.4-1998, Product Safety Signs and Labels, provides guidelines for the design of safety signs and labels for application to products.
Substantiation: The present language can be interpreted to exclude multifamily dwellings such as apartment buildings from the marking requirements. Many of these structures are supplied by large services having substantial available short-circuit current.
This proposal also deletes the term "dwelling occupancies" which is not defined in Article 100 and thus is subject to varying interpretations. The terms "one-family dwelling," and "two-family dwelling" are defined in Article 100. The use of these defined terms in the section will result is correct application of the rule.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 1-162 that addresses the submitter's concerns.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We support the recommendation in the proposal.

1-166 Log #4790 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Jason Sisk, Lebanon, IN
Recommendation: Revise text as follows:
110.16 Flash Protection. Electrical equipment, such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling occupancies, and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked in accordance with 110.16(A) and 110.16(B). The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.
(A) Arc-Flash Hazard Warning. To warn qualified persons of potential electric arc flash hazards
(B) Overcurrent Protective Device. With the size, setting(s), type, model number, and location of the upstream overcurrent protective device
There is no change to either Fine Print Note.
Substantiation: A worker that approaches electrical equipment needs to know the particular attributes of the upstream overcurrent protective device so that he or she can determine the arc-flash energy and arc-flash boundary. Even if the worker is able to turn off the power, he or she must dress in appropriate PPE until he or she can prove there is an absence of voltage. It is impossible to use the "NFPA 70E Tables" or to calculate the arc-flash energy without knowing the attributes of the overcurrent device. This proposal provides that necessary information for the worker. This information is easily determined (and easily marked on the equipment) during the construction phase, but it is often very difficult and time-consuming to determine at a later time, especially at 2:00 AM in the morning with the plant manager standing over your shoulder, screaming that the line is "down". Finally, by additionally providing the location of the upstream overcurrent protective device, the worker is more likely to go and shut it off, especially if he or she is under pressure to get a line up and running again.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that it is important to know the particular attributes of the upstream overcurrent protective device to determine the arc-flash energy and arc-flash boundary, however; the submitter has not provided justification for expanding the marking requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We support the recommendation in the proposal.

1-167 Log #2646 NEC-P01 **Final Action: Reject**
(110.17 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: 110.XX Continuous Covering. The sheath, armor, and jackets of cables shall be continuous between boxes, other enclosures, and other terminations.
Substantiation: A similar rule is in 352.48(F); location in this article would provide for general application.
Panel Meeting Action: Reject
Panel Statement: The proposal is unsubstantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects, and the need for the proposed requirements in Article 110 has not been substantiated. The referenced rule is nonexistent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-168 Log #4826 NEC-P01 **Final Action: Reject**
(110.17)

Submitter: John Whitney, Newtown Square, PA
Recommendation: Add new section:
Identification of Cables and Conductors. Cables and conductors within enclosures intended for personnel entry shall be permanently and legibly tagged or labeled to indicate the owner, application, and the line or circuit number such as "METRO Electric Co. Circuit #123 15KV". Tags, labels and their attachments shall be durable and of materials suitable to withstand the environment in which they are installed.
Substantiation: Manholes and interconnecting duct systems are often shared by facility owners, serving utilities, and Municipal entities. Manholes may contain assortments of fiber optic and copper cables including communications, power, and data cables. Cables and conductors may be provided with physical protection such as inner duct or arc proofing. It is often difficult to determine the cable or conductor type or application through visual inspection of the jacket or insulation. To perform a hazard assessment of facilities installed within enclosures intended for personnel entry requires information regarding the facilities installed. When cables and conductors are identified with legible tags or labels, the process of determining the application and owner is much simpler than searching through outdated records stored at a remote location. On site cable identification through field applied tags and labels expedites owner notification and the hazard assessment process when quick repair is a consideration. Identifying cables and conductors at the time of installation is relatively inexpensive and simple to achieve and could hardly be considered restrictive. Cost relative to benefit analysis of applying identification to cables and conductors will prove this proposal to be one of the most cost effective methods to significantly increase the level of safety for personnel required to enter manholes and other electric enclosures intended for personnel entry. One incident of unintended interruption of service, damage to electrical facilities, or injury to personnel would immediately demonstrate how insignificant the cost or difficulty of identifying cables and conductors is when compared to costs associated with the unintended event. Certainly anyone experiencing such an event would testify that given the opportunity they would have marked the cables and conductors to prevent the incident. Although there are certainly other opportunities for cable identification in other sections of the NEC, this proposal specifically addresses a need to mitigate electrical hazard exposure to personnel working within enclosures intended for personnel entry and as such, belongs in Article 110, paragraph V.
Panel Meeting Action: Reject
Panel Statement: The submitter has not supplied sufficient technical substantiation to justify the change, and the subject matter of this proposal may be more appropriately addressed in Article 300.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: The submitter has provided sufficient substantiation in our view. (Refer to our comment on Proposal 1-49 regarding the criterion for "technical substantiation") The submitter is encouraged to submit this concept to other NEC panels or to other related NFPA documents.

Comment on Affirmative:

HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted.

1-169 Log #719 NEC-P01 **Final Action: Reject**
(110.20)

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Add text and a new Fine Print Note to read as follows:

110.20 Enclosure Types.

Enclosures (other than surrounding fences or walls) of switchboards, panelboards, industrial control panels, motor control centers, meter sockets, and motor controllers, rated not over 600 volts nominal and intended for such locations, shall be marked with an enclosure-type number as shown in Table 110.20.

Table 110.20 shall be used for selecting these enclosures for use in specific locations other than hazardous (classified) locations, except where specifically permitted elsewhere in this *Code*. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

FPN: See 500.7(C). 500.8(C)(6)(b), 502.10(B)(1)(2), 502.10(B)(4), 502.115(B), 502.120(B)(1) and (2), 502.130(B)(2), 502.135(B)(1) *Exception*, 502.135(B)(3), 502.150(B)(1), 503.10(A), 503.115, 503.120, 506.8(D), and 506.15(C)(2) and (8) for use in hazardous (classified) locations of dusttight enclosures.

Substantiation: Correlation issue. 110.20 limits Enclosure Types to "other than hazardous (classified) locations". Table 110.20 FPN associates the term "dusttight" with Enclosure Types 3, 3S, 3SX, 3X, 5, 12, 12K, and 13. In Class II, Division 2 and Class III, Divisions 1 and 2 and Zone 22 classified locations, 500.7(C). 500.8(C)(6)(b), 502.10(B)(1)(2), 502.10(B)(4), 502.115(B), 502.120(B)(1) and (2), 502.130(B)(2), 502.135(B)(1) *Exception*, 502.135(B)(3), 502.150(B)(1), 503.10(A), 503.115, 503.120, 506.8(D), and 506.15(C)(2) and (8) allow "dusttight" as a permitted protection technique.

If the Article 100 definition for "Dusttight" is identical to the 500.2 definition for "Dusttight" and the 506.2 definition for "Dusttight" (redundant definitions compliant with *NEC® Style Manual* 2.2.2.1?), then

110.20 Enclosure Types 3, 3S, 3SX, 3X, 5, 12, 12K, and 13

= Article 100/500.2/506.2 "Dusttight"

= Articles 500/502/503 protection technique for Class II, Division 2 and Class III, Divisions 1 and 2 classified locations

= Article 506 protection technique for Zone 22 classified locations.

Therefore some 110.20 Enclosure Types are NOT always precluded from use in some hazardous (classified) location applications.

Panel Meeting Action: Reject

Panel Statement: The proposal is redundant. Existing language states, "other than hazardous locations." The code sections in the proposed FPN only relate to hazardous locations.

Therefore, there are no places "where specifically permitted" except for hazardous locations.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: The panel should have accepted this proposal in principle. As the submitter has noted, not all enclosure types should be "precluded from use in some hazardous (classified) location." To clarify, the panel should have revised the sentence to read: "Table 110.20 shall be used for selecting these enclosures for use in specific locations." The remaining text is unnecessary, and no other changes to the remainder of the paragraph are needed.

1-170 Log #3817 NEC-P01 **Final Action: Reject**
(110.20)

Submitter: Thomas J. Baker, Puget Sound Electrical Training

Recommendation: Add new text to read as follows:

110.20 Enclosure Types.

Enclosures (other than surrounding fences or walls) of switchboards, panelboards, industrial control panels, motor control centers, meter sockets, and motor controllers, rated not over 600 volts nominal and intended for such locations, shall be marked with an enclosure-type number as shown in Table 110.20.

Table 110.20 shall be used for selecting these enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

FPN - IP ratings as used by the European Committee for Electro Technical Standardization (CENELEC) (NEMA IEC 60529 Degrees of Protection Provided by Enclosures - IP Code), and specify the environmental protection an enclosure provides. An IP rating is not equivalent to Enclosure-Type Number in Table 110.20. The following table converts NEMA Enclosure ratings to IEC 60529 IP Ratings.

Substantiation: The 2002 NEC added SI units in section 90.9 Units of Measurement and section 90.1(D). Relation to Other International Standards added a reference to an IEC international standard to clarify the NEC addresses international requirements on potential hazards.

IP ratings are commonly used by European manufacturers, and for domestic products intended for European markets. IP Ratings and NEMA enclosure ratings are not always the same, per information from NEMA. By adding the information the FPN, users of international products can determine if they meet NEC requirements.

Luminaire manufacturers frequently use IP ratings in product literature. A typical advertisement from a recent LD&A, (published by the Illuminating Engineering Society) is included, notice the product is shown as "IP67".

The following IP to NEMA enclosure table is from NEMA:

See Table A-1 on Page 84

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 1-251.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ANTHONY, M.: See comment on Proposal 1-251.

1-171 Log #4388 NEC-P01 **Final Action: Accept**
(110.20)

Submitter: John R. Kovacik, Underwriters Laboratories Inc.

Recommendation: Revise text as follows:

110.20 Enclosure Types.

Enclosures (other than surrounding fences or walls) of switchboards, panelboards, industrial control panels, motor control centers, meter sockets, enclosed switches, transfer switches, power outlets, circuit-breakers, adjustable-speed drive systems, pullout switches, portable power distribution equipment, termination boxes, general purpose transformers, fire pump controllers, fire pump motors, and motor controllers, rated not over 600 volts nominal and intended for such locations, shall be marked with an enclosure-type number as shown in Table 110.20.

Table 110.20 shall be used for selecting these enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

Substantiation: The enclosures of the products proposed to be added to 110.20 are required to be marked with an enclosure-type number.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-172 Log #4579 NEC-P01 **Final Action: Accept**
(110.20)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Relocate this material as 110.28 in Part II of the article.

Substantiation: This material does not apply to medium voltage applications. Its location in Part I is therefore incorrect because 110.30 specifically incorporates all coverage in Part I except as supplemented or modified by part III provisions, and no provision in Part III modifies the NEMA enclosure types. It must be located where it will only apply to installations operating at 600V and below.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BOYCE, K.: The proposal should be rejected. The present text clearly and effectively identifies the requirements as applicable to specific equipment rated not more than 600 V. The proposed relocation of these requirements - for a third time in three Code cycles - will have a negative impact on Code users.

Table A-1 Conversion of NEMA Enclosure Type Ratings to IEC 60529Enclosure Classification Designations (IP) (Cannot be Used to Convert IEC classification Designations to NEMA Type Ratings)

IP First Character	NEMA Enclosure type																		IP Second Character
	1		2		3, 3X, 3S, 3SX		3R, 3RX		4, 4X		5		6		6P		12, 12K, 13		
IPO_																			IP_O
IP1_																			IP_1
IP2_																			IP_2
IP3_																			IP_3
IP4_																			IP_4
IP5_																			IP_5
IP6_																			IP_6
																			IP_7
																			IP_8
	A	B	A	B	A	B	A	B	A	B	A	B	A	B	A	B	A	B	

A = A shaded block in the "A" column indicates that the NEMA Enclosure Type exceeds the requirements for the respective IEA 60529 IP First Character Designation. The IP First Character Designation is the protection against access to hazardous parts and solid foreign objects.
B = A shaded block in the "B" column indicates that the NEMA Enclosure Type exceeds the requirements for the respective IEC 60529 IP Second Character Designation. The IP Second Character Designation is the protection against the ingress of water.

1-173 Log #1865 NEC-P01 **Final Action: Reject**
(110.21)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: The manufacturers name, trademark, or other descriptive marking by which the ~~organization responsible for the product~~ manufacturer can be identified shall be placed on all electrical equipment. Other markings that indicate voltage, current, wattage, or other ratings shall be provided as specified elsewhere in this Code. The markings shall be ~~of sufficient durability to withstand the environment involved~~ durable.
Substantiation: Since the manufacturers name, etc. is required, the manufacturer should be the "organization". "Durable" is defined as able to exist for a long time, which inherently includes environments for which the equipment is suitable. "Sufficient" is subjective and a term to be avoided per the Style manual.
Panel Meeting Action: Reject
Panel Statement: The proposal is not in compliance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-174 Log #2678 NEC-P01 **Final Action: Reject**
(110.21)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
The marking shall be permanently affixed and durable ~~of sufficient durability to withstand the environment involved~~.
Substantiation: Edit. "Sufficient" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The proposal is not in compliance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects. In addition, the panel does not agree that the proposed change is editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: This proposal should have been accepted. As the submitter has noted, the word "sufficient" is subjective and should be avoided. The proposed text more clearly defines the intent of the section.

1-175 Log #2135 NEC-P01 **Final Action: Reject**
(110.22)

Submitter: Kenneth Dale Bristow, Stellar Technologies
Recommendation: 110.22 All conductors to terminal parts shall be identified as to indicate its disconnecting device.
Substantiation: This sentence, at the beginning of the existing text, will reduce time in circuit verification during final installation and service.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with NFPA Regulations Governing Committee Projects Section 4.3.3(d).
There is no substantiation for the proposed change.
The panel refers the submitter to 90.1(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: Marking the load end of a supply circuit is a haltingly clever; though the specifics of how wires would be labeled would have to be worked out. We disagree with panel statement regarding insufficient substantiation. This is one of several proposals this cycle that are so intuitively understandable so as to be their own substantiation.

1-176 Log #2677 NEC-P01 **Final Action: Reject**
(110.22(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
The marking shall be permanently affixed and durable ~~of sufficient durability to withstand the environment involved~~.
Substantiation: Edit. "Sufficient" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The term is not unenforceable or vague in context as provided for in 3.2.1 of the NEC Style Manual.
In addition, the proposed change is not editorial.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: This proposal should have been accepted. As the submitter has noted, the word "sufficient" is subjective and should be avoided. The proposed text more clearly defines the intent of the section.

1-177 Log #2935 NEC-P01 **Final Action: Accept in Principle in Part**
(110.22(B))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 10 for comment.
Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text to read as follows:
(B) Engineered Series Combination Systems. ~~Where~~ Equipment enclosures for circuit breakers or fuses ~~are~~ applied in compliance with series combination ratings selected under engineering supervision in accordance with 240.86(A) ~~and marked on the equipment as directed by the engineer, the equipment enclosure(s)~~ shall be legibly marked in the field as directed by the engineer to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION — ENGINEERED SERIES COMBINATION SYSTEM ~~RATED _______ AMPERES~~. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED. SEE DOCUMENTATION LOCATED ____________.

Substantiation: While the addition of this subsection for the 2008 NEC was needed, several valid questions continue to be raised that this Proposal intends to answer. First, where does the rule come from? [240.86(A)]. Second, what gets marked in the existing blank? The ampere rating of the breaker or fuse? The ampere rating of the switchboard or panelboard? The short-circuit current rating of the respective equipment? In reality, the engineer must include the make, model and operating characteristics of the overcurrent devices to be used in the engineered series-combination in the documentation for the series-combination. Any other information in the existing blank is inadequate for future maintenance, repair or replacement. The documentation referred to in this proposal is required as a condition in 240.86(A).

Other changes are intended to be editorial in nature.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed wording to read as follows:

"(B) Engineered Series Combination Systems. Equipment enclosures for circuit breakers or fuses applied in compliance with series combination ratings selected under engineering supervision in accordance with 240.86(A) shall be legibly marked in the field as directed by the engineer to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION — ENGINEERED SERIES COMBINATION SYSTEM RATED _______ AMPERES. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED."

The FPN in the existing code is to be deleted.

Panel Statement: By virtue of the meeting action, the panel has rejected the proposed revisions to the marking and Accepted the remainder of the proposed text.

In addition, the panel deleted the FPN in the existing code since the language has now been incorporated into the text.

The proposed revisions to the marking have not been substantiated.

240.86(A) contains the prescriptive requirements for documentation and marking of the rating.

The panel requests that the Technical Correlating Committee refer this proposal to Code-Making Panel 10 for comment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

(110.22(C))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 10 for comment.

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise text to read as follows:

(C) Tested Series Combination Systems. Equipment enclosures for ~~Where~~ circuit breakers or fuses ~~are~~ applied in compliance with the series combination ratings marked on the equipment by the manufacturer in accordance with 240.86(B)~~, the equipment enclosure(s)~~ shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION — SERIES COMBINATION SYSTEM RATED ____ AMPERES, OVERCURRENT DEVICE CATALOG NUMBER _______. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED.

Substantiation: While the addition of this subsection for the 2008 NEC was needed, several valid questions continue to be raised that this Proposal intends to answer. First, where does the rule come from? [240.86(B)]. Second, what gets marked in the existing blank? The ampere rating of the breaker or fuse? The ampere rating of the switchboard or panelboard? The short-circuit current rating of the respective equipment? In reality, the make and model of the overcurrent device to be operated as a series-combination along with the ampere rating should be provided. Any other information in the existing blank is inadequate for future maintenance, repair or replacement.

Other changes are intended to be editorial in nature.

Panel Meeting Action: Accept in Principle in Part

The panel revises the proposed text to read as follows:

"(C) Tested Series Combination Systems. Equipment enclosures for circuit breakers or fuses applied in compliance with the series combination ratings marked on the equipment by the manufacturer in accordance with 240.86(B) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION — SERIES COMBINATION SYSTEM RATED ____ AMPERES. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED."

In addition, delete the FPN in the existing code text.

Panel Statement: The panel has rejected the proposed revisions to the marking and accepted the remainder of the proposed text.

In addition, the panel deleted the FPN in the existing code since the language has now been incorporated into the text.

The proposed revisions to the marking have not been substantiated.

The panel requests that the Technical Correlating Committee refer this proposal to Code-Making Panel 10 for comment.

1-179 Log #1765 NEC-P01 **Final Action: Reject**

(110.23)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete "potentially".

Substantiation: Edit. It is unclear if "potentially" is related to voltage or possibility.

Panel Meeting Action: Reject

Panel Statement: Use of the term "potentially" to refer to the possibility of energization is necessary and removal is not substantiated.

3.2.5.6 of the NEC Style Manual requires the use of the word "voltage" rather than "potential".

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: The panel should have accepted this proposal. As the submitter has noted, use of the word "potentially" is unclear, a bit misleading and adds no value to the code requirement. Generally, unused current transformers, whether associated with energized or de-energized circuits should be short-circuited.

1-180 Log #2222 NEC-P01 **Final Action: Reject**

(110.24)

Submitter: Allen Forbes, L & A Electric, Inc.

Recommendation: Add new text to read as follows:

110.24 Qualified Persons. Electrical installations shall be made by qualified persons, or those persons directly supervised by qualified persons.

Substantiation: To prevent untrained persons from doing electrical installations.

Panel Meeting Action: Reject

Panel Statement: The proposal is unsubstantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects.

Qualifications of installers are outside the purview of the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-181 Log #2937 NEC-P01 **Final Action: Reject**

(110.24)

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise text to read as follows:

110.24 Locked Electrical Equipment Rooms or Enclosures. Electrical equipment rooms or enclosures housing electrical apparatus that are controlled by a lock(s) shall be considered readily accessible to persons who have a key or other means of ready access.

Delete existing 110.26(G) in the 2008 NEC.

Substantiation: CMP-1 took an important first step in clarifying an important rule when they moved the provision for accessing locked equipment or equipment rooms from the opening paragraph of 110.26 while processing the 2008 NEC.

Another logical step needs to be for this Code cycle by moving these provisions for "Locked Electrical Equipment Rooms or Enclosures" out of Section 110.26. Section 110.26 continues to apply to working spaces and dedicated equipment space and not directly to access to locked electrical equipment. For example, look at the titles and or opening phrases of the following subsections of 110.26:

(A) Working Space.

(B) Clear Spaces. Working space...".

(C) Entrance to and Egress from Working Space.

(D) Illumination. Illumination shall be provided for all working spaces...".

(E) Headroom. The minimum headroom of working spaces...".

(F) Dedicated Equipment Space.

This provision for access to locked equipment should be located in the General Part of Article 110 so it will apply to both equipment rated through 600 volts as well as to equipment rated over 600 volts. This revised rule will answer an often asked question, "Can equipment that is locked to prevent unauthorized access be considered readily accessible if authorized personnel have a key or other means of access?" The answer needs to be "Yes" since controlled access to electrical equipment and disconnecting means is necessary in many, many occupancies.

Panel Meeting Action: Reject

Panel Statement: The requirement for locked enclosures in equipment and installations over 600 Volts is addressed by 110.31. To apply this generally would diminish the present requirement in 110.31 that access is only for qualified persons.

To relocate 110.26(G) to a general requirement removes it from association with the accessibility requirements in other parts of 110.26.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: This proposal should have been accepted. As the submitter has noted, the text should be removed from 110.26(G) and placed into new 110.24. Logically, locked electrical equipment rooms or enclosures have nothing to do with spaces about electrical equipment. Had the panel accepted this proposal, it is appropriate that they visit 110.34(C) and 110.76(B) as correlation issues may exist.

1-182 Log #3792 NEC-P01 **Final Action: Accept in Principle**
(110.24 (New))

Submitter: Jacquelyn Dickerson, Sterling Heights, MI
Recommendation: Add a new 110.24.

110.24 Available Short-Circuit Current Marking. Enclosures in other than residential occupancies in which service or feeder conductors terminate shall be field marked with:
(1) The available short-circuit current and
(2) The date that the short-circuit current was determined.

Substantiation: Since determination of the available short-circuit current is already mandatory before distribution equipment can be specified or installed, it is only a minor inconvenience to require that the value be field marked on service and feeder equipment. In return for that minor inconvenience, electrical inspectors can more easily enforce 110.9 and 110.10. Future engineers and electricians will have a pretty good feel for the approximate available fault current and can begin their modification/new addition work with a good starting point. The values can of course change, so additional calculations may be necessary, depending upon how long ago the original determination was made. The proposal limits the requirements to enclosures where service and feeder conductors terminate so that individual light switches, outlets boxes, light fixtures, and similar branch circuit components have no chance of coming under this requirement.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 1-183.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

ANTHONY, M.: Acceptance of this proposal is tantamount to the requirement for incident energy calculations engraved on all equipment labels that has been rejected in the past several code cycles.

Acceptance of this proposal would mean that even smaller motor feeders and would have to be modeled on a computer. No architectural-engineering design budget can afford the cost of data gathering in alteration projects. According to this proposal, a premises wiring model would have to get down 30 ampere end-use equipment levels. Few operations and maintenance budgets in our industry can afford to gather and store and maintain this information either. Whatever money is available would be more effectively spent on training, developing shut-down practices (per NFPA 70B), and installing next generation equipment that reduces flash hazards.

Available fault current changes as source-load and branch-node configuration change over time. Available fault current is always a computed – never measured – value. To quote an electrical professional at one of APPA's member institutions:

"Why would we want to add a permanent label knowing that it can be inaccurate someday (possibly even the first day of service if the utility made a recent change to their system)? This is not a concern with other equipment nameplates and labels because they don't become dated (e.g. voltage doesn't change, bus ampacity doesn't change, the serial number doesn't change, and transformer capacity doesn't change).

The addition of the date does little to remedy the situation. Who determines how old is too old? Absent any direction, I expect engineering consultants would use that data as a starting point for their work including an arc flash analysis. A proper engineering design for additions, modifications, or analysis should always start from scratch which requires the latest available short circuit current from the utility…".

…If the proposal goes through, what short circuit current value do we post if we have multiple sources (e.g. primary selective system)? We have locations where the short circuit current is one value if supplied from one feeder, a different value if supplied from the other, and higher during a closed transition (which our design anticipates). Posting the worst case value isn't always the best solution. We've seen examples where the lower short circuit current produced the higher arc flash energy because the tripping time was longer."

If this proposal is accepted then many adopting jurisdictions will simply take exception to it. It is conceivable that this passage would be the most widely rejected passage of the 2011 NEC. The NEC will be dragged out in front of state legislators as "too costly to adopt" by interveners during state-level electrical advisory board adoption processes.

Allocating resources to gather branch and node data for circuit models – ad infinitum -- so that the mathematics of a building distribution model – not the equipment itself – can be maintained is not a wise use of scarce resources. We should heed the language of Section 90.1 that refers to the **practical** safeguarding of persons and property from hazards arising from the use of electricity. This proposal is a good idea; but it is not practical.

The panel seems to have recognized this by accepting in principle and reducing its scope. Please refer to our comments on Proposal 1-183.

FISKE, W.: See my Explanation of Negative on Proposal 1-183 (Log #3792).

MONIZ, G.: See NEMA's statement on Proposal 1-183.

1-183 Log #4783 NEC-P01 **Final Action: Accept in Principle**
(110.24)

TCC Action: The Technical Correlating Committee directs that the Chairs of Code-Making Panels 1 and 10 form a Task Group to correlate the actions taken on Proposals 10-72 and 1-183.
Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Add the following new text:

110.24 Available Fault Current.

(A) Marking. Electrical equipment such as switchboards, panelboards, industrial control panels, motor control centers, and HVAC equipment, that are in other than dwelling occupancies, shall be field marked with the available short-circuit current and the date the label was applied.

(B) Modification or Renovation to Electrical Distribution System. When modification or renovation to the electrical distribution system occurs, the available fault current shall be recalculated. Equipment interrupting ratings and short-circuit current ratings shall be verified or corrected to be adequate for the recalculated available fault.

Substantiation: Equipment is required to have an interrupting rating or short-circuit current rating equal to or greater than the available fault current. This requirement applies to all equipment, all the time. Any equipment operating with ratings less than the available fault current is in violation of the NEC and creates a potentially unsafe condition. Existing electrical distribution systems often experience change over the life of the system. As the system ages, the supply network to which it is connected is impacted by growth and is forced to increase capacity or increase efficiency by reducing transformer impedance. In some cases, optional standby systems can be added to provide back-up power to select loads. All of these changes to the electrical distribution system can result in an increase of the available fault current. This increase in available fault can exceed the ratings of the originally installed equipment (creating a violation of 110.9 and 110.10 and an unsafe condition for personnel). This proposal is an effort to bring awareness to a real problem that usually goes ignored by owners, designers, and contractors (often because they are unaware of the affect of system changes to equipment ratings).

It is important to note that OSHA requires what is being proposed here and that these requirements are for the life of the system. This proposal is consistent with what OSHA requires. The question of whether or not the above referenced requirements apply to previously installed equipment is specifically addressed in 1910.303(b) therefore, in consideration of this proposal recall that Federal law requires that the interrupting rating must always be sufficient for the current that is available at the line terminals of the equipment, regardless of when the equipment is installed.

Requirements in the 2009 Edition of NFPA 70E rely on the available fault current to be known to complete an arc flash hazard analysis per 130.3. For instance, the available fault current must be known to determine the Arc Flash Protection Boundary and required PPE in accordance with 130.3(A) and 130.3(B). The equipment must be then be marked with the incident energy or required level of PPE per 130.3(C). In addition, per 130.3, an arc flash hazard analysis is also required to be updated when major modifications or renovations take place. The analysis must be reviewed periodically and not exceed a 5 year timeline and account for changes in the electrical distribution system that could affect the original arc flash analysis.

NFPA 70E is a workplace safety document and NFPA 70 is an installation Code. There are rules in each document that should provide for consistency in achieving and maintaining minimum levels of safety for the installation and workers. The need for more effective correlation is apparent between NFPA 70E and NFPA 70 with regard to available fault current levels at equipment since it is an essential component of achieving compliance in both documents. This proposal provides additional language in Article 100 that already requires equipment to have suitable interrupting ratings (110.9) and short circuit current ratings (110.10) regardless if it is existing or newly installed equipment. The new requirement provides a clear reminder that electrical distribution system alterations or modifications should always include verification and assurances of compliance with 110.9 and 110.10, which should be happening anyway, but is in reality consistently left unaddressed, resulting in numerous unsafe conditions and improper application of existing energized electrical equipment operating on systems where the available fault current is beyond the maximum rating of the equipment. This proposal is an effort to promote consistent correlation between requirements on NFPA 70E and NFPA 70 and more importantly include requirements that address real safety issues and unsafe conditions that are often knowingly allowed to exist which contradicts the provisions in 90.1(A).

In addition to the reasons stated above, this is a common and challenging issue that Code enforcement authorities have to deal with on a regular basis. In some jurisdictions, they handle this issue through administrative provisions that address existing installations. However, this is not the norm. Including clear requirements in the NEC that reinforce the requirements of 110.9 and 110.10 are met, will assist jurisdictions in their efforts to approve such installations.
Panel Meeting Action: Accept in Principle

The panel revised the proposed wording to read as follows:

110.24 Available Fault Current

(A) Field Marking. Service equipment in other than dwelling units shall be legibly marked in the field with the available fault current. The field marking(s) shall include the installation date and be of sufficient durability to withstand the environment involved.
(B) Modifications. When modifications to the electrical installation occur, that affect the available fault current at the service, the available fault current shall be verified or recalculated as necessary to ensure the service equipment interrupting ratings are sufficient for the available fault current at the line terminals of the equipment. The required field marking(s) in (A) above shall be adjusted to reflect the new level of available fault current.

Exception: The field marking requirements in (A) and (B) shall not be required in industrial installations where conditions of maintenance and supervision ensure that only qualified persons service the equipment.

Panel Statement: The revised recommendation meets the intent of the submitter.
The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 3 Abstain: 1
Explanation of Negative:

FISKE, W.: CMP-1 should accept the addition of 110.24(A) Field Marking, to the NEC, but not 110.24(B) Modifications. Subpart (B) would create a requirement that cannot generally be fulfilled. Utilities are not required to notify customers when they make changes to the supply system that would affect available fault current at the service. The NEC Style Manual proscribes unenforceable language, and 110.24(B) would be unenforceable.

LABRAKE, JR., N.: This proposal should be rejected since the requirement covering the need for most occupancies other than dwellings is already covered by OSHA as stated by the Submitter. In addition, the need for restricting the requirements to "other than dwelling units" as proposed, has not been established. Some dwelling occupancies could have higher available fault current as noted in the Panel's discussion.

MONIZ, G.: The accepted language requires the available fault current to be marked on service equipment. However, the acceptance of this proposal creates questions and safety concerns.

Is the value marked on the service equipment the maximum utility provided value, or was a calculation performed from the actual transformer parameters? If it is the maximum utility provided value, it would be the "worst case" number applicable only for determining equipment ratings. However, the maximum utility provided value can not be used for making arc flash calculations for NFPA 70E purposes (contrary to the statement in the Substantiation). Determining arc flash energy by using a conservatively high level of short circuit current can actually equate to an incorrect lower value of arc flash energy which would then expose workers to unnecessary hazards.

Once a label is placed on the equipment with an available fault current, how does the next person know if that is for "equipment ratings only" or can that value be used for the arc flash analysis as may be found on markings now required by NFPA 70E?

The most accurate information can be obtained from a current document based on the status of the system, not based on a marking on the equipment.

NEMA also opposes this marking requirement due to concerns about its validity and accuracy. The marking as conveyed in the accepted text places workers unnecessarily at risk, and makes uniform enforcement questionable. Also see NEMA comment to 10-71.

Explanation of Abstention:

ANTHONY, M.: This proposal is a scaled-down version of the more comprehensive proposal 1-182. As such, it may be more economically feasible than earlier conceptions for flash protection guided by incident energy calculations that require short circuit impedance data.

Keep in mind that the legal artifice known as the "service point" in many campus style complexes can be at any of three different locations: the line side of a medium voltage switch, the line side of a transformer, the load side of the secondary main breaker, or at the primary meter at the high voltage the utility supply. Much depends upon the technical and financial relationship between the utility and the campus microgrid, and the technical and financial relationship between the campus microgrid and the individual buildings.

In most jurisdictions, AIC calculations must be supervised under a registered professional electrical engineer to accumulate impedance data and process it for posting on service labels. APPA electrical engineers would have to contact the local utility to obtain circuit information (source MVA; positive, negative, and zero-sequence impedances, etc.) It is not clear whether the utilities would be entitled to compensation for a step-increase in customers asking for this data. It is not hard to imagine that actions will be brought in front of public utility commissions to grant utilities the ability to adjust their tariffs or to at least back charge customers in order to pay for the additional engineering required to assist its customers to meet an NEC requirement.

Acceptance of this proposal is far less costly than Proposal 1-182. In both cases, however, we believe that scarce resources are more effectively allocated to training, shutting down circuits, and simply building safer systems.
We will enter an abstention now and wait to read public comment. We will listen for a functional middle ground.

1-184 Log #4827 NEC-P01 **Final Action: Reject**
(110.24 (New))

Submitter: John Whitney, Newtown Square, PA
Recommendation: Add new section:
<u>Where manholes, tunnels and vaults have unused ducts, all unused ducts shall be effectively closed.</u>
Substantiation: Unused openings in underground enclosures permit ingress of ground water which carries soils into the enclosure. Over time, the accumulation of soils will completely engulf the electrical facilities within the enclosure. Accumulation of soils concealing electrical cables and equipment within the space introduces additional hazards into the already hazardous environment of the space. Soils can conceal damaged cables or equipment. Clearing soils from concealed cables and equipment exposes workers to additional risk and requires extreme care not to damage the facilities. Underground enclosures by their location are expected to be subject to ground water ingress, however, the simple requirement to effectively close unused openings will limit or eliminate soils accumulation within underground enclosures resulting in safer installation and maintenance of the electrical facilities therein.
Panel Meeting Action: Reject
Panel Statement: The term "effectively" is unenforceable and vague in the proposed context, in conflict with 3.2.1 of the NEC Style Manual.

The panel reaffirms its position in Proposal 1-160 of the 2008 code cycle.

The submitter's concerns are best addressed by the design professional. Some subterranean installations may be designed to drain into the drainage system located in the manhole, and the proposed text may cause raceways that are arranged to drain into a drainage system to back up into the building, structure, or equipment at the other end.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-185 Log #4828 NEC-P01 **Final Action: Reject**
(110.25 (New))

Submitter: John Whitney, Newtown Square, PA
Recommendation: Add new section:
<u>Duct Sealing. All cables and conductors installed in ducts entering manholes, tunnels and vaults shall be effectively sealed to prevent ingress of fluids and gases.</u>
Substantiation: Underground conduit systems are commonly subject to settlement, subsidence, and undermining as well as other unintended compromises due to careless excavation and inadequate repairs. Damage to underground conduits connected to underground enclosures permits ingress of ground water which carries soils into the enclosure. Over time, the accumulation of soils will completely engulf the electrical facilities within the enclosure. Accumulation of soils concealing electrical cables and equipment within the space introduces additional hazards into the already hazardous environment of the space. Soils can conceal damaged cables or equipment and often render the equipment inoperable. Clearing soils from concealed electrical cables and equipment is a hazardous activity which exposes personnel to additional risk of injury from concealed damage to facilities and requires extreme caution not to damage the facilities while attempting to expose them for maintenance. Underground enclosures by their location are expected to be subject to ground water ingress, however, the simple requirement to effectively close occupied conduits with duct seals will limit or eliminate soils accumulation within underground enclosures resulting in safer installation and maintenance of the electrical facilities therein.
Panel Meeting Action: Reject
Panel Statement: The term "effectively" is unenforceable and vague in the proposed context, in conflict with 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-186 Log #1439 NEC-P01 **Final Action: Accept in Part**
(110.26)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: ~~Sufficient~~ <u>A</u>ccess and working space shall be provided maintained ~~about all electrical~~ <u>in accordance with 110.26(A) and (B)</u> to permit ready and safe operation, maintenance, <u>and inspection</u> of such equipment.
Substantiation: "Sufficient" is a term to be avoided per the Style Manual. Subsection (A) specifies equipment for which working space is required which does not include "all electric equipment" of the first paragraph, which literally includes raceways, cables, and other electric equipment not likely to require examination, adjustment, servicing, or maintenance, especially if underground or encased in concrete. Access and working space per 110.26 is presumed "sufficient".
Panel Meeting Action: Accept in Part

The panel accepts the removal of the word "Sufficient" and rejects the remainder of the proposed text.
Panel Statement: The panel agrees with the submitter that the word

"sufficient" is vague and unenforceable, in this context, according to the NEC Style Manual.

The panel rejects the remainder of the proposal since 110.26 is for all equipment.

The submitter has insufficient technical substantiation to add "inspection" as it is an activity already covered by operation and maintenance as stated in the present requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-187 Log #3288 NEC-P01 **Final Action: Accept in Part**
(110.26)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text as follows:

~~Sufficient~~ Access and working space shall be provided and maintained about all electrical equipment likely to require examination, adjustment, servicing, or maintenance, to permit ready and safe operation and maintenance of such equipment.

Substantiation: "All" electrical equipment includes raceways. The provisions should be limited to equipment likely to require examination, adjustment, servicing, or maintenance such as specified in (A). "Sufficient" is subjective and a term to be avoided per the Style Manual.

Panel Meeting Action: Accept in Part

The panel Accepts the removal of the word "Sufficient" and Rejects the remainder of the proposed text.

Panel Statement: The panel agrees with the submitter that the word "sufficient" is vague and unenforceable, in this context, according to the NEC Style Manual.

The panel rejects the remainder of the proposal since 110.26 is for all equipment.

The submitter has insufficient technical substantiation to add "likely to require examination, adjustment, servicing" as they are activities already covered by operation and maintenance as stated in the present requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-188 Log #3620 NEC-P01 **Final Action: Reject**
(110.26 (New))

Submitter: David A. Williams, Delta Township

Recommendation: Add new text to read as follows:

Illumination emergency power. In the event of power supply failure, an emergency system shall automatically illuminate the areas around electrical panels. The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. This requirement is for buildings that are required to have emergency egress illumination by building code.

Substantiation: The safety of the electrician has been overlooked in the past. Emergency lighting needs to be installed in the areas where electrical panels are located for egress of someone that may have been injured from an electrocution. The building code has not addressed this location and I think this is an area that needs to be addressed for the safety of electrical personnel, or others entering or trying to exit from the electrical equipment room.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 1-249.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: Emergency illumination for service switchgear--especially switchgear that controls emergency power--should be a general requirement for electrical installations; much as working/clearance/dedicated space, and panic hardware is a general requirement. Electrical people should be looking after their own in this regard; not leaving the issue to the architectural trades that dominate the code panels in the Life Safety Code. The Life Safety Code is generally broken up into 40-odd chapters dealing with occupancy type. Electrical rooms are not an occupancy type and the word "electrical room" does not even appear in NFPA 101.

One need only do a Google search on "arc flash hazard" to find several video files recording flash injuries to electricians. In one of them, the video recorded the fact that a camera was present in the room but emergency lighting was not present in the room (i.e., the recovery operations were impaired because there were no emergency lights).

See related comment on Proposal 1-249

Comment on Affirmative:

HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted.

1-189 Log #3985 NEC-P01 **Final Action: Reject**
(110.26 (New))

Submitter: Michael A. Anthony, University of Michigan Business Operations

Recommendation: Add new figure:

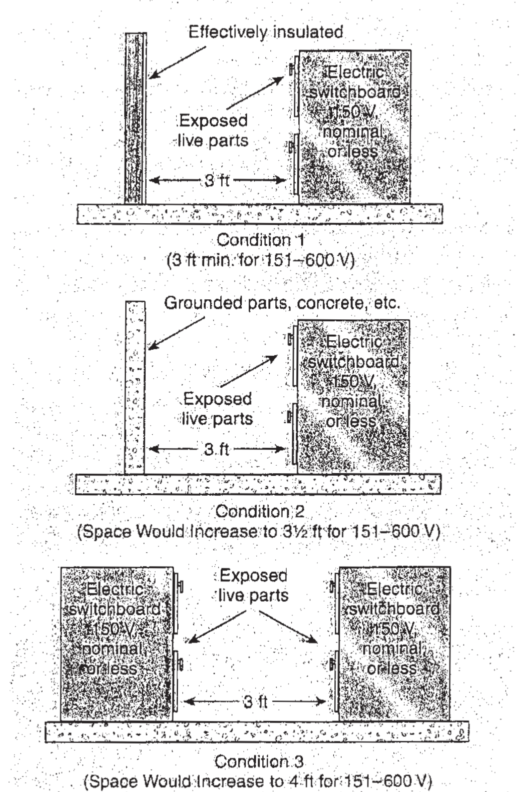

Exhibit for 110.26

Substantiation: 1. The rules regarding space around equipment is one of the most consulted and most difficult parts of the NEC. This illustration, scanned from the 2005 NEC Handbook, will help NEC users.

2. Users should not have to purchase the NEC Handbook in order to understand the NEC.

3. An illustration like this is more likely to be used than Figure 410.2 illustrating closet storage space, or Figure 515.3 illustrating Marine Terminal Handling Flammable Liquids, for example.

4. The presence of figures leavens the look and feel of the NEC and makes the requirement more understandable by electrical professions who learn more quickly from "hands-on", visual aids

Panel Meeting Action: Reject

Panel Statement: Figures may demonstrate an idea or concept to enhance wording in the Code, but there is no technical substantiation provided that any figures need to be added.

90.1(C) makes it clear that the NEC is not an instruction manual for untrained persons.

See section 2.3 of the NEC Style Manual that addresses the use of figures.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: This proposal should have been Accepted in Principle with the figures re-labeled as Fine Print Notes. The NEC contains several figures and graphics, Figure 410.8, 515.3, 517.41, 800.154. These are managed in the style manual in the following passages, re-produced here for reader convenience:

2.3.1 Mandatory. Tables and figures, including any accompanying notes, represent mandatory requirements, unless specifically noted as in 2.3.2. Tables and figures shall be referenced in the text and shall be designated by the number of the *NEC* rule in which they are referenced. Each table shall have a title and each figure shall have a caption. Titles and captions shall be as brief as possible, consistent with clarity.

2.3.2 Nonmandatory. When the *NEC* is adopted into law, graphics in the text of the document become mandatory. If a Code-Making Panel wishes to use a table or figure to illustrate only a typical situation, not a mandatory requirement, that table or figure shall be identified as a fine print note or be placed in an annex. Each table shall have a title and each figure shall have a caption.

The sheer number of proposals coming in on Article 110 workspace requirements is technical substantiation for the need for the use of graphics in one of the most difficult (and most widely used) articles of the NEC.

Substantiation: 1. The rules regarding space around equipment are one of the most consulted and most difficult parts of the NEC. This illustration, scanned from the 2005 NEC Handbook, will help NEC users.

2. Users should not have to purchase the NEC Handbook in order to understand the NEC.

3. An illustration like this is more likely to be used than Figure 410.2 illustrating closet storage space, or Figure 515.3 illustrating Marine Terminal Handling Flammable Liquids, for example.

4. The presence of figures leavens the look and feel of the NEC and makes the requirement more understandable by electrical professionals who learn more quickly from "hands-on", visual aids

5. Movement of these illustrations to the NEC will leave space in the NEC Handbook for its authors to handle other challenging material.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 1-189.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: See comment on Proposal 1-189.

1-193 Log #780 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: Robert Sogla, Coon Rapids, MN

Recommendation: Revise text to read as follows:

110.26 (A) Working Space. Working space for equipment operating at 600 volts, nominal, or less to ground and likely to require examination, adjustment, servicing, or maintenance ~~while energized~~ shall comply with the dimensions of 110.26(A)(1), (A)(2), and (A)(3) or as required or permitted elsewhere in this Code.

Substantiation: We need to update this to our current understanding of NFPA 70E. Hopefully, people will find very few things that they must do while the equipment is energized. These rules must be maintained even if it is company policy that the equipment is always de-energized before any work is performed.

Panel Meeting Action: Reject

Panel Statement: Removing the words "while energized" would expand the requirement to de-energized equipment without sufficient substantiation.

The recommendation is in violation of 4.3.3(d) of the NFPA Regulations Governing Committee Projects. The content of proposals must contain a statement of the problem and substantiation for proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted.

1-194 Log #781 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: Robert Sogla, Coon Rapids, MN

Recommendation: Revise text to read as follows:

110.26(A) Working Space. Working space for ~~equipment~~ power production, service, and distribution equipment operating at 600 volts, nominal, or less to ground and likely to require examination, adjustment, servicing, or maintenance while energized shall comply with the dimensions of 110.26(A)(1), (A)(2), and (A)(3) or as required or permitted elsewhere in this Code.

Substantiation: By accepting my proposals for new definitions in Article 100 per power production equipment and distribution equipment, we clarify that it is these types of equipment that are involved. We will have general rules for all equipment and specific rules for specific equipment.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation does not state the nature of the problem or how the proposal would relieve the problem. This contradicts 4.3.3(d) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-195 Log #2670 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Working space for electrical equipment operating at 600 volts, nominal, or less, ~~to ground,~~ except snap switches, receptacles, luminaries, motors, boxes, and the like, and likely to require examination, adjustment, servicing, or maintenance ~~while energized~~ shall comply with the dimensions of 110.26(A)(1), (A)(2) and (A)(3) or as required or permitted elsewhere in this Code.

Substantiation: Equipment is defined as including appliances, luminaires, snap switches, receptacles, motors, etc. for which this provision literally applies. I have observed many
installation s of disconnecting means for air conditioners, heat pumps, and other equipment installed above or next to such equipment without the specified work space, perhaps justified by the phrase "while energized", which since these disconnecting means can be deenergized by a feeder or service disconnecting means and deemed not to be covered by this section. The reality is that examination and servicing is done while energized, such as voltage check, fuse replacement, etc. Other sections may allow for different requirements. Voltage is already considered to be "to ground".

Panel Meeting Action: Reject

Panel Statement: The recommendation does not enhance clarity or usability.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MCMAHILL, L.: The panel should have accepted this proposal in part by accepting the addition of the word "electrical" and deletion of the words "to ground." The addition of the word "electrical" would have better clarified the intent and application of the section and the words "to ground" are unnecessary as voltage is considered to ground.

1-196 Log #3642 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise text to read as follows:

110.26(A) Working Space. Working space for equipment operating at 600 volts, nominal, or less to ground and likely to ~~require examination, adjustment, servicing, or maintenance~~ be examined, adjusted, serviced or maintained while energized shall comply with the dimensions of 110.26(A)(1), (A)(2), and (A)(3) or as required or permitted elsewhere in this Code.

Substantiation: The use of the word "required" in the existing code language makes this section very hard to enforce as there is no code rule or other rule that "requires" equipment to be worked on while energized. If the work is not required the current code rule does not require workspace. The proposed change will require the work space if the equipment is likely to be worked on while energized.

Panel Meeting Action: Reject

Panel Statement: The recommendation does not enhance clarity or usability.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-197 Log #1 NEC-P01 **Final Action: Reject**
(110.26(A)(1)(a) and 110.34.(A))

NOTE: This proposal appeared as Comment 1-77 on Proposal 1-111 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-111 was:

Delete the words "and indicated" from the last sentence, and add the following sentence at the end: "The switch or circuit breaker shall be indicating."

Submitter: Michael P. Walls, American Chemistry Council

Recommendation: Modify 110.34(A)Exception as shown below.

110.34 Work Space and Guarding.

(A) Working Space. Except as elsewhere required or permitted in this *Code*, the minimum clear working space in the direction of access to live parts of electrical equipment shall not be less than specified in Table 110.34(A). Distances shall be measured from the live parts, if such are exposed, or from

the enclosure front or opening if such are enclosed.
Exception: Working space shall not be required in back of equipment such as dead-front switchboards or control assemblies
where there are no renewable or adjustable parts (such as fuses or switches) on the back and where all connections are accessible from locations other than the back. Where rear access is required to work on non-electrical de-energized parts on the back of enclosed equipment, a minimum working space of 750 mm (30 in.) horizontally shall be provided.
Substantiation: The panel action should continue to be Reject on Proposal 1-111 because Condition 1, 2, or 3 working clearances may still be needed on de-energized equipment for tasks such as testing for the absence of voltage as noted in Mr. Barrios' ROP affirmative ballot comment. Also as noted in Mr. Barrios' ballot comment, "de-energized parts" in 110.34(A) Exception should be changed to "non-electrical parts" as shown above so that the requirements in 110.26(A)(1)(a) and 110.34(A) are consistent. Failure to modify 110.34(A) will continue the inconsistency between the low voltage and medium voltage clearance requirements behind dead front equipment for another code cycle. This action should not be considered as new material since the proposed changes in 110.34 (A) Exception appeared in the ROP.
Panel Meeting Action: Reject
Panel Statement: The proposal is unclear as to the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BARRIOS, L.: The recommendation in this proposal was incorrectly stated from NFPA. Proposal 1-197 was a HOLD on Comment 1-77 from the 2008 Code Cycle. Comment 1-77 proposed to change "de-energized" to "non-electrical" in the Exception to 110.34A in order to correct an inconsistency in the requirements for safe work clearance behind electrical equipment that presently exists between equipment operating 600V and below, and equipment operating above 600V. The panel considered the proposed change in Comment 1-77 as new material and acted to HOLD this comment for the 2011 Code cycle. Justification for change: Section 110.26(A)(1)(a), which covers equipment rated 600V nominal and less states, "Where rear access is required to work on nonelectrical parts on the back of enclosed equipment, a minimum horizontal working space of 762 mm (30 in.) shall be provided". The exception to Section 110.34A, which covers equipment rated over 600V nominal states, "Where rear access is required to work on de-energized parts on the back of enclosed equipment, a minimum working space of 762mm (30 in.) horizontally shall be provided. Changing "de-energized parts" to "nonelectrical parts" will remove the inconsistency between the two requirements.

1-198 Log #782 NEC-P01 **Final Action: Reject**
(110.26(A)(1)(C))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
(C) Existing Buildings. In existing buildings where ~~electrical equipment~~ power production, service, or distribution equipment are ~~is~~ being replaced, Condition 2 working clearance shall be permitted between dead-front switchboards, panelboards, or motor control centers located across the aisle from each other where conditions of maintenance and supervision ensure that written procedures have been adopted to prohibit equipment on both sides of the aisle from being open at the same time and qualified persons who are authorized will service the installation.
Substantiation: By accepting my proposals for new definitions in Article 100 for "power production equipment" and "distribution equipment", we clarify that it is these types of equipment that are involved. We will have general rules for all equipment and specific rules for specific equipment. These rules are not to be used simply because anything that falls into the general definition of equipment is being replaced.
Panel Meeting Action: Reject
Panel Statement: The proposal is not in compliance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-199 Log #783 NEC-P01 **Final Action: Reject**
(110.26(A)(1)(C))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
(C) Existing Buildings. In existing buildings where electrical equipment is being replaced, Condition 2 working clearance shall be permitted between ~~dead front switchboards, panelboards, or motor control centers~~ such equipment located across the aisle from each other where conditions of maintenance and supervision ensure that written procedures have been adopted to prohibit equipment on both sides of the aisle from being open at the same time and qualified persons who are authorized will service the installation.
Substantiation: By replacing "switchboards, panelboards, or mcc's" with "such equipment" we are removing this list and replacing it with a term that will, by definition if you adopt my other proposal, add items that we did not have before in this list yet none of the items added have created anything more dangerous than what we started with. (Please see my other proposals for 110.26(A)(1)(C)).
Panel Meeting Action: Reject
Panel Statement: The proposal is not in compliance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-200 Log #784 NEC-P01 **Final Action: Reject**
(110.26(A)(1)(C))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
(C) Existing Buildings. In existing buildings where ~~electrical equipment~~ power production, service, or distribution equipment are ~~is~~ being replaced, Condition 2 working clearance shall be permitted between ~~dead front switchboards, panelboards, or motor control centers,~~ such equipment located across the aisle from each other where conditions of maintenance and supervision ensure that written procedures have been adopted to prohibit equipment on both sides of the aisle from being open at the same time and qualified persons who are authorized will service the installation.
Substantiation: By accepting both of my other proposals for 110.26(A)(1)(C), we will end up with this clearly defined statement which will allow existing buildings to modify the limited space they have to accommodate these types of equipment without violating the basic intent of this section.
Panel Meeting Action: Reject
Panel Statement: The proposal is not in compliance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-201 Log #561 NEC-P01 **Final Action: Reject**
(110.26(A)(2))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text to read as follows:
(2) Width of Working Space. The width of the working space in front of the electrical equipment shall be the width of the equipment or 762 mm (30 in.) whichever is greater. ~~In all cases, the work space shall permit at least a 90 degree opening of equipment doors or hinged panels.~~
(3) Hinged Covers and Doors. Electrical equipment enclosures that include hinged covers or doors shall comply with either (a) or (b) or both as applicable.
(a) Equipment Without Environmental Enclosure(s). The work space in front of electrical equipment shall permit at least a 90 degree opening of equipment doors, enclosure doors or hinged panels.
(b) Equipment Within Environmental Enclosure(s). The work space in front of electrical equipment shall permit at least a 90 degree opening of equipment environmental enclosure doors or hinged panels. Equipment doors, enclosure doors or hinged panels inside an environmental enclosure shall be capable of opening 90 degrees without the removal or modification of the environmental enclosure.
(4) ~~(3)~~ Height of Working Space. Text unchanged...
Substantiation: The proposal intends to clarify the requirements for at least a 90 degree opening of hinged doors or hinged panels that serve as the deadfront of the equipment in addition to any hinged doors or hinged panels that are included with environmental enclosures of equipment. As an example, some equipment such as switchboards and panelboards is manufactured with Type 3R enclosures that include environmental hinged covers or doors that meet the 90 degree swing requirement, but the hinged deadfront doors or panels inside are restricted from opening 90 degrees. There are claims about inconsistencies between the NEC product standards for switchboards and panelboards about this specific issue. The proposed language clarifies what is required by the NEC for worker safety and can also serve as a basis for any necessary revision to these applicable product standards. See the photos that I have provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposal's attempt to clarify the requirement of the width of the working space in front of the electrical equipment misses the purpose of the requirement, which is to ensure that the "work space" permits at least a 90 degree opening of equipment doors or hinged panels. Section 110.26(A)(2) addresses the "working space" and not the equipment. The submitter's concern is a product standards issue and should be raised with the standards development organizations responsible for such equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: Manufacturers should be reading the debate on this proposal and should be thinking of ways to solve a common problem in this industry: how to specify the doors correctly. Here we are presented an opportunity to balance the specifics and the interconnectedness of the installation-versus-product standard conundrum.
Comment on Affirmative:
BOYCE, K.: The effort to pursue development of requirements in applicable product standards to address this issue is supported as the most effective and appropriate path.
FISKE, W.: Intertek fully supports the Panel Statement. Going beyond the

Panel Statement that questions regarding proper construction of equipment should be directed to standards-developing organizations, we note that such a sweeping requirement as a 90 degree opening of all doors and covers, regardless of where located on equipment, would extend to a very large number of doors and covers where 90 degree opening is not needed for safety, or even for convenience.

1-202 Log #785 NEC-P01 **Final Action: Reject**
(110.26(A)(2))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
(2) Width of Working Space. The width of the working space in front of the electrical equipment power production, service, and distribution equipment shall be the width of the equipment or 762 mm (30 in.), whichever is greater.
Substantiation: By accepting my proposals for new definitions in Article 100 for "power production equipment" and "distribution equipment", we clarify that it is these types of equipment that are involved. We will have general rules for all equipment and specific rules for specific equipment.
Panel Meeting Action: Reject
Panel Statement: The proposal is not in compliance with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-203 Log #3518 NEC-P01 **Final Action: Reject**
(110.26(A)(2))

Submitter: Randy Hunter, City of Las Vegas
Recommendation: Revise text to read as follows:
(2) Width of Working Space. The width of the working space in front of the electrical equipment shall be the width of the equipment or 762 mm (30 in.), whichever is greater. In all cases, equipment doors or hinged panels shall open at least 90 degrees and the work space shall permit at least a 90 degree opening of equipment doors or hinged panels.
Substantiation: After receiving the official interpretation from the UL PDE that doors don't actually have to open 90 degrees, only the UL standard and the code require the "space" to allow a door to open 90 degrees, I felt the language needed to be made clearer, and less interpretive. The changes above leave no doubt as to the requirement that we must have the doors open 90 degrees.
See the figure that I have provided which according to UL met the standard and the existing code as written.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-201.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: See comment on Proposal 1-201.
Comment on Affirmative:
BOYCE, K.: The effort to pursue development of requirements in applicable product standards to address this issue is supported as the most effective and appropriate path.
FISKE, W.: See my Comment on Affirmative on Proposal 1-201 (Log #561).

1-204 Log #623 NEC-P01 **Final Action: Reject**
(110.26(A)(3))

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Delete text as follows:
(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or ~~platform~~ to the height required by 110.26(E). Within the height requirements of this section, other equipment that is associated with the electrical installation and is located above or below the electrical equipment shall be permitted to extend not more than 150 mm (6 in.) beyond the front of the electrical equipment.
Substantiation: This requirement applies to readily accessible electrical equipment. The term platform implies that the equipment installed on the platform would not meet the readily accessible definition.
Panel Meeting Action: Reject
Panel Statement: The degree of equipment accessibility is determined by other sections of the Code. The panel disagrees that the term" platform" implies the equipment installed on a platform would not meet the readily accessible definition. The existing requirement clarifies that the height of the working space is measured from the level of the platform where the equipment is installed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-205 Log #624 NEC-P01 **Final Action: Reject**
(110.26(A)(3))

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Revise text to read as follows:
(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or a readily accessible platform to the height required by 110.26(E). Within the height requirements of this section, other equipment that is associated with the electrical installation and is located above or below the electrical equipment shall be permitted to extend not more than 150 mm (6 in.) beyond the front of the electrical equipment.
Substantiation: This requirement applies to readily accessible electrical equipment and the term platform implies that the equipment installed on platforms may require portable ladders to access the equipment which would not meet the definition of readily accessible.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-204.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-206 Log #786 NEC-P01 **Final Action: Reject**
(110.26(A)(3))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or platform to the height required by 110.26(E). Within the height requirements of this section, all ~~other~~ equipment that has removable covers and that is associated with the power production, service, or distribution equipment ~~electrical installation and is located above or below the electrical equipment~~ shall be installed so that the front of all such equipment is common and none of these types of equipment ~~permitted to~~ extends ~~not~~ more than 150 mm (6 in.) beyond the front of all other such equipment located in this area ~~the electrical equipment~~.
Substantiation: By defining the types of equipment under discussion, we eliminate the other kinds of equipment, such as fittings, that have no merit in this topic. Then, we clarify that all of the equipment that someone might need to access, cannot extend out nor be recessed, more than 6 in. from all other equipment requiring access in this area.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not enhance clarity or usability and the submitter did not provide adequate technical substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-207 Log #2381 NEC-P01 **Final Action: Accept**
(110.26(A)(3))

Submitter: David G. Humphrey, Midlothian, VA
Recommendation: Revise text to read as follows:
110.26(A)(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or platform to ~~the height required by 110.26(E)~~. a height of 2.0 m (6 1/2 ft) or the height of the equipment, whichever is greater. Within the height requirements of this section, other equipment that is associated with the electrical installation and is located above or below the electrical equipment shall be permitted to extend not more than 150 mm (6 in.) beyond the front of the electrical equipment.
Exception: In existing dwelling units, service equipment or panelboards that do not exceed 200 amperes shall be permitted in spaces where the height of the working space is less than 2.0 m (6 1/2 ft).
Substantiation: The requirements of sections 110.26(A)(3) and 110.26(E) are effectively the same. To determine the height of the working space we are directed to the height of the headroom requirement referenced in 110.26(E) illustrating the point that the 2.0 m (6 1/2 ft) height/headroom: is different than "height of working space" and this minimum "height/headroom dimension appears to be a redundant requirement. The requirements of 110.26(E) are limited to service equipment, switchboards, panelboards, or motor control centers. Separation of these specific pieces of equipment into another section, and the use of the term "headroom" in lieu of "height of working space" can lead to confusion by the user. The implication may be that "headroom" is different than "height of working space" and this minimum "height/headroom" requirement of 110.26(E) is only applicable to these specific equipment types.
110.26(E) separates the requirement for the "height of working space" and declares this space "headroom". It is difficult to imagine the service equipment, switchboard, panelboard or motor control center that would not require examination, adjustment, servicing, or maintenance while energized, thus, necessitating compliance with 110.26(A)(3) requiring a height of working space to be that of the referenced "Headroom". Accordingly, 110.26(E) is a redundant requirement of 110.26(A)(3) and with the proposed relocation of the Exception to 110.26(A)(3) and elimination of the term "headroom", the requirement for this working space is clear and this redundancy is eliminated.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-208 Log #787 NEC-P01 **Final Action: Accept**
(110.26(A)(3) Exception)

TCC Action: The Technical Correlating Committee directs that the panel reconsider the panel action to comply with the NEC Style Manual regarding the word "allowed".

This action will be considered by the panel as a public comment.

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise to read as follows:

Exception: Meters that are installed in meter sockets shall be allowed to extend beyond the other equipment. The meter socket shall be required to follow the rules of this section.

Substantiation: Meters can often have a big impact on where this plane is established. Often, they are owned by others and can be 6 in. deep all by themselves. Without this exception, a legal installation could become illegal after the meter is installed.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-209 Log #755 NEC-P01 **Final Action: Reject**
(110.26(C)(1))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:

(1) Minimum Required. At least one entrance of sufficient area shall be provided to give access to and egress from the working space about ~~electrical equipment~~ power production, service, and distribution equipment.

Substantiation: The phrase "electrical equipment" is just too broad and covers many items that are not being discussed here. We should replace it with well defined terms. See my proposed new definitions - "power production equipment" and "distribution equipment".
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-210 Log #2618 NEC-P01 **Final Action: Reject**
(110.26(C)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

At least one entrance ~~of sufficient area~~ not less than 610 mm (2 ft) and 2.0 m (6 1/2 ft) high shall be provided to give access to ~~and egress from~~ the required working space ~~about~~ for electrical equipment.

Substantiation: "Sufficient" is subjective and a term to be avoided per the Style Manual. Proposal is similar to 110.33(A). The working space should be that required for specific equipment covered by 110.26(A) not equipment such as raceways, fittings, boxes, etc., which don't require service or maintenance.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not enhance clarity or usability, the submitter did not provide adequate technical substantiation, and the term is not unenforceable or vague in context as provided for in 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-211 Log #756 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
(2) Large Equipment. For ~~equipment~~ power production, service, and distribution equipment rated 1200 amperes or more and over 1.8 m (6 ft) wide ~~that contains overcurrent devices, switching devices, or control devices,~~ there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/2 ft) high at each end of the working space.
Substantiation: By removing the rather vague term "equipment" and replacing it with well defined terms from Article 100, we no longer have to include this list to define the type of equipment under discussion. See my proposals for new definitions - "power production equipment" and "distribution equipment".
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.

The recommendation does not enhance clarity or usability.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-212 Log #2249 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector
Recommendation: Add new and delete text to read as follows:

...not less than ~~(610 mm (24 in.)~~...812 mm (32 in.)...

Substantiation: This is to be consistent with NFPA 5000 (11.2.1.2.4 Minimum Door Width), NFPA 101 (7.2.1.2.4 Minimum Door Width) and ICC 2006 (1008.1.1 Size of door). During the last code cycle, there were several proposals emphasizing space within electrical equipment and means of egress recommendations as well as access and locking suggestions. There were no proposals for widening the access to such spaces. Which is as important as maintaining the safety of the personnel accessing them by providing not only the minimum area for the spaces, but also sufficient width to get in and out of such spaces.
Panel Meeting Action: Reject
Panel Statement: In general, the area in question is accessible to qualified persons only and is not required to be a door. The dimensions noted are a minimum. In addition, if the building or life safety code requires a door opening wider than the NEC minimum, then those requirements would apply. As a note, NFPA 5000 allows the door width to be less than 32 in. (810 mm) based on certain conditions. For example, exit access doors serving a room not exceeding 70 ft^2, and not required to be accessible to persons with severe mobility impairments shall be not less than 24 in. (610 mm); door openings serving a building or portion thereof not required to be accessible to persons with severe mobility impairments shall be permitted to be 28 in. (710 mm).
Number Eligible to Vote: 12

1-213 Log #2757 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Rich Wolfe, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:

(2) Large Equipment. For equipment rated 1200 amperes or more ~~and over 1.8 m (6 ft) wide~~ that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 m (6 1/2 ft) high at each end of the working space.

Substantiation: The width and/or size of the equipment should be deleted. The potential for an arc flash and need for proper exits and panic hardware is not reduced because of narrow switchgear. In my opinion, it would be worse because electrical equipment rooms are becoming smaller and smaller. It would also be consistent with text in 110.26(C)(3) which notes 1200 ampere or greater, but does not have the 6 ft rule.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action on the Proposal 1-127 from the 2008 ROP to reinstate the 6 ft width requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MCMAHILL, L.: This proposal should have been accepted. As the submitter has noted, the width of the equipment should have no relationship to the entrance to and egress requirements from the working space. Theoretically, the hazard can be greater for a 4-foot wide 3,000 ampere switchboard as it is for an 8-foot wide 1,200 ampere switchboard. This change would also eliminate the application concern as to whether the requirement applies only to a single assembly or to multiple assemblies. In other words, does the requirement apply to six separate 2-foot wide side-by-side 1200 ampere switchboard sections? As the submitter has further noted, the proposed change would also allow for parallel structure with 110.26(C)(3).

1-214 Log #3643 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
(2) Large Equipment. For equipment rated 1200 amperes or more and ~~over 1.8 m (6 ft) wide~~ where the arc flash protection boundary exceeds the workspace in front of the equipment, that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 m (61/2 ft) high at each end of the working space.
~~A single entrance to and egress from the required working space shall be permitted where either of the conditions in 110.26(C)(2)(a) or (C)(2)(b) is met.~~
~~(a) Unobstructed Egress. Where the location permits a continuous and unobstructed way of egress travel, a single entrance to the working space shall be permitted.~~
~~(b) Extra Working Space. Where the depth of the working space is twice that required by 110.26(A)(1), a single entrance shall be permitted. It shall be located such that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.26(A)(1) for equipment operating at that voltage and in that condition.~~
Substantiation: Arc flash is a serious hazard and the installation needs to be

made in a manner that will reduce the hazard to workers. Providing a second means of egress where the arc flash boundary exceeds the available work space will help limit the exposure to the arc flash hazard.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-213. In addition, the proposal would add an unenforceable requirement in that the arc flash protection boundary is not necessarily required to be known at the time of installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-215 Log #4523 NEC-P01 **Final Action: Reject**
(110.26(C)(2)(a))

Submitter: Justin B. Biller, Roanoke County Office of Building Safety / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
A single entrance to and egress from the required working space shall be permitted where either of the conditions in 110.26(C)(2)(a) or (C)(2)(b) is met.
(a) Unobstructed Exit. Where the location permits a continuous and unobstructed ~~way of egress travel~~ aisle with a minimum clear width of 30 in. (761 mm), a single entrance to the working space shall be permitted.
Also, add the definition "Aisle" extracted from NFPA 5000 to Article 100 Definitions as follows:
Aisle. An unenclosed path of travel that forms part of the exit access and provides an open and unobstructed path of egress travel to another aisle, a corridor, a vomitory, or an exit. [NFPA 5000 3.3.2.1]
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.
Currently language in section 110.26(C)(2)(a) is vague in its description of what constitutes a clear "way of egress travel" to assist the code user in determining whether a single entrance into electrical rooms is permitted. This proposed language intends to clearly establish what provides a minimum safe exit access from potential electrical hazards. Aisle is a defined term in the NFPA 5000, *Building, Construction and Safety Code* and is proposed to be extracted for continuity between codes. This proposal adds a requirement of 30 in. for the width of the aisle when only one entrance to and egress from the required working space is allowed as an exception. Effectively, the 30 in. working space requirement must be provided all the way to the one entrance/exit of the working space for this exception.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the current text is vague and prefers the phrase "way of egress travel" because the term "aisle" is more associated with a passageway between areas of seating. The use of the term "aisle" as defined in the recommendation precludes those exits paths that lead to an open area on the perimeter of the working space within the same room. The submitter has not identified a problem and failed to provide adequate substantiation. Section 4.3.3 of the NFPA Regulations Governing Committee Projects requires each proposal to include a statement of the problem and substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-216 Log #4762 NEC-P01 **Final Action: Reject**
(110.26(C)(2)a.)

Submitter: Scott Kale, Mecklenburg County
Recommendation: Add revised text to read as follows:
Unobstructed Exit. Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted. Obstructions include door or other barriers.
Substantiation: The word "unobstructed" needs clear examples or defining. This wording is being used as a catch-all to reduce working clearances.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-217 Log #757 NEC-P01 **Final Action: Reject**
(110.26(C)(3))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
(3) Personnel Doors. Where ~~equipment~~ power production, service, or distribution equipment rated 1200 A or more ~~that contains overcurrent devices, switching devices, or control devices~~ is installed and there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
Substantiation: By removing the rather vague term "equipment" and replacing it with well defined terms from Article 100, we no longer have to include this list to define the type of equipment under discussion. See my proposals for new definitions - "power production equipment" and "distribution equipment".
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-218 Log #3556 NEC-P01 **Final Action: Reject**
(110.26(C)(3))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
110.26 (C)(3) Personnel Doors. Where equipment ~~rated 1200 A or more~~ that contains overcurrent devices, switching devices, or control devices that is likely to require examination, adjustment, servicing, or maintenance while energized is installed and there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
This requirement shall not apply to the following:
(1) Systems rated 240-volts or less where the system is supplied by a single transformer and the transformer is rated less than 125 kVA
(2) Electrical equipment inside an individual dwelling unit.
Substantiation: The requirement of second level subdivision 110.26(C)(3) exists for the sole purpose of personnel safety. In the event of an arc flash/blast, electrical installers/maintainers need to have doors that open in the direction of egress and panic hardware to escape the extreme thermal energy and other hazards that accompany an arc flash/blast.
The original requirement for "Large Equipment" in 110.26(C) did not address the need for personnel doors to open in the direction of egress, and the need for panic hardware. The original requirement was based on the need for a door at each end of the working space. The requirement specifically addressed "Large Equipment" and settled on 1200-amps as the trigger for two doors. This requirement was equipment driven. The present text of 110.26(C)(3) is people driven. It's purpose, is to allow the quickest means of egress to an installer/maintainer in the event of a fault.
The present text of 110.26(C)(3) includes a trigger of 1200 amps because it was editorially separated into a new third level subdivision in the 2008 NEC ROC stage. While the trigger of 1200 amps may be appropriate for the need for two doors, it is not substantiated with respect to personnel safety. Serious injury and fatalities have, and continue to occur in equipment rated at levels far below 1200 amps.
The need for safe electrical work practices is recognized. In accordance with NFPA 70E, energized electrical work may only occur when either the infeasibility or greater hazard threshold is met. An arc flash hazard analysis is required, as well as appropriate personal protective equipment. When all of the prudent measures are taken for energized work, the need for doors that open in the direction of egress and panic hardware still exist.
It is not practical, nor is it substantiated to deny doors that open in the direction of egress and panic hardware for equipment rated less than 1200 amps. It is "common knowledge" that serious injuries and fatalities occur from arc flash/blast in equipment rated 30 to 1000 amps. It is imperative that installer/maintainers be provided with a means a speedy egress in the event of a fault.
Exceptions are included (in positive text) for the following:
(1) Systems rated 240-volts or less where the system is supplied by a single transformer and the transformer is rated less than 125 kVA
NFPA 70E added a new exception No.1 to 130.3 that requires an arc flash analysis, to recognize that a systems rated 240-volts or less, where the system is supplied by a single transformer, and the transformer is rated less than 125 kVA, are not as prone to arc duration as other systems.
(2) Electrical equipment inside an individual dwelling unit
The phrase "electrical equipment inside of a dwelling unit" is used to exempt all panelboards etc. inside of a dwelling unit. This choice of words is necessary to include distribution equipment for example in a high rise condominium. The requirement for personnel doors would not exist inside of a condominium (the individual dwelling unit) but may exist in the electrical room on each floor.
Panel Meeting Action: Reject
Panel Statement: This proposal is too restrictive and does not enhance clarity or usability as proposed. The submitter did not provide adequate substantiation to make this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1
Explanation of Negative:
HICKMAN, P.: We are in general agreement with the recommendation.
We are voting negative on the panel action to reject this proposal. Our notes indicate that Panel 1 generally agreed with the concept in Proposal 1-218.
The submitter has correctly identified a serious safety concern. Consider two separate installations; (1) a 277/480-volt, 1200-amp feeder supplying a switchboard and (2) a 277/480-volt, 800-amp feeder supplying a switchboard. The present text would require personnel door(s) to open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure for the 1200-amp feeder but not the 800-amp feeder. The 277/480-volt, 1200-amp feeder would require ground-fault protection of equipment in accordance with 215.10 but the

277/480-volt, 800-amp feeder would not.

Panel 1 correctly asked that additional substantiation be presented in a comment in the Report on Comments to substantiate to the reduction or removal of the 1200-amp threshold. We suggest the reduction of the 1200-amp threshold below the 1000-amp threshold for ground-fault protection of equipment. The next smaller standard OCPD size below 1000-amp in 240.6 is 800-amp. We believe that this proposal should have been accepted in principle as follows:

"(3) Personnel Doors. Where equipment rated 800 A or more that contains overcurrent devices, switching devices, or control devices is installed and there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure."

Explanation of Abstention:

ANTHONY, M.: We agree with the submitter that 1200A threshold is high and the purpose of safety would be advanced with the 1200A level removed. The proposal would be improved if exceptions (1) and (2) were cast in positive language. In our view, the proposal enhances clarity and usability. Adequate substantiation – including "common knowledge" has been provided.

For the convenience of readers and extract from the NFPA Rules Governing Committee Projects has been reproduced here as a reference in the determination of what constitutes adequate substantiation:

4.3.3 Content of Proposals. Each Proposal shall be submitted to the Council Secretary and shall include the following:

(a) Identification of the submitter and his or her affiliation (i.e., TC, organization, company), where appropriate

(b) Identification of the Document, edition of the Document, and paragraph of the Document to which the Proposal is directed

(c) Proposed text of the Proposal, including the wording to be added, revised (and how revised), or deleted

(d) Statement of the problem and substantiation for Proposal

It appears that in Section 4.3.3(d) the term "substantiation" is not substantiated.

1-219 Log #3851 NEC-P01 **Final Action: Reject**
(110.26(C)(3))

Submitter: Bill McGovern, City of Plano

Recommendation: Revise text as follows:

(3) Personnel Doors. Where equipment rated 1200 A or more contains overcurrent devices, switching devices, or control devices ~~is~~ are installed and there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the doors(s) shall open in the direction of egress and equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

Substantiation: This is an editorial correction to the statement.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that the present language is correct and the proposed change is not substantiated. "Equipment" is a singular noun.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-220 Log #3865 NEC-P01 **Final Action: Reject**
(110.26(C)(3))

Submitter: Mike Weitzel, Bechtel

Recommendation: Revise text as follows:

(3) Personnel Doors. Where equipment... existing paragraph text remains as is... latched but open simple pressure.

Add new sentence.

This requirement shall not apply to doors other than the access and egress doors to and from the working space

Substantiation: There has been misunderstanding and confusion on the part of the Authority Having Jurisdiction as to how to apply this requirement. It is a good requirement, and serves the purpose of improved electrical safety for the worker. However, the requirement has been interpreted by some as requiring all doors within 25 feet of the edge of a working space to have hardware that opens under simple pressure. Such doors may not be the egress or exit door to the space, but actually the next door or set of doors to a hallway, or which may lead to a flight of stairs. Yet still located within 25 ft of the space. The door(s) in question could also be a closet door within 25 feet off the working space. Some building inspectors may interpret the requirement to apply to all doors within 25 ft and make them part of the building exit paths required in the building codes. I do not believe that this was the intent of the Code Panel.

Panel Meeting Action: Reject

Panel Statement: The present wording identifies that the requirement applies only to the personnel door(s) intended for entrance to or egress from the working space. The requirement does not necessarily apply to all other doors within 7.6 m of the working space.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: In our view, this proposal accommodates architecturally complex arrangements; room within a room situations, for example. There is enough ambiguity in the present language to merit the proposed changes, even at the risk of redundancy.

SASSAMAN, H.: This proposal provides further clarity and usability to this section.

1-221 Log #205 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Seth Jamison, Jamison Electric

Recommendation: Revise as follows:

110:26 (D) Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed indoors. Additional lighting outlets shall not be required where the work space is illuminated by an adjacent light source or as permitted by 210.70(A)(1), Exception No. 1, for switched receptacles. In electrical equipment rooms, the illumination shall not be controlled by automatic means only. Any automatic means of illumination installed in electrical equipment rooms shall be installed in such a way to allow the automatic means of illumination to be bypassed to provide personal controlled illumination in electrical equipment rooms.

Substantiation: Recently I installed a Metering device in an electrical equipment room. I had both hands inside a 300 amp main disconnect when the lights in the room went out. I automatically assumed that a power outage had occurred but the light coming from under the door from the adjacent room made me realize that wasn't the case. I made my way towards the door and the light came back on. I looked to the side of the door and realized the culprit was a wall mounted motion sensor with a large UPS blocking its field of view. I flipped the switch on the motion sensor, but all it would do was cut the lights off or, when in the on position, allow the motion sensor to control them. 110:26 (D) does not go far enough to protect the field electrician. Automatic means often include poorly positioned motion sensors. These sensors are often located on the wall with an obstructed field of view. The code should be more specific to require total area coverage when automatic means off illumination are used in electrical equipment rooms.

The statement "In electrical equipment rooms, the illumination shall not be controlled by automatic means only" is not explicit enough. Motion sensors are often installed in a manner that allows you to turn of the lights, but not override control of the motion sensor. In other words if the device is on the lights are being controlled by the motion sensor. If you turn the device off then the lights go out.

Unfortunately, value engineering and the push to lower energy consumption often leaves electricians in the dark will working in live panels. Please consider revising the code to specify that the automatic means of illumination can be overridden to provide illumination in electrical equipment rooms.

Panel Meeting Action: Reject

Panel Statement: The existing text is clear in that "the illumination shall not be controlled by automatic means only." The additional text is redundant.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-222 Log #491 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Joe Tedesco, Tedesco Electrical Code Consultants, Inc.

Recommendation: Add new text as follows:

Add: "Table 110.26(D) MINIMUM ILLUMINATION INTENSITIES IN FOOT CANDLES"

See Page 96 for Table 110.26(D)

Substantiation: Illumination is not defined. See OSHA Standard 1926.56(a).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Minimum illumination levels are addressed in the building and life safety codes. In addition, the submitter has not provided sufficient substantiation for the change in accordance with the NFPA Regulations Governing Committee Projects, Section 4.3.3(d).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

TABLE 110.26(D) MINIMUM ILLUMINATION INTENSITIES IN FOOT CANDLES

Foot-Candles	Area of Operation
5…………….	General construction area lighting.
3…………….	General construction areas, concrete placement, excavation and waste areas, access ways, active storage areas, loading platforms, refueling, and field maintenance areas.
5…………….	Indoors: warehouses, corridors, hallways, and exitways.
5…………….	Tunnels, shafts, and general underground work areas: (Exception: minimum of 10 foot-candles is required at tunnel and shaft heading during drilling, mucking, and scaling. Bureau of Mines approved cap lights shall be acceptable for use in the tunnel heading)
10…………...	General construction plant and shops (e.g., batch plants, screening plants, mechanical and electrical equipment rooms, carpenter shops, rigging lofts and active store rooms, mess halls, and indoor toilets and workrooms.)
30…………...	First aid stations, infirmaries, and offices.

1-223 Log #758 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
(D) Illumination. Illumination shall be provided for all working spaces about ~~service equipment, switchboards, panelboards, or motor control centers~~ power production, service, and distribution equipment installed indoors.
Substantiation: By using well defined terms from Article 100, we no longer have to include this list to define the type of equipment under discussion. See my proposals for new definitions - "power production equipment" and "distribution equipment".
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation for inclusion of the new text and deletion of the existing text in accordance with the NFPA Regulations Governing Committee Projects, Section 4.3.3(d).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-224 Log #791 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Joseph E. Rossi, Township of Clinton
Recommendation: Revise text to read as follows:
Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor centers with an illumination luminaire fixture that shall not be greater than 3 ft away for indoor installation.
Substantiation: This section of 110.26 is too ambiguous. Currently in a single-family dwelling, a basement can have a luminaire fixture 6 ft away with a 40 watt bulb and still meet code. As per 90.1 the purpose of the NEC is to practice safeguarding. A bulb at any distance farther than 3 ft will certainly not shine enough light.
This will ensure that personnel working on the panel will be in a safe condition.
Panel Meeting Action: Reject
Panel Statement: This requirement would be overly restrictive, and difficult to enforce. The illumination is the important aspect and not the location of the luminaire. In accordance with the NFPA Regulations Governing Committee Projects, Section 4.3.3(d), the submitter has not provided sufficient substantiation for the change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-225 Log #1440 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete: "installed indoors".
Substantiation: The Code is a safety code. Is there no potential hazard involved where 600 volt or less equipment is installed outdoors? Section 110.26 (A) requires working space for equipment for safety; illumination is also a necessary component for safety.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with Section 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted.

1-226 Log #1686 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Michael Worthington, URS Corp.
Recommendation: Add new text to read as follows:
(D) Electrical Equipment Illumination.
(1) Illumination. (Retain the existing paragraph as it is now).
(2) Emergency Lighting. Where electrical equipment is rated 1000 A. or more that contain switchboards, panelboards or industrial control panels where personnel are permitted to examine, adjust, operate or maintain. Emergency lighting shall be provided to illuminate an egress path from the working space about the electrical equipment in case of failure to the area lighting. The emergency lighting system shall meet the requirements of Articles 700.IV and 700.V.
Substantiation: The problem of personnel being injured, unconscious or blinded by an equipment failure, such as an arc flash which could send the entire work area into total darkness. If personnel cannot see to escape the area or rescue personnel cannot see to rescue the injured, the delay could be the difference between surviving and not surviving an accident. This safety issue could be eliminated by providing emergency lighting around the electrical equipment and to an egress path. What good is it to have panic bars on doors (Article 110.26(C)(3)) if there is no egress lighting to guide personnel to the doors.
I recently saw a video of electricians working in a large well illuminated electrical room racking in a circuit breaker. There was a arc flash (the object of the film), the room went totally dark and the video continued to run with a dark screen. The electricians were in the dark without egress lighting so they cannot see to get around electrical equipment and safely escape. This video demonstrated a life safety issue that needs to be addressed and is easily resolved with a minimum amount of cost for emergency lighting equipment that already exist on the market.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-249.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ANTHONY, M.: Please refer to comment on Proposal 1-249.
Comment on Affirmative:
HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted.

1-227 Log #2142 NEC-P01 **Final Action: Accept in Principle**
(110.26(D))

Submitter: Richard McAllister, La Center, WA
Recommendation: Delete text as follows:
~~In electrical rooms~~, the illumination shall not be controlled by automatic means only.
Substantiation: Currently, room occupancy type is determined by the building department/code. In a new school, we have electrical rooms (including the building service) that, since they were designated "storage", have automatic lighting controls only. By removing "in electrical rooms", we would assure that all areas referred to by this article would have safe lighting.
Panel Meeting Action: Accept in Principle
Revise the wording in the existing text to read as follows:
(D) Illumination. Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers

installed indoors and shall not be controlled by automatic means only. Additional lighting outlets shall not be required where the work space is illuminated by an adjacent light source or as permitted by 210.70(A)(1), Exception No. 1, for switched receptacles.
Panel Statement: The revision meets the submitter's concerns and clarifies that the illumination is for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed indoors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-228 Log #621 NEC-P01 **Final Action: Reject**
(110.26(E))

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Revise text to read as follows:
(E) Headroom. The minimum headroom of working spaces about ~~service equipment, switchboards, panelboards, or motor control centers~~ electrical equipment likely to require examination, adjustment, servicing, or maintenance while energized shall be 2.0 m (6 1/2 ft). Where the electrical equipment exceeds 2.0 m (6 1/2 ft) in height, the minimum headroom shall not be less than the height of the equipment.
Substantiation: This change will include all equipment that is mandated by 110.26(A).
Panel Meeting Action: Reject
Panel Statement: The proposal is unsubstantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Ballot Results: Affirmative: 12

1-231 Log #2382 NEC-P01 **Final Action: Accept**
(110.26(E))

Submitter: David G. Humphrey, Midlothian, VA
Recommendation: Delete the following text:
~~110.26(E) Headroom. The minimum headroom of working spaces above service equipment, switchboards, panelboards, or motor control centers shall be 2.0 m (6 1/2 ft). Where the electrical equipment exceeds 2.0 m (6 1/2 ft) in height, the minimum headroom shall not be less than the height of the equipment.~~
~~*Exception: In existing dwelling units, service equipment or panelboards that do not exceed 200 amperes shall be permitted in spaces where the headroom is less than 2.0 (6 1/2 ft).*~~
Substantiation: This is a companion proposal to the section 110.26(A)(3) proposal blending the language of 110.26(E) and 110.26(A)(3), thus, necessitating the need for the deletion of 110.26(E).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-232 Log #760 NEC-P01 **Final Action: Reject**
(110.26(E) Exception)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Delete the following text:
~~Exception: In existing dwelling units, service equipment or panelboards that do not exceed 200 amperes shall be permitted in spaces where the headroom is less than 2.0 m (6 1/2 ft).~~
Substantiation: Where such items are located does not diminish the power that such items contain. If this is allowed, then allow it. A dwelling unit should not change the issue. If someone wishes to redo such an installation, make them do it correctly. Such equipment can always be mounted outside if it must. This will increase the safety of anyone working on such equipment.
Panel Meeting Action: Reject
Panel Statement: The exception applies to existing dwelling installations and allows minor relief where it is impossible to attain the minimum headroom. The exception is applicable to 200A service equipment or panelboards.
The submitter has not provided sufficient substantiation for the proposed change in accordance with the NFPA Regulations Governing Committee Projects, Section 4.3.3(d).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted. We do not necessarily agree that the relief granted in the exception is minor so we therefore do not necessarily agree with all of the panel statement.

1-233 Log #53 NEC-P01 **Final Action: Accept**
(110.26(F))

Note: This Proposal appeared as Comment 1-94 on Proposal 1-135 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-135 was:
Delete the term "distribution boards" to read as follows:
"All switchboards, panelboards, ~~distribution boards~~, and motor control centers...".
Submitter: Code-Making Panel 19,
Recommendation: The following is the Final Action of a task group appointed to review Proposal 1-135. CMP-19 recommends accepting this proposal.
Substantiation: CMP-19 agrees that the NEC does not define distribution board and that a distribution board is considered a type of panelboard. Removing the words "distribution boards" from 110.26(F) may alleviate the submitter's concern, while maintaining the requirement for dedicated equipment space for all types of panelboards. This change will not impact the articles under the purview of CMP-19.
This comment was balloted through CMP-19 with the following results:
14 Eligible to Vote
12 Affirmative
2 Not Returned (W. Bowman and R. Carlson)
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-234 Log #54 NEC-P01 **Final Action: Accept**
(110.26(F))

Note: This Proposal appeared as Comment 1-95 on Proposal 1-135 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-135 was:
Delete the term "distribution boards" to read as follows:
"All switchboards, panelboards, ~~distribution boards~~, and motor control centers...".
Submitter: Code-Making Panel 9,
Recommendation: Recommend the proposal be held for study.
Substantiation: CMP-9 believes the proposal has merit, however, it needs to be correlated with Article 408, which uses the phrase "switchboards, panelboards, and distribution boards" units scope. The current text in 110.26(F) simply repeats that scope information so as not to inadvertently change the application of 110.26(F), which originated within what is now Article 408 in the 1981 cycle and remained there for almost twenty years. CMP-9 will review the scope statement in 408.1 during the 2011 code cycle, and the text of 408.1 and 110.26(F) can be correlated during that cycle. CMP-9 understands that scope statements are under the purview of the Technical Correlating

Committee.

This comment has been balloted through CMP-9 with the following balloting results.

11 Eligible to Vote

10 Affirmative

1 Not Returned (H. deVega)

Panel Meeting Action: Accept

Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-235 Log #761 NEC-P01 **Final Action: Reject**

(110.26(F))

Submitter: Robert Sogla, Coon Rapids, MN

Recommendation: Revise text to read as follows:

(F) Dedicated Equipment Space. All ~~switchboards, panelboards, distribution boards, and motor control centers~~ <u>power production, service, and distribution equipment</u> shall be located in dedicated spaces and protected from damage.

Substantiation: By using well defined terms from Article 100, we can remove this list. See my proposals for new definitions - "power production equipment" and "distribution equipment".

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with section 4.3.3(d) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-236 Log #2050 NEC-P01 **Final Action: Accept**

(110.26(F))

Submitter: Larry T. Smith, National Electrical Seminars, Inc.

Recommendation: Revise text to read as follows:

110.26(F) Dedicated Equipment Space.

All switchboards, panelboards, ~~distribution boards,~~ and motor control centers shall be located in dedicated spaces and protected from damage.

Substantiation: The 1937 NEC makes this statement, "**3841. Scope.** The requirements of this Article shall apply to all switchboards, panelboards, and distribution boards used for the control of light and power circuits...".

What is a distribution board? No one seems to know. The title of Article 408 is Switchboards and Panelboards and we have clear definitions of both in Article 100, but *distribution boards* are not defined in Article 408 or Article 100. In 1937, everyone in the electrical industry probably knew what a *distribution board* was, but not today. At least one AHJ in a major city considers a UPS a distribution board and is requiring dedicated space (110.26(F)) above all UPS equipment. In the opinion of another AHJ, separate safety switches mounted on a 2 ft x 4 ft sheet of plywood constitutes a distribution board.

Distribution board appears to be an archaic term that should be deleted. If not deleted, distribution boards should be defined in Article 100 or Article 408.

Panel Meeting Action: Accept

Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-237 Log #2673 NEC-P01 **Final Action: Reject**

(110.26(F))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete: "and protected from damage".

Substantiation: Edit. already covered by 110.27(B) which uses the word "likely". This section requires protection whether or not damage is likely.

Panel Meeting Action: Reject

Panel Statement: 110.27 is specific to guarding of live parts. 110.26(F) addresses dedicated equipment space. The panel does not agree that this is editorial.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-238 Log #487 NEC-P01 **Final Action: Reject**

(110.26(F)(1)(e))

Submitter: Brenson (Ben) Kingren, Louisville Electrical Joint Apprenticeship Training Committee

Recommendation: Add new text as follows:

Access. Permanent ladders or stairways, or pull down ladders or stairways shall be provided to give access to the working space around electrical equipment installed in attics of dwelling units (i.e., furnaces – either all electric or combination gas/electric, h2o heaters and similar equipment-either gas or electrically operated).

Substantiation: Most scuttle holes (attic accesses) end up in clothes closets with the access point over the top of shelving in a confined space that doesn't accommodate either inspection or service of the above mentioned equipment. Another problem with these installations is the scuttle holes are small and impede access. This change would accommodate these areas being inspected as they should be and maintenance done on equipment more regularly to maintain safety within the dwelling.

Panel Meeting Action: Reject

Panel Statement: Section 110.26(F) addresses dedicated equipment space and what is permitted in and above this space. Access to equipment is covered by 110.26(C).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-239 Log #1330 NEC-P01 **Final Action: Reject**

(110.26(F)(2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete present text and substitute:

Electrical equipment installed outdoors shall be identified for the use and location. Exposed live parts shall be protected from contact by unqualified persons. Where judged necessary by the authority having jurisdiction equipment shall be protected where likely to be subject to physical damage or drainage from piping or rain gutter systems. No architectural appurtenance, aboveground sprinkler systems, electrical or nonelectrical equipment, or plant growth that impairs the working space required in 110.26(A) shall be permitted.

Substantiation: "Unauthorized" is not defined, a person may be authorized, but not qualified. Identified enclosures with no exposed live parts or exposed live parts behind fences or walls do not need additional protection from contact by persons. Where deemed necessary by the AHJ, protection from physical damage whether or not from vehicular traffic, should be required.

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with section 4.3.3(d) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-240 Log #1892 NEC-P01 **Final Action: Reject**

(110.26(F)(2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete present text and substitute: Electrical equipment installed outdoors shall be identified for the use and location There shall be no exposed live parts accessible to unqualified persons.

Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual. "Identified for the use and location" provides for environmental conditions, likelihood of physical damage, type of enclosures. All electrical equipment doesn't require the working space specified in 110.26(A) which also requires the work space to be clear.

Panel Meeting Action: Reject

Panel Statement: An enclosure, as used in this section, could be the housing of apparatus, or the fence or walls surrounding the equipment to prevent personnel from accidentally contacting energized parts or to protect the equipment from physical damage.

The term "suitable" as used in this context is the correct term as provided by 3.2.1 of the NEC Style Manual.

Section 110.26(F)(2) applies to all specified equipment, dedicated space and working clearance space as described in 110.26(A).

The panel does not agree that this proposal is editorial.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-241 Log #1975 NEC-P01 **Final Action: Reject**

(110.26(F)(2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: ~~Outdoor~~ <u>E</u>lectrical equipment <u>installed outdoors</u> shall be installed in ~~suitable~~ <u>identified</u> enclosures and shall be protected <u>where likely to be exposed to physical damage</u> ~~from accidental contact by unauthorized personnel or by vehicular traffic or by accidental spillage or leakage from piping systems.~~ The working clearance shall include the zone described in 110.26(A). <u>No architectural appearance, plant growth other than grass or other equipment shall be located in this zone.</u>

Substantiation: Outdoor electrical equipment may be perceived as equipment that is marked "for outdoor use" and this equipment will have identified enclosures. "Suitable" is subjective and a term to be avoided per the Style Manual. "Identified" will provide protection from accidental contact with live parts by persons or animals, and be recognized for use in the environment. "Likely to be subject to physical damage" covers all sources not just vehicles. Outdoor equipment includes raceway, for example, which if identified for use do not need other enclosures. "Physical damage" includes spillage and leakage, whether or not accidental. Section 110.26 already applies without the reference and is more comprehensive since it covers working space and access to equipment.

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with section 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-242 Log #2619 NEC-P01 **Final Action: Reject**
(110.26(F)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
~~Outdoor~~ Electrical equipment installed outdoors shall be ~~installed in suitable enclosures~~ identified and shall be protected where likely to be subject to physical damage. ~~from accidental contact by unauthorized personnel or by vehicular traffic, or by accidental spillage or leakage from piping system. The working space shall include the zone described in 110.26 (A). No architectural appurtenance or other equipment shall be located in this zone.~~
Substantiation: "Suitable" is subjective and a term to be avoided per the Style Manual. "Outdoor" equipment may be perceived as equipment marked for outdoor or wet locations, or weatherproof or raintight types. Equipment such as RMC, IMC, RNMC, LTFMC, LTFNMC, EMT, weather boxes and fittings etc., identified for the use do not need additional enclosures. 110.26 already applies, but only where required for operation and maintenance, while this section has no such limitation and doesn't include 110.34 for over 600 volts.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with section 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-243 Log #2977 NEC-P01 **Final Action: Reject**
(110.26(F)(2))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. ~~The working clearance space shall include the zone described in 110.26(A). No architectural appurtenance or other equipment shall be located in this zone.~~
Substantiation: These sentences are simply unnecessary repetition. The working space provisions are clearly explained in 110.26(A), so there is no reason to have them repeated in this subsection. Furthermore, the first sentence of the proposed deletion uses the term "working clearance space", as opposed to the more accurate term "working space".
Panel Meeting Action: Reject
Panel Statement: The proposal is unsubstantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: This proposal should have been accepted. As the submitter has noted, the text is simply redundant - working space requirements are addressed in 110.26(A). Section 110.26(F)(1) and (2) are specific to dedicated equipment space. Working space is separate and distinct from dedicated equipment space.

1-244 Log #3284 NEC-P01 **Final Action: Reject**
(110.26(F)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Electrical equipment installed outdoors shall be identified for the use and location. Equipment that is not watertight shall not be located where likely to be subject to drainage from piping or rain gutter systems. No architectural appurtenances, sprinkler equipment, plant growth other than grass, or other electrical or nonelectrical equipment shall be installed in the space required by 110.26
Substantiation: Listed or otherwise identified equipment for outdoor use will have acceptable enclosures. "Suitable" is subjective and a term to be avoided per the Style Manual. RMC and EMT for example are permitted for use outdoors without additional enclosures. "Identified for the use and location" includes protection from damage and accidental contact with live parts, whereas present wording appears to literally require means to prevent contact with equipment such as raceways, transformer enclosures, switches, circuit breakers, luminaries, etc. Live parts and physical damage are additionally covered by 110.27. For correlation all applicable parts of 110.26 should apply not just (A).
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with section 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-245 Log #1548 NEC-P01 **Final Action: Reject**
(110.26(F)(2)(a))

Submitter: Richard Hollander, City of Tucson
Recommendation: Add new text as follows:
110.26(F)(2)(a) Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the grade to a height of 1.8 m (6 ft) above the equipment, shall be dedicated to the electrical installation. No piping, or other equipment foreign to the electrical installation shall be located in this zone.
Substantiation: Some of the same conditions that apply to an indoor installation in regard to piping and other equipment (Ex: Water piping, Gas Piping, hose Bibs, Phone and Cable boxes) pose the same problems outdoors. Access may be impeded by these foreign objects in the area.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There was inadequate substantiation to support the change.
The panel disagrees that all equipment requires the space suggested in the submitter's recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are in general agreement with the recommendation.

1-246 Log #2 NEC-P01 **Final Action: Reject**
(110.26(F)(3))

NOTE: This proposal appeared as Comment 1-96 on Proposal 1-135 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-135 was:
Delete the term "distribution boards" to read as follows:
"All switchboards, panelboards, ~~distribution boards~~, and motor control centers...".
Submitter: Charles Ball, S & C Electric Company
Recommendation: Add a new section to 110.26(F)(3):
110.26(F)(3): Arc-Resistant Switchgear. Provide clear space in accordance with the manufacturer's recommendations. No obstructions such as foreign systems, suspended ceilings, piping, dusts or structures shall be located within the required clear space for indoor or outdoor installations. Exceptions listed in 110.26(F)(1) and 110.26(F)(2) are not allowed when the switchgear is arc resistant.
Substantiation: Arc-resistant switchgear is often designed to direct the exhaust from an internal fault away from areas where personnel could be standing. Unobstructed space is required for the equipment to vent properly. Obstructions could impede or prevent proper venting and result in hot gasses being released toward personnel. The NEC should not allow exceptions such as suspended ceilings, that conflict with the requirements of this type of switchgear and cause an unexpected hazard.
Panel Meeting Action: Reject
Panel Statement: The panel supports the installation of arc-resistant switchgear in accordance with instructions. This issue is already addressed by 110.3. The need for a new requirement in 110.26 has not been substantiated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: The language of 110.3 is general. This terminology of this proposal, a) brings visibility to another method that engineers can apply to protect electricians, b) shows that the NEC can be used as an innovative safety technology diffuser.

1-247 Log #2250 NEC-P01 **Final Action: Reject**
(110.26(G))

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector
Recommendation: Add new text to read as follows:
...shall be considered accessible to qualified personnel and shall be arranged such that a person on the inside can exit when the access door is locked from the outside.
Substantiation: Plenty of effort has been put into Article 110 to accommodate the safety of the personnel servicing electrical equipment. Looking at 110.33(A), it states that...doors shall open in the direction of egress...One cannot exit an area if both locks or padlocks have been set from the other side or perhaps latched due to other circumstances (wind, intentionally, etc.). That is the purpose for this revised text, just to make a clear message that no closet, enclosure, room or vault door shall be locked from outside and/or inside without being able to exit.
Panel Meeting Action: Reject
Panel Statement: 110.26(G) is a permissive allowance in that locked electrical equipment rooms or enclosures can be considered accessible to qualified persons. Regardless of this, locked electrical equipment rooms or enclosures must still comply with the requirements of 110.26(C)(3).
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-248 Log #3760 NEC-P01 **Final Action: Reject**
(110.26(H))

Submitter: Jebediah J. Novak, Cedar Rapids Electrical JATC / Rep. Int'l Brotherhood of Electrical Workers
Recommendation: Add the following section:
110.26(H) Access to Electrical Equipment Behind Panels Designed To Allow Access. Access to electrical equipment shall not be denied by an accumulation of conductors, cables and raceways that prevents removal of panels, including suspended ceiling panels.
Substantiation: A similar requirement already exists in Section 760.21 of the 2008 NEC. By creating this new section in Article 110, this requirement would apply universally throughout the entire NEC.
Panel Meeting Action: Reject
Panel Statement: The concerns of the submitter are already met by 300.23.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-249 Log #3743 NEC-P01 **Final Action: Reject**
(110.26(O) (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. Assn. of Education Facility Executives - APPA.ORG
Recommendation: Add text to read as follows:
110.26(0) (NEW) Emergency Illumination. The area around all service panels in non-dwelling unit occupancies 200 amperes and above shall be automatically illuminated upon loss of power. For a period of 90 minutes illumination levels shall be 1-footcandle on the egress path from the switchgear and 3-footcandles on the vertical surfaces of the service equipment.
Substantiation: This proposal provides both an illuminated egress and ingress path for a) the electrician who is working in the service equipment area without a flashlight, b) for the maintenance mechanic who may neither be an electrician nor familiar with the electric service equipment to work on it in the dark.

Electric service panels are not always installed along either the primary or secondary egress path required by the Life Safety Code and this panel should not leave it to Architects to remember that there may be someone stuck in the dark in the electrical room, or that the path to the electrical room ought to be illuminated in order to diagnose a power outage. This should be a General Requirement as much as marking of disconnects or the guarding of live parts.

The 3 footcandle requirement matches the illumination levels required in 7.3.1 of NFPA 110 for Level 1 emergency power systems and follows NESC practices for vertical illumination.
Panel Meeting Action: Reject
Panel Statement: Emergency illumination requirements are a function of the building codes and NFPA 101, *Life Safety Code*.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: Emergency illumination requirements should not be a function of the many competing building codes any more than dedicated space above switchgear should be granted by the Life Safety Code. Electrical services and transfer equipment spaces are typically not on the escape/egress/rescue path. During an outage both the trained and the untrained would be fetching around in the dark unless the area was designed with lighting adequate for diagnosing; for example, transfer switch auto-manual mode, the odor of a fried solenoid or a loose wire on a starting battery. Arguably, lighting around service equipment during power outages is not emergency lighting at all but a concept closer to optional standby. A start would be the 1-2 foot requirement for a limited class of switchgear.

Manufacturers could help the industry with product innovations that have self-contained illumination packages. One could imagine a transfer switch, for example, with some form of an emergency battery (adapted from common unit emergency lighting packs) adapted so that the transfer switch would illuminate at least part of the ingress path electricians would need to diagnose a power problem. All manufacturers could offer an option that would integrate an emergency lighting package in the switchgear itself—thus reducing site conduit and wiring installation cost.
Comment on Affirmative:
BOYCE, K.: The submitter is encouraged to pursue proposals on this topic in the applicable Life Safety and Building Codes.
HICKMAN, P.: We are in general agreement with the recommendation. See our statement on 1-188.

1-250 Log #3295 NEC-P01 **Final Action: Reject**
(110.27(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Where otherwise provided in this code.
Substantiation: Live parts of equipment operating at over 50 volts such as busbars, switches, and circuit breakers without enclosures (404.3(A) Exception No. 2) in nonrestricted occupancies is a hazard. This provision doesn't reference qualified persons as does (1), (2), and (3).
Panel Meeting Action: Reject
Panel Statement: The proposed revision is to 110.27(D)which does not exist. In addition, the proposal does not comply with 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCMAHILL, L.: This proposal should have been accepted in principle. It appears that the submitter is referring to 110.27(A) for the proposed change. The intent of the change makes sense. For clarity, the panel should have revised the first sentence to read "Unless otherwise~~Except as elsewhere~~ required or permitted by this Code, live parts of electrical equipment operating at 50 volts or more shall be guarded against accidental contact by approved enclosures or by any of the following means:" This change would meet the intent of the submitter and better clarify the intent of the section.

1-251 Log #4420 NEC-P01 **Final Action: Reject**
(110.28, Tables 110.28(a), (b), and (c) (New))

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Recommendation: Add the following new text as 110.28 and Tables 110.28(a), (b) and (c).
110.28 (NEW) Ingress Protection.
Tables 110.28(a), (b) and (c) provide the basis for determining the protection provided by products and equipment marked with IP ratings. Ingress Protection ratings classify the degrees of protection provided by enclosures and enclosing parts of electrical equipment for two conditions: 1) the protection of persons against access to hazardous parts and protection of equipment against the ingress of solid foreign objects and 2) the ingress of water. The degree of protection against these two conditions is designated by an IP Code. Products claiming ingress protection are marked with the letters IP followed by two characteristic numerals, either of which may be replaced by an "X", with or without suffix letters. The first characteristic numeral indicates the degree of protection provided by the enclosure or enclosing part with respect to persons and solid foreign objects entering the enclosure. The second characteristic numeral indicates the degree of protection provided by the enclosure or enclosing part with respect to the harmful ingress of water. The optional suffix letters indicate protection of persons against access to hazardous parts if higher than that indicated by the first characteristic numeral. IP ratings do not specify degrees of protection against damage of equipment, risk of explosions, or conditions such as moisture (produced for example by condensation) or corrosive vapors.

See Tables 110.28(a), (b), and (c) on page 101

Substantiation: The number of products and equipment being marked with Ingress Protection (IP) ratings has increased significantly over the past few years. Although there are few products which are required to be marked with an IP rating, manufacturers are optionally applying an IP rating to many industrial, commercial and residential products, in most cases to satisfy customer needs. The IP rating system not only applies to enclosures, but also any enclosing part of electrical equipment. This translates into the opportunity to specify a level of ingress protection for open products. This system can designate a degree of protection against contact with live electrical parts, for example, contact by human body parts such as a fist, back of hand or a finger and contact by tools or wires.

The IP rating system is defined in the ANSI/NEMA Standard 60529. This standard was adopted as a US National Standard in 2004. It is an adoption of IEC 60529, Degrees of protection provided by enclosures (IP Code). The ANSI/NEMA standard contains no deviations from the IEC version. However, it is understood that US standards which require enclosed products to be marked with an enclosure type rating specify that the rating shall be from the NEMA/UL enclosure type rating system covered in 110.20 of the NEC.

The proposal is not intended to mandate the marking of an IP rating on any product. It is intended to provide guidance in understanding the meaning of IP ratings and to raise the level of awareness of the existence of the IP rating system. The information proposed to be added will provide Code users an explanation of the protection afforded by products and equipment marked with IP ratings.
Panel Meeting Action: Reject
Panel Statement: Ingress Protection is not an NEC requirement, and inclusion in the NEC may lead the code user to believe that it is a requirement.

This information might be suitable for inclusion in an annex.

The requirements for an IP rating in ANSI/IEC Standard 60529 are not

Table 110.28(a) IP Rating – First Characteristic Numeral		
Ingress of Human Body Parts, Tools and Solid Objects		
Numeral		
0	No protection	
1	Back of hand, Fist	Large foreign bodies, diameter greater than 50mm
2	Finger	Medium-sized foreign bodies, diameter greater than 12.5
3	Tools and wires with a thickness greater than 2.5mm	Small foreign bodies, diameter greater than 2.5mm
4	Tools and wires with a thickness greater than 1mm	Granular foreign bodies, diameter greater than 1mm
5	Complete protection, (limited ingress permitted)	Dust protected; dust deposits are permitted, but their volume must not affect the function of the equipment
6	Complete protection	Dust-proof

Table 110.28(b) IP Rating - Second Characteristic Numeral		
Ingress of Water		
Numeral	**Protection against the ingress of water**	**Protection for a Specific Condition**
0	No special protection	
1	Water dripping/falling vertically	Condensation/Light rain
2	Water sprayed at an angle (up to 15º degrees from the vertical)	Light rain with wind
3	Water sprayed at an angle (any direction up to 60º degrees from the vertical)	Heavy rainstorm
4	Water sprayed from all directions, (limited ingress permitted)	Splashing
5	Low pressure water jets from all directions, (limited ingress permitted)	Hosedown, residential
6	High pressure jets from all directions, (limited ingress permitted)	Hosedown, industrial
7	Temporary immersion, 15 cm to 1m	Temporary immersion in water
8	Permanent Immersion, under pressure	Continuous immersion in water,

Table 110.28(c) IP Rating – Optional Suffix Letters	
Letter	**Protection against Human/Tool Contact**
A	Back of hand, Fist
B	Finger
C	Tools and wires with a thickness greater than 2.5mm
C	Tools and wires with a thickness greater than 1mm

Notes to Tables 110.28(a), (b) and (c)

1. Where a characteristic numeral is not specified, it is replaced by the letter “X” (“XX” if both numerals are omitted).

2. Additional letters may be omitted without replacement.

3. An enclosure or enclosing part marked with a first characteristic numeral indicating a degree of protection also complies with all lower degrees of protection for the first characteristic numeral.

4. An enclosure or enclosing part marked with a second characteristic numeral of 6 or lower indicating a degree of protection complies with the requirements for all lower degrees of protection for the second characteristic numeral. An enclosure or enclosing part designated with second characteristic numeral 7 or 8 may be unsuitable for exposure to water jets (designated by second characteristic numeral 5 or 6) and may not comply with requirements for numeral 5 or 6 unless it is dual coded such as IPX5/IPX7.

5. If an enclosure or enclosing part provides different degrees of ingress protection for different intended mounting arrangements, the relevant degrees of protection related to the respective mounting arrangements are indicated in the instructions provided with the product.

6. Where one part of an enclosure has a different degree of protection to that of another part of the same enclosure, the enclosure is marked to indicate the degree of protection for the specific parts of the enclosure.

7. For products marked with the second characteristic numeral 8, the maximum immersion depth and time are indicated in the instructions provided with the product.

the same as the requirements in Table 110.20 and could lead to misapplied equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1
Explanation of Negative:
HICKMAN, P.: We are in general agreement with the recommendation, share the concerns expressed in the panel statement, and agree that an accept in principle as Annex information would have been more appropriate than inclusion in Article 110.
Explanation of Abstention:
ANTHONY, M.: While it is true that IP is not an NEC requirement, maybe it should be. Many examples of electrical equipment – such as covered disconnect switches -- did not start as NEC requirements either. Integration of the concept underlying this proposal would be an example of how consensus documents like the NEC can hasten the diffusion of an innovation farther out the "S-Curve". The content of this proposal could start as an informative annex in the NEC – as the panel states -- or in other related NFPA documents.
Comment on Affirmative:
BOYCE, K.: The proposed text would enhance the usability of the Code. Placement of the proposed text in an Informative Annex would be appropriate.

1-252 Log #3747 NEC-P01 **Final Action: Accept**
(110.31(A))

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise 110.31(A) as shown below:
~~**(A) Fire Resistance of**~~ **Electrical Vaults.** <u>Where an electrical vault is required or specified for conductors and equipment operating at over 600 volts, nominal, the following shall apply.</u>
(1) <u>**Walls and Roof.**</u> The walls and roof~~, floors, and doorways of vaults containing conductors and equipment over 600 volts, nominal,~~ shall be constructed of materials that have adequate structural strength for the conditions, with a minimum fire rating of 3 hours. <u>For the purpose of this section, studs and wallboards shall not be considered acceptable.</u>
(2) <u>**Floors**</u>. The floors of vaults in contact with the earth shall be of concrete that is not less than 4 in. (102 mm) thick, but where the vault is constructed with a vacant space or other stories below it, the floor shall have adequate structural strength for the load imposed on it and a minimum fire resistance of 3 hours. ~~For the purpose of this section, studs and wallboards shall not be considered acceptable.~~
(3) <u>**Doors.** Each doorway leading into a vault from the building interior shall be provided with a tight-fitting door that has a minimum fire rating of 3 hours. The authority having jurisdiction shall be permitted to require such a door for an exterior wall opening where conditions warrant.</u>
(4) <u>**Locks.** Doors shall be equipped with locks, and doors shall be kept locked, access being allowed only to qualified persons. Personnel doors shall swing out and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.</u>
(5) <u>**Transformers.** Where a transformer is installed in a vault as required by Article 450, the vault shall be constructed in accordance with the requirements of Part III of Article 450.</u>
<u>*Exception to 1, 2 and 3: Where the vault is protected with automatic sprinkler, water spray, carbon dioxide, or halon, construction of 1-hour rating shall be permitted.*</u>
<u>FPN No. 1: For additional information, see ANSI/ASTM E119-1995, Method for Fire Tests of Building Construction and Materials, NFPA 251-2006, Standard Methods of Tests of Fire Resistance of Building Construction and Materials and NFPA 80-2007, Standard for Fire Doors and Other Opening Protectives.</u>
<u>FPN No. 2: A typical 3-hour construction is 150 mm (6 in.) thick reinforced concrete.</u>
Substantiation: Currently, the provisions in 110.31(A) are both incomplete and somewhat out of place. The language doesn't really have any driving language as to when the requirements might apply.
The following addresses the specific changes:
1) The title is changed to just "electrical vaults" since it is proposed that the section cover more than just the fire resistance rating.
2) Driving language has been added in the main paragraph to indicate that the section applies when a vault is required or specified. Since the NEC doesn't have specific requirements to use a vault (except for Article 450), this appears to be the only way to actually have some application of the language.
3) The section is split into a number of subsections. Item (1) applies to walls and roofs and contains the requirement currently in 110.31(A). Item (2) is added to apply to floors and contains the current provisions in 110.31(A) for floors. Note that the sentence regarding studs and wall board is moved into item (1) since it would not apply to the floor. The reference to "doors" has been taken out of these sections and moved to a new item (3).
4) Item (3) has been added to apply to doors and is taken from 450.43(A).
5) Item (4) has been added to specify the locking requirements for the doors on the vault. These requirements were taken from 450.43(C).
6) Item (5) has been added to make it clear that any vault that is required due to the requirements of Article 450 must be constructed to Article 450 Part III. Although the language in 450 is similar to this proposal, there are requirements for door sills and ventilation that would not be applicable in an equipment/conductor vault. As such, it makes more sense to simply defer to Article 450 where the vault includes a transformer that is required by Article 450 to be in a vault.
7) An exception to the construction requirements is added to allow for 1 hr construction when the vault is protected by a fire suppression system. This exception is taken from 450.42 and 43. If I can reduce a transformer vault to 1 hr by adding fire suppression, having similar permission for a general electrical vault would be acceptable since the transformer fires are likely more severe than what would occur in an equipment room without a transformer.
8) Two new FPNs are added that parallel the existing FPNs in 450.42 and 450.53. Proposed FPN No. 1 is a combined FPN derived from 450.42 FPN 1 and 450.53 FPN. Proposed FPN No. 2 is taken from 450.42 FPN No. 2.
Overall this proposal will improve the usability, completeness and applicability of 110.31(A).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
MCMAHILL, L.: The panel should have accepted the proposal in principle and modified as follows:
"Where an electrical vault is required or specified, the following shall apply."
"(2) Floors. Floors in contact with the earth shall be ...".
"(3) Doors. Doors leading into a building or structure shall be tight-fitting and a minimum fire rating of 3 hours...." Relocate the personnel doors requirement to this item.
(4) Locks shall be provided on all doors, and doors shall be kept locked... ".
(5) Transformer vaults shall be constructed in accordance with the requirements of ... ".

1-253 Log #4810 NEC-P01 **Final Action: Reject**
(110.31(A))

Submitter: Leo F. Martin, Jr., Martin Electrical Code Consultants
Recommendation: 110.31(A) Revise the last sentence to read. For the purpose of this section, studs and wallboard construction shall not be acceptable.
Substantiation: More consistent with the language used in Building Codes. In addition, see 450.42 Transformer Vault construction last sentence.
Panel Meeting Action: Reject
Panel Statement: The replacement of "wallboards" with "wallboard construction" is not substantiated.
The proposal does not comply with section 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
HICKMAN, P.: We support the recommendation in the proposal and disagree that the recommendation is not substantiated. The recommended text is used in 450.42 as the submitter pointed out.
HITTINGER, D.: This proposal should have been accepted. I do not agree with the panel statement that the submitter did not provide substantiation for the change. The submitter's reference to 450.42 provides the parallel wording that should be incorporated in 110.31(A).
MCMAHILL, L.: This proposal should have been accept in principle by revising the last word in the sentence from "acceptable" to "permitted." Section 110.31(A) last sentence to read: "For the purpose of this section, studs and wallboard construction shall not be permitted." This would allow for parallel structure with other code requirements.

1-254 Log #1976 NEC-P01 **Final Action: Reject**
(110.33(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: At least one entrance not less than 610 mm (24 in.) wide and 2.0 m (6 1/2 ft) high shall be provided to give access to the working space <u>required in 110.32</u> about electric equipment.
Substantiation: The working space should be the required space for safe operation and maintenance. "Equipment" includes many parts of electric equipment which do not require operation or maintenance by personnel such as raceways, cables, etc. The provision should clearly indicate entrance requirements apply only to required working space.
Panel Meeting Action: Reject
Panel Statement: The proposed addition is extraneous.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-255 Log #2251 NEC-P01 **Final Action: Reject**
(110.33(A))

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector
Recommendation: Add new and delete text to read as follows:
...not less than ~~610 mm (24 in.)~~...<u>812 mm (32 in.)</u>...
Substantiation: This is to be consistent with NFPA 5000 (11.2.1.2.4 Minimum

Door Width), NFPA 101 (7.2.1.2.4 Minimum Door Width) and ICC 2006 (1008.1.1 Size of door). During the last code cycle, there were several proposals emphasizing space within electrical equipment and means of egress recommendations as well as access and locking suggestions. There were no proposals for widening the access to such spaces. Which is as important as maintaining the safety of the personnel accessing the area by providing not only the minimum area for the spaces, but also sufficient width to get in and out of such spaces in the event of an emergency.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 1-212.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-256 Log #712 NEC-P01 **Final Action: Reject**
(110.34)

Submitter: Joe Tedesco, Boston, MA
Recommendation: Add FPN: NFPA 70E-2009, Standard for Electrical Safety in the Workplace, covers arc flash hazard analysis, 130.3.
Substantiation: NFPA 70E does not require signs reading: "DANGER HIGH VOLTAGE KEEP OUT".
Panel Meeting Action: Reject
Panel Statement: The proposal is unsubstantiated based on 4.3.3(d) of the NFPA Regulations Governing Committee Projects. In addition, the proposal is redundant to 110.16, FPN No. 1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-257 Log #762 NEC-P01 **Final Action: Reject**
(110.34)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
110.34 Except as elsewhere required or permitted in this code, equipment likely to require examination, adjustment, servicing, or maintenance ~~while energized~~ shall have clear working space in the direction of access to ~~live parts of~~ the electrical equipment and shall not be less than specified in Table 110.34(A).
Substantiation: We need to update this to our current understanding of NFPA 70E. Hopefully, people will find very few things that they must do while the equipment is energized. These rules must be maintained even if it is company policy that the equipment is always de-energized before any work is performed.
Panel Meeting Action: Reject
Panel Statement: See the panel action on Proposal 1-193.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-258 Log #1630 NEC-P01 **Final Action: Reject**
(110.40)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "Table 310.67 through Table 310.86" to "Table 310.60(C)(1) through Table 310.60(C)(20)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.67 through 310.86 as Tables 310.60(C)(1) through 310.60(C)(20) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: Code-Making Panel 1 understands that Code-Making Panel 6 has purview over Article 310.
The panel requests that the Technical Correlating Committee forward this proposal to Code-Making Panel 6 for comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-259 Log #763 NEC-P01 **Final Action: Reject**
(110.73)

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
110.73 Equipment Work Space. Where electrical equipment ~~with live parts~~ that is likely to require examination, adjustment, servicing, or maintenance ~~while energized~~ is installed in a manhole, vault, or other enclosure designed for personnel access, the work space and associated requirements in 110.26 shall be met for installations operating at 600 volts or less.
Substantiation: We need to update this to our current understanding of NFPA 70E. Hopefully, people will find very few things that they must do while the equipment is energized. These rules must be maintained even if it is company policy that the equipment is always de-energized before any work is performed.
Panel Meeting Action: Reject
Panel Statement: See the panel action on Proposal 1-193.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HICKMAN, P.: We are in general agreement with the recommendation but do not believe that adequate substantiation has been submitted.

1-260 Log #4897 NEC-P01 **Final Action: Accept in Principle**
(110.74)

TCC Action: The Technical Correlating Committee directs Code-Making Panel 1 to add titles to the first level subdivisions as required by the NEC Style Manual.
This action shall be considered as a public comment.
Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Revise text as follows:
~~110.74 Bending Space for Conductors.~~ Conductor Installation Requirements: Conductors installed in manholes and other enclosures intended for personnel entry shall be installed in accordance with (A) & (B).
(A) Wire bending space for conductors operating at 600 volts or below shall be provided in accordance with the requirements of 314.28. Conductors operating at over 600 volts shall be provided with bending space in accordance with 314.71(A) and (B) as applicable.
(B) All conductors shall be cabled racked up. or arranged in an approved manner that provides ready and safe access for persons to enter for installation and maintenance.
Substantiation: To be consistent with the manual of style. Eliminate multiple requirement in a single paragraph.
Panel Meeting Action: Accept in Principle
Revise the the proposed text to read as follows:
110.74 Conductor Installation. Conductors installed in manholes and other enclosures intended for personnel entry shall be installed in accordance with 110.74 (A), (B), and (C), as applicable:
(A) Wire bending space for conductors operating at 600 volts or less shall be provided in accordance with the requirements of 314.28.
(B) Conductors operating at over 600 volts shall be provided with bending space in accordance with 314.71(A) and 314.71(B), as applicable.
(C) All conductors shall be cabled, racked up, or arranged in an approved manner that provides ready and safe access for persons to enter for installation and maintenance.
Exception: Where 314.71(B) applies, each row or column of ducts on one wall of the enclosure shall be calculated individually, and the single row or column that provides the maximum distance shall be used.
Panel Statement: The panel supports renaming and subdividing 110.74. The panel editorially modified the proposal to further subdivide requirements for 600 V or less and over 600 V.
The revised wording increases clarity and usability and addresses the concerns of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BARRIOS, L.: Reword (B) to "Wire bending space for conductors operating over 600 volts shall be provided in accordance with the requirements of 314.71(A) and 314.71(B), as applicable." The change is editorial in nature to make the statements in (A) and (B) parallel in structure.
MCMAHILL, L.: Article 110, Part V, is applicable to manholes and other electrical enclosures intended for personnel entry. Section 110.74 is specific to bending space for conductors in these locations. As such, there is no need to repeat this information in the bending space for conductors requirement. The panel should continue to accept this proposal in principle, however, the section should be revised as follows:
110.74 Bending Space for Conductors. Bending space for conductors shall be provided in accordance with the following:
(1) Conductors operating at 600 volts or less shall be in accordance with 314.28.
(2) Conductors operating at over 600 volts shall be in accordance with 314.71(A) and 314.71 (B), as applicable.
(3) Conductors shall be cabled, racked up, or arranged in an approved manner that provides ready and safe access for persons to enter for installation and maintenance.

1-261 Log #2749 NEC-P01 **Final Action: Reject**
(110.74 Exception No. 2 (New))

Submitter: Jerry Woodward, Thomas & Betts Corp.
Recommendation: Add a new exception as follows:
Exception 2: Where the conductors are terminated with a listed ninety degrees style electrical connector, values less than as required by 110.74 can be used.
Substantiation: There are listed connectors intended to reduce bending space for conductors. These connectors can be effectively used in much smaller areas. Attached is an overview of the application.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposal uses the word "can" which is in conflict with 3.1.1 of the NEC Style Manual.
NEC Article 110, Part V, is applicable to manholes and other electrical

enclosures intended for personnel entry. 110.74 requires that the conductors in such spaces be provided with bending space. 312.6(B) is applicable to wire-bending space at terminals.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ANTHONY, M.: With its focus process, the panel has overlooked a significant innovation in wiring method and missed an opportunity to diffuse such innovation for Part V installations. Ninety-degree connectors should be recognized at least as a Fine Print Note (soon to be an Advisory Note).

1-262 Log #2252 NEC-P01 **Final Action: Reject**
(110.76(B))

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector
Recommendation: Revise text to read as follows:
... from the outside~~, or in the case of normally locking by padlock, the locking arrangement shall be such that the padlock can be closed on the locking system to prevent locking from the outside.~~
Substantiation: Plenty of effort has been put into Article 110 to accommodate the safety of the personnel servicing electrical equipment. Looking at 110.76(B), it states that...that a person on the inside can exit when the access door is locked from the outside...One cannot exit an area if bolt locks or padlocks (with or without a locking system) has been set from the other side or perhaps latched due to other circumstances (wind, intentionally, etc.). That is the purpose for this deleted text, just to make a clear message that no closet, enclosure, room or vault door shall be locked from outside without being able to exit from the inside. See NFPA 5000 (11.2.1.5 Locks, Latches, and Alarm Devices.)
Panel Meeting Action: Reject
Panel Statement: The proposal does not substantiate the proposed removal of the provision.
The Section noted in NFPA 5000 is part of the building means of egress component.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 200 — USE AND IDENTIFICATION OF GROUNDED CONDUCTORS

5-29 Log #2714 NEC-P05 **Final Action: Reject**
(200.1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(2) Grounded <u>circuit</u> conductors in premises wiring systems.
(3) Identification of grounded <u>circuit</u> conductors.
Substantiation: Edit. "Grounded" is defined in Article 100 as "connected to earth", which includes equipment grounding conductors and grounding electrode conductors which is not the intent but literally includes them because they are part of a premises wiring system.
Panel Meeting Action: Reject
Panel Statement: A system or circuit conductor that is intentionally grounded is defined in Article 100 as a "grounded conductor". The recommended text is redundant and does not improve clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-30 Log #3819 NEC-P05 **Final Action: Reject**
(200.1)

Submitter: Thomas J. Baker, Puget Sound Electrical Training
Recommendation: Add new text to read as follows:
200.1 Scope.
This article provides requirements for the following:
(1) Identification of terminals
(2) Grounded conductors in premises wiring systems
(3) Identification of grounded conductors
FPN <u>No. 1</u>: See Article 100 for definitions of Grounded conductor, ~~and~~ Grounding Conductor, <u>Neutral</u> and <u>Neutral Point</u>.
<u>FPN No. 2: A neutral conductor is always grounded, see 250.20. a grounded conductor may not be a neutral conductor.</u>
Substantiation: For most electricians, the white conductor is referred to as the neutral and not the grounded conductor. The 2008 NEC added a definition of neutral and neutral point, but it is not obvious when a grounded conductor is a neutral. The title of Article 200 remains as Use and Identification of Grounded Conductors, with no clear reference to a neutral conductor. Adding this FPN would help electricians understand what a grounded conductor is and its importance. Similar explanations have been made with 250.4 FPN, 250.20(D) FPN No.1 and 430.126(A)(4) FPN.
Panel Meeting Action: Reject
Panel Statement: "Grounded conductor" is defined in Article 100 as a system or circuit conductor that is intentionally grounded. The proposal does not add clarity to the scope of Article 200. The neutral conductor is not always a grounded conductor.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-30a Log #CP504 NEC-P05 **Final Action: Accept**
(200.1 FPN)

Submitter: Code-Making Panel 5,
Recommendation: Revise text to read as follows:
FPN: See Article 100 for definitions of Grounded Conductor, <u>Equipment Grounding Conductor</u> and Grounding <u>Electrode</u> Conductor.
Substantiation: The revisions have been made to correlate with the deletion of the term "Grounding Conductor" in Article 100. The panel notes that this proposal is to only make the necessary revision in terminology for correlation with their action on Proposal 5-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposal as this revision is part of a larger effort and is necessary to correlate with the deletion of the defined term "grounding conductor" from Article 100. It should also be noted that coordinated proposals to revise this term in Chapter 8 have been submitted. The CMP-5 chairman's report to the TCC recommended that the TCC assign a Task Group made up of CMP-5 members and CMP-16 members to ensure correlation with the deletion of the term "grounding conductor."

5-31 Log #315 NEC-P05 **Final Action: Accept in Principle**
(200.2)

Submitter: Robert J. Walsh, City of Hayward
Recommendation: Revise text to read as follows:
All premises wiring systems, other than circuits and systems exempted or prohibited by 210.10, 215.7, 250.21, 250.22, 250.162, <u>430.21, 430.25,</u> 503.155, 517.63, 668.11, 668.21, and 690.41 Exception, shall have a grounded conductor that is identified in accordance with 200.6. The grounded conductor shall comply with 200.2(A) and (B).
Substantiation: Many loads do not require a neutral conductor such as electric Motors.
Panel Meeting Action: Accept in Principle
Revise the existing text of the 2008 NEC to read:
"All premises wiring systems, other than circuits and systems <u>specifically</u> exempted or prohibited by <u>other sections of this *Code*</u> ~~210.10, 215.7, 250.21, 250.22, 250.162, 503.155, 517.63, 668.11, 668.21, and 690.41, Exception,~~ shall have a grounded conductor that is identified in accordance with 200.6. The grounded conductor shall comply with 200.2(A) and (B)."
This action does not affect the existing text of 200.2(A) and 200.2(B).
Panel Statement: CMP-5 recognizes there are other sections than those included in the list or suggested text that are not required to have a grounded conductor.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 13 Negative: 3
Explanation of Negative:
DOBROWSKY, P.: This section should be deleted in its entirety. Modifying the language is not incorrect but it is now essentially useless and provides no guidance to the user. If a grounded conductor is required specific sections already address that, stating that one is always required- unless specifically exempted "somewhere" adds no value.
HARDING, G.: The panel action appears to only remove the list from this requirement and does not address the actual concerns of the submitter. The panel action should have included a new sentence to read as follows:
"For premises wiring systems, a grounded conductor shall not be required to be installed with the ungrounded conductors of a feeder or branch circuit where it is unnecessary based on the load served."
WILLIAMS, D.: This proposal should be a straight accept. The present section wording provides a number of sections where a grounded conductor is not required to be routed with branch circuits or feeder applications. The submitter has included two additional sections where a grounded conductor should not be required for a motor branch circuits and feeders. Since it was not referenced in this section a grounded conductor is required. The panels actions of removing the listed sections will now require a grounded conductor routed to all of the previously referenced sections unless specifically exempted in the code.
Comment on Affirmative:
JOHNSTON, M.: Continue to accept the revisions as proposed as a proactive approach in NEC development. The revision removes the list and results in a reference that is more likely to remain accurate in subsequent NEC cycles. The concerns of the submitter should be addressed by including clear text that relaxes the requirement for a grounded conductor to be installed with all circuits where it is unnecessary because of the type of load the circuit serves. A three-phase load should not always be required to include a grounded (neutral) conductor.

5-32 Log #4889 NEC-P05 **Final Action: Accept**
(200.2(B), FPN (New))

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Add a FPN after 200.2 (B) to reference 300.13(B) as follows:
FPN: See 300.13(B) for the continuity of grounded conductors used in multiwire branch circuits.
Substantiation: To reference a related section of this Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-33 Log #3793 NEC-P05 **Final Action: Reject**
(200.3 Exception)

Submitter: Laura Jenkins, NIETC
Recommendation: Revise text to read as follows:
Exception: Listed Utility-interactive inverters identified for use in distributed resource generation systems such as a photovoltaic ~~and fuel cell~~ systems, shall be permitted to be connected to premises wiring without a grounded conductor if the connected premises wiring or utility system includes a grounded conductor.
Substantiation: Article 690 has a section 690.35 Ungrounded Photovoltaic Power Systems that details what extra steps are necessary to have an ungrounded DC system installed safely. There is no section in Article 692 that mirrors those same concerns. You shouldn't include fuel cell systems in with Ungrounded PV systems.
Panel Meeting Action: Reject
Panel Statement: The inverters used for photovoltaic and fuel cell systems have been evaluated for safety in accordance with the applicable UL standards. Section 110.3(B) requires the installation to be in compliance with the instructions and labels provided with the product. The substantiation includes no technical arguments for the exclusion of fuel cell systems from the exception. The code does not prohibit the use of ungrounded systems supplied from fuel cells. Listed utility-interactive inverters provide a grounded conductor interconnection connection for distributed resource generation systems.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-34 Log #1489 NEC-P05 **Final Action: Accept**
(200.6(A))

Submitter: Darryl Hill, Wichita Electrical JATC / Rep. IBEW LU #271
Recommendation: Revise text as follows:
200.6 Means of Identifying Grounded Conductors.
(A) Sizes 6 AWG Or Smaller. An insulated grounded conductor of 6 AWG or smaller shall be identified by ~~a continuous white or gray outer finish or by three continuous white stripes on other than green insulation along its entire length. Wires that have their outer covering finished to show a white or gray color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section. Insulated grounded conductors shall also be permitted to be identified as follows:~~ one of the following means:
(1) By a continuous white outer finish.
(2) By a continuous gray outer finish.
(3) By three continuous white stripes along its entire length on other than green insulation.
(4) Wires that have their outer covering finished to show a white or gray color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section.
(5) The grounded conductor of a mineral-insulated, metal-sheathed cable shall be identified at the time of installation by distinctive marking at its terminations.
(6) A single-conductor,...no change to this text
(7) Fixture wire...no change in this text
(8) For aerial cable,...no change in this text
Substantiation: 200.6(A) should all be in a list item format. Currently, this text lists eight ways to identify an insulated grounded conductor 6 AWG and smaller but only lists out 4 of these. Also, 200.6(B) is currently in a list item type format, but 200.6(A) is not, yet it requires the same type of identification of the grounded conductor. With this change, it would help add clarity, uniformity, and usability to this Section. Another problem to this requirement is that in the original text it states... "by three continuous white stripes on other than green insulation along its entire length" when this should read "by three continuous white stripes along its entire length on other than green insulation."
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
BRENDER, D.: Wire and Cable manufacturers should be consulted as to whether a colored thread is used inside an outer braid on conductor insulation to identify the manufacturer. This language may be archaic.

5-35 Log #1556 NEC-P05 **Final Action: Reject**
(200.6(A))

Submitter: Joseph E. Rossi, Township of Clinton
Recommendation: Revise text as follows:
An insulated grounded conductor of 6 AWG or smaller shall be identified by a continuous manufacteres white or gray outer finish or by three continuous white strips on other than green insulation along its entire length.
Substantiation: There is a lot of confusion about this section of the code. I have failed contractors many times because they will take the two ends of a black wire and tape them white. When I cite this section to them, they tell me about section 206.6(B). That is for larger than #6 wire. Therefore, by putting the word "manufactures" before the word "white" it would be a clearer definition of what needs to be done.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the code. The present code language addresses the submitter's concern as the conductors in sizes 6 AWG and smaller are required to have a "continuous white or gray outer finish."
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-36 Log #2758 NEC-P05 **Final Action: Reject**
(200.6(A) and (B))

Submitter: Rich Wolfe, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
(A) Sizes 10 ~~6~~ AWG or Smaller. An insulated grounded conductor of 10 ~~6~~ AWG or smaller shall be identified by a continuous white or gray outer finish or by three continuous white stripes on other than green insulation along its entire length. Wires that have their outer covering finished to show a white or gray color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section. Insulated grounded conductors shall also be permitted to be identified as follows:
(B) Sizes Larger Than 10 ~~6~~ AWG. An insulated grounded conductor larger than 10 ~~6~~ AWG shall be identified by one of the following means:
Substantiation: Electricians have been using #8 Black insulated wire and taping ends with white and/or green tape. It has been accepted by many AHJs. Most electricians only carry white and green wire up to #10 AWG. The proposal is to reword the code article to reflect what is being done and accepted in the field.
Panel Meeting Action: Reject
Panel Statement: Conductors are readily available with white and gray insulation in sizes 6 AWG and smaller. Insufficient technical substantiation has been provided to reduce the provisions of this section.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
DOBROWSKY, P.: Conductors #8 AWG and larger can effectively be identified in the field by marking the terminations.
A similar change needs to be made in 250.119 to permit 8 and 6 AWG to be re-identified as equipment grounding conductors.

5-37 Log #3249 NEC-P05 **Final Action: Reject**
(200.6(A)(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows:
"or covered" after "insulated" in the first sentence.
Substantiation: Edit. Where covered conductors are used (310.2(A) Exception) the requirement should apply.
Panel Meeting Action: Reject
Panel Statement: There is insufficient technical substantiation to require cable assemblies where the grounded conductor is covered by the outer sheath, such as SE cable, to now have that sheath (covering) colored white or gray or have three white stripes along the length. There is no evidence this grounded (neutral conductor) has been misidentified. Section 310.2(A) Exception cited by the submitter only applies where specifically permitted by the code. Section 200.6(A) and (B) do not permit covering as a substitute for insulation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-38 Log #1490 NEC-P05 **Final Action: Accept**
(200.6(B))

Submitter: Darryl Hill, Wichita Electrical JATC / Rep. IBEW LU #271
Recommendation: Revise text as follows:
(B) Sizes Larger Than 6 AWG. An insulated grounded conductor larger than 6 AWG shall be identified by one of the following means:
(1) By a continuous white ~~or gray~~ outer finish
(2) By a continuous gray outer finish
(3) By three continuous white strips along its entire length on other than green insulation.
(4) At the time of installation,...no changes to remaining text.

Substantiation: 200.6(B) is currently in a list item type format and this listing only lists 3 ways or methods to identify the grounded conductor when in fact there are 4 different means to identify a grounded conductor larger than 6 AWG. To separate the white outer finish and the gray outer finish into their own list item would clear up this requirement and make it more user friendly.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-39 Log #3914 NEC-P05 **Final Action: Reject**
(200.6(B))

Submitter: David A. Williams, Delta Township
Recommendation: Revise text as follows:
(B) Sizes 4 AWG or Larger ~~Than 6 AWG~~. An insulated grounded conductor ~~larger than 6 AWG~~ 4 AWG or larger shall be identified by one of the following means:
Substantiation: This section has been misread over the years by many installers and has created code violations that could have been eliminated if the wording was changed. The proposed wording clarifies the size of conductors that are referenced in this section.
Panel Meeting Action: Reject
Panel Statement: The proposed wording does not have the same meaning as the existing code language because it omits 5 AWG covered in Table 610.14(A). There is insufficient technical substantiation provided to support the recommendation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
PORTER, C.: I agree with the submitter's substantiation. If the panel's concern for not changing the requirement to "4 AWG and larger" is merely to ensure inclusion of the 5 AWG size, then the requirement should be changed to state "5 AWG or larger" to satisfy the intent of the submitter.

5-40 Log #2292 NEC-P05 **Final Action: Reject**
(200.6(B)(3))

Submitter: Joseph E. Rossi, Township of Clinton
Recommendation: Revise text to read as follows:
This marking shall encircle the conductor or insulation at each end and at every point where the conductor is accessible.
Substantiation: Currently, an electrician can put a 1/16 in. piece of white tape around a #250 kcmil wire and technically meet the code. The section of this article states: "shall encircle the conductor." However, it does not state how much of the conductor, which can cause inconsistency with inspection. Therefore, the reading of 250.199 and 200.6 should read the same.
Panel Meeting Action: Reject
Panel Statement: The substantiation does not support the proposed change. The substantiation addresses the size or adequacy of the marking where the proposed change is for locations in the system where the markings are to be required. It is noted that there is no Section 250.199 and the panel concludes the submitter intended Section 250.119.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-41 Log #2154 NEC-P05 **Final Action: Reject**
(200.6(D))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
(D) Grounded Conductors of Different Systems. Where the premises wiring system has grounded conductors of different systems ~~are installed in the same raceway, cable, box, auxiliary gutter, or other type of enclosure~~, each grounded conductor shall be identified by system. Identification that distinguishes each system grounded conductor shall be permitted by one of the following means:
Substantiation: This will match the language in 210.5 and 215.12. Existing code would allow a white grounded conductor for a 120/208 and a 277/480 as long as they didn't share the same raceway, etc. The above change would make the language similar with all the other conductor identification sections and clarify the intent to clearly identify each conductor of each system on a premises.
Panel Meeting Action: Reject
Panel Statement: The proposal broadens the requirement to all systems on a property (inside and outside), including those in multiple separate buildings on the same property without adequate substantiation of a problem. This proposed revision makes the requirement impractical for full compliance in many cases and is overly restrictive, especially where there are multiple systems on the same premises (which could mean systems of overhead conductor spans overhead). No substantiation has been provided that indicates a need for this requirement to be extended beyond enclosures. The number of systems on the premises (inside and outside) could be excessive, making compliance and enforcement difficult. The purpose of 200.6(D) is to improve safety for workers that have to access enclosures that contain multiple grounded conductors from different systems. That is where distinguishing between them is an important safety concern and necessitates differentiation by identification.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
WILLIAMS, D.: This proposal should be accepted.The requirement for identifying the grounded conductors where there are different systems installed in a building should be the same for the grounded conductors as it is for the ungrounded conductors. This is an important safety requirement for the people working on the system and to the occupants to ensure that the grounded conductors of one system are not connected to another system. The wording of section 210.5 and 215.2 are identical and section 200.6(D) should mirror those requirements. The sections being worded differently allows for the enforcement of the circuit identification requirement to be misapplied.
Comment on Affirmative:
JOHNSTON, M.: Continue to reject this proposal for the reasons provided in the panel statement. The proposed changes would result in unintended restrictions that are not substantiated.

5-42 Log #3517 NEC-P05 **Final Action: Reject**
(200.6(D))

Submitter: Randy Hunter, City of Las Vegas
Recommendation: Revise text to read as follows:
(D) Grounded Conductors of Different Systems. Where the premises wiring system has grounded conductors of different systems ~~are installed in the safe raceway, cable, box, auxiliary gutter, or other type of enclosure~~, each grounded conductor shall be identified by system. Identification that distinguishes each system grounded conductor shall be permitted by one of the following means:
Substantiation: This will match the language in 210.5 and 215.12. Existing code would allow a white grounded conductor for a 120/208 and a 277/480 as long as they didn't share the same raceway, etc. The above change would make the language similar with all the other conductor identification sections and clarify the intent to clearly identify each conductor of each system on a premise.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 5-41.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-51 Log #2258 NEC-P05 **Final Action: Accept in Principle**
(200.6(D))

Submitter: Russell LeBlanc, Helio Electric Inc.
Recommendation: Add additional wording and revise the last sentence following section (3).
This means of identification shall be permanently posted at each (~~branch-circuit~~) panelboard and switchboard, (or shall be documented in a manner that is readily available).
Substantiation: The means of identification for grounded conductors must also be provided at feeder panelboards and switchboards in addition to "branch-circuit" panelboards. This is an effect to coordinate marking of grounded conductors with ungrounded conductors. See 210.5(C) and 215.12(C).
Panel Meeting Action: Accept in Principle
Revise the last sentence of 200.6(D) to read:
The means of identifications shall be documented in a manner that is readily available or shall be permanently posted where the conductors of different systems originate.
Panel Statement: CMP-5 recognizes that the revision was proposed to Section 200.6(D) rather than 200.60 and accepts the recommended concept and has revised the recommendation to not limit the identification requirement to panelboards and switchboards only.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-43 Log #3602 NEC-P05 **Final Action: Reject**
(200.7 Exception (New))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add new text to read as follows:
200.7 Use of Insulation of a White or Gray Color or with Three Continuous White Stripes.
(A) General. The following shall be used only for the grounded circuit conductor, unless otherwise permitted in 200.7(B) and (C):
(1) A conductor with continuous white or gray covering
(2) A conductor with three continuous white stripes on other than green insulation
(3) A marking of white or gray color at the termination
(B) Circuits of Less Than 50 Volts. A conductor with white or gray color insulation or three continuous white stripes or having a marking of white or

gray at the termination for circuits of less than 50 volts shall be required to be grounded only as required by 250.20(A).

(C) Circuits of 50 Volts or More. The use of insulation that is white or gray or that has three continuous white stripes for other than a grounded conductor for circuits of 50 volts or more shall be permitted only as in (1) through (3).

(1) If part of a cable assembly and where the insulation is permanently reidentified to indicate its use as an ungrounded conductor, by painting or other effective means at its termination, and at each location where the conductor is visible and accessible. Identification shall encircle the insulation and shall be a color other than white, gray, or green.

(2) Where a cable assembly contains an insulated conductor for single-pole, 3-way or 4-way switch loops and the conductor with white or gray insulation or a marking of three continuous white stripes is used for the supply to the switch but not as a return conductor from the switch to the switched outlet. In these applications, the conductor with white or gray insulation or with three continuous white stripes shall be permanently reidentified to indicate its use by painting or other effective means at its terminations and at each location where the conductor is visible and accessible.

(3) Where a flexible cord, having one conductor identified by a white or gray outer finish or three continuous white stripes or by any other means permitted by 400.22, is used for connecting an appliance or equipment permitted by 400.7. This shall apply to flexible cords connected to outlets whether or not the outlet is supplied by a circuit that has a grounded conductor.

FPN: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

Exception to (A), (B), and (C): Identification of the grounded conductor of an isolated power circuit shall be as required in 517.160(A)(5).

Substantiation: Correlation issue. Devices connected to isolated power circuits in accordance with 517.160(A)(5) conflict with existing 200.7 requirements.

Panel Meeting Action: Reject

Panel Statement: The proposed exception is not needed. An isolated power circuit, as described in 517.160 (A)(2), has no grounded conductor. The requirements in Article 200 do not apply to the conductors referred to in 517.160(A)(5).

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-44 Log #2938 NEC-P05 **Final Action: Accept in Principle**
(200.7(C))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise text to read as follows:

(C) Circuits of 50 Volts or More. The use of insulation that is white or gray or that has three continuous white stripes for other than a grounded conductor for circuits of 50 volts or more shall be permitted only as in (1) and (2) ~~through (3)~~.

(1) If part of a listed cable assembly that has ~~and where~~ the insulation ~~is~~ permanently reidentified to indicate its use as an ungrounded conductor~~,~~ by phase-taping, painting, or other effective means at its termination~~,~~ and at each location where the conductor is visible and accessible. Identification shall encircle the insulation and shall be a color other than white, gray, or green.

(2) ~~Where a cable assembly contains an insulated conductor for single-pole, 3-way or 4-way switch loops and the conductor with white or gray insulation or a marking of three continuous white stripes is used for the supply to the switch but not as a return conductor from the switch to the switched outlet. In these applications, the conductor with white or gray insulation or with three continuous white stripes shall be permanently reidentified to indicate its use by painting or other effective means at its terminations and at each location where the conductor is visible and accessible.~~

~~(3) Where~~ A ~~a~~ flexible cord, having one conductor identified by a white or gray outer finish or three continuous white stripes or by any other means permitted by 400.22, that is used for connecting an appliance or equipment permitted by 400.7. This shall apply to flexible cords connected to outlets whether or not the outlet is supplied by a circuit that has a grounded conductor.

FPN: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

Substantiation: The provisions of this section should clearly apply to "listed" cable assemblies as included in the NEC and not to a field-fabricated cable assemblies. Phase taping is perhaps the most common method of identifying conductor insulation in the field and should be added to this section.

Section 200.7(C)(2) is not required due to the provisions of (C)(1). Section 210.7(C)(1) allows the white or gray insulated conductor to be reidentified and used as an ungrounded conductor for supplying equipment such as motors, water heaters and space heaters. If this reidentification is considered to be safe for these circuits, the same provision should be considered safe for switch legs and travelers for switch loops.

Other changes are intended to be editorial or to comply with Section 3.3.4 of the NEC Style Manual which states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Principle

In the recommendation for 200.7(C)(1) delete the term "listed" and revise "phase-taping" to "marking tape". Accept the rest of the recommendation as submitted.

Panel Statement: The submitter has not provided technical substantiation to support the listing requirement of cables. The revision of "phase-taping" to "marking tape" uses terminology that is consistent with other marking requirements in the code.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

HARDING, G.: Continue to accept the proposal in principle. Installers need to be informed regarding code accepted methods to re-identify white or gray conductors as ungrounded conductors.

JOHNSTON, M.: Continue to accept in principle. The panel should retain the clear guidelines for installers and maintenance personnel as to accepted methods and practices of re-identifying white or gray conductors as ungrounded conductors at accessible locations. The balance of the revisions proposed should be accepted.

5-45 Log #3507 NEC-P05 **Final Action: Accept in Principle**
(200.7(C)(2))

Submitter: George Moore, Golden, CO

Recommendation: Revise text to read as follows:

Where a cable assembly contains an insulated conductor for single pole, 3-way or 4-way switch loops and the conductor with white or gray insulation or a marking of three continuous white stripes is used as supply to the single pole, 3-way or 4-way switch, or as 3-way or 4-way travelers but not as a return conductor from the switch to the switched outlet.

Substantiation: Some jurisdictions interpret the current wording to mandate using the reidentified conductor as supply to the switch. The rewording clarifies that the reidentified conductor can be used as supply of travelers in 3-way and 4-way switches.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 5-44.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-46 Log #3863 NEC-P05 **Final Action: Accept in Principle**
(200.7(C)(2))

Submitter: Cedric D. Johnson, Denver, CO

Recommendation: Revise text as follows:

Where a cable assembly contains an insulated conductor for single pole, 3 way or 4 way switch loops, and travelers, and the conductor with white or gray insulation or a working of three continuous white stripes is used for the supply to the switch but not as a return conductor from the switch to the switched outlet.

Substantiation: Because of not having the two words and travelers in the paragraph it is somewhat confusing to the electricians wire 3-ways since switch loops are not defined clearly thus leaving it up to the AHJ to whether or not you can use the white wire as travelers.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 5-44.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-47 Log #4773 NEC-P05 **Final Action: Accept in Principle**
(200.7(C)(2))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety

Recommendation: Add text to read as follows:

200.7 Use of Insulation of a White or Gray Color or with Three Continuous White Stripes.

(C) Circuits of 50 Volts or More.

(2) Where a cable assembly contains an insulated conductor for single-pole, 3-way or 4-way switch loops and the conductor with white or gray insulation or a marking of three continuous white stripes is used for the supply to the switch but not as a return conductor from the switch to the switched outlet or between 3-way and 4-way switches as travelers. In these applications, the conductor with white or gray insulation or with three continuous white stripes shall be permanently reidentified to indicate its use by painting or other effective means at its terminations and at each location where the conductor is visible and accessible.

Substantiation: This change will clarify that the white conductors can not be switched when used as travelers.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 5-44.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-48 Log #798 NEC-P05 **Final Action: Reject**
(200.7(C)(4) (New))

Submitter: John O'Hara, Westford, MA
Recommendation: Add a new (C)(4) as follows:
(4) An insulated white conductor as part of a cable assembly shall be permitted to be permanently re-identified as a gray conductor for use with a 480/277 Volt system.
(See companion Proposal for 200.6(A) for new Exception).
Substantiation: Presently, for example, if a two-wire 12 AWG cable assembly originating in a 480/277 volt panelboard was to be used to supply a single 277 volt luminaire; the conductors would be required to be two-wire brown and gray, orange and gray, or yellow and gray. The 12 AWG ungrounded conductor can be re-identified, but the grounded conductor cannot as it is smaller than 6 AWG. Typically, two-wire cable assemblies are insulated black and white and to demand other color combinations is cost prohibitive.
Panel Meeting Action: Reject
Panel Statement: The provision of 200.7(A)(3) already permits the recommended application.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

5-49 Log #3644 NEC-P05 **Final Action: Accept in Principle**
(200.8 (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Add new text to read as follows:
200.XX Common Neutral Conductors. Common neutral conductors shall not be used unless specifically permitted elsewhere in this code.
Substantiation: It appears that CMP 2 is attempting to prohibit the use of common neutral conductors by specifically permitting them in 215.4(A) and 225.7(B). There is no reasonable reading of the words "shall be permitted" that can lead the code user to the conclusion that these words actually prohibit the use of common neutral conductors in other cases. The act of specifically permitting something in no way prohibits something else. Section 3.1.2 in the NEC Style Manual says that the words "shall be permitted" are to be used to permit an alternate installation method. The words "shall not" are required to be used to prohibit an installation method per 3.1.1 of the Style Manual. This change will make the wording in 215.4 and 225.7 comply with the style manual rules. Also the prohibition of the use of common neutrals should rest with CMP 5 as they have control of Article 200, Use and Identification of Grounded Conductors and not with CMPs 2 and 4.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
200.4 Neutral Conductors. Neutral conductors shall not be permitted to be used for more than one multiwire branch circuit or for more than one set of ungrounded feeder conductors unless specifically permitted elsewhere in this *Code.*
Panel Statement: CMP-5 revised the proposal to more specifically apply to multiwire branch circuits and feeders.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
JOHNSTON, M.: Continue to accept this proposed revision as amended by the action of CMP-5. This additional section provides clarity to users about how neutral conductors should be used and coordinates with the newly defined terms neutral conductor and neutral point. Additional uses of the term common conductor are not necessary and the NEC should migrate to removal of the term as it is undefined and can cause inconsistency in enforcement.

5-50 Log #3603 NEC-P05 **Final Action: Reject**
(200.10(B)(1))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text to read as follows:
200.10 Identification of Terminals.
[200.10(A) unchanged by this Proposal]
(B) Receptacles, Plugs, and Connectors. Receptacles, polarized attachment plugs, and cord connectors for plugs and polarized plugs shall have the terminal intended for connection to the grounded conductor identified as follows:
(1) Identification shall be by a metal or metal coating that is substantially white in color or by the word *white* or the letter *W* located adjacent to the identified terminal or by an insulated conductor identified as required in 200.7 and 200.9.
[remainder of 200.10(B) and 200.10 unchanged by this Proposal]
Substantiation: Receptacles, plugs and connectors with wire leads (conductors) as terminals have been manufactured and listed for decades. Devices with integral leaded terminals and associated terminal identification, however, are not specifically recognized here. Intentionally not worded as in 200.10(D) for screw shell devices (lampholders) because additional identification methods permitted by 200.7 and 200.9 have been employed in listed receptacles, plugs and connectors.
Panel Meeting Action: Reject
Panel Statement: A wire type lead is not a "terminal". The wire type lead is required to be properly identified by white or gray or three white stripes from the product safety standards for proper installation. Section 200.7 applies to this identification requirement.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

ARTICLE 210 — BRANCH CIRCUITS

2-28 Log #1503 NEC-P02 **Final Action: Reject**
(210)

Submitter: William Q. Cellini, Jr., Ardmore, PA
Recommendation: Add new text to read as follows:
(●) General Purpose (GP) Branch-circuit
(●) General Purpose (GP) Outlet (GPO)
(●) General Purpose (GP) Receptacle (GPR).
Substantiation: Addition of these terms will enhance, facilitate, and clarify their use.
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as is required by 4.3.3(C) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-29 Log #4417 NEC-P02 **Final Action: Accept**
(Table 210.2)

TCC Action: The Technical Correlating Committee understands that the reference to Code-Making Panel 19 in the panel statement should refer to Code-Making Panel 13.
Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Recommendation: Add new text to read as follows:
Add "445.20" into Table 210.2.
Substantiation: This is a companion proposal for a new section 445.20 dealing with GFCI protection for 15 kW and smaller generators so a reference to Table 210.2 recognizing this new section provides proper cross reference where a branch circuit is supplied from a generator.
This proposal was developed by a Task Group composed of Task Group Chairman Paul Casparro and Chair of Panel 3 (NJATC); Jim Wiseman at Square D Schneider-Electric and Panel 15 (NEMA); John R. Kovacik with Underwriters Laboratories, Panels 10, 13 and the NEC TCC (UL); Richard Owen with City of St Paul, Minnesota, Panel 3, and the NEC TCC (IAEI); and Mark C. Ode with Underwriters Laboratories, Panels 3, 13, and the NEC TCC (UL).
Panel Meeting Action: Accept
Panel Statement: Panel recommends that the TCC correlates the action on this proposal and Section 445.20 under the purview of CMP-19.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PAULEY, J.: The reference is not appropriate for Table 210.2. The proposed reference deals with GFCI protection of receptacles that are part of a generator. Table 210.2 covers specific purpose branch circuit requirements that are in addition to the requirements of Article 210. The reference in 445 would not be relevant to branch circuits.

2-30 Log #2326 NEC-P02 **Final Action: Reject**
(210.4(A))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Add a new last sentence as follows: **210.4 Multiwire Branch Circuits; (A) General.** Branch circuits recognized by this article shall be permitted as multiwire circuits. A multiwire circuit shall be permitted to be considered as multiple circuits. All conductors of a multiwire branch circuit shall originate from the same panelboard or similar distribution equipment. Multiwire circuits shall be permitted only in supervised industrial installations as defined in 240.2.
Substantiation: The potential hazards presented by multiwire branch circuits to both equipment and personnel are well understood by those experienced in the electrical industry. Over the years, changes to this part of the code have attempted to address those concerns with the latest revision being the new requirement for simultaneous disconnection of all ungrounded conductors of multiwire branch circuits. However, there is now an unintended or unforeseen consequence of that new provision that actually increases the danger to electrical workers. This new increased hazard, along with the other potential problems arising from the use of multiwire branch circuits now suggest that it be used only in limited situations.
The supporting reasons for the proposed addition of a new last sentence to section 210.4(A) to restrict the use of multiwire branch circuits to industrial installations with qualified personnel as defined in 240.2 are as follows.
1) With the new requirement for multi-pole circuit breakers to supply

multiwire branch circuits, the level of safety is indeed increased for those who choose to disconnect the power before working on the circuit. However, especially in the office setting where computers are in common use, maintenance workers are LESS LIKELY to turn off the circuit to do such things as replace receptacles and switches. The disruption of office-worker productivity for two or three times as many affected workers is a disincentive to electrical-worker safety, which will probably result in more incidental exposure of energized circuits to personnel while performing routine maintenance on electrical systems.

2) As the years go by, apprentices become journeymen, and the once-accepted practice of protecting multiwire branch circuits with single-pole devices (circuit breakers or fuses) becomes long forgotten, the likelihood of a worker turning off a single-pole circuit breaker to work on what is assumed to be an individual circuit (non-multiwire) increases -- along with the danger to that worker where the 1-pole circuit breaker is actually part of a multi-wire branch circuit and the worker opens the neutral conductor (shock hazard and possible equipment damage). Of course, this scenario depends somewhat on the eventual increased popularity of multiwire branch circuits now and in the future.

3) Multiwire branch circuits, whether protected by single- or multi-pole devices, have always presented a potential over-voltage hazard to the equipment connected to those circuits any time there is a disruption in continuity to the common neutral conductor. A loose neutral or a neutral wire accidentally removed at its source panel termination could result in the destruction of sensitive or high-impedance electrical equipment due to the sudden rise in voltage (above the rating of the connected equipment) where there is a resulting series connection of that equipment with other equipment on the other phase or leg.

4) With the ever growing proliferation of electronics and the solid-state switching power in electrical equipment, especially in the non-residential setting, the occurrence of nonlinear-load conductor heating is a growing concern. In fact, this is pointed out by the fine print note following section 240.4(A), as well as other sections such as 220.61(C)(2), 310.15(B)(4)(c), 400.5(B), 450.3 FPN: No. 2, and others. The resulting added heat in the neutral conductor is dependent not only on the load current and the other usual considerations of ambient temperature and conductor bundling but also the frequency of the harmonic currents imposed on the neutral (common) conductor, which technology seems to be forever increasing.

5) Multiwire branch circuits are already given “special consideration” in sections 590.4(D), 590.4(E), 605.6, and 605.7, and are NOT ALLOWED (other than by “exception”) in sections 501.40, 502.40, 505.21, and 506.21 of the code. These code sections have evolved with the recognition of the potential hazards posed by multiwire branch circuits installed in specific circumstances, and the code panels have acted to diminish those risks. It is now time to act further in reducing the future installation of multiwire branch circuits covered by the NEC.

Panel Meeting Action: Reject

Panel Statement: Installers in residential occupancies need to be qualified when working on or around energized circuits whether multiwire or individual.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-31 Log #452 NEC-P02 **Final Action: Reject**

(210.4(B))

Submitter: Lanny G. McMahill, Phoenix, AZ

Recommendation: Delete text to read as follows:

~~(B) Disconnecting Means. Each multiwire branch circuit shall be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates.~~

Substantiation: Delete item (B). The intent of this change in the ’08 NEC was well meant. Unfortunately, it may have the opposite effect by creating potential unsafe conditions for the electrical mechanics in the field. As an example, where luminaries are supplied by multiiwire branch circuits, and a luminaire circuit needs to be serviced, most mechanics will not disconnect all the branch circuits as it could leave a given area in total darkness. Via discussions with electrical mechanics, several have raised concerns with this requirement and have advised that they will simply remove the energized conductor from the branch circuit overcurrent device that needs to be serviced. Obviously, this is not a good work practice, but many have advised that disconnecting all circuits may not be an option. In the interest of work person safety, it is recommended to delete item “B” and continue with the requirements as noted on Section 210.7(B). Section 210.7(B) is specific to multiple branch circuits serving devices or equipment on the same yoke. This makes sense.

Where it is necessary to require disconnection of all multiwire branch circuits, such as is noted in Section 605.6 and 7, this makes sense too. Requiring the disconnection of all multiwire branch circuits does not make sense and, again, may have the opposite effect of simply impacting worker safety!

Panel Meeting Action: Reject

Panel Statement: The submitter’s substantiation is anecdotal and lacks any technical data to support his claim. The proposed deleted text would create a greater hazard to those required to service equipment that is supplied by a multiwire branch circuit. The present text assists the qualified person servicing equipment supplied by multiwire branch circuits in identifying and safely de-energizing all current carrying conductors of the circuit. Removing this language would increase the hazard to all personnel working on multiwire branch circuits. As described by the submitter 2-pin luminaires are now required to have individual disconnecting means installed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-32 Log #598 NEC-P02 **Final Action: Reject**

(210.4(B))

Submitter: Herbert S. Pharo, Cape May, NJ

Recommendation: Revise text as follows:

Each multiwire branch circuit shall be provided with a means that will simultaneously disconnect all ungrounded conductors nearest ~~At~~ the point where the branch circuit originates.

Substantiation: The problem is that the point where the branch circuit originates is at the overcurrent protective device. Nearest as used in 230.70(A)(1).

The new word will make it clear that the disconnect need not be overcurrent protective device.

Panel Meeting Action: Reject

Panel Statement: The term “nearest” is vague and unenforceable. The present language is clear and enforceable by the authority having jurisdiction.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-33 Log #790 NEC-P02 **Final Action: Reject**

(210.4(B))

Submitter: Charles Petri, Petri Electric, Inc.

Recommendation: Delete Item 210.4(B) and replace with the following:

“On new installations, all multiwire branch circuits shall be provided with an individual grounded conductor on each circuit”.

Substantiation: If the reason that this was put into the Code was to reduce shock hazard that exists when disconnecting neutral conductor on sheared neutral multiwire branch circuit, the following must be considered:

1. When doing remodel or tenant finish work in an existing office building, in which the premises wiring system was a multiwire branch system with a common neutral conductor, we are now required to add a 3-pole circuit breaker to control the branch circuits. Three 277v lighting circuits may control all the lighting on a floor; therefore, when a ground fault exists, all three circuits will be tripped and the whole floor will be without light. Now, the building maintenance person or electrical contractor will be called to fix the problem. To troubleshoot, they probably will remove the panel cover and deadfront, by flashlight, disconnect two circuits from circuit breaker, then reset breaker. If breaker holds, they will disconnect remaining circuit, connect one of the other circuits and repeat the sequence until they determine the shorted circuit. This would expose them to possible arc flash hazard if circuit breaker flashes. If circuit breaker performs OK, then they will probably leave the circuit breaker “on” so that 2/3 of the offices have light, and troubleshoot the bad circuit. This puts them back in the original position of working on a circuit that has current flowing in the neutral.

2. In connecting circuits to modular furniture, if the circuits come from the same panel, on overload or ground-fault on one of the “dirty” circuits will also shut off power to computers, possibly causing loss of data. In some instances, the isolated ground computer circuit comes from a UPS system which is separate from the “dirty power” system.

210.4(A) does not allow this multiwire system.

Panel Meeting Action: Reject

Panel Statement: The proposed text conflicts with the definition of a multiwire branch circuit.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-34 Log #1484 NEC-P02 **Final Action: Reject**

(210.4(B))

Submitter: Daniel L. Wilt, Springfield Acme Electric

Recommendation: Add new text as follows:

Exception: When multiwire branch circuits are used to feed office fixtures/furniture with factory furnished attachment whips, common trip breakers or breaker ties, shall not be required.

Substantiation: Modern office fixtures/furniture often utilize a multiwire connection whip offering 3 circuits with a common neutral and equipment ground, in addition to provision for an isolated ground circuit. Disruption of 1 circuit under existing article would cause loss of power to entire block of cubicles. Exception No. 1 is not very clear on “one utilization equipment.”

Panel Meeting Action: Reject

Panel Statement: Previous substantiation for 210.4(B) cited electrical incidents associated with the absence of a requirement for simultaneous disconnect of ungrounded conductors in a multiwire circuit. Adding this exception will reintroduce this same potentially hazardous condition. Section 605.6 already addresses simultaneous disconnect of multiwire branch circuits where they supply fixed type partitions.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-35 Log #3248 NEC-P02 **Final Action: Reject**
(210.4(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Each multiwire branch circuit shall be provided with <u>an identified</u> means that simultaneously disconnects... (remainder unchanged).
Substantiation: "Identified" will require the means (not specified) to be suitable.
Panel Meeting Action: Reject
Panel Statement: The present text is clear and the submitter's recommended text does not add any clarity to the code. Identification is covered in 408.4 of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-36 Log #4859 NEC-P02 **Final Action: Reject**
(210.4(B))

Submitter: John Steinke, Amish Electric
Recommendation: Delete this section.
Substantiation: In specific situations, such as where the multi-wire branch circuit (MWBC) supplies different circuits to devices sharing a common yoke, the NEC already requires a common disconnecting means.
In other situations - such as an office where the lighting is distributed over two or three circuits - requiring a common disconnecting means both complicates troubleshooting, and introduces other hazards.
In many cases, the breaker is the only disconnecting means; either there are no individual switches, or the switches incorporate motion sensors, etc., and may not be relied upon as a disconnection means.
Leaving the entire office in the dark not only increases the inconvenience to all when performing maintenance, it also creates a hazard. Should one circuit fail, people are left to flounder in the dark. Maintenance will be performed by flashlight - inherently more dangerous - or by working live (against all rules).
Likewise, a 'common trip' will negate the very purpose of many separate circuits: to prevent one piece of equipment from failing when another does.
MWBC's, as a practice, have both their detractors and their advocates. Such is a design choice, and probably beyond the scope of the NEC (See Article 90.1) If it is the intent of the NEC to ban MWBC's, it should do so directly, and not by adding multiple strictures on them.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation for the removal of the requirement for simultaneous disconnecting means. See Panel Statement on Proposal 2-34.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-37 Log #3874 NEC-P02 **Final Action: Accept**
(210.4(B), FPN (New))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the panel action on this proposal and consider deleting the mandatory phrase "required by this section" to comply with 3.1.3 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Michael J. Farrell, III, Lucas County Building Regulations
Recommendation: Add new Fine Print Note (FPN) following text of 210.4(B) Disconnecting Means
FPN: See 240.15(B) for use of single pole circuit breakers as the disconnect means required by this section.
Substantiation: Placement of a FPN will direct the code reader to all of the requirements for proper application of this article. It would prevent some of the confusion in applying the disconnect requirements for multiwire branch circuits.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-38 Log #2225 NEC-P02 **Final Action: Reject**
(210.4(B) Exception (New))

Submitter: Allen Forbes, L & A Electric, Inc.
Recommendation: Add new text to read as follows:
Exception: A single branch circuit supplying a building or structure with lighting outlets.
Substantiation: With an overcurrent trip, all lighting outlets are off. This change will allow lighting outlets to remain on when there is an overcurrent trip.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation addresses a design issue that is outside the scope of the NEC. The present text provides for minimum requirements for the safe installation and use of equipment supplied by multiwire branch circuits. The NEC is not an instruction manual for untrained persons and therefore cannot circumvent minimum safe installation requirements to account for unsafe work practices performed by improperly trained personnel.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-39 Log #1275 NEC-P02 **Final Action: Reject**
(210.4(C))

Submitter: Stephen Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:
210.4 Multiwire Branch Circuits.
~~**(C) Line to Neutral Loads.** Multiwire branch circuits shall supply only line-to-neutral loads.~~
~~*Exception No. 1: A multiwire branch circuit that supplies only one utilization equipment.*~~
~~*Exception No. 2: Where all ungrounded conductors of the multiwire branch circuit are opened simultaneously by the branch-circuit overcurrent device.*~~
FRN: See 300.13(B) for continuity of grounded conductor on multiwire circuits.
Substantiation: Since exception #2 to 210.4(C) shall be always met by application of 210.4(B), the requirements of 210.4(C) can never be strictly enforced.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect. The provision to limit multiwire branch circuits to line-to-neutral loads only is important and independent of 210.4(B). The first exception permits a single utilization equipment to be supplied that may be other than only line to neutral connected (e.g., a 120/240V range). The second exception permits multiple pieces of utilization equipment that may be line to line connected to be supplied, but only where the overcurrent device is common trip.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-40 Log #256 NEC-P02 **Final Action: Reject**
(210.4(C) Exception No. 2)

Submitter: Pete Baldauf, City of Vandalia
Recommendation: Delete Exception No. 2 to 210.4(C) in its entirety.
Substantiation: Exception No. 2 to 210.4(C) is redundant in light of the fact that 210.4(B) already requires all ungrounded conductors of a multi-wire branch circuit to be simultaneously disconnected at the point where the branch circuit originates.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-39.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-41 Log #3850 NEC-P02 **Final Action: Reject**
(210.4(C) Exception No. 2)

Submitter: Bill McGovern, City of Plano
Recommendation: Delete text as follows:
~~Exception No. 2: Where all ungrounded conductors of the multiwire branch circuit are opened simultaneously by the branch circuit overcurrent device.~~
Substantiation: Exception No. 2 is no longer needed as all multiwire branch circuits now require simultaneous disconnection.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-39.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-42 Log #224 NEC-P02 **Final Action: Accept in Part**
(210.4(D))

TCC Action: The Technical Correlating Committee understands that the panel action on this proposal modifies the panel action on Proposal 2-43.
Submitter: Pete Baldauf, City of Vandalia
Recommendation: Revise as follows:
The ungrounded and grounded conductors of each multi-wire branch circuit shall be grouped by ~~wire ties or similar means~~ <u>approved means</u> in ~~at least one location~~ <u>each location that terminations, connections or splices are made.</u>
Substantiation: Grouping only at the point of origin does not take junction boxes, wireways, etc. into consideration. These other locations also present the same possibility to have an energized grounded conductor as contemplated by the original submitter for 210.4(D).
Panel Meeting Action: Accept in Part
Revise text to read as follows:
"The ungrounded and grounded conductors of each multi-wire branch circuit shall be grouped by wire ties or similar means at each location that terminations, connections, or splices are made."
Panel Statement: The panel accepts the deletion of the phrase "at least one

location" and the addition of the phrase "each location that terminations, connections or splices are made." The panel rejects the deletion of the phrase "wire ties or similar means" and the addition of the phrase "approved means" because no substantiation has been provided to warrant this change. See panel action on proposal 2-43, which further modifies the text as accepted in this proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PAULEY, J.: The extension of the grouping requirement to each termination and splice point is not justified. The grouping provision was added in the 2008 NEC to allow the installer to readily identify the conductors of the multi-wire branch circuit in the panelboard and be able to select the correct conductors for circuit isolation purposes. Grouping the conductors at a splice or junction point does not serve this same purpose. The reason for the grouping will not be readily evident by an electrician other than the original installer. In addition, it will not be evident to the electrical inspector as to whether the conductors are grouped properly at a splice or junction point.
Comment on Affirmative:
KING, D.: The panel action on this proposal has increased the level of safety for qualified persons required to access boxes and enclosures that contain splices and terminations. Grouping of multiwire branch circuits will assist the qualified person in identifying grounded conductors that may present a shock or electrocution hazard due to all of the ungrounded conductors of the multiwire branch circuit not being safely deenergized.

2-43 Log #2055 NEC-P02 **Final Action: Accept**
(210.4(D))

TCC Action: The Technical Correlating Committee understands that the panel actions on Proposals 2-42 and 2-48 modify the panel action on this proposal.
Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Recommendation: Editorially revise 210.4(D) as follows:
(D) Grouping. The ungrounded and grounded conductors of each multiwire branch circuit shall be grouped by ~~wire~~ cable ties or similar means in at least one location within the panelboard or other point of origin.
Substantiation: "Cable ties" is the term used throughout the NEC. There is no other use of the term "wire ties". The term "steel tie wires" is used in 250.52(A)(2)(3), but that is an obvious reference to the device used to bind reinforcing rods.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-44 Log #2329 NEC-P02 **Final Action: Reject**
(210.4(D))

Submitter: Michael L. Last, Na'alehu, HI
Recommendation: Add new text as follows:
Grouping. The ungrounded and grounded conductors of each multiwire branch circuit shall be grouped by wire ties or similar means and identified as such in at least one location within the panelboard or other point of origination. The means of identification shall be permanent by tagging or similar methods.
Substantiation: The fact that three (or more) conductors are bundled within a panelboard is not indicative that the conductors so bundled constitute a multiwire branch circuit. It is not unusual for numerous circuit conductors to be grouped per discretion of the installing party. The requirement of grouping all conductors of each multiwire branch circuit WITHOUT (further) IDENTIFICATION could lead to the negating of the intent of existing 210.4(D). With identification of a group of conductors marked, "multiwire branch circuit", it would quickly and definitively establish that the conductors so bundled constitute the reason for grouping; and lacking such identification, other bundles of conductors would indicate that the conductors were grouped for some other purpose.
Panel Meeting Action: Reject
Panel Statement: The grouping requirement is sufficient to identify the grounded conductor that is associated with the ungrounded conductor of a multiwire branch circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: The Submitter of this Proposal has identified a common installation practice that in many cases compromises this important safety requirement. I disagree with the panel statement that "the grouping requirement is sufficient." The submitter has clearly substantiated that grouping alone is not sufficient and proposes an effective and practical means to ensure that the intent of 210.4(D) is met. The Panel should give this proposal further consideration.

2-45 Log #3666 NEC-P02 **Final Action: Accept in Principle**
(210.4(D))

Submitter: Mark Smythe, Smythe Electric Inc. / Rep. Minnesota State Contract Electrical Inspector
Recommendation: Revise text as follows:
210.4(D) Grouping. The ungrounded and grounded conductors of each multiwire branch circuit shall be grouped by wire ties or similar means in at least one location within the panel board or other point of origination, and in each junction or splice box through out the entire branch circuit where more than one set of multiwire circuits are present.
Substantiation: The safety reasons for grouping the grounded conductors with the ungrounded conductors of multiwire circuits in a panel board should also apply to the entire branch circuit. Extending a circuit from an existing junction box where more than one set of multi wire circuits are present would present the problem of identifying the correct grounded conductor with the proper ungrounded conductor. There would be a potential safety hazard by creating an "open neutral: situation while working on the circuit.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-42, which satisfies the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-46 Log #4151 NEC-P02 **Final Action: Accept in Principle**
(210.4(D))

Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Revise text to read as follows:
(D) Grouping. The ungrounded and grounded conductors of each multiwire branch circuit shall be grouped by wire ties or similar means in at least one location within the panelboard or similar distribution equipment and other enclosures where more than one multiwire branch circuit is present. ~~or other point of origination.~~
Substantiation: The grouping of the ungrounded and grounded conductors is just as important in other enclosures as it is in panelboards or switchboards. Damage to equipment may result if the wrong neutral is connected when extensions or alterations are made to the circuits.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-42, which satisfies the submitter's intent.
Number Eligible to Vote: 12

2-48 Log #3250 NEC-P02 **Final Action: Accept in Part**
(210.4(D) and Exception (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with respect to the addition of the word "circuit".
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
The ungrounded and grounded circuit conductors of each multiwire circuit shall be grouped by ~~wire~~ cable ties, tape, or other approved means in at least one location within the panelboard or other point of origination.
Exception: The requirement for grouping shall not apply where the multiwire circuit is supplied from a single circuit breaker or fused switch in an enclosure identified for only one circuit breaker or switch.
Substantiation: Identification should not be necessary where only one circuit is involved. Tape can be a means of identification as permitted in other sections.
Panel Meeting Action: Accept in Part
Revise text as follows:

"The ungrounded and grounded circuit conductors of each multiwire circuit shall be grouped by cable ties, tape, or other approved means in at least one location within the panelboard or other point of origination.

The remainder of the proposed text is rejected.

Panel Statement: The panel accepts the deletion of the word "wire" and the addition of the word "cable" and rejects the remaining proposed text because it does not add any clarity to this section.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-49 Log #552 NEC-P02 **Final Action: Reject**

(210.4(D) Exception)

Submitter: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Add new text to read as follows:

"...circuit, at a location unique to the circuit, that makes...".

Substantiation: Duplex connectors: When a multiwire circuit enters a cabinet through one of these, the identification inherent in having its own cable often is lost. Adding this wording will eliminate arguments about "obvious" in these-common-cases. Photos are available, should they be of any value. (The photos were not provided to NFPA).

Panel Meeting Action: Reject

Panel Statement: The Submitter's proposed text does not add clarity.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-50 Log #2888 NEC-P02 **Final Action: Reject**

(210.4(D) Exception)

Submitter: Joseph Bellantoni, Rivers Electrical

Recommendation: Revise text to read as follows:

The requirement for grouping shall not apply if the circuit enters from a cable ~~or raceway unique to the circuit that makes the grouping obvious~~ terminating in a single connector.

Substantiation: Conductors can be added to raceways after the initial installation of the original circuit conductors. If a multiwire branch circuit installed in a raceway is grouped at the time of installation then the integrity of the circuit is sure to be maintained. In addition, when cables enter a panelboard via a duplex style connector it can be difficult to differentiate the grouping of the conductors, if the cable of a multiwire branch circuit enters through a single connector there is no question about grouping.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-49.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-51 Log #3558 NEC-P02 **Final Action: Reject**

(210.5(C))

Submitter: James T. Dollard, Jr., IBEW Local 98

Recommendation: *Note: The following proposal is a suggested rewrite of 210.5(C). It is editorial in nature and is not written in legislative format for ease of reading and clarity.*

(C) Identification of Ungrounded Conductors.

(1) Method of Identification. An insulated ungrounded conductor, whether used as a single conductor or in multiconductor cables, shall be finished to be clearly distinguishable from grounded and grounding conductors in accordance with (a) and (b).

(a) Multiple Nominal Voltage Systems. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, the ungrounded conductors of each nominal voltage system shall be clearly distinguished from the ungrounded conductors of other nominal voltage systems at all termination, connection, and splice points in accordance with (1) and (2) as applicable:

(1) Each ungrounded conductor size 6 AWG and smaller shall be identified by system using a continuous color along its entire exposed length.

(2) Each ungrounded conductor larger than 6 AWG shall be identified by system using color coding, marking tape, tagging, or other approved means.

(b) Phase or Line Identification. Where an enclosure contains ungrounded conductors supplied by more than one phase or line, each ungrounded conductor shall be clearly distinguished from all other phase or line conductors using separate color coding, marking tape, tagging, or other approved means.

(2) Posting of Identification Means. The method utilized for identification for conductors originating within a branch-circuit panelboard or similar branch-circuit distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at that branch-circuit panelboard or similar branch-circuit distribution equipment.

Substantiation: The proposed revision to 210.5(C) is submitted in an attempt to provide clarity. As written the present text would require all 120-volt and 277-volt circuits to be identified by phase and system. I believe that the intent of this requirement is twofold.

(1) The first is to document or mark the branch circuit panelboard or other distribution equipment to alert installers and maintainers that more than one nominal voltage system exists.

(2) The second is to use that documented/posted marking method at all termination, connection, and splice points to alert the installer maintainer to identify the nominal voltage.

A typical installation in a commercial setting may involve a 208/120-volt and 480/277-volt systems. The present text in the 2008 NEC can be interpreted to mandate that every 120-volt branch circuit be identified by phase and system requiring for example black, red or blue conductors or marking for all single phase 120-volt circuits. Where a cable assembly such as MC cable is employed, 12/2 will always have circuit conductors in black (ungrounded) and white (grounded.) The black conductor in such a single phase branch circuit is sufficient to identify the system. However a branch circuit with more than one phase or line would be required to be identified by phase and system.

I do not believe that the intent of CMP-2 was to have every 120-volt branch circuit in an MC cable installation re-identified from black to red or blue if "B" or "C" phase are employed. I do believe that where more than one ungrounded conductor exists, the conductors should be identified by phase/line and system.

Panel Meeting Action: Reject

Panel Statement: The proposal introduces new requirements not supported by the substantiation. The new requirements are: the ungrounded conductor shall be finished to be clearly distinguished and ungrounded conductors smaller than 6 AWG shall be identified by a continuous color along its entire exposed length. The panel continues to maintain the position that conductors may be identified by marking tape, tagging or other approved means. See panel action on Proposal 2-52, which addresses restructuring of the present text.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: The Submitter of this proposal incorporates in his proposed text a requirement that is already in many cases a common industry standard. Incorporating this method of identification as a minimum requirement in this section will assist the qualified person in safely identifying the system they are working on. A comment on this proposal with additional substantiation would allow the panel to give this proposal further consideration.

2-52 Log #3749 NEC-P02 **Final Action: Accept**

(210.5(C))

Submitter: Jim Pauley, Square D Company/Schneider Electric

Recommendation: Revise text as follows:

(C) Identification of Ungrounded Conductors.

(1) Application. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit shall be identified by phase or line and system at all termination, connection, and splice points.

(2) Means of Identification. The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means.

(3) Posting of Identification Means. The method utilized for conductors originating within each branch-circuit panelboard or similar branch-circuit distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment.

Substantiation: This proposal is to revise 210.5(C) to split up the paragraph and create some subsections with titles. This should improve the readability of the section. There are no changes to the technical requirements established by the current language.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-53 Log #3807 NEC-P02 **Final Action: Reject**

(210.5(C))

Submitter: Gary Sixel, Sixel & Schwinn, Inc.

Recommendation: Delete text as follows:

(C) Ungrounded Conductors. Where the premises wiring system has branch circuits supplied from more than one nominal, voltage system, each ungrounded conductor of a branch circuit shall be identified by ~~phase or line and~~ system at all termination, connection, and splice points.

Substantiation: Identifications of conductors by phase or line on branch circuits present many problems.

Upon rough in wiring, loads may be unknown, requiring circuits to be transferred to a different phase or line to balance the system. When rewiring, loads change, and it may also be necessary to transfer loads to a different phase to balance the system. Transferring a load to another phase would require remarking or changing the wire color throughout the conduit run, which could be very labor intense, very costly and impractical to do on long-branch circuits supplying many outlets or fixtures.

Three phase motor rotation would need to be changed at the motor terminals in order to keep the colors continuous throughout the system. In some cases power may not be available when motors are initially wired. When power becomes available changing rotations at the motor leads can be a major undertaking, especially with multiple larger horse power motors.

With arc flash becoming an issue, the motor junction box should have the cover installed before applying power, especially in hazardous locations. Changing rotation at the starter or disconnect switch is a more reasonable solution.

With submersible water pump motors, the motor leads are factory installed. If the rotation is incorrect there is no way to change the wire color coming out of this motor.

Where three-phase motors are controlled through a reversing starter, the reversing starter changes the phases so when this motor runs in one direction the conductors will be correctly identified. When the motor is reversed and the phases are switched by the starter it is impossible to have the phase marking follow through.

In the perfect electrical marking world, marking conductors sounds o.k. In rework or maintenance projects, the entire circuit would have to be traced to check or adjust conductor markings. Many times the junction boxes or excess points are unknown. This would mean as time goes on the conductor markings will not be accurate. Incorrect markings are more of a hazard than no markings.

Panel Meeting Action: Reject

Panel Statement: Identifying phase conductors helps installers identify what phase or line they are working on. Identification of phases and lines will help prevent the overloading of the grounded conductor.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-54 Log #4371 NEC-P02 **Final Action: Reject**

(210.5(C))

Submitter: Dale Voss, Specht Electric

Recommendation: 210.5 (C) UNDERGROUNDED CONDUCTOS *(Return to 2005 NEC wording)*

Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit, <u>WHERE ACCESSIBLE</u>, shall be identified by ~~phase or line and system at all termination, connection, and splice points~~ <u>SYSTEM</u>. The means of identification shall be permitted to be by separate color coding, marking tape, tagging or other approved means. ~~The method utilized for conductors originating within each branch-circuit panel board or similar branch-circuit distribution equipment shall be documented in a manner that is readily available or~~ <u>AND</u> shall be permanently posted at each branch-circuit panel board or similar branch-circuit distribution equipment.

Substantiation: Color coding would be in conflict when a forward and reversing starter switches around two of the phase conductors to change motor rotation.

When establishing three-phase motor rotation, varying from fractional to thousand horsepower motors, one possible application would be to use a phase rotation meter which would be connected to the motor leads. By manually turning the motor shaft, which would establish the electrical rotation of the motor lead and by establishing the rotation of the supply leads to the motor would then give a correct rotation to that particular application.

The problem is that the motor mechanical connection might not be that easily disconnected to be able to use the motor phase rotation meter on the motor leads. At this time, it is possible that the actual motor rotation will not be known or the machine is unable to be run from lubrication, cooling requirements, etc.

It may be hard to get the wiring to the motor; and as construction is completed, may make it even harder to verify or modify connection rotation.

As the motors get bigger, the lead connections are harder to make up and the temporary separation of leads at higher voltage become more difficult. To apply power to verify rotation presents an Arc Flash condition from a safety standpoint and a barrier distance requirement to safely conduct the test to verify the rotation of the motor.

Why can't the last load terminations, either in a starter disconnect combination, an MCC or the disconnect located by the motor be the starting point where the leads are taken to the motor where no color marking is needed. Rotation can easily and safely be changed by switching two of the motor leads. Also depending on the phase colors, one of those colors could be used on all three leads to establish the motor voltage.

Panel Meeting Action: Reject

Panel Statement: The panel continues to affirm that the phase and line identification is an essential safety consideration. The panel considers identification at all termination, connection, and splice points to be the locations where the marking is necessary. It is not the objective of the panel to detail every possible identification scenario. The substantiation does not support the proposal to revise this requirement for all installations. See panel statement on Proposal 2-53.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-55 Log #4505 NEC-P02 **Final Action: Reject**

(210.5(C))

Submitter: Steven F. Wydeveld, Village of Homer Glen / Rep. Building Code Development Committee (BCDC)

Recommendation: Revise text to read as follows:

210.5(C) The method utilized for conductors originating within each branch-circuit panelboard or similar branch circuit distribution equipment shall be documented in writing in a<u>n</u> ~~manner that is readily available~~ approved manner or shall be permanently posted at each branch-circuit panelboard or similar branch circuit distribution equipment.

Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.

The term "manner that is readily available" is unclear and subjective, which is unnecessary because it is to be in an approved manner by the AHJ. An AHJ requires that all documentation be in writing and the addition of 'approved manner' allows the AHJ the flexibility on where and how the identification shall occur.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the addition of the wording "in writing" and change to "in an approved manner". Documentation is typically in writing. The documentation does not have to be posted on the panel board just available similar to documentation for a cable numbering system. Submitter's proposal removes the "readily available" requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: This proposal should have been accepted in part. I agree with the panel that the requirement for the documentation to be "readily available" should not be deleted. But disagree with the rest of the statement. Requiring the documentation to be in writing adds clarity and is easier to enforce by the authority having jurisdiction. The addition of the word "approved" would ensure that the method is acceptable to the Authority Having Jurisdiction.

2-56 Log #4301 NEC-P02 **Final Action: Reject**

(210.6(2))

Submitter: Robert Kopelman, Rockville Centre, NY

Recommendation: Add new text as follows:

210.6 Branch-Circuit Voltage Limitations.

All outlets shall have thermal protection including GFI combination thermal outlets.

(2) Cord-and-plug-connected loads 1440 volt-amperes, nominal, or less than 1/4 hp

The term similar occupancies in 210.6(A) refers to sleeping rooms in dormitories, fraternities, sororities, nursing homes, and other such facilities. This requirement is intended to reduce the exposure of residents in dwellings and similar occupancies to electric shock hazards when using or servicing permanently installed luminaires and cord-and-plug-connected portable lamps and appliances.

Substantiation: There is a major problem called a glowing connection. As UL 1699 Scope states — AFCIs "1.3 These devices are not intended to detect glowing connections". Glowing connections are a major cause of fires. There is a new UL document 498 with thermal protection that states that device shall detect abnormal heating in 8 locations in an outlet. These 8 locations are where overheating can and does occur. I have provided documents showing that an AFCI starts to detect Arcs at 5 amps. Also provided are forensic documents showing that the glowing connection can occur with 1 amp. Most electricians and inspectors have never seen a glowing connection because it happens inside the wall. But, take an outlet and put a load on it, loosen the screw terminal in a dark room and it is freighting. The screw terminals loosen up over time due to the differential of expansion and contraction of the metals involved. A minute air gap is formed and the natural vibrations of the earth and the vibrations caused by normal living circumstances help to create the glowing connection.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Product is currently listed as a receptacle with no evaluation of its ability to enhance the safety of wiring devices. A thorough study of wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. Installation of these devices is not currently prohibited by the NEC.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-57 Log #4302 NEC-P02 **Final Action: Reject**

(210.6(A))

Submitter: Robert Kopelman, Rockville Centre, NY

Recommendation: Add new text as follows:

(A) Occupancy Limitation. In dwelling units and guest rooms or guest suites of hotels, motels, and similar occupancies, the voltage shall not exceed 120 volts, nominal, between conductors that supply the terminals of the following <u>(The outlets in these areas shall be thermally protected).</u>

The term similar occupancies in 210.6(A) refers to sleeping rooms in dormitories, fraternities, sororities, nursing homes, and other such facilities. This requirement is intended to reduce the exposure of residents in dwellings and similar occupancies to electric shock hazards when using or servicing permanently installed luminaires and cord-and-plug-connected portable lamps and appliances.

Substantiation: There is a major problem called a glowing connection. As UL 1699 Scope states — AFCs "1.3 These devices are not intended to detect glowing connections". Glowing connections are a major cause of fires. There is a new UL document 498 with thermal protection that states that device shall detect abnormal heating in 8 locations in an outlet. These 8 locations are where overheating can and does occur. I have provided documents showing that an AFCI starts to detect Arcs at 5 amps. Also provided are forensic documents showing that the glowing connection can occur with 1 amp. Most electricians and inspectors have never seen a glowing connection because it happens inside the wall. But, take an outlet and put a load on it, loosen the screw terminal in a dark room and it is freighting. The screw terminals loosen up over time due to the differential of expansion and contraction of metals involved. A minute air gap is formed and the natural vibrations of the earth and the vibrations caused by normal living circumstances help to create the glowing connections.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-56.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-58 Log #2299 NEC-P02 **Final Action: Accept in Principle**
(210.6(C)(1))

Submitter: John Marshall, Underwriters Laboratories Inc.

Recommendation: Article 210.6(C)(1) – Revised to read

"Listed electric-discharge <u>or light emitting diode type</u> luminaires."

Substantiation: LED luminaires will also be powered from 277 V circuits.

Panel Meeting Action: Accept in Principle

Revise Section 210.6(C)(1) text as follows:

"Listed electric-discharge or listed light emitting diode type luminaires."

Panel Statement: The panel has clarified that "light emitting diode type luminaries" shall be listed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ORLOWSKI, S.: It may be preferable to list these two different types of light methods in separate lines as are the other different types of methods listed in the section.

2-59 Log #2978 NEC-P02 **Final Action: Accept**
(210.7)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise text to read as follows:

~~210.7 Branch-Circuit Requirements for Device Connections and Locations.~~
<u>210.7 Multiple Branch Circuits</u>
~~(A) Receptacle Outlet Location. Receptacle outlets shall be located in branch circuits in accordance with Part III of Article 210.~~
~~(B) Multiple Branch Circuits.~~
Where two or more branch circuits supply devices or equipment on the same yoke, a means to simultaneously disconnect the ungrounded conductors supplying those devices shall be provided at the point at which the branch circuits originate.

Substantiation: 210.7(A) serves no purpose, as compliance with Part III of the article is not an option. The title of this section does not lend to the requirement of existing subsection (B), making the requirement difficult to find for newer Code users. This proposal makes the Code a more user friendly document.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-60 Log #3673 NEC-P02 **Final Action: Reject**
(210.7(B))

Submitter: Mark Smythe, Smythe Electric Inc.

Recommendation: Delete 210.7(B) in its entirety.

Substantiation: 210.7(B) is redundant as new 2008 210.4(B) does already encompass the intent of 210.7(B).

210.4(B) Disconnecting Means. "Each multiwire branch circuit shall be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates."

Panel Meeting Action: Reject

Panel Statement: Multiple branch-circuits are different than multiwire branch circuits in that they do not need a line to neutral connection. Removing this section from the code would greatly increase the hazard of electric shock or electrocution to qualified persons servicing these systems.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-61 Log #4580 NEC-P02 **Final Action: Reject**
(210.7(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Delete the words "at the point at which" and replace them with "within or immediately adjacent to the panelboard or other location where."

Substantiation: This proposal clarifies that a double pole snap switch operated in accordance with 404.8(C) and located immediately adjacent to a panelboard could serve as the disconnecting means for two branch circuits supplying equipment on a common device yoke. Without such permission, fusible panelboards cannot be used to supply such equipment, which is excessive. It is also the only option where two circuits leave a panel from two different locations therein or are of two different amperages, as frequently occurs where 210.52(B)(1) Exception No. 1 is used in a dining room. Assuming the switch is installed in accordance with the marking requirement in 110.22(A), it will meet the safety objectives of this section of the NEC. This rule must be distinguished in intended application from the simultaneous disconnecting requirement in 210.4(C) Exception No. 2, where the intent is to disallow any possibility of single-pole disconnection for electrical as distinguished from maintenance reasons. The section at issue in this proposal addresses the safety of those who would maintain multi-circuited equipment, and who will be visiting the panelboard to disconnect power. A simultaneous trip is not required, only the evident availability of safe disconnection.

Panel Meeting Action: Reject

Panel Statement: The submitter's proposed text is vague and unenforceable. The present text is clear and provides the AHJ with prescriptive requirements in which to determine what is a practical and safe installation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-62 Log #4865 NEC-P02 **Final Action: Reject**
(210.7(B))

Submitter: John Steinke, Amish Electric

Recommendation: Add: Where, in a single phase system, a device has both a two-pole and a single-pole outlet on the same yoke, a three-pole disconnect will be used.

A companion proposal has been submitted to 408.36(C).

Substantiation: There exist combination devices that, for example, have a 240v receptacle and a 120v receptacle mounted on the same yoke. One ought to have these both become disconnected at the same time, as with a multi-wire branch circuit.

Yet, 408.36(C) would seem to prohibit this practice. I do not believe that was the intent of 408,36 as that section addresses an obsolete device that was used to 'create' limited three phase power from a single phase source.

210.4(C) appears to address this issue, and even to allow one 'leg' of the two-pole circuit to also supply the single-pole device, but I believe the NEC needs to be more specific.

Panel Meeting Action: Reject

Panel Statement: The present text already addresses the submitter's concerns. Simultaneous disconnection is currently required for multiple branch circuits supplying a single contact device.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-63 Log #471 NEC-P02 **Final Action: Reject**
(210.8)

Submitter: Lanny G. McMahill, Phoenix, AZ

Recommendation: Revise the Section as follows:

210.8 Ground-Fault Circuit-Interrupter Protection for Personnel.

FPN: See 215.9 for ground-fault circuit-interrupter protection for personnel on feeders.

(A) ~~Dwelling Units~~ <u>All Occupancies</u>. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (8) shall have ground-fault circuit-interrupter protection for personnel.

(1) Bathrooms.

(2) Garages, and also accessory buildings that have a floor located at or below grade level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use.

(3) Outdoors.

Exception <u>No. 1</u> to (3): Receptacles that are readily accessible and are supplied by a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with 426.28.

<u>*Exception No. 2 to (3): In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power is interrupted or having a design that is not compatible with GFCI protection.*</u>

(4) Crawl spaces — at or below grade level.

(5) Unfinished basements — for purposes of this section, unfinished basements are defined as portions or areas of the basement not intended as habitable rooms and limited to storage areas, work areas, and the like.

Exception to (5): A receptacle supplying only a permanently installed fire alarm or burglar alarm system shall not be required to have ground-fault circuit-interrupter protection.

FPN: See 760.41(B) and 760.121(B) for power supply requirements for fire alarm systems.

Receptacles installed under the exception to 210.8(A)(5) shall not be considered as meeting the requirements of 210.52(G).

(6) Kitchens — where the receptacles are installed to serve the countertop surfaces.

(7) ~~Laundry, utility, and wet bar~~ <u>Sinks</u> — where the receptacles are installed

within 1.8 m (6 ft) of the outside edge of the sink.

Exception No. 1 to (7): In industrial laboratories, receptacles used to supply equipment where removal of power would introduce a greater hazard shall be permitted to be installed without GFCI protection.

Exception No. 2 to (7): For receptacles located in patient care areas of health care facilities other than those covered under 210.8(B)(1), GFCI protection shall not be required.

(8) Boathouses.

~~**(B) Other Than Dwelling Units.** All 125 volt, single-phase, 15 and 20 ampere receptacles installed in the locations specified in (1) through (5) shall have ground fault circuit interrupter protection for personnel:~~

~~(1) Bathrooms~~

~~(2) Kitchens~~

~~(3) Rooftops~~

~~(4) Outdoors~~

~~*Exception No. 1 to (3) and (4): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow melting or deicing equipment shall be permitted to be installed without GFCI protection.*~~

~~*Exception No. 2 to (4): In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power is interrupted or having a design that is not compatible with GFCI protection.*~~

~~(5) Sinks - where receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.~~

~~*Exception No. 1 to (5): In industrial laboratories, receptacles used to supply equipment where removal of power would introduce a greater hazard shall be permitted to be installed without GFCI protection.*~~

~~*Exception No. 2 to (5): For receptacles located in patient care areas of health care facilities other than those covered under 210.8(B)(1), GFCI protection shall not be required.*~~

(~~C~~B) Boat Hoists. GFCI protection shall be provided for outlets not exceeding 240 volts that supply boat hoists installed in dwelling unit locations.

Substantiation: This is an effort to consolidate and clarify the requirements for GFCI protection for Dwelling Units (A) and Other than Dwelling Units (B). There is no intent to change the primary requirements.

Logically, the shock hazards are the same for the given areas, so the personnel protection requirements should be the same too. This proposed change is intended to make the requirements easier to understand and enforce — there is no intent to change the requirements. To clarify:

The title of subsection (A) has been changed to “All Occupancies”. The words “Laundry, utility, and wet bar” have been removed from the requirements for Sinks — the requirement should apply to all sinks. If necessary, a note could be included after Sinks to indicate that sinks include “Laundry, utility, and wet bar” sinks. The Exceptions for Roofs and Outdoors have been maintained; however, the word Roofs has been removed from the main rule as a roof is generally an outdoor location. This is intended to eliminate confusion as to the difference between a roof and an outdoor location. Regardless, the word Roofs could be included in the requirement if necessary. The Exceptions for sinks have also been maintained, and the Exception to Outdoors for snow melting and deicing equipment has been maintained with the reference to Section.

Again, there is no intent to change the primary requirements of the subsections; only an effort to consolidate and clarify the requirements.

Panel Meeting Action: Reject

Panel Statement: The proposal has changed the requirements for dwelling units and non-dwelling units without any substantiation.

Number Eligible to Vote: 12

(210.8)

Submitter: Chris B. Boettcher, Primary Electric, Inc.

Recommendation: Add new text as follows:

Add an exception to state GFCI not required on sump pump cord and plug connected as long as a single yoke receptacle or locking type receptacle is used.

Substantiation: Will prevent false tripping of GFCI which could cause the sump pump not to run.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 2-73.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-65 Log #3598 NEC-P02 **Final Action: Reject**
(210.8)

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Add new text to read as follows:

210.8 Ground-Fault Circuit-Interrupter Protection for Personnel. Where ground-fault circuit interrupter protection for personnel is supplied by plug-and-cord-connection, it shall be listed as portable GFCI protection or provide a level of protection equivalent to a portable GFCI, whether assembled in the field or at the factory.

FPN: See 215.9 for ground-fault circuit-interrupter protection for personnel on feeders.

[remainder of 210.8 unchanged by this Proposal]

Substantiation: “Portable GFCIs” are required by the trinational *Standard for Ground-Fault Circuit-Interrupters, NMX-J-520-ANCE-2006* 1, *CSA C22.2 No. 144.1-06* 2, *ANSI/UL943-2005* 3, Clause 6.7.2.1, and construction-site portable power-distribution equipment is similarly required by standard *Portable Power-Distribution Equipment, UL1640* 3, Clauses 53.3 - 53.5 and 63.3 - 63.4, additionally to de-energize the “load” output contacts and terminals when one or more of the following defects occurs:

the grounded conductor to the power supply is opened

the grounded conductor is transposed with an ungrounded conductor to the power supply

one of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened

When Underwriters Laboratories (in UL product category KCXS) and CSA International (in CSA product class 1451-81) list such products, both certifiers specifically identify these as “portable GFCIs” to differentiate them from other GFCIs. Listed portable GFCIs can be embodied not only as GFCI plugs and in-line GFCI cord sets but even some GFCIs for permanent wiring such as SOME faceless GFCI receptacles can be additionally Listed and identified as portable GFCIs.

[1] Asociación de Normalización y Certificación (Association of Standardization and Certification),

[2] Canadian Standards Association

[3] Underwriters Laboratories Inc.

When conventional GFCIs intended for permanent, inspected hard-wiring are used in what should be portable GFCI applications, where the any of the indicated defect conditions occur, the ground-fault-detection circuitry is NOT powered and the GFCI protection cannot operate but power is nonetheless delivered UNinterrrupted EVEN IN THE PRESENCE OF A GROUND-FAULT. Any GFCI protection the user assumes is present is in fact UNAVAILABLE.

Amongst those NOT directly involved in GFCI manufacture who are nonetheless involved with this *Code*, there is a significant misperception that GFCI protection of personnel will provide a panacea against ALL causes of lethal electric shock. Due to their misunderstanding of the differences between GFCIs for permanent installation and portable GFCIs, a significant number of cord reel manufacturers unwittingly extrapolated their Listings for portable (cord-and-plug-connected) cord reels [having ordinary receptacles as outlet components] and their Listings for HARD-WIRED cord reels acceptably having GFCI receptacles as outlet components, without the overt knowledge of at least two major certifiers, to incorrectly encompass portable (cord-and-plug-connected) cord reels having GFCI receptacles (no open neutral protection) as outlet components where portable GFCI protection (with open neutral protection) was warranted.

It is also common to find cord-and-plug-connected field assemblies employing GFCI receptacles (no open neutral protection) as outlet components rather than portable GFCI protection (with open neutral protection) of the outlets. Some times, these are field repairs misperceived as safety upgrades where conventional receptacles in plug-and-cord-connected equipment are replaced with conventional GFCI receptacles. Furthermore, field repairs of plug-and-cord-connected equipment are occasionally encountered where portable GFCIs (faceless-receptacle-type) have been field-replaced with more-readily available, conventional GFCI receptacles under the mistaken belief that they are equivalent. In either situation, where the indicated defects occur, the user has a false sense of security because power is still delivered.

Companion proposals have been made to 100 “Ground-Fault Circuit Interrupter (GFCI), *Portable (as applied to ground-fault circuit interrupters)*” [NEW], to 215.9, to 518.3(B)†, and to 590.6.

† NOTE: That 518.3(B) proposal regarding portable GFCI protection is separate from another proposal I submitted for 518.3(B) involving GFCI protection required elsewhere in the *Code*.

Panel Meeting Action: Reject

Panel Statement: 210.8 currently requires receptacles that are installed at the outlet to have GFCI protection. This requirement cannot be met with a portable GFCI device.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ORLOWSKI, S.: In addition to the Panel Statement, the proposed provision seems to apply more to temporary wiring such as that used on a job site covered under Article 590 - Temporary Installations. Federal OSHA regulations already cover this use of these types of devices.

2-66 Log #4330a NEC-P02 **Final Action: Reject**
(210.8)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 18 for action in Article 406.
This action will be considered by the panel as a public comment.
Submitter: Steven Orlowski, National Association of Home Builders
Recommendation: Revise Text:
406.11 Tamper-Resistant Receptacles in Dwelling Units.
In all areas specified in ~~210.52~~ 210.8, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.
Add New Section:
210.8 Tamper Resistant Receptacles Protection for Children.
(A) Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles shall be tamper-resistant where the receptacle is located within 44 inches of the finished floor in the habitable rooms of the dwelling unit. Tamper resistant receptacles shall no be required in the following locations specified in (1) through (7).
(1) Bathrooms
(2) Garages, and also accessory buildings that have a floor located at or below grade level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use
(3) Outdoors
(4) Crawl spaces — at or below grade level
(5) Unfinished basements — for purposes of this section, unfinished basements are defined as portions or areas of the basement not intended as habitable rooms and limited to storage areas, work areas, and the like
(6) Kitchens where the receptacles are installed to serve the countertop surfaces or appliances
(7) Laundry, utility, and wet bar sinks
(Renumber subsequent sections)
A companion proposal has been sent to CMP-18 for action on the 406.11 portion of this proposal.
Substantiation: Currently the code requirement for tamper-resistant receptacles is too broad in scope and requires tamper-resistant receptacles in areas of the home that should not pose a threat to, or are inaccessible to, young children. This proposal lists several locations within the dwelling where there is no need to provide safeguarding for unattended children. Receptacles that are not readily accessible or that are dedicated for equipment should not be required to be tamper resistant. Examples of these areas that tamper-resistant receptacles should not be required are those found in attics, crawlspaces, mechanical rooms, behind equipment such as dishwasher, stoves, refrigerators, countertops, etc. To require tamper-resistant receptacles in these and other areas, not accessible to children under the age 5, shows a lack of forethought for this code requirement. Regarding last cycle, there were some members of the committee who felt it was best to require all the receptacles within the dwelling to be protected so the installer would not mistakenly miss a location. This belief is unfounded and may reflect a misunderstanding on the abilities of the electrician. For years now, along with all of the other NEC requirements one needs understand, installers have the knowledge to know which circuits are required to be connected to AFCI and which receptacles require GFCI protection. With proper training and clearly identifying the required locations for tamper resistant receptacles within the NEC, the installer will not be confused.
Panel Meeting Action: Reject
Panel Statement: Many of the locations described in the submitter's substantiation are accessible to children.
The panel recommends to the TCC that this proposal be sent to CMP-18 for consideration for action in Article 406.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-67 Log #4327 NEC-P02 **Final Action: Reject**
(210.8(5)() Exception)

Submitter: Steven Orlowski, National Association of Home Builders
Recommendation: Add new text to Exception 210.8(5)
Exception to (5): A receptacle supplying only a permanently installed sump pump, fire pump, fire alarm or burglar alarm system shall not be required to have ground-fault circuit-interrupter protection.
Substantiation: Based on the importance of these life safety and property protection systems, which are required by the building and life-safety codes, the proposed additional protection systems should be included in this Exception to insure these are provide with an uninterrupted power supply in an emergency situation. The life safety protection afforded by sump pumps and fire pumps provide the same level of property and life safety protection as do fire alarms and burglar alarm system. By not including these devices, the loss of power to any of these devices could pose a substantial loss to the building occupants or property owner.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 2-73. The panel rejects the addition of fire pumps. Installation requirements for fire pumps is covered in Article 695.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-68 Log #310 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Joel A. Rencsok, Scottsdale, AZ
Recommendation: Delete item 2. titled Garages.
Delete item 8. titled Boathouses.
Substantiation: These two items do not belong in dwelling units.
See definition of dwelling unit; Garages and Boathouses are not included in this definition.
Definition: A single unit, providing complete and independent living facilities for one or more persons, including permanent provisions for living, sleeping, cooking and sanitation.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter that the present definition of a dwelling unit does not cover dwelling unit garages and boathouses. The phrase "facilities for living" includes storage, garage, outdoor spaces, and boathouses that are accessories of the dwelling unit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-69 Log #670 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Les Amburgey, Ambark Electrical Service
Recommendation: I would like to see a GFI receptacle with an alarm built in. The alarm can monitor current before providing the GFI protection. So if no current is detected over a period of 3 hours, an alarm sounds, alerting the homeowner. The 3 hour period should allow for the auto defrost, however, it would be nice if the time limit was programmable.
Substantiation: The problem with GFI receptacles on a residential refrigerator is not that the GFI won't work, but that the GFI will kick out at some point due to various reasons and the home owners will lose food. This occurs in the extra freezer or refrigerator in the garage or basement more than in the kitchen.
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as is required by 4.3.3(C) of the NFPA Regulations Governing Committee Projects. The wording to be added, revised, and how revised, or deleted is not specified in the recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-70 Log #689 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Keith M. Whitesel, Whitesel Electric
Recommendation: Reinstate the exceptions for dedicated space equipment to the GFCI requirement for 210.8(A) from the 2005 NEC.
Substantiation: While I agree that sump pump motors and refrigerators or freezers do not cause nuisance tripping, the nuisance tripping still occurs. This can cause a great deal of damage to the property.
I live in a flood zone and if my sump pump were to be connected to a GFCI (which it was) and the GFCI were to nuisance trip (which it did) my basement would flood every time it rained more than 1 in.
GFCIs in my area trip many times during lightning storms. My freezer would have thawed numerous times had it been connected to a GFCI. This would have caused hundreds of dollars in lost food.
The purpose of the code as stated in 90.1 is the protection of people AND property.
By removing the exceptions for GFCI protection on ALL receptacles in basements/garages, you clearly have the potential to cause damage to the property when nuisance tripping occurs.
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as is required by 4.3.3(C) of the NFPA Regulations Governing Committee Projects. The wording to be added, revised, and how revised, or deleted is not specified in the recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-71 Log #2422 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
Article 100
DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified

that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.
Substantiation: If Power Safe Protector is accepted in 210.8 only, a definition will be needed. There is a proposal for Article 100 also.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 2-72 precludes the need for a definition in this article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-72 Log #2423 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
210.8 ~~Ground-Fault Circuit-Interrupter~~ Power Safe Protector Protection for Personnel.
(A) Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (8) shall have ~~ground fault circuit-interrupter~~ power safe protector protection for personnel.
Substantiation: The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a “Power Off” safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There are no product requirements for PSP protection. A thorough study of wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. Installation of these devices is not currently prohibited by the NEC.
The requirements for delivery of power and thermal sensing are associated with the receptacle itself and should be reviewed by CMP-18.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-73 Log #3750 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: After item (8) in 210.8(A) add the following Exception:
Exception to (3), (4) and (5): It shall be permitted to omit GFCI protection for a receptacle installed to provide power to a cord and plug connected sump pump or sewage lift pump where the receptacle is a single receptacle and supplied from an individual branch circuit.
Substantiation: The deletion of the exceptions in 210.8(A) for the 2008 NEC cycle has met with some opposition from local authorities because of the application of GFCI to sump pumps or sewage lift pumps. For the record, it is recognized that these pumps are indeed compatible with GFCI protection in that their leakage current is limited by the product standards to.75 mA. However, even with this compatibility there is still significant reservation with GFCI application in both of these applications.
This proposal is to provide some relief, but with very specific limitations.
1) It is specific to sump pumps and sewage lift pumps. I would certainly agree that the panel should not add back in a general exception for appliances. These two applications are very specific.
2) The exception requires that a single receptacle be installed which would limit the connection of other devices.
3) The exception would require an individual branch circuit be installed. If the power continuity considerations are so significant that there is concern for having GFCI protection, then it would make sense that one of the trade offs be that the circuit only supply that application. This would support the stated concern for continuity of power by limited what other connected loads could potentially result in power failure.
Although I do not have significant concern in having GFCI protection in these applications, the objective is to try and satisfy some of the concerns expressed by AHJs.
The best placement of the exception is somewhat difficult to determine based on the layout of 210.8(A). Since the exception is intended to apply to three of the items in the list, it seemed to make the most sense to located it at the end and indicate which of the items in the list it applies to. Alternatively, the panel could add the exception to each of the three items in the list, but that seemed to be too redundant.
Panel Meeting Action: Reject
Panel Statement: The panel continues to maintain the position that this equipment is compatible with GFCI. Instructions provided with many listed sump pumps require or recommend GFCI protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-74 Log #2426 NEC-P02 **Final Action: Reject**
(210.8(A), (B), (C), and (D))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
210.8 ~~Ground-Fault Circuit-Interrupter~~ Power Safe Protector Protection for Personnel.
(A) DEFINITION: A Power Safe Protector (PSP) device is designed to keep the power off until a circuit check can assure that any connected appliance or equipment are free of ground faults, or short circuits, and that the connected appliance or equipment has actually been switched on. Only then will the PSP device be energized. It will continue to protect from ground faults, series arc-faults and overheating of the supply wire connections while energized by turning the PSP device off when there is a problem. The PSP device will then sound an audible sound and flash a red indicator light to call attention to the problem. The PSP device will automatically reset when problem is cleared. The PSP device will illuminate a steady green indicator light when energizing any appliance or other equipment.
(B) ~~(A)~~ Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (8) shall have ~~ground-fault circuit-interrupter~~ power safe protector protection for personnel.
(C) ~~(B)~~ Other Than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) shall have ~~ground-fault circuit-interrupter~~ power safe protector protection for personnel:
(1) Bathrooms
(2) Kitchens
(3) Rooftops
(4) Outdoors
Exception No. 1 to (3) and (4): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed without ~~GFCI~~ PSP protection.
Exception No. 2 to (4): In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power is interrupted or having a design that is not compatible with ~~GFCI~~ PSP protection.
(5) Sinks - where receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.
Exception No. 1 to (5): In industrial laboratories, receptacles used to supply equipment where removal of power would introduce a greater hazard shall be permitted to be installed without ~~GFCI~~ PSP protection.
Exception No. 2 to (5): For receptacles located in patient care areas of health care facilities other than those covered under 210.8(B)(1), ~~GFCI~~ PSP protection shall not be required.
(D) ~~(C)~~ Boat Hoists. ~~GFCI~~ PSP protector protection shall be provided for outlets not exceeding ~~240~~ 125 volts that supply boat hoists installed in dwelling unit locations. 240 volt hoist shall have GFCI protection.
Substantiation: The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a “Power Off” safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-72.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-75 Log #311 NEC-P02 **Final Action: Reject**
(210.8(A) Exception to (5))

Submitter: Forrest R. Currier, Currier Electric
Recommendation: Revise text to read as follows:
~~A~~ Receptacles supplying ~~only a~~ permanently installed fire alarm, or burglar alarm systems, or that is dedicated solely for the condensate pump of a heating system shall not be required to have ground-fault circuit-interrupter protection.
Substantiation: Forced hot air heating units are being used in concert with air conditioning requiring a condensate pump to expel moisture from the system, also some forced hot water heating units are now being installed that come from the manufacturer with a prewired receptacle for the condensate pump as well. Requiring this outlet to be ground-fault circuit-interrupter protected could on a false trip prevent the pump to work and cause damage to the heating unit as well as personal properties.
I would also add that 210.63 mandates a receptacle within 7.5 m (25 ft) and on the same level as the heating unit for servicing of the equipment which must not be connected to the load side of the equipment disconnecting means, whereas the receptacle for the condensate pump in the manufactured units are connected to the load side.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any substantiation to indicate that listed condensate pumps for heating and air conditioning systems are not compatible with listed GFCI devices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-76 Log #4712 NEC-P02 **Final Action: Reject**
(210.8(A) Exception No. 1 to (5))

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Designate existing Exception #2 as Exception (1) to (5) Single receptacles not readily accessible for sump pumps and sewer ejector pumps.
Substantiation: Many complaints have been received when GFCI tripped out creating additional hazards.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 2-73.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-77 Log #1735 NEC-P02 **Final Action: Accept in Principle in Part**
(210.8(A)(2))

Submitter: Jared Boone, Wichita Electrical JATC
Recommendation: Revise text to read as follows:
210.8(A)(2) Garages, and also accessory buildings that have a floor located at or below grade level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use. The test/reset function in these locations shall be in a readily accessible location.
Exception to (2): A receptacle supplying only a permanently installed fire alarm or burglar alarm system shall not be required to have ground-fault circuit-interrupter protection.
Substantiation: This proposal is the work of a task group formed by the 2nd Year Apprenticeship Class 2B of 2008. Jared Boone, Darrious Davis, Kyle Davis, Christopher Dennis, Bryan Harvey, Clayton Horsch, David Poland, Corey Smet, Robert Thurman, Caleb Wiechman, and Darryl Hill. This task group has concluded the following Substantiation:
In the case that there may be receptacles in garages and similar areas that may not be readily accessible and because it is recommended that GFCIs be tested monthly, we feel that these devices may never be tested and reset because of their location. We realize homeowners probably do not have a regular program for testing their GFCIs, but they may check them occasionally. GFCIs not in a readily accessible location, will most likely never be tested because of the extra effort to access their location. We feel that the location of the test/reset function should be in a location that is readily accessible to the occupant of the dwelling unit.
The second part of this proposal is extracted from the exception for unfinished basements. The proposed exception addresses the possibility of fire alarm and home security systems being installed where this code elsewhere requires GFCI protection. We feel that the builder or homeowner should have the option of using a device that is not GFCI protected. If the power supply requirements per other sections in the code exempt these systems from being GFCI protected and these systems were to be installed in accessory buildings or a detached garage, then we should have this exception for this requirement also.
Panel Meeting Action: Accept in Principle in Part
Add a new second sentence to the main paragraph of 210.8(A) and 210.8(B) to state, "The ground-fault circuit-interrupter shall be installed in a readily accessible location."
Reject the remainder of the proposal.
Panel Statement: The panel agrees that the GFCI should be readily accessible location.
The panel did not add the proposed exception since the installation of fire and/or burglar alarm control panels in garages is uncommon.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-78 Log #2766 NEC-P02 **Final Action: Reject**
(210.8(A)(2))

Submitter: Vern Hertz, North Dakota State Electrical Board
Recommendation: Add new text to read as follows:
Exception to (2): GFCI protection shall not be required if a single receptacle is installed for garage door openers.
Substantiation: There are garages without a means of egress and if outlet tripped there would be no way to get into the building. Also, many school kids and families use key codes as a way to enter the home if the key is lost or do not have a key with them. By a single receptacle, it would eliminate people plugging in additional items such as, cord reels, ceiling lights, etc.
Panel Meeting Action: Reject
Panel Statement: The submitter of this proposal has not submitted any substantiation to support his statement that listed GFCI devices are not compatible with listed garage door openers. Electric garage door openers are required to have an emergency release cord for manual operation of the door during a power outage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-79 Log #3497 NEC-P02 **Final Action: Reject**
(210.8(A)(2))

Submitter: Steven Stier, Stier Electric Co., Inc.
Recommendation: Add text to read as follows:
Exception to (2): Garage door opener receptacles which are located at least 8 ft above ground.
Substantiation: Prevent homeowners from being unable to raise garage door in rainy/wet weather.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with exempting receptacles at elevated locations from GFCI protection. These receptacles may supply equipment that is located in a readily accessible location of a garage that should require GFCI protection. There is insufficient substantiation provided to indicate that GFCIs are incompatible with garage door openers. See panel statement on Proposal 2-78.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-80 Log #3588 NEC-P02 **Final Action: Reject**
(210.8(A)(2))

Submitter: Peter Hoekstra, Technical Consultant for the Association of Home Appliance Manufacturers
Recommendation: Add new text to read as follows:
Exception to (2): A single receptacle or a duplex receptacle for two appliances located within the dedicated space for each appliance that, in normal use, is not easily moved from one place to another and is cord-and-plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).
Receptacles installed under the exception to 210.8(A)(2) shall not be considered as meeting the requirements of 210.52(G).
Substantiation: This exception was deleted in the 2008 NEC. Deviations from the 2008 NEC have been issued by individual states adopting the NEC.
The 2008 NEC requires refrigerators and freezers in garages to be located on GFCI circuits. While the extension of GFCI protection is applauded and supported by the industry of appliance manufacturers, manufacturers continue to observe problems with these appliances plugged into GFCI circuits. The issues are:
1. While there have been improvements to GFCI's to reduce unwarranted tripping, it still does occur. UL 843 Ground Fault Circuit Interrupters Section 6.8.4 b) allows the GFCI to trip 3 in 10 times when operated in adverse conditions and in 6.8.5 a) allows the GFCI to trip 3 in 100 times in normal use.
2. Garages may be unattended areas for long periods of time. This increases the possibility that users will not notice refrigerator or freezer appliances are off for a long period of time and the possibility that foodstuffs will be spoiled through no fault of the appliance. Manufacturers continue to experience service calls and consumer complaints for "nuisance" failures of GFCI's. The hazards of spoiled foodstuffs, potential food-borne diseases, and mold growth have much greater probability than the risk of electric shock.
3. There have been no electric shock incidents reported to CPSC for the last 10 years for refrigerators or freezers. All of these appliances are grounded.
4. While appliance manufacturers continue to lower leakage currents on new appliance products for increased safety, the shift in field population to new products takes more than 25 years.
5. No technical substantiation was provided for removal of this exception from the 2005 NEC.
6. Many manufacturers continue to stipulate in their owner's use and operation manuals that the appliance is not to be connected to a GFCI-

protected outlet.

7. GFCI protected circuits for refrigerators and freezers which are not easily moved may not be visible for inspection. The tripping of a GFCI may not be easily identified and may mislead the appliance user into initiating an unnecessary service call or cause the risk of injury from unnecessarily moving the appliance to reset a GFCI. This exception was deleted in the 2008 NEC. Deviations from the 2008 NEC have been issued by individual states adopting the NEC.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided sufficient substantiation to support his recommendation to remove the requirement for GFCI protection from all appliances. The panel maintains its position that equipment is compatible with GFCI.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-80a Log #CP200 NEC-P02 **Final Action: Reject**

(210.8(A)(2) and 210.8(A)(4))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" based on the lack of a proposal to Code-Making Panel 1 to define "Finished Ground Level."

Submitter: Code-Making Panel 2,

Recommendation: Revise text to read as follows

(2) Garages, and also accessory buildings that have a floor located at or below the finished ground level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use

(4) Crawl spaces — at or below the finished ground level.

Substantiation: The panel has developed a proposal to replace "grade" with a new defined term "finished ground level". The panel recognizes that if the definition of "finished ground level" is not accepted by CMP-1 then this proposal should be reported as Reject by the TCC.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-81 Log #796 NEC-P02 **Final Action: Reject**

(210.8(A)(2) and (5))

Submitter: David C. Hintermeister, Community Electric Inc.

Recommendation: Add new text to read as follows:

A single receptacle installed so as to be inaccessible, for the use of a refrigerated food storage appliance.

Substantiation: Freezers and refrigerators in basements and garages are no more dangerous than those in kitchens which are not required to be GFCI protected.

Panel Meeting Action: Reject

Panel Statement: The panel continues to maintain the position that this equipment is compatible with GFCI. The panel disagrees that refrigerators in "basements and garages are no more dangerous than those in kitchens. " The hazards associated with the use of electricity in damp and wet locations is well documented by CMP-2.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-82 Log #3450 NEC-P02 **Final Action: Reject**

(210.8(A)(2), Exception to (2))

Submitter: Larry Logan, Township of Princeton

Recommendation: Add text to read as follows:

Exception to (2): Single receptacles that are not readily accessible and supply power for garage door openers only.

Substantiation: It is a very common practice for women and older people to use the garage as a safe way to enter the house, thus, not subjecting themselves to burglars or rapists. It is also a very common practice for contractors to provide GFI protection to several outlets both inside the garage and outdoors by the use of one (1) device. If this device is tripped by a landscaper or worker who does not have access to the house, then this level of safety and security has been taken away. I also believe that no demonstrated hazard has been reported for a ground fault from a garage door opener.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-79.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-83 Log #797 NEC-P02 **Final Action: Reject**

(210.8(A)(2) Exception (New))

Submitter: David C. Hintermeister, Community Electric Inc.

Recommendation: Add Exception to read as follows:

Exception: A receptacle installed in an inaccessible location for an overhead door opener.

Substantiation: A residential door opener is typically a cord and plug appliance installed on the ceiling of a garage, and is normally inaccessible to anyone. Having it on a GFCI does nothing to promote public safety, and nuisance tripping can cause a security risk, as the garage door is typically the main family entrance to the home.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-79.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-84 Log #1399 NEC-P02 **Final Action: Reject**

(210.8(A)(2) Exception)

Submitter: Jayson Ouillette, Rep. IBEW Local 252

Recommendation: Add new text as follows:

Exception to (2): A receptacle supplying only a permanently installed fire alarm or burglar alarm system shall not be required to have ground-fault circuit-interrupter protection.

Substantiation: Many homes have fire alarm or burglar alarm systems installed in garages. THESE systems need to be exempt from GFCI protection to function reliably. The exception already exists for basements and needs to be extended to other areas where these systems are likely to be installed.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-77.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-85 Log #4704 NEC-P02 **Final Action: Reject**

(210.8(A)(2) Exception (New))

Submitter: Nicholas Neumann, Bridges Electric

Recommendation: Add new exception to (2)as follows:

Exception: Garage door openers shall not be GFCI protected if a single receptacle is installed.

Substantiation: If the GFCI receptacle trips when you are not home, you can still open the garage door and drive in.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-78.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-86 Log #4714 NEC-P02 **Final Action: Reject**

(210.8(A)(2) Exception (New))

Submitter: Robert P. McGann, City of Cambridge

Recommendation: Add new text as follows:

(2) Exception Single receptacles not readily accessable for garage doors, sump pumps or sewer ejector pumps.

Substantiation: Many complaints have been received when GFCI has tripped out on the above mentioned creating additional hazards.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 2-73. The panel rejects an exception for receptacles supplying garage door openers because the submitter has not provided adequate substantiation as to the greater hazard that could exist on these circuits.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-87 Log #1587 NEC-P02 **Final Action: Reject**

(210.8(A)(2) Exception to (2))

Submitter: Wilbur Davis, Davis Machine & Electric Service

Recommendation: Add new text to read as follows:

Exception to (2) A dedicated 15 or 20 ampere branch circuit that is for the sole purpose of supplying power to a refrigerator, freezer, or any type unit that is designed for the sole purpose of preserving food in a residential garage shall not be required to have GFCI protection, but the branch circuit supplying power to the above equipment shall have a 15 or 20 ampere twist lock receptacle installed.

Substantiation: Reason for this code exception: Many people go on vacation, or they may not frequent their freezer often, and have no idea the power is off in the garage. In the summer time, especially when there are many thunder storms, lightning can strike great distances from a residence and cause a GFCI to trip. A surge from the power company can also cause a GFCI to trip. A faulty piece of equipment on the same branch circuit can cause a trip.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel continues to maintain the position that this equipment is compatible with GFCI.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-88 Log #2168 NEC-P02 **Final Action: Accept**
(210.8(A)(3))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
Exception to (3): Receptacles that are not readily accessible and are supplied by a ~~dedicated~~ branch circuit dedicated to ~~for~~ electric snow-melting, ~~or~~ deicing, or pipeline and vessel heating equipment shall be permitted to be installed in accordance with 426.28, or 427.22, as applicable.
Substantiation: Dedicated branch circuit is not defined, and is often confused with the term “individual branch circuit”. With the confusion, it can be easily argued that the circuit for the snow melting or deicing equipment must supply only one outlet [Article 100], which is not the requirement.
Pipeline and vessel heating systems also contain provisions for GFPE protection, which should also be permitted in lieu of GFCI protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-89 Log #2293 NEC-P02 **Final Action: Reject**
(210.8(A)(3))

Submitter: Thomas D’Agostino, BSafe Electric, Inc.
Recommendation: It is proposed that 210.8(A) Dwelling Units) ((3) Outdoors) of Article 210 (Branch Circuits), which provides an exception for certain equipment from being required to be protected by either a ground-fault circuit-interrupter or an arc-fault circuit-interrupter, be revised to require additional protection as follows.
Chapter 1 General - Article 100 Definitions
Add an additional definition as follows:
Receptacle with an Integral Thermal Circuit-Interrupter
A receptacle with an integral thermal circuit-interrupter is a contact device, installed at the outlet for the connection of an attachment plug, that senses a temperature rise within the receptacle to a specified level and that interrupts electricity flow to the receptacle if the specified temperature is exceeded.
Chapter 2 Wiring and Protection - Article 210 Branch Circuits
210.8(A) Dwelling Units) ((3) Outdoors)
Change the Exception to (A)(3) to read as follows [New words underlined]
Exception to (3): Receptacles that are not readily accessible and are supplied by a branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with 426.28. Each 15- or 20- ampere receptacle that is not a ground-fault circuit-interrupter installed in a 125 volt, single phase branch circuit shall be protected by either:
1. a listed arc-fault circuit interrupter breaker, or alternately
2. being a listed integral arc-fault circuit interrupter receptacle, or alternately
3. being a listed receptacle with an integral thermal circuit-interrupter
Substantiation: The proposed revision is intended to offer the public benefits that would lessen a recognized (known) hazard or ameliorate a continuing dangerous condition or situation. This would be accomplished by recognizing an advance in the art of safeguarding property or life that was previously unavailable to the public.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Product is currently listed as a receptacle with no evaluation of its ability to enhance the safety of wiring devices. A thorough study of wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. Installation of these devices is not currently prohibited by the NEC. The panel rejects the definition because the Panel action on this proposal precludes the need for a definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-90 Log #2979 NEC-P02 **Final Action: Accept**
(210.8(A)(3))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-91 Log #720 NEC-P02 **Final Action: Reject**
(210.8(A)(3) Exception to No. (3))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text and add a new Fine Print Note to the *Exception* to read as follows:
210.8 Ground-Fault Circuit-Interrupter Protection for Personnel.
(A) Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (8) shall have ground-fault circuit-interrupter protection for personnel.
(3) Outdoors
Exception to (3): Receptacles that are not readily accessible and are supplied by a ~~dedicated~~ branch circuit identified in accordance with 408.4 as being solely for electric snow-melting or deicing equipment shall be permitted to be installed ~~in accordance with 426.28~~ without GFCI protection for personnel.
FPN: For receptacles supplying decorative lighting used for holiday lighting and similar purposes, see 590.6(A).
[remainder of 210.8 unchanged by this Proposal]
Substantiation: 426.28 that addresses ground-fault protection of EQUIPMENT would apply regardless of this Exception and has no bearing on GFCI protection of PERSONNEL encompassed by 210.8. This revision to 210.8(A)(3) *Exception to (3)* is identical to the revision to 210.8(B)(3) *Exception No. 1 to (3) and (4)* in the 2008 *NEC®*.
Clarification and the FPN are added to distinguish dedicated branch circuits used solely for electric snow-melting or deicing equipment from branch circuits used alternately for electric snow-melting or deicing equipment and then for decorative lighting and similar accessories for holiday lighting and similar purposes. Decorative lighting and holiday lighting accessories can extend downward to become accessible even though the receptacle from which they are supplied may not be accessible. Other than the usage of “dedicated branch circuit” in 210.8(A)(3) *Exception to (3)* and 210.8(B)(3) *Exception No. 1 to (3) and (4)*, the remainder of the *NEC®* addresses only dedicated SPACES requiring electricity, NOT electrical circuits. Other uses of “dedicated” in the *NEC®* as applied to specific equipment are for the NONelectrical attributes (structural, mechanical, ventilating, hydraulic, etc.).
Regarding the added FPN, roof-mounted snow-melting and deicing equipment (and the receptacles that supply it) is not accessible. Temporary installations of decorative lighting for holiday lighting typically hang substantially below the roofline and are frequently readily accessible.
Panel Meeting Action: Reject
Panel Statement: The requirements of 404.8 are already required and do not need to be referenced. The reference to 426.28 is necessary to clarify the exception. The panel rejects the addition of the FPN. It is the intent of this exception to allow for the connection of rooftop electric snow melting and deicing equipment only.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-92 Log #2294 NEC-P02 **Final Action: Reject**
(210.8(A)(5))

Submitter: Thomas D’Agostino, BSafe Electric, Inc.
Recommendation: It is proposed that 210.8(A) Dwelling Units) ((5) Unfinished Basements) of Article 210 (Branch Circuits), which provides an exception for certain equipment from being required to be protected by either a ground-fault circuit-interrupter or an arc-fault circuit-interrupter, be revised to require additional protection as follows.
Chapter 1 General - Article 100 Definitions
Add an additional definition as follows:
Receptacle with an Integral Thermal Circuit-Interrupter
A receptacle with an integral thermal circuit-interrupter is a contact device, installed at the outlet for the connection of an attachment plug, that senses a temperature rise within the receptacle to a specified level and that interrupts electricity flow to the receptacle if the specified temperature is exceeded.
Chapter 2 Wiring and Protection - Article 210 Branch Circuits
210.8(A) Dwelling Units) ((5) Unfinished basements))
Change the Exception to (A)(5) to read as follows:
Exception No. 1 to (5): A receptacle supplying only a permanently installed fire alarm ~~or burglar alarm~~ system shall not be required to have ground-fault circuit-interrupter protection. Each 15- or 20-ampere receptacle that is not a ground-fault circuit-interrupter installed in a 125 volt, single phase branch circuit shall be a receptacle with an integral thermal circuit-interrupter.
FPN: See 760.41(B) and 760.121(B)(2) for power supply requirements for fire alarm systems.
Add a new Exception to (A)(5) to read as follows:
Exception No. 2 to (5): A receptacle supplying only a permanently installed burglar alarm system shall not be required to have ground-fault circuit-interrupter protection. Each 15- or 20-ampere receptacle that is not a ground-fault circuit-interrupter installed in a 125 volt, single phase branch circuit, shall be protected by either:
1. a listed arc-fault circuit interrupter breaker, or alternately

2. being a listed integral arc-fault circuit interrupter receptacle, or alternately
3. being a listed receptacle with an integral thermal circuit-interrupter

Substantiation: The proposed revision is intended to offer the public benefits that would lessen a recognized (known) hazard or ameliorate a continuing dangerous condition or situation. This would be accomplished by recognizing an advance in the art of safeguarding property or life that was previously unavailable to the public.

Note: Supporting material is available for review at NFPA Headquarters.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-93 Log #3524 NEC-P02 **Final Action: Reject**
(210.8(A)(5))

Submitter: David Zinck, Newburyport Wiring Inspector

Recommendation: Renumber the existing exception 1 to (5) and add:

Exception 2 to (5) : Receptacles installed in accordance with 422.12 Exception 1.

Substantiation: The deletion of the exceptions to GFCI protection of receptacles in unfinished basements should never have been applied to the condensate outlet at the furnace or boiler. Nobody is going to GFCI protect the entire branch circuit for the heating system. At least nobody in the snow belt. A frozen pipe that bursts can reach $100K in damage. I have seen several.
The only solution is to provide GFCI protection for just the single receptacle at the heating system. You can not install a duplex receptacle at this location because it is a violation of 422.12. So the only solution is to use a faceless GFCI device and feed downstream to the single receptacle. This is more labor and stock intensive than most electricians want to get. One solution some are using is to cut the male plug off of the end and hardwire it into the junctions box with the disconnect switch. This not only violates the UL listing of the device but it makes the guy who has to replace that pump get into the wiring. He may not have any training and may not be qualified to do this. Besides, it should be able to be replaced by just plugging it in.

This problem is becoming rampant, it is worthy of an interim amendment.

Panel Meeting Action: Reject

Panel Statement: The submitter of this proposal has not provided technical substantiation to support his statement that listed GFCI devices are not compatible with listed condensate pump equipment. Section 422.12 Exception No.1 is permissive and does not require the heater circuit to be used with associated equipment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-94 Log #3589 NEC-P02 **Final Action: Reject**
(210.8(A)(5))

Submitter: Peter Hoekstra, Technical Consultant for the Association of Home Appliance Manufacturers

Recommendation: Revise text to read as follows:

Exception No. 1 *to (5): A receptacle supplying only a permanently installed fire alarm of burglar alarm system shall not be required to have ground-fault circuit-interrupter protection.*

Exception No. 2 to (5): A single receptacle or a duplex receptacle for two appliances located within the dedicated space for each appliance that, in normal use, is not easily moved from one place to another and is cord-and-plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

Substantiation: This exception was deleted in the 2008 NEC. Deviations from this section of the 2008 NEC have been issued by individual states adopting the NEC.

The 2008 NEC requires refrigerators, freezers, and sump pumps in unfinished basements to be located on GFCI circuits. While the extension of GFCI protection is applauded and supported by the industry of appliance manufacturers, manufacturers continue to observe problems with these appliances plugged into GFCI circuits. The issues are:

1. While there have been improvements to GFCI's to reduce unwarranted tripping, it still does occur. UL 843 Ground Fault Circuit Interrupters Section 6.8.4 b) allows the GFCI to trip 3 in 10 times when operated in adverse conditions and in 6.8.5 a) allows the GFCI to trip 3 in 100 times in normal use.
2. Unfinished basements may be unattended areas for long periods of time. This increases the possibility that users will not notice refrigerator, freezer or sump pump appliances are off for a long period of time and the possibility that foodstuffs will be spoiled or basement areas flooded through no fault of the appliance. Manufacturers continue to experience service calls and consumer complaints for "nuisance" failures of GFCI's. The hazards of spoiled foodstuffs, potential food-borne diseases, mold growth and flood damage have much greater probability than the risk of electric shock.
3. There have been no electric shock incidents reported to CPSC for the last 10 years for refrigerators or freezers. All of these appliances are grounded.
4. While appliance manufacturers are always working to lower leakage currents on new appliance products for increased safety, the shift in field population to new products takes more than 25 years.
5. No technical substantiation was provided for removal of this exception from the 2005 NEC.
6. Many manufacturers continue to stipulate in their owner's use and operation manuals that the appliance is not to be connected to a GFCI-protected outlet.
7. GFCI protected circuits for refrigerators and freezers which are not easily moved may not be visible for inspection. The tripping of a GFCI may not be easily identified and may mislead the appliance user into initiating an unnecessary service call or cause the risk of injury from unnecessarily moving the appliance to reset a GFCI.

Panel Meeting Action: Reject

Panel Statement: The statement that no electric shock incidents associated with refrigeration equipment have occurred in the last 10 years is inaccurate. The panel has previously considered an electrocution incident associated with a refrigerator. The GFCI tripping tests referred to in the substantiation are not necessarily indicative of the likelihood of a GFCI tripping when used with refrigeration equipment. The substantiation makes general references to GFCI tripping and manufacturers' recommendations regarding GFCIs but does not provide sufficient detail to conclude that GFCIs are not compatible with refrigeration equipment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-95 Log #2400 NEC-P02 **Final Action: Reject**
(210.8(A)(5), Exception No. 2 to (5))

Submitter: Roger Zieg, Zieg Electric

Recommendation: Revise text to read as follows:

Exception No. 2 to (5): A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).

Substantiation: This proposal calls for the restoration of the exception found in the 2005 NEC. There are many dwelling units, including apartment buildings, with basements which depend on sump pumps to keep the basements from flooding during thunderstorms. Having a GFCI only requirement for this location will cause many homes to not be protected from flooding due to the GFCI tripping during thunderstorms. Code Making Panel 19 added a similar exception to Article 547 in the 2008 NEC for dedicated equipment. Several jurisdictions have accepted the NEC 2008, but in doing so have exempted this section and returned to the exception in the 2005 NEC. The State of Iowa is one example.

(210.8(A)(5) Exception (New))

Submitter: David C. Hintermeister, Community Electric Inc.

Recommendation: Add Exception to read as follows:

Exception: A receptacle supplying a sump pump.

Substantiation: In areas where ground water is a problem, it is imperative that a sump pump remains running to protect property from water damage. Especially when the homeowner is away from home.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 2-73.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-97 Log #2466 NEC-P02 **Final Action: Reject**
(210.8(A)(5) Exception to (5))

Submitter: Jeffrey Waterman, Liberty Pumps, Inc. / Rep. Sump and Sewerage Pump Manufacturing Association

Recommendation: Revise text to read as follows:

Exception to (5): A receptacle supplying only a permanently installed ~~fire alarm or burglar alarm system~~ fire alarm system, burglar alarm system, or high-water flooding alarm system shall not be required to have ground-fault circuit-interrupter protection.

Substantiation: There is an undeniable potential for health and safety hazards which can result from basement flooding due to a multitude of issues including water pipe failure, groundwater intrusion, backup of storm or drain sewers, or sump or sewage pump failures. Flooded basements create a potential for shock hazards from non-GFCI protected circuits serving such items as furnace blowers and well pumps. Water backed up from sewers or sewage tanks has inherent health risks from the pathogens it potentially may carry. The resulting molds and bacterial growth from water damage can cause health problems long after the flooding itself has been addressed. It would seem reasonable that high water flooding alarms warrant the same consideration for reliability given to fire and burglar alarm systems, and, therefore, would be better served if not on a circuit protected by a ground-fault circuit-interrupter.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation to support his recommendation to exclude high water flooding alarm systems from the requirements of GFCI protection. CMP-2 maintains it's position that listed

equipment is compatible with listed GFCI devices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
WOOD, T.: This proposal should be accepted.
I believe these 3 items should not be required to be GFCI protected, as they can be vital to the safety of life and property.

2-98 Log #4768 NEC-P02 **Final Action: Reject**
(210.8(A)(5) Exception No. 2 to (5) (New))

Submitter: Phillip Cullen, Cullen HVAC
Recommendation: Add text to read as follows:
Exception No. 2 to (5): A single receptacle that is an integral part of a listed utilization equipment, such as a heating furnace, for use of a condensate pump and not intended for personnel use.
Substantiation: Many times it is interpreted that a single receptacle that is an integral part of a listed heating furnace needs to be GFCI protected because the furnace is, generally, located in an unfinished basement. This is not practicable as (1) modifying the receptacle voids the manufacturers warrantee (and maybe the listing), (2) placing the entire circuit (including the furnace) on a GFCI branch-circuit breaker will void the installers warrantee (and maybe the manufacturers) and (3) a GFCI protected receptacle is required within 25 ft of HACR equipment for use by service personnel by 210.63.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-93.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-99 Log #2410 NEC-P02 **Final Action: Reject**
(210.8(A)(6))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Add: (6) Attics which are not intended for habitable rooms, but contain an appliance that requires service.
Substantiation: In unfinished attics that contain an appliance, such as an a/c unit, that requires service, the service technician will need to run an extension cord from the flloor that allows access to the attic and through the access panel which is in violation of 408.8(3).
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated the requirement to add GFCI to receptacles in attics. The panel notes that 210.63 would require a receptacle to be installed within 25 feet and on the same level.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-100 Log #2774 NEC-P02 **Final Action: Reject**
(210.8(A)(6) Exception No. 1 (New))

Submitter: Kerry G. Ginther, Conifer, CO
Recommendation: Add new text as follows:
Exception 1: Where countertop in the kitchen is between 38 in. and 32 in. from floor the countertop shall be considered a kitchen office space and GFCI protection of recepticles is not required.
Substantiation: This exception would allow the use of TVSS receptacles for sensitive computers or other sensitive office electronic components.
Panel Meeting Action: Reject
Panel Statement: The height in which a kitchen countertop is installed is a design consideration and does not define the countertop space as not being suitable for the connection of appliances.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-101 Log #55 NEC-P02 **Final Action: Accept in Principle**
(210.8(A)(7))

Note: This Proposal appeared as Comment 2-35 on Proposal 2-40 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 2-40 was:
Eliminate exception number 2 to (2) and eliminate exception number 2 to (5).
Submitter: Joseph A. Hertel, Rep. Safety and Buildings
Recommendation: Revise text to read:
(7) Laundry, utility, bedroom and wet bar sinks, where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.
Substantiation: Bedroom sinks are quite common in current construction where a vanity with sink is installed in addition to a bathroom for a master bedroom. It can be argued that the sink is in the bathroom area or can be used as a wet bar but the addition of the word bedroom would eliminate the question.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-103.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-102 Log #537 NEC-P02 **Final Action: Accept in Principle**
(210.8(A)(7))

Submitter: Dennis J. Cox, Elkhart County Building Dept. / Rep. IAEI
Recommendation: Add new text as follows:
Laundry, utility and ~~(wet bar sinks)~~ (all sinks) where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink (in any direction).
Substantiation: There seem to be some confusion with some electrical contractors on this matter. The definition of a wet bar sink is a bar or countertop with a sink and running water used for mixing alcoholic beverages. A kitchen sink meets this definition. By making this change, this would clear this up. 210.8(A)(6) requires countertop outlets to be GFCI in a kitchen but not 6 ft. away.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-103, which satisfies the submitters intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-103 Log #1610 NEC-P02 **Final Action: Accept in Principle**
(210.8(A)(7))

Submitter: David Shields, Keystone Electrical Inspectors, Inc.
Recommendation: Revise text to read as follows:
~~Laundry, utility and wet bar~~ Sinks - where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.
Substantiation: 1. This would make text consistent with text for “other than dwelling units” (Section 210.(B)(5)).
2. There is no reason to limit the use of GFCI protection within 1.8 m (6 ft) of any sink in a dwelling unit.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Sinks - for other than kitchens as covered in 210.8(A)(6), where receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink
Panel Statement: The panel has met the submitters intent. The panel has accepted the submitter’s concept and ensured that sinks in kitchens remain covered under 210.8(A)(6).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
PAULEY, J.: NEMA agrees with the panel action to include all sinks. However, the words added by the panel may create some confusion about how the kitchen sink should be treated. The wording as selected by the panel covers sinks other than kitchens as covered in 210.8(A)(6). However, since 210.8(A)(6) is specific to receptacles serving the countertop, some readers may interpret that this new wording covers receptacles within 6’ of the kitchen sink that do not serve the countertop (i.e. receptacles for the disposal and dishwasher). This was not the intent of the panel. Revising the words to eliminate the reference to 210.8(A)(6) may make the text clearer. Revise the words to read: “Sinks - located in areas other than kitchens, where receptacles are installed within 1.8m (6 ft) of the outside edge of the sink.”

2-104 Log #1707 NEC-P02 **Final Action: Accept in Principle**
(210.8(A)(7))

Submitter: David Barnhart, City of Portland
Recommendation: Revise text to read as follows:
~~Laundry, utility, and wet bar sinks~~ All sinks where the receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.
Substantiation: This change will cover all types of sinks in the dwelling including mop sinks.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-103.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-105 Log #299 NEC-P02 **Final Action: Accept in Principle**
(210.8(B))

Submitter: Christine Porter, Intertek
Recommendation: Add new text to read as follows:
(x) Wet Locations
Substantiation: Indoor locations such as car washes, food processing areas of facilities that manufacture food products, and other indoor wet locations have the same risks to users of portable appliances as outdoor locations. Expanding the requirement from outdoor locations to indoor wet locations has been a local requirement in the Washington State Amendments for the 2005 cycle without issues and should be a requirement in all areas that adopt the NEC.
Panel Meeting Action: Accept in Principle
Add new text to read as follows:

(6) Indoor wet locations.
Panel Statement: The panel added the term indoor because outdoor receptacles are already covered under 210.8(B)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-106 Log #300 NEC-P02 **Final Action: Reject**
(210.8(B))

Submitter: Joseph V. Morrell, Jr., Wyeth Pharmaceuticals
Recommendation: Add new text as follows:
Proposal for "other than dwelling units" to require GFCI protection around eye washes and safety showers. Currently, there are no requirements for GFCI protection around these normally "dry" locations that may become wet locations in the event of an emergency. Use of GFCI protection in these areas will reduce electrocution and shock hazards to the user of this safety equipment in the event of an emergency. I recommend having all 15 amp and 20 amp 120 volt outlets within 6 ft of safety showers and eye washes (with drains) to be GFCI protected. I recommend having all 15 amp and 20 amp 120 volt outlets within 25 ft of safety showers and eye washes (without drains) to be GFCI protected. All other outlets within the 6 ft boundary should be protected by the weatherproof cover.
Substantiation: Use of safety showers and eye wash stations can create electrocution and shock hazards for the user with splashing water or water pooling on the floor. Safety showers and eye washes are often installed in normally dry locations with little regard to the surrounding electrical installations. Flow rate and water temperature are installation concerns while electrical concerns are often only considered when an eye wash or safety shower is installed outdoors and needs heat tracing. When performing risk analysis on plant eye wash and safety showers, it was noted in almost every installation that there were risks of shock and electrocution if the devices were activated for the required 15 to 20 minute period. The installation of GFCI receptacles and weatherproof covers will greatly reduce electrical hazards that may exist in the areas of operation.
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as is required by 4.3.3(C) of the NFPA Regulations Governing Committee Projects. The wording to be added, revised and how revised, or deleted is not specified in the recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-107 Log #309 NEC-P02 **Final Action: Reject**
(210.8(B))

Submitter: Joel A. Rencsok, Scottsdale, AZ
Recommendation: Add item 2. titled Garages to section (B) of 210.8
Add item 8. titled Boathouses to section (B) of 210.8
Substantiation: These two items do not belong in dwelling units under section (A) and should be placed in section (B).
See definition of dwelling unit; Garages and Boathouses are not included in this definition.
Definition: A single unit, providing complete and independent living facilities for one or more persons, including permanent provisions for living, sleeping, cooking and sanitation.

Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter that the present definition of a dwelling unit does not cover dwelling unit garages and boathouses. The phrase "facilities for living" includes storage, garage, outdoor spaces, and boathouses that are accessories of the dwelling unit.
Number Eligible to Vote: 12

(210.8(B))

Submitter: Steve McNamara, Hastings, MN
Recommendation: Delete text as follows:
210.8(B) Other Than Dwelling Units. All 125-volt, singlephase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) shall have ground-fault circuit-interrupter protection for personnel:
(1) Bathrooms
(2) kitchens
(3) ~~Rooftops~~
~~(4)~~ Outdoors
Substantiation: I put a strike through deleted text.
The text is not needed. Rooftops are covered in outdoors.
Panel Meeting Action: Reject
Panel Statement: The panel recognizes that some rooftop areas may contain enclosures for the protection of equipment. The existing text clarifies that all receptacles installed at rooftops are to be GFCI protected, even those that may be considered to not be outdoors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-109 Log #3223 NEC-P02 **Final Action: Accept in Principle**
(210.8(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as Proposal 2-77 addresses a different section with different text.
This action will be considered by the panel as a public comment.
Submitter: Jack E. Jamison, Jr., MEGCO Inspections, Inc. / Rep. WV Division Ohio Chapter
Recommendation: Revise text as follows:
210.8(B) Other than Dwelling Units all 125-volt, single-phase, 15- 20-ampere receptacles installed in the locations specified in (1) through (8) shall have readily accessible ground-fault circuit-interrupter protection for personnel.
The ground-fault circuit-interrupter operating device trip reset buttons shall be in a readily accessible location, either at the panelboard supplying the branch circuit, or the device itself.
Substantiation: Many GFCI receptacles are located behind large appliances, i.e. refrigerator, and are difficult to locate to test or reset.
This will mirror requirements of 680.71 for access to GFCI protection for hydromassage bathtubs.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-77.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-110 Log #4182 NEC-P02 **Final Action: Accept**
(210.8(B))

Submitter: Richard A. Janoski, Finleyville, PA
Recommendation: Add new text as follows:
(6) Locker Rooms - with adjacent showering facilities.
Substantiation: I think that a GFCI requirement is in order for locker rooms with adjacent showering facilities. The conditions that would warrant GFCI protection of receptacle outlets include, persons who are exiting the shower area walking in their bare feet, carrying wet clothes, and towels. They are entering a locker room which is constructed of tile flooring, which may be wet from other users of the showering facility, it would have a floor drain that serves to drain the wet floor. These persons could then be putting to use electrical appliances such as electric shavers, and electric hair driers. As per Section 210.8 (A)(1), Bathrooms are required to have GFCI protection for receptacles, and under the Article 100 definition of Bathrooms, the showering facilities would be covered, but the adjacent locker rooms would not be included, and a hazard exists.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-111 Log #2425 NEC-P02 **Final Action: Reject**
(210.8(B) and Exceptions)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
210.8 ~~Ground-Fault Circuit-Interrupter~~ Power Safe Protector Protection for Personnel.
(B) Other Than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) shall have ~~ground fault circuit interrupter~~ power safe protector protection for personnel:
(1) Bathrooms
(2) Kitchens
(3) Rooftops
(4) Outdoors
Exception No. 1 to (3) and (4): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed without ~~GFCI~~ PSP protection.
Exception No. 2 to (4): In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power is interrupted or having a design that is not compatible with ~~GFCI~~ PSP protection.
(5) Sinks - where receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.
Exception No. 1 to (5): In industrial laboratories, receptacles used to supply equipment where removal of power would introduce a greater hazard shall be permitted to be installed without ~~GFCI~~ PSP protection.
Exception No. 2 to (5): For receptacles located in patient care areas of health care facilities other than those covered under 210.8(B)(1), ~~GFCI~~ PSP protection shall not be required.
Substantiation: The Power Safe Protector (PSP) device overcomes these

limitations in three ways:

1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.

2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.

3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-112 Log #650 NEC-P02 **Final Action: Reject**
(210.8(B), Exception No. 2 to (5))

Submitter: Jerry Steele, Lifepoint Hospitals, Inc
Recommendation: Delete the following text:
~~Exception No. 2 to (5): For receptacles located in patient care areas of health care facilities other than those covered under 210.8(B)(1), GFCI protection shall not be required.~~
Substantiation: This exception eliminates all GFCI receptacles in patient care areas including receptacles installed for use at the sink locations. With the removal of the exception, it will force design engineers to locate receptacles required for beds, exam tables, monitors and critical equipment, 6 ft from the sink. I have not seen a room where this would be unworkable. An exception could be written for dedicated receptacles for monitors within 6 ft on a sink if necessary. This exception has eliminated GFCI protection for the population that is in a weakened condition and more susceptible to electric shock.
Panel Meeting Action: Reject
Panel Statement: The exception is necessary to correlate with the jurisdiction that CMP-15 has in Article 517 for health care facilities.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-113 Log #2169 NEC-P02 **Final Action: Accept**
(210.8(B) Exception No. 1 to (3) and (4))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
Exception to (3) and (4): Receptacles that are not readily accessible and are supplied by a ~~dedicated~~ branch circuit dedicated to ~~for~~ electric snow-melting, ~~or~~ deicing, or pipeline and vessel heating equipment shall be permitted to be installed in accordance with 426.28, or 427.22, as applicable.
Substantiation: Dedicated branch circuit is not defined, and is often confused with the term "individual branch circuit". With the confusion, it can be easily argued that the circuit for the snow melting or deicing equipment must supply only one outlet [Article 100], which is not the requirement.
Pipeline and vessel heating systems also contain provisions for GFPE protection, which should also be permitted in lieu of GFCI protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-114 Log #2980 NEC-P02 **Final Action: Accept**
(210.8(B) Exception No. 1 to (3) and (4))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
Exception to (3) and (4): Receptacles that are not readily accessible and are supplied by a ~~dedicated~~ branch circuit dedicated to ~~for~~ electric snow-melting, ~~or~~ deicing, or pipeline and vessel heating equipment shall be permitted to be installed in accordance with 426.28, or 427.22, as applicable.
Substantiation: Dedicated branch circuit is not defined, and is often confused with the term "individual branch circuit". With the confusion, it can be easily argued that the circuit for the snow melting or deicing equipment must supply only one outlet [Article 100], which is not the requirement.
Pipeline and vessel heating systems also contain provisions for GFPE protection, which should also be permitted in lieu of GFCI protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-115 Log #838 NEC-P02 **Final Action: Reject**
(210.8(B) Exception No. 1 to (5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
In industrial and commercial laboratories receptacles used to supply equipment or processes where unscheduled ~~removal~~ loss of power ~~would~~ is likely to introduce a ~~greater~~ hazard shall be permitted to be installed without GFCI protection.
Substantiation: The provision should cover commercial locations where a hazard is likely to occur. It may be difficult to determine if a GREATER hazard will occur. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: Industrial facilities have less public access and electrical installations are more likely to be supervised by an engineer. The submitter of this proposal has not provided adequate substantiation to support his recommendation to relax the requirement for GFCI protection in commercial facilities.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-116 Log #2862 NEC-P02 **Final Action: Reject**
(210.8(B)(2))

Submitter: David H. Platt, PA State Certified Electrical Inspector
Recommendation: Add a new Exception as follows:
Exception No. 1 to (2): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit supplying food refrigeration equipment connected to a single outlet at the dedicated location of said food refrigeration equipment.
Substantiation: This would allow for safe operation of kitchen food refrigeration equipment that cause nuisance tripping of ground fault protection resulting in the spoilage and unsafe keeping of refrigerated products, while still requiring ground fault protection of all other readily accessible receptacles for personnel protection.
Panel Meeting Action: Reject
Panel Statement: The substantiation does not provide sufficient information to conclude that GFCIs are incompatible with refrigeration equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-117 Log #3634 NEC-P02 **Final Action: Reject**
(210.8(B)(2) Exception (New))

Submitter: Greg Chontow, Hopatcong, NJ
Recommendation: Add new text to read as follows:
Exception: Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for refrigeration equipment.
Substantiation: Present wording does not exempt GFCIs for refrigeration equipment. This should be exempted to avoid lost product with nuisance tripping.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-116.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-118 Log #3761 NEC-P02 **Final Action: Reject**
(210.8(B)(3))

Submitter: Jebediah J. Novak, Cedar Rapids Electrical JATC / Rep. Int'l Brotherhood of Electrical Workers
Recommendation: Delete text to read as follows:
(B) Other Than Dwelling Units.
~~(3) Rooftops~~
Substantiation: With the recent change making all 125-volt, single-phase, 15- and 20-ampere receptacles installed in outdoor locations required to have GFCI protection, list item three is redundant and should be deleted.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-108.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-119 Log #721 NEC-P02 **Final Action: Reject**
(210.8(B)(3) and (4) Exception No. 1 to (3) and (4))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text and add a new Fine Print Note to the *Exception* to read as follows:
210.8 Ground-Fault Circuit-Interrupter Protection for Personnel.

(B) Other Than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) shall have ground-fault circuit-interrupter protection for personnel~~:~~.

(3) Rooftops

(4) Outdoors

Exception No. 1 to (3) and (4): Receptacles that are not readily accessible and are supplied by a ~~dedicated~~ branch circuit identified in accordance with 408.4 as being solely for electric snow-melting or deicing equipment shall be permitted to be installed without GFCI protection.

FPN: For receptacles supplying decorative lighting used for holiday lighting and similar purposes, see 590.6(A).

[remainder of 210.8 unchanged by this Proposal]

Substantiation: Clarification and the FPN are added to distinguish dedicated branch circuits used solely for electric snow-melting or deicing equipment from branch circuits used alternately for electric snow-melting or deicing equipment and then for decorative lighting and similar accessories for holiday lighting and similar purposes. Decorative lighting and holiday lighting accessories can extend downward to become accessible even though the receptacle from which they are supplied may not be accessible. Other than the usage of "dedicated branch circuit" in 210.8(A)(3) *Exception to (3)* and 210.8(B)(3) *Exception No. 1 to (3) and (4)*, the remainder of the *NEC®* addresses only dedicated SPACES requiring electricity, NOT dedicated electrical circuits. Other uses of "dedicated" in the *NEC®* as applied to specific equipment are for the NONelectrical attributes (structural, mechanical, ventilating, hydraulic, etc.).

Regarding the added FPN, roof-mounted snow-melting and deicing equipment (and the receptacles that supply it) is not accessible. Temporary installations of decorative lighting for holiday lighting typically hang substantially below the roofline and are frequently readily accessible.

Panel Meeting Action: Reject

Panel Statement: The requirements of 408.4 are already required and do not need to be referenced. The reference to 426.28 is necessary to clarify the exception. The Panel rejects the addition of the FPN. It is the intent of this exception to allow for the connection of rooftop electric snow melting and deicing equipment only.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-120 Log #2295 NEC-P02 **Final Action: Reject**

(210.8(B)(5))

Submitter: Thomas D'Agostino, BSafe Electric, Inc.

Recommendation: It is proposed that 210.8(B) Other Than Dwelling Units) ((5) Sinks) of Article 210 (Branch Circuits), which provides an exception for certain equipment from being required to be protected by either a ground-fault circuit-interrupter or an arc-fault circuit-interrupter, be revised to require additional protection as follows.

Chapter 1 General - Article 100 Definitions

Add an additional definition as follows:

Receptacle with an Integral Thermal Circuit-Interrupter. A receptacle with an integral thermal circuit-interrupter is a contact device, installed at the outlet for the connection of an attachment plug, that senses a temperature rise within the receptacle to a specified level and that interrupts electricity flow to the receptacle if the specified temperature is exceeded.

Chapter 2 Wiring and Protection - Article 210 Branch Circuits

210.8(B) Other Than Dwelling Units) ((5) Sinks)

Change Exception No. 1 to (5) to read as follows:

Exception No. 1 to (5): In industrial laboratories, receptacles used to supply equipment where removal of power would introduce a greater hazard shall be permitted to be installed without GFCI protection. They shall, however, be listed receptacles with an integral thermal circuit-interrupter.

Substantiation: The proposed revision is intended to offer the public benefits that would lessen a recognized (known) hazard or ameliorate a continuing dangerous condition or situation. This would be accomplished by recognizing an advance in the art of safeguarding property or life that was previously unavailable to the public.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-89.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-121 Log #2939 NEC-P02 **Final Action: Reject**

(210.8(B)(5))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise text to read as follows:

(5) Sinks — those ~~where~~ receptacles ~~are~~ installed within 1.8 m (6 ft) of the outside edge of the sink.

Exception No 1 to (5): In industrial, university, and research laboratories, receptacles shall be permitted to be installed without GFCI protection if used to supply equipment that requires continuous ~~where removal of~~ power for procedures being performed or the process involved ~~would introduce a greater hazard shall be permitted to be installed without GFCI protection~~ provided the area is staffed with persons who have documented safety training to recognize and avoid the hazards involved.

~~Exception No 2 to (5): For receptacles located in patient care areas of health care facilities other than those covered under 210.8(B)(1), GFCI protection shall not be required.~~

Substantiation: Some of the changes proposed to the requirement in (5) and Exception No. 1 are intended to be editorial and bring the text into compliance with the NEC Style Manual. Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Similar or identical work is done in research and university laboratories as is done in industrial laboratories so the Exception should apply to those laboratories as well. The exception should apply only if the persons working in the area without GFCI protection have been trained on the hazards involved. This concept is included in the definition of "Qualified Person" in Article 100. The training needs to be documented for the protection of the person, the owner and the AHJ. The relocation of the phrase "shall be permitted to be installed without GFCI protection" is intended to improve the sentence structure. The phrase "would introduce a greater hazard" is very subjective and the phrase "requires continuous power for procedures being performed or the process involved" is suggested as being more prescriptive.

Exception No. 2 is proposed for deletion since the organization of the NEC in 90.3 indicates the requirements in Chapters 1 through 4 apply generally and changes or modifications can be made in Chapter 5. The Code Panel responsible for Article 517 should take action they feel appropriate.

Panel Meeting Action: Reject

Panel Statement: The proposed change does not add additional clarity. Documented safety training is not described or defined sufficiently to allow determination of compliance.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-122 Log #4178 NEC-P02 **Final Action: Accept**

(210.8(B)(5) (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 14 for comment.

Submitter: Timothy D. Curry, Curry Electric, Inc.

Recommendation: Add new text as follows:

Garages, service bays, and similar areas.

Substantiation: In commercial and industrial buildings, we frequently see an "area" that is used for a wide variety of tasks, including, to perform routine servicing of the companies vehicles. During these maintenance procedures, it would not be uncommon for liquids to be spilled onto the floor (usually concrete). Art. 511 is typically not invoked, because, during plan review, or even inspection, it would simply appear that this is an area with an overhead door to allow vehicles to drive into, or out of, the building, for whatever purpose. Furthermore, Art. 511 does not apply to a **strictly** diesel facility, since the scope of Art. 511 uses the words "VOLATILE" flammable liquids and diesel fuel is not a "volatile" liquid. Yet, the same hazards exist with diagnostic equipment, electrical hand tools, or portable lighting equipment, the potential for spilled fluids, and multiple paths to ground. With this change, you would eliminate a loop hole that has, to date, exempted quite a few areas from GFCI protection.

Panel Meeting Action: Accept

Panel Statement: The panel recognizes that the new subdivision should be (B)(6). The panel recommends for correlation purposes that the TCC refers to CMP-14 for comment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

PAULEY, J.: It should be noted that this new provision creates a more stringent requirement than that currently contained in 511.12 since this provision would apply to ALL 15 and 20 ampere 125V receptacle outlets regardless of what they supply. Although this may be appropriate, it does create a conflict with garages that are covered by Article 511. The TCC will have to determine an appropriate correlation path with CMP 14 to avoid the conflict.

2-123 Log #3846 NEC-P02 **Final Action: Accept**

(210.8(B)(5) Exception No. 2 to (5))

Submitter: Bill McGovern, City of Plano

Recommendation: Revise text as follows:

For receptacles located in patient ~~core areas~~ bed locations of general care or critical care areas of health care facilities other than those covered under 210.8(B)(1), GFCI protection shall not be required.

Substantiation: Numerous comments were returned from health care professionals at the comment stage of the previous edition (ROC 2-57) expressing concern with hand washing sinks located in hospitals typically being located within 6 ft of the patient bed. Substantiation was given that receptacles serving patient care life support, monitoring, and other portable patient care equipment would now require GFCI protection. There was fear that interruption of electrical power caused by the tripping of a GFCI device may severely jeopardize the patient's life and/or the treatment being rendered. The code making panel's statement addressed the submitter's concern that receptacles at the bedside that may be supplying critical equipment not be included in the requirements for GFCI protection.

The term receptacles located in the patient care areas of health care facilities is a very large umbrella covering many different types of facilities. While the submitter's concerns were addressed by the Exception No. 2 to (5) many more receptacles were now exempt GFCI protection. Receptacles located within 1.8 m (6 ft) of sinks in dentist and doctors examination rooms were now not required to have GFCI protection. These types of health care facilities would normally not be providing any type of critical patient care, life support or monitoring equipment. Addressing the patient bed locations of general care and critical care areas of health care facilities places this exception now only in hospitals and ambulatory health care occupancies. These areas would also be required to be served by the critical branch of the essential electrical system to which electrical life support equipment may be connected.

Panel Meeting Action: Accept

(210.8(C))

Submitter: Sarah Ibarra, Metro Wastewater Reclamation District
Recommendation: Revise text to read as follows:

Boat Hoists. GFCI protection shall be provided for outlets not exceeding 240 volts that supply boat hoists installed in dwelling unit locations.

Substantiation: This boat hoists section/paragraph should be in the Dwelling Units section/paragraphs.
Panel Meeting Action: Reject
Panel Statement: Subsection (A) covers 125 volt 15 and 20 ampere receptacles. The requirements in subsection (C) extend GFCI protection to branch circuits rated up to 240 volts with higher ampacities. This section also covers boat hoists that are directly connected.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-126a Log #2772 NEC-P02 **Final Action: Reject**
(210.8(C))

Submitter: Angela Beargeon, Denver, CO
Recommendation: Delete text and relocate.

Boat Hoist

GFCI protection shall be provided for outlets not exceeding 240 volts that supply boat hoists installed in dwelling unit locations.

Substantiation: This code concerns dwelling units this should show up under 210.8(A).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-126.

2-127 Log #557 NEC-P02 **Final Action: Reject**
(210.8(C))

Submitter: Joe Riley, City of Arlington
Recommendation: Revise text as follows:

210.8 ~~(C)~~ (A) Dwelling Units. (9) Boat Hoist. GFCI protection shall be provided for outlets not exceeding 240 volts that supply boat hoists installed in dwelling unit locations.

Substantiation: The subsection as written should be relocated under 210.8(A) Dwelling Units as (9) Boat Hoists, for the simple reason it is referring to boat hoists installed in dwelling unit locations.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-126.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-128 Log #1719 NEC-P02 **Final Action: Reject**
(210.8(C))

Submitter: Larry T. Smith, National Electrical Seminars, Inc.
Recommendation: Move 210.8(C) to 210.8(A) and create new 210.8(A)(9) for boat hoists.

~~210.8(C) Boat Hoists. GFCI protection shall be provided for outlets not exceeding 240 volts that supply boat hoists installed in dwelling unit locations.~~

210.8(A)(9) Boat Hoists. GFCI protection shall be provided for outlets not exceeding 240 volts that supply boat hoists installed in dwelling unit locations.

Substantiation: Traditionally 210.8(A) has contained GFCI requirements for dwelling units; 210.8(B) has been reserved for other than dwelling units. The 2005 NEC broke with that convention by adding 210.8(C) for boat hoists in dwelling unit locations.

It's much easier to explain to students of the Code that 210.8(A) contains the requirements for dwelling units, and 210.8(B) contains the general rules for other than dwelling units; for the sake of clarity and their understanding, we should try to keep it that way.

Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-126.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-129 Log #2424 NEC-P02 **Final Action: Reject**
(210.8(C))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:

210.8 ~~Ground-Fault Circuit-Interrupter~~ Power Safe Protector Protection for Personnel.

(C) Boat Hoists. ~~GFCI~~ PSP protector protection shall be provided for outlets not exceeding ~~240~~ 125 volts that supply boat hoists installed in dwelling unit locations. 240 volt boat hoist shall have GFCI protection.

Substantiation: The Power Safe Protector (PSP) device overcomes these limitations in three ways:

1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.

2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.

3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

2-131 Log #3119 NEC-P02 **Final Action: Reject**
(210.8(D) (New))

Submitter: Paul S. Hamer, Chevron Energy Technology Company
Recommendation: Add 210.8(D) as follows:
(D) Three-Phase Ground-Fault Circuit-Interrupter System Protection for Personnel.
(1) Supplying Lighting Outlets. All branch circuits that supply lighting outlets and operate at a voltage exceeding 150 volts to ground shall be three phase, and shall be protected by a three-phase ground-fault circuit-interrupter system (GFCIS-3Ph). The power supply source shall be a separately derived system and each branch circuit shall be included as part of the GFCIS-3Ph. Upon detection of a ground fault, the GFCIS-3Ph shall initiate disconnection of all three phases of the faulted branch circuit. The branch circuits shall meet the requirements of 210.4. The requirements of this section shall become effective January 1, 2014.
(2) Supplying Other Than Lighting Loads. Three-phase branch circuits that supply loads other than lighting outlets shall be permitted to be protected by a GFCIS-3Ph. If a GFCIS-3Ph is implemented for these branch circuits, the power supply source shall be a separately derived system and each branch circuit shall be included as part of the GFCIS-3Ph. Upon detection of a ground fault, the GFCIS-3Ph shall initiate disconnection of all three phases of the faulted branch circuit. The branch circuits shall meet the requirements of 210.4.
FPN: Segregation of the power supply on a separately derived system facilitates proper application of the three-phase ground-fault circuit-interrupter system on all of the branch circuits.
Substantiation: Introduction
There are many electrocutions that occur on three-phase 480 volt systems, particularly 277 volt branch circuits that supply lighting outlets. Ground-fault circuit-interrupters (GFCIs) have saved many lives on 120 volt and 120-240 volt single-phase systems since being introduced to the NEC in 1971. Application of GFCIs at voltages higher than 120 volts has not progressed due to fact that the higher system voltages to ground result in higher capacitive charging current of branch circuits or feeders, which in turn can lead to “nuisance trips.” This proposal describes a Three-Phase Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) that overcomes nuisance tripping by a novel approach to current sensing and tripping logic. It is initially proposed as a requirement for branch circuits that supply lighting outlets due to the historical risk of these circuits, but the GFCIS-3Ph is also applicable to all three-phase circuits and this proposal allows its application as an option for all three-phase branch circuits. Application of the proposed GFCIS-3Ph technology has the potential to almost eliminate electrocutions for persons who make direct contact between an energized phase conductor and ground on three-phase systems rated below 1000 volts, phase-to-phase.
The Problem
In order to avoid a shock hazard, the first-priority activities expected of qualified electrical workers are to exercise safe work practices, to de-energize and “lock out” any circuit to be worked on, to put into practice a “test before touch” habit, and to use shock-protective personal protective equipment. But – a mistake, oversight, accidental contact, or contact with defective wiring or fixtures by even a qualified person should not result in his or her death. In a number of cases, electrocutions of both qualified electrical workers and non-electrical employees have resulted from contact with damaged or improperly installed lighting fixtures or branch circuits, or during work within the limited space above a suspended ceiling that disturbs or detaches the wiring systems of luminaires. In many light-industrial and commercial enterprises, it is an unfortunate fact that many lighting circuits and fixtures are serviced by non-qualified persons. Applicable OSHA accident reports document at least 90 electrocutions that have occurred on 277 volt lighting circuits dating back to the 1980’s (see summary descriptions in the attached Appendix 1). Another 41 people have died from electrocution where the specific system voltage was not listed in the accident report. (The OSHA accident data base does not appear to have been updated comprehensively since approximately 2000.) The OSHA accident report listings demonstrate that inadvertent contact with energized parts happens far too often on low-voltage systems – over half of the documented electrocutions (69 of the 131) being non-qualified persons (i.e., those people described as an “employee,” helper,” “apprentice,” or other non-electrician descriptions in the accident report details). An electrical shock does not need to result in a fatality. The proposed three-phase ground-fault circuit-interrupter system can prevent most electrocutions that occur due to contact with energized circuit parts on 480 or 600 volt three-phase systems. Introduction of this concept as a requirement for three-phase lighting feeder and branch circuits is a first, and important, step toward the implementation of this life-saving technology. This is the fundamental reason for this proposal.
Ground-fault circuit-interrupters, as applied to 120 volt single-phase circuits, have saved many lives since requirements were introduced in the 1971 NEC. Almost 40 years later, it is appropriate to extend ground-fault circuit-interrupter requirements to higher voltage systems – building on the pioneering work done by Charles F. Dalziel, which led to the development of the ground-fault circuit-interrupter in the 1960’s. The revolutionary approach of the system described in this proposal has the potential to almost eliminate electrocutions for persons who make direct contact between an energized phase conductor and ground on three-phase systems rated below 1000 volts, phase-to-phase.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Working technology has not been demonstrated and is not available for evaluation. The NEC does not currently prohibit the installation of such a system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-132 Log #3796 NEC-P02 **Final Action: Reject**
(210.8(D) (New))

Submitter: John A. Schultz, St. Paul, MN
Recommendation: Add text to read as follows:
<u>(D) Location of Device. Devices that provide ground-fault circuit-interrupter protection shall be readily accessible. Where located within a structure, access to the interior of the structure shall be provided by a personnel door.</u>
Substantiation: In many instances, dwelling garages and similar structures are constructed without personnel doors and rely on a vehicle door for interior access. In these instances and where vehicle doors are provided with power openers supplied by circuits provided with ground-fault circuit-interrupter protection and the devices are located within the structure and the device trips, there is no way to access the device to reset it without damaging the structure or vehicle door. Deleting Exception 1 to section 210.8(A)(2) in the 2005 NEC has created this issue.
Panel Meeting Action: Reject
Panel Statement: The submitter’s recommendation is a design consideration and is not in the purview of Panel 2. The scenario described in the submitter’s substantiation would occur with any power loss to the circuit supplying a garage door opener and is not specifically related to GFCI protection. There is no substantiation that listed GFCI receptacles are not compatible with listed garage door openers.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-133 Log #2879 NEC-P02 **Final Action: Reject**
(210.9, FPN (New))

Submitter: William Gross, Electric Service of Clinton
Recommendation: Add new FPN as follows:
Branch circuits shall not be derived from autotransformers unless the circuit the supplied has a grounded conductor that is electrically connected to a grounded conductos of the system supplying the autotransformer.
<u>FPN: See 450.4 Autotransformers 600 Volts or Less.</u>
Substantiation: Reference to 450.4 is necessary to apply and correctly install branch circuits for autotransformers.
Panel Meeting Action: Reject
Panel Statement: The FPN is unnecessary. Article 450 applies to transformers as a general application of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-134 Log #4779 NEC-P02 **Final Action: Reject**
(210.9 Exception No. 2)

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Recommendation: Delete this Exception in its entirety.
Substantiation: This exception permits installation of electrical equipment in a manner not considered safe by the requirements of 210.9 based on the hypothetical presence of a qualified person. Without prescriptive requirements to provide the assured presence of a qualified person this exception is a contradiction to the purpose of the Code.
Panel Meeting Action: Reject
Panel Statement: The authority having jurisdiction has the responsibility to evaluate whether persons responsible for the supervision and maintenance are qualified before permitting such installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: I agree with the submitter, the exception allows for an installation that is less than safe. An exception that permits a reduction in safety should include clear prescriptive language for proper interpretation by both the electrician and the authority having jurisdiction. Since there is no requirement for documentation that would provide evidence to the AHJ that a qualified person actually exists, this could lead to inconsistent and improper application of this section.
WOOD, T.: This proposal should be accepted.
For too long, a special group has been able to use the Code when and where they like, while hiding under the presence of a so called “qualified person.”

2-135 Log #494 NEC-P02 **Final Action: Reject**
(210.10(A))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 9 for action.
This action will be considered by the panel as a public comment.
Submitter: Rodger L. Moore, Moore Electrical Contracting, Inc.
Recommendation: Add new text to read as follows:
Photoelectric switching devices used to switch lighting or power circuits that contain 2 ungrounded conductors on a grounded system (i.e., 208V, 240V, 480V) shall be required to switch all ungrounded conductors at the same time.
Exception: A 3 wire photoelectric cell may switch a contactor that switches all the ungrounded conductors at the same time.
Substantiation: When a standard 3 wire photoelectric cell is used to control a circuit with 2 ungrounded conductors, as in a 480V lighting circuit, it only switches one pole of the circuit. This is a very common application in area lighting where 2 or more fixtures are installed on a light pole, a single pole-top PE cell is used. This creates a situation where during the daylight hour or if the PE cell is defective, voltage read across the field terminals in the fixture will read 0 volts, even though both terminals have a potential of 277V to ground. Someone servicing the fixture could be in trouble. Requiring the PE cell to switch both ungrounded conductors will eliminate this situation. If the PE cell is part of the integral wiring of the fixture, the voltage on the field terminals will read 480V, the serviceman would know the fixture is energized. Although I used area lighting as an example, a similar problem would occur when ever a 2 pole circuit is switched with a PE cell.
Panel Meeting Action: Reject
Panel Statement: The situation described in the substantiation does not appear to be in compliance with the present text of 210.10, which requires that the switching device be in each ungrounded conductor of the tapped circuit. In addition, the panel recommends that this proposal be forwarding to CMP-9 for possible action with respect to the photoelectric cell being used as a switching device in general. The arrangement in the proposed exception is not prohibited in the current NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-136 Log #3804 NEC-P02 **Final Action: Reject**
(210.10(A)(2))

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Add language in 210.10(A)(2) as follows: “(2) Garages, and also other rooms within the dwelling and/or accessory buildings that have a floor located...” (remaining text unchanged)
Substantiation: The problem is that a grade level workshop (not in a basement) often has a concrete floor and unfinished walls, but there is no NEC requirement to provide GFCI protection for the receptacle outlets in these areas. In my area, we have Levit style homes, and these workshops are commonplace. If the shop is in a basement or in an accessory building, then we need GFCI protection. If I put the same shop in a grade-level unfinished room that is attached (part of) the dwelling, then suddenly there is no need for GFCI protection. These workshop rooms often double as storage and a place to obtain power for outdoor equipment, the floor often is damp from the yard, and GFCI protection should be mandated.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any substantiation to expand the requirements for GFCI protection to all finished rooms at or below grade level. The substantiation only addresses unfinished workshop areas. The panel recognizes that this proposal addresses 210.8(A)(2).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-137 Log #4383 NEC-P02 **Final Action: Reject**
(210.10(A)(2))

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Add language in 210.10(A)(2) as follows:
(2) Garages, and also other rooms within the dwelling and/or accessory buildings that have a floor located…(remaining text unchanged)
Substantiation: The problem is that a grade level workshop (not in a basement) often has a concrete floor and unfinished walls, but there is no NEC requirement to provide GFCI protection for the receptacle outlets in these areas. Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-138 Log #340 NEC-P02 **Final Action: Accept**
(210.11(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Delete the words “per” in the first sentence and revise the sentence to read as follows: “…volt-amperes/square meter or volt-amperes/square foot, the wiring system…”.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. It is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-139 Log #3275 NEC-P02 **Final Action: Reject**
(210.11(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Where the load is calculated on the basis of volt-amperes per sq. meter or per sq. ft the wiring system from the source of supply covered by this Code to the outlets shall be provided and rated to serve not less than the calculated load. This load shall be evenly proportioned as much as practical among branch circuits of the same rating which are not individual circuits. Overcurrent devices shall be installed to serve the calculated load.
Exception No. 1: The load shall not be required to be evenly proportioned for a dedicated circuit(s) intended to supply only a limited area or outlets for a specific use.
Exception No. 2: The load shall not be required to be evenly proportioned for the circuit(s) required by 210.11(C)(3).
Substantiation: “From the source of power to the outlets” is more specific and includes the branch circuits (not included in present text). The “load” of this section is the amount of area served. The “evenly proportioned” present requirement doesn’t apply, for example, where on “outlet” (see definition) supplies more than one receptacle. Proposal exempts individual circuits from the evenly proportioned requirement. Present literal text requires an even load proportion (area served) between 15-ampere circuits which may serve an area of 1800 sq. ft. and 20-ampere circuits which may serve an area of 2400 sq. ft. which restricts the 20-ampere circuit to 1800 sq. ft. where 15-ampere circuits are also installed. A requirement for overcurrent devices should not be limited to branch circuits which may be supplied by a feeder. The exceptions are proposed to allow a dedicated circuit which supplies a specific area or load such as a bathroom, computer stations, entertainment centers, ham radio equipment, or office equipment, etc. to be exempt from the balanced load requirement (equal area). “Connected” load is not defined; it may be deemed to not include a computed (watt/sq. ft.) load where no actual load is connected.
Panel Meeting Action: Reject
Panel Statement: The addition of the words “from source of supply covered by this code to the outlets” is unnecessary and confusing. The current text clearly states that the wiring system and the branch circuit panelboards must be able to serve the calculated load.
The current text dealing with “..evenly proportioned among multi-outlet branch circuits in the panelboard” does not prohibit the proportioning among branch circuts of different sizes. The proportioning can take into account the size of the branch circuit device.
The panel also notes that the submitter has not pointed out any issue with the application of the rule in the field.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-140 Log #2981 NEC-P02 **Final Action: Reject**
(210.11(C))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
(C) Dwelling Units.
(1) Small-Appliance Branch Circuits. In addition to the number of branch circuits required by other parts of this section, two or more 20-ampere, 120 volt, small-appliance branch circuits shall be provided for all receptacle outlets specified by 210.52(B).
(2) Laundry Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one additional 20-ampere, 120 volt, branch circuit shall be provided to supply the laundry receptacle outlet(s) required by 210.52(F). This circuit shall have no other outlets.
(3) Bathroom Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one 20-ampere, 120 volt, branch circuit shall be provided to supply bathroom receptacle outlet(s). Such circuits shall have no other outlets.
Exception: Where the 20-ampere circuit supplies a single bathroom, outlets for other equipment within the same bathroom shall be permitted to be supplied in accordance with 210.23(A)(1) and (A)(2).

FPN: See Examples D1(a), D1(b), D2(b), and D4(a) in Annex D.
Substantiation: It can be argued that a 240V circuit satisfies the requirements of 210.11(C), although this obviously is not the intent. Specifying the voltage in the requirement helps to eliminate such an argument, and provides consistency with many other code rules.
Panel Meeting Action: Reject
Panel Statement: The reference to voltage is unnecessary. 210.52 already states that the receptacle requirements are for 125-volt, 15- and 20-ampere outlets.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-141 Log #3274 NEC-P02 **Final Action: Reject**
(210.11(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add the following:
The rating of receptacle(s) shall be 20-amperes.
Substantiation: The majority of receptacles will be multiple type (duplex). The maximum load is limited to 15 amperes for such receptacles. Many portable electric space heaters and hair blow dryers have ratings which exceed 12 amperes. If such loads could be ascertained prior to final inspection, a 20-ampere receptacle would be required. While listing agencies do not limit multiple 15 ampere receptacles to a maximum 12 ampere load, the Code does even though compliance is unlikely as the AHJ would have to be present to enforce the rule. The proposal is no more of a “what if” kind than 422.16(B)(4) which requires an individual branch circuit for what might be installed in the future.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation that devices with 20 ampere attachment caps are dominating the residential market in such a manner that would drive the need for 20 ampere T-slot receptacles. Duplex receptacles intended for the connection of 15-ampere rated plugs are tested for a combined total load of 20 amperes. The panel also notes that the submitter’s reference to 422.16(B)(4) is a section on cord and plug connecting a range hood which is not a “what if” scenario.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-142 Log #4923 NEC-P02 **Final Action: Reject**
(210.11(C))

Submitter: Robert Kopelman, Rockville Centre, NY
Recommendation: Revise text to read as follows:
Branch Circuit, Appliance. A branch circuit that supplies energy to one or more outlets to which appliances are to be connected and that has no permanently connected luminaires that are not a part of an appliance.
Two or more 20-ampere small-appliance branch circuits are required by 210.11(C)(1) for dwelling units. Section 210.52(B)(1) requires that these circuits supply receptacle outlets located in such rooms as the kitchen, pantry, and so on. These small-appliance branch circuits are not permitted to supply other outlets or permanently connected luminaires.(<u>These outlets are to be thermally protected</u>)(See 210.52 for exact details.)
Substantiation: The above can be accomplished by using GFI circuit breakers in the electric panel or using a combination GFI with thermal sensing. There is a major problem called a glowing connection. As UL 1699 Scope states – AfCI’s “ 1.3 These devices are not intended to detect glowing connections” Glowing connections are a major cause of fires. There is a new UL document 498 with thermal protection that states that device shall detect abnormal heating in 8 locations in an outlet. These 8 locations are where overheating can and does occur. Attached are documents showing that an AFCI starts to detect Arcs at 5 amps. Also attached are forensic documents showing that the glowing connection can occur with 1 amp. Most electricians and inspectors have never seen a glowing connection because it happens inside the wall. But take an outlet and put a load on it, loosen the screw terminal in a dark room and it is freighting. The screw terminals loosen up over time do to the differential of expansion and contraction of the metals involved. A minute air gap is formed and the natural vibrations of the earth and the vibrations caused by normal living circumstances help to create the glowing connections.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: These products are currently listed as a receptacle with no evaluation of its ability to enhance the safety of wiring devices. A thorough study of wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. Installation of these devices is not currently prohibited by the NEC. In addition, if the submitter is proposing a specific feature to a receptacle, the proposal should be forwarded to CMP-18 since they have responsibility for receptacle construction requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-143 Log #3892 NEC-P02 **Final Action: Reject**
(210.11(C)(1))

Submitter: Alan Padilla, E Light Electric Services
Recommendation: Revise text as follows:
In addition to the number of branch circuits required by other parts of this section, two or more dedicated 20-ampere branch circuits shall be provided for all receptacle outlets specified by 210.52(B). <u>Multiwire branch circuits shall not be permitted to comply with the provisions of this section.</u>
Substantiation: The neutral/grounded conductor loaded of a multiwire branch circuit can result in load differentials between the ungrounded conductor and the grounded conductor. The GFCI responds to this load differential.
By requiring dedicated circuits for these receptacles we help reduce nuisance tripping making the GFCI protection more effective.
Panel Meeting Action: Reject
Panel Statement: A multiwire branch circuit can be used and can be appropriately protected by using a 2-pole GFCI circuit breaker or by using GFCI receptacles after the point where the multi-wire branch circuit is divided to supply separate circuits. It is suggested that the submitter reference the GFCI manufacturers installation instructions for the proper application on multi-wire branch circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-144 Log #4921 NEC-P02 **Final Action: Reject**
(210.11(C)(1))

Submitter: Robert Kopelman, Rockville Centre, NY
Recommendation: Add new text to read as follows:
Branch Circuit, Appliance. A branch circuit that supplies energy to one or more outlets to which appliances are to be connected and that has no permanently connected luminaires that are not a part of an appliance.
Two or more 20-ampere small-appliance branch circuits are required by 210.11(C)(1) for dwelling units. 2-147 Log #1727 NEC-P02 **Final Action: Reject**
(210.11(C)(3))

Submitter: Paul J. Kennedy, Jr., Kennedy Seminars
Recommendation: Revise the last sentence to read as follows:
Such circuit shall have no more than two bathrooms and shall have no other outlets.
Substantiation: I have had to go into houses that have had more than 2 bathrooms on one circuit and run an additional circuit to separate the amount of outlets that were on a single circuit which was causing the circuit breaker to overheat and trip. By limiting the number of bathrooms to no more than 2 on a single 20 amp circuit, this will eliminate any overheating/tripping problems and the fires that would result from these over heated circuits.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation does not resolve the issued as claimed in the substantiation. The number of receptacle outlets within a single bathroom on a branch circuit is not limited. As such, the same claimed overloading could occur with a single bathroom. The submitter has not substantiated that a two bathroom limit would resolve the alleged problem. In addition, the panel does not agree with the substantiation that the unintended overloading a properly installed and protected circuit is creating a fire hazard. The overcurrent protection for the circuit would be opening before the conductors reached damaging temperatures.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This Proposal should be given further consideration by Panel 2. Limiting the required circuits to two bathrooms as proposed by the submitter will reduce or eliminate circuit overloading in these areas.
Comment on Affirmative:
ORLOWSKI, S.: In Agreement with the Committee Reason and Statement for Rejecting this Proposal. No documentation whatsoever was submitted with this Proposal to support the contention that accepting the proposed change "will reduce or eliminate circuit overloading in these areas." In other words, what's the problem?

Submitter: George M. Stolz, II, Pierce, CO
Recommendation: Revise text to read as follows:
(3) Bathroom Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one 20-ampere branch circuit shall be provided to supply the bathroom receptacle outlet(s) required by 210.52(D). Such circuits shall have no other outlets.
Substantiation: A code-minimum installation calls for a receptacle installed within 3 ft of a bathroom sink, served by a circuit dedicated for that purpose. When someone adds a voluntary and permitted receptacle for lighting or other purposes in the bathroom above and beyond the minimum expectations of the NEC, there is no reason to consider them the required bathroom receptacles that are required to be served from the required circuit.
As the text currently stands, it can be interpreted that every circuit that serves a receptacle in the bathroom (regardless of the designer's intent for that circuit) must be served from a 20A circuit that serves only bathrooms.
This would have no impact on GFCI requirements as posed by other sections. It would serve to clarify the section and the minimum code-required receptacles it should be referencing. The proposed language would also serve to isolate the required receptacles from other loads away from the sinks, if this effect is undesirable an exception permitting other receptacles inside the bathroom to be served would counteract that. Additional receptacle outlets installed to meet design criteria need not meet the requirements of this article.
Panel Meeting Action: Reject
Panel Statement: The current rule permits the 20A bathroom circuit to supply all receptacle outlets installed in the bathroom, whether they are installed to meet 210.52(D) or are in addition to the ones required by 210.52(D). The submitters notation that every receptacle outlet in the bathroom must be supplied from a 20A bathroom branch circuit is correct and is intended by the panel. However, there is no limitation on the number of 20A branch circuits that can be used in the bathroom.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-150 Log #3617 NEC-P02 **Final Action: Reject**
(210.11(C)(3) Exception No. 2 (New))

Submitter: Terrence V. Wendt, City of Omaha
Recommendation: Add new text to read as follows:
Exception 2. In addition to the required receptacles specified in 210.11(C)(3) and lighting outlets required in 210.70(A)(1), General-purpose branch circuit receptacles shall be permitted.
Substantiation: Bathrooms are getting larger and turning into relaxation centers with televisions, rope light, and more. By allowing general purpose circuits to feed receptacles other than the basin outlets you can alleviate unnecessary load on the required 20 amp bathroom circuit.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that general purpose branch circuits should be used to supply receptacle outlets in the bathroom. The devices described in the substantiation can be supplied from the 20A branch circuit, or an additional 20A branch circuit can be installed to pick up these receptacles. In either case, the 20A circuit is required to be dedicated to the bathroom(s).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-151 Log #231 NEC-P02 **Final Action: Reject**
(210.11(C)(4) and 210.65)

Submitter: Timothy F. Terrell, America's Full Line Electrical Service, LLC
Recommendation: Add new text to read:
210.11(C)(4) Smoke Detector Circuit. In addition to the number of branch circuits required by other parts of this section, at least one 15-ampere branch circuit shall be provided to supply smoke detector outlet(s). Such circuit shall have no other outlets.
210.65 Smoke Detector Locations. Smoke Detectors shall be located within each habitable bedroom and within each adjoining hallway. All detectors shall have a battery back-up and shall be interconnected through the 120 volt wiring side. Location of detectors shall be in compliance with Table 210.65.1 and 210.65.2.
Substantiation: As an electrical contractor, in the residential market, it is placed on the electrical contractor to provide for smoke detectors since it is wired 120V with a battery back-up. However, there is no article defining locations, sizing, etc. for this condition. With the addition of the circuit under 210, then NFPA 72 can be applied to NFPA 70 defining placement, sizing, etc. I feel with the addition of solar PV systems, and back-up generators on residences, the separation of this circuit and the integrity demand for this circuit will continue to assist in life saving practices should main power service be lost, and some residential power be used and open candle flames utilized.
Panel Meeting Action: Reject
Panel Statement: The requirements for placement of smoke alarms are the responsibility of the NFPA 101 and NFPA 5000 committees. The requirements for the power supplies and interconnection of smoke alarms is the

responsibility of the NFPA 72 committees.

There is no basis for adding an NEC requirement for a dedicated branch circuit for smoke alarms. The panel notes that a dedicated circuit is not prohibited. In some designs, it is preferred to have the smoke alarms on a circuit with lighting or other loads to more readily identify the loss of power. The submitter has not substantiated creating a more restrict branch circuit requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-152 Log #497 NEC-P02 **Final Action: Reject**
(210.12)

TCC Action: The Technical Correlating Committee understands that the proposal number for the panel statement is Proposal 2-162, rather than Proposal 2-152.

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Insert a hyphen between "Circuit" and "Interrupter" in the title of (A) and in the text of (B).

Substantiation: To correlate with the title of 210.12.

Panel Meeting Action: Reject

Panel Statement: Item (A) has been deleted through the panel action on proposal 2-152. The usage of the term in item (B) is in accordance with the NEC Style Manual. When the term is used as a noun, only the first pair of words is hyphenated. When used as an adjective, both pairs of words are hyphenated.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: NAHB supports the position that the mandates for Arc-Fault Circuit Interrupters (AFCI's) should be removed from the National Electric Code. Not once in the entire development of the NEC has a Proposal to mandate AFCI's ever provided supporting information that there is a cost-benefit to society if these devices are installed. Quite the contrary. There is more data, documentation, and information that shows mandating these devices will cost billions of dollars to maybe save less than 30 million dollars of losses a year. This is unacceptable. Especially in this economy. Allowing manufacturer's to mandate the purchase and installation of their products through the NEC should be looked on the same as the practices by large corporations in misusing public funds. No jurisdiction should ever adopt any industry standard that does not consider the cost-benefits it will impose on that community.

2-153 Log #3485 NEC-P02 **Final Action: Reject**
(210.12)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Jack Wells, Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium

Recommendation: Revise text to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Definition: Arc-Fault Circuit-Interrupter (AFCI). A device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected.

(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

FPN No. 1: For information on types of arc-fault circuit interrupters, see UL 1699-1999, *Standard for Arc-fault Circuit Interrupters.*

FPN No. 2: See 11.6.3(5) of NFPA 72®-2007, National Fire Alarm Code®, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.

FPN No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

~~Exception No. 1: Where RMC, IMC, EMT or steel armored cable, Type AC, meeting the requirements of 250.118 using metal outlets and junction boxes is installed for the portion of the branch circuit between the branch circuit overcurrent device and the first outlet,~~ it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.

Exception No. 2: Where a branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, or steel armored cable, Type AC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.

Substantiation: This proposal is made on behalf of The Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium. The Consortium members are: Cooper Wiring Devices, Hubbell Incorporated (Delaware), Leviton Manufacturing Company, Inc., Pass and Seymour/ Legrand.

NEC 210.12 requires, in certain living areas, AFCI protection of outlets in NEW construction dwelling units. There is presently an unintentional barrier built into the wording of this article that inhibits the development of receptacle type AFCIs. Receptacle type AFCIs would be located closer to the probable arcing sources and be more sensitive to hazardous vs. normal arcing. The requirement of a metal conduit or metal-jacketed cable for the banch circuit between the branch circuit overcurrent device and the first (AFCI Receptacle) outlet is in many cases cost prohibitive. It is evident that some States are not adopting AFCI requirements. This proposal would work toward reducing objections by providing flexibility and alternatives, thus resulting in increased safety.

The primary intent of AFCI technology within a dwelling unit is to mitigate electrical fires due to arcing. As stated on NFPA website under Research and Reports, Fact Sheets, Electrical Safety in the Home; "Cords and plugs accounted for the largest share of the 2002-2005 home structure fire civilian deaths involving electrical distribution or lighting equipment." These electrical fires would be best mitigated by an AFCI device installed at the closest location to where these cords and plugs are most commonly used, a receptacle.

Additionally, wiring insulations have dramatically improved over the past (50) years. The Fire Protection Research Foundation Residential Electrical System Aging Research Project Technical Report dated April 2, 2008 and prepared by Underwriters Laboratories supports this statement. The following is taken directly from this report (page 20): "Thermoplastic insulated wires, typical of the 1950s vintage and later, generally continue to perform with excellent results, even after 50 years or more of service in the home. The electrical and mechanical characteristics of these wires appear to be exceeding even the original expectations of performance after aging and normal use."

Given the robustness of today's insulations over their predecessors the primary concerns of arcing would be in extension cords, televisions, heaters, electrical appliances and electrical connection/interfaces. Removing the above-mentioned barrier to the use of AFCI receptacles would result in the AFCI devices being installed closer to the more probable cause of hazardous arcing. The AFCI receptacle option would also take away some of the objections of AFCI adoption in the fact that the reset operation would be more accessible to the user.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

Exception No. 1: It shall be permitted to install a listed outlet branch circuit AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.

Panel Statement: The panel did not delete the subtitle "Exception No. 1" because the panel recognizes the submitters proposed text was intended for Exception No. 1. The panel has deleted the word "combination" and inserted the words "outlet branch circuit" because CMP-2 has documented the series arc protection benefit of this type of device on the line side of the receptacle outlet.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 6 Negative: 4 Abstain: 2

Explanation of Negative:

COLUCCIO, F.: Panel 2 is not recognizing the main reason why the wiring methods must be steel protected as debated last code cycle, by allowing non-metallic cable to be installed on 20% to 60% of a run for general purpose branch circuits and 100% on runs for individual branch circuits defeats the entire purpose of what is written in the 2008 NEC. The panel has no information on how the combination AFCI device will function when providing upstream protection, additional information is required to determine the performance of this device, I have concerns when ceiling outlets with attached various types of luminaires can be the first outlet.

LAROCCA, R.: We recognize and applaud the submitter's intention to make additional types of AFCI devices available. Looking at the technical issues alone and the substantiation supporting the proposal, CMP-2 has stated in previous code cycles that the requirements for AFCI protection apply to the entire branch circuit which begins at the final overcurrent protective device. The panel action would remove AFCI protection for parallel arcing faults from the first portion of the branch circuit without adding further limitations or mechanical protection. The submitter has failed to provide any technical substantiation or risk vs. benefit study to support this action. It is reasonable to assume that the same installer using the same installation techniques has installed the entire branch circuit. Also, the first portion of the branch circuit may be of significant length, especially in larger homes, where the service panel and the first outlet of some branch circuits may be located at far different ends of the house. The submitter provided no substantiation or data to suggest that damage from installation or penetration related events is less likely to occur to the first portion of the branch circuit versus that portion remaining after the first outlet or whether the first portion of the branch circuit is adequately protected against arcing faults by anything other than the AFCI function. The data reviewed by the panel to date is not specific enough to show whether fires that originated in fixed wiring occurred in the portion of the branch circuit before or after the first outlet, or whether the fault was a series arcing fault or a parallel arcing fault. Existing data that we are aware of does not permit us to draw any conclusion in support of this action.

PAULEY, J.: The panel has reduced the requirements for electrical safety from the level of the 2008 NEC. By allowing the AFCI to be installed at the first outlet without any protection of the wiring between the panel and the first outlet, the panel has effectively eliminated AFCI protection on 25% to 50% of the wiring that was previously covered by 210.12. The provision in 210.12 is for the branch circuit wiring itself and the panel has ignored the technical discussion and evidence that lead to the AFCI provisions to go into the code in the 1999 cycle. In addition, the panel has added a device - the outlet branch circuit AFCI - which is not part of the product standard and which has not had requirements developed with appropriate industry input. The panel has no information on how this device will perform or what its expected level of protection will be "upstream" of the AFCI itself.

WILKINSON, R.: The whole circuit should be protected.

Explanation of Abstention:

BOYNTON, C.: My reason for Abstaining is to further analyze the technical justification for reducing the branch circuit protection already provided for in the existing code.

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

Comment on Affirmative:

BECKER, R.: I agree with the proposal to have the circuit detection located in the first outlet. I agree with the substantiation statement that the premise wiring system is not subject to "arcing". I do not agree that substantiation has been provided that identifies the "arcing" condition that is to be detected.

KING, D.: I disagree with the NEMA comment to the negative submitted by Mr. Pauley, it is factually inaccurate in both it's characterization of CMP 2 actions and misleading with respect to the OBC type AFCI.

The statement "By allowing the AFCI to be installed at the first outlet without any protection of the wiring between the panel and the first outlet..." is factually incorrect. CMP 2 specified the "Outlet Branch Circuit" type which is tested for detection of series arcing on the home run and for series and parallel arcing downstream. In fact AFCI protection continues to be required for the entire circuit.

The statement "...the panel has effectively eliminated AFCI protection on 25% to 50% of the wiring that was previously covered by 210.12" is factually incorrect. CMP 2 eliminated only parallel arcing protection on the home run. The 25% to 50% is undocumented and unsupportable. No data is available to indicate what percentage of the wiring system is represented by the home run, nor is any data available quantifying the percentage of series vs. parallel arcing on the home run.

The statement "The provision in 210.12 is for the branch circuit wiring itself and the panel has ignored the technical discussion and evidence that lead to the AFCI provisions to go into the code in the 1999 cycle" is merely one opinion of the CMP 2 discussion. Another is that the Panel fully discussed the issues and did not ignore the technical discussion nor the evidence that led to the 1999 as well as the 2008 provisions.

The statement "In addition, the panel has added a device – the outlet branch circuit AFCI – which is not part of the product standard and which has not had requirements developed with appropriate industry input. The panel has no information on how this device will perform or what its expected level of protection will be "upstream" of the AFCI itself" is incorrect. The Panel heard from UL that while there is not a standard covering OBC AFCIs there is an "outline of investigation" that is a public document and that UL is fully capable of listing such a product as it has in the past.

I agree with the Panel Action on this Proposal because it provides a more practical alternative for compliance with this section in many applications. The Panel action to revise the text to require "outlet type" AFCI protection provides series arc protection on the line side of the device eliminating the need for additional physical protection of the conductors to the first outlet. The Panel action on this Proposal allows for a more practical means of meeting the requirements of 210.12 and will extend this life saving technology to more branch circuit wiring than what is being protected by the present code text.

WEBER, R.: I applaud the Panel and its action to Accept in Principal this proposal. The AFCI protection means is critical to enhancing the electrical safety cause and provides the greatest good for the public. I will be the first to admit the listed branch circuit AFCI device type units are not the same as breaker type protection schemes. Both provide the same level of Series and Parallel arcing protection down stream from the first listed branch circuit AFCI device type unit; thus they are equal. But in the home run circuit from that first listed branch circuit AFCI device type unit back to the panel board, it has been misunderstood that the listed branch circuit AFCI device type units does not provide protection for that segment of the circuit, which is not true. In the home run circuit, the use of a breaker does provide Series and Parallel arcing protection; whereas listed branch circuit AFCI device type units only provide Series arcing protection means. Thus, they are not totally equal, but this statement then begs the question of the arcing faults that occur in the home run circuit how many are of a Series arcing in nature which I believe to be the predominate condition and then how many are of a Parallel arc fault. It is to my understanding that the most occurrences are from either the first receptacle outlet and cord appliance connection to it and then the next is the appliance or what ever piece of electrical utilization equipment that is energized by the circuit. Is there enough of a significance occurrence to negate the use of listed branch circuit AFCI device type units because of home run circuits problems; I do not believe that to be the case. The total acceptance of the AFCI protection means by many jurisdictions has, in my opinion, been from the fact that the designer, electrician/installer at present does not have a viable option of using devices versus breakers. With the present Exception No. 1, to 210.12(B) and the use of metal raceways or metal covered cables for that home run circuit, it is not a viable option or one that enhances the use of listed branch circuit AFCI device type units. Given economic consideration and comparisons between the use of the breaker and device type protection; we need to even the playing field and open up the competition for what is the most desirable use to meet the AFCI protection means and let the consumer decide. With this proposal utilizing listed branch circuit AFCI device type units protection and nonmetallic-sheathed cable in the home run circuits, I believe that has been accomplished via the action taken by the panel. Many electrical installations do not presently have circuit breakers and would then require a sub-panel board to be installed to meet the present code requirement whereas the device type would address that issue and for existing circuit extensions as well where we would have AFCI protection down stream from that point on the extension; which is another desirable aspect. If we truly want the AFCI protection scheme to be widely accepted and grow in use, this is a means to that end.

2-154 Log #3487 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Jack Wells, Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium

Recommendation: Revise text to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Definition: Arc-Fault Circuit Interrupter (AFCI). A device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected.

(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms. parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

FPN No. 1: For information on types of arc-fault circuit interrupters, see UL 1699-1999, *Standard for Arc-fault Circuit Interrupters*.

FPN No. 2: See 11.6.3(5) of NFPA 72®-2007, *National Fire Alarm Code®*, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.

FPN No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

Exception No. 1: Where RMC, IMC, EMT, <u>RNC</u> or steel armored cable, Type AC, meeting the requirements of 250.118 using metal outlet and junction boxes is installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.

Exception No. 2: <u>Where a listed metal or nonmetallic conduit or tubing is encased in not less than 50 mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.</u>

Exception No. ~~2~~3: Where a branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, <u>RNC</u> or steel armored cable, Type AC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.

Substantiation: This proposal is made on behalf of The Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium. The Consortium members are: Cooper Wiring Devices, Hubbell Incorporated (Delaware), Leviton Manufacturing Company Inc., Pass and Seymour/Legrand.

Exception No. 1 and proposed No. 3 was revised to add RNC (Rigid Nonmetallic Conduit, Articles 352 and 355) as an approved wiring method for the protection of cables and conductors. Sections 300.4(D) Exception No. 1 and 300.4(F) Exception No. 1 shows that Rigid Nonmetallic Conduit is an approved method to protect cables and conductors from the penetration of nails and screws and can be used either exposed or concealed. Referencing Proposal 3-36 and Comment 3-29 for the 1999 NEC, Panel 3 rejected the use of Type AC Cable as an approved method from preventing nail or screw penetrations where as RNC has always been an approved method. The intent of this proposal is not to remove the Type AC Cable but to permit other proven wiring methods for the protection of conductors and cables from the penetration of nails and screws.

A new Exception (proposed Exception No. 2) was added to allow all types of conduits and tubings to be used where encased in concrete. Several Sections of the NEC such as 518.4 or 520.5 recognize that a raceway encased in concrete is a pathway and that the protection, such as nail and screw penetration, is provided by the concrete.

Panel Meeting Action: Reject

Panel Statement: Panel action on Proposal 2-153 makes this recommendation unnecessary.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

Comment on Affirmative:

COLUCCIO, F.: The panel should have accepted this proposal in part to allow RNC and ENT wiring methods by adding an exception No. 3 to what is written in 210.12 (B) Exception No.1 and Exception No.2 of the 2008 NEC to read as follows:

Exception No.3: For general purpose branch circuits including individual fire alarm circuits, RNC or ENT encased in not less than 50mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, where stubbing up out of the concrete the wiring method to the first metal box shall be RMC, IMC, or EMT.

This will allow non-metallic wiring methods to be installed in concrete deck work on low and high rise buildings.

2-155 Log #3896 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Kasey Card, E Light Electric Services

Recommendation: Revise text as follows:

All 120-Volt, single phase, 15 and 20 ampere branch circuits supplying outlets installed in dwelling unit ~~family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways~~ bedrooms or similar rooms or areas shall be protected by a listed arc fault circuit interrupter combination type, installed to provide protection of the branch circuit.

Substantiation: I believe we should return to the original requirement for AFCI protection until more AFCI device are available and the cost is reduced for these devices. No data has yet to be presented to indicate that the AFCI protection has reduced residential fires. The expanded AFCI requirements have added significant cost to the dwelling unit electrical cost and yet no documented safety benefit can be shown to justify this cost. The US is heading into difficult economic times. Safety requirements that increase the cost of installation should be weighted carefully against the safety benefits versus the additional cost. We should at least wait to add these costs and requirements until we have documented data to show they truly decrease residential fires.

Panel Meeting Action: Reject

Panel Statement: AFCI devices are widely available in the market, and the panel notes that the costs have already come down since the introduction of AFCIs into the 1999 NEC. The panel has reviewed significant data over numerous code cycles and continues to support the safety benefits provided by AFCIs. The panel has carefully considered the justification for AFCIs at each phase of the code cycle where the requirements have been introduced and changed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-156 Log #3992 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12)

TCC Action: It was the action of the Technical Correlating Committee to refer this proposal to Code-Making Panel 3 for correlating action in Article 760.

This action will be considered by the panel as a public comment.

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Revise 210.12.

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Definition: Arc-Fault Circuit Interrupter (AFCI). A device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected.

(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

FPN No. 1: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.

FPN No. 2: See 11.6.3(5) of NFPA 72®-2007, National Fire Alarm Code®, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.

FPN No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

Exception No. 1: Where RMC, IMC, EMT or steel armored cable, Type AC, meeting the requirements of 250.118 using metal outlet and junction boxes is installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.

Exception No. 2: Where a <u>dedicated</u> branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in <u>metal raceway</u> ~~RMC, IMC, EMT, or steel armored cable, Type AC,~~ meeting the requirements of 250.118~~,~~ with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted<u>, subject to the following conditions</u>.

(1) <u>All non-power-limited circuits permitted by Part II of Article 760 shall be installed in metal raceway.</u>

<u>(2) All power-limited circuits shall be installed with the requirements of Part III of Article 760.</u>

Substantiation: The overall purpose of this proposal is to clarify the installation of fire alarm system wiring where the requirements for AFCI protection prevail.

The term "dedicated branch circuit" is from NFPA 72-2007, which reads as follows: "**4.4.1.4.1 Dedicated Branch Circuit.** A dedicated branch circuit of one of the following shall supply primary power."

It seems appropriate to use the term "metal raceway" rather than identify only certain types of installation materials.

Where a dwelling is greater that 25,000 square feet, NFPA 90A is the reference standard for air conditioning systems. This means that Type AC cable would not be permitted in an air duct by NEC, 300.22(B). Additionally, the rooms identified in 310.18 could fall under the requirements of NFPA 90A & 300.22.

The (1) and (2) additions to Exception No. 2 differentiate between the two types for fire alarm system field wiring. Non-power-limited circuits are permitted to be installed using non-power-limited fire alarm cable. This type of circuit will have maximum values of 150 volts and 10 amps. Clearly this type of circuit should be in metal raceway in keeping with the intent of AFCI protection. Conversely, power-limited circuits are not considered to be a source of fire ignition, so installation of power-limited cable is not a fire safety issue. The power source requirements for a power-limited fire alarm circuit is the equivalent to the Article 725 Class 2 or Class 3 requirements (e.g., door bell circuits, temperature control circuits, and security system circuits run throughout a home).

Panel Meeting Action: Accept in Principle in Part

In the current Exception No. 2 to 210.12(B) revise to read as follows:

"Exception No. 2: If an individual branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, or steel armored cable, Type AC meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted."

The remainder of the proposal is rejected.

Panel Statement: The panel has revised the wording to specify that an individual branch circuit must be installed to the fire alarm control unit. The use of the term "individual" is consistent with the definition in Article 100 and with the terminology used in Article 760. The panel changed "where" to "if" to be consistent with the panel action on Proposal 2-182.

The panel has rejected the remainder of the proposal based on the following: The use of the generic term "metal raceway" would include raceways such as flexible metal conduit, which the panel did not agree as being acceptable when this issue was debated during the 2008 NEC cycle. The expectation is that the metal raceway provide sufficient physical protection as well as a ground return path. The two "conditions" are rejected because they are outside the scope of Article 210. Circuits that are supplied from a fire alarm control unit whether power limited or not fall under the purview of Article 760. CMP-2 recommends to the TCC that this proposal be sent to CMP-3 for action in Article 760 with respect to the proposed conditions on the power limited and non-power limited circuits.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

Comment on Affirmative:

COLUCCIO, F.: The panel should have accepted this proposal in part to allow RNC and ENT wiring methods by adding an exception No. 3 to what is written in 210.12 (B) Exception No.1 and Exception No.2 of the 2008 NEC to read as follows:

Exception No.3: For general purpose branch circuits including fire alarm circuits, RNC or ENT encased in not less than 50mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first metal box, where stubbing up out of the concrete the wiring method to the first metal box shall be RMC, IMC, or EMT.

This will allow non-metallic wiring methods to be installed in concrete deck work in low or high rise buildings.

2-157 Log #4316 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Richard W. Becker, Engineered Electrical Systems, Inc.

Recommendation: Delete this paragraph.

Substantiation: "Arcing" in 120 Volt circuits, for premises wiring or portable cords, has not been substantiated or demonstrated by proponents of the paragraph. There is no indicator on the devices that distinguish between standard circuit breaker overcurrent detection and "arcing".

Panel Meeting Action: Reject

Panel Statement: The panel has reviewed technical studies that support the use of these devices for their intended purpose and disagrees with the submitter's statement that their effectiveness has not been demonstrated.

The submitter's statement regarding an indicator is a product feature that is not necessary for the application of the product.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1

Explanation of Negative:

BECKER, R.: I do not agree that technical studies support the use of these devices. The benefit of arc detection has not been adequately substantiated or demonstrated. I am not able to produce a series condition that will cause the AFCI to trip. A parallel condition, that will trip the AFCI is an instantaneous event that causes the standard circuit breaker trip mechanisms to react substantially faster than the AFCI detection. I have not seen, nor am I aware of, a field condition that can be detected by the AFCI sensor. Fire investigation reports appear to be based on "joule heating" incidents, that can be demonstrated and repeated, and will not be detected by the AFCI. There is no correlation provided as to the number of the "possible electrically caused fires" that could or would be detected. Based on my personal experience, I believe the number is very small, and in no way justifies the cost of the device.

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-158 Log #4328 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Steven Orlowski, National Association of Home Builders

Recommendation: Delete all of the following:

~~210.12 Arc-Fault Circuit-Interrupter Protection.~~

~~(A) Definition: Arc-Fault Circuit Interrupter (AFCI). A device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected.~~

~~(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.~~

~~FPN No. 1: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.~~

~~FPN No. 2: See 11.6.3(5) of NFPA 72®-2007, National Fire Alarm Code®, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.~~

~~FPN No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.~~

~~Exception No. 1: Where RMC, IMC, EMT or steel armored cable, Type AC, meeting the requirements of 250.118 using metal outlet and junction boxes is installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.~~

~~Exception No. 2: Where a branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, or steel armored cable, Type AC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.~~

Substantiation: During the recent code revision cycle to the 2008 *National Electrical Code,* there was a lack of fire data used to support the expansion of arc-fault circuit interrupters (AFCI's) to all receptacles in the dwelling, let alone the mandatory installation of AFCI's in bedrooms. Looking at the latest data from NFPA in the report "The U.S. Home Product Report (Appliances and Equipment Involved in Fires)", by John R. Hall, Jr. of the Fire Analysis and Research Division of NFPA dated November 2005, the report shows that the annual average of home fires is 372,900, with direct property damage of $443,000,000. Of this number 32,000 (or 9% = $39,870,000) of these fires are caused by "electrical distribution equipment." Of that 9%, only 14,500 (or 4% = $17,720,000) of those fires are attributed to "fixed wiring, switches, outlets, and receptacles." And, there is no data or study to support that any of these 14,500 fires would have been prevented had there been an AFCI device installed. Using the U.S. Census Bureau data on building permits for 2004 (Table (S-3) Final) shows 1,656,413 one- & two-family dwelling units and 413,664 multifamily units for that year.

Furthermore, calling this a "limited approach to the expansion of AFCI" still does not result in any cost-benefit to homeowners or society. It just needlessly increases the cost of housing. There is still no justification for any jurisdiction to burden its citizens with this unneeded expense. As it was during the 1999 revision cycle, there has been a failure to provide any fire study or cost benefit study to support installing these devices in bedrooms. NAHB continues to argue the requirement of AFCI on the basis that NO data or study has ever been assembled to support the expanded coverage to the whole house.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees with the submitter's assertions in the substantiation. CMP-2 has reviewed significant amounts of data, heard presentations on all sides of the issue, reviewed cost analysis from various sources (including the CPSC), and concluded that AFCIs do provide a justified safety benefit to the electrical system and to the consumer.

The panel also notes that the submitter fails to take the total cost of electrical fires into account, including loss of life, the impact on the families involved, and the impact of fire fighters and fire-fighting resources.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1

Explanation of Negative:

BECKER, R.: The substantiation for this proposal clearly documents that this article should be deleted.

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-159 Log #4863 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: John Steinke, Amish Electric

Recommendation: Delete entire section.

Substantiation: The entire AFCI issue has been a nightmare for the NEC, and has done much to undermine the code making process and led to decreased respect for the NEC. Political issues aside, there still remain a number of technical matters that need to be resolved.

The first issue has been the failure of the manufacturers to produce the product, as promised. Even the latest version is not available in a form that can be used with a multi-wire branch circuit. AFCI's installed under the 2005 NEC do not meet the requirements for the 2008 NEC.

As so well documented by Huber (Peter Huber; Galileo's Revenge: Junk Science in the Courtroom), the "law" ALWAYS gets in trouble when it attempts to legislate to the 'cutting edge' of technology, rather than to established norms. Even after a decade of code revisions, the AFCI is far from proven, or accepted, in the field.

Part of the problem has been the 'moving target' aspect of the debate. First the AFCI was to protect us from crushed plugs and frayed extension cords; then it was to protect the entire circuit (Goodbye $12 device, hello $35 breaker). It was claimed to protect against broken wires and loose connections ("series arcs"); when shown not to do so, an improved version was promised.

One major player in the debate has been the role of "Romex," or NMC. AFCI manufacturers have made many claims as to the hazards presented by an errant staple; at the same time, cable makers have campaigned (successfully) to expand the NEC's acceptance of their wiring method. Oddly enough, where AFCI devices have been allowed (in theory; they're still not available), they are to be supplied by a more substantial wiring method.

If NMC is so unsafe as to require this additional protection.... maybe we need to delete Article 334. We certainly ought not be expanding the approved uses of the method.

Nor is the self-interest of the manufacturers to be ignored. Every manufacturer has opposed the development of AFCI test equipment, apart from the test button on the breaker. In a related development, US Customs has already seized numerous "GFCI" breakers with false labels and a 'test' button that did nothing but turn them off. Absent recognized test equipment, the inspector has no way, in the field, of determining if a circuit really is protected.

There have many other concerns voiced; if nothing else, these concerns are evidence that the technology is not yet accepted.

The AFCI debate has been fraught with design issues. In previous codes, the specification that bedrooms be AFCI protected resulted in dedicated circuits for bedrooms. This change in wiring practices resulted in costs that went well beyond the cost of the breakers.

As currently written, every circuit in a house (except, for some reason, stairwells) now requires either AFCI or GFCI protection. Not only has this resulted in a tenfold increase in breaker expense, there are many other additional costs that result. These additional costs include:

a) Lack of panel space. It is common for even a new home to have panels filled with 'skinny' breakers. You can't just add panel spaces - there's only room for so many cables to enter the top - you end up needing to add panels and feeders;

b) The inability to use multi-wire branch circuits will result in additional panel fill issues and material costs;

c) The very heat generated by AFCI's will ensure that panel interiors remain well over 40C - the temperature at which breakers are calibrated; and,

d) Anecdotal reports are suggesting a major nuisance problem, caused either by appliances, or by devices mandated by energy codes (motion sensors, timers, additional fluorescent light ballasts, etc.) If nothing else, the inability to independently test parts of a circuit, and the 'whole circuit' approach, greatly complicate troubleshooting.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-157. The submitter's claims regarding the availability of AFCIs is not substantiated and is in conflict with the industry experience regarding availability across the country. In addition, the panel notes the following on the claims regarding "additional costs" in the submitter's substantiation:

(a) Lack of panel space - there are numerous panels on the market that can take up to 42 full-size circuits (and potential even higher numbers with the change to Article 408 in the 2008 NEC).

(b) Multiwire circuits - 2-pole AFCIs can be used on multi-wire circuits. The availability of such a device is driven by market demand. If the market has a sufficient demand for such a product, the manufacturers will respond.

(c) The submitter has provided no information to substantiate the claim that panelboard temperatures are exceeding the requirements provided in the standards.

(d) The claim of nuisance tripping is, as noted by the submitter, anecdotal in nature and not actionable by the panel.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-160 Log #2535 NEC-P02 **Final Action: Reject**
(210.12 Exception No. 3 (New))

Submitter: Marcus R. Sampson, Lysistrata Electric
Recommendation: Add new text as follows:

Exception No. 3: An existing circuit may be extended with no more than ten (10) feet of conductor without AFCI protection.

Substantiation: Frequently, installers are asked to extend an existing branch circuit for a limited use, such as extending a living room 15-amp receptacle circuit for a new gas fireplace receptacle or a 15-amp bedroom receptacle circuit to add a smoke alarm. This exception would allow a single, limited extension of existing, code complaint wiring without the added expense of changing the service panel to one that accommodates AFCIs or rewiring an older home.

This seems a reasonable allowance for those occupancies where a minor installation project could easily become a costly, major electrical undertaking.

Panel Meeting Action: Reject
Panel Statement: The decision on applying the new construction AFCI requirements to a circuit modification is that of the authority having jurisdiction.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-161 Log #590 NEC-P02 **Final Action: Accept in Principle**
(210.12(A))

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Revise text as follows:

Move existing definition of Arc-Fault Circuit Interrupter from 210.12 to article 100 definitions.

Substantiation: The term is used in four Articles and should be located in Article 100 in accordance with the NEC Style Manual.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-162.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-162 Log #701 NEC-P02 **Final Action: Accept in Principle**
(210.12(A))

Submitter: Thomas R. Proffit, I.B.E.W. Electrician/JATC Director
Recommendation: Revise text to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

~~(A) Definition: Arc-Fault Circuit Interrupter (AFCI). A device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc-fault is detected.~~

~~(B)~~ (A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

Substantiation: The proper and most useful place for definitions is in Article 100, Part I Definitions.

This definition was found in 210.12(A), note that the NEC Style Manual requires a defined term used in more than one article be defined in Article 100. See 760.121(B), 440.65, or 550.25.

Panel Meeting Action: Accept in Principle

Relocate 210.12(A) definition to Article 100.

Delete the words "(B) Dwelling Units" from the existing (B) so that the remaining text becomes a main rule of 210.12.

Change the title of the section to "Arc-Fault Circuit-Interrupter Protection for Dwelling Units."

Panel Statement: The panel agrees with moving the definition to Article 100 and has made further changes to the section to eliminate the subdivision lettering and create a single main rule with exceptions. The title was also revised to make it clear that the section applies to dwelling units.

The panel recommends to the TCC that CMP-2 maintain responsibility for the definition.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-163 Log #2880 NEC-P02 **Final Action: Accept in Principle**
(210.12(A))

Submitter: William Gross, Electric Service of Clinton
Recommendation: Delete section 210.12(A) and relocate this definition to Article 100.
Substantiation: This definition appears in more than two articles of the NEC. Specifically in sections 210.12(A), 210.12(B), 440.65, 550.25(A), 760.41(B) and 760.121(B). It should be relocated to Article 100.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-162.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-164 Log #526 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Sarah Ibarra, Metro Wastewater Reclamation District
Recommendation: Revise text to read as follows:

All ~~120~~ 125 volt, single phase, 15- and 20-ampere branch circuit supplying outlets installed in dwelling units.

Substantiation: All 125 volt, single phase, 15- and 20-ampere branch circuit supplying outlets installed in dwelling units.
Panel Meeting Action: Reject
Panel Statement: Changing from 120V to 125V is technically incorrect. The branch circuit carries a nominal voltage of 120V as stated in 220.5. 125V is generally in reference to voltage ratings of specific devices such as a receptacle.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-165 Log #529 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: George H. Little, Little Enterprises
Recommendation: Revise text as follows:

Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed or extended in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

Substantiation: The current wording implies that it is only that the new branch circuits are required to have arc-fault protection. Inserting the words "or extended" will provide for protection of not only the new branch circuits but also any new wiring installed as an extension of an otherwise non-AFCI protected circuit.
Panel Meeting Action: Reject
Panel Statement: The decision on applying the new construction AFCI requirements to a circuit modification is that of the authority having jurisdiction.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1
Explanation of Negative:

KING, D.: I agree with Mr. Webber's explanation of negative. Accepting this Proposal in Principal in Part would add clear prescriptive requirements for the Authority Having Jurisdiction to be able to consistently enforce. The Proposed text will not expand the existing requirement for AFCI Protection but rather it will ensure that AFCI Protection is required in locations that are already required for new installations.

WEBER, R.: This proposal should have been accepted in Principal and Part; given the affirmative vote on at the panel meeting on Proposal 2-153 and subsequent support in the written ballot phase for listed branch circuit AFCI device type units in the branch circuit for extensions. The use of this type device for replacement of existing receptacles and extensions to the branch circuits should be supported. The part that would not be accepted "combination-type", would not be valid with the listed new type device. If we do not provide clear code text and requirements, the circuit extensions are going to remain up to the AHJ as to if it is required or not. Given this new enhanced safety protection scheme for an AFCI protection option, it needs our support.

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-166 Log #676 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Ray C. Mullin, Ray C. Mullin Books

Recommendation: Revise text to read as follows:

210.12 Arc-fault Circuit-Interrupter Protection.

(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling units ~~family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas~~ shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

Exception No. 1: Exempt from (B) are 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling units that are required to have GFCI protection as stipulated in 210.8(A).

Note: It shall be permitted to provide both AFCI and GFCI protection for 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling units.

Exception No. 2: Insert current Exception No. 1.

Exception No. 3: Insert current Exception No. 2.

Substantiation: There is much confusion in the interpretation of 210.12(B). Down the road, AFCI and GFCI devices will become available in many types. The "Laundry list" of rooms really does not cover all types of rooms that come under many different names.

My proposal is quite simple to understand and enforce.

Panel Meeting Action: Reject

Panel Statement: The list of rooms is consistent and easy to understand since it was based on a similar list in NEC 210.52(A). The submitter's claim that AFCI protection is not required where GFCI protection is required is inaccurate. AFCI protection and GFCI protection are two independent protections that accomplish two different objectives. AFCI protection is for protection from fire ignition for the branch circuit. GFCI protection is for protection from electrocution. Currently, there are areas of the dwelling that would require both forms of protection - one example is a wet bar located within a den or family room. The receptacles within 6 ft of the wet bar must have GFCI protection and the circuits supplying all outlets in the room must have AFCI protection. The panel does not agree that the current provisions are confusing - branch circuits supplying outlets in the rooms specified in 210.12(B) must be provided with AFCI protection. Receptacles installed as specified in 210.8(B) must have GFCI protection. Both requirements coexist and must be complied with.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-167 Log #687 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Keith M. Whitesel, Whitesel Electric

Recommendation: Delete "Dining rooms" from the list of rooms that require AFCI protection.

Substantiation: Since Kitchens and Bathrooms are not on the list I can only assume that it is because they have GFCI protection.

210.52 allows dining rooms to be fed from the small appliance circuits. The current requirement in 210.12 for AFCI protection on the dining room receptacles would force BOTH GFCI and AFCI protection on the small appliance circuit if it also feeds the dining room. Have both AFCIs GFCIs been tested along with each other to function properly?

210.8 does not require kitchen wall receptacles to be GFCI protected so why are the dining room wall receptacles required to be so protected.

While I agree that AFCI protection has great potential for saving lives and property, the technology has not been around long enough and used long enough to promote it into all areas of a house. Just as GFCI protection needed to prove itself reliable so does AFCI protection.

See the supporting material I have provided for further possible wiring connections that will be affected.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The list of rooms currently in 210.12(B) was developed based on proposals and comments in the 2008 cycle that allowed for an incremental expansion of AFCI. Having or not having GFCI protection does not impact the AFCI requirements. The panel also notes that AFCI protected circuits can have GFCI receptacles installed without compatibility issues.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-168 Log #722 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Delete *Exception No. 2* and the numbering of *Exception No. 1* to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

FPN No. 1: For information on types of arc-fault circuit interrupters, see UL 1699-1999, *Standard for Arc-Fault Circuit Interrupters*.

FPN No. 2: See 11.6.3(5) of *NFPA 72*®-2007, *National Fire Alarm Code*®, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.

FPN No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

Exception ~~No. 1~~: Where RMC, IMC, EMT or steel armored cable, Type AC, meeting the requirements of 250.118 using metal outlet and junction boxes is installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.

~~Exception No. 2: Where a branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, or steel armored cable, Type AC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.~~

Substantiation: Correlation issue. In the NEC® fire alarm system universe, there two types fire alarm circuits: Non-Power-Limited Fire Alarm (NPLFA) Circuits in Part II of Article 760 and Power-Limited Fire Alarm (PLFA) Circuits in Part III of Article 760. 760.41(B) of Part II and 760.121(B) of Part III, both already referenced in 210.12(B) FPN No. 3, each state without qualification as to any wiring method: "This branch circuit shall not be supplied through … arc-fault circuit interrupters.". No AFCI protection on NPLFA and PLFA circuits. No interference with essential fire alarms due to the need to reset tripped AFCIs (and GFCIs). Period.

210.12(B) Exception No. 2, however, states that "… AFCI protection shall be permitted to be omitted", i.e., that AFCI protection is optionally ALLOWED to supply NPLFA and PLFA circuits (but you can leave AFCI protection out, too, if you want), under particular wiring method arrangements. This 210.12(B) Exception No. 2 conflicts with 760.41(B) and 760.121(B).

Therefore, delete 210.12(B) Exception No. 2 and redesignate 210.12(B) Exception No. 1 as 210.12(B) Exception.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that this is a correlation issue. CMP-2 is responsible for branch circuits and added the exception as a means to comply with the provision of 760.41(B) and 760. 121(B). The requirement to install the branch circuit in a metal raceway provides a method to accomplish a level of protection and allows the provision in 760 to be met. The use of the words "shall be permitted to be omitted" along with the direct references to the Article 760 provisions provides clear and consistent direction to the user.

See also the panel action and statement on Proposal 2-156.

2-169 Log #1885 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: All 120-volt single phase 15- and 20-ampere circuits supplying outlets installed ~~in~~ inside dwelling units and accessory structures ~~family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas~~ shall be protected by a listed arc-fault circuit interrupter, combination type, installed to provide protection of the branch circuit.

Substantiation: Edit. Proposal eliminates a laundry list of locations and eliminates outside outlets on circuits with no outlets inside buildings or accessory structures, which do not warrant an arc-fault circuit interrupter.

Panel Meeting Action: Reject

Panel Statement: The submitter has noted that the proposal is "editorial" when in fact it results in a significant change in requirements. The submitter should provide technical substantiation for the change.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-170 Log #2780 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Travis Kummer, Kummer Electric LLC
Recommendation: Revise text as follows:
(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuit supplying outlets installed in dwelling unit kitchens, laundry rooms, utility rooms, bathrooms, garages, outdoor areas (other than those required to be ground-fault circuit-interrupter protected by this code), family rooms, dining areas, living rooms...etc. (continue as currently written).
Substantiation: As written currently in 210.12(B) there is no Arc-fault circuit-interrupter protection at all in the areas underlined above. These areas should be treated no differently than thhe areas currently stated in 210.12(B) as fire hazards exist in the above underlined areas due to arcing as in all other areas.
Panel Meeting Action: Reject
Panel Statement: See panel statements on Proposals 2-174 and 2-166.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-171 Log #2817 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Larry Cross, Local Union #98 IBEW
Recommendation: Revise text as follows:
Kitchen outlets that are not covered by 210.8(A)(6).
Substantiation: It could be possible to have outlets in the kitchen of a dwelling unit not protected by an AFCI or GFCI circuit the way 210.12(B) and 210.8(A)(6) is addressed in the 2005 NEC
Panel Meeting Action: Reject
Panel Statement: The submitter is confusing AFCI protection and GFCI protection. The AFCI requirements are for specific rooms as specified in the present list within 210.12(B). Having or not having GFCI protection does not impact those AFCI provisions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-172 Log #2889 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Lisa M. Couture, Mr. Electric
Recommendation: Revise text to read as follows:
(B) Dwelling Units.
All 120-volt, single phase, 15- and 20-amp branch circuits supplying outlets installed in dwelling units family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sun rooms, recreation rooms, clothes closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.
Substantiation: Garages are required by Code to have ground-fault circuit interrupter protection for personnel (210.8(A)(2)).
Single family dwelling units, with washer and dryer units in garages, enclosed in walls with walls around the units, it appears as a closet, requiring arc-faulting by Code.
Panel Meeting Action: Reject
Panel Statement: The use of the term "closets" is intended to cover both clothes and other storage closets. The submitter's revision would limit the application to only clothes closets. The panel does not agree that the configuration described by the submitter is a closet.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-173 Log #3150 NEC-P02 **Final Action: Reject**
(210.12(B))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Terry Cromer, NC Association of Electrical Contractors
Recommendation: Revise text as follows:
All 120-volt, single phase, 15- and 20-ampere ~~branch circuits supplying~~ outlets installed in dwelling unit family rooms, dinning rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, ~~installed to provide protection of the branch circuit~~.
Substantiation: By changing to code language this way you would eliminate the exceptions. It would allow the use of Nonmetallic-Sheathed Cable (Type NM). Type NM Cable is the most used wiring method in dwelling units and is a proven safe method. The 2005 NEC allow Type AC Cable which can be very easily damaged when installed through bored holes in wood members. If the outside jacket is damaged on the AC Cable, then the integrity of the grounding system is endangered where NM Cable would not.
I know that there would be some wire that would not have AFCI Protection, but is that not the case in the other wiring methods in Exception 1 as well. It is proven that arc-faults in the hard wiring of dwelling units generally happen at termination points, such as where the wire is attached to a receptacle or switch. By putting the AFCI protection at the first receptacle, just like GFCI protection, it would protect the circuit down stream from that point.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-153.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 4 Abstain: 1
Explanation of Negative:
COLUCCIO, F.: CMP2 is not recognizing the main reason why the wiring methods must be steel protected as debated in the last code cycle, by allowing non-metallic cable to be installed on 20% to 60% of a run on for general purpose branch circuits and 100% on runs for individual branch circuits defeats the entire purpose of what is written in the 2008 NEC. The panel has no information on how the combination AFCI will function when providing upstream protection. Additional information is required to determine the performance of this device, I have concerns when ceiling outlets with attached various types of luminaires can be the first outlet.
LAROCCA, R.: See my explanation of negative vote on Proposal 2-153.
PAULEY, J.: See negative voting comment on Proposal 2-153.
WILKINSON, R.: The whole circuit should be protected.
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.
Comment on Affirmative:
KING, D.: See my Affirmative with Comment for Proposal 2-153.

2-174 Log #3451 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Larry Logan, Township of Princeton
Recommendation: Add text to read as follows:
Dwellings Units. All 120 volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling units ~~family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas~~ shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.
Substantiation: If, in fact, we are trying to protect the BRANCH CIRCUIT from arc-fault hazards, then the circuits that are protected by GFCI devices should not be excluded. I'm sure some members of Code Making Panel 2 must have seen the result of staples in walls or screws piercing wires that have caused fires from the arc effect, but may not have been a ground fault. I also believe that most GFCI protection is provided by a receptacle type device in homes, thus, leaving the BRANCH CIRCUIT unprotected until the first device. This proposal would also do away with the litany of room types required to be protected.
Panel Meeting Action: Reject
Panel Statement: In the 2008 NEC cycle the panel expanded AFCI to the list of locations and rooms as shown in 210.12(B). It is the intent of the panel to continue with AFCI in currently listed locations and rooms through the 2011 NEC. This expansion is independent of the requirements for GFCI.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-175 Log #3832 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: James H. Maxfield, Dover, NH
Recommendation: Revise text to read as follows:
(B) Dwelling Units. All 125-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sun rooms, recreation rooms, kitchen and bathroom lighting circuits, closets and hallways within finished living areas, or similar habitable rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.
Substantiation: The purpose of this proposal is to clarify the intended areas for AFCI protection within the dwelling. Current code language appears to require all 125v, 15-20 ampere branch circuits supplying any closet or hallway circuits to be AFCI protected regardless of their location within the dwelling even if it is in an unfinished area within the dwelling unit. It appears that the current code language requires AFCI protection of closet and hallway branch circuits in the finished living areas and in unfinished areas such as walk-up 3rd floor areas, basements, wine cellars, and garages (garage under style)etc., and other unfinished areas within the dwelling structure.

Additionally, the current code requires AFCI protection of the lighting circuits within most of the finished living areas except the kitchen and bathrooms.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The revisions are unnecessary. The list in 210.12(B) was derived substantially from the list already contained in 210.52(A) and as such there is no need to specify "habitable" rooms. The addition of the kitchen and bathroom lighting circuits would add further confusion because the list is based on the the room and not specific outlets within the room. The inclusion of hallways and closets that are not finished does not created a conflict and simply provides additional locations for the required AFCI protection. For the revision of 120V to 125V see the panel statement on Proposal 2-164.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-176 Log #4581 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise to read as follows:

All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets in or for dwelling units shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit. For those circuits supplying receptacle outlets that are required to have ground-fault circuit-interrupter protection for personnel by 210.8(A), and where that protection is provided as part of the branch-circuit overcurrent device, the arc-fault circuit interrupter shall be permitted to be omitted.

Substantiation: This wording assures residual current detection of some sort on all dwelling unit branch circuits. The 2008 NEC requires AFCI protection for all wiring except areas where GFCI protection is generally required for receptacle outlets (outdoors, kitchens, bathrooms, basements). This leaves wiring faults in the branch circuits uncovered for those areas, seemingly without adequate substantiation. How does an arcing failure in the 20A branch-circuit wiring to a bathroom receptacle know that it is supposed to self extinguish because there is no AFCI ahead of it?

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that AFCI and GFCI provisions are interchangeable. The current list is an expansion of AFCI to specified areas of the dwelling unit. Whether or not GFCI protection is provided has no bearing on the AFCI requirements.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-177 Log #4713 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Robert P. McGann, City of Cambridge

Recommendation: Revise text as follows:

Dwelling Unit <u>(Habitable Areas and closets and hallways)</u> ~~(Family Rooms, Dining Rooms, Living Rooms, Parlors, Libraries, Dens, Bedrooms, sun rooms, recreation rooms, closets, hallways or similar rooms or areas.~~

Substantiation: The terminology similar rooms or areas is confusing, at best. For example when your dining area is in a dwelling is the kitchen counter top. This would solve that confusion and also give expanded protection into areas that only have GFCI protection, which is not a safe guard for the hazards that AFCI would protect against.

Panel Meeting Action: Reject

Panel Statement: The current wording is based largely on the list from 210.52(A). There have not been significant issues with interpreting the words of 210.52(A) that have existed for a number of code cycles and as such there should be no similar interpretation problems with the 210.12(B) wording.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-178 Log #4778 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Lawrence S. Cross, BCIT

Recommendation: Add finished basements to 210.12(B).

Substantiation: The terms recreation rooms, similar rooms or areas may not meet the meaning of finished basements. Therefore outlets in the finished basement could be left unprotected from Arc-Fault Circuit-Interrupter Protection and Ground-Fault Circuit-Interrupter Protection because the outlet is now installed in a finished basement as opposed to an unfinished basement.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that the current wording of "similar rooms" would not include the finished basement as described. The terms used are consistent with those in 210.52(A) that would also require that outlets be spaced appropriately in such a finished space.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-179 Log #4876 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: David Zinck, Wiring Inspector / Rep. Newburyport, MA

Recommendation: Add two additional sentences.

This requirement shall apply to new dwellings or new branch circuits in existing dwellings. It shall not apply to modifications to existing circuits in existing dwellings.

Substantiation: An electrician is call to a small room renovation. The homeowner has a carpenter remove a short section of wall. They find there is a wire running through it. The electrician simply has to install a plug on either side of the opening and run a new wire between the two. Most electricians could leave the truck running and do this job. But there is a problem.

The electrician finds that it is a multiwire branch circuit. He would have to rewire them in order to install an arc-fault circuit breaker. He also finds that the panel is a "Push-Matic" (or any other brand no longer made) panel that is flush mounted in a finish room. Now he has to replace the panel, or install a new panel, plus rewire the two circuits, just to be able to install arc-fault circuit breakers. What is really going to happen is the electrician is not going to pull a permit or get an inspection and he is going to just install the two plugs. Or the carpenter is going to do it himself because he never carried the $800 this job just turned into.

The added wording would eliminate this problem by allowing simple modifications to be done without requiring the AFCI circuit breakers.

Panel Meeting Action: Reject

Panel Statement: The decision on applying the new construction AFCI requirements to a circuit modification is that of the authority having jurisdiction.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-180 Log #4924 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Robert Kopelman, Rockville Centre, NY

Recommendation: Revise text to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

(B) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit. <u>(These outlets shall have thermal sensing built in).</u>

Substantiation: There is a major problem called a glowing connection. As UL 1699 Scope states – AfCI's " 1.3 These devices are not intended to detect glowing connections" Glowing connections are a major cause of fires. There is a new UL document 498 with thermal protection that states that device shall detect abnormal heating in 8 locations in an outlet. These 8 locations are where overheating can and does occur. Attached are documents showing that an AFCI starts to detect Arcs at 5 amps. Also attached are forensic documents showing that the glowing connection can occur with 1 amp. Most electricians and inspectors have never seen a glowing connection because it happens inside the wall. But take an outlet and put a load on it, loosen the screw terminal in a dark room and it is freighting. The screw terminals loosen up over time do to the differential of expansion and contraction of the metals involved. A minute air gap is formed and the natural vibrations of the earth and the vibrations caused by normal living circumstances help to create the glowing connections.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel is unclear of what the submitter intends. An outlet is defined in Article 100 of the NEC as "a point on the wiring system where power is taken to supply utilization equipment". It is unclear how the "outlet" can have thermal sensing built in. If the submitter's intent is to require that a receptacle, luminaire, or similar device have some type of thermal sensing then proposals should be made to CMP 18 or to the product standard. Also see the panel statement on Proposal 2-142.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-181 Log #3748 NEC-P02 **Final Action: Reject**
(210.12(B) Exception No. 1)

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise Exception No. 1 of 210.12(B) as follows:
Exception No. 1: Where the ~~Where RMC, IMC, EMT or steel armored cable, Type AC, meeting the requirements of 250.118 using metal outlet and junction boxes is installed for the~~ portion of the branch circuit between the branch-circuit overcurrent device and the first outlet is installed with metal outlet and junction boxes and installed using the following wiring methods, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
a. RMC
b. IMC
c. EMT
d. steel armored cable, Type AC, meeting the requirements of 250.118
e. steel sheathed cable, Type MC, meeting the requirements of 250.118
Substantiation: The purpose of this proposal is to accomplish two objectives. First, the proposal rearranges the existing text to move the wiring methods into a list that follows the other parts of the exception. This allows for easier reference to the wiring methods that the exception permits.
The proposal also adds a new wiring method by permitting steel sheathed MC cable. There are steel sheathed versions of MC cable that could be used as equivalent to the steel sheathed AC cable that is already permitted.
CMP 2 has done an excellent job at maintaining its consistency with respect to AFCI requirements. For each revision to the AFCI requirements, it is important that the panel maintain its commitment to the fundamental tenants that have been developed by the panel over numerous code cycles. These tenants can be outlined as follows:
1. The first and fundamental objective of AFCI protection is to protect the branch circuit wiring (which is exactly the reason the provisions are in Article 210).
2. The entire branch circuit must be protected by the AFCI. The panel has addressed numerous times over multiple code cycles that omitting portions of the branch circuit without other appropriate measures is unacceptable.
3. The AFCI is permitted to not protect a portion of the branch circuit provided that portion is provided with other elements of protection that are inherent in the wiring method. These other elements are: physical protection by a metallic raceway or metallic cable sheath, the raceway or cable sheath must qualify as a grounding path and cable sheaths must be of steel construction. All of these elements were generated from substantiation provided to the panel during the 2008 NEC cycle. All of these elements are critical because the objective is to create means for the normal branch circuit overcurrent device to be able to provide protection should an arcing fault event occur in the portion of the wiring not protected by the AFCI.
4. AFCI protection must cover both parallel and series arcing events – this is established by the provision requiring that a combination AFCI be used.
This proposal maintains those fundamental tenants that the code panel has set forth.
Panel Meeting Action: Reject
Panel Statement: The panel has revised the exception in Proposal 2-153. These revisions make the recommendation unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1
Explanation of Negative:
WILKINSON, R.: This should be accept.
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.
Comment on Affirmative:
COLUCCIO, F.: This proposal should have been accepted as written with an additional item (f) to read as follows:
(f) For general purpose branch circuits including individual fire alarm circuits RNC or ENT encased in not less than 50mm (2in.) of concrete for the portion of the branch-circuit between the branch circuit overcurrent device and the first metal box, when stubbing up out of the concrete the wiring method shall comply with a, b, c, or e listed above.
This will allow non-metallic wiring methods to be installed in concrete deck work in low and high rise buildings.

2-182 Log #2940 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12(B) Exception No. 1 and No. 2)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise 210.12(B) Exception Nos 1 and 2 as follows:
Exception No. 1: If ~~Where~~ RMC, IMC, EMT or ~~steel armored~~ Type MC or ~~cable,~~ Type AC cables meeting the requirements of 250.118 and ~~using~~ metal outlet and junction boxes are ~~is~~ installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
Exception No. 2: If ~~Where~~ a branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, or ~~steel armored~~ Type MC or ~~cable,~~ Type AC cables meeting the requirements of 250.118 and ~~using~~ metal outlet and junction boxes are ~~is~~ installed, AFCI protection shall be permitted to be omitted.
Substantiation: Armored cables are more than suitable to offer the physical protection needed for the branch circuit conductors between the panelboard and box where receptacle-type ACFI devices are permitted to be installed. The cables must pass rigorous testing mandated in UL-4, the UL standard that applies to Type AC cables and UL 1569, the UL standard that applies to Type MC cables.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Accept in Principle in Part
Revise text of Exception No. 2 as follows:
"Exception No. 2: If an individual branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, or steel sheathed cable, Type AC or MC meeting the requirements of 250.118 with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted."
The remainder of the proposal is rejected.
Panel Statement: The panel notes that the action on this proposal is in addition to the action taken on 2-156. The panel accepts changing "where" to "if" in Exception No. 2. The panel accepts the addition of MC cable to Exception No. 2 but retains the reference to steel outer covering. The remainder of the proposal is rejected. As the panel reviewed information and testimony during the 2005 cycle, it was noted that relative to the arcing events the steel armor plays a key role.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.
Comment on Affirmative:
COLUCCIO, F.: This proposal accepted in principle in part to include individual branch circuits for fire alarms, and adding a new exception No. 3 to read as follows:
Exception No.3: For general purpose branch circuits including individual fire alarm circuits RNC or ENT encased in not less than 50mm (2in.) of concrete for the portion of the branch-circuit between the branch circuit overcurrent device and the first metal box, when stubbing up out of the concrete the wiring method to the first metal box shall be RMC, IMC, EMT, or steel sheathed MC cable meeting the requirements of 250.118.
This will allow non-metallic wiring methods to be installed in concrete deck work in low and high rise buildings.

2-183 Log #4582 NEC-P02 **Final Action: Reject**
(210.12(B) Exception No. 1 and No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Replace the words "RMC, IMC, EMT" them with "steel raceways and auxiliary gutters" in both exceptions.
Substantiation: This recognizes that frequently steel wireways and auxiliary gutters are placed adjacent to panelboards for other reasons. It should not be necessary to make acrobatic conduit or tubing runs to use these exceptions.
Panel Meeting Action: Reject
Panel Statement: The panel has revised Exception No. 1 in Proposal 2-153. These revisions make the recommendation to Exception No. 1 unnecessary.
For Exception No. 2, the panel does not agree with replacing the specific raceways with a generic reference to "steel raceways". Doing so would include raceways such as flexible metal conduit, which is not intended. The minimal application of wireways and auxiliary gutters for branch circuits in a dwelling unit does not justify the inclusion in the list.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-184 Log #3516 NEC-P02 **Final Action: Reject**
(210.12(B) Exception No. 3)

Submitter: Randy Hunter, City of Las Vegas
Recommendation: Exception No. 3: In existing dwellings it shall be permissible to install a combination AFCI device at the first outlet to provide protection for the remaining portion of the branch circuit.
Substantiation: Owners of any home built before the last two code cycles have not been able to benefit from the safety provided by the AFCI technology. With this proposal we don't get the protection of the home run, however protection of the rest of the circuit is certainly better than none at all. The code should not discriminate against those who don't have a new residence. I have asked in several public forums how many of the attendees have AFCI and it is usually less than 10 percent, if this device is as good as we believe, we should make it possible for more people to benefit from it in existing dwellings without extensive re-wiring or modifications which could include homerun replacement or panel change outs. This would allow for retro-fitting provisions similar to the GFCI methods used in Art 406.3 (D)(3).
Panel Meeting Action: Reject

Panel Statement: The panel has revised the exception in proposal 2-153. These revisions make the recommendation unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1
Explanation of Negative:
KING, D.: This Proposal should have been accepted in Principal. See my explanation of negative on Proposal 2-165.
WEBER, R.: I understand that given the support for the action taken on Proposal 2-153, for Listed Branch Circuit AFCI devices being utilized as an option, that this proposal was rejected. Given the close vote during the panel review of that proposal; I feel that this proposal should have been accepted in principle to support the need for this means of protection in existing dwellings and extensions made to existing circuits. We need to support the expansion of the use of AFCI technology as it enhances the cause of electrical safety to the public.
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.
Comment on Affirmative:
COLUCCIO, F.: This proposal should be accepted in part and the wording should be changed to read as follows:
Exception No. 3: In existing dwellings containing existing wiring it shall be permissible to install a combination AFCI device at the first outlet to provide protection for the remaining portion of the branch circuit.
Even though this decision should be made by the AHJ, guidance can be given to the home owner making the decision whether to change the fuse panel to circuit breakers or install AFCI devices at the first outlets.

2-185 Log #3803 NEC-P02 **Final Action: Reject**
(210.12(C))

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Add Section 210.12(C) to read as follows: <u>(C) Guest Rooms and Guest Suites. Guest rooms and guest suites that are provided with permanent provisions for cooking shall comply with 210.12(B) and 406.11.</u>
Substantiation: Since we are already extending the dwelling unit requirements for branch circuits in these areas in 210.18. it is obvious that we are treating these areas as dwellings. By extending other dwelling unit requirements to these areas we are enhancing the safety of these areas. These rooms and suites are often short-term apartments, and as such should provide the same degree of safety as any other dwelling unit.
Panel Meeting Action: Reject
Panel Statement: This provision is already covered in 210.18, which requires that these areas have branch circuits installed to meet the dwelling unit rules. This addition would be redundant.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-186 Log #4373 NEC-P02 **Final Action: Reject**
(210.12(C) (New))

Submitter: Alan Manche, Square D Company/Schneider Electric
Recommendation: Add a new 210.12(C) to read as follows:
(C) AFCI Protection in Existing Installations. Where an existing dwelling unit panelboard containing 15 or 20 ampere 120V branch circuit overcurrent devices is upgraded or replaced, AFCIs shall be installed to meet the requirements of 210.12(B). Only those branch circuits that are part of the upgraded or replaced panelboard are required to comply with this section.
Substantiation: This proposal offers language to the code panel in order to establish a retrofit requirement for AFCIs in existing installations.
The provision to retrofit GFCIs in Article 406 is activated when a receptacle is replaced. Since AFCI protection is for the branch circuits, it is logical that a retrofit requirement be activated when the existing dwelling unit panelboard is being replaced.
This proposal would require that AFCI protection be installed in an existing installation where the dwelling unit panelboard is being replaced. There are various implementations that may replace the panelboard such as upgrading the service, replacing damaged or non functioning panelboards, or other repair situations.
One of the most fundamental provisions of this requirement is that the proposal would put AFCI protection on the same circuits that are required to have AFCI protection in new installations. So as the panelboard is replaced, AFCIs would be required on circuits that supply bedrooms, living spaces, etc. (same areas specified in 210.12(B)).
The proposal also makes it clear that only those branch circuits that are part of the replaced panelboard are required to now have AFCI protection. So if an installation had two existing panelboards and only one of those was being replaced, then only those branch circuit that are part of the panelboard being replaced must be provided with AFCI protection.
The most important aspect of a retrofit provision is that it not have elements that would create an installation that has a "lower level" of protection than that for new installations. This proposal accomplishes the objective of maintaining equivalent protection by requiring that it meet the same provisions as new construction through a reference to 210.12(B).
Much of the discussion about a retrofit provision has been around how to handle wiring systems that are already plagued with problems. Installing AFCIs in existing installations will certainly find installations that have grounded or crossed neutrals in the branch circuits. However, if our objective is to take actions that will make these existing systems safer, then those types of wiring issues need to be tracked down and repaired.
In addition, CMP 2 must ensure the fundamental protection requirements that have been developed over numerous code cycles related to AFCIs remain in place:
● AFCI protection must be provided for the entire branch circuit
● Trade offs in the location of the AFCI protection must be with wiring methods that provide the necessary physical and electrical characteristics
● AFCIs must protect from the circuit from both parallel and series arcing events.
Panel Meeting Action: Reject
Panel Statement: The panel would like more experience to be obtained regarding the installation of combination type AFCIs in new dwellings before requiring the installation of combination type AFCIs in the wide variety of existing dwellings that will have numerous different wiring configurations.
Number Eligible to Vote: 12

2-187 Log #4384 NEC-P02 **Final Action: Reject**
(210.12(C))

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Add Section 210.12(C) to read as follows:
<u>**(C) Guest Rooms and Guest Suites.** Guest rooms and guest suites that are provided with permanent provisions for cooking shall comply with 210.12(B) and 406.11.</u>
Substantiation: The problem is a lack of consistent safety rules in areas considered as dwelling units.
Since we are already extending the dwelling unit requirements for branch circuits in these areas in 210.18, it is obvious that we are treating these areas as dwellings. By extending other dwelling unit requirements to these areas we are enhancing the safety of these areas. These rooms and suites are often short-term apartments, and as such should provide the same degree of safety as any other dwelling unit.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-185.

Explanation of Abstention:
ORLOWSKI, S.: Please see NAHB's Comment on Proposal 2-152.

2-188 Log #3147 NEC-P02 **Final Action: Reject**
(210.13 (New))

Submitter: Steven R. Montgomery, 2D2C Inc.
Recommendation: Add new text to read as follows:
<u>Electrical-Fault Circuit-Interrupter Protection for Dwelling Units</u>
<u>All 125-volt, single-phase, 15- and 20-ampere receptacles installed shall have Electrical Fault Circuit Interrupter protection.</u>
Substantiation: Resistive heating and arcing faults ignite most of the major residential electrical fires. Resistive heating faults ignite 59% of the fires, in spite of branch circuit over-current protection (see "<u>Electrical Ignition Causes of Fires in Ontario 2002-2007</u>," Electrical Safety Authority (ESA) report, 2008). The latest code enhancements, including Arc Fault Circuit Interrupters (per UL Std. 1699), are not designed to protect against resistive heating from current flowing through poor branch circuit connections (high resistance points), overloaded appliances and open neutral conditions. New homes may have aged and potentially faulty appliances, extension cords and lighting fixtures brought in by homeowners. The 2006 NFPA report titled "Selected Residential Electrical Fires" indicates these faults have resulted in numerous fire fatalities.
Electrical Fault Circuit Interrupter (EFCI) technology is designed to provide primary protection against resistive heating ignition mechanisms including high resistance points in branch circuit wiring (cause of 23% of residential electrical fires, per the attached ESA 2008 report), appliance overloads (cause of 17% of the electrical fires), and open neutral conditions (cause of 2% of the electrical fires). EFCI also provides supplementary protection against overloaded circuits (cause of 7% of the electrical fires) and insulation damage that leads to arc tracking (cause of 7% of the electrical fires). A large portion of residential electrical ignitions are caused by resistive heating that cannot be protected by branch circuit overcurrent devices but can be protected by EFCI.
EFCI protection must be located at the junction between the load and branch circuit wiring to detect these faults and cannot be located at the panelboard. EFCI technology is a superior approach compared all relevant alternatives. (see "<u>Alternatives to Electrical Fault Circuit Interrupter (EFCI) Technology</u>", Wayne Hartill, 2D2C Inc., 2008.)

The complete protection of EFCI technology has been previously referred to as the combination of Overload Fault Circuit Interrupter (OFCI) and Power Fault Circuit Interrupter (PFCI) technologies. For simplicity, OFCI and PFCI technologies have been renamed Electrical Fault Circuit Interrupter (EFCI). Some previous documentation refers to the old nomenclature.

Two Fact Finding Reports from independent NRTL's substantiate the performance of EFCI technology. (see "Descriptive Report and Test Results", Todd Hamden, CSA International, Feb 2006 & "Descriptive Report and Test Results", Intertek Testing Services NA Ltd., Jan 2006). A third NRTL Fact Finding Report has been request from Underwriters Laboratories (UL).

Products containing EFCI technology have NRTL certification against UL 498 and UL 498A standards and have been available for sale in the marketplace since 2006. Multiple producers of EFCI technology exist in the marketplace. With a mandate more producers will likely enter the marketplace.

A mandate of EFCI technology is required because the net safety benefit to society is far greater than that of voluntary sales alone.

Please review submitted letters of support from the following fire forensics experts including:

- Vytenis Babrauskas, Ph.D., President of Fire Science and Technology Inc. and author of the "Ignition Handbook".
- John S. Robison, President of Robison Forensic Consulting, previously Alabama State Fire Marshal, and previous President of International Fire Marshals Association.
- Chris W Korinek, P.E., President of Synergy Technologies and author of Chapter 10 of "Kirks Fire Investigation" book.
- Doug Crawford, Deputy Fire Marshal of the Ontario Office of the Fire Marshal.

Note that multiple sister proposals have been submitted as a new 100, 210.50(C), 406.3(D)(4) and 550.13(A)(4).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: There are no product requirements for electrical-fault circuit-interrupter protection. The Fact-Finding Investigations submitted by the two testing laboratories (CSA and Intertek) appear to be only test programs designed by the product manufacturer. They conclude that Safe Plug performs as specified by the manufacturer. A thorough study of wiring device failure mechanisms, and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. Installation of these devices is not currently prohibited by the NEC. In addition, the features proposed for receptacle power denial and overload protection of the cords are issues that would be under the jurisdiction of CMP-18 and CMP-10 respectively.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-189 Log #4568 NEC-P02 **Final Action: Reject**
(210.13 (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 17 and 18 for action on protection of the appliance and action related to the construction of the receptacle, respectively.

This action will be considered by Code-Making Panels 17 and 18 as public comments.

Submitter: Phil Simmons, Simmons Electrical Services / Rep. OFI, Inc. (Safe Plug)

Recommendation: Add new text to read as follows:

210.13 Electric Clothes Dryer Receptacle. All 15-, 20, and 30-ampere, 125- or 250-volt receptacles installed in a dwelling for electric clothes dryer(s) shall have electrical fault circuit interrupter protection.

Substantiation: Based on data from the 2007 U.S. Fire Administration report titled "Clothes Dryer Fires in Residential Buildings", 12,700 clothes dryer fires occur in residential buildings, annually, resulting in 15 deaths and 300 injuries. 80% of clothes dryer fires occur in residential buildings. Average loss per dryer fire in residential buildings is $9,176. Electrical failure or malfunction accounts for 15.3% of residential dryer fires. Mechanical failure or malfunction accounts for 32.6%.

Electrical Fault Circuit Interrupter (EFCI) is designed to prevent electrical failure fires caused by resistive heating ignition mechanisms that cannot be protected by branch circuit overcurrent protection including poor connections / high resistance points, appliance overloads, and open neutral conditions. EFCI could also detect mechanical failure fires such as seized motor bearings. Due to their nature, these faults cannot be detected by branch circuit overcurrent devices but can be detected by EFCI. EFCI protection must be located at the junction between the load and branch circuit wiring to detect these faults and cannot be located at the panelboard.

EFCI technology is a superior approach compared all relevant alternatives. (see Alternatives to Electrical Fault Circuit Interrupter (EFCI) Technology: Dryer, Wayne Hartill, 2D2C Inc., 2008).

The complete protection of EFCI technology has been previously referred to as the combination of Overload Fault Circuit Interrupter (OFCI) and Power Fault Circuit Interrupter (PFCI) technologies. For simplicity, OFCI and PFCI technologies have been renamed Electrical Fault Circuit Interrupter (EFCI). Some previous documentation refers to the old nomenclature.

Two Fact Finding Reports from independent NRTL's substantiate the performance of EFCI technology. (see Descriptive Report and Test Results, Todd Hamden, CSA International, Feb 2006 & Descriptive Report and Test Results, Intertek Testing Services NA Ltd., Jan 2006). A third NRTL Fact Finding Report has been requested from Underwriters Laboratories (UL). These Fact Finding Reports tested the implementation of EFCI technology in NEMA 5-15R duplex receptacles. The results of these reports also support EFCI as implemented into a NEMA 14-50R dryer receptacle since they differ only in form factor.

Products containing EFCI technology have been NRTL tested against UL standards and available for sale in the marketplace since 2006. Multiple producers of EFCI technology exist in the marketplace. With a mandate more producers will likely enter the marketplace.

EFCI receptacles sold in the marketplace have NRTL certification against UL 498 and UL 498A standards.

A mandate of EFCI technology in a NEMA 14-50R dryer receptacle is required because the net safety benefit to society is far greater than that of voluntary sales alone.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 2-189.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-191 Log #4711 NEC-P02 **Final Action: Reject**
(210.18)

Submitter: Robert P. McGann, City of Cambridge

Recommendation: Revise text as follows:

210.18 Guest rooms, guest suites and <u>sleeping areas in dormitories.</u>

Substantiation: This addition to this title is not only to correlate with 210.60, but also with consideration of plug strip use attached to each other and laying in amongst clothing on floor. This view holds true most times an inspector enters these inhabited areas. Our inspectors see this weekly, this is why we need a code rule to stand on regarding outlet spacing, AFCI + GFCI protection otherwise we will need to go on recommending these.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented substantiation to require that all sleeping areas in dormitories comply with all of the branch circuit provisions for dwelling units. In addition, the proposal is unclear because it only proposes changes to the title of the section.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

KING, D.: I disagree with the panel action. This is an area where AFCI protection needs to be added. For any one that has ever been in or has lived in a residence hall or other college/university living unit you certainly can appreciate the need. The same hazards exists in these locations as in dwelling unit bedrooms.

2-192 Log #3486 NEC-P02 **Final Action: Reject**
(210.19 (New))

Submitter: Jack Wells, Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium

Recommendation: Add text to read as follows:

<u>210.19 (new) - When additional branch circuits are added to an existing installation and where no AFCI circuit breakers are available due to age or type of the distribution panel, a Listed Combination Type AFCI Receptacle shall be permitted provided it is installed as the first outlet on the branch circuit and the branch circuit wiring is continuous from the service panel to the AFCI receptacle.</u>

Substantiation: This proposal is made on behalf of The Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium. The Consortium members are: Cooper Wiring Devices, Hubbell Incorporated (Delaware), Leviton Manufacturing Company, Inc., Pass and Seymour/ Legrand.

This new proposal seeks a compromise in that it has no effect on the existing rules for AFCI protection in new construction. The proposal specifically rules out installations where combination circuit breaker AFCI's are readily available for new construction and only permits the combination AFCI receptacle as a safety measure of last resort for the retrofit market. This proposal adds a significant level of safety when the practicality of a new service panel, or sub-panel is not warranted. As an example, a home with fuses can easily add cost effective AFCI protection for an additional branch circuit without imposing a huge expense on the homeowner.

In anticipation of a comment questioning the availability of AFCI receptacles, the panel is reminded of section 90.4 which states: "The Code may require new products, constructions, or materials that may not yet be available at the time the Code is adopted." Also, the panel is reminded of the action it took when accepting a previous proposal for Combination AFCIs when none were available at the time the proposal was accepted.

By accepting this proposal, the panel will recognize the many requests from field installers for a receptacle AFCI and pave the way for continued technological innovation by specifically allowing AFCI receptacles without the armored "home-run" that has never been justified other than anecdotally.

Panel Meeting Action: Reject

Panel Statement: The panel has revised 210.12 in Proposal 2-153. These revisions make the recommendation unnecessary.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

PAULEY, J.: See NEMA statement on Proposal 2-153. Given NEMA's position on Proposal 2-153, this proposal may need to be revisited at the Comment stage.

2-193 Log #2957 NEC-P02 **Final Action: Reject**
(210.19(A) (New))

Submitter: Paul A. Keleher, Paul Keleher Electrical Services

Recommendation: Revise text to read as follows:

210.19 Conductors- Minimum Ampacity and size

(A) Branch Circuits Not More Than 600 Volts.

(5) <u>**Permissible Voltage-Drop.** The circuit conductors of a 15 or 20-ampere/120-volt branch circuit shall be sized such that voltage-drop measured at the rated ampacity of the circuit shall be 5% or less at any outlet.</u>

<u>*Exception No. 1: Use of non-standardized circuit breakers in compliance with 240.4 shall be permitted on circuits supplying dedicated loads with high inrush or motor starting current where a circuit breaker meeting the requirements of this section can be shown to nuisance trip.*</u>

<u>*Exception No. 2: Where 240.3 or 240.4(G) applies.*</u>

<u>**FPN:** Standard 120/240V circuit breakers rated from 15-50A that are listed to meet the overcurrent protection requirements of 240.4 contain a nonadjustable, instantaneous trip mechanism whose current setting will open the circuit within 1 cycle of being subjected to an overcurrent equal to or greater than 20 times their rated current. A full-load voltage drop measurement of 5% on a 120V branch circuit allows the system to deliver at least 20 times the rated current of the circuit to a short-circuit or bolted fault, ensuring that the circuit breaker's instantaneous mechanism will respond in compliance with other requirements of this Code.</u>

Substantiation: CMP-2 rejected a proposal in the last cycle to make 210.19(A), FPN 4 mandatory with the statement, "it is not clear from the substantiation that making the fine print note mandatory will reduce electrical fires". The present proposal is substantiated by a sample of >1000 in-situ short-circuit tests conducted at 15-20A/120V receptacle outlets selected at random in dwelling units across the US. This data substantiates the claim of the previous submitter and this proposal that limiting voltage drop at outlets is necessary to provide effective protection against branch circuit fault current. Analysis of the test data shows that:

1. At more than ½ of the outlets in the sample, the breaker failed to trip instantaneously.
2. In nearly 20% of those tests where the instantaneous trip failed, the value of I2T conductor heating recorded by the test exceeded the maximum safe limit according to accepted industry standards for conductor heating in insulated cables, potentially compromising the insulation when power to the circuit is restored.
3. In ALL tests where the breaker did respond instantaneously, conductor heating was limited to levels far below the safe threshold, safely preventing conductor overheating during fault conditions.

Furthermore, this failure in circuit breaker performance violates the requirements of section 250.4(A)(5) and other sections of the NEC. In 2005 CMP- 5 added several new sections and notes to the NEC, all reinforcing the intent of the CMP regarding the purpose of the equipment-grounding conductor in a circuit. 250.4(A)(5) is an extraordinary requirement in that explanatory language usually reserved to a non-mandatory Fine Print Note is here made MANDATORY TEXT. The intent of these requirements and the extraordinary emphasis it has placed on them is to make clear to installers of electrical circuits that an equipment-grounding conductor must be a "...permanent, low impedance circuit facilitating the operation of the overcurrent device...". The Panel has indicated its intent in 250.4(A)(5) is for an OCPD to operate "as quickly as possible," which for a thermal/magnetic circuit breaker means it must respond magnetically. The published time/current curves of the 5 dominant lines of 120/240V, 15-50A standard circuit breakers used to meet the requirements of 240.4 all show the magnetic response mechanism in a circuit breaker, when engaged, will clear the circuit in 1-cycle (.167 seconds). Therefore, the intent of NEC Section 250.4(A)(5) is to assure that a fault to the equipment-grounding conductor will trigger the magnetic response of a thermal/magnetic circuit breaker. The data indicates that the intent of 250.4(A)(5) is not met at more than half of 15 and 20A/120V outlets.

NEC Section 240.9 (Thermal Devices) prohibits the use of thermal devices as protection from short circuits or ground faults. Although intended to clarify the proper use of thermal overload relays in motor applications, 240.9 says in part, " thermal relays and other devices not designed to open short circuits or ground faults shall not be used for the protection of conductors against overcurrent due to short circuits or ground faults." So, when the magnetic (instantaneous) trip mechanism in a thermal/magnetic circuit breaker fails to engage in response to a short circuit or ground fault at an outlet, leaving the thermal device as the sole response mechanism, this thermal device is being used as de facto protection of conductors against a short circuit or ground fault, in violation of 240.9.

Referring to the chart accompanying this proposal, the system supplying any outlet on a 120V branch circuit that exhibits a voltage-drop of 5% or less when measured at the full rated load of the circuit as stipulated in the proposal, will deliver sufficient current to a short circuit or ground fault to trigger a magnetic (instantaneous) circuit breaker response, provided that response is set to trigger at 20X its current-rating or less, as products installed to meet the requirements of Section 240.4 presently do. A proposal presently under evaluation by UL/STP-489 will, if accepted, assure that the circuit breaker performance described in the proposed Fine Print Note is assured in the future for all OCPD devices installed to meet the overcurrent protection requirements of 240.4.

The result of this coordination is that all 15 and 20A/120V outlets are assured of an instantaneous breaker response to fault current, putting to rest the questions raised by the test data and assuring compliance with 250.4(A)(5) and 240.9 for 15-20A/120V outlets.

The data supporting this proposal shows how the failure of circuit breakers to respond instantaneously to fault-level overcurrent creates a safety issue based on accepted engineering standards that the NEC should address. Accordingly, the submitter urges the NEC to accept this proposal and put the safety questions raised by the test data to rest.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms their position taken on similar proposals in previous Code cycles that voltage drop is a design consideration that must be dealt with by the installer/designer for each installation and can be specific to the involved equipment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-194 Log #1841 NEC-P02 **Final Action: Reject**

(210.19(A)(1))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: Branch circuit conductors shall have an <u>allowable</u> ampacity not less than the maximum <u>calculated</u> load to be served. Where a branch circuit supplies continuous load(s) or any combination of continuous and noncontinuous load(s), the minimum branch circuit conductor size, ~~before~~ <u>after</u> the application of any adjustment or correction factors, shall have an allowable ampacity not less than the continuous load(s) plus 125 percent of the continuous load(s).

Substantiation: Loads should be designated as "calculated". Conductor sizes before application of adjustment/correction factors may not be adequate after reduction factors of table 310.15(B)(2)(a).

Panel Meeting Action: Reject

Panel Statement: The use of the term "ampacity" is consistent with 310.15. The addition of calculated load is incorrect. The basic premise of the sentence is to establish a rule that the conductors must always be adequate for the maximum load. The calculated load may or may not be the maximum load.

For the explanation of rejecting the change of the word "before" to "after" see the panel statement on Proposal 2-195.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-195 Log #2941 NEC-P02 **Final Action: Accept in Part**

(210.19(A)(1))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise text to read as follows:

(A) Branch Circuits Not More Than 600 Volts.

(1) General. Branch-circuit conductors shall have an <u>allowable ampacity, after the application of any adjustment or correction factors, not less than the noncontinuous load plus 125 percent of the continuous load and</u> ~~ampacity~~ not less than the maximum load to be served. ~~Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load~~.

Exception No. 1: <u>If</u> ~~Where~~ the assembly, including the overcurrent devices protecting the branch circuit(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the branch circuit conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

Exception No. 2: Grounded conductors that are not connected to an overcurrent device shall be permitted to be sized at 100 percent of the continuous and noncontinuous load.

Substantiation: An attempt is being made to simplify the requirements as well as to revise the phrase, "before the application of any adjustment or correction factors" to, "after the application of any adjustment or correction factors." This is the way conductors are being selected in the field and complies with the intent of 110.14(C) to assure the conductors are sized not smaller than that required in Table 310.16 based upon the temperature rating of the terminations. The present language can be interpreted to require that the conductors be sized for the noncontinuous load plus 125 percent of the continuous load plus any adjustment or correction factors.

Also, see 240.4(D) which used the phrase for Small Conductor overcurrent protection, "<u>after</u> any correction factors for ambient temperature and number of conductors have been applied." This seems to be the correct concept to ensure proper conductor ampacity.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Part

Change the word "Where" to "If" in the Exception No. 1.

The remainder of the proposal is rejected.

Panel Statement: The two sentences of the main rule are separate issues. The first sentence is intended to establish a basic rule that the conductors must be able to serve the load. The second sentence is to specifically handle the continuous and noncontinuous load issue.

The submitter's change of the word "before" to "after" is technically incorrect. Making that change would require that the 125% sizing rule apply sequentially to the ampacity adjustment factors when, in fact, those ampacity adjustments can overlap the 125% calculation provided the conductor can carry the load and be protected by the overcurrent device. Applying the 125% after adjusting for ambient conditions or conduit fill would result in a conductor larger than necessary to comply with all of the rules.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-196 Log #2951 NEC-P02 **Final Action: Reject**

(210.19(A)(1))

Submitter: Konrad J. A. Kundig, Kundig Metallurgical Consultant

Recommendation: Revise text to read as follows:

(1) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served <u>and not less than the rating of the branch circuit.</u> Where a branch circuit supplies continuos loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.

Substantiation: The requirement that the rating of a branch circuit cannot be higher than the final ampacity of the circuit conductors is already in 210.19(A)(2) for circuits with multiple receptacle outlets serving cord-and-plug loads, because of the unpredictable nature of those loads. This requirement should apply universally. If a gap is left between the ampacity of circuit conductors and a higher circuit breaker rating, a hazardous condition could occur, either due to a mistake in the calculation of load by a designer, or due to a future addition to that load. In fact, the circuit breaker's ampere rating may be the only indication to a future designer/installer of the circuit's capacity.

In the 2008 NEC Handbook, the proposed change is assumed to be in effect in two references, as follows: (1) the discussion following 210.20(A) Exception, on page 93, states: "The rating of the overcurrent device cannot exceed the final ampacity of the circuit conductors after all the derating or correction factors have been applied, such as for temperature or number of conductors." (2) The discussion following 240.4(B) on page 172 states: "Section 210.19(A) requires that branch-circuit conductors have an ampacity not less than the rating of the branch circuit and not less than the maximum load to be served."

Adoption of this proposal will require correlation with other Code sections. For example, 210.19(A)(2) will no longer be necessary.

Panel Meeting Action: Reject

Panel Statement: The revision would be in conflict with 240.4(B) that permits rounding up to the next size overcurrent device when the conductor ampacity does not correspond to a standard size.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-197 Log #1716 NEC-P02 **Final Action: Reject**

(210.19(A)(1), FPN No. 5 (New))

Submitter: Larry T. Smith, National Electrical Seminars, Inc.

Recommendation: Add new text as follows:

<u>FPN No. 5: See 110.14(C)(1)(a) and (b) for termination provisions of equipment.</u>

Substantiation: Ignoring the temperature rating of equipment is the most common mistake being made in conductor sizing today. Entirely too many wiremen take no notice of the temperature limitations of 110.14(C) when sizing conductors. They disregard the temperature rating of equipment, and use the 90°C column of Table 310.16 when 90°C rated conductors, such as THHN, are being used. I've even had engineers stand up in seminars and yell "Larry, how are we supposed to know that!?"

At the very least, there should be a Fine Print Note directing the reader to the rules of 110.14(C)(1)(a) and (b).

Panel Meeting Action: Reject

Panel Statement: The provisions of 110.14(C) apply generally to all installations. As such, adding cross references to rules that already apply is redundant and only adds confusion to areas of the code that do not have a similar cross reference.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-198 Log #4583 NEC-P02 **Final Action: Accept**

(210.19(A)(1) Exception No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Delete this exception.

Substantiation: This exception should be reserved for instances where the grounded conductor runs from busbar to busbar, as is the case for a feeder. Branch circuit applications typically involve runs from busbar to device, and the equipment on the other end of the wire may not be as forgiving as the connection on a busbar. IT should also be pointed out that the exception is not limited to neutrals, and there are applications where the grounded conductor will be a phase conductor. The literal text could then result in two different sizes of wire arriving at the same device and carrying the same current, and therefore causing unequal heating across the device terminals. The version of this provision that applies in Article 215 is perfectly acceptable, but the wording here was never fully substantiated. In addition, there appears to be little real-world need for this allowance, and it should be either withdrawn or severely limited if it stays in the NEC at all.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-199 Log #3247 NEC-P02 **Final Action: Reject**

(210.19(A)(2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: The heading is "multioutlet" while the text refers to more than one receptacle; multiple receptacles can be installed in one outlet box which may be the only outlet on the circuit. Section 210.21 and the tables thereto appear to be sufficient.

Panel Meeting Action: Reject

Panel Statement: The tables in 210.21 are not sufficient for this issue since the rule in 210.19(A)(2) deals with the conductor itself The rule is important because it establishes that for circuits with multiple receptacles, the rating of the overcurrent device cannot exceed the ampacity of the conductor.

For the heading, see panel action and statement on Proposal 2-200.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-200 Log #4584 NEC-P02 **Final Action: Accept in Principle in Part**

(210.19(A)(2))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 10 for action in 240.4(B)(1) for consistency relating to the text in 210.19(A)(2).

This action will be considered by the panel as a public comment.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Insert the word "outlet" after the words "more than one receptacle".

Substantiation: As written, this paragraph conflicts with both its title and also with 240.4(B)(1), both of which apply to multioutlet applications. A duplex receptacle can be wired to the next higher standard overcurrent device rating according to 240.4(B)(1), but not two single receptacles in different outlets. However, as written, the text of this section disallows the use of the next higher standard device for a duplex receptacle, in direct conflict with 240.4(B)(1). This proposal brings the paragraph text in line with its title and removes the conflict with Article 240.

Panel Meeting Action: Accept in Principle in Part

Revise the title of 210.19(A)(2) to read:

"**(2) Branch Circuits with More than One Receptacle.**"

The remainder of the proposal is rejected.

Panel Statement: The panel has revised the title of the section to make it consistent with the text. The panel does not agree with revising the rule to apply only when there is more than one outlet versus more than one receptacle. The objective is to ensure that the rating of the overcurrent device does not exceed the conductor ampacity when you supply multiple cord and plug connected loads. With respect to a conflict with 240.4(B)(1), the panel recommends to the Technical Correlating Committee that this proposal be forwarded to CMP 10 for possible action in Article 240 to make 240.4(B)(1) consistent with the rule in 210.19(A)(2).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-201 Log #3570 NEC-P02 **Final Action: Reject**

(210.19(A)(3))

Submitter: George M. Stolz, II, Pierce, CO

Recommendation: Add the following to the end of 210.19(A)(3):

<u>The demand load as calculated in accordance with Article 220 shall be permitted as the maximum load to be served.</u>

Substantiation: Table 220.55, Note 4, allows the branch circuit load to be derived from the table. This would clarify the use of the table at the branch circuit level. As this section reads, it could be intrepreted two ways; one by the nameplate of the appliance, and the other by Table 220.55 as allowed by that section.

Panel Meeting Action: Reject

Panel Statement: 220.55 already provides the specific guidance requested by the submitter.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-202 Log #1842 NEC-P02 **Final Action: Reject**

(210.19(A)(3) Exception No. 1 and (A)(4))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise latter part of (A)(3) Exception No. 1: ...and shall be ~~sufficient for~~ not less than the load to be served.

Revise latter part of (A)(4): "...and shall be ~~sufficient for~~ not less than the load to be served and shall not be smaller than 14 AWG copper or <u>12 AWG aluminum or copper-clad aluminum</u>.

Substantiation: "Sufficient" is subjective and a term to be avoided per the Style Manual. Tap conductors of aluminum or copper-clad aluminum should be minimum 12 AWG.

Panel Meeting Action: Reject

Panel Statement: The use of the term "sufficient" is appropriate in this context. It is unnecessary to specify the conductor type in reference to #14 AWG since Table 310.16 already provide the limits on aluminum conductors.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-203 Log #4890 NEC-P02 **Final Action: Reject**

(210.19(A)(4) Exception No. 1)

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services

Recommendation: Revise text as follows:

Tap conductors shall have an ampacity sufficient for the load served. In addition, they shall h~~ave an ampacity of not less than 15~~ <u>be a minimum of 14 AWG</u> for circuits rated less than 40 amperes and ~~not less than 20~~ <u>12 AWG</u> for circuits rated at 40 or 50 amperes and only where these tap conductors supply any of the following loads.

Substantiation: Table 310.16 does not include conductors with an ampacity of 15 amperes under the 60 degree C or the 75 degree C columns. Whips that are part of listed equipment are covered under the product standard. Field installed flexible cords are covered under Table 400.5(A) which also requires 14 AWG for 15 amperes and 12 AWG for 20 amperes, with the exception for cord types HPD, HSN, HSJ, HSJO, & HSJOO which are for portable heaters. The proposed change would also correlated this section with 240.5(A)

Panel Meeting Action: Reject

Panel Statement: The reference to the ampacity is correct in this section. Should the conductors have to be ampacity adjusted, the rule is intended to still require that the adjusted ampacity not be less than 15 or 20A respectively.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-204 Log #3298 NEC-P02 **Final Action: Accept**

(210.20(B)(3))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Change the word "larger" to "rated higher".

Substantiation: Edit. "Rated" is more appropriate and the word used in the latter part.

Panel Meeting Action: Accept

Panel Statement: The panel notes that the revision is to 210.21(B)(3) and not 210.20(B)(3).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-205 Log #668 NEC-P02 **Final Action: Reject**

(210.21(B)(1))

Submitter: William Riggenbach, Riggs Electric

Recommendation: Revise text to read as follows:

(1) Single Receptacle <u>or One Duplex Receptacle</u> on an Individual Branch Circuit. A single receptacle <u>or one duplex receptacle</u> on an individual branch circuit shall have an ampere rating not less than that of the branch circuit.

Substantiation: The use of one (1) 15 amp rated duplex receptacle on 20 amp circuits is commonplace in the industry. The interpretation of the Code is that under 210.21(B)(3), a duplex receptacle falls under the “two or more receptacles” part of paragraph (3). However, under Table 210.21(B)(2), a 15 amp receptacle may only carry 12 amperes, whereas a 20 amp receptacle may carry 16 amperes, the same as the 20 amp circuit may carry. Placing a single 15 amp duplex receptacle on a 20 amp circuit limits the ampacity of that circuit to 12 amperes.
Panel Meeting Action: Reject
Panel Statement: The submitter’s interpretation is incorrect. A 15A duplex receptacle consists of two receptacles by definition and each could supply up to 12A (further limited by the branch circuit overcurrent device). As such a duplex receptacle can fully utilize a 20A branch circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-206 Log #704 NEC-P02 **Final Action: Reject**
(Table 210.21(B)(2))

Submitter: Steven French, I.B.E.W. Electrician/Apprentice Instructor
Recommendation: Revise Table 210.21(B)(2) as follows:

Table 210.21(B)(2) Maximum Cord-and-Plug-Connected Load to Receptacle

Circuit Rating (Amperes)	Receptacle Rating (Amperes)	Maximum Load (Amperes)
15 ~~or 20~~	15	12
20	20	16
30	30	24

Substantiation: By allowing the installation of 15 amp device(s) (receptacle) on a 20 amp branch circuit increases the chance of a fire that may result in destruction of property and loss of life.
The table states that a 15 amp receptacle is to experience a maximum of 12 amp load. In today’s world this can not be ensured without an overcurrent device limiting the current flow.
The 1940 NEC stated that a 15 amp receptacle could be installed on a 20 amp circuit if only 15 amp loads utilized the receptacle.
In today’s world the users are often using adapters installed on the receptacle for convenience of plugging in more than two utilized equipment. This is done by strips and adapters, all of which have one common connection point to the wiring systems, which is the 15 amp receptacle installed on a 20 amp circuit.
By omitting allowing the installer to install a 15 amp receptacle on a 20 amp circuit, would be supported by NEC Article 110.10. Listed products applied in accordance with their listing shall be considered to meet the requirements of this section.
Manufacturers normally do not list 15 amp receptacles to be used in a 20 amp circuit.
The general rule should install the device according to its listings.
Note: there would be a very negligible financial impact, but a significant increase in safety.
Panel Meeting Action: Reject
Panel Statement: A 15A receptacle is listed for use on a 20 ampere circuit. The 15A receptacle is further limited to the 12A level through the attachment cap that is placed on the product. The submitter has not substantiated that adapters have resulted in fires or lack of protection of the branch circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-207 Log #1963 NEC-P02 **Final Action: Reject**
(210.21(B)(2) and Table 210.21(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: This rule is virtually unenforceable. The NEC is a safety code which permits a receptacle on an individual circuit to supply a load for which it is rated. What safety hazard is incurred if a 15 ampere rated receptacle supplies a 15 ampere load? The typical user doesn’t know that a listed appliance with a 15 ampere cord plug for a 13 ampere rated appliance is prohibited by the Code from being plugged into a 15 ampere receptacle. Where more than one receptacle with a special configuration is installed on a branch circuit only for the supply of a single appliance such as a carpet cleaner or floor polisher, the circuit is technically an individual circuit and the tables do not apply. The panel has stated deletion would remove a safety margin; why is a safety margin not required for a single receptacle on an individual circuit? Listed receptacles are rated to carry current up to their rating. If these provisions are intended to allow for additional load, they don’t correlate with 90.1(B).
Panel Meeting Action: Reject
Panel Statement: The rule is necessary to correlate with the product standards for receptacles. 15A duplex receptacles are evaluated to supply 15A through the individual receptacle contact points.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-208 Log #3246 NEC-P02 **Final Action: Reject**
(210.21(B)(2) and Table 210.21(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: This rule is virtually unenforceable. The NEC is a safety code which permits a receptacle on an individual circuit to supply any load for which it is rated. What safety hazard is incurred if a 15 ampere rated receptacle supplies a 15 ampere load? The typical user doesn’t know that a listed appliance with a 15 amp cord plug for a 13 ampere rated appliance is prohibited by the Code from being plugged into a a 15 ampere receptacle. Where more than one receptacle with special configuration is installed on a dedicated circuit only for the supply of a single appliance such as a floor polisher or carpet cleaner the circuit is technically an individual circuit and the tables do not apply. The panel has stated this would remove a safety margin. Why is a safety margin not required for a single receptacle on an individual circuit? Listed receptacles are rated to carry current up to their rating. If these provisions are intended to allow for additional loads they don’t correlate with 90.1(B).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-207.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-209 Log #669 NEC-P02 **Final Action: Reject**
(210.21(B)(3))

Submitter: William Riggenbach, Riggs Electric
Recommendation: Add new text to read as follows:
210.21(B)(3)(a) Where two or more 15 ampere rated receptacles are installed on a 20 ampere rated circuit, the device must not be used for continuity of the circuit. Splices must be made for ungrounded, grounded (neutral) and ground conductors, and a pigtail be brought out for connection to the device.
Substantiation: Common practice (at least in the state of Georgia) is to “stab” the #12 NM-B cable into the back of 15 ampere receptacles (i.e., a kitchen or dining room circuit). This is true even if the receptacles are only rated for #14 wire. I have seen at least two circumstances where a fire has either already happened or was about to happen. Splices and pigtails will not only remove continuity from the circuit, but will also allow the circuit loading to be 16 amperes instead of the 12 that is in place using the receptacle for continuity.
Panel Meeting Action: Reject
Panel Statement: The push-in terminals of a receptacle are limited to #14 AWG, which would limit the overcurrent protection of the circuit to not more than 15 amperes.
When not using the push-in terminals, the receptacle is suitable for use on a 20 ampere circuit and the terminals are suitable for 20 amperes. The submitter has not substantiated that all 15A receptacles must be pigtailed rather than connection to the terminals directly.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-210 Log #4590 NEC-P02 **Final Action: Reject**
(210.23 Exception (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 8 for comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert an exception following the parent text and prior to (A), as follows:
Exception: Luminaires protected with supplementary overcurrent devices in accordance with 368.17(C) Exceptions No. 2 or No. 3 shall be permitted to be supplied from busways of higher ratings than those specified in 210.23.
Substantiation: The rules in the two exceptions cited in this proposal clearly envision supplementary overcurrent protective devices, not branch-circuit overcurrent devices. The new definition of this term in Article 100 makes this very clear. That means that the busway to which they are connected must have the status of a branch circuit. That status then invokes the circuit ampere limits described in 210.23, which are very unlikely to match the typical busway ratings on which the exceptions in 368.17(C) will be applied. This proposal provides the necessary correlation to avoid what is effectively a conflict between Articles 210 and 368.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that 368.17(C) clearly envisions supplemental overcurrent protection. In fact, the current Exception No. 2 specifically references the branch circuit overcurrent device. The panel recommends that the Technical Correlating Committee send this proposal to CMP-8 for comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-211 Log #4795 NEC-P02 **Final Action: Reject**
(210.23(A)(2) Exception)

Submitter: Adam J. Drozdowski, Artisan Electrical Contractors
Recommendation: Add the following new text:
Exception: When there is two or more receptacles used to supply a load for utilization equipment fastened in place, it shall be permissible to use the full allowable ampacity of the branch circuit if the receptacles are not readily accessible.
Substantiation: The receptacles behind dishwashers, pigs, refrigerators, etc. with cord and plug connection that are not readily accessible will not be subjected to other loads of other equipment.
Panel Meeting Action: Reject
Panel Statement: The current rule only invokes the 50% limitation if the branch circuit supplies, in addition to the fixed in place equipment, lighting units, cord and plug connected equipment not fixed in place, or both. As such, if the circuit supplies only equipment fastened in place, the full branch circuit can be used.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-212 Log #3292 NEC-P02 **Final Action: Reject**
(210.23(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: A 40- or 50-ampere circuit shall be permitted to supply cooking appliances ~~that are fastened in place~~ in any occupancy.
Substantiation: Present wording implies such circuits cannot supply a free-standing electric range that is not fastened in place.
Panel Meeting Action: Reject
Panel Statement: Removal of the words would imply that the circuit could supply smaller cord and plug connected cooking appliances, which is not intended. The panel is not aware that the present words are resulting in issues with freestanding ranges in the field.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-213 Log #296 NEC-P02 **Final Action: Accept**
(210.24)

Submitter: Mario L. Mumfrey, Inspection Bureau Inc.
Recommendation: Revise text to read as follows:
Branch-Circuit Requirements - Summary.
The requirements for circuits that have two or more outlets or receptacles, other than the receptacle circuits of 210.11(C)(1), (C)(2) and (C)(3), are summarized in Table 210.24. This Table provides only a summary of minimum requirements, see 210.19, 210.20, and 210.21 for specific requirements applying to branch circuits.
Substantiation: Code Uniformity - for a more accurate calculation of dwelling unit(s) total connected general lighting loads and the consideration given to the demands of specific required loads of Article 220.
Since the inception of the individual 20 amp branch circuit requirement for dwelling unit bathroom receptacle outlet(s) in 1996 NEC 210.52(D), it has been unclear why the Code-Making Panel refuses to consider this circuit as an "other than lighting load". The CMP simply states in their rejection comment that dwelling unit bathroom outlet(s) are lighting loads and are calculated under the square footage rule for general-use outlets. There is a conflict in the NEC concerning this.
210.11 (new in the 1999 NEC) was a major recognition of the importance of special 20 amp loads for dwelling units; in particular small appliances, laundry and bathrooms. Prior to this new Section in 210, small appliances and laundry load requirements were in 220.4. However, when the CMP relocated these loads to Article 210 their significant load contribution to the Service/Feeder demand factors was recognized. At the same time, the bathroom load requirements were moved to 210.11(C)(3). The 1999 CMP made it clear in 220.3(B)(10)(a) - (1999 code section at the time) - that the 20 amp bathroom circuit now required in 210.11(C)(3) must be included in the general-use outlet requirements for dwelling unit square footage calculations.
There have been numerous attempts during each code cycle to have this required 20 amp bathroom dwelling unit receptacle outlet load be recognized as a 1.5 kva addition to the Service/Feeder demand calculations as with its counterparts of the same code article. 220.42 of the 2008 NEC states that demand factors for general lighting shall not be applied in determining the number of branch circuits. This is clearly a conflict since 210.11(C)(3) is considered a lighting load and requires a minimum of "one" 20-amp branch circuit that can have no other loads. In fact, the code language in 210.11(C)(3) is almost exactly like that of 210.11(C)(1) & (C)(2) which requires 1.5 kva for each 2-wire circuit installed. It cannot be both ways, first calling the dwelling unit bathroom receptacle outlet(s) a lighting load and then requiring an individual circuit to supply it without taking into consideration the connected load.
This one word change submitted for review would also require changes to Articles 210 and 220 to allow a coherent flow to the change.
Panel Meeting Action: Accept
Panel Statement: The panel agrees with adding (C)(3) to the text because the required branch circuit for the bathroom must be 20 amperes and the table could imply that a 15A circuit is acceptable.
However, the panel does not agree with the submitters substantiation that this change results in having to calculate 1500VA for the bathroom branch circuit. The panel maintains its position that the additional 1500VA in the feeder or service calculation is not necessary. The table provides a summary of branch circuit requirements and not load calculations.
The panel does not agree that the application of the demand factors of 220.42 create a conflict with 210.11(C)(3).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-214 Log #2300 NEC-P02 **Final Action: Accept**
(Table 210.24, Footnote 2)

Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Table 210.24, Footnote 2 – Revised to
"410.30(C)" to "410.62(C)"
Substantiation: Typo due to renumbering of Article 410 from the 2005 to the 2008 edition.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-215 Log #3297 NEC-P02 **Final Action: Accept in Part**
(210.25(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Branch circuits ~~required~~ installed for the purpose of lighting central alarm, signal, communications, or other ~~needs~~ purposes for public or common areas of a two-family dwelling, a multifamily dwelling, or a multi-occupancy building shall ~~not~~ be supplied from branch-circuit distribution equipment that supplies only such circuits. ~~an individual dwelling unit or tenant space.~~
Substantiation: Edit. A service is equipment that may supply individual units or tenant spaces. Present wording can be deemed as not permitting such circuits to be supplied by a service that serves all dwelling units or tenant spaces.
Panel Meeting Action: Accept in Part
Revise the text of 210.25(B) to read as follows:
"Branch circuits installed for the purpose of lighting, central alarm, signal, communications, or other purposes for public or common areas of a two-family dwelling, a multifamily dwelling, or a multi-occupancy building shall not be supplied from equipment that supplies only an individual dwelling unit or tenant space."
Panel Statement: The panel accepts the revision of the words "installed" and "purposes". The panel did not accept the recommendation to add branch circuit distribution equipment and to delete the reference to individual dwelling unit or tenant space because the text needs to specify that the common equipment must be connected ahead of any equipment that supplies "only an individual unit or tenant space".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-216 Log #2530 NEC-P02 **Final Action: Reject**
(210.50(B))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Add text as follows:
[210.50] **(B) Cord Connections.** A receptacle outlet shall be installed wherever flexible cords with attachment plugs are used. Where flexible cords are permitted to be permanently connected, receptacles shall be permitted to be omitted for such cords. Receptacle outlets shall not be installed where flexible cord is not permitted in accordance with 400.8.
Substantiation: The current text of the NEC, in 400.8(5), does not allow flexible cord to be used above a suspended or dropped ceiling. The NEC does NOT currently have any restriction on the installation of receptacle outlets in such locations. Wherever a receptacle outlet is installed, a flexible cord is sure to follow!
For added clarity for code users and also for enforceability, it makes sense to include the proposed new sentence as shown here in 210.50(B).
Panel Meeting Action: Reject
Panel Statement: The receptacle outlet is not prohibited and could be installed to provide temporary power for purposes such as those in 210.63 or for purposes such as a plug-in power supply.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(210.50(C)(5) Exception to (5))

Submitter: Michael R. Fisher, Bluhm Electric Inc.
Recommendation: Revise text as follows:
Exception to (5): To comply with the conditions specified in (1) or (2), receptacle outlet shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop and within 150 mm (6 in.) of the countertop overhang. ~~Receptacles mounted below a countertop in accordance with this exception shall not be located where the countertop extends more than 150 mm (6 in.) beyond its support base.~~
Substantiation: We have countertops with overhangs that exceed 150 mm (6 in.) which create a safe place to place a receptacle. Since the requirement is to have the receptacle within 300 mm (12 in.) of the top of the countertop and as long as it is within 150 mm (6 in.) of the overhang. It would not matter how much the overhang would extend. It would be safer installation to have the receptacle under the overhang instead of on the front or side where the cords that are attached would be more in the traffic area of the kitchen.
Panel Meeting Action: Reject
Panel Statement: The panel notes that the proposal is actually to 210.52 and not 210.50. The 150 mm (6 in.) restriction in the current requirement is meant to preclude the installation of the receptacle outlet below the countertop where the counter protrudes far enough from the supporting base for a chair or stool to fit beneath it. This could cause damage to an attachment plug or power supply cord used with the outlet or injury to a person who knocked an appliance off the counter by bumping into the plug or power cord. Relocating the outlet to the underside of the counter at a distance of 150 mm (6 in.) or less would not address this concern.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-219 Log #541 NEC-P02 **Final Action: Reject**
(210.52)

Submitter: William L. Arnold, Arnold Electrical Inspection, P.C.
Recommendation: Add new text to read as follows:
At least one GFCI protected outlet shall be installed in safe rooms, storm cellars, and similar rooms.
Substantiation: These type rooms are becoming more and more popular. Homeowners and some electricians argue that since this is not a habitable room, it does not require any wiring. I can find nothing in the codes to overrule this argument. Therefore, I feel that a new code is needed.
Panel Meeting Action: Reject
Panel Statement: The listing of rooms in 210.52(A) utilizes the term “similar rooms” to describe the areas where receptacle placements are required. The submitter has not shown that the rooms described would differ substantially from the rooms listed in 210.52(A) or from an unfinished basement to warrant a specific list. The requirements for GFCI protection are outlined in 210.8.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-220 Log #2411 NEC-P02 **Final Action: Reject**
(210.52(l))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Add (I) Attics: In dwelling units where attic spaces are not used for habitable living space and contain an appliance that requires service at least one 125 volt single phase 15- or 20- ampere rated receptacle outlet shall be required. This outlet shall be within 25 ft of the appliance.
Substantiation: There is no provision for a receptacle outlet in attics that contain appliances that require service. A service technician needs to run an extension cord from the floor which has access to the attic through the attic access panel which is in violation of 408.8(3).
Panel Meeting Action: Reject
Panel Statement: The panel notes that the provisions in 210.63 already require a receptacle on the
same level and within 25 feet.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-221 Log #2903 NEC-P02 **Final Action: Reject**
(210.52, FPN)

Submitter: David A. Williams, Lansing, MI
Recommendation: Delete the Fine Print Note to 210.52.
Substantiation: The fine print note should be deleted since the listing requirements do not permit receptacles to be installed above baseboard heaters. See the 2008 UL White Book, Page 186 Category (KLDR). “To reduce the likelihood of cords contacting the heater, the heater should not be located beneath electrical receptacles.”
Panel Meeting Action: Reject
Panel Statement: The FPN is still accurate. The note is important to draw attention to the instructions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-222 Log #1884 NEC-P02 **Final Action: Reject**
(210.52(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Except as provided in 210.52(C) in every living room, kitchen, family room,...(remainder unchanged).
Substantiation: Edit. Correlation with 210.52(C).
Panel Meeting Action: Reject
Panel Statement: The rules in 210.52(A) still apply to the wall space around the kitchen. A reference to 210.52(C) is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-223 Log #2962 NEC-P02 **Final Action: Accept in Principle**
(210.52(A))

Submitter: Joseph Whitt, JW Electric
Recommendation: New text:
210.52(A) General Provisions. In every kitchen, family room, dining room, living room, parlor, library, den, sunroom, bedroom, recreation room, foyer, or similar room or area of dwelling units, receptacle outlets shall be installed in accordance with the general provisions specified in 210.52(A)(1) through (A)(3).
Substantiation: Today’s homes are being built with larger foyers some being as large as other rooms in the dwelling. As the code now stands, this area will be considered a hall which would require only one receptacle if it is more than ten feet in one direction no matter the other direction. With the addition of foyers to 210.52(A) it will reduce the possibilities of a homeowner running extension cords under rugs and through doorways of the foyer to power table lamps and other appliances.
Panel Meeting Action: Accept in Principle
The panel does not Accept the insertion of the word “foyer” as recommended in the proposal. Instead, the panel has created a new section (I) to read as follows:
“(I) Foyers. Foyers that have an area that is greater than 60 ft2 shall have a receptacle(s) located in each wall space as defined in 210.52 (A)(2)(1).”
Panel Statement: The panel has added a new subdivision “(I) Foyers” for clarity. The panel has also added a minimum area requirement to this section to exempt smaller foyers that typically do not have the space to facilitate home furnishings and electrical equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ORLOWSKI, S.: In agreement with the Ballot Comment from Mr. Pauley, and somewhat in agreement with the Ballot Comment from Mr. Coluccio. There are too many possible configurations of a foyer. But, the biggest problem is what constitutes a “foyer”. In almost all configurations of residential units, there is no foyer at the entrance door, only a hallway. Hallways are already covered under 210.52 (H) that only requires “3.0 m (10 ft) or more in length shall have at least one receptacle outlet.” If a new provision relating to foyers is included in the NEC, a definition of a “foyer” needs to be added to the NEC, and the minimum size, window location, door locations needs to be considered relative to the placement of receptacle outlets.
PAULEY, J.: The panel did not have substantiation to treat foyers over 60 sq ft as rooms that require receptacles in all wall spaces that would qualify under 210.52(A). This creates a requirement for receptacles in spaces where they have no practical use. Consider an entry door with side glass panels and two small walls about 2.5’ in width on each side that then extend into another space. This provision would require receptacles in both of these wall spaces with no practical purpose.
Comment on Affirmative:
COLUCCIO, F.: The panel is correct in requiring foyers over 60sq. ft. to have receptacles, many foyers are not designed to have receptacles and I have seen this in the field when performing inspections. The wording should be changed to relax what was written so this proposal won’t be rejected. There are many different shaped foyers you have to take into consideration where you

can easily have many wall spaces 2 feet wide or greater on each side of a doorway resulting in many receptacles having to be installed in this area.
rewrite (l) to read:
(l) Foyers. Foyers that have an area that is greater than 60 sq. ft. shall have a receptacle (s) installed in each wall 900 mm (3 ft) or greater in width excluding doorways from this measurement.
KING, D.: I agree with the Panel Action to now require receptacles be installed in Foyers over 60 sq ft. This added requirement will eliminate the use of extension cords run across doorways and openings to supply lights and other electrical appliances located along wall spaces in these areas.

2-224 Log #3566 NEC-P02 **Final Action: Reject**
(210.52(A))

Submitter: John E. Coleman, Electrical Forensics, Inc.
Recommendation: Add new text as follows:
<u>Receptacles shall not be installed below or within two feet horizontally of windows that may be covered by curtains.</u>
<u>Exception: Receptacles dedicated to HVAC components.</u>
Substantiation: High resistance points generated by improper connections or damaged power cords can produce ignition sources for nearby combustible window treatments.
Curtains often touch connected cords and provide an abundant source of fuel for potential fires. Curtains are especially hazardous to electrical connections when the window is open permitting the wind to oscillate curtains.
Panel Meeting Action: Reject
Panel Statement: This rule is unenforceable since there is no basis for determining whether or not
curtains would exist. It is often specified that the receptacle be directly below the window to allow for holiday decorations to be used in the window.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-225 Log #3806 NEC-P02 **Final Action: Reject**
(210.52(A))

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Add language to the middle of 210.52(A) as follows: "**(A) General Provisions.** In every kitchen, family room, dining room, living room, parlor, library, den, sunroom, <u>three-season room,</u> bedroom, recreation room..." (remaining text remains unchanged)
Substantiation: Unheated three-season rooms are often treated as nothing more than a deck with a roof, and proper receptacle spacing is not observed. These rooms are often constructed exactly as any indoor room in a dwelling except for heat. For three-quarters of the year, they are used as interior living space, including furniture, cord-and-plug connected lighting, and appliances such as televisions. Without proper receptacle spacing, some or all of these items are connected with extension cords or undersized lamp cord extensions or other unsafe means. By adding these rooms into the requirements of 210.52(A), electrical safety will be enhanced.
Panel Meeting Action: Reject
Panel Statement: The use of the term "similar rooms" in the current language provides the necessary latitude to include the room described by the submitter. The term "three season room" is undefined.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-226 Log #4385 NEC-P02 **Final Action: Reject**
(210.52(A))

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Add language to the middle of 210.52(A) as follows
(A) General Provisions. In every kitchen, family room, dining room, living room, parlor, library, den, sunroom, <u>three-season room,</u> bedroom, recreation room… (remaining text remains unchanged)
Substantiation: Unheated three-season rooms are often treated as nothing more than a deck with a roof, and proper receptacle spacing is not observed. These rooms are often constructed exactly as any indoor room in a dwelling except for heat. For three-quarters of the year, they are used as interior living space, including furniture, cord-and-plug connected lighting, and appliances such as televisions. Without proper receptacle spacing, some or all of these items are connected with extension cords or undersized lamp cord extensions or other unsafe means. By adding these rooms into the requirements of 210.52(A), electrical safety will be enhanced.

2-227 Log #4493 NEC-P02 **Final Action: Accept in Principle**
(210.52(A))

Submitter: Clynard M. Welch, Randolph Community College
Recommendation: Revise text as follows:
210.52 Dwelling Unit Receptable Outlets.
(A) General Provisions. In every kitchen, family room, dining room, living room, parlor, library, den sunroom, bedroom, recreation room, <u>foyer,</u> or similar room or area of dwelling units, receptacle outlets shall be installed in accordance with the general provisions specified in 210.52(A)(1) through (A)(3).
Substantiation: Add foyer because homes are being built with substantially large foyers that are being decorated with electrical appliances such as table lamps and other items that use electricity. With the only requirement for receptacle being found in 210.52(H) the use of extension cords to supply power to these items are being used.
The inclusion of foyers to the text in 210.52(A) would require receptacles to be installed as outlined in that section and eliminate the use of cords that could possibly cause fire.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-223.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: See NAHB's Comment on Proposal 2-223.

2-228 Log #4791 NEC-P02 **Final Action: Accept in Principle**
(210.52(A))

TCC Action: It was the action of the Technical Correlating Committee that this action be rewritten to comply with the NEC Style Manual.
The panel action did not include a title for the new subdivision (4).
This proposal will be considered by the panel as a public comment.
Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Revise text as follows:
Receptacle outlets shall be installed in accordance with the general provisions specified in 210.52(A)(1) through (A)(3) <u>and shall be in addition to 210.52(C)</u>.
Substantiation: Required countertop receptacles cannot be used to comply with wall space requirements, an example is a 3 ft wall space between the end of a counter and a door, that wall space needs a receptacle and cannot use a countertop receptacle to comply.
Panel Meeting Action: Accept in Principle
Add a new item (4) to 210.52(A) to read as follows:
(4) Receptacles installed for countertop surfaces as specified in 210.52(C) shall not be considered as the receptacles required by 210.52(A).
Panel Statement: The panel has accepted the concept and added a new item (4) to specifically note that countertop receptacles are not permitted to be counted as meeting the surfaces as provisions of 210.52(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ORLOWSKI, S.: Need to revise 210.52(A)(2)(1) as follows.
Wall Space. As used in this section, a wall space shall include the following:
(1) Any space 600 mm (2 ft) or more in width (including space measured around corners) and unbroken along the floor line by doorways, fireplaces, "fixed cabinets," and similar openings.
Without this text the "unbroken floor line" would include the floor line in front of the kitchen cabinets.

2-229 Log #1349 NEC-P02 **Final Action: Reject**
(210.52(A) and Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (A)(1)(3):
The space afforded by fixed room dividers such as ~~free standing~~ bar-type counters or ~~railings~~ other fixed appurtenances.
Add after (A):
Exception: Wall spaces occupied by cabinets, built-in furniture, or other appurtenances.
Substantiation: "Free-standing" as in electric range, can be deemed as not fastened in place. Proposed Exception is for clarification.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the term "freestanding" as used in this context implies not fastened in place. The objective is to ensure that a freestanding bar-type counter that is used as a room divider is included in the wall space measurements. A bar-type counter, without any wall space behind it, that is attached to the kitchen wall counter is not a room divider. The proposed exception is unnecessary since the described items are not "wall space".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-230 Log #269 NEC-P02 **Final Action: Accept**
(210.52(A)(1))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "in" to "of" so the section reads: "...along the floor line of any wall space...".
Substantiation: Grammatical correction. The floor line is not in the wall space.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-231 Log #2331 NEC-P02 **Final Action: Reject**
(210.52(A)(1))

Submitter: David Nemchik, Medina County Building Department [Ohio]
Recommendation: Revise text as follows:
(1) Spacing. Receptacles shall be installed such that no point measured horizontally along the floor line in any wall space is more than ~~1.8 m (6 ft)~~ 1.5 m (5 ft) from a receptacle outlet.
Substantiation: The original purpose of this spacing requirement was to reduce the usage of extension cords in dwellings. Free standing table luminaires and other portable cord and plug electrical equipment is commonly supplied with a 6 ft cord. When these are placed on an end table 6 ft from a receptacle, the cord is sometimes pulled tauntly elevated in midair against the wall. This results in lighter equipment being tipped over by the pull of the cord weight. This also results in the homeowner introducing an extension cord to eliminate the midair cord. When maximum allowable spacing and cord length are the same, the cord is required to follow the same path as the tape measure, "as the crow flys".
Additionally, the expansion of tamper resistant receptacles does not increase the safety to children when these energized extension cords without TR are available to the children.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated that the current 6 ft spacing requirement is inadequate. For the situation described in the substantiation the table could easily be moved to allow the 6 ft cord to be adequate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-232 Log #2726 NEC-P02 **Final Action: Reject**
(210.52(A)(1))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Recommendation: Revise text to read as follows:
(1) **Spacing.** Receptacles shall be installed in each wall space so that no point measured horizontally along the floor line in ~~any~~ that wall space is more than 1.8 m (6 ft) from a receptacle outlet.
Substantiation: The change would clarify that receptacles outside the boundaries of the wall space do not fulfill the requirement for having receptacles that serve the wall space. For example, as presently written, the Code might be interpreted as allowing (1) A kitchen countertop receptacle that is close to the edge of the countertop to also serve a wall space adjacent to the cabinet/countertop surface, and (2) A receptacle mounted in the floor in the middle of a doorway to serve the two wall spaces to the left and to the right of the doorway. Also, consider a wall that has two feet of wall space on the left, then a three foot wide doorway, then additional wall space to the right of the doorway. The two foot wall space needs a receptacle, but the present NEC words can be interpreted as allowing that space to be served by a receptacle immediately to the right of the doorway. The receptacle serving a wall space should be actually IN that wall space.
Panel Meeting Action: Reject
Panel Statement: No clarity is provided by the submitter's recommendation. For additional information regarding countertop receptacles see panel action and statement on Proposal 2-228.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-233 Log #2781 NEC-P02 **Final Action: Reject**
(210.52(A)(1))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Recommendation: Revise text as follows:
(1) **Spacing.** Receptacles shall be installed so that no point on the floor line of ~~measured horizontally along the floor line in~~ any wall space is more than 1.8 m (6 ft), measured horizontally along the floor line, from a receptacle outlet.
Substantiation: This change corrects a grammar error that is a source of confusion. The phrase, "measured horizontally along the floor line," is apparently intended to be associated with the 1.8 meter (6 ft) measurement. But that phrase is presently located next to, and is therefore associated with (according to the rules of grammar), the word "point." You cannot measure a point. But more importantly, in its present location, that phrase allows us to select a point in the wall space, connect a six foot long string to that point, and look for a receptacle within a six foot circle centered at that point. It does not matter if that receptacle is above a kitchen countertop or is across a doorway's opening. The notion of "measured along a floor line" is completed, as soon as you select a point. The notion of being within six feet does not require a measurement to be taken along a floor line, nor does it forbid you to go across an area that is not part of the wall space.
Panel Meeting Action: Reject
Panel Statement: The submitter's wording doesn't add any clarity to the existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-234 Log #2782 NEC-P02 **Final Action: Reject**
(210.52(A)(2)(1))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Recommendation: Revise text as follows:
(1) Any space 600 mm (2 ft) or more in width (including space measured around corners) and unbroken along the floor line by permanently installed kitchen cabinets or by doorways, fireplaces, and similar openings.
Substantiation: As written, if a kitchen has a wall that is partially, but not completely, fitted with cabinets, and if you start measuring the open wall space in order to lay out the wall space receptacles, you will measure along the floor line, come to the cabinet base, measure around the corner to the front of the cabinet, continue measuring along the front of the base cabinet until you come to its other edge, measure around the corner to the back of the cabinet, and continue the measurement along the remaining floor line. This puts the "wall space" receptacle requirements of 210.52(A)(1) at odds with the "wall counter spaces" receptacle requirements of 210.52(C)(1). The lines at which the sides and the front of a kitchen cabinet meet the floor should not be considered "wall spaces," in the context of 210.52(A)(1). The present wording allows them to be considered wall spaces. The proposed wording still treats a permanent wall-to-wall bookcase as "wall space."
Panel Meeting Action: Reject
Panel Statement: The kitchen cabinets are not wall space under the rule as stated in the current code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-235 Log #1509 NEC-P02 **Final Action: Reject**
(210.52(A)(2)(3))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Recommendation: Revise text to read as follows:
(3) The space ~~afforded~~ occupied by fixed room dividers such as freestanding bar-type counters ~~or railings.~~
(4) Railings that establish a boundary between two areas or two elevations on the same floor level, or that provide a safety barrier between floor levels, but excluding staircase handrails.
Substantiation: This corrects an error in the use of the English language. There are no published definitions of the word "afford" and its derivative form "afforded" that fit into the context in which "afforded by" appears in 210.52(A)(2)(3). The nearest definition might be, "to furnish or supply," but even that does not fit the intended context. Thus, the current wording has no meaning, and it cannot, therefore, be enforced.
A simple substitution of the word "occupied" for "afforded" would correct the language error, but would create a new ambiguity. That is because the "space occupied by a railing" could be argued to include only the top and bottom rails and the posts that connect them, not the open air between the posts.
Bar-type counters are often used as the boundaries between two separate rooms on the same floor level. Railings are not. Railings frequently separate rooms with at least a one-step difference in height. Even more frequently, they establish a safety barrier between a second floor landing and the open living spaces below. These two cases are not addressed in the present wording, as the railing would not comprise a "room divider." For example, look at the architectural plans of the second floor landing, and you will not see two rooms with a railing between them. Rather, you see one room, with a railing at one edge, and thus the railing is not a "room divider." The intent of this code article may be to require floor-mounted receptacles along this railing, but the present wording does not require them. The additional words shown are needed to clarify that a railing is a "wall space."
Panel Meeting Action: Reject
Panel Statement: The current wording conveys the intent to include railings that serve as fixed room dividers regardless of their location. The submitter's text does not add clarity to the current text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-236 Log #240 NEC-P02 **Final Action: Reject**
(210.52(A)(2)(c))

Submitter: David Ware, Yorktown, VA
Recommendation: Revise as follows:
(c) The space affected by fixed room dividers ~~such as free standing bar type counters or railings~~.
Substantiation: 210.52(C)(3) speaks to the island counter spaces. Inspectors are calling islands "wall space" and requiring outlets on seating areas which is a hazard. Please see the photos I have provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The deletion of the language would eliminate the requirement for receptacles in areas where they are needed. In the majority of applications, an island does not function as a fixed room divider, which is what is addressed by the current language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-237 Log #1147 NEC-P02 **Final Action: Reject**
(210.52(A)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
(3) Floor Receptacles.
(a) Receptacle outlets in floors shall not be counted as part of the required number of receptacle outlets unless located within 450 mm (18 in.) of the wall.
(b) In meeting rooms located in office buildings and hotels/motels, a receptacle outlet in a listed floor box shall be installed in the center of each room. For a dividable meeting room a single receptacle outlet in a listed floor box shall be installed in the center of each partitioned area.
Substantiation: The purpose of this new section is to increase the number of access points to the electrical supply to reduce reliance on the use of extension cords and the number of extended and potentially overloaded in meeting rooms. Without centrally located receptacles, extension cords are used with power strips (which are often daisy chained) attached at wall outlets. Extension cords are a tripping hazard and damaged extension cords are a shock and fire hazard. The increased use of laptop computers and projection equipment has led to greater demand for electrical receptacles in convenient locations. The NEC needs to recognize this trend by requiring receptacles to be installed in listed floor boxes in the center of meeting areas, thereby reducing the need for extension cords.
Panel Meeting Action: Reject
Panel Statement: The proposal deals with meeting rooms in office buildings and hotel/motels, but the proposal is made to the section of the code that applies to dwelling units.
See panel action and statement on Proposal 2-276.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ORLOWSKI, S.: First, NO documentation was provided to show the current provisions are a cause of a real fire or other life/fire-safety problem that would be solved if the floor boxes were mandated. Second, it is unfortunate that the scope of the NEC does not relate to the NEC being the "minimum" requirements for "practical safeguarding" for electrical installations. The proposed requirement is nothing more than mandating a "convenience outlet that in fact may never be used.

2-238 Log #3699 NEC-P02 **Final Action: Reject**
(210.52(A)(3) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Section 210.52(A)(3) should be revised to read as follows:
(3) Floor Receptacles.
(a) Receptacle outlets in floors shall not be counted as part of the required number of receptacle outlets unless located within 450 mm (18 in.) of the wall.
(b) A receptacle outlet in a listed floor box shall be installed at least 1.8m (6ft) from the wall in rooms that are 60 m² (625 ft²) in area or larger other than hallways, bedrooms, basements, kitchens, bathrooms, garages and swimming pool rooms. A receptacle outlet in a listed floor box shall be installed for each 60 m² (625 ft²) in area in a room.
Substantiation: The purpose of this new section is to increase the number of access points to the electrical supply to reduce the number of potentially overloaded circuits in residential family rooms, living rooms and great rooms. Panel 2 discussed how cord lengths for lamps and other electrical equipment have been shortened from 6 feet to 5 feet. The lack of a sufficient number of available receptacle outlets near the center of larger rooms leads the homeowner to use extension cords in place of a permanent wiring. In addition, extension cords may be covered by rugs or carpets. According to the Electrical Safety Foundation International (EFSi), this should never be done as heat buildup and friction could cause a fire. Also, cords left exposed across a room can create a tripping hazard (see attached brochure). With the proliferation of cord connected home use electrical products such as room air conditioners, dehumidifiers, humidifiers, air purifiers, cordless phones, home entertainment systems, computer equipment, electronic games, multiple TV's, appliances, etc., it is evident that the number of receptacles required 50 years ago is no longer adequate for today's home. The addition of floor receptacles as recommended in this proposal will help to ensure that there are an adequate number of receptacles available for connection of the large number of cord connected appliances now being used in the typical dwelling.
Damaged extension cords are a cause for shock and fire. Furniture and lights are placed in the middle of these rooms away from any wall receptacles. Requiring the provision for receptacles to be installed in listed floor boxes will eliminate the need for extension cords. The proposed language is written so that there is flexibility in where to locate the floor receptacle(s). According to National Association of Homebuilders statistics, the average size home more than doubled in size since the 1950's. The proposed 625 square foot (25 foot by 25 foot) room is directed toward much larger homes then the average house built today.
There has been a significant increase in the number of cord connected household electrical products used in dwellings, there has been no corresponding change in the NEC that addresses the need for the additional receptacle outlets that are necessary to accommodate the use of these products by the homeowner. Since 1956, the receptacle spacing requirements in 210.52(A)(1), and the resultant number of receptacles installed, has remained unchanged.
Previous editions of the NEC Handbook (e.g., 1981) stated, "Receptacles are to be located so that no point in any wall space is more than 6 ft from a receptacle. This rule intends that an appliance or lamp with a flexible cord attached may be placed anywhere in the room and be within 6 ft of a receptacle, thus eliminating the need for extension cords." Since most cord connected equipment will have 5 ft cords, based on the UL standards requirements for these products, it is still true that the receptacle spacing requirements now in the NEC will allow the cord on any single product to reach a receptacle from any point along the wall without the use of extension cords. However, this requirement did not anticipate the use of cord connected electrical equipment used in large rooms where the furniture is placed in the middle. The addition of floor receptacles will allow lamps and other electrical appliances to be used in the center of large rooms without the use of extension cords.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Requiring the placement of receptacles in the floors of dwelling unit areas of 625 ft^2 or more, located at least 6 ft from the wall, in areas that may have no furniture or other provisions for interior design specifications, is not practical and has not been substantiated. If a floor receptacle were required in such areas, it could still end up underneath furniture which, if still used by the homeowner, would be a hazard in itself.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:
KING, D.: Placement of furniture should not be a consideration for panel 2 when determining the minimum safety requirements for the spacing of receptacles in dwelling units. The intent of the submitter is to require a receptacle and not to mandate the location of the device. The location of the device is a design consideration and can be determined at the time that the receptacle is installed. Minimum spacing requirements for receptacles reduces the use of extension cords and can prevent electrical fires in dwelling units.
LAROCCA, R.: In large rooms such as "great rooms" that have become increasingly popular, the only requirement is for receptacles to be installed along the wall space. If receptacles are not included in the open floor space, extension cords will be used to provide power to lamps and other appliances used in the open central area of the room. Cords used in such a manner will be run under carpets and rugs and may be damaged creating a potential fire or shock hazard, or create a tripping hazard if left exposed. Requiring one or more floor receptacles in large rooms would help prevent these potentially hazardous conditions.
PAULEY, J.: This proposal should have been accepted by Panel 2. The NEC is not a design manual. The locations of floor boxes are the responsibility of designers and architects.
WEBER, R.: This proposal should have been accepted in principal and placed as an identified code requirement to address large room areas in dwellings and the need for other than wall receptacles around the outside walls. There was a similar proposal for the 2008 NEC Cycle, that was not supported at that time, however dwelling units are being built with large room areas and then forced to run cords under carpets or other floor coverings to provide electrical power to interior room areas and layouts. I agree that the designated location for the floor receptacle would need some flexibility and defined area limits that may require more than one receptacle to be installed. We need to address this issue with clear and meaningful code text.
Comment on Affirmative:
ORLOWSKI, S.: First, NO documentation was provided to show the current provisions are a cause of a real fire or other life/fire-safety problem that would be solved if the floor boxes were mandated. Second, it is unfortunate that the scope of the NEC does not relate to the NEC being the "minimum" requirements for "practical safeguarding" for electrical installations. The

proposed requirement is nothing more than mandating a "convenience outlet that in fact may never be used.

2-239 Log #4194 NEC-P02 **Final Action: Reject**
(210.52(B)(1) Exception No. 2)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read as follows:
Exception No. 2: ~~The receptacle outlet~~ A single receptacle for refrigeration equipment shall be permitted to be supplied from an individual branch circuit rated 15 amperes or greater.
Substantiation: The definition of individual branch circuit indicates that it only supplies one utilization equipment which would seem to require a single receptacle opposed to a duplex receptacle to be used. A question was asked at the 2008 Southern Section IAEI meeting and multiple answers were provided indicating that duplex receptacles are acceptable. Although adding the term "single receptacle" to this exception might seem redundant, many do not read the ROP panel statements. If CMP 2 intends to permit duplex receptacles then the word "individual" should be deleted from this exception.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that a single receptacle is required. A receptacle other than a single receptacle could be used and other means such as configuration or arrangement of the equipment could limit the application to a single utilization equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-240 Log #2822 NEC-P02 **Final Action: Reject**
(210.52(B)(2) (New))

Submitter: Herbert Porter, Akron, Oh
Recommendation: Add Exception to read as follows:
(2) No Other Outlets. The two or more small-appliance branch circuits specified in 210.52(B)(1) shall have no other outlets.
Exception No. 1: A receptacle installed solely for the electrical supply to and support of an electric clock in any of the rooms specified in 210.52(B)(1).
Exception No. 2: Receptacles installed to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units.
Exception No. 3 A single range exhaust hood mounted above a range may be connected to one of the small appliance branch circuits that serve the countertop receptacles.
Substantiation: Allowing a single range hood to be direct connected to one of the small appliance branch circuits will allow the electrician more flexibility when wiring a kitchen. One or two of the two required small appliance are available whereas the electrician can easily leave a wire out for a range hood. Most range hoods consume a maximum of two amps. Prior to the 1996 NEC. outdoor receptacle outlets were permitted to be connected the small appliance branch circuit and there was never a problem. I submitted a similar proposal for the 1996 code cycle and the proposal was accepted in principal. but was rejected in the comment stage.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that all range hoods add only minimal load to the small appliance branch circuit. Some of these hoods draw significant load and in some cases also include a microwave. The panel intends to limit the connections of equipment to the small appliance branch circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-241 Log #1714 NEC-P02 **Final Action: Reject**
(210.52(C))

Submitter: Ronald E. Hackett, Village of Buffalo Grove / Rep. NE Suburban IAEI
Recommendation: Add new text as follows:
(C) In kitchens, pantries, breakfast rooms, dining rooms, and similar areas of the dwelling units, receptacle outlets for countertop spaces shall be installed in a kitchen to serve countertop surfaces in accordance with 210.52(C)(1) through (C)(5).
Where a range, counter-mounted cooking unit, or sink is installed in an island or peninsular countertop, the range, counter-mounted cooking unit, or sink shall be considered to divide the counter space into two separate countertop spaces as defined in 210.52(C)(4). ~~Each separate countertop space shall comply with the applicable requirements in 210.52(C).~~
At least one receptacle shall be installed for the countertop space behind the range, counter-mounted cooking unit or sink; where the long dimension is 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater.
Substantiation: 210.52(C) is unclear to the electrical professional. From the electrician, instructor and the AHJ one is uncertain as to where or when a receptacle is required. Homeowners and designers may be included as well. The general rule is that at least one receptacle shall be installed at each island countertop space with a long dimension of 600 mm (24 in.) or greater and short dimension of 300 mm (12 in.) or greater.
The result is that many AHJs are only requiring one receptacle whether or not the island has separate spaces due to the installation of a range, cooking unit or sink. This is not the intent. AHJs are frustrated on this topic.
Currently, 210.52(C) makes a wonderful attempt to consolidate and apply one requirement for two distinct and unrelated spaces. However, this attempt falls short. Figure 210.52(C)(1), shows two illustrations. One shows a space exempt from wall line where "x" is less than 300 mm (12 in.). This requirement is clear and precise. It gives the user of the NEC a clear guideline concerning the wall space behind the appliance or sink with regards to receptacle spacing. The exception indicates that receptacle outlets shall not be required on a wall directly behind a range, counter-mounted cooking unit or sink where the wall space is less than 12 in. The key to understanding this is the wall. You have to have a wall.
This same 12 in. or less does not work for all island or peninsula counter spaces. For instance, an island with no wall space. The difference is that there may not be a wall directly behind the appliance or sink. This difference between wall space and no wall space for islands or peninsulas needs to be addressed. Clarification is warranted. In most cases, the island will not have wall space. Where this is the case, this 12 in. or less is not practical especially for the new innovative island designs.
When applying 210.52(C), the main criteria for determining separate spaces for islands and peninsulas should be based on whether a range, counter-mounted cooking unit, or sink is installed and not on the width measurement behind the range if 12 in. or less. In practical terms, this is when we should have separate spaces in determining the number of receptacles. This confusion is why many AHJs base their inspection on the general rule. "One receptacle outlet on the island, period". This is not the intent of 210.52 (C).
With new innovative islands. See article from Chicago Tribune on kitchen islands. The island most likely will include a sink or a cooking unit or both. As an AHJ, we should have clear code language as to the specific requirement. If the island has a sink or cooking unit, we should be able to conclude that the island has separate spaces. The next step then is to determine the number of separate spaces. We base the number of receptacles on the number of separate spaces. The Code reference to 210.52(4) brings us to (C)(1), (C)(2) and (C)(3). Any space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater, at least one receptacle is required. This is clear and right to the point. This works for the island with wall space and without wall space.
The proposal makes it clear that when we have a range, counter-mounted cooking unit, or sink on the island or peninsular, we have separate spaces. To determine if that space requires a receptacle, we visit 210.52(4). Also, where the space behind the range, counter-mounted cooking unit or sink has long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm(12 in.) or greater, at least one receptacle is required.
Additionally, deleting reference to 210.52(C) should be accepted. It would be better served by including 210.52(C) under 210.52(C)(4). For example, (4) Separate Spaces, should read as follows: Countertop spaces separated by rangetops, refrigerators, or sinks shall be considered as separate countertop spaces in applying the requirements of 210.52(C), (C)(1), (C)(2) and (C)(3). Removing redundancy of code sections will help alleviate confusion and be more user friendly. All requirements for separate spaces should be located under (4) separate spaces. This makes perfect sense. Why have someone go back and forth between 210.52(C) and 210.52(C)(4)?
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the current wording is confusing. If the space behind the sink or range is less than 12 in. then the countertop is considered to be two spaces that each must meet the dimensions to require a receptacle. If the space is 12 in. or greater, the space is considered to be a single countertop and only one receptacle is required.
The submitter has also confused the application of the drawings. These drawings apply to 210.52(C)(1), which only applies to wall counter space as indicated in the reference to the figures from 210.52(C)(1) Exception.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-242 Log #3108 NEC-P02 **Final Action: Accept in Principle in Part**
(210.52(C))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revised Text and the upper drawing in Figure 210.52(C)(1):
(C) Countertops. In kitchens, pantries, breakfast rooms, dining rooms, and similar areas of dwelling units, receptacle outlets for countertop spaces shall be installed in accordance with 210.52(C)(1) through (C)(5).
~~Where a range, counter-mounted cooking unit, or sink is installed in an island or peninsular countertop and the width of the countertop behind the range, counter-mounted cooking unit, or sink is less than 300 mm (12 in.), the range, counter-mounted cooking unit, or sink is considered to divide the countertop space into two separate countertop spaces as defined in 210.52(C)(4). Each separate countertop space shall comply with the applicable requirements in 210.52(C).~~

(1) Wall Countertop Spaces. A receptacle outlet shall be installed at each wall countertop space that is 300 mm (12 in.) or wider. Receptacle outlets shall be installed so that no point along the wall line is more than 600 mm (24 in.) measured horizontally from a receptacle outlet in that space.

Exception: Receptacle outlets shall not be required on a wall directly behind a range, counter-mounted cooking unit, or sink in the installation described in Figure 210.52(C)(1).

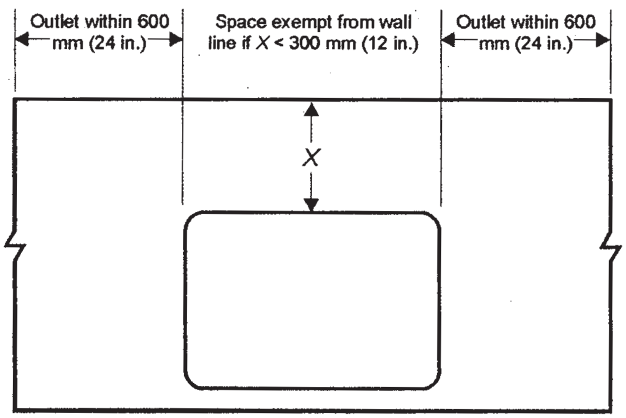
(2) Island Countertop Spaces. At least one receptacle shall be installed at each island countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater.

(3) Peninsular Countertop Spaces. At least one receptacle outlet shall be installed at each peninsular countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. A peninsular countertop is measured from the connecting edge.

(4) Separate Spaces. If a range, rangetop, counter-mounted cooking unit, or sink is installed in an island or peninsular countertop and the depth of the countertop behind the range, counter-mounted cooking unit, or sink is less than 300 mm (12 in.) as shown in Figure 210.52(C)(1), the range, rangetop, counter-mounted cooking unit, or sink is considered to divide the countertop space into two separate countertop spaces. Each separate countertop space shall comply with the applicable requirements in 210.52(C)(1), (C)(2) and (C)(3). ~~Countertop spaces separated by rangetops, refrigerators, or sinks shall be considered as separate countertop spaces in applying the requirements of 210.52(C)(1), (C)(2), and (C)(3).~~

210.52(C)(5) is not revised by this Proposal.

Replace the upper drawing in Figure 210.52(C)(1) with the following proposed revision:



Range or counter-mounted cooking unit in counter space

Revise the text in Figure 210.52(C)(1) to read, "Figure 210.52(C)(1) Determination of Area Behind a Range, ~~or~~ Counter-Mounted Cooking Unit, or Sink."

Substantiation: The second paragraph in 210.52(C) is proposed to be moved to 210.52(C)(4) and replace that subsection as it clearly relates to "Separate Spaces" as covered in that section and duplication is not necessary.

The upper drawing in Figure 210.52(C) needs to be revised as shown as most commonly, counter-mounted cooking units, rangetops and sinks do not extend from the face of kitchen counters. And, that is not the issue being addressed. This section addresses whether the appliance or sinks create a separation of the counter top for the purpose of determining the appropriate placement of receptacle outlets.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Principle in Part

Delete the second paragraph of 210.52(C).

Revise 210.52(C)(4) to read as follows:

"**(4) Separate Spaces.** Countertop spaces separated by rangetops, refrigerators, or sinks shall be considered as separate countertop spaces in applying the requirements of 210.52(C)(1). If a range, counter-mounted cooking unit, or sink is installed in an island or peninsular countertop and the width of the countertop behind the range, counter-mounted cooking unit, or sink is less than 300 mm (12 in.), the range, counter-mounted cooking unit, or sink is considered to divide the countertop space into two separate countertop spaces as defined in 210.52(C)(4). Each separate countertop space shall comply with the applicable requirements in 210.52(C)."

The remainder of the proposal is rejected.

Panel Statement: The panel agrees with relocating the second paragraph of 210.52(C) to become the second paragraph of 210.52(C)(4). The panel does not agree with deleting the current sentence in 210.52(C)(4) because the text is applicable to wall counter spaces.

The panel does not agree with revising the drawing. The drawing as referenced from 210.52(C)(1) is applicable to wall counter space and is intended to convey how to deal with a corner mounted sink, etc. or a sink that extends from the wall counter. Normal wall counters are not wide enough to accommodate a sink and have space behind the sink that would be greater than 12 in. A placement of sink or cooking unit in a normal 23 in. deep wall counter will in the vast majority of cases create separate spaces.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-243 Log #4498 NEC-P02 **Final Action: Accept in Principle**
(210.52(C))

Submitter: Monica J. Johnson, Randolph Community College

Recommendation: Revise text to read as follows:

210.52 Dwelling Unit Receptacle Outlets.

(C) Countertops. In kitchens, pantries, breakfast rooms, dining rooms, and similar areas of dwelling units, receptacle outlets for countertop spaces shall be installed in accordance with 210.52(C)(1) through (C)(5). Receptacles installed to serve countertops shall not serve to fulfill the requirements of wall space covered in 210.52(B)(1) as covered by 210.52(A).

Substantiation: Some installers and code officials think that receptacles installed to serve the countertops of kitchen receptacles will fulfill the wall space requirement outlined in 210.52(A) due to the fact that the receptacle is less than 5 1/2 ft from finish floor as outlined in 210.52(4).

I have provided a diagram.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Ballot Results: Affirmative: 12

2-244 Log #1510 NEC-P02 **Final Action: Reject**
(210.52(C)(1))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.

Recommendation: Revise text to read as follows:

(1) Wall Countertop Spaces. A receptacle outlet shall be installed at each wall countertop space that is 300 mm (12 in.) or wider, exclusive of the countertop's side edges.

Substantiation: This change would clarify the requirement for a receptacle on a countertop space 12 in. or wider. As written, it could be interpreted that a receptacle is required for certain countertop spaces no wider than 11 in., or even as narrow as 1 in., as described below. I will use 6 in. for this example.

The side edge of a countertop is typically 25 in. long. At issue is whether that is intended to be included in the "12 in. or wider" requirement. Please note that 210.52(A)(2)(1) specifically includes space that is measured around corners. By contrast, 210.52(C)(1) does not say, one way or the other, whether to measure around corners. As written, if there were a sink within 6 in. of a countertop's side edge, and if you had to measure countertop wall space starting where the side wall meets the front edge of the countertop and continue to measure around the corner, you would get a total of 31 in. (i.e., 25 in. of space along the side edge plus 6 in. along the back edge). Thus, you would conclude that two receptacles are required. This would be a dangerous place to put receptacles. Even though GFCI protection would be required at that location, it would still be wrong to have an appliance sitting on 6 in. (or less) of countertop space, with a cord that could easily dangle into the sink.

It should also be noted that if the kitchen's back wall and the countertop's side edge end at the same place, and if there is no side wall, then (1) you do not have a peninsula, (2) there is no "countertop wall space" along that edge, (3) it is not possible to place a receptacle such that it is within 24 in. of the front corner, and (4) the present wording of this article can be interpreted as requiring a receptacle along this countertop side edge anyway.

I have provided marked-up figures that would emphasize the intent that the side edges of countertops are not to be included in the measurement of countertop wall spaces.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

(210.52(C)(1))

Submitter: George M. Stolz, II, Pierce, CO

Recommendation: Add the following sentence at the end of (C)(1):

Sidewalls that run perpendicular to the counter shall be permitted to be omitted from this measurement.

Substantiation: A receptacle installed along the back wall of a counter space is usually close to 24 in. from the front edge of a counter. This would serve as a clarification as to where the measurement for receptacle layout begins, the back corner of the wall counter space. As this section is currently written, there are at least two different ways of interpreting it, I am advancing the most prevalent interpretation in the field.

I have provided a discussion from an internet forum about this proposal, to clarify what exactly is sought by this proposal.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-246.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-246 Log #4585 NEC-P02 **Final Action: Reject**
(210.52(C)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following sentence: "Where a countertop space is bounded by more than one wall, the length of a wall line perpendicular to the front edge and equal to the depth of the counter shall not be included in this measurement."
Substantiation: Consider two identical 25-in. deep counters 4 ft long, one in a corner and the other between a kitchen sink and a refrigerator. On the literal text of this paragraph, the wall line for the counter in the corner is just over 6 ft long, because the wording "along the wall line" directly parallels "along the floor line" in 210.52(A)(1) and that rule always applies around contiguous wall sections. The other counter is simply a 4-ft counter. Why should one of two identical counters in terms of length and area get double the receptacle coverage? This disparity has been a source of inconsistent code application for decades, and it is time to clarify what should be enforced. In this example, the counter in the corner has zero length beyond the counter depth that is perpendicular to the front edge. The proposal text also covers short returns, however. As soon as the perpendicular wall space exceeds the counter depth it starts being counted, so a 12-in. return gets a receptacle outlet.
Panel Meeting Action: Reject
Panel Statement: The panel intends that this space be included in the wall line measurement. Exempting the space could result in receptacles being spaced 6 ft apart where the counter continues along wall.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-247 Log #1721 NEC-P02 **Final Action: Reject**
(210.52(C)(1) Exception and Figure 210.52(C)(1))

Submitter: Ronald E. Hackett, Village of Buffalo Grove / Rep. NE Surburban IAEI
Recommendation: Add new text as follows:
210.52(C)(1), Exception. Figure 210.52(C)(1) Determination of Area Behind a Range, or Counter-Mounted Cooking Unit or Sink where the counter connects to wall space.
Substantiation: Add new text as follows:
210.52(C)(1) Exception applies where there is a wall directly behind a range, counter-mounted cooking unit, or sink. The heading of the title should be the first indication that the figures clarify what is to be done with the wall space directly behind an appliance or sink. To be consistent with the exception, the heading needs to make it clear that the figure is based on wall space and that a free standing island or peninsula is not applicable.
Panel Meeting Action: Reject
Panel Statement: Figures are only applicable where they are referenced within the code text itself. In the case of Figure 210.52(C)(1), it is only referenced from 210.52(C)(1) Exception.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-248 Log #585 NEC-P02 **Final Action: Reject**
(Figure 210.52(C)(1))

Submitter: Mitch Feininger, North Dakota State Electrical Board
Recommendation: Revise Figure 210.52(C)(1) as follows:

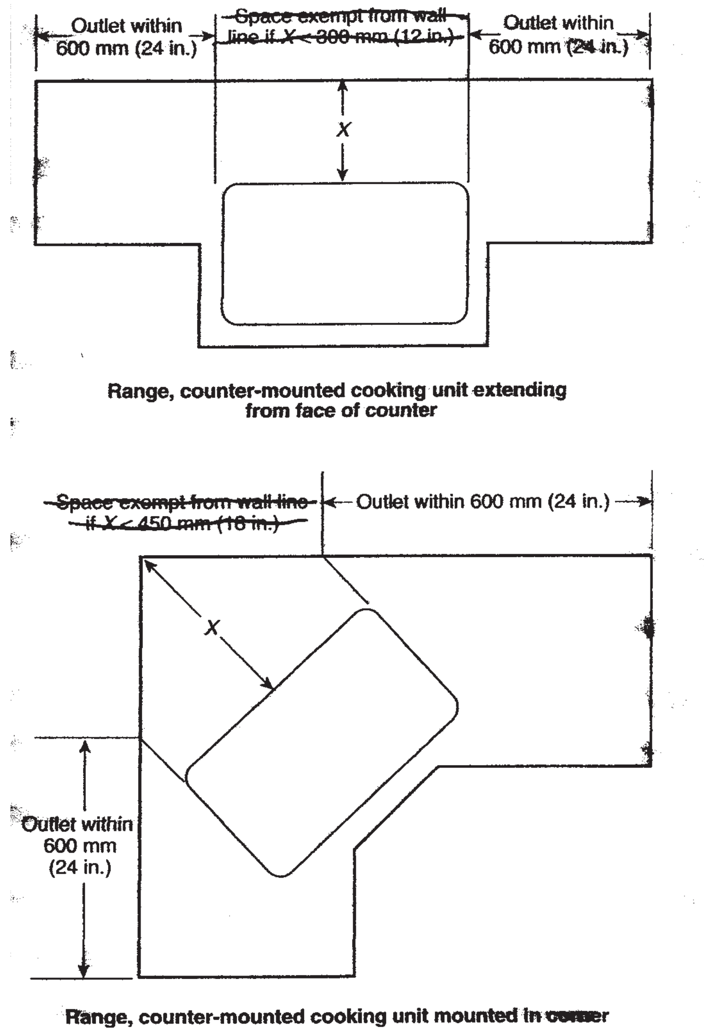

Figure 210.52(C)(1) Determination of Area Behind a Range, or Counter-Mounted Cooking Unit or Sink

Substantiation: Both of the illustrations in Figure 210.52(C)(1) are commonly complemented by windows at least as wide as the cooking unit or sink leaving no provisions for the installation of an ac receptacle. The bottom illustration typically consists of 2 windows on either side of the corner with solid framing between them. Note that 406.4(E) prohibits mounting receptacles face-up. The code is impractical in most applications.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the window makes the counter space unusable. As such, the space must be included in the wall line measurements if the dimensions exceed the values as shown in the figures. The submitter should note that the text does not require that the receptacle be in the space behind the sink or cooking unit, only that it be included in the wall line measurement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-249 Log #4873 NEC-P02 **Final Action: Reject**
(210.52(C)(2))

Submitter: David Zinck, Wiring Inspector / Rep. Newburyport, MA
Recommendation: Delete this subsection.
Substantiation: The requirement for an outlet on the island came in in the 1990 NEC. The argument for it was that if someone wanted to use an appliance on the island, they would have to run an extension cord from another counter plug to the island. This would create the hazard that someone walking by could accidentally pull the appliance off of the counter. If the appliance were a coffee pot or a FryBoy (a small at-home fryolator) there could be a burn hazard.

In the history of electricity it never happened. How do I know? Simple. Let me ask you all a simple question. Where do you keep the extension cords at your house? If you work in the field, you have a couple on the truck. If you are handy around the house you might have a 50' one at the work bench. If you have an electric hedge trimmer or lawn mower, you probably have a 100 footer in the shed. Other than that, they pare packed away with the Xmas ornaments in the attic. Would anyone go get one of these 100' cords, leave 90' of it in a pile between counter and island, just to use an appliance at the island? Of course not. you will just move the blender to the counter with the outlet.

This requirement also leads to inconsistent inspections. One house has an island with an overhang on 3 sides 6" or greater and all moveable surfaces (drawers, and doors, etc.) on the only side that does not have a 6" overhang. You tell this electrician that he does not have to have one. The neighbor has a space for one but is adamantly opposed to it. You have to tell him that he has to have one whether he likes it or not. I bet your name comes up at the pool party. Lets say the only spot for one is about 1 1/4" above the draws and below the counter. Do you force them to install plugmold whether they like it or not? Good luck finding that in Tamper-Proof.

It also introduces a hazard. If the outlet is about 12" down on the side of the island, that Fryboy or coffee pot cord is ripe for being pulled by a small child. Just having the outlet here invites the appliances to this location. I have 3 year old triplets. You cannot watch them every second. And I can attest to the fact that they do get into everything.

Deleting the requirement for this outlet does not outlaw it. Anyone who wants one can have one. It leaves the decision to the homeowner.
Panel Meeting Action: Reject
Panel Statement: The panel has debated the issue of where to mount receptacles on islands over numerous code cycles. The current wording of the NEC provides a reasonable set of rules to address practical mounting based on the construction of the countertop and cabinets. Deleting the section entirely would leave substantial areas of modern kitchens without any receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-250 Log #3571 NEC-P02 **Final Action: Reject**
(210.52(C)(3)Exceptions 1 and 2)

Submitter: George M. Stolz, II, Pierce, CO
Recommendation: Add text as follows:

Exception No. 1: If a peninsula contains a rangetop or sink which would divide it into two counter spaces according to the provisions of 210.52(C)(4), a receptacle shall not be required for the portion of the peninsula that is between the rangetop or sink and the wall counter space connecting edge.
Exception No. 2: If a rangetop or sink exists at the end of a peninsula, a receptacle shall not be required.
Substantiation: For the first exception: Presently a peninsula that is 8 ft long is only required to have one receptacle. There is no reason to require a receptacle in the middle of the overall peninsula just because someone added a sink or a range in the middle.

For the second exception: It builds on the principle of the first. In practice, in the field, I see many receptacles installed at the end of a peninsula containing a sink at its very end, and none in the center of the overall peninsula (the opposite of what would currently be required by the NEC.)

I'm not defending the practice, I'm saying that installers often ignore sinks in peninsulas anyway. They cause migraines.

A modern kitchen with a full complement of wall counterspace receptacles should provide enough places to plug in appliances. Sounding a call across the land that a peninsula lacking a receptacle under these circumstances will likely improve safety, lest someone actually use that non-required receptacle on the 2 ft countertop next to the sink.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is confusing. If a peninsula has a sink or range installed and the space behind the sink or range is less than 12 in., the space becomes two countertop spaces and a receptacle is required for each space provided it meets the minimum dimension requirements. If the sink were installed at the end of the peninsula, placing a receptacle at the end where the sink is located is not code compliant because the peninsula space that meets the minimum requirements does not have a receptacle installed.

Ballot Results: Affirmative: 12

2-251 Log #4586 NEC-P02 **Final Action: Accept in Principle**
(210.52(C)(3) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following exception:

Exception: A receptacle in a wall countertop space shall be permitted to serve as the receptacle for a peninsular countertop space where the spaces are contiguous and the receptacle is located within 1.8 m (6 ft) of the end.
Substantiation: The NEC does not clearly address the common instance where a peninsular countertop may or may not be served by a receptacle in a wall for a contiguous counter. Technically that wall receptacle is not "at" the peninsular counter unless the "connecting edge" is taken to be extended from the near front lip of the peninsula at right angles to the adjacent wall counter, a creative interpretation that works but that is very inconsistently applied. Many peninsulas are really attached kitchen tables, and present significant construction difficulties in providing a receptacle if the wall is not an eligible placement. However, once a peninsular counter exceeds 6 ft in distance from the wall, it would still require a receptacle somewhere at its more distant margin to comply with 210.52(A)(2)(3), and this proposal reinforces that requirement.
Panel Meeting Action: Accept in Principle

Revise the submitter's recommendation to read:

Exception: A receptacle in a wall countertop space shall be permitted to serve as the receptacle for a peninsular countertop space where the spaces are contiguous and the receptacle is located within 1.8 m (6 ft) of the outside end of the peninsula.
Panel Statement: The panel has accepted the submitter's recommendation but added additional words to make it clear that the 6-ft measurement is from the end of the peninsula itself.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

KING, D.: This proposal will eliminate the existing requirement for at least one receptacle to supply a penninsular countertop space in many common installations without adequate substantiation from the Submitter. The code clearly defines where a penninsular countertop space begins and it should be considered a separate countertop space.

WEBER, R.: I feel the panel needs to reconsider its position on this proposal and ultimately reject, this exception which would remove the requirement or have a required receptacle on the peninsular counter top space if it is shorter than 6 ft. long. As proposed the wall receptacle within 6 ft. of the end of the peninsular and at the wall line that it attaches to, would meet the code. As most counter top appliances being utilized now come with an 18 in. to 2 ft. cord connected to it, we would then need to use an extension cord or plug strip inserted in the wall receptacle to provide power for use on the peninsular space. Some may say to just not place any appliances for use on the peninsular area; my position is to retain the current code requirement and provide a fixed receptacle to meet the dwelling unit owners needs.

2-252 Log #1713 NEC-P02 **Final Action: Accept in Principle**
(210.52(C)(4))

Submitter: Ronald E. Hackett, Village of Buffalo Grove / Rep. NE Suburban IAEI
Recommendation: Revise text as follows:

(4) Separate Spaces. Countertop spaces separated by rangetops, refrigerators, or sinks shall be considered as separate countertop spaces in applying the requirements of 210.52_(C),_ (C)(1), (C)(2), and (C)(3).
Substantiation: Including (C) under (4) Separate Spaces is better served here, avoids confusion and redundancy and becomes more user friendly. Where to find the requirements for separate spaces should be located together. This is part (4). Part (C), includes requirements for separate spaces and as such should be included under (4). In (4), separate spaces, it makes sense referencing part (C) in addition to (C)(1), (C)(2) and (C)(3) due to the fact that part (C) contains separate space requirements.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-242.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-253 Log #2056 NEC-P02 **Final Action: Reject**
(210.52(C)(5))

Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Recommendation: Amend 210.52(C)(5) as follows:

(5) Receptacle Outlet Locations. Receptacle outlets shall be located in, on, or above, but not more than 500 mm (20 in.) above the countertop. Receptacle outlets rendered not readily accessible by appliances fastened in place, appliance garages, sinks, or rangetops as covered in 210.52(1), Exception, or appliances occupying dedicated space shall not be considered as these required outlets.
Substantiation: The present text in 210.52(C)(5) is prescriptive in requiring the receptacle outlet to be "located above...the countertop". The strict interpretation of this requirement can prohibit acceptance, and even listing, or

certain design solutions. "Tombstone" style receptacles have been offered for many years and should be allowed to be counted. Note that 406.4(E) does not permit receptacles to be installed in the face up position.

Panel Meeting Action: Reject

Panel Statement: The present text permits "tombstone" style receptacles to be used. The receptacle would still be "above" the countertop.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

PAULEY, J.: This proposal should have been accepted by Panel 2. The panel statement does not address the proposal to allow "in the countertop" constructions. The existing code requirement is design restrictive. The proposed language does not eliminate the requirement that the receptacle face remains vertical.

2-254 Log #2762 NEC-P02 **Final Action: Reject**
(210.52(C)(5))

Submitter: Donald R. Offerdahl, North Dakota State Electrical Board

Recommendation: Revise text to read as follows:

(5) Receptacle Outlet Location. Receptacle outlets shall be located above, hut not more than 500 mm (20 in.) above, the countertop. Receptacle outlets rendered not readily accessible by appliances fastened in place, ~~appliance garages~~, sinks, or rangetops as covered in 210.52(C)(1), Exception, or appliances occupying dedicated space shall not be considered as these required outlets.

Substantiation: Receptacle outlets located in appliance garages are readily accessible by definitions. I do not know of anyone who cannot get to the receptacle located in a appliance garage.

Appliance garages can be located in the comer of counters and by not recognizing that wall space, will result in not meeting the requirements of 21 0.52(c)(l) because the receptacles would be installed more that 48 inches apart. The best way to look at the layout of the counter is to treat the space as if the appliance garage is not there when laying out the spacing of the receptacles. In many cases home owners will open the door to the appliance garage, pull the appliance forward and utilize the appliance in that area. By laying out the receptacles as if the appliance garage is not there, this application would have a better location for the receptacles to use that appliance.

Panel Meeting Action: Reject

Panel Statement: Allowing the receptacle in the appliance garage to be counted could leave a large portion of counter space without access to a receptacle. Often appliance garages are used to store numerous small appliances which would severely limit the access to the receptacle.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-255 Log #3801 NEC-P02 **Final Action: Reject**
(210.52(C)(5))

Submitter: Robert Steven Hale, City of Hillsboro

Recommendation: Delete condition No. 2 to exemption No. 5 of Receptacle Outlet Location.

Substantiation: Electrical outlets below counter tops in kitchen island's and peninsula's require cords to dangle over the counter top when in use. Based on the US Consumer Safety bulletin that suggests this condition should not exist due to the temptation for children to pull on these cords and potentially cause the electrical appliance connected to the cord to be pulled off the counter top causing burns or other injuries, this condition No. 2 to exemption No. 5 of 210.52(C)(5) that allows receptacles 12 in. below counter top should be omitted.

Panel Meeting Action: Reject

Panel Statement: The panel has debated this topic over numerous code cycles and has taken the position that the current language provides a reasonable balance in the approach. The panel shares concerns relative to the access of a side-mounted receptacle to children, which is why the language minimizes the installation of receptacles on the side of countertops as much as possible with the present products and construction methods. Parents will have to be prudent in their use of side-mounted receptacles where small children are present as they are with many other hazards in the home. The primary requirement is that the receptacles be mounted above the countertop.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ORLOWSKI, S.: The aspect of having "accessible" outlets for the disabled and those of short stature needs to be retained.

2-256 Log #4772 NEC-P02 **Final Action: Reject**
(210.52(C)(5))

Submitter: John E. Staires, Tulsa, OK

Recommendation: Revise text as follows:

~~*Exception to (5): To comply with the conditions specified in (1) or (2), receptacle outlets shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop. Receptacles mounted below a countertop in accordance with this exception shall not be located where the countertop extends more than 150 mm (6 in.) beyond its support base.*~~

~~*(1) Construction for the physically impaired*~~

~~*(2) On island and peninsula countertops where the countertop is flat across its entire surface (no backsplashes, dividers, etc.) and there are no means to mount a receptacle within 500 mm (20 in.) above the countertop, such as an overhead cabinet.*~~

Exception to (5): To accommodate construction for the physically impaired receptacles shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop. Receptacles mounted below a countertop in accordance with thisexception shall not be located where the countertop extends more than 150 mm (6 in.) beyond its support base.

Substantiation: Each year, numerous children and adults are burned due to appliance cords overhanging kitchen countertops. Electrically heated appliances may be pulled down onto children when they are able to readily access the length of appliance cord overhanging the countertop edge. According to the National Burn Center Reporting Systems, from June 2004 to December 2005, 261 burn incidents involving children under the age of 15 were reported by a poll off 33 burn centers nationwide. There are products commercially available to enable mounting of receptacles above countertop surfaces, eliminating the need to mount receptacles below the countertop. In accordance with 406.4 (E), the commercially available equipment for locating receptacles above the countertop do not mount the receptacles in a face-up position. Mounting of receptacles below the countertop should be permitted to accommodate the physically impaired, and eliminating the exception allowing receptacles below the countertop on kitchen islands and peninsulas is an important step in improving the safety of children. The City of Tulsa, working with local representatives of the Shriners Hospitals, has added language to our adopting ordinance for the 2008 *National Electrical Code* prohibiting the mounting of receptacles below kitchen countertops, and the language contained in this proposal is the consensus opinion of the City of Tulsa Electrical Examining and Appeals Board.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-249.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-257 Log #3572 NEC-P02 **Final Action: Reject**
(210.52(C)(5) Exception)

Submitter: George M. Stolz, II, Pierce, CO

Recommendation: Add a third condition to the exception of (C)(5):

(3) On wall counter spaces where windows are within 5 in. of the counter surface.

Substantiation: There is currently no provision for installation of a receptacle on counters that are backed entirely by glass. This is becoming a much more popular feature in expensive homes, and presents installers with an impossible predicament when trying to adhere to the code. A wall composed of glass is not an acceptable reason to mount receptacles below counter height in today's NEC. This will provide relief for installers, whose receptacle requirements are frequently a back-burner item when a dwelling is designed.

Essentially, when these predicaments arise the electrician gets stuck in a tug of war between the AHJ and the customer unnecessarily. This will allow an option where currently the code does not provide one - unless the panel would like to go on record saying that countertops flanked by windows are not backed by "wall space", which would make all our lives easier yet.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that this aesthetic preference is a reasonable basis to eliminate receptacle mounting above the countertop. Architects and designers will need to ensure that their design can accommodate the receptacles as required by the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-258 Log #2057 NEC-P02 **Final Action: Accept in Principle**
(210.52(D))

Submitter: Timothy P. McNeive, Thomas & Betts Corporation

Recommendation: Add a second paragraph in 210.52(D) as follows:

(D) Bathrooms. In dwelling units, at least one receptacle shall be installed in bathrooms within 900 mm (3 ft) of the outside edge of each basin. The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop or installed on the side or face of the basin cabinet not more than 300 mm (12 in.) below the countertop.

Listed receptacle outlet assemblies designed to be located in or on the countertop shall be permitted.

Substantiation: Similar to kitchen countertops in 210.52(C)(5), listed receptacles designed for installation in or on bathroom countertops should be permitted.

Panel Meeting Action: Accept in Principle

Revise 210.52(D) to read as follows:

(D) Bathrooms. In dwelling units, at least one receptacle outlet shall be installed in bathrooms within 900 mm (3 ft) of the outside edge of each basin. The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop, located on the countertop, or installed on the side or face of the basin cabinet not more than 300 mm (12 in.) below the countertop.

Panel Statement: The panel has added words to the existing text to make it clear that the receptacle can be located on the countertop using a "tombstone" or other method.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-259 Log #3671 NEC-P02 **Final Action: Reject**

(210.52(D))

Submitter: Mark Smythe, Smythe Electric Inc.

Recommendation: Revise text as follows:

210.52(D) Bathrooms. In dwelling units, at least one receptacle outlet shall be installed in bathrooms within 900 mm (3 ft) of the outside edge of each basin. The receptacle outlet shall be <u>in a readily accessible location,</u> on a wall or partition that is adjacent to the basin or basin countertop, or installed on the side or face of the basin cabinet not more than 300 mm (12 in.) below the counter top.

Substantiation: The addition of the "in a readily accessible location" would eliminate the argument that a receptacle installed adjacent to the basin, in a cabinet, is code compliant.

Panel Meeting Action: Reject

Panel Statement: The main paragraph of 210.52 already specifies that the receptacles required in 210.52 are in addition to any receptacle located in a cabinet.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-260 Log #3520 NEC-P02 **Final Action: Reject**

(210.52(E))

Submitter: David Zinck, Newburyport Wiring Inspector

Recommendation: Revise text to read as follows:

(1) One Family and Two Family Dwelling. For a one family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible ~~while standing~~ at grade level and ~~located~~ not more than...".

Substantiation: This restores the requirement to the 2005 NEC. Standing on grade should not be required. It has been a common practice to install the required rear GFCI receptacle on the deck where people can use it for a radio, TV, laptop computer, etc. while enjoying their deck. To require that this outlet be off of the deck just so that one can be standing on the grade while plugging in does not make sense. It also leads to inconsistent inspections. Picture a condo project where early buyers can chose from a variety of deck options. One choses a railing option that is wide enough so that you can reach through the balusters and plug into the outlet located near the edge of the deck while standing on grade. It passes. The next unit has a railing that the balusters are too close together to reach through to plug in. The exact same receptacle installation fails. The next unit choses a glass railing with the exact same receptacle and this one fails. The next unit choses to locate his receptacle in the middle of a large deck. At first glance you would think that this one certainly fails. But this owner decides to put a trap door in his deck that he can lift and store his kayak or deck furniture under. It so happens that you can stand on grade inside this trap door and plug into the receptacle. Would anyone ever lift up the trap door just to stand on grade and plug into this receptacle? Of course not. But, this receptacle passes inspection. They all should.

Let's not forget the reason for the rule in the first place. It is so that the most convenient receptacle to use outside is a GFCI protected outlet. The rule adopted in the 2008 NEC solves no problems and creates new ones. Let's go back to the 2005 wording.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the substantiation. Previous codes required that the receptacle be accessible "at grade level," and the panel has repeatedly stated over numerous code cycles that this required the receptacle be accessible while standing on grade. The panel added the wording in the 2008 NEC to reinforce this long standing position that the panel has conveyed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-261 Log #4587 NEC-P02 **Final Action: Reject**

(210.52(E))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee

Recommendation: Revise this material to read as follows:

<u>(E) Outdoor Outlets.</u> Outdoor receptacle outlets shall be installed in accordance with (E)(1) through (E)(3). [See 210.8(A)(3).]

<u>(1) One-Family and Two-Family Dwellings.</u> For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet readily accessible from grade and not more than 2.0 m (6 1/2 ft) above grade level shall be installed at the front and back of the dwelling.

<u>(2) Multifamily Dwellings.</u> For each dwelling unit of a multifamily dwelling where the dwelling unit is located at grade level and provided with individual exterior entrance/egress, at least one receptacle outlet readily accessible from grade and not more than 2.0 m (6 1/2 ft) above grade level shall be installed.

<u>(3) Balconies, Decks and Porches</u>. Balconies, decks and porches that are attached to the dwelling unit and are accessible from inside the dwelling shall have at least one receptacle outlet installed accessible from the balcony, deck or porch.

<u>Exception to (3)</u>: Balconies, decks, or porches with a usable area of less than 1.86 m2 (20 ft2) are not required to have a receptacle installed.

Substantiation: The literal text of the NEC disqualifies a receptacle on a low open deck or open porch from serving as one or more of the required outdoor receptacles for one- and two-family dwelling units unless it is close enough to the edge so it can be reached while standing on grade. No credible basis has been put forward to support this distinction. The safety justification for the receptacle placement is clearly met provided there is unfettered access to the receptacle, and that it is low enough so it will be routinely used for outdoor applications instead of resorting to running cords through windows or doorways. This proposal supports both objectives. It would still need to be readily accessible, which means not obstructed from someone approaching from grade, and not up more than a few steps. It might even be in a damp, as opposed to a wet location, resulting in a less hazardous condition. It would not be more likely to require an extension cord, and in fact, it might be less likely since it would be placed nearest the likely location for electrical appliance usage.

This is because a receptacle placed in the middle of a porch or deck will frequently be where "flexible cords with attachment plugs are used" and therefore in accordance with the general rule in 210.50(B). Requiring additional receptacles or effectively mandating inconvenient receptacle locations serves no safety objective and is excessive. We are also aware of instances where this rule has been used to disqualify a receptacle between two garage doors on the grounds that the asphalt surface below did not count as actual grade, etc. It is time to limit this rule to the simple requirements for safety. Remember, the current NEC requirements are satisfied on a low 30-ft deck if a single receptacle is placed at the edge but within the perimeter of that deck, thereby meeting both 210.52(E)(1) and (E)(3). A rule that creates a market incentive for such bizarre placements reflects poorly on the NEC process.

This proposal also removes a distinction between a one- and two-family dwelling (subject to the deck disqualification), and a multifamily dwelling (certainly not so restricted, in fact, their decks don't even require stairs to grade.) Regardless of accessibility, many outdoor receptacle covers allow for the application of a lock, which should address concerns about improper access in some neighborhoods, concerns that frequently apply equally in one- or two-family applications.

Panel Meeting Action: Reject

Panel Statement: The panel has had and continues to have the position that the most effective use of the required receptacle is while standing on grade. Additional receptacles that are installed for a porch or deck are permitted to be installed. There are significant variations in designs that are not clear as to whether or not a receptacle on a porch or deck is readily accessible, and the panel has the view that this is most effectively handled with having a clear requirement with respect to standing on grade.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-262 Log #3490 NEC-P02 **Final Action: Reject**

(210.52(E)(1))

Submitter: Thomas N. Tombarello, Sandown, NH

Recommendation: Revise 210.52(E)(1) as follows:

For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible ~~while standing at~~ <u>from</u> grade level and located not more than 2.0 m (6 1/2 ft) above grade shall be installed at the front and back of the dwelling.

Substantiation: The present text is being interpreted by some that to locate an outdoor receptacle above a 4-inch thick perimeter concrete apron, a 2-inch brick walk, a 4-inch hot top driveway between two garage doors, 6-in. of mulch, etc. does not <u>now</u> meet the requirements of (E)(1) unless a person can stretch across such boundaries; insert the attachment cap; while keeping their feet in bounds (ft on grass). This is contrary to the Panel's Statement this was not CMP 2's intent when they wrote the rule. Check the IAEI Analysis of the 1984 NEC.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the interpretation that the concrete, brick or mulch described in the substantiation is not considered to be grade level. Using the interpretation that the term only includes grass or dirt is inconsistent with the use of the term throughout the NEC.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-262a Log #CP201 NEC-P02 **Final Action: Reject**
(210.52(E)(1) and 210.52(E)(2))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" based on the lack of a proposal to Code-Making Panel 1 to define "Finished Ground Level."
Submitter: Code-Making Panel 2,
Recommendation: Revise text to read as follows:
(1) One-Family and Two-Family Dwellings. For a one-family dwelling and each unit of a two-family dwelling that is at the finished ground level, at least one receptacle outlet accessible while standing at the finished ground level and located not more than 2.0 m (6½ ft) above the finished ground level shall be installed at the front and back of the dwelling.
(2) Multifamily Dwellings. For each dwelling unit of a multifamily dwelling where the dwelling unit is located at the finished ground level and provided with individual exterior entrance/egress, at least one receptacle outlet accessible from the finished ground level and not more than 2.0 m (6½ ft) above the finished ground level shall be installed.
Substantiation: The panel has developed a proposal to replace "grade" with a new defined term "finished ground level". The panel recognizes that if the definition of "finished ground level" is not accepted by CMP-1 then this proposal should be reported as Reject by the TCC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-263 Log #3899 NEC-P02 **Final Action: Reject**
(210.52(E)(1) and 210.52(E)(2))

Submitter: Kody Inman, E Light Electric Services
Recommendation: Revise text as follows:
For a one family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible while standing at grade level and located not more than ~~2.0 m (61/2 ft)~~ 1.2 m (4 ft) above grade shall be installed at the front and back of the dwelling. (Same height corrections to both sections)
Substantiation: Lowering the height for required receptacles will help those that may have difficultly accessing and using a receptacle mounted at 61/2 ft above the ground and will not decrease safety in anyway.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated lowering the value to 4 ft. The current value is used elsewhere in the code to describe the accessibility of switches and other devices that must be accessed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-264 Log #453 NEC-P02 **Final Action: Reject**
(210.52(E)(3) and Exception to (3))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Add new text and delete existing text as follows:
(3) Balconies, Decks, and Porches. Balconies, decks, and porches with a usable area of 1.86 m^2 (20 ft^2) or greater and that are accessible from inside the dwelling unit shall have at least one receptacle outlet installed within the perimeter of the balcony, deck, or porch. The receptacle shall not be located more than 2.0 m (6$^1/_2$ ft) above the balcony, deck, or porch surface.
~~Exception to (3): Balconies, decks, or porches with a usable area of less than 1.86 m2 (20 ft2) are not required to have a receptacle installed.~~
Substantiation: The intent of this change is to convert the exception into positive code language by placing it in the main rule. By including the text "with a usable area of 1.86 m^2 (20 ft^2) or greater and" does not change the existing requirement or the exception to the rule as presently worded. This change also makes for a more user friendly code requirement.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 2-266. The panel has removed the exception so that the rule applies to balconies and decks of all sizes.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: As pointed out during the development of this new provision last cycle, if there is no minimum dimension for a balcony, the opening area and guardrail afforded for a door in an exterior wall, installed for aesthetics or ventilation, would now be considered a "balcony".
It is truly unfortunate that most of the members of Panel 2 are not that familiar with the many types of architectural projections that will now be labeled as a balcony. These include the safety guardrail at second floor double doors that are used for natural ventilation. This arrangement consists of a simple guardrail that may extend a few inches out from the face of the building. There is no usable, occupiable, or habitable space, it is just a guardrail. In addition, a simple architectural balcony that extends a foot or so out in front of these doors. There is hardly any area for more than one person to stand, let alone participate in any activity except looking. The Exception was included in the 2008 NEC as it provided the means to define the usable area of a deck or balcony. Without this exception, the manufactures have gotten another mandate into the NEC to require more of their products without providing substantiation that a problematic fire or life-safety situation exists.

2-265 Log #2155 NEC-P02 **Final Action: Reject**
(210.52(E)(3) and Exception to (3))

2-266 Log #1148 NEC-P02 **Final Action: Accept**
(210.52(E)(3) Exception)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Delete the Exception:
~~Exception to (3): Balconies, decks, or porches with a usable area of less than 1.86 m2 (20 ft2) are not required to have a receptacle installed.~~
Substantiation: If a porch, deck or balcony is accessible, the safety of having a receptacle installed should be provided. There should be no distinction between sizes of these areas. The code rule intent is to avoid cords from passing through doorways. There is no less chance that this would occur for small porches, decks or balconies. These smaller areas will have holiday lighting and small appliances used there. Please reference Mr. King's Explanation of Negative in 2008 ROC 2-230.
KING, D.: I disagree with the Panel that a minimum dimension of 20 sq. ft should be a condition for this requirement. If a porch, deck or balcony is accessible and intended for use by occupants of the dwelling than a receptacle should be required regardless of the minimum dimension. The purpose of this section is to eliminate the use of cords through doorways to supply electrical equipment at these locations. Cords passed through doorways are a potential cause for electrical shock and fire due to damage that can easily occur to the cord where it passes through the doorway. Acceptance of this Comment will allow this hazardous condition to continue to exist for porches, decks and balconies that are less than 20 sq. ft.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: As pointed out during the development of this new provision last cycle, if there is no minimum dimension for a balcony, the opening area and guardrail afforded for a door in an exterior wall, installed for aesthetics or ventilation, would now be considered a "balcony".
It is truly unfortunate that most of the members of Panel 2 are not that familiar with the many types of architectural projections that will now be labeled as a balcony. These include the safety guardrail at second floor double doors that are used for natural ventilation. This arrangement consists of a simple guardrail that may extend a few inches out from the face of the building. There is no usable, occupiable, or habitable space, it is just a guardrail. In addition, a simple architectural balcony that extends a foot or so out in front of these doors. There is hardly any area for more than one person

to stand, let alone participate in any activity except looking. The Exception was included in the 2008 NEC as it provided the means to define the usable area of a deck or balcony. Without this exception, the manufactures have gotten another mandate into the NEC to require more of their products without providing substantiation that a problematic fire or life-safety situation exists.

Comment on Affirmative:

WEBER, R.: I commend the panel and its action to remove the code section which states, "the area of less than 20 sq.ft. are not required to have a receptacle installed" for that portion of balconies, decks or porch spaces. This was put in the code during the 2005 NEC ROC cycle and was disputed at that time. It makes sense that if an exterior space is afforded some railing and small area whatever that may be; it will be used and should have a GFCI protected receptacle installed to provide power. Holiday lighting on the exterior of a dwelling unit is becoming more common and almost is displayed the year round for the various holidays observed. The other alternative is to have a cord put through the doorway out to that space without GFCI protection in most cases and create a known electrical code violation. If it is there (outside GFCI receptacle) it will be used, and we are ensuring a safe means to meet the customer's needs.

2-267 Log #2982 NEC-P02 **Final Action: Reject**
(210.52(E)(3) Exception No. 3)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:

Exception to (3): Balconies, decks, or porches with a usable area of less than 1.86 m^2 (20 ft^2) ~~are~~ shall not be required to have a receptacle installed.

Substantiation: This is a simple edit to provide consistency in code language and compliance with the style manual.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 2-266. The panel has removed the exception so that the rule applies to balconies and decks of all sizes.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

ORLOWSKI, S.: As pointed out during the development of this new provision last cycle, if there is no minimum dimension for a balcony, the opening area and guardrail afforded for a door in an exterior wall, installed for aesthetics or ventilation, would now be considered a "balcony".

It is truly unfortunate that most of the members of Panel 2 are not that familiar with the many types of architectural projections that will now be labeled as a balcony. These include the safety guardrail at second floor double doors that are used for natural ventilation. This arrangement consists of a simple guardrail that may extend a few inches out from the face of the building. There is no usable, occupiable, or habitable space, it is just a guardrail. In addition, a simple architectural balcony that extends a foot or so out in front of these doors. There is hardly any area for more than one person to stand, let alone participate in any activity except looking. The Exception was included in the 2008 NEC as it provided the means to define the usable area of a deck or balcony. Without this exception, the manufactures have gotten another mandate into the NEC to require more of their products without providing substantiation that a problematic fire or life-safety situation exists.

2-268 Log #2548 NEC-P02 **Final Action: Reject**
(210.52(G))

Submitter: Russell A. Boyd, Harrison, TN
Recommendation: Revise text to read as follows:

210.52(G) Basements and garages, for a one family dwelling, the following provision shall apply: Add (3) Garages: outlets shall be installed as covered in 210.8(A) and 210.52 (A)(1) and (2).

Substantiation: Problem: Safety Concerns, trip Hazards: This is to eliminate extension cords running all around the floor, causing trip hazards and overloading outlet and circuit breakers.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated requiring that outlets in a garage be spaced in the same manner as a habitable room. The use of receptacles in the garage are considerably different than that of a habitable room.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-269 Log #1612 NEC-P02 **Final Action: Reject**
(210.52(G)(1))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In 210.52(G)(1), add an additional sentence to read: "Where the garage accommodates more than two vehicles, at least one receptacle shall be provided for each vehicle space."
Substantiation: Many new larger homes are being built with attached garages that will accommodate 3 or more vehicles. A single receptacle requires the use of very long portable cords which can be a safety hazard.
Panel Meeting Action: Reject
Panel Statement: The objective is to have a receptacle available in the garage for use by the occupant. There is no substantiation submitted to support basing the number of receptacles on the number of vehicles that the garage can hold. In addition, there may be no clear definition of what defines the "vehicle space" for the placement of the receptacle.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-270 Log #3492 NEC-P02 **Final Action: Accept**
(210.52(G)(1))

Submitter: Mike Theisen, Midwestern Electrical Seminars
Recommendation: Add a provision to cover other out buildings normally found on single family premises.

(G) Basements, ~~and~~ Garages, and Accessory Buildings. For a one-family dwelling, the following provisions shall apply: (1) At least one receptacle outlet, in addition to those for specific equipment, shall be installed in each basement, in each attached garage, and in each detached garage or accessory buildings with electric power.

Substantiation: Many one-family dwellings have a detached garage and an additional building which services a similar purpose to a garage, but is not covered in 210.52(G). The same safety concerns should be addressed in these out buildings as in detached garages.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-271 Log #3291 NEC-P02 **Final Action: Reject**
(210.52(G)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise. ~~Where a portion of the basement is finished into one or more habitable rooms~~ Each separate unfinished portion shall have ~~a~~ at least one receptacle outlet installed in accordance with this section.
Substantiation: Whether or not the basement has habitable rooms is irrelevant; an unfinished basement may have separate walled portions which should warrant at least one receptacle outlet.
Panel Meeting Action: Reject
Panel Statement: The original rule required that a receptacle be installed in an unfinished basement regardless of how it was configured. The problem arose when part of the basement became finished and the receptacles were no longer GFCI protected, but used in the unfinished portion. The rule as stated only invokes the installation of the receptacle in the unfinished spaces when part of the basement is finished. This avoids the issue of only having non-GFCI protected receptacles available in the basement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-272 Log #2356 NEC-P02 **Final Action: Reject**
(210.52(H))

Submitter: James Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:

(H) Hallways. In dwelling units, the following provisions shall apply:

(1) Hallways of 3.0 m (10 ft) or more in length shall have at least one receptacle outlet. As used in this subsection, the hall length shall be considered the length along the centerline of the hall without passing through a doorway.

(2) portions of hallways that are wider than 1.4 m (4 ½ ft) shall have a receptacle located in each wall space as defined in 210.52(A)(2)(1).

Substantiation: In hallways wider than the normal 38 in. to 40 in., occupants frequently want to locate a table, chest, bookcase, lighted knick knack cabinet, or other piece of furniture in these hallway spaces and place a lamp on top, if it is not internally lit. Under the existing Code, power for the lighting would have to be provided by an extension cord run under a rug or through an adjacent doorway, which could lead to an unsafe or hazardous condition.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that having a 4.5 ft wide hallway creates an area that requires receptacle spacing by 210.52.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-273 Log #3573 NEC-P02 **Final Action: Accept in Principle**
(210.52(H))

Submitter: George M. Stolz, II, Pierce, CO
Recommendation: Revise text to read as follows:
(H) Hallways and Foyers. In dwelling units, hallways and foyers of 3.0 m (10 ft) or more in length shall have at least one receptacle outlet.
As used in this subsection, the hall or foyer length shall be considered the length along the centerline of the hall without passing through a doorway.
Substantiation: In the panel response to proposals such as 2-195 Log #397 in the 2008 cycle, it became apparent that the panel would like foyers dealt with like hallways. This change would clarify the panel's intent for foyers.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-223.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: There are too many possible configurations of a foyer. But, the biggest problem is what constitutes a "foyer". In almost all configurations of residential units, there is no foyer at the entrance door, only a hallway. Hallways are already covered under 210.52 (H) that only requires "3.0 m (10 ft) or more in length shall have at least one receptacle outlet." As the area of a dwelling that might be referred to as a foyers is included in the NEC, a definition of a "foyer" needs to be added to the NEC, and the minimum size, window location, door locations needs to be considered relative to the placement of receptacle outlets.

2-274 Log #4758 NEC-P02 **Final Action: Accept**
(210.52(H))

Submitter: D. Jerry Flaherty, East Islip, NY
Recommendation: Add revised text to read as follows:
(H) Hallways. In dwelling units, hallways of 3.0 m (10 ft) or more in length shall have at least one receptacle outlet.
As used in this subsection, the ~~**hall**~~ **hallway** length shall be considered the length along the centerline of the ~~**hall**~~ **hallway** without passing through a doorway.
Substantiation: No definition for "hall" in NEC.
Webster dictionary has several definitions that are not in line with this section of NEC.
1) "Entrance space into which the main door to house" — new large homes have "halls" that are quite large, fully furnished with tables (table lamps) and seating. By definition and code these "halls" need only one receptacle. I have inspected many with extension cords which are a fire hazard.
210.52(H) Hallways.
2) Webster definition - "A communually owned building where public business is transacted or where people meet etc. "which is in line with other areas of the NEC (assembles halls, dance halls, etc.) but not with this section of the code.
"Hallway" is not defined in the NEC and Webster defines as a passage connecting two or more rooms which is closer to what the NEC is referring too, but not quite.
See Proposal for a definition of a Hallway.
Hallway. A walled corridor used exclusively to connect two or more rooms.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-275 Log #2464 NEC-P02 **Final Action: Accept in Principle**
(210.55 (New))

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Add a New Section 210.55 Meeting or Conference Rooms to read as follows:
210.55 Meeting or Conference Rooms.
(A) Meeting or Conference Rooms. For the purpose of this section, a meeting or conference rooms are defined as a designated communal office space in office buildings, hotels/motels or other structures that are designed for the assembly and seating of people. Meeting or conference rooms do not include individual offices or lecture halls found in buildings, hotels/motels or other structures.
(B) Floor Box Outlet Location. In meeting or conference rooms located in office buildings, hotels/motels or other structures, a minimum of one receptacle outlet in a listed floor box shall be installed. When only one floor box is provided it shall be located in the center of each room. For a dividable meeting or conference rooms a receptacle outlet in a minimum of one listed floor box shall be installed of each partitioned area. When only one floor box is provided it shall be located in the center of each partitioned area.
Substantiation: NEMA has submitted a similar proposal to add a NEW section for Meeting Rooms. The purpose of this proposal is to expand on the NEMA proposal to add a definition of a meeting room and to include the term "Conference Room". Additionally, this proposal does not restrict placement of the required floor box when more than one is installed. "Other Structures" was also added since meeting and conference rooms can be found in other buildings such as hospitals and arenas.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 2-276.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ORLOWSKI, S.: First, NO documentation was provided to show the current provisions are a cause of a real fire or other life/fire-safety problem that would be solved if the floor boxes were mandated. Second, it is unfortunate that the scope of the NEC does not relate to the NEC being the "minimum" requirements for "practical safeguarding" for electrical installations. The proposed requirement is nothing more than mandating a "convenience outlet that in fact may never be used. With few exceptions, the placement of receptacle outlets in commercial/industrial occupancies has always been a design consideration of the architect on consultation with the owner or tenant. With now mandating this floor receptacle Panel P02 has now made the NEC a design manual. It cannot be anything else because mandating a floor receptacle in the "middle of the room" can serve no other purpose than requiring design criteria the members of this Panel want.
WILKINSON, R.: This is a design matter and should be rejected.

2-276 Log #3700 NEC-P02 **Final Action: Accept**
(210.55 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add a New Section 210.55 Meeting Rooms to read as follows:
210.55 Meeting Rooms. In meeting rooms located in office buildings and hotels/motels, a receptacle outlet in a listed floor box shall be installed in the center of each room. For a dividable meeting room a single receptacle outlet in a listed floor box shall be installed in the center of each partitioned area.
Substantiation: The purpose of this new section is to increase the number of access points to the electrical supply to reduce reliance on the use of extension cords and the number of extended and potentially overloaded in meeting rooms. Without centrally located receptacles, extension cords are used with power strips (which are often daisy chained) attached at wall outlets. Extension cords are a tripping hazard and damaged extension cords are a shock and fire hazard. The increased use of laptop computers and projection equipment has led to greater demand for electrical receptacles in convenient locations. The NEC needs to recognize this trend by requiring receptacles to be installed in listed floor boxes in the center of meeting areas, thereby reducing the need for extension cords.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ORLOWSKI, S.: First, NO documentation was provided to show the current provisions are a cause of a real fire or other life/fire-safety problem that would be solved if the floor boxes were mandated. Second, it is unfortunate that the scope of the NEC does not relate to the NEC being the "minimum" requirements for "practical safeguarding" for electrical installations. The proposed requirement is nothing more than mandating a "convenience outlet that in fact may never be used. With few exceptions, the placement of receptacle outlets in commercial/industrial occupancies has always been a design consideration of the architect on consultation with the owner or tenant. With now mandating this floor receptacle Panel P02 has now made the NEC a design manual. It cannot be anything else because mandating a floor receptacle in the "middle of the room" can serve no other purpose than requiring design criteria the members of this Panel want.
WILKINSON, R.: This is a design matter and should be rejected.
Comment on Affirmative:
WEBER, R.: Once again, the panel has made the correct decision on accepting this proposal regarding the need for a listed floor receptacle in meeting rooms located in office buildings and hotel/motels to meet the needs of today's IT system requirements and use. The panel may need to look at the room size and be flexible on the most efficient location for the listed floor receptacle....but it should be made available and save the daisy chaining of power cord strips that are now used because of the lack of availability of a power connection point in the meeting room space.

(Note: Sequence 2-277 was not used)

2-278 Log #2276 NEC-P02 **Final Action: Accept in Principle**
(210.60(A))

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Revise Section to 210.60(A) to read as follows:
(A) General. Guest rooms or guest suites in hotels, motels, sleeping rooms in dormitories, and similar occupancies shall have receptacle outlets installed in accordance with 210.52(A) and 210.52(D). <u>The receptacles required for this section shall be in addition to any receptacle that is part of a furniture, luminaire or appliance.</u> Guest rooms or guest suites provided with permanent provisions for cooking shall have receptacle outlets installed in accordance with all of the applicable rules in 210.52.
Substantiation: This section was revised to add a requirement that receptacles used in guest rooms or guest suites in hotels, motels, sleeping rooms in dormitories, and similar occupancies shall not be integral the luminaires or appliances within the rooms. The new requirement will prevent these rooms from using portable lamps, luminaires or appliances with receptacles built into them to fulfill the number of required receptacles. Many of these portable lamps or luminaires are not Listed by a NRTL and are poorly built.
As the number of laptops and recharges for phones and other devices increase, guest rooms or guest suites in hotels, motels, sleeping rooms in dormitories, and similar occupancies need reliable and safe receptacles. In addition, permanently plugged in appliances are used more readily in dormitories.
Attached is a photo of a desk lamp at a Hilton in Alexandria, VA. This photo was taken during the 2008 IAEI Southern Section meeting. The desk lamp did not have any markings for a NRTL nor a bottom to conceal the conductors and splices. This desk lamp was used to fulfill the number of receptacles required for the hotel room.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
In the submitter's recommendation replace the words "that is part of a furniture, luminaire or appliance" with the words "that is part of a luminaire, appliance, or movable furniture."
Panel Statement: The panel revised the text to make it clear that the receptacles cannot be part of furniture that can be moved.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-279 Log #138 NEC-P02 **Final Action: Reject**
(210.60(B))

Submitter: Craig Schmidt, Hayes, VA
Recommendation: I would like to propose a change to the NEC, section 210.60(B) to say something such as:
"An unswitched receptacle shall be placed within 6 ft from the head of each bed solely for the use of sleeping aids. A separate receptacle shall be provided where a lamp, clock, or other device will be used at the same location."
Substantiation: I am one of millions of people with sleep-apnea. I require a CPAP machine to assist me during my sleeping hours. When traveling, I use hotels and motels. To access a receptacle, I must unplug a lamp, clock, or other device and often flip a switch. I often must pull the mattress away from the wall to plug in my breathing machine.
Panel Meeting Action: Reject
Panel Statement: The current rule requires that at least two receptacle outlets in the room be readily accessible. Attempting to further specify the receptacle location is limited because of the furniture layouts used in hotel and motel rooms. The panel also notes that the current rule prohibits the receptacle from being installed where the attachment cap would contact the bedding or that the receptacle be guarded.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-280 Log #2383 NEC-P02 **Final Action: Reject**
(210.60(B))

Submitter: David G. Humphrey, Midlothian, VA
Recommendation: Revise text to read as follows:
(B) Receptacle Placement. In applying the provisions of 210.52(A) <u>to guest rooms or guest suites without permanent provision for cooking,</u> the total number of receptacle outlets shall not be less than the minimum number that would comply with the provisions of that section. These receptacle outlets shall be permitted to be located conveniently for permanent furniture layout. ~~At least two receptacle outlets shall be readily accessible.~~ <u>All guest rooms or guest suites with or without permanent provisions for cooking, shall have at least two receptacle outlets that are readily accessible.</u> Where receptacles are installed behind the bed <u>of any guest room</u>, the receptacle shall be located to prevent the bed from contacting any attachment plug that may be installed or the receptacle shall be provided with a suitable guard.
Substantiation: The revised text makes clear exactly what portions of 210.60(B) apply to these distinctly different types of hotel or motel guest rooms. 210.52(A) tells us that *"all of the applicable rules in 210.52"* apply to guest rooms or guest suites with permanent provisions for cooking. 210.52(A) does not permit relocation of receptacle outlets to comply with permanent furniture layout. Consequently, the relocation permissions located in 210.60(B) does not apply to guest rooms with permanent provisions for cooking. 210.60(B) begins with the statement *in applying the provisions of 210.52(A)* and does not differentiate between whether the guest room has permanent provisions for cooking or not.
Panel Meeting Action: Reject
Panel Statement: The intent of the current rule is to allow that receptacles in all guest rooms or suites be permitted to be placed convenient to furniture layout. The submitter's recommendation would remove this flexibility from those guest rooms and suites that have permanent provisions for cooking.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-281 Log #3575 NEC-P02 **Final Action: Reject**
(210.63)

Submitter: George M. Stolz, II, Pierce, CO
Recommendation: Revise text to read as follows:
210.63 Heating, Air-Conditioning, and Refrigeration Equipment Outlet. A 125-volt, single-phase, 15- or 20- ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of heating, air conditioning, and refrigeration equipment. The receptacle shall be located ~~on the same level and~~ within 7.5 m (25 ft) of the heating, air conditioning, and refrigeration equipment. The receptacle outlet shall not be connected to the load side of the equipment disconnecting means. <u>The receptacle shall be accessible without passing through a doorway.</u>
Substantiation: I can think of no good reason that the service receptacle cannot be placed on a porch that can be accessed by climbing three steps to utilize it. Adding the last sentence will ensure that the required receptacle is not indoors while the equipment served is outdoor equipment. The "same level" requirement is even more restrictive than "readily accessible", which would be a welcome compromise, if the panel were so inclined.
Panel Meeting Action: Reject
Panel Statement: The submitter's revision would allow a receptacle on the main floor to be used to meet the requirements for equipment located in an attic space. The idea of placing the receptacle on the same level can be universally applied.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-282 Log #540 NEC-P02 **Final Action: Reject**
(210.70)

Submitter: William L. Arnold, Arnold Electrical Inspection, P.C.
Recommendation: Add new text to read as follows:
<u>Safe Rooms or Storm Cellars: When these rooms are an integral part of the house, there shall be at least one wall switch controlled lighting outlet and one battery powered emergency luminaire.</u>
Substantiation: These type rooms are becoming more and more popular. Homeowners and some electricians argue that since this is not a habitable room it does not require any wiring. I can find nothing in the codes to overrule this argument. Therefore, I feel that a new code is needed.
Panel Meeting Action: Reject
Panel Statement: These rooms are not any more unique than those listed in 210.52(A) or an unfinished basement. As such, the rules for those same areas should be applied. The submitter has not substantiated a requirement for a battery powered luminaire.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-283 Log #748 NEC-P02 **Final Action: Reject**
(210.70)

Submitter: Darrell W. Morrow, Inspector for City of Montgomery
Recommendation: Add new text to read as follows:
On commercial buildings at least one wall switch controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exit if no other means of illuminating is provided.
Substantiation: A lot of commercial buildings do not have illumination at some rear entrances and no other forms of illumination.
Panel Meeting Action: Reject
Panel Statement: The requirements for commercial building lighting are established in the appropriate building code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-284 Log #3633 NEC-P02 **Final Action: Reject**
(210.70(1))

Submitter: Greg Chontow, Hopatcong, NJ
Recommendation: Revise text to read as follows:
A wall switch shall control at least one lighting outlet at <u>each entry</u> to every habitable room and bathroom.
Substantiation: It is my intent to insure the safety of the occupants. The present wording does not take into consideration multiple entrances to a room.
Panel Meeting Action: Reject
Panel Statement: As the panel stated over numerous code cycles, the need to have a switch at all entrances to a room is a design consideration for the particular situation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-285 Log #1726 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Paul J. Kennedy, Jr., Kennedy Seminars
Recommendation: Add an additional sentence to read as follows:
A wall switch is required at each entry and exit of a habitable room or similar rooms or areas.
Substantiation: I have seen many rooms that have multiple entry/exits that when there are furnishings in place would make it impossible to traverse the room or area safely without first turning on a wall switch near the entry/exit to light the way.
Panel Meeting Action: Reject
Panel Statement: As the panel stated over numerous code cycles, the need to have a switch at all entrances to a room is a design consideration for the particular situation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-286 Log #2777 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Chris Fackler, FSG Electric
Recommendation: Revise text as follows:
At least one wall switch - controlled lighting outlet shall be installed in every habitable room and bathroom <u>and that switch shall be located in the same room as the outlet it controls.</u>
Substantiation: In dwelling units (and other applications as deemed necessary) the switch should be located in the same room as the device/luminaire it controls for the reasons of convenience and identification.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is too restrictive. There are instances where it is appropriate for the switch to be located at the door just before you go into the room.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-287 Log #3220 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Paul J. Kennedy, Jr., Kennedy Seminars
Recommendation: Add an additional sentence to read as follows:
A wall switch is required at each entry and exit of a habitable room or similar rooms or areas.
Substantiation: I have seen many rooms that have multiple entry/exits that when there are furnishings in place would make it impossible to traverse the room or area safely with out first turning on a wall switch near the entry/exit to light the way.
Panel Meeting Action: Reject
Panel Statement: As the panel stated over numerous code cycles, the need to have a switch at all entrances to a room is a design consideration for the particular situation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-288 Log #3509 NEC-P02 **Final Action: Reject**
(210.70(A)(1))

Submitter: Joel Green, Evergreen, CO
Recommendation: Revise text to read as follows:
(A)(1) Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom. <u>At least one point of control shall be at the usual point of entry to the room.</u>
Substantiation: Currently, there is no requirement for the control to be located near entry or exit locations. Entering into a dark room and being required to cross the room to turn on the lights may cause tripping.
Panel Meeting Action: Reject
Panel Statement: The term "usual point of entry" is vague and difficult to determine. There are instances where a switch may be located outside of that room.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-289 Log #3491 NEC-P02 **Final Action: Reject**
(210.70(A)(2)(a) and (b))

Submitter: Mike Theisen, Midwestern Electrical Seminars
Recommendation: Revise the text in 210.70(A) to read as follows:
210.70(A)(2) Additional Locations. Additional lighting outlets shall be installed in accordance with (A)(2)(a), (A)(2)(b), and (A)(2)(c).
(a) At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, ~~and~~ detached garages, <u>and accessory buildings</u> with electric power.
(b) For dwelling units, attached garages, ~~and~~ detached garages, <u>and accessory buildings</u> with electric power, at least one wall switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exits with grade level access. A vehicle door in a garage or <u>accessory building</u> shall not be considered as an outdoor entrance or exit.
Substantiation: Accessory buildings, auxiliary buildings, sheds, pole buildings, out buildings, and utility buildings all have uses similar to detached garages and should have similar lighting outlet requirements. Since the code already uses the term accessory building in 210.8(A)(2), I have chosen that term to refer to the aforementioned list of buildings.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated requiring lighting outlets in all accessory buildings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: This Proposal should be given further consideration by Panel 2. The same hazards exists in accessory buildings that are supplied with electrical power that do in detached garages. Therefore, the need to require a switched lighting outlet for similar occupancies already covered in section 210.70 (A)(2)(a) and (b) is warranted.
WEBER, R.: The Panel should have accepted this proposal; the term "and accessory buildings" is consistent with the already incorporated garage concept, be it attached or detached and the need for a lighting outlet in those structures. It only applies when it is "with electrical power" and if a receptacle is needed, clearly a wall switched lighting outlet should be installed as well. What is being utilized now is cord sets and handy lights plugged into the receptacle and strung to various locations in the building. The question raised is then what is the safer practice and prolonged use of the temporary cords.

2-289a Log #CP202 NEC-P02 **Final Action: Reject**
(210.70(A)(2)(b))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" based on the lack of a proposal to Code-Making Panel 1 to define "Finished Ground Level."
Submitter: Code-Making Panel 2,
Recommendation: Revise text to read as follows:
(b) For dwelling units, attached garages, and detached garages with electric power, at least one wall switch–controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exits with access to the finished ground level. A vehicle door in a garage shall not be considered as an outdoor entrance or exit.
Substantiation: The panel has developed a proposal to replace "grade" with a new defined term "finished ground level". The panel recognizes that if the definition of "finished ground level" is not accepted by CMP-1 then this proposal should be reported as Reject by the TCC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-290 Log #2143 NEC-P02 **Final Action: Reject**
(210.70(A)(2)(c))

Submitter: Gerald "Jerry" Rose, City of Biloxi, Mississippi
Recommendation: Delete text as follows:
(c) Where one or more lighting outlet(s) are installed for ~~interior~~ stairways, there shall be a wall switch at each ~~floor~~ level, and landing level that includes an entryway, to control the lighting outlet(s) where the stairway between ~~floor~~ levels has six risers or more.
Exception to (A)(2)(a), (A)(2)(b), and (A)(2)(c): In hallways, in stairways, and at outdoor entrances, remote, central, or automatic control of lighting shall be permitted.
Substantiation: Section 210.70 points out that adequate lighting and proper control and location of switching are as essential to the safety of occupants of dwelling units, hotels, motels, and so on, as are proper wiring requirements. proper illumination ensures safe movement for persons of all ages, thus preventing many accidents. Since several hurricanes have hit the US and due to FEMA regulations, many house are being built anywhere from ten to fifteen feet above grade. it is just as important to provide control of lighting for exterior stairs as well as interior stairs.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that exterior stairs are required to have switches installed in the same manner as interior stairs. There are other security and related access concerns to the switches that are unique to exterior applications.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-291 Log #2538 NEC-P02 **Final Action: Reject**
(210.70(A)(2)(c))

Submitter: Peter Tokle, Coon Rapids, MN
Recommendation: Revise text to read as follows:
210.70 (A) Dwelling Units. In dwelling units, lighting outlets shall be installed in accordance with 210.70(A)(1), (A)(2), and (A)(3).
"...(c) Where one or more lighting outlet(s) are installed for interior stairways, <u>including attached garages</u>, there shall be a wall switch at each floor level, and landing level that includes an entryway, to control the lighting outlet(s) where the stairway between floor levels has six risers or more...".
Substantiation: Many split-level homes have stairways (with six or more risers) either leading up from the garage level into the main level of the home or stairways going down for entrance to the lower level. Lighting control is always located inside the door into the dwelling. Having another switch by the stairs in the garage is a safety issue, so occupants don't have to climb up or down the stairs in the dark.
Panel Meeting Action: Reject
Panel Statement: The stairs as described are interior stairways under the current rule.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-292 Log #671 NEC-P02 **Final Action: Reject**
(210.70(A)(3))

Submitter: Wendell Whistler, Whistler Consulting & Technical Services
Recommendation: Add new text to read as follows:
210.70(A)(3) Storage or Equipment Spaces. For attics, underfloor spaces, utility rooms, and basements, at least one lighting outlet containing a switch or controlled by a wall switch shall be installed where these spaces are used for storage or contain equipment requiring servicing. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.
<u>Attic and Crawl Space Locations. Furnaces and air conditioning equipment shall be permitted to be located in attics and crawl spaces, provided there is an access door at least 900 mm by 562.5 mm (36 in. by 22 1/2 in.) and a passageway of at least 900 mm (3 ft) high by 900 mm (3 ft) wide by 900 mm (3 ft) with a suitable permanent walkway at least 600 mm (24 in.) wide extending from the point of entry to each component.</u>
Substantiation: When doing inspection service, maintenance, repair and replacement of furnaces and air conditioning equipment installed in attics and crawl spaces, the access to the equipment spaces and working spaces about the equipment that are provided are insufficient to allow for safe work on energized electrical equipment during troubleshooting of the equipment. Text inserted for change was taken from 600.21(E) with editorial changes to walkway with and width and depth of working space. ARTICLE 215 — FEEDERS

2-294 Log #536 NEC-P02 **Final Action: Reject**
(215.2, FPN 2)

Submitter: Dennis J. Cox, Elkhart County Building Dept. / Rep. IAEI
Recommendation: Add new text as follows:
I propose that this section be changed to an enforceable code section. The text to read the same as it does in the NEC 2008 and to be code section 215.2(A)(4).
Substantiation: In the I.R.C. 2006 Code Section E3304.1 voltages throughout Chapters 33 through 42, the voltages considered shall be at which the circuit operates. So if the NEC 3% V.D. permitted for branch circuit and 5% total V.D. permitted will provide reasonable efficiency of operation. Then, if the voltage drop of a given circuit exceeds the 3% or 5% then the voltage is not at which the circuit operates and is a code violation.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been supplied to justify making a specific voltage drop
mandatory. See panel action and statement on Proposal 2-193.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-295 Log #2012 NEC-P02 **Final Action: Reject**
(215.2(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Consider the following: A 208/120 volt 3-phase 4-wire feeder run to an auxiliary gutter in a pump room with taps to a disconnecting means for a 100 hp 208 volt motor and a 15 ampere circuit breaker for a 120-volt receptacle and a lighting outlet. The feeder is protected by noontime-delay fuses with a rating 300 percent of the motor FLA (273 A. x 300%=819 amperes), plus 360 volt-amperes for the lighting and receptacle outlets for a total load of 822 amperes. If a standard fuse rating of 800 amperes is used the grounded conductor is required to be 1/0 copper or 3/0 aluminum, for a total calculated load of 3 amperes. If these conductors were service conductors (90 C. 350 kcmil copper, 230.42 *can apply and 250.24 (C)(1) indicates the grounded conductor can be 6 or 4 AWG. It is not reasonable that a feeder with overcurrent protection is* required to have the grounded conductor larger than a grounded service conductor where the load is identical for both. Tap conductors from a feeder are still feeders until overcurrent protection is provided and are covered by this rule which appears to conflict with 240.21(B). This rule does nothing to protect grounded conductors of other feeders or branch circuits which may be installed in the same raceway, where the grounded conductor may be much smaller than the largest feeder grounded conductor. This rule is only effective where one feeder is installed in a dedicated raceway or enclosure, and no other conductors are installed, or all other circuits have the same value of overcurrent protection. In the proposed scenario the grounded tap conductor to the 15-ampere circuit breaker is a feeder and 1/0 or 3/0 AWG which is unreasonable. The proposal which resulted in this provision provided no data to indicate burn-out of grounded feeder conductors is a particular widespread problem.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation does not give reasons for deleting all of 215.2(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-296 Log #2942 NEC-P02 **Final Action: Accept in Part**
(215.2(A)(1))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text to read as follows:
(A) Feeders Not More Than 600 Volts.
(1) General. Feeder conductors shall have an ampacity not less than required to supply the load as calculated in Parts III, IV, and V of Article 220. The minimum feeder-circuit conductor size, <u>after</u> ~~before~~ the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.
Exception No. 1: <u>If</u> ~~Where~~ the assembly, including the overcurrent devices protecting the feeder(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the feeder conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.
Exception No. 2: Grounded conductors that are not connected to an overcurrent device shall be permitted to be sized at 100 percent of the continuous and noncontinuous load.
<u>(2) Grounded Conductor.</u> The size of the feeder circuit grounded conductor shall not be smaller than that required by 250.122~~, except that 250.122(F) shall not apply where grounded conductors are run in parallel~~.
~~Additional minimum sizes shall be as specified in 215.2(A)(2) and (A)(3) under the conditions stipulated.~~
Renumber (2) and (3) to (3) and (4) respectively.
Substantiation: An attempt is being made to simplify the requirements as well as to revise the phrase, "<u>before</u> the application of any adjustment or correction factors" to, "<u>after</u> the application of any adjustment or correction factors." This is the way conductors are being selected in the field and complies with the intent of 110.14(C) to assure the conductors are sized not smaller than that required in Table 310.16 based upon the temperature rating of the terminations. The present language can be interpreted to require that the conductors be sized for the noncontinuous load plus 125 percent of the continuous load plus any adjustment or correction factors.
The sentence proposed for deletion is not necessary as the rules in existing (A)(2) and (A)(3) stand alone and modify the general requirements for the specific application.
A new title is being proposed for the paragraph on grounded conductors to comply with the NEC Style Manual. The reference to 250.122(F) regarding equipment grounding conductors run in parallel is proposed for deletion as the previous exception that permitted a reduced size equipment grounding conductor in some cases was deleted in the 2008 NEC.
Also, see 240.4(D) which used the phrase for Small Conductor overcurrent protection, "<u>after</u> any correction factors for ambient temperature and number of conductors have been applied." This seems to be the correct concept to ensure proper conductor ampacity.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Accept in Part
Revise text as follows:
Exception No. 1: <u>If</u> the assembly, including the overcurrent devices protecting the feeder(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the feeder conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.
<u>(2) Grounded Conductor.</u>
The remainder of the proposal is rejected.
Panel Statement: The panel accepts changing the word "Where" to "If" in Exception No. 1. The panel also accepts adding "(2)" and the title "Grounded Conductor". The remainder of the proposal is rejected. For the rejection of changing "before" to "after" see panel statement on Proposal 2-195. The panel rejects the deletion of the reference to 250.122(F) since the panel does not intend that the size of the grounded conductor has to be fully based on 250.122 in each parallel raceway.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-297 Log #1717 NEC-P02 **Final Action: Reject**
(215.2(A)(1), FPN No. 1 (New))

Submitter: Larry T. Smith, National Electrical Seminars, Inc.
Recommendation: Add new text as follows:
<u>FPN No. 1: See 110.14(C)(1)(a) and (b) for termination provisions of equipment.</u>
Substantiation: Ignoring the temperature rating of equipment is the most common mistake being made in conductor sizing today. Entirely too many wiremen take no notice of the temperature limitations of 110.14(C) when sizing conductors. They disregard the temperature rating of equipment, and use the 90°C column of Table 310.16 when 90°C rated conductors, such as THHN, are being used. I've even had engineers stand up in seminars and yell "Larry, how are we supposed to know that!?"
At the very least, there should be a Fine Print Note directing the reader to the rules of 110.14(C)(1)(a) and (b).
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that there is a need for an additional reference to 110.14(C) as those provisions apply to all installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-298 Log #3388 NEC-P02 **Final Action: Reject**
(215.2(A)(2))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
215.2(A)(2) Ampacity Relative to Service<u>-Entrance</u> Conductors. The feeder conductor ampacity shall not be less than that of the service<u>-entrance</u> conductors where the feeder conductors carry the total load supplied by the service<u>-entrance</u> conductors with an ampacity of 55 amperes or less.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: The definitions have not been agreed to at this point. Should CMP-4 revise the definitions and all of the rules associated with the use of the terms, CMP-2 can address the issue again at the comment stage. The panel notes that there appears to be no additional clarity added by the revision to the definitions.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Ballot Results: Affirmative: 12

2-300 Log #3952 NEC-P02 **Final Action: Reject**
(215.2(A)(4), 215(B), and 220.87)

Submitter: James E. Degnan, Sparling

Recommendation: Add text as follows:

215.2(A)(4)Existing Feeder, Load Addition. Where the existing feeder load has been determined in accordance with 220.87 the feeder shall have an allowable ampacity of not less than 125% of the load determined by 220.87 plus the ampacity required for the new load by 215.2(A)(1).

Exception 1: Where the assembly, including the overcurrent devices protecting the feeders, is listed for operation at 100 percent of its rating, the allowable ampacity of the conductors shall be permitted to be not less than the sum of 110% of the existing load plus the new load.

220.87 Determining Existing Loads. The calculation of a feeder or service load for existing installations shall be permitted to use actual maximum demand to determine the existing load under all of the following conditions:

(1) The maximum demand data is available for a 1-year period.

Exception: If the maximum demand data for a 1-year period is not available, the calculated load shall be permitted to be based on the maximum demand (measure of average power demand over a 15-minute period) continuously recorded over a minimum 30-day period using a recoding ammeter or power meter connected to the highest loaded phase of the feeder or service, based on the initial loading at the start of the recording. The recording shall reflect the maximum demand of the feeder or service by being taken when the building or space is occupied and shall include by measurement or calculation the larger of the heating or cooling equipment load, and other loads that may be periodic in nature due to seasonal or similar conditions.

~~(2) The maximum demand at 125 present plus the new load does not exceed the ampacity of the feeder or rating of the service.~~

(3) (2) The feeder has overcurrent protection in accordance with 240.4, and the service has overload protection in accordance with 230.90.

Substantiation: The text of 220.87(2) identifies the minimum size of a feeder and belongs in Article 215, not Article 220. At its present location the text conflicts with the following:

215.1 Scope. This article covers the installation requirements, overcurrent protection requirements minimum size, and ampacity of the conductors for feeders supplying branch circuit loads.

220.1 Scope. This article provides requirements for calculating branch-circuit, feeder, and service loads.

220.1 General The calculated load…after any applicable demand factors permitted by Part II or IV…(the 125% is not a demand factor)

This change may also impact the loading of services as permitted by 230.90. The existing language required that the service size be a minimum of 125% of the measured load. This proposal changes the language, so that when 230.90 refers to "load", existing load in 220.87 is load and nothing more. I believe this is acceptable as service conductors could also be fully loaded in a new facility. The alternative would be to make arrangements for a change in Article 230 to keep the 125% margin.

The proposed text also makes an allowance for the use of continuously rated devices on existing systems, where the existing code is not clear on this issue.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the submitter's substantiation. The 125 percent factor in 220.87 is intended to be a safety factor to increase the load. Relocating the text to Article 215 would be an improper application.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Ballot Results: Affirmative: 12

2-303 Log #314 NEC-P02 **Final Action: Reject**
(215.7(B) (New))

Submitter: Robert J. Walsh, City of Hayward
Recommendation: Add new text to read as follows:
215.X Feeder With No Common Neutral Conductors. Grounded conductors shall not be required to be run with feeder conductors supplying panelboards that do not, in turn, supply unbalanced neutral currents.
Substantiation: Many loads do not require a neutral conductor such as electric motors and electrical heaters. Some jurisdictions presently require the grounded to be installed even when it is not needed.
Panel Meeting Action: Reject
Panel Statement: There is no current code requirement to install a grounded conductor in a feeder where it is not utilized by the loads.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-304 Log #498 NEC-P02 **Final Action: Reject**
(215.9)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Insert a hyphen between "Circuit" and "Interrupter" in the first sentence.
Substantiation: The addition of the hyphen provides consistency throughout the Code and correlates with the title of 215.9.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: The usage of the term is in accordance with the NEC Style Manual. When the term is used as a noun, only the first pair of words is hyphenated. When used as an adjective, both pairs of words are hyphenated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-305 Log #3120 NEC-P02 **Final Action: Reject**
(215.9)

Submitter: Paul S. Hamer, Chevron Energy Technology Company
Recommendation: Renumber the existing wording of Section 215.9 and include as (A):
215.9 Ground-Fault Circuit-Interrupter Protection for Personnel.
(A) Ground-Fault Circuit-Interrupter Protection for 125-volts, Single-Phase Feeders.
Feeders supplying 15- and 20-ampere receptacle branch circuits shall be permitted to be protected by a ground-fault circuit interrupter in lieu of the provisions for such interrupters as specified in 210.8 and 590.6(A).
Add a new section, (B):
(B) Three-Phase Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) Protection for Three-Phase Feeders.
(1) Supplying Lighting Outlets. Three-phase feeders that supply branch circuits for lighting outlets with an operating voltage exceeding 150 volts to ground shall be permitted to be protected by three-phase ground-fault circuit-interrupter systems in lieu of the provisions for such systems as specified in 210.8.
(2) Supplying Other Than Lighting Loads. Three-phase feeders that supply loads other than lighting shall be permitted to be protected by three-phase ground-fault circuit-interrupter systems in lieu of the provisions for such systems as specified in 210.8.
Substantiation: See my companion proposal for 210.8(D). If the proposal for 210.8(D) is accepted, this proposal would allow the alternative of using the three-phase ground-fault circuit-interrupter systems on the feeders – both for "supplying lighting outlets" and "supplying other than lighting loads" – in lieu of the branch circuit requirements of 210.8(D).
This proposal subdivides the existing 215.9 to accommodate single-phase and three-phase ground-fault protection. The proposed title of "A" is added to differentiate the existing "Ground-Fault Circuit-Interrupter Protection for 125-volts, Single-Phase Feeders" from the newly proposed provisions in "B" for "Ground-Fault Circuit-Interrupter System (GFCIS-3Ph) Protection for Three-Phase Feeders."
Provision B(1) is proposed to correspond with the proposal submitted for the proposed new section 210.8(D)(1). Provision B(2) is added to indicate an allowed option of using the three-phase ground-fault circuit-interrupter systems for loads other than lighting, corresponding to the proposed new section 210.8(D)(2).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-131.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-306 Log #3599 NEC-P02 **Final Action: Reject**
(215.9)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text to read as follows:
215.9 Ground-Fault Circuit-Interrupter Protection for Personnel. Feeders supplying 15- and 20-ampere receptacle branch circuits shall be permitted to be protected by a ground-fault circuit interrupter in lieu of the provisions for such interrupters as specified in 210.8 and 590.6(A). Where ground-fault circuit interrupter protection for personnel is supplied by plug-and-cord-connection, it shall be listed as portable GFCI protection or provide a level of protection equivalent to a portable GFCI, whether assembled in the field or at the factory.
Substantiation: "Portable GFCIs" are required by the trinational *Standard for Ground-Fault Circuit-Interrupters, NMX-J-520-ANCE-2006* 1, *CSA C22.2 No. 144.1-06* 2, *ANSI/UL943-2005* 3, Clause 6.7.2.1, and construction-site portable power-distribution equipment is similarly required by standard *Portable Power-Distribution Equipment, UL1640* 3, Clauses 53.3 - 53.5 and 63.3 - 63.4, additionally to de-energize the "load" output contacts and terminals when one or more of the following defects occurs:
the grounded conductor to the power supply is opened
the grounded conductor is transposed with an ungrounded conductor to the power supply
one of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened
When Underwriters Laboratories (in UL product category KCXS) and CSA International (in CSA product class 1451-81) list such GFCI products, both certifiers specifically identify these as "portable GFCIs" to differentiate them from other GFCIs. Listed portable GFCIs can be embodied not only as GFCI plugs and in-line GFCI cord sets but even some GFCIs for permanent wiring such as SOME faceless GFCI receptacles can be additionally Listed and identified as portable GFCIs.
[1]Asociación de Normalización y Certificación (Association of Standardization and Certification),
[2]Canadian Standards Association
[3]Underwriters Laboratories Inc.
When conventional GFCIs intended for permanent, inspected hard-wiring are used in what should be portable GFCI applications, where the any of the indicated defect conditions occur, the ground-fault-detection circuitry is NOT powered and the GFCI protection cannot operate but power is nonetheless delivered UNinterrrupted EVEN IN THE PRESENCE OF A GROUND-FAULT. Any GFCI protection the user assumes is present is in fact UNAVAILABLE.
Amongst those NOT directly involved in GFCI manufacture who are nonetheless involved with this *Code*, there is a significant misperception that GFCI protection of personnel will provide a panacea against ALL causes of lethal electric shock. Due to their misunderstanding of the differences between GFCIs for permanent installation and portable GFCIs, a significant number of cord reel manufacturers unwittingly extrapolated their Listings for portable (cord-and-plug-connected) cord reels [having ordinary receptacles as outlet components] and their Listings for HARD-WIRED cord reels acceptably having GFCI receptacles as outlet components, without the overt knowledge of at least two major certifiers, to incorrectly encompass portable (cord-and-plug-connected) cord reels having GFCI receptacles (no open neutral protection) as outlet components where portable GFCI protection (with open neutral protection) was warranted.
It is also common to find cord-and-plug-connected field assemblies employing GFCI receptacles (no open neutral protection) as outlet components rather than portable GFCI protection (with open neutral protection) of the outlets. Some times, these are field repairs misperceived as safety upgrades where conventional receptacles in plug-and-cord-connected equipment are replaced with conventional GFCI receptacles. Furthermore, field repairs of plug-and-cord-connected equipment are occasionally encountered where portable GFCIs (faceless-receptacle-type) have been field-replaced with more-readily available, conventional GFCI receptacles under the mistaken belief that they are equivalent. In either situation, where the indicated defects occur, the user has a false sense of security because power is still delivered.
Companion proposals have been made to 100 "Ground-Fault Circuit Interrupter (GFCI), *Portable (as applied to ground-fault circuit interrupters)*" [NEW], to 210.8, to 518.3(B)*, and to 590.6.
* NOTE: That 518.3(B) proposal regarding portable GFCI protection is separate from another proposal I submitted for 518.3(B) involving GFCI protection required elsewhere in the *Code*.
Panel Meeting Action: Reject
Panel Statement: 215.9 refers to feeders and the proposal deals with portable GFCIs which would not be acceptable to meet the requirements of this section.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

ORLOWSKI, S.: In addition to the Panel Statement, the proposed provision seems to apply more to temporary wiring such as that used on a job site covered under Article 590 - Temporary Installations. Federal OSHA regulations already cover this use of these types of devices.

2-307 Log #223a NEC-P02 **Final Action: Reject**
(215.10)

Submitter: Kim Hovey, Howard R. Green Company
Recommendation: Where 1000A (or more) service or feeder terminates in a factory listed device distribution device, ground fault protection is not required. Where any branch circuit of the listed device is 1000A or more, provide ground fault detection.
Substantiation: I think the intent of the 1000A or more ground fault requirement is not clear, especially, when the handbook explanatory notes make it clear that the ground fault protection is only for the line side, not the supply. Since most service (or feeders) utilize the tap rules, and terminate at a main breaker of a factory listed device, it should be clarified whether the ground fault rule is necessary. To me, there is a large difference between factory distribution devices and field installed conduit and wires.

I have submitted the same proposal to sections 230.95, 240.13, and 240.21(C).
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-308 Log #4909 NEC-P02 **Final Action: Reject**
(215.10)

Submitter: James Brozek, Acton, MA
Recommendation: Delete 215.10 entirely. This is a companion proposal in association with a proposal covering new 240.27 and 240.28, which consolidates requirements from 240.13, 230.95, 700.26, 215.10, 517.17, and 708.52.
Substantiation: If the proposal for new 240.27 and 240.28 is accepted 215.10 will no longer be necessary.
Panel Meeting Action: Reject
Panel Statement: The provision is applicable to feeder disconnects and is appropriate in Article 215.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-309 Log #3929 NEC-P02 **Final Action: Reject**
(215.10 Exception No. 3 (New))

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association (NEFA)
Recommendation: Add a third exception.

Exception No 3: Ground fault relays on the normal source side (line side of the transfer switch) that supply emergency systems, legally required standby systems, or healthcare essential electrical systems, are permitted to be restrained from operating for ground faults on the loadside of the transfer switch if the system complies with both of the following:

(a) Ground fault protection relays on the normal source side (line side of the transfer switch) are not restrained from operation for ground faults on the normal source side (line side of the transfer switch)

(b) Audible and visual signal devices indicate -whenever a ground fault relay has been restrained. Instructions on the course of action to be taken in the event of an indicated ground fault shall be located at or near the sensor location.

Substantiation: For life-safety purposes and system reliability for the prevention of blackouts, it is desirable that a ground-fault on the load side of a transfer switch in an emergency system, legally required standby system, or healthcare essential electrical system, not take out the ground fault protection on the normal source. This proposal allows the ground fault protection on the normal source to be restrained from operating and taking down all or large portions of the normal system because of a ground fault on the load side of the transfer switch. For these critical life-safety-related applications, it requires both audible and visual signaling that a ground fault has occurred and that it is being restrained.

Restraining the normal system ground fault protection relays for faults on the load side of the transfer switch is consistent with the concept of continuity of service for emergency systems (700.26 & 700.7(D)), legally required standby systems (701.17), and healthcare essential electrical svstems (517.17(B)).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The provisions for health care facilities are covered in 517.17. The selectivity aspects of the ground fault protection system is a design issue and is the responsibility of the designer.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-310 Log #538 NEC-P02 **Final Action: Reject**
(215.12(C))

Submitter: Joseph R. Penachio, Joe Penachio Electrician
Recommendation: Add new text to read as follows:

(C) Ungrounded Conductors. Where the premises wiring system has feeders supplied from more than one nominal voltage system, each ungrounded conductor of a feeder shall be identified by phase or line and system at all termination, connection, and splice points. The means of identification shall be permitted to be by separate color coding, marking tape, or other approved means. The method utilized for conductors originating within each feeder panelboard or similar feeder distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at each feeder panelboard or similar distribution equipment. Where both system panelboards or distribution equipment are located in the same area, the identification shall also be located within each panelboard(s), or similar distribution equipment.
Substantiation: Several attendees in my continuing education classes have stated the fact that it is not uncommon to have the covers installed on the other nominal voltage system panelboard or distribution equipment when they are located adjacent to/or in the same area. Identifying them inside may minimize this error or at least make it more obvious to the electrician which system is in the panelboard or equipment. The covers could be properly identified as black/red/blue for the 480-277 volt wye system and brown/orange/yellow for the 208-120 volt wye system. But, if the panelboard cover(s) were previously installed on the opposite nominal voltage panelboard, an electrician could mistakenly assume the black/red/blue as the 208/120 volt wye system, or he could be the one who incorrectly reinstalls the panelboard cover(s), resulting in the same potential hazard. This would address this possible hazard.
Panel Meeting Action: Reject
Panel Statement: The recommended sentence would always require that the marking information be posted in the panelboard. The rule permits the marking information to be made readily available.

The substantiation does not justify the recommendation.
Number Eligible to Vote: 12

(220.4(e))

Submitter: William Q. Cellini, Jr., Ardmore, PA
Recommendation: Add new text to read as follows:

“(e) General Purpose (GP) Branch-Circuits”.
Substantiation: Addition of this paragraph will clarify use of GP branch-

circuits, plus enhance and facilitate.
Panel Meeting Action: Reject
Panel Statement: The section referenced in the submitter's proposal does not exist in the 2008 NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-314 Log #2776 NEC-P02 **Final Action: Reject**
(220.5(B))

Submitter: Chris Fackler, FSG Electric
Recommendation: As in 220.5(B) Fractions of an Ampere include this section in Article 210 so as to cover the entire code for dropping fraction less than 0.5.
Substantiation: Using a fraction less than 0.5 sometimes requires conductors to unnecessarily be up-sized per code.
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-315 Log #3508 NEC-P02 **Final Action: Reject**
(220.5(B))

Submitter: Eric Deitchel, Safeway
Recommendation: Where calculations result in a fraction of an ampere that is less than.5, such friction shall be permitted to be dropped. If the fraction of an ampere results in more than.5, such fraction be permitted to be rounded up to the next whole ampere.
Substantiation: There would no longer be confusion over whether or not it should be left the same or rounded up.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the code and does not address rounding of a 0.5 calculation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-316 Log #4317 NEC-P02 **Final Action: Reject**
(220.5(B))

Submitter: Richard W. Becker, Engineered Electrical Systems, Inc.
Recommendation: Revise as follows:
Where calculations result in a fraction of an ampere ~~that is less than 0.5, such fractions shall be permitted to be dropped.~~ <u>the result shall be rounded to the nearest whole number.</u>
Substantiation: "Rounding" to whole numbers is a standard mathematical concept that is performed regularly and by most computer programs. The present language in the code is not in accordance with standard mathematical practice.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-317 Log #4588 NEC-P02 **Final Action: Reject**
(220.5(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows: Calculations shall be permitted to be rounded to the nearest whole ampere, with decimal fractions smaller than 0.5 dropped."
Substantiation: The recent volley of proposals on this point has convinced this submitter that this should be clarified. The proposal wording accords with usual rounding requirements, and also Annex D, Example D3(a) which uses this approach. The submitter, who sat on the Article 220 rewrite task group, intends this as a simple editorial clarification of existing intent.
Panel Meeting Action: Reject
Panel Statement: The code does not prohibit the calculation method proposed by the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-318 Log #180 NEC-P02 **Final Action: Reject**
(Table 220.12)

Submitter: Eric W. Dougan, Louis Perry and Associates
Recommendation: Table 220.12 values should be changed/updated to match the International Energy Conservation Code (IECC) or the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) lighting loads allowances.
Substantiation: The NEC values in Table 220.12 are much higher than the IECC or ASHRAE vales. Most states require energy compliance certificates based on IECC or ASHRAE values. If NEC values were used, most would fail the energy compliance study.
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ORLOWSKI, S.: The provisions related to electric conservation contained in the IECC and ASHRAE 90.1 are not related to life-safety or electrical-safety concerns. The provisions in those standards are what are deemed "above code" considerations to provide a means to use less electrical energy. These standards also are not intended to supersede the life-safety regulations adopted into law. In addition, these energy conservation criteria are stated as performance criteria as one of many means to achieve a decided level of overall energy conservation for a whole building, not particularly only the electric energy usage.

2-319 Log #420 NEC-P02 **Final Action: Accept**
(Table 220.12)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Delete the words "per" in the column headings and revise the column headings to read:
"Volt-Amperes/Square Meter" and "Volt-Amperes/Square Foot".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-320 Log #3751 NEC-P02 **Final Action: Reject**
(220.12)

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Add a new exception following the FPN and before the Table in 220.12 to read as follows:
Exception: Where the building is designed and constructed to comply with an energy code adopted by the local authority, the lighting load shall be permitted to be calculated at the values specified in the energy code where the following conditions are met
a. A power monitoring system is installed that will provide continuous information regarding the total general lighting load of the building.
b. The power monitoring system will be set with alarm values alert the building owner or manager if the lighting load exceeds the values set by the energy code.
c. The demand factors specified in 220.42 are not applied to the general lighting load.
Substantiation: Energy efficiency is a critical issue faced by North American today. The objective of this new exception is to allow for some relief in the NEC calculations for lighting loads when an energy code is used to design and construct the building. For example in Table 220.12, office buildings are required to be calculated at 3.5 va/sq.ft. for the general lighting load. ASHRAE 90.1 specifies a maximum lighting load of XXX for office buildings constructed to comply with that code. For large office buildings, this can result in a significant reduction in the lighting load.
However, there have always been some issues that have been problematic with reducing these loading calculations to the lower levels. The issues related to maintenance and monitoring of the system. A building can be constructed today with good compliance to the energy code, but if the proper maintenance and monitoring are not provided the load can increase significantly over time and result in an overloaded service or feeder – something that our calculations in Article 220 try to avoid.
To address this issue, the exception is worded in a manner that it can only be applied where a complete power monitoring system is installed. The wording that indicates a "complete" power monitoring system is also intended to make it clear that simply putting a "meter" on the building is not sufficient. These systems are becoming very common place today and can be cost effectively installed. The exception is also worded to require that the system be monitored to ensure that the lighting loads remain at or below the specified values in the energy code. This requires some commitment on the part of the building owner, but is a reasonable system requirement in order to be able to reduce the load calculations.
This revision also "rewards" designers and building owners to allow lower service/feeder calculations (resulting in lower initial electrical system cost) if they commit to the energy efficiency aspects of the building. It should also be noted that the exception is worded to require that the entire building be constructed to the energy code and not just the electrical system.
A final sentence has been added to the exception to make it clear that if the exception is applied, then the lighting load demand factors should not be applied. This avoids "double dipping" of using the lower values and the demand factors.
While I agree that the panel should not reduce the load calculations without some conditions, this proposal provides a reasonable set of conditions to allow the trade-off.
Panel Meeting Action: Reject

Panel Statement: The energy codes are not uniformly applied throughout the country so no specific load requirements are possible based on these codes. The NEC specifies the minimum load requirements based on electrical safety.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

ORLOWSKI, S.: The provisions related to electric conservation contained in the IECC and ASHRAE 90.1 are not related to life-safety or electrical-safety concerns. The provisions in those standards are what are deemed "above code" considerations to provide a means to use less electrical energy. These standards also are not intended to supersede the life-safety regulations adopted into law. In addition, these energy conservation criteria are stated as performance criteria as one of many means to achieve a decided level of overall energy conservation for a whole building, not particularly only the electric energy usage.

In addition, the demand that is calculated in accordance with the NEC or engineering practices is only design criteria to determine service and feeder size, equipment, etc. These values have been determined using typical electric use over many decades. Just because the original electrical engineer for a building designs the appliances and lighting fixtures to use less electric than require by the NEC to calculate the service/feeder equipment does not mean that will always be load on the service, etc. As time goes by additional appliances or lighting loads may be added, or equipment changed-out are of a larger load. Anyone can install energy conserving appliances and lighting if they so desire. But, electrical safety should not be based on a possible installation, it should be based on the probable installation and history of electric use.

2-321 Log #4374 NEC-P02 **Final Action: Reject**
(220.12)

Submitter: Alan Manche, Square D Company/Schneider Electric
Recommendation: Revise the General Lighting Load unit load in Table 220.12 for Dwelling Units from 3VA to 6VA.

Table 220.12
Dwelling Units 33 ~~3VA~~ 6VA

Substantiation: I have had the privilege to participate in over 20 state adoption hearings for the 2008 National Electrical Code. The common topics that arise at these hearing include tamper resistant receptacles and AFCI protection usually brought to the table by the state home builders association opposing the protection. A clear message in the testimony that unfolds from the home builders in nearly every state is that the NEC is not sufficient in terms of the number of circuits that are required. When economic impact information is presented at the hearings, the home builders consistently argue the number of circuits in the analysis that is restricted to the NEC requirements is insufficient for a functional home.
I n general, the data and testimony presented by the home builders association show figures that are at least doubled the number of general lighting load circuits in the home as compared to the required number of circuits. Even NEMA promotional material on AFCI recognizes that there are likely more than the minimum number of circuits to ensure the functionality of the home.

CMP-2 has acted in the past to ensure functionality of the home such as requiring a 20A receptacle circuit for the bathroom. This proposal seeks to ensure appropriate functionality of the electrical system as repeatedly shared by the home builders and the home builders association across the country at government hearings.
Panel Meeting Action: Reject
Panel Statement: No substantiation was given to increase dwelling load. The substantiation addresses increasing the number of branch circuits not the general lighting load. The minimum number of branch circuits as specified by the code is adequate based on the 3 VA per square foot for dwelling units.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-322 Log #4857 NEC-P02 **Final Action: Reject**
(220.12)

Submitter: Mary Pat Dennis-Andre, Bothell, WA
Recommendation: Add text to read as follows:

220.12 Lighting Load for Specified Occupancies. A unit lighting load of not less than that specified in Table 220.12 for occupancies specified therein, or the lighting load as specified in the currently adopted energy code, shall constitute the minimum lighting load. (The rest of the section to remain unchanged.)
Substantiation: The current table 220.12 is out of date with modern lighting design and products. For instance, the International Energy Conservation Code, adopted in many states and municipalities, allows a maximum lighting load of 1VA/sf for offices, yet Table 220.12 requires capacity for 3.5VA/sf. This discrepancy results in over estimating the electrical demands, equipment that is larger than it needs to be, and consumes more nonrenewable resources than necessary (copper, aluminum, steel, etc.). Energy conservation is now a serious matter and a matter of national security. Energy codes are becoming more stringent and more widely enforced. This allowance has been in effect in Washington State for many years with no capacity or safety problems reported. It is time the NEC recognized the immediate need to conserve energy and scarce resources.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-320.

Ballot Results: Affirmative: 12

2-323 Log #2532 NEC-P02 **Final Action: Reject**
(220.13)

Submitter: Arturo Gaspar Molina Canales, Sta Catarina, NL
Recommendation: Add exact drop Voltage Calculation Method.
Substantiation: According to Mexican laws, voltage drop accepted for main power lines is maximal 1 percent. Comparative calculations between this method and accepted method can result to select a different cable.

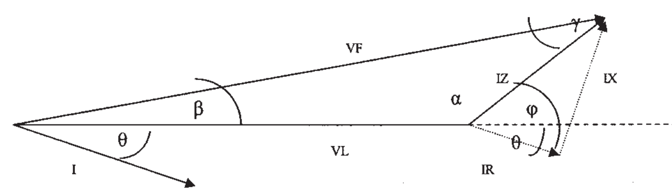
EDV can be called as the difference between the absolute values of VF and VL.

Where VF = Source side voltage
And VL = load side voltage

DV AS A VECTORIAL DIFFERENCE
Important notes respect this difference represented by IZ

When IZ = I*square root (r2 + x2)	Mathematically this value is correct but Really doesn't have sense.
And when IZ = I* (rcosΦ + xsenΦ)	Calculated value is approximate

PROCESS OF EXACT DELTAV CALCULATION
Triangle of load
I have forwarded an Interactive Calculator sheet.



The method for exact drop voltage calculation uses two concepts:
1. EDV as the difference between absolute value of Foint voltage (VE) and load voltage (VL)
2. Application and solution according the law of sinus that is:

$$\frac{VE}{\text{Sen }\alpha} = \frac{IZ}{\text{Sen }\beta} = \frac{VL}{\text{Sen }\gamma}$$

Solution:

$$\alpha = \pi - (\theta - \phi) \text{ Where } \theta = \text{arc cos } (\text{F.P.}) \text{ and } \phi = \text{arc tan } (X/R)$$

$$\beta = \text{arc sen} \frac{IZ * \text{sen } \alpha}{VE}$$

$$\gamma = \pi - \alpha - \beta$$

$$VL = VF \ \frac{\text{Sen }\gamma}{\text{Sen }\alpha}$$

$$EDV = \frac{VF\text{- }VL}{VL} * 100$$

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-324 Log #4920 NEC-P02 **Final Action: Reject**
(220.14)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 18 for comment.
Submitter: Robert Kopelman, Rockville Centre, NY
Recommendation: Revise text to read as follows:
II 220.14-Other Loads--- All Occupancies
(H) Fixed Multioutlet Assemblies. Fixed multioutlet assemblies used in other than dwelling units or the guest rooms or guest suites of hotels or motels shall be calculated in accordance with (H)(1) or (H)(2). For the purposes of this section, the calculation shall be permitted to be based on the portion that contains receptacle outlets. Multioutlet Assembly. A type of surface, flush, or freestanding raceway designed to hold conductors and receptacles, assembled in the field or at the factory (.All multioutlet assemblies shall have thermal sensing built in protection for all outlets).
Substantiation: There is a major problem called a glowing connection. As UL 1699 Scope states – AfCI's " 1.3 These devices are not intended to detect glowing connections" Glowing connections are a major cause of fires. There is a new UL document 498 with thermal protection that states that device shall detect abnormal heating in 8 locations in an outlet. These 8 locations are where overheating can and does occur. Attached are documents showing that an AFCI starts to detect Arcs at 5 amps. Also attached are forensic documents showing that the glowing connection can occur with 1 amp. Most electricians and inspectors have never seen a glowing connection because it happens inside the wall. But take an outlet and put a load on it, loosen the screw terminal in a dark room and it is freighting. The screw terminals loosen up over time do to the differential of expansion and contraction of the metals involved. A minute air gap is formed and the natural vibrations of the earth and the vibrations caused by normal living circumstances help to create the glowing connections.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: These products are currently listed as receptacles with no evaluation of their ability to enhance the safety of wiring devices. A thorough study of wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. Installation of these devices is not currently prohibited by the NEC. In addition, if the submitter is proposing a specific feature to a receptacle, the proposal should be forwarded to CMP-18 since they have responsibility for receptacle construction requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-325 Log #293 NEC-P02 **Final Action: Reject**
(220.14(1))

Submitter: Mario L. Mumfrey, Inspection Bureau Inc.
Recommendation: Revise text to read as follows:
This provision shall not be applicable to the receptacle outlets specified in 210.11(C)(1), (C)(2) and (C)(3).
Substantiation: Code Uniformity - for a more accurate calculation of dwelling unit(s) total connected general lighting loads and the consideration given to the demands of specific required loads of Article 220.
Since the inception of the individual 20 amp branch circuit requirement for dwelling unit bathroom receptacle outlet(s) in 1996 NEC 210.52(D), it has been unclear why the Code-Making Panel refuses to consider this circuit as an "other than lighting load". The CMP simply states in their rejection comment that dwelling unit bathroom outlet(s) are lighting loads and are calculated under the square footage rule for general-use outlets. There is a conflict in the NEC concerning this.
210.11 (new in the 1999 NEC) was a major recognition of the importance of special 20 amp loads for dwelling units; in particular small appliances, laundry and bathrooms. Prior to this new Section in 210, small appliances and laundry load requirements were in 220.4. However, when the CMP relocated these loads to Article 210 their significant load contribution to the Service/Feeder demand factors was recognized. At the same time, the bathroom load requirements were moved to 210.11(C)(3). The 1999 CMP made it clear in 220.3(B)(10)(a) - (1999 code section at the time) - that the 20 amp bathroom circuit now required in 210.11(C)(3) must be included in the general-use outlet requirements for dwelling unit square footage calculations.
There have been numerous attempts during each code cycle to have this required 20 amp bathroom dwelling unit receptacle outlet load be recognized as a 1.5 kva addition to the Service/Feeder demand calculations as with its counterparts of the same code article. 220.42 of the 2008 NEC states that demand factors for general lighting shall not be applied in determining the number of branch circuits. This is clearly a conflict since 210.11(C)(3) is considered a lighting load and requires a minimum of "one" 20-amp branch circuit that can have no other loads. In fact, the code language in 210.11(C)(3) is almost exactly like that of 210.11(C)(1) & (C)(2) which requires 1.5 kva for each 2-wire circuit installed. It cannot be both ways, first calling the dwelling unit bathroom receptacle outlet(s) a lighting load and then requiring an individual circuit to supply it without taking into consideration the connected load.
This one word change submitted for review would also require changes to Articles 210 and 220 to allow a coherent flow to the change.
Panel Meeting Action: Reject
Panel Statement: As the panel has stated in previous code cycles, the requirement for the 20A circuit to supply bathroom receptacle outlets is not intended to be included as a separate load calculation. Although a separate circuit is required, the loading is permitted to be part of the general lighting load calculation in 220.12.
The panel recognizes that the proposal is for 220.14(I).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-326 Log #339 NEC-P02 **Final Action: Accept in Principle**
(220.14(B))

Submitter: Paul J. Cormier, Worcester Electrician School
Recommendation: Revise as follows:
(B) Dwelling Unit(s) electric dryers and ~~Household~~ Dwelling Unit(s) electric cooking appliances.
Substantiation: As presently written, it can be interpreted that all occupancies would have to comply with 220.14(B) as it applies to electric dryers. Changing "Household" to dwelling unit(s) reflects the format used throughout Article 220.
Panel Meeting Action: Accept in Principle
Revise title of 220.14(B) as follows:
"(B) Electric Dryers and Electric Cooking Appliances in Dwelling Units."
Panel Statement: The panel has revised the title to meet the intent of the submitter. The panel notes that the term "household" is used in 220.54 and 220.55.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-327 Log #341 NEC-P02 **Final Action: Accept**
(220.14(G))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
In (1) and (2), change "per" to "for each".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-328 Log #342 NEC-P02 **Final Action: Accept**
(220.14(I))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
In the second sentence, change "per" to "for each".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-329 Log #2558 NEC-P02 **Final Action: Reject**
(220.14(I), FPN (New))

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Add the following FPN after 220.14(l):
FPN: The load calculation in 220.14(l) does not limit the number of receptacles on a single branch circuit.
Substantiation: This section is a perennial topic of misunderstanding, and deserves clarification. The proposed wording is similar to the FPN following 410.151(B).
Panel Meeting Action: Reject
Panel Statement: The material proposed is not appropriate for a FPN since it contains an interpretation. In addition, the submitter is incorrect in that 220.14(I) does limit the number of receptacles on a branch circuit for applications other than dwelling units covered in 220.14(J) and banks and office buildings covered in 220.14(K).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-330 Log #292 NEC-P02 **Final Action: Reject**
(220.14(J)(1))

Submitter: Mario L. Mumfrey, Inspection Bureau Inc.
Recommendation: Revise text to read as follows:
All general-use receptacle outlets of 20 ampere rating or less, ~~including~~ excluding receptacles connected to the circuits in 210.11(C)(3).
Substantiation: Code Uniformity - for a more accurate calculation of dwelling unit(s) total connected general lighting loads and the consideration given to the demands of specific required loads of Article 220.
Since the inception of the individual 20 amp branch circuit requirement for dwelling unit bathroom receptacle outlet(s) in 1996 NEC 210.52(D), it has been unclear why the Code-Making Panel refuses to consider this circuit as an "other than lighting load". The CMP simply states in their rejection comment that dwelling unit bathroom outlet(s) are lighting loads and are calculated under the square footage rule for general-use outlets. There is a conflict in the NEC concerning this.
210.11 (new in the 1999 NEC) was a major recognition of the importance of special 20 amp loads for dwelling units; in particular small appliances, laundry and bathrooms. Prior to this new Section in 210, small appliances and laundry load requirements were in 220.4. However, when the CMP relocated these loads to Article 210 their significant load contribution to the Service/Feeder demand factors was recognized. At the same time, the bathroom load requirements were moved to 210.11(C)(3). The 1999 CMP made it clear in 220.3(B)(10)(a) - (1999 code section at the time) - that the 20 amp bathroom circuit now required in 210.11(C)(3) must be included in the general-use outlet requirements for dwelling unit square footage calculations.
There have been numerous attempts during each code cycle to have this required 20 amp bathroom dwelling unit receptacle outlet load be recognized as a 1.5 kva addition to the Service/Feeder demand calculations as with its counterparts of the same code article. 220.42 of the 2008 NEC states that demand factors for general lighting shall not be applied in determining the number of branch circuits. This is clearly a conflict since 210.11(C)(3) is considered a lighting load and requires a minimum of "one" 20-amp branch circuit that can have no other loads. In fact, the code language in 210.11(C)(3) is almost exactly like that of 210.11(C)(1) & (C)(2) which requires 1.5 kva for each 2-wire circuit installed. It cannot be both ways, first calling the dwelling unit bathroom receptacle outlet(s) a lighting load and then requiring an individual circuit to supply it without taking into consideration the connected load.
This one word change submitted for review would also require changes to Articles 210 and 220 to allow a coherent flow to the change.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-325.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-331 Log #343 NEC-P02 **Final Action: Accept**
(220.14(L))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change "per" to "for each".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-332 Log #2298 NEC-P02 **Final Action: Accept in Principle**
(220.18(B))

TCC Action: The Technical Correlating Committee understands that the action on this proposal is to "Accept in Principle" since the title was changed.
Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Article 220.18(B) – Revised to
"(B) Inductive Lighting Loads. For circuits supplying lighting units that have ballasts, transformers, ~~or~~ autotransformers, or LED drivers, the calculated load shall be based on the total ampere ratings of such units and not the in the total watts of the lamps."
Substantiation: LED driver loads should also be calculated by adding their currents. "LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ.
Panel Meeting Action: Accept
The text shall now read as follows:
"**(B) Inductive and LED Lighting Loads.** For circuits supplying lighting units that have ballasts, transformers, autotransformers, or LED drivers, the calculated load shall be based on the total ampere ratings of such units and not on the total watts of the lamps."
Panel Statement: The panel accepted the submitter's revision and revised the title to make it clear what is covered by the section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-333 Log #4891 NEC-P02 **Final Action: Reject**
(220.18(B))

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Revise text as follows:
~~**Inductive Lighting Loads.**~~ **Electric-discharge or HID Lighting Loads.** For circuits supplying lighting units that have ballasts, transformers, or autotransformers, the calculated load shall be based on the total ampere ratings of such units and not on the total watts of the lamps.
Substantiation: This section should also reference lighting units that have ballasts, etc. that are not inductive loads, such as electronic-type ballasts.
Panel Meeting Action: Reject
Panel Statement: The proposed title "electric discharge or HID lighting" is too restrictive for inductive-lighting load. There is no substantiation for the change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-334 Log #4819 NEC-P02 **Final Action: Reject**
(220.40, FPN No. 2 (New))

Submitter: George Ferguson, Technical Education & Safety Institute
Recommendation: Add text to read as follows:
FPN No. 2: To assure adequate quality of power, the available supply to the feeder or service conductors should be capable of continuously supplying a minimum of 70 percent of the calculated load.
Substantiation: Typically the serving utility provides a facility with transformer capacity below the calculated load. This has the potential of introducing power quality problems within the facility.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated the recommendation. In addition, the FPN is improper since requirements are not permitted in FPNs.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-335 Log #148 NEC-P02 **Final Action: Accept in Principle**
(220.43(B) Exception (New))

Submitter: Gerald L. Binkley, Larson Binkley Inc. Consulting Engineers
Recommendation: Add an exception to read as follows:
"Exception: If a facility is governed by local energy code standards, additional wattage load shall not exceed the maximum calculated track load as prescribed in the energy code."
Substantiation: The minimum load requirement for track lighting was adopted when there were no enforceable energy codes in the United States. Since that time 64% of all the states have adopted energy codes that reduce the lighting wattage connected to light track installations. See schedule as of 9-26-07:

See TABLE (SCHEDULE) on page171

Light track is still an important part of retail lighting design and based on the present NEC requirements services, transformers and panels are designed based on a minimum capacity of 150 watts per two foot section of track. But based on energy codes, many installations are only allowed to install track lighting with half (or less) of that capacity being used.
National retail chains are installing hundreds of feet of light track so as to create flexibility within their light system, but being told by their engineers that oversized transformers are necessary for the installation. An example of a retail store installing, 150 feet of track within the state of Alabama would be limited to a maximum of 4,500 watts per ASHRAE 90.1 2001. But according to the NEC 220.43(B) the load that must be accounted for as a demand load would be 11,250 watts. This added load could increase the size of a step-down transformer, panelboard and service entrance. Energy codes have encouraged building designs to load transformers as much as possible so as to make them as energy efficient as possible.
All of this seems to be a conflict between NEC and local energy codes. We need to bring the National Electrical Code more in line with Energy codes and not force the building owners to pay for capacity that will never (legally) be used.
Panel Meeting Action: Accept in Principle
Add a new exception to read:
"Exception: If the track lighting is supplied through a device that limits the current to the track, the load shall be permitted to be calculated based on the rating of the device used to limit the current."
Panel Statement: The panel has added an exception that compromises between the current code requirement and a reduced load for energy

conservation. By simply basing the value on the energy code, there is no limit to the number of heads that could be installed on the track. In a number of states, the issue has been resolved by supplying the track through devices that limit the amount of current drawn by the track. The new exception would allow any length of track, but would require that the load be based on the rating of the devices used to limit the current.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ORLOWSKI, S.: The provisions related to electric conservation contained in the IECC and ASHRAE 90.1 are not related to life-safety or electrical-safety concerns. The provisions in those standards are what are deemed “above code” considerations to provide a means to use less electrical energy. These standards also are not intended to supersede the life-safety regulations adopted into law. In addition, these energy conservation criteria are stated as performance criteria as one of many means to achieve a decided level of overall energy conservation for a whole building, not particularly only the electric energy usage.
In addition, the demand that is calculated in accordance with the NEC or engineering practices is only design criteria to determine service and feeder size, equipment, etc. These values have been determined using typical electric use over many decades. Just because the original electrical engineer for a building designs the appliances and lighting fixtures to use less electric than require by the NEC to calculate the service/feeder equipment does not mean that will always be load on the service, etc. As time goes by additional appliances or lighting loads may be added, or equipment changed-out are of a larger load. Anyone can install energy conserving appliances and lighting if they so desire. But, electrical safety should not be based on a possible installation, it should be based on the probable installation and history of electric use.

2-336 Log #3272 NEC-P02 **Final Action: Reject**
(220.45 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows:
220.xx Continuous Load. Luminaires and lampholders shall be considered a continuous load where installed as follows:
(1) In commercial and industrial premises
(2) In common areas of multifamily dwellings such as, but not limited to, hallways, stairwells, exits, recreation areas, meeting rooms, dining rooms, laundry rooms, vehicle parking, exterior lighting.
Substantiation: Continuous load has not generally been applied to lighting in dwellings. Examples for multifamily dwelling in Annex D do not indicate continuous load provisions, whereas many areas may have lighting operating continuously for 3 hours or more.
Panel Meeting Action: Reject
Panel Statement: The determination of whether or not a load is continuous is dictated by its application and determined on a case by case basis. The examples in Annex D are intended to be basic examples of load calculations and are not intended to be all encompassing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-337 Log #3304 NEC-P02 **Final Action: Reject**
(220.51)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change 100 percent to 125 percent in the text and exception. And “connected” to “calculated”.
Substantiation: 424.3(B) states electric heating loads are continuous loads.
215.2(A)(1) requires a feeder ampacity not less than 125 percent of continuous load.
Example D3(a) in Annex D, under Overcurrent Protection (for feeders), indicates overcurrent protection not less than 125 percent of the load is required.
The reason for the 125 percent requirement for branch circuits equally applies to feeders and service conductors.
220.40 states calculated feeder or service loads shall not be less than the sum of branch circuit loads.
“Calculated” load is well covered; “connected” load is not defined; is it the same or different than calculated load?
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any substantiation to indicate that the feeder or service load should be increased.
The 125 percent for continuous loads is a factor of the conductor and overcurrent device selection and not a factor in the load calculation. As such, it is not required to add 25 percent for the load calculation itself.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-338 Log #3381 NEC-P02 **Final Action: Reject**
(220.51 Exception)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
220.51 *Exception: Where reduced loading of the conductors results from units operating on duty-cycle, intermittently, or from al units not operating at the same time, the authority having jurisdiction may grant permission for feeder and service-entrance conductors to have an ampacity less than 100 percent, provided the conductors have an ampacity for the load so determined.*
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-298.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-339 Log #3271 NEC-P02 **Final Action: Reject**
(220.52(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
In each dwelling unit the load shall be calculated at ~~1500~~ 3000 volt-amperes for ~~each 2-wire~~ the small-appliance branch circuits covered by 210.11(C)(1). Where the load is subdivided through one or more feeders the calculated load for each shall include not less than the ~~1500~~ 3000 volt-amperes for ~~each 2-wire~~ the small appliance branch circuits. The load shall be permitted to be included with the general lighting load and subject to the demand factors provided in Table 220.42.
Exception: the individual branch circuit permitted by 210.52(B)(1) Exception No. 2 and additional small appliance branch circuits shall be permitted to be excluded from the calculation required by 220.52.
Substantiation: Section 210.11(C)(1) doesn’t specify a 2-wire circuit; a multiwire circuit is not prohibited. Since no additional load is specified for the branch circuit of Exception No. 2 for 210.52(B)(1) (presumably because there is no additional load) the same consideration should be applied where more than two small appliance branch circuits are installed and no actual additional load is installed. Where additional general lighting circuits are which exceed the minimum 3 va/sq.ft requirement no additional load is imposed on feeders and services.
Panel Meeting Action: Reject
Panel Statement: The submitter’s substantiation is incorrect. 1500VA is required for each small appliance branch circuit including those beyond the two that are required. The reference to 2-wire is appropriate and not in conflict with the use of a multi-wire circuit since 210.4 specifies that these shall be permitted to be considered as individual circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-340 Log #4892 NEC-P02 **Final Action: Reject**
(220.52(A) and (B))

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Delete section 220.52(A) & (B) and move the text contained in 220.52(A) & (B) to 220.14 in Part II Branch circuit load requirements.
Substantiation: The requirements contained in 220.52(A) & (B) are branch circuit load requirements similar to the requirements in 220.14(F). The scope of article 220 states part II is to be used for branch circuit loads and part III or IV are to be used for feeder or service loads. The first section in part III (220.40) states the calculated load of a feeder or service shall not be less than the sum of the loads on the branch circuits supplied, as determined by part II of this article, after any applicable demand factors permitted by part III or IV or required by part V. The last sentence in both (A) & (B) allows this load to be included with the general lighting load and subjected to the demand factors provided in Table 220.42. The general lighting load is calculated in part II. This change would make article 220 more “user friendly” without changing any of the current requirements.
Panel Meeting Action: Reject
Panel Statement: The provisions in 220.52 are loads for the feeder and service calculation. The 1500 VA load addition does not limit the small appliance branch circuit loading.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-341 Log #297 NEC-P02 **Final Action: Reject**
(220.52(C))

Submitter: Mario L. Mumfrey, Inspection Bureau Inc.
Recommendation: Add new text as follows:
(C) Bathroom Circuit Load. A load of not less than 1500 volt-amperes shall be included for each 2-wire branch circuit as covered by 210.11(C)(3). This load shall be permitted to be included in the general lighting load and subjected to the demand factors provided in Table 220.42.
Exception: The outlet(s) for other equipment within the same bathroom permitted in 210.11(C)(3) Exception, shall be permitted to be excluded from the calculations required by 220.52.
Substantiation: Code Uniformity - for a more accurate calculation of dwelling unit(s) total connected general lighting loads and the consideration given to the demands of specific required loads of Article 220.
Since the inception of the individual 20 amp branch circuit requirement for dwelling unit bathroom receptacle outlet(s) in 1996 NEC 210.52(D), it has been unclear why the Code-Making Panel refuses to consider this circuit as an “other than lighting load”. The CMP simply states in their rejection comment that dwelling unit bathroom outlet(s) are lighting loads and are calculated under the square footage rule for general-use outlets. There is a conflict in the NEC concerning this.
210.11 (new in the 1999 NEC) was a major recognition of the importance of special 20 amp loads for dwelling units; in particular small appliances, laundry and bathrooms. Prior to this new Section in 210, small appliances and laundry load requirements were in 220.4. However, when the CMP relocated these loads to Article 210 their significant load contribution to the Service/Feeder demand factors was recognized. At the same time, the bathroom load requirements were moved to 210.11(C)(3). The 1999 CMP made it clear in 220.3(B)(10)(a) - (1999 code section at the time) - that the 20 amp bathroom circuit now required in 210.11(C)(3) must be included in the general-use outlet requirements for dwelling unit square footage calculations.
There have been numerous attempts during each code cycle to have this required 20 amp bathroom dwelling unit receptacle outlet load be recognized as a 1.5 kva addition to the Service/Feeder demand calculations as with its counterparts of the same code article. 220.42 of the 2008 NEC states that demand factors for general lighting shall not be applied in determining the number of branch circuits. This is clearly a conflict since 210.11(C)(3) is considered a lighting load and requires a minimum of “one” 20-amp branch circuit that can have no other loads. In fact, the code language in 210.11(C)(3) is almost exactly like that of 210.11(C)(1) & (C)(2) which requires 1.5 kva for each 2-wire circuit installed. It cannot be both ways, first calling the dwelling unit bathroom receptacle outlet(s) a lighting load and then requiring an

individual circuit to supply it without taking into consideration the connected load.

This one word change submitted for review would also require changes to Articles 210 and 220 to allow a coherent flow to the change.

Panel Meeting Action: Reject

2-342 Log #3906 NEC-P02 **Final Action: Reject**

(220.53)

Submitter: Eugene F. Swisher, City of Tampa / Rep. IBEW Local 915

Recommendation: Revise text as follows:

..., other than electric ranges, clothes dryers, space heating equipment, water heaters) or air conditioning equipment.

Substantiation: The new tankless type water heaters for residential use can range up to 29,000 watts, 340 amp circuits feeding them all on when water is being heated. Applying the 25% demand can result in inadequate service or feeder.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation to add water heaters to the list of appliances where the 75 percent factor is not permitted to be used.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-343 Log #1769 NEC-P02 **Final Action: Reject**

(220.54)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: ELECTRIC CLOTHES DRYERS ~~DWELLING UNITS~~. The load for ~~household~~ 208-volt and 240-volt electric clothes dryers ~~in a dwelling unit~~ shall be either 5000 watts (volt-amperes) or the nameplate rating, whichever is greater, for each outlet ~~dryer~~ served. The use of the demand factors in Table 220.54 shall be permitted for household 208-volt and 240-volt electric dryers. (remainder unchanged)

Substantiation: Present literal wording requires a 5000 watt load calculation for electric dryers which includes those connected for 120 volts, where a 208-volt or 240-volt outlet is not installed. Since commercial laundromats may not be installed at time of final inspection, the minimum 5000 watt requirement is reasonable. Since an outlet may be installed without a dryer being actually installed, the calculated load should apply to the outlet.

Panel Meeting Action: Reject

Panel Statement: Electric clothes dryers are calculated at the nameplate rating in other than dwelling units. The submitter has not supplied adequate substantiation to allow applying the demand factors to anything other than dwelling units. The term “household” is the appropriate term for dryers designed for use in dwelling units.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-344 Log #2036 NEC-P02 **Final Action: Reject**

(220.54)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: ELECTRIC CLOTHES DRYERS. ~~DWELLING UNITS.,~~ The load for ~~household~~ 208-volt and 240-volt electric clothes dryers ~~in a dwelling unit~~ shall be either 5000 watts (volt-amperes) or the nameplate rating, whichever is larger, for each dryer served. (remainder unchanged).

Substantiation: Present 5000 watt minimum should only apply to 208 and 240-volt dryers. Some dryers are 120-volt connected and covered by the 1500 watt calculation for the laundry circuit receptacles. Minimum requirement should apply to commercial Laundromats where at the time of circuit installation the nameplate ratings are not known. Present wording indicates 120-volt electric dryers are calculated at 5000 watts.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-343.

43	~~20~~ **16**		
41	~~18~~ **15**		

Substantiation: When you calculate the kW load for ranges using the percentages in Column B for more than 6 ranges the calculation for 7 and 8 kW ranges is higher than the kW load in Column C for the same number of ranges. The new percentages are a more accurate calculation. It doesn’t make sense that 20 – 7 kW ranges at 28% equals 39.2 kW which is greater than 28 – 12 kW at 35 kW in Column C. I know the heading states to use Column C unless in all cases except as otherwise permitted in Note 3, but the percentages should be changed to be more accurate without having to correlate the calculation to Column C and then use Column C because it is lower.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated revising the table percentages. The higher kW ranges have more diversity than the lower kW models.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-346 Log #3521 NEC-P02 **Final Action: Reject**

(Table 220.55, Note 4)

Submitter: Tim Henry, Code Electrical Classes Inc.

Recommendation: Delete the first sentence of Note 4 of Table 220.55

4. Branch Circuit Load. ~~It shall be permissible to compute the branch circuit load for one range in accordance with Table 220.55.~~

Substantiation: This is the only place in the NEC that allows a demand factor to be applied to a branch circuit. Table 220.55 permits a reduction to the connected load of household cooking equipment on feeders and service entrance conductors based on not all the cooking equipment being on at the same time in an apartment complex which makes sense. But to allow a reduction of a single range on a branch circuit is encouraging a future violation of the NEC. As an example: by using Note 4 for sizing a branch circuit to a single 12kw household electric range the 12kw range is permitted to be reduced to 8kw. 8000 watts / 240 volts = 33.3 amperes versus the nameplate of the range which would be 12,000 watts / 240 volts = 50 amperes. Instead of being wired to the nameplate connected load using a #6 conductor the NEC permits this single range to be installed with a #8 conductor on a 40 ampere circuit breaker. I also understand that in general not all 4 burners on the cook top and the oven are on at the same time. But what about in the case of Thanksgiving dinners when all 4 burners and the oven can be turned on at the same time and full current is drawn until the oven has reached its preset

temperature. We now have sized our conductor and circuit breaker based on an 33.3 ampere load versus the 50 ampere load we now have. The violation of the NEC now occurs when the serviceman replaces the 40 ampere breaker with a 50 ampere breaker protecting a #8 wire.
Panel Meeting Action: Reject
Panel Statement: There is no substantiation that the current rule is resulting in branch circuits that are undersized for the application. The range is not a continuous load.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-347 Log #802 NEC-P02 **Final Action: Reject**
(Table 220.55 Note 4)

Submitter: Richard J. Cripps, Association of Home Appliance Manufacturers
Recommendation: Revise text to read as follows:
Note 4: Branch-Circuit Load. It shall be permissible to calculate the branch-circuit load for one range <u>or one multi-cavity wall-mounted oven</u> in accordance with Table 220.55. The branch-circuit load for one <u>single cavity</u> wall-mounted oven or one counter-mounted cooking unit shall be the name plate rating of the appliance. The branch-circuit load for a counter-mounted cooking unit and not more than two wall-mounted ovens, all supplied from a single branch circuit and located in the same room, shall be calculated by adding the nameplate rating of the individual appliance and treating this total as equivalent to one range.
Substantiation: In Note 4, it is permissible to calculate the branch-circuit load for one range in accordance with Table 220.55. While it takes into account a range, which consists of two cooking zones - a cooktop and an oven - it does not differentiate between the wall-mounted oven types. A double oven or combination oven like a range consists of two or more cooking zones.
This proposal is to differentiate between a single cavity wall-mounted oven and a mulit-cavity wall-mounted oven. With this differentiation, a mulit-cavity wall-mounted oven should be treated like one range and a single cavity wall-mounted oven should be treated like a single counter-mounted cooking unit.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the concept is intended to apply to “cooking zones”. The original rule was based on the diversity achieved by a range consisting of an oven and a cooktop. There is no substantiation that the same level of diversity exists with dual wall mounted ovens when they are in use at the same time.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-348 Log #1730 NEC-P02 **Final Action: Reject**
(220.60)

Submitter: Lawrence R. Walsh, MTA Bridges and Tunnels
Recommendation: Replace “unlikely” with “impossible”.
Substantiation: Utilization of the word “unlikely” opens an excessive loophole in the preparation of calculations since “unlikely is not defined in 100” and outside sources are commonly utilized for the definition of these words.
A common definition of “unlikely” is improbable. Loads that operate less than 4380 hours of the 8760 hour year fit the definition of “unlikely” since, at any point in time it is improbable that they will be operating.
Most lighting, appliance and motor loads are operated less than 4380 hours per year.
The utilization of the adjective “noncoincident” in the same sentence does not reduce the scope of the loophole since it is impossible for a load operated less than 4380 hours per year to be operated consistently with any other load for more than 4380 hours per year.
Panel Meeting Action: Reject
Panel Statement: The term “unlikely” is intended to provide sufficient latitude to apply the rule in a broad set of situations. For example, if air conditioning and baseboard heat is installed, it is unlikely that they will operate at the same time, but it would not be “impossible”.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-349 Log #2011 NEC-P02 **Final Action: Reject**
(220.60)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part: “...it shall be permitted to use only the largest load that will be used at one time for calculating the ~~total~~ <u>branch circuit</u>, feeder, and service load.
Substantiation: This provision is appropriate for branch circuits, but does not apply to total load on the feeder or service since they may also supply other loads.
Panel Meeting Action: Reject
Panel Statement: This provision is in Part III, which is feeder or load service calculations. As such it is inappropriate to reference the provision for branch circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-350 Log #3109 NEC-P02 **Final Action: Reject**
(220.82)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Delete Section 220.82.
Delete Examples D2(a), D2(b) and D2(c) in Annex D
Substantiation: The NEC should not recognize two parallel load calculation rules that result in different calculated loads for the same dwelling unit. This is confusing to the users of the NEC. Either the Standard or Optional methods should be allowed but not both.
The optional calculation method provided in 220.82 is most often misapplied as the General Loads in 220.82(B)(3) require the use of nameplate information. This is most often not available at the time the load calculation is being made. So, those doing the load calculations either use the default loads provided for in Tables in Article 220 intended for load calculations under the “Standard Method” or loads from someone’s book as typical loads.
The Optional Calculations in 220.83 for adding loads to existing dwelling units, for multifamily dwellings in 220.84 and for two dwelling units in 220.85 seem legitimate.
Section 3.3.4 of the NEC Style Manual states that “where” should not be used to mean “when” or “if.” This proposal intends to use the word “if” where appropriate.
Panel Meeting Action: Reject
Panel Statement: The optional calculation serves an appropriate purpose when the conditions specified in the section are met and the calculation is performed as stated by the section. If the nameplate information is not available or not used, then 220.82 would not be applicable.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-351 Log #2313 NEC-P02 **Final Action: Reject**
(220.82(A))

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Add after the last sentence...<u>Where the total load calculated according to this section is carried by a single set of service or feeder conductors the total shall be permitted to be reduced by 10%.</u>
Substantiation: This is a companion to a proposal to one that would delete Table 310.15(B)(6) and will resolve a situation where ampacity of conductors is adjusted based on load diversity. That adjustment, which recognizes a pattern of usage by the occupants, properly belongs in load calculations not conductor ampacity. Since that pattern of usage is not affected by the phase arrangement of the system there is no need to restrict it to single phase systems. The calculation of the neutral conductor is properly addressed by other sections of this article.
Panel Meeting Action: Reject
Panel Statement: The 10 percent load reduction is arbitrary and not substantiated. The provisions of 310.15(B)(6) permit a specific size conductor to supply a dwelling unit service as calculated by Article 220. It does not modify the load calculation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-352 Log #3377 NEC-P02 **Final Action: Reject**
(220.82(A))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
220.82(A) Feeder and Service Load. This section applies to a dwelling unit having the total connected load served by a single 120/240-volt or 208Y/120-volt set of 3-wire service<u>-entrance</u> or feeder conductors with an ampacity of 100 or greater. (The remainder of the text is unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.
Service<u>-Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service<u>-entrance</u> conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles.

That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Ballot Results: Affirmative: 12

2-353 Log #294 NEC-P02 **Final Action: Reject**

(220.82(B)(2))

Submitter: Mario L. Mumfrey, Inspection Bureau Inc.

Recommendation: Revise text to read as follows:

(2) 1500 volt-amperes for each 2-wire, 20-ampere branch circuit covered in 210.11(C)(1), (C)(2) and (C)(3) as follows:

a. small appliances

b. laundry

c. bathroom(s).

Substantiation: Code Uniformity - for a more accurate calculation of dwelling unit(s) total connected general lighting loads and the consideration given to the demands of specific required loads of Article 220.

Since the inception of the individual 20 amp branch circuit requirement for dwelling unit bathroom receptacle outlet(s) in 1996 NEC 210.52(D), it has been unclear why the Code-Making Panel refuses to consider this circuit as an "other than lighting load". The CMP simply states in their rejection comment that dwelling unit bathroom outlet(s) are lighting loads and are calculated under the square footage rule for general-use outlets. There is a conflict in the NEC concerning this.

210.11 (new in the 1999 NEC) was a major recognition of the importance of special 20 amp loads for dwelling units; in particular small appliances, laundry and bathrooms. Prior to this new Section in 210, small appliances and laundry load requirements were in 220.4. However, when the CMP relocated these loads to Article 210 their significant load contribution to the Service/Feeder demand factors was recognized. At the same time, the bathroom load requirements were moved to 210.11(C)(3). The 1999 CMP made it clear in 220.3(B)(10)(a) - (1999 code section at the time) - that the 20 amp bathroom circuit now required in 210.11(C)(3) must be included in the general-use outlet requirements for dwelling unit square footage calculations.

There have been numerous attempts during each code cycle to have this required 20 amp bathroom dwelling unit receptacle outlet load be recognized as a 1.5 kva addition to the Service/Feeder demand calculations as with its counterparts of the same code article. 220.42 of the 2008 NEC states that demand factors for general lighting shall not be applied in determining the number of branch circuits. This is clearly a conflict since 210.11(C)(3) is considered a lighting load and requires a minimum of "one" 20-amp branch circuit that can have no other loads. In fact, the code language in 210.11(C)(3) is almost exactly like that of 210.11(C)(1) & (C)(2) which requires 1.5 kva for each 2-wire circuit installed. It cannot be both ways, first calling the dwelling unit bathroom receptacle outlet(s) a lighting load and then requiring an individual circuit to supply it without taking into consideration the connected load.

This one word change submitted for review would also require changes to Articles 210 and 220 to allow a coherent flow to the change.

2-354 Log #3843 NEC-P02 **Final Action: Reject**

(220.82(B)(3) and (4))

Submitter: Ted "Smitty" Smith, Electrical Experts Consulting

Recommendation: Revise text to read as follows:

(3) The nameplate rating of the following, excluding any motor loads:

a. b. c. d. No change.

(4) ~~The nameplate ampere or kVA rating of all permanently connected motors not included in item (3).~~ 125 percent of the nameplate ampere rating or kVA rating of the largest motor as determined by the full load current and 100 percent of the nameplate ampere or kVA rating of all other motor loads.

Substantiation: Article 430 requires that the largest motor be calculated at 125 percent and all other loads at 100 percent. The current wording in this section does not account for the 125 percent for the largest motor and is therefore in conflict with Article 430 and 440. Using the method in Part III of Article 220 this is accounted for and should also be accounted for in Part IV Methods.

Panel Meeting Action: Reject

Panel Statement: It is not necessary to add the 25 percent factor for feeder or service load calculations, which is what 220.82 covers. There is no conflict with Article 430 since the provisions in Article 430 are for calculating the conductor size specific to motor circuits.

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

220.84(A)(3) Each dwelling unit is equipped with electric space heating or air conditioning, or both. Feeders and service-entrance conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 220.61.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.

It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Submitter: Mario L. Mumfrey, Inspection Bureau Inc.
Recommendation: Revise text to read as follows:

(2) 1500 volt-amperes for each 2-wire, 20-ampere branch circuit covered in 210.11(C)(1), (C)(2) and (C)(3) as follows:

a. small appliances
b. laundry
c. bathroom(s).

Substantiation: Code Uniformity - for a more accurate calculation of dwelling unit(s) total connected general lighting loads and the consideration given to the demands of specific required loads of Article 220.

Since the inception of the individual 20 amp branch circuit requirement for dwelling unit bathroom receptacle outlet(s) in 1996 NEC 210.52(D), it has been unclear why the Code-Making Panel refuses to consider this circuit as an “other than lighting load”. The CMP simply states in their rejection comment that dwelling unit bathroom outlet(s) are lighting loads and are calculated under the square footage rule for general-use outlets. There is a conflict in the NEC concerning this.

210.11 (new in the 1999 NEC) was a major recognition of the importance of special 20 amp loads for dwelling units; in particular small appliances, laundry and bathrooms. Prior to this new Section in 210, small appliances and laundry load requirements were in 220.4. However, when the CMP relocated these loads to Article 210 their significant load contribution to the Service/Feeder demand factors was recognized. At the same time, the bathroom load requirements were moved to 210.11(C)(3). The 1999 CMP made it clear in 220.3(B)(10)(a) - (1999 code section at the time) - that the 20 amp bathroom circuit now required in 210.11(C)(3) must be included in the general-use outlet requirements for dwelling unit square footage calculations.

There have been numerous attempts during each code cycle to have this required 20 amp bathroom dwelling unit receptacle outlet load be recognized as a 1.5 kva addition to the Service/Feeder demand calculations as with its counterparts of the same code article. 220.42 of the 2008 NEC states that demand factors for general lighting shall not be applied in determining the number of branch circuits. This is clearly a conflict since 210.11(C)(3) is considered a lighting load and requires a minimum of “one” 20-amp branch circuit that can have no other loads. In fact, the code language in 210.11(C)(3) is almost exactly like that of 210.11(C)(1) & (C)(2) which requires 1.5 kva for each 2-wire circuit installed. It cannot be both ways, first calling the dwelling unit bathroom receptacle outlet(s) a lighting load and then requiring an individual circuit to supply it without taking into consideration the connected load.

This one word change submitted for review would also require changes to Articles 210 and 220 to allow a coherent flow to the change.

Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-325.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-361 Log #3842 NEC-P02 **Final Action: Reject**
(220.84(C)(3) and (4))

Submitter: Ted “Smitty” Smith, Electrical Experts Consulting
Recommendation: Revise text to read as follows:

(3) The nameplate rating of the following, excluding any motor loads:

a. b. c. d. No change.

(4) ~~The nameplate ampere or kVA rating of all permanently connected motors not included in item (3).~~ 125 percent of the nameplate ampere rating or kVA rating of the largest motor as determined by the full load current and 100 percent of the nameplate ampere or kVA rating of all other motor loads.

Substantiation: Article 430 requires that the largest motor be calculated at 125 percent and all other loads at 100 percent. The current wording in this section does not account for the 125 percent for the largest motor and is therefore in conflict with Article 430 and 440. Using the method in Part III of Article 220 this is accounted for and should also be accounted for in Part IV Methods.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-354.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-362 Log #313 NEC-P02 **Final Action: Reject**
(Table 220.86)

Submitter: Robert J. Walsh, City of Hayward
Recommendation: Revise text to read as follows:

Table 220.86 Optional Method-Demand Factors for Feeders and Service-Entrance Conductors for Schools

Connected Load	Demand Factor (Percent)
First 33 VA/m^2	(3 VA/m^2) at 100
~~Over 33 to~~ The next 220 VA/m^2	(~~3 to~~ 20 VA/ft^2) at 75
Remainder ~~over 220 VA/m^2~~	~~(20 VA/ft^2)~~ at 25

Substantiation: The original wording to calculate the demand factors in Table 220.86 can be interpreted two ways. For example, a 12,000 ft^2 school has a calculated load of 300,000 VA. By dividing 300,000 VA by 12,000 ft^2, the dividend is 25 VA/ft^2. After calculating the 1st 3000 VA at 100%, the next step could be to subtract the 1st 3 VA/ft^2 from 25 VA/ft^2 leaving a remainder of 22 VA/ft^2. The next step could be to multiply the next 20 VA/ft^2 at 75% and subtract 20 VA/ft^2 from 22 VA/ft^2 leaving a remainder of 2 VA/ft^2 that is multiplied by 25%. This method of calculation is consistent with example D1A in Annex D and the use of Table 220.42 when calculating the demand factors for dwelling lighting loads. After calculating the 1st 3000 VA at 100%, the next step is to subtract 3000 VA from 9000 and multiply the remaining 6000 VA at 35%.

However, the second way to interpret the calculations in Table 220.86 could be to calculate the 1st 3000 VA at 100% and multiple the next 17 VA/ft^2 (3 to 20 VA/ft^2) at 75%. The remaining 5 VA/ft^2 would be multiplied at 25%. This method of calculation is not consistent with the use of Table 220.42 as demonstrated in Example D1A in Annex D.

Therefore, I am submitting this proposal to simplify and clarify the proper method of calculating the demand factors for school feeders and service-entrance conductors for schools from Table 220.86 by revising the Table’s instruction for calculation. The proposed revision would coincide with existing published educational texts.

Panel Meeting Action: Reject
Panel Statement: The panel agrees that the second method in the substantiation is correct and that the first method is inconsistent with the table.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-363 Log #2559 NEC-P02 **Final Action: Accept**
(Table 220.86)

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text as follows:

Over 33 through ~~to~~ 220 VA/m^2 (3 through ~~to~~ 20 VA/ft^2) at...”.

Substantiation: This change would clarify the intent that 220 VA/m^2 (20 VA/ft^2) is included in the wording. The revised wording would be consistent with the wording in Table 220.55 and Note 3 to Table 220.55. In addition, 2-326 Log #2153 of the 2008 proposals included the following comment on affirmative (Note to TCC: This should be done to all tables in the NEC).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-364 Log #4901 NEC-P02 **Final Action: Reject**
(220.86 Exception (New))

Submitter: Michael A. Anthony, University of Michigan
Recommendation: Add an exception to 220.86 as shown below:

220.86 Schools.

(1) The calculation of a feeder or service load for schools shall be permitted in accordance with Table 220.86 in lieu of Part III of this article where equipped with electric space heating, air conditioning, or both. The connected load to which the demand factors of Table 220.86 apply shall include all of the interior and exterior lighting, power, water heating, cooking, other loads, and the larger of the air-conditioning load or space-heating load within the building or structure.

Exception: If the installation will be similar to the type of installation already under management, with a 3-year baseline of historical electrical demand data, the calculated feeder or service load shall be permitted to be based on calculations made under the supervision of a registered professional engineer.

(2) Feeders and service conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 220.61. Where the building or structure load is calculated by this optional method, feeders within the building or structure shall have ampacity as permitted in Part III of this article; however, the ampacity of an individual feeder shall not be required to be larger than the ampacity for the entire building.

(3) This section shall not apply to portable classroom buildings.

Substantiation: Electrical demand data, gathered from up-to-the moment electrical metering technologies installed in many educational facilities, reveals that there is a substantial gap between the actual measured electrical load at the building service and the capacity of the service required by the basic and optional branch, feeder and service sizing rules that appear in Article 220. Article 220 demand factors that apply to schools has neither been informed by recent energy saving end-use equipment, nor by the building environmental controls that are now deployed in many educational facilities, nor by the energy codes now being adopted in many jurisdictions.

Table 220.86, in particular, originated in another era of the electrical industry when its conservatism could be financed. Initiatives undertaken by NEMA, EPRI and DOE on reducing the energy consumption of transformers suggest that the National Electric Code should fall in line, starting with the way it prescribes load calculations. A new era in the electrical industry is open us and our leading practices need to be aligned more closely with the products of experience and observation.

For example, at many educational institutions, unit substations sized with a 1000 kVA transformer using the rules of Article 200 will never see even a 300 kW load throughout a 50 year life-cycle. Engineers submit load letters to the serving utility asking for an X-kVA transformer based upon NFPA fire safety rules, and the serving utility will install a 50% X-kVA transformer (with space provisions for a fully sized transformer in the future). Dollar loss associated with 1-percent no-load losses alone, on 500 kVA of over-capacity for a year are on the order of $4380.

I have tracked other proposals of this nature that have been submitted to the committee, among them, 2-356 Log #2683 NEC-PO2 submitted by the American Chemistry Council in 2008. Ans I share the panel's concern that open ended approaches to load calculations may not establish minimum levels of safely. But the panel should not have rejected the American Chemistry Council's proposal for lack of technical substantiation data when it could not present any technical substantiation of its own. How else can the NEC change with the times (and allow Owners put that $4380 to work keeping a riskier part of the electrical system safe).

This proposal puts to work the wealth of data available to educational facility managers and engineers that has come from sophisticated metering systems. When the energy management experts at educational facility management organizations can present to an electrical engineer a clear pattern of 1.5 VA per square foot of peak demand, an 1.0 VA of average demand for all the schools in this district, or all the colleges and universities in the state, the engineer ought to be able to secure approval for a design based upon those numbers, allowing some additional capacity for future growth.

Panel Meeting Action: Reject

Panel Statement: There is no clear definition on how "similar" the installation would need to be in order for the demand data to be accurately applied in a new installation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-365 Log #3403 NEC-P02 **Final Action: Reject**
(220.88)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

220.88 New Restaurants. Calculation of a service or feeder load where the feeder serves the total load, for a new restaurant shall be permitted in accordance with Table 220.88 in lieu of Part III of this article.

The overload protection of the service-entrance conductors shall be in accordance with 230.90 and 240.4.

Feeder conductors shall not be required to be of greater ampacity than the service-entrance conductors.

Service-entrance or feeder conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 220.61.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 2-298.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-366 Log #2256 NEC-P02 **Final Action: Reject**
(220.89 (New))

Submitter: Michael J. Pomerleau, Target

Recommendation: Add text as follows:

220.89 Prototype Buildings

The calculation of feeder or service load for a new installation of the same building plan shall be permitted to use actual demand of the existing building's load under the following conditions:

(1) The buildings are of the same size, layout and equipment.

(2) The new installation has the same or higher efficiency within major electrical systems. (Lighting, HVAC, Refrigeration...).

(3) Maximum demand data of the existing building is available for a 1-year period.

(4) The maximum demand at 125 percent does not exceed the ampacity of the feeder or rating of the service.

(5) The feeder has overcurrent protection in accordance with 240.4 and the service has overload protection in accordance with 230.90.

Substantiation: An engineer having data of multiple buildings of the same design should be able to size the service within a safety factor of the known load of multiple existing prototype buildings. The extra service capacity due to sizing per current NEC calculations creates unnecessary waste of copper and a larger than required carbon footprint for our corporation. Our store loads per NEC calculations require using a 3,000 amp service. We have utility data from 1,675 stores showing a maximum demand of approximately 1,200 amps and would like to reduce the service size to 2000 amps. We now have submetering in our stores and measure the actual load of our systems.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees with reducing the minimum load calculations required for feeders and services using the demand data as a basis. The calculation methods provided in this article provide a means to determine adequate feeder and service ampacities but do not require that the entire capacity be connected. The term "prototype building" is not defined.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-367 Log #2353 NEC-P02 **Final Action: Reject**
(220.90 (New))

Submitter: Timothy Croushore, Allegheny Power
Recommendation: Add a new 220.90 to read as follows:
220.90 Engineering Supervision. Feeder and service load calculations for new or existing loads shall be permitted by a qualified Registered Professional Engineer. Feeder conductors shall not be required to be of greater ampacity than the service conductors. Service or feeder conductors shall be permitted to have neutral load determined by 220.61.
Substantiation: The purpose of this change is to add the provision to permit a qualified Registered Professional Engineer to perform load calculations to use appropriate demand/diversity factors for occupancies of similar loads to calculate the feeder or service load. This proposal would allow the load calculation work of the advisory committee on Electrical Safety Research to be used by qualified engineering professionals.

The requirement for a qualified Registered Professional Engineer is similar to the requirement proposed in 645.25 for a qualified Registered Professional Engineer to perform load calculations for computer facilities. The requirement for a qualified Registered Professional Engineer is the most stringent requirement for the capabilities of the individual to calculate the load. This Code accepted term is more limiting to the requirements and capabilities of the engineer than does the Code accepted term "engineering supervision." Using this term in this new section will assure that calculations done by the requirements of this section will be done carefully and accurately.

This provision would also provide the capabilities of a qualified registered professional engineer to calculate loads for similar occupancies in a manner similar to the way Section 220.87 does for existing loads. The qualified registered professional engineer will have the ability to apply demand or diversity factors to the loads of feeders or services. These demand or diversity factors are for similar uses and similar occupancies and are either published or are available from sources of data that meter such loads. For example, this new section may be used by an electrical engineer with a Professional Engineering registration calculating the service or feeder size for commercial occupancies such as a Lowes, Home Depot, Wal-Mart, Target, K-Mart, Cold Stone, Walgreens, Rite-Aid, Krogers, Wynn-Dixie, Supervalue, PetSmart, Petco, etc. and other occupancies based on previously installed and monitored electrical metering. This section could also be used for industrial occupancies under the supervision of a qualified registered professional engineer where demand/diversity factors are accepted by industry for process loads and manufacturing loads.

The last two sentences of this new section are the same as the last two sentences of 220.88 for New Restaurants.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with eliminating all references to the load calculations in the NEC and relying only on the engineers judgment. The panel notes that the submitter can still accomplish the objective by working with the authority having jurisdiction to accept different calculations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-368 Log #3845 NEC-P02 **Final Action: Accept**
(Table 220.102)

Submitter: Ted "Smitty" Smith, Electrical Experts Consulting
Recommendation: Revise text to read as follows:

~~Loads expected to operate simultaneously, but not less than 125 percent full load current of the largest motor and not less than 60 amperes of the load.~~ ~~100~~

The greater of the following: All loads that are expected to operate simultaneously, 125 percent of the full load current of the largest motor, or the first 60 amperes of the load. 100

No changes to remainder of table.
Substantiation: I am an instructor for apprenticeship and for journeyman continuing education in Colorado. We have a large number of farms in Colorado and so load calculations for farms is something that is frequently required of us. I have taught these calculations for years and I have yet to have a student that grasps the intent of this table without a great deal of explanation. I understand that the NEC is not meant for instructional purposes or as an instruction manual but that does not mean we have to word things in such a way as to make them as confusing as possible. The above wording does not change the intent of the requirement, but does make it clearer.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(220.102(B))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:

220.102(B) Other than Dwelling Unit. Where a feeder or service supplies a farm building or other load having two or more separate branch circuits, the load for feeders, service-entrance conductors, and service equipment shall be calculated in accordance with demand factors not less than indicated in Table 220.102.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

ARTICLE 225 — OUTSIDE BRANCH CIRCUITS AND FEEDERS

4-21 Log #678 NEC-P04 **Final Action: Accept in Principle**
(225.2)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comment expressed in the voting.

The text must comply with the NEC Style Manual.

The proposed text includes definitions in 225.2 that are not used in Article 225 or in the NEC. All text must be written in accordance with 90.5(A) in mandatory language.

This action will be considered by the panel as a public comment.

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Revise text to read as follows:

225.2 Definitions.

Electric Supply Station. Any building, room, or separate space within which electric supply equipment is located and the interior of which is accessible only to qualified persons. This includes generating stations and substations, including their associated generator, storage battery, transformer, and switchgear rooms or enclosures, but does not include facilities such as pad-mounted equipment and installations in manholes and vaults.

1. Generating Station. A plant wherein electric energy is produced by conversion from some other form of energy (e.g., chemical, nuclear, solar,mechanical, or hydraulic) by means of suitable apparatus. This includes all generating station auxiliaries and other associated equipment required for the operation of the plant. Not included are stations producing power exclusively for use with communications systems.

2. Substation. An enclosed assemblage of equipment, e.g., switches, circuitbreakers, buses, and transformers, under the control of qualified persons,through which electric energy is passed for the purpose of switching or modifying its characteristics.

225.3~~2~~ Other Articles.

Editorially relocate 225.2 to 225.3 to create a new 225.2.

225.8~~3~~ Calculation of Loads 600 Volts, Nominal, or Less.

Editorially relocate 225.3 to 225.8 to create a new 225.2.

III. Over 600 Volts

225.50 Sizing of Conductors. The sizing of conductors over 600 volts shall be in accordance with 210.19(B) for branch circuits and 215.2(B) for feeders.

225.51 Isolating Switches. Where oil switches or air, oil, vacuum, or sulfur hexafluoride circuit breakers constitute a building disconnecting means, an isolating switch with visible break contacts and meeting the requirements of 230.204(B), (C), and (D) shall be installed on the supply side of the disconnecting means and all associated equipment.

Exception: The isolating switch shall not be required where the disconnecting means is mounted on removable truck panels or metal-enclosed switchgear units that cannot be opened unless the circuit is disconnected and that, when removed from the normal operating position, automatically disconnect the circuit breaker or switch from all energized parts.

225.52 Disconnecting Means

(A) Location. A building or structure disconnecting means shall be located in accordance with 225.32, or it shall be electrically operated by a similarly located remote control device.

(B) ~~225.53~~ Type. Each building or structure disconnect shall simultaneously disconnect all ungrounded supply conductors it controls and shall have a fault-closing rating not less than the maximum available short-circuit current available at its supply terminals.

Exception: Where the individual disconnecting means consist of fused cutouts, the simultaneous disconnection of all ungrounded supply conductors is not required provided that there is a means to disconnect the load before opening the cutouts. A permanent legible sign shall be installed adjacent to the fused cutouts indicating the above requirement.

Where fused switches or separately mounted fuses are installed, the fuse characteristics shall be permitted to contribute to the fault closing rating of the disconnecting means.

(C) Locking

Disconnecting means shall be capable of being locked in the open position. The provisions for locking shall remain in place with or without the lock installed.

Exception: Where an individual disconnecting means consist of fused cutouts, a suitable enclosure, capable of being locked and sized to contain all cutout fuse holders shall be installed at a convenient location to the fused cutouts.

(D) Indicating

Disconnecting means shall clearly indicate whether they are in the open "off" or closed "on" position.

(E) Uniform Position

Where disconnecting means handles are operated vertically the "up" position of the handle shall be the "on" position.

Exception: A switching device having more than one "on" position, such as a double throw switch, need not comply with this requirement.

(F) Identification. Where a building or structure has any combination of feeders, branch circuits, or services passing through it or supplying it, a permanent plaque or directory shall be installed at each feeder and branch circuit disconnect location denoting all other services, feeders,, or branch circuits supplying that building or structure or passing through that building or structure and the area served by each.

225.56 Inspections and Tests

(A) Pre-Energization and Operating Tests. The complete electrical system shall be performance tested when first installed on site. Each protective, switching, and control circuit shall be adjusted in accordance with recommendations of the protective device study and tested by actual operation using current injection or equivalent methods as necessary to ensure that each and every such circuit operates correctly to the satisfaction of the authority having jurisdiction.

(1) Instrument Transformers. All instrument transformers shall be tested to verify correct polarity and burden.

(2) Protective Relays. Each protective relay will be demonstrated to operate by injecting current (and/or voltage) at the associated instrument transformer output terminal and observing that the associated switching and signaling functions occur correctly and in proper time and sequence to accomplish the protective function intended.

(3) Switching Circuits. Each switching circuit will be observed to operate the associated equipment being switched.

(4) Control and Signal Circuits. Each control or signal circuit will be observed to perform it's proper control function or produce a correct signal output.

(5) Metering Circuits. All metering circuits will be verified to operate correctly from potential and current sources similarly to protective relay circuits.

(6) Acceptance Tests. Complete acceptance tests shall be performed after the station installation is completed, on all assemblies, equipments, conductors, control and protective systems as applicable to verify the integrity of all the systems.

(7) Relays and Metering Utilizing Phase Differences. All relays and metering which use phase differences for operation shall be verified by measuring phase angles at the relay under actual load conditions after operation commences, which may be at a later date than Pre-energization tests.

(B) Test Report. A test report covering the results of the tests required in 225.56(A) shall be delivered to the authority having jurisdiction prior to energization.

F.P.N. For acceptance specifications refer to NETA ATS-2007 Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems published by the InterNational Electrical Testing Association.

225.60 Clearances over Roadways, Walkways, Rail, Water, and Open Land.

(A) 22 kV, Nominal, to Ground or Less. The clearances over roadways, walkways, rail, water, and open land for conductors and live parts up to 22 kV, nominal, to ground or less shall be not less than the values shown in Table 225.60.

Table 225.60 Clearances over Roadways, Walkways, Rail, Water, and Open Land

Location	Clearance m	Clearance ft
Open land subject to vehicles, cultivation, or grazing	5.6	18.5
Roadways, driveways, parking lots, and alleys	5.6	18.5
Walkways	4.1	13.5
Rails	8.1	26.5
Spaces and ways for pedestrians and restricted traffic	4.4	14.5
Water areas not suitable for boating	5.2	17.0

(B) Over 22 kV Nominal to Ground. Clearances for the categories shown in Table 225.60 shall be increased by 10 mm (0.4 in.) per kV above 22,000 volts.

(C) Special Cases. For special cases, such as where crossings will be made over lakes, rivers, or areas using large vehicles such as mining operations, specific designs shall be engineered considering the special circumstances and shall be approved by the authority having jurisdiction.

Table 225.61 Clearances over Buildings and Other Structures

Clearance from Conductors or Live Parts from:	**Horizontal**		**Vertical**	
	m	**ft**	**m**	**ft**
Building walls, projections, and windows	2.3	7.5	—	—
Balconies, catwalks, and similar areas accessible to people	2.3	7.5	4.1	13.5
Over or under roofs or projections not readily accessible to people	—	—	3.8	12.5
Over roofs accessible to vehicles but not trucks	—	—	4.1	13.5
Over roofs accessible to trucks	—	—	5.6	18.5
Other structures	2.3	7.5	—	—

FPN: For additional information, see ANSI C2-2007, National Electrical Safety Code.

225.61 Clearances over Buildings and Other Structures.

(A) 22 kV Nominal to Ground or Less. The clearances over buildings and other structures for conductors and live parts up to 22 kV, nominal, to ground or less shall be not less than the values shown in Table 225.61.

(B) Over 22 kV Nominal to Ground. Clearances for the categories shown in Table 225.61 shall be increased by 10 mm (0.4 in.) per kV above 22,000 volts.

FPN: For additional information, see ANSI C2-2007, National Electrical Safety Code.

225.70 Substations

(A) Warning Signs.

(1) General. A permanent, legible warning notice carrying the wording “DANGER — HIGH VOLTAGE” shall be placed in a conspicuous position in the following areas:

(a) At all entrances to electrical equipment vaults, electrical equipment rooms, areas, or enclosures; and

(b) At points of access to conductors on all high voltage conduit systems and cable systems; and

(c) On all cable trays containing high-voltage conductors with the maximum spacing of warning notices not to exceed 3 m (10 ft.); and

(2) Isolating Equipment. Permanent legible signs shall be installed at isolating equipment warning against operating it while carrying current, unless the equipment is interlocked so that it cannot be operated under load.

(3) Fuse Locations. Suitable warning signs shall be erected in a conspicuous place adjacent to fuses, warning operators not to replace fuses while the circuit is energized.

(4) Backfeed. The following steps shall be taken where the possibility of backfeed exists:

(a) Each group-operated isolating switch or disconnecting means shall bear a warning notice to the effect that contacts on either side of the device may be energized; and

(b) A permanent, legible, single-line diagram of the station switching arrangement, clearly identifying each point of connection to the high-voltage section, shall be provided in a conspicuous location within sight of each point of connection.

(5) Metal Enclosed and Metal Clad Switchgear. Where metal enclosed switchgear is installed the following steps shall be taken:

(a) A permanent, legible, single-line diagram of the switchgear shall be provided in a readily visible location within sight of the switchgear and this diagram shall clearly identify interlocks, isolation means, and all possible sources of voltage to the installation under normal or emergency conditions, including all equipment contained in each cubicle, and the marking on the switchgear shall cross-reference the diagram.

Exception to (a): Where the equipment consists solely of a single cubicle or metal-enclosed unit substation containing only one set of high-voltage switching devices, diagrams are not required.

(b) Permanent, legible signs shall be installed on panels or doors that give access to live parts over 600 volts carrying the wording “DANGER — HIGH VOLTAGE” to warn of the danger of opening while energized.

(c) Where the panel gives access to parts that can only be de-energized and visibly isolated by the serving utility, the warning shall add that access is limited to the serving utility or following an authorization of the serving utility.

Substantiation: This proposal is the work of the “High Voltage Task Group” appointed by the Technical Correlating Committee. The task group consisted of the following members: Alan Peterson, Paul Barnhart, Lanny Floyd, Alan Manche, Donny Cook, Vince Saporita, Roger McDaniel, Stan Folz, Eddie Guidry, and Jim Dollard.

The following substantiation is separated to provide clarity:

225.2

A new.2 section is created for definitions in accordance with the NEC Manual of Style. The term “Electric Supply Station” is defined with a definition in ANSI/IEEE C2-2007, National Electrical Safety Code.

225.3 & 225.8

In order to add a new 225.2 for definitions, it is necessary to editorially relocate 225.2 to 225.3 and 225.3 to 225.8.

225.52

The existing text of this section is editorially separated into two new first level subdivisions for clarity and usability. The text is separated into (A) Location and (B) Type to logically separate the information in accordance with the NEC Manual of Style.

A new first level subdivision “(C) Locking”, is added to require that the disconnecting means addressed in 225.52 be capable of being locked in the open position for safety. This text mirrors the text that presently exists in 490.44(C) and is necessary in Part III of Article 225. A high voltage substation may rely on different types of disconnects as well as isolation switches for the purposes of this section and this requirement is necessary in Article 225.

A new first level subdivision “(D) Indicating”, is added to require that the disconnecting means addressed in 225.52 clearly indicate whether they are in the open “off” or closed “on” position. This text mirrors the text that presently exists in 240.81and is necessary in Part III of Article 225. The requirements of 240.81 exist in Part VII of Article 240 and apply only to circuit breakers. The requirement in 404.7 does not adequately address indication requirements for high voltage disconnecting means.

A new first level subdivision “(E) Uniform Position”, is added to require that the disconnecting means handles addressed in 225.52 are operated vertically so that the “up” position of the handle shall be the “on” position. This text mirrors the text that presently exists in 240.81and is necessary in Part III of Article 225. The requirements of 240.81 exist in Part VII of Article 240 and apply only to circuit breakers.

225.56

The installation of substations requires that the overcurrent protection be provided with a designed system consisting of instrument transformers, protective relays, switching circuits, conrol circuits, signal circuits, metering circuits, as well as relays and metering utilizing phase differences. This type of installation requires pre-energization and operating tests to verify proper operation and for the submission of acceptance test criteria to the AHJ. The FPN refers the code user to the industry standard, NETA ATS-2007 for acceptance testing.

225.70

The text in this section is derived primarily from the Ontario Code, Section 36 High-Voltage Installations. This document is attached to the proposal for your information.

First level subdivision “(A) Warning Signs”, provides prescriptive requirements for signage in different areas of a substation as outlined below:

(1) General. This second level subdivision provides general signage requirements throughout the substation.

(2) Isolating Equipment. This signage requirement is intended to prevent someone from opening an isolation switch under load.

(3) Fuse Locations. This signage requirement is intended to prevent the replacement of fuses while the supply circuit is energized.

(4) Backfeed. This signage requirement is intended to prevent injury and damage to equipment where a potential backfeed situation exists.

(5) Metal Enclosed Switchgear. This signage requirement is intended to provide installer/maintainers with necessary information including, single line diagram, interlocks, isolation means, all possible sources of voltage and signs on equipment which allow access to energized parts.

Panel Meeting Action: Accept in Principle

Revise 225.56(A)(2) of the submitter's text as follows follows: (2) Protective Relays. Each protective relay will be demonstrated to operate by injecting current (and/or voltage) at the associated instrument transformer output terminal <u>(or test switch)</u> and observing that the associated switching and signaling functions occur correctly and in proper time and sequence to accomplish the protective function intended.

Panel Statement: The general practice is to inject current at the test switch to prove protective relay connections and functions.

The panel accepts the remainder of the recommendation as submitted.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

MCDANIEL, R.: **EEI Negative Ballot Statement on Proposal 4-21:**

I am balloting negative on this proposal, but do recognize that there are benefits to include medium and high voltage premises wiring installation requirements in the NEC. My reasons for negative ballot on the Panel's action are on items in this proposal that need to be addressed to improve safety and clarity. These are:

1. In 225.2 Definitions, the two terms, "Electric Supply Stations" and "Generating Station" do not occur as terms used in the Code nor used two or more times. In addition, these terms as defined in this proposal are not covered by the NEC as specified in 90.2(B). The term "substation" is used in Article 490 Part III and Article 530 Part VI and, therefore, the definition should move to Article 100.

2. Requirements for an electric substation apply to both outdoor and indoor applications and do not fall under the scope of Article 225. These requirements should be considered under either Article 110 or 490.

3. In 225.52, Exception, using fuses as a non-simultaneous disconnect can result in a ferroresonant condition.

4. In 225.52(C), requirements that only applied to metal-enclosed switchgear in 490.44(C) are proposed to be applied in a general case without technical substantiation. In addition, the proposed exception contains vague and unenforceable language such as "at a convenient location" that is not permitted according to 3.2.1 in the NEC Style Manual.

5. Proposed 225.52(D) and (E) do not address all possible switching configurations. In addition, this language came from 240.81, which is only for circuit breakers and applied generally here. Configurations are possible where one side or another can be energized, regardless of the switch orientation.

6. Regarding proposed 225.56; there are a number of occurrences in this proposed section where the words "will be" or "may be" are used and do not meet the requirements of 3.1.1 and 3.1.2 of the NEC Style Manual. "May" is specifically prohibited unless it recognizes a discretionary judgment on the part of the AHJ. In addition, inspections and tests as described in this proposed section are work practices outside the purpose of the Code; see 90.1(C). The information as proposed is better suited in NFPA 70B and/or NFPA 70E.

7. The proposed 225.70 contains vague and unenforceable language such as "in a conspicuous location" that is not permitted according to 3.2.1 in the NEC Style Manual. Also, in 225.70(A)(4) backfeed is an issue, but as written it applies only to over 600 Volt and not to under 600 Volt applications. It may be more appropriate to be considered in a general area such as Article 110. Additionally, the proposed section mentions "steps shall be taken" which is written as a procedure and outside the purpose of the Code; see 90.1(C). Although there is no objection in using information for this proposed text as derived primarily from other codes such as the Ontario Code, it does not necessarily constitute sufficient technical substantiation for inclusion into the NEC.

4-22 Log #4804 NEC-P04 **Final Action: Accept**
(Table 225.2)

Submitter: Leo F. Martin, Jr., Martin Electrical Code Consultants

Recommendation: In Table 225.2 application of other Article add after the word Grounding <u>and Bonding</u>.

Substantiation: To be consistent with the Title and Scope of Article 250.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-23 Log #4364 NEC-P04 **Final Action: Reject**
(225.4 Exception)

Submitter: Donald W. Zipse, Electrical Forensics, LLC

Recommendation: Delete the following words from Section 225.4, Exception, "and grounded circuit conductors"

Substantiation: By continuing to allow the "grounded circuit conductors", commonly referred to as the neutral to be installed bare allows the neutral current to flow uncontrolled over the earth. This uncontrolled flow of "stray current" results in the potential to harm not only humans but to cows and pigs.

"In order to have and maintain an electrical installation safe from electrical shocks and to prevent electrocution from stray current: All continuously, flowing man made electric current shall be contained within a conductor, insulated from earth, except at one place within the system and only one place can the neutral be connected to earth."

This is accomplished within industrial facilities since they do not make the bastardized electrical transformer connection between the primary neutral and the secondary neutral, which allows the continuous flow of dangerous and hazardous high voltage neutral current over the earth and ground conductors. The industrial facilities keep the neutral insulated and carry the ground conductor with the phase conductors. (See IEEE Standard 141, "Electrical Power Distribution", The Red Book.)

Within the past three years 4 young people were injured due to the uncontrolled flow of neutral current in the earth. Two suffered permanent brain damage and another was declared dead due to electrocution from neutral current (Bryan K. Fitzpatrick ("Bryan") and Diana J. Fitzpatrick ("Diana"), individually, and Timothy Sean Fitzpatrick ("Timothy"), a minor, by and through his Next Friend Bryan K. Fitzpatrick).

Over thirty years ago the Code Making Panel charged with trailers realized persons were being killed by neutral current flowing uncontrolled on the trailers and the over the earth. That panel required an insulated neutral conductor run to all trailers. The next code cycle the panel responsible for marinas adopted the same requirement for insulated neutrals. For 21 years code proposals were submitted to a third panel to make the neutral insulated, which after seven (7) code cycles they did.

Am I going to have to submit this code proposal multiple times until this code panel follows the actions of three previous Code Making Panels making the neutral an insulated conductor, based on safety to the public? I hope NOT.

Panel Meeting Action: Reject

Panel Statement: The conductors are outdoor overhead conductors. They are not installed in the earth and as such they can be bare.

The exception that the submitter has referenced refers to overhead conductors and only if such an installation is specifically permitted elsewhere in the NEC. Installations in existing facilities commonly utilize this exception where feeders are run between buildings and overhead cables are installed that utilize a bare support conductor that also serves for feeder circuit neutral and grounding purposes. The new requirements found in Section 250.32 limit installations such as this to existing installations only, and this exception is required for these existing installations.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-24 Log #274 NEC-P04 **Final Action: Accept**
(225.7(B))

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Change "computed" to "calculated".

Substantiation: The term "calculated" more accurately describes the operation. It is not necessary to have a computer to do the calculations, they can also be done manually.

This is one of a series of proposals to provide consistent terminology throughout the code.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-25 Log #4589 NEC-P04 **Final Action: Accept**
(225.7(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Delete the clause "where the luminaires are not less than 900 mm (3 ft) from windows, platforms, fire escapes, and the like."

Substantiation: With current luminaire construction and grounding requirements the continuing presence of this rule is very difficult to defend. Consider, for example, the conventional bollard-style luminaires operating at 277 volts that mount on grade. Any two-year old can toddle up to one of those and hug it with no code objection. There are no branch-circuit limitations in 210.6(C) that correlate with this rule, so there are no placement limitations for these luminaires indoors, even in environmentally challenging areas such as commercial locker rooms. However, woe betides an installer who places such a luminaire near a fire escape landing, or even near a window.

This proposal is a modest step; a more comprehensive step (not proposed at this time) would be to delete both this paragraph and also (D) in their entirety on the grounds that 210.6 adequately covers the topic. Certainly 210.6(D) does not leave much for 225.7(D) to do, and 210.6(C) covers 225.7(C) except for a spacing limit for certain locations that is very difficult to explain. This section carried a minimum height above grade limitation until the 1987 NEC, however, that has now been gone over two decades and these limits should keep it company.

(225.18)

Submitter: Allen L. Clapp, Power & Communication Utility Training Center
Recommendation: Revise text to read as follows:
225.18 Clearance for Overhead Conductors and Cables.
Overhead spans of open conductors and open multiconductor cables of not over 600 volts, nominal, shall have a clearance of not less than the following when at maximum final sag resulting from ice loading or thermal line losses, whichever is greater:
FPN: New, unstretched wires are installed at initial sag conditions. Over time, the weight, wind, and ice loading received in service will cause inelastic (nonrecoverable) deformation (permanent stretching) in the wire. Final sag conditions occur when further inelastic deformation is reduced to a negligible amount. Maximum sag occurs when the combination of (a) elastic (recoverable) deformation due to thermal or ice loading and (b) inelastic deformation is the greatest. Rule 230A4, Rule 232A, and Appendix B of the National Electrical Safety Code ANSI C2-2007 contain information on (a) calculating the inelastic deformation due to conductor/cable weight, ice loading, and wind loading that is appropriate for various loading areas and useful in calculating maximum final sag and (b) appropriate conductor temperatures and ice loading useful in determining conditions that will produce maximum final sag, respectively.
(1) 3.0 m (10 ft) — above finished grade, sidewalks, or from any platform or projection from which they might be reached where (a) the voltage does not exceed 150 volts to ground and (b) the area is accessible to pedestrians only
(2) ~~3.7 m (12.0 ft)~~ 3.8 m (12.5 ft) — over portions of residential property and residential driveways~~, and those commercial areas~~ where (a) such portions are not subject to truck traffic and ~~where~~ (b) the voltage does not exceed 300 volts to ground
EXCEPTION: This clearance may be reduced to 3.7 m (12.0 ft) for cables with insulated conductors cabled together with an effectively grounded, bare neutral or messenger; this exception does not apply for cables having an insulated neutral or messenger
(3) 4.5 m (15 ft) — for those areas listed in the 3.7-m (12-ft) classification where the voltage exceeds 300 volts to ground
(4) 5.5 m (18 ft) — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, portions of driveways on residential property subject to truck traffic, and other land traversed by vehicles, such as cultivated, grazing, forest, and orchard.
Substantiation: This proposal contains three types of changes. The first addresses the need to assure that the conductors will not sag enough after installation to produce vertical clearances less than those required by this NEC section. The second addresses the need to recognize that the front portions of most residential driveways are general-use driveways and subject to truck traffic. The third prohibits use of the reduced clearance of 12 ft for service drops to commercial buildings.
To assure that conductors and cables are installed high enough to maintain the required clearance throughout their life, and not just at installation, consideration of sag changes due to their own weight, ice loading, and thermal loading is necessary. The National Electrical Safety Code contains appropriate information for use in calculating maximum final sags to assure that vertical clearances are met and is, therefore, a good reference.
Many portions of residential property are subject to truck traffic. In particular, the front portion of most residential driveways is subject to moving vans, delivery trucks, and ambulances. As a result of hundreds of service drops being torn down in the 1980s, the NESC raised the clearances required for service drops above driveways and limited the application of the reduced clearance of 12 ft (applicable only to service drops) to only those *residential* buildings where the height of the building did not allow achieving the full clearance value of 16.0 ft required by NESC Table 232-1. Some of the service-drop teardown accidents reviewed had serious safety consequences. In some cases, service drops torn down by moving vans and delivery trucks (which often exceed 12 ft in height) were touched in a damaged area by personnel trying to move them out of the way. In others, ambulances cut off the lights and power to houses to which they were making an emergency response call. Since this NEC section does not cover service drops, there is no reason to allow less than the normal line clearances.
The NESC clearances to ground are based upon review of more than twenty years of accident data, as well as the general history of above-ground clearances. Clearances for open wire (whether bare or covered) are required to be greater than those for multiplex cable (duplex, triplex, and quadruplex) with an effectively grounded bare neutral or messenger. Those NESC Table 232-1, Category 5 clearances are 12.0 ft for multiplex cable with bare neutrals/

messengers and 12.5 ft for open wire (bare or covered wire) above areas not subject to trucks (vehicles defined as being greater than 8 ft in height), riders on horseback or other large animals, etc.. Where subject to trucks, riders on horseback, etc., NESC clearances are 16.0 ft and 16.5 ft, respectively. It is recommended that, at a minimum, the NEC match the NESC clearances. Thus, the clearances in 225.18(2) should be increased for open wire to match those of NESC Table 232-1, Category 5.

The above proposal was worded in a manner to make the least changes to the existing language as practical. However, you may find that the following language may be preferable for subpart 4:

4) 5.5 m (18 ft) — over public streets, alleys, roads, parking areas, driveways (excluding portions of driveways on residential property not subject to truck traffic), and other lands (such as cultivated, grazing, forest, and orchard lands) subject to truck traffic, ~~driveways on other than residential property, and other land such as cultivated, grazing, forest, and orchard~~

I am a licensed Professional Engineer with over 400 electric and communication utilities and large industrial complexes as clients. I am a member of NFPA, IEEE, and IAEI. I have used both the National Electrical Code and the National Electrical Safety Code in my work since 1964. I have been a member of NESC subcommittees since 1971 and have served several times over the years on NESC/NEC coordination task forces. I have reviewed over 20 years of electrical accident data in that capacity. I have also been involved in over 600 accident investigation and litigation assignments over the years. The above proposal is made to (a) improve safety and (b) harmonize certain requirements of the NEC with those of theNESC to limit the opportunity for confusion.

Panel Meeting Action: Reject

Panel Statement: The submitter has submitted a proposal whereby the only calculation formula is defined in a different ANSI Standard, the National Electrical Safety Code. This additional standard is not uniformly adopted and it would be impossible for local AHJs to enforce this requirement and installers to comply with it. Article 225 applies to outside feeders and branch circuits, both are clearly premises wiring systems and are on the customer side of the "Service Point," and these particular installations have nothing to do with service drops at the interface of residential driveways and streets as referenced by the submitter. In addition these conductors have to have properly sized short circuit, ground fault, and overload protection at their point of supply and thus are not as susceptible to personnel hazard as utility supply conductors would be. The submitter has not defined any documented problems with the existing requirements.

4-31 Log #3 NEC-P04 **Final Action: Accept in Part**
(225.18(5) (New))

NOTE: This proposal appeared as Comment 4-8 on Proposal 4-12 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-12 was:

Revise text to read as follows:

225.18 Clearance from Grade ~~Ground~~.

Overhead spans of open conductors and open multiconductor cables of not over 600 volts, nominal, shall have a clearance of not less than the following:

(1) 3.0 m (10 ft) - above finished grade, sidewalks, or from any platform or projection from which they might be reached where the voltage does not exceed 150 volts to ground and accessible to pedestrians only

(2) 3.7 m (12 ft) - over residential property and driveways, and those commercial areas not subject to truck traffic where the voltage does not exceed 300 volts to ground

(3) 4.5 m (15 ft) - for those areas listed in the 3.7-m (12 ft) classification where the voltage exceeds 300 volts to ground

(4) 5.5 m (18 ft) - over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land traversed by vehicles, such as cultivated, grazing forest, and orchards.

Submitter: Joseph A. Hertel, Rep. Safety and Buildings

Recommendation: Add the following to 225.18 Clearance from Grade:

"(5) 7.5 m (24.5 ft) - over track rails of railroads."

Substantiation: There is currently no specified height for these conductors above a railroad. We have many industrial facilities where rail is used throughout the facility and the conductors are owned and maintained by the facility. The height requirements are from tables found in ANSI C2, National Electrical Safety Code, which we have used since there is no mention in the NEC.

Panel Meeting Action: Accept in Part

Add the following text:

The panel accepts the addition of text: "(5) 7.5 m (24.5 ft) - over track rails of railroads." and rejects the title change. The title already was changed in the 2008 code.

Panel Statement: The panel accepts the addition of text "(5) 7.5 m (24.5 ft) - over track rails of railroads" and rejects the title change. The title already was changed in the 2008 code.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-32 Log #2746 NEC-P04 **Final Action: Reject**
(225.19(A), (B), and (C))

Submitter: Allen L. Clapp, Power & Communication Utility Training Center

Recommendation: Revise text to read as follows:

225.19 Clearances from Buildings for Conductors of Not over 600 Volts, Nominal, Passing but Not Attaching To Buildings or Other Nonbridge Installations .

The following clearances apply to conductors and cables passing but not attaching to buildings.

FPN: For service drop clearances, see 230.24.

Horizontal clearances shall be not less than the following values when at rest without wind deflection. Vertical clearances shall be not less than the following values when at maximum final sag.resulting from ice loading or thermal line losses, whichever is greater:

FPN: New, unstretched wires are installed at initial sag conditions. Over time, the weight, wind, and ice loading received in service will cause inelastic (nonrecoverable) deformation (permanent stretching) in the wire. Final sag conditions occur when further inelastic deformation is reduced to a negligible amount. Maximum sag occurs when the combination of (a) elastic (recoverable) deformation due to thermal or ice loading and (b) inelastic deformation is the greatest. Rule 230A4, Rule 232A, and Appendix B of the National Electrical Safety Code ANSI C2-2007 contain information on (a) calculating the inelastic deformation due to conductor/cable weight, ice loading, and wind loading that is appropriate for various loading areas and useful in calculating maximum final sag and (b) appropriate conductor temperatures and ice loading useful in determining conditions that will produce maximum final sag, respectively.

(A) Vertical Clearances Above Building Roofs. Overhead spans of open conductors and open multiconductor cables shall have a vertical clearance of not less than ~~2.5 m (8 ft)~~ 3.0 m (10 ft) above the roof surface (if the surface is not readily accessible to pedestrians) or 3.4 m (11 ft) above the roof surface (if the surface is readily accessible to pedestrians). The vertical clearance above the roof level shall be maintained ~~for a distance not less than 900 mm (3 ft) in all directions from the edge of the roof.~~ as a diagonal arc from the edge of the roof over to a vertical extension of the horizontal clearance required by (B) below.

Exception No. 1: The area above a roof surface subject to pedestrian or vehicular traffic shall have a vertical clearance from the roof surface in accordance with the clearance requirements of 225.18.

~~Exception No. 2: Where the voltage between conductors does not exceed 300, and the roof has a slope of 100 mm in 300 mm (4 in. in 12 in.) or greater, a reduction in clearance to 900 mm (3 ft) shall be permitted.~~

~~Exception No. 3: Where the voltage between conductors does not exceed 300, a reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (1) not more than 1.8 m (6 ft) of the conductors, 1.2 m (4 ft) horizontally, pass above the roof overhang and (2) they are terminated at a through-the-roof raceway or approved support.~~

~~Exception No. 4: The requirement for maintaining the vertical clearance 900 mm (3 ft) from the edge of the roof shall not apply to the final conductor span where the conductors are attached to the side of a building.~~

(~~B~~C) Clearances From Nonbuilding or Nonbridge Structures. From signs, chimneys, radio and television antennas, tanks, and other nonbuilding or nonbridge structures, clearances ~~— vertical, diagonal, and horizontal —~~ shall not be less than ~~900 mm (3 ft).~~ the following. The diagonal clearance in the transition zone between vertical and horizontal clearances shall be not less than the vertical clearance requirement.

	Catwalks and other surfaces upon which personnel walk	Other portions of such installations
Vertical	3.4 m (11.0 ft)	1.7 m (5.5 ft)
Horizontal	1.5 m (5.0 ft)	1.5 m (5.0 ft)

(~~C~~ B) Horizontal Clearances from Buildings. Clearances shall not be less than ~~900 mm (3 ft)~~ 1.5 m (5.0 ft).

Substantiation: Exceptions 2, 3, and 4 apply only to service drops, which are covered in 230.24 and should not be duplicated here. Having the duplicate here causes confusion, in that some think that ordinary secondary wires or cable passing by a building can have the lower clearances.

I have also proposed adding language relative to final sag at this location similar to that recommended in separate proposals for 225.18 and 230.24(B). Wires must be installed high enough at installation to allow the required clearances to be met under all conditions of expected loading. The effect of both inelastic deformation and elastic deformation must be considered.

The remainder of this proposal is to harmonize the NEC clearance values with those of the NESC.

As a part of my NESC Clearances Subcommittee work, I led the review of electrical accidents relating to construction and maintenance of buildings and other installations adjacent to energized power lines in the 1970s and again in the 1980s. In each case, we had a solid 10 years of accident data gathered from state public service commissions and electric utilities across the nation, with the outlying and overlapping information spanning approximately 24 years. The review was performed by a special task force of utility engineers, consulting engineers, and public service commission engineers familiar with both building construction and maintenance and utility line construction.

This work was done as a part of a complete coordination of NESC line clearances to assure that appropriate amounts of clearance were required in each type of area. Several NESC clearances to buildings and other installations were adjusted at that time to match the accident data. The history of these changes is written up in the NESC Handbook at the discussion of Rule 234C. The basis for the 1990 and later NESC clearances, including the electrical and mechanical components of clearance and the dimensions of expected conflicting activity, can be found in Appendix A of the NESC.

The above proposals are made to adjust NEC clearances to match the accident data that was available to us and assure that appropriate clearances are required by the NEC, based upon both the expected activity in the area over which or beside which the conductor exists and the relative voltage of the conductor.

The values that are not adjusted either match or exceed those required by the NESC and are not proposed to be changed. The values for portions of signs, etc., upon which personnel walk are new to the NEC. The changes in other values are necessary to limit contact by those working or playing on the surfaces of the buildings, signs, etc., as applicable.

I am a licensed Professional Engineer with over 400 electric and communication utilities and large industrial complexes as clients. I am a member of NFPA, IEEE, and IAEI. I have used both the National Electrical Code and the National Electrical Safety Code in my work since 1964. I have been a member of NESC subcommittees since 1971 and have served several times over the years on NESC/NEC coordination task forces. I have also been involved in over 600 accident investigation and litigation assignments over the years. The above proposal is made to (a) improve safety and (b) harmonize certain requirements of the NEC with those of the NESC to limit the opportunity for confusion.

Panel Meeting Action: Reject

Panel Statement: The submitter has submitted a proposal whereby the only calculation formula is defined in a different ANSI Standard, the National Electrical Safety Code. This additional standard is not uniformly adopted and it would be impossible for local AHJs to enforce this requirement and installers to comply with it. Article 225 applies to outside feeders and branch circuits, both are clearly premises wiring systems and are on the customer side of the "Service Point," and these particular installations have nothing to do with service drops at the interface of residential driveways and streets as referenced by the submitter. In addition these conductors have to have properly sized short circuit, ground fault and overload protection at their point of supply and thus are not as susceptible to personnel hazard as utility supply conductors would be. The submitter has not defined any documented problems with the existing requirements.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-33 Log #4893 NEC-P04 **Final Action: Reject**

(225.21)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal with respect to "agreeing" with the submitter, yet providing no specific reason for the panel action.

This action will be considered by the panel as a public comment.

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services

Recommendation: Revise text as follows:

~~225.31 Multiconductor Cables on Exterior Surfaces of Buildings. Supports for multiconductor cables on exterior surfaces of buildings shall be as provided in 230.51.~~ <u>225.21 Support of Multiconductor Cables and Raceways. Multiconductor cables and raceways mounted on or attached to the exterior surface of a building or structure shall be supported under the conditions described in their respective articles and sections.</u>

Substantiation: Branch circuits and feeders located in areas covered by the scope of article 225 may be installed using any of the wiring methods appropriate for the location. These wiring methods include both cables and raceways. The revised text addresses both cables and raceways, as well as buildings and structures.

Panel Meeting Action: Reject

Panel Statement: The panel agrees that all required information is not in Chapter 3.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-34 Log #3703 NEC-P04 **Final Action: Accept**

(225.22)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise 225.22 as follows:

225.22 Raceways on Exterior Surfaces of Buildings or Other Structures.

Raceways on exteriors of buildings or other structures shall be arranged to drain and shall be ~~raintight~~ <u>suitable for use in wet locations</u>.

Substantiation: Acceptance of this proposal would correlate with the Panel's action on 230.53 during the 2008 NEC cycle. With respect to the raceways specified in the wiring methods in 225.10, the individual articles identify such raceways for their suitability for use in "wet locations." The word "raintight" in 225.22 is overridden, or introduces confusion as to which is the true requirement.

The definition of "raceway" in Article 100 does not include fittings. Section 314.15(A) requires that "... fittings installed in wet locations shall be listed for use in wet locations," not "raintight". The definition of "raintight" in Article 100 contains unenforceable language "...will not result in entrance of water under specified test conditions" verifiable only for listed raceways. Raceways suitable for use in wet locations are listed for use in wet locations, not "raintight".

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-35 Log #307 NEC-P04 **Final Action: Accept**

(225.27 (New))

Submitter: Joel A. Rencsok, Scottsdale, AZ

Recommendation: Add a new section to Article 225 which states:

225.X Raceway Seal. Where a feeder raceway enters a building or structure from an underground distribution system, it shall be sealed in accordance with 300.5(G). Spare or unused raceways shall also be sealed. Sealants shall be identified for use with the cable insulation, shield or other components.

Substantiation: Feeders entering buildings or other structures are no different than services. The requirements should be the same. See NEC 230.8.

I have provided a few photos of what can happen when an underground metal mole damaged a feeder trying to install a cable for digital cable. The sustaining arc generated hydrogen gas and the 600-ampere fuses did not blow.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

SIGMUND, J.: I am voting against the panel action to accept. In industrial locations, where conditions of maintenance and supervision would preclude unintended underground objects entering electrical equipment, an exception should be included stating that for industrial locations, where conditions of maintenance and supervision ensure that only qualified persons will be maintaining and installing this equipment, the requirement to seal all underground conduits does not apply.

4-36 Log #4 NEC-P04 **Final Action: Accept**

(225.30 (New))

NOTE: This proposal appeared as Comment 4-12 on Proposal 4-16 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-16 was:

Revise the text in the main paragraph of 225.30 as follows:

~~Where more than one building or other structure is on the same property and under single management, each additional building or other structure that is served by a branch circuit or feeder on the load side of the service disconnecting means shall be supplied by only one feeder or branch circuit.~~ <u>A building or other structure shall be permitted to be supplied by one set of feeder conductors or by one set of branch circuit conductors</u> unless <u>otherwise</u> permitted in 225.30(A) through (E). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit. <u>Feeders or branch circuits shall be permitted to run from one building or other structure to another building or other structure where the buildings or other structures are on the same property and under single management.</u>

Submitter: Henry A. Jenkins, Wake County, Inspections Development / Rep. N.C. Ellis Cannady Chapter of I.A.E.I

Recommendation: The Panel should have Accepted in Principle. We suggest the addition of a new second paragraph to read as follows:

"Where a branch circuit or feeder originates in these additional buildings or other structures, only one feeder circuit shall be permitted to supply power back to the original building or structure, unless permitted in 225.30(A) through (E)."

Insert it between the existing first sentence and the last sentence. Making the existing sentence into a separate third paragraph. The new text to read as follows:

225.30 Number of Supplies. Where more than one building or other structure is on the same property and under single management, each additional building or other structure that is served by a branch circuit or feeder on the load side of the service disconnecting means shall be supplied by only one feeder or branch circuit unless permitted in 225.30(A) through (E).

<u>Where a branch circuit or feeder originates in these additional buildings or other structures, only one feeder or branch circuit shall be permitted to supply power back to the original building or structure, unless permitted in 225.30(A) through (E).</u>

Substantiation: The existing text only covers one feeder or branch circuit to supplying an additional building or structure where there is more than one building on the same property and under single management. The text does not address bringing more than one feeder or branch circuit from one of these peripheral buildings back to the original building. The present text would permit an unlimited number of feeders or branch circuits to be brought back to the original building. For example, a generator could provide power for an emergency branch circuit panel in building No. 2 and any number of branch circuits could be fed from that emergency panel back to the original building to supply any number of emergency loads. The same would hold true for a feeder distribution panel.
Panel Meeting Action: Accept
Panel Statement: The panel recognizes that the new text is to be inserted between the first sentence and the last sentence. The result will be that the last sentence will become a third paragraph.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-37 Log #5 NEC-P04 **Final Action: Accept**
(225.30 (New))

NOTE: This proposal appeared as Comment 4-13 on Proposal 4-16 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-16 was:
Revise the text in the main paragraph of 225.30 as follows:
~~Where more than one building or other structure is on the same property and under single management, each additional building or other structure that is served by a branch circuit or feeder on the load side of the service disconnecting means shall be supplied by only one feeder or branch circuit.~~ <u>A building or other structure shall be permitted to be supplied by one set of feeder conductors or by one set of branch circuit conductors</u> unless <u>otherwise</u> permitted in 225.30(A) through (E). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit. <u>Feeders or branch circuits shall be permitted to run from one building or other structure to another building or other structure where the buildings or other structures are on the same property and under single management.</u>
Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Panel should have Accepted in Principle in Part. We suggest the adding of a new second paragraph to read as follows:
"Where a branch circuit or feeder originates in these additional buildings or other structures, only one feeder circuit shall be permitted to supply power back to the original building or structure, unless permitted in 225.30(A) through (E)." Insert it between the existing first sentence and the last sentence making the existing sentence into a separate third paragraph. The new text to read as follows:
225.30 Number of Supplies. Where more than one building or other structure is on the same property and under single management, each additional building or other structure that is served by a branch circuit or feeder on the load side of the service disconnecting means shall be supplied by only one feeder or branch circuit unless permitted in 225.30(A) through (E). <u>Where a branch circuit or feeder originates in these additional buildings or other structures, only one feeder or branch circuit shall be permitted to supply power back to the original building or structure, unless permitted in 225.30(A) through (E).</u>
Substantiation: The existing text only covers one feeder or branch circuit to supplying an additional building or structure where there is more than one building on the same property and under single management. The text does not address bringing more than one feeder or branch circuit from one of these peripheral buildings back to the original building. The present text would permit an unlimited number of feeders or branch circuits to be brought back to the original building.
For example, a generator could provide power for an emergency branch circuit panel in Building No. 2 and any number of branch circuits could be fed from that emergency panel back to the original building to supply any number of emergency loads. The same would hold true for a feeder distribution panel.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-38 Log #3753 NEC-P04 **Final Action: Accept in Principle**
(225, Part II and 225.30)

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise the title of Part II to Article 225 to read as follows:
II. ~~More than One Building or Other Structure~~ <u>Buildings or Other Supplied by a Feeder(s) or Branch Circuit(s)</u>
In addition, revise the text of 225.30 to read as shown:
225.30 Number of Supplies. ~~Where more than one~~ <u>A</u> building or other structure ~~is on the same property and under single management, each additional building or other structure~~ that is served by a branch circuit or feeder on the load side of ~~the~~ <u>a</u> service disconnecting means shall be supplied by only one feeder or branch circuit unless permitted in 225.30(A) through (E). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit.
Substantiation: The overall intent of Part II of Article 225 needs to be clarified. The present wording is leading to a significant amount of time being spent arguing over whether or not a building is supplied from another building or from a structure or from something else. It would appear that the ultimate intent of these provisions in Article 225 is to require that we have appropriate disconnecting means at any building or structure that is supplied by a branch circuit or feeder. If that is the case, why not simply revise the language to make that clear.
For example, take a building that has the service disconnect located away from the building by some distance (i.e. determined by the AHJ to not be at the building itself). The conductors from the service disconnect to the building are an outside feeder. We would expect that the provisions of Part II apply to that feeder when it gets to the building.
The problem is with the present wording that says "each additional building or structure". If the service disconnect is a pad mounted single switchboard section, the only way you can argue that Part II of 225 applies is to argue that the switchboard is a "structure". I believe that it only adds confusion to say that a piece of electrical equipment is a structure.
The proposed revision to both the Part II title and to 225.30 would simply the text to simply say that if you have a building supplied by a feeder or branch circuit, you have to comply with Part II. Note that the proposed title for Part II is identical to the title used by CMP 5 for 250.32. The use of the same terminology in both parts of the code would greatly benefit users in applying the proper rules.
The suggested revision to 225.30 that changes "…of the service disconnecting…" to …of a service disconnecting… is to simply recognize that there may be more than one service disconnecting means on the premises.
Panel Meeting Action: Accept in Principle
Revise the title as follows: Buildings or Other Structures Supplied by a Feeder(s) or Branch Circuit(s).
The panel accepts the changes to the first sentence of Section 225.30.
Panel Statement: The panel accepted in principle the title change but revised the wording. The panel accepted the remainder of the proposal.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-39 Log #3894 NEC-P04 **Final Action: Reject**
(225.30(F))

Submitter: Kris Dobler, E Light Electric Services
Recommendation: Add new text as follows:
<u>(F) Modular temporary school rooms or offices that consist of a single disconnecting means for each module shall be permitted to be served by a separate feeder for each module. The documented switching procedures required in section (E) shall apply when two or modules are combined to make a single structure.</u>
Substantiation: Many schools and construction sites are now using modular school and office buildings for temporary classroom and office space. These modules often can be combined to make large office or classroom space. Each module typically comes with a separate disconnecting means because the manufacturer does not know how they will combined at the time of manufacture. The current requirements of the NEC often times require the installer to remove the single disconnect or make the installation of multiple modules work. This change would allow multiple feeds, one to each module, for a temporary office or classroom were multiple modules are installed without decreasing safety or increasing cost to the customer.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any technical or factual data to support the requested reduction in safety requirements. The concerns expressed by the submitter are really design and installation concerns and these issues are no different when feeders are the source of supply than they are if a service is the source of supply.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-40 Log #664 NEC-P04 **Final Action: Reject**
(225.32)

Submitter: Joe Penachio, Joe Penachio Electrician
Recommendation: Revise text to read as follows:
Location. The disconnecting means shall be installed either inside or outside of the building or structure served or where the <u>raceway, cable or</u> conductors pass through the building or structure. The disconnecting means shall be at a readily accessible location nearest the point of entrance of the <u>raceway, cable or</u> conductors. For the purpose of this section, the requirements in 230.6 shall be utilized.
Substantiation: This is a companion proposal to a proposal to 230.70(A)(1) submitted in June 2008.

As stated, the nearest point of entrance of these conductors is where the conductors exit the raceway or cable. A legal argument can be made that a disconnect could be installed 20, 30, or even 50 ft inside a building or structure because it would still be installed at the nearest point of entrance of the conductors as stated.

Adding the wording "raceway, cable, or" ahead of the word "conductors" clarifies the code's intent that the disconnect be at the nearest point of entrance to the building or structure.

Panel Meeting Action: Reject

Panel Statement: The existing language mandates what the submitter is requesting. The term conductors is used and this generic term applies to all conductors entering a building or structure regardless of the wiring method that has been selected to contain the conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-41 Log #4139 NEC-P04 **Final Action: Reject**

(225.32)

Submitter: Larry LeVoir, City of Irvine

Recommendation: Add new text to read as follows:

<u>Where the disconnecting means is located outside the building and is within sight of the building, an additional disconnecting means shall not be required where conductors enter the building.</u>

Substantiation: This addition would permit the disconnect to be located up to fifty feet away from the building. Under current wording, if the disconnect is located outside and not mounted on the building, then the rules in Article 225 would require an additional disconnecting means inside the building where the conductors enter. This would seem needlessly restrictive in my opinion. This proposal also parallels the existing requirements in 700.12(B)(6), 701.11(B)(5), and 702.11 which allow the disconnecting means for a feeder to be remote from the building.

Panel Meeting Action: Reject

Panel Statement: Over the past several code cycles, CMP 4 has had to grapple with this issue of what distance from a building or structure is a safe distance for locating a disconnecting means whether it be for service conductors or feeder conductors and no agreeable distance has been found. The submitter has not presented and documented technical rationale for changing this opinion.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-42 Log #594 NEC-P04 **Final Action: Reject**

(225.32, FPN (New))

Submitter: Paul Guidry, Fluor Enterprises, Inc.

Recommendation: Add the following FPN under main paragraph:

<u>FPN: For corresponding grounding requirements, see 250.32(D).</u>

Substantiation: It's been my experience that 250.32(D) grounding requirements are missed often. Adding this FPN may aid the user by alerting them to the fact that there is more to consider when utilizing 225.32.

Panel Meeting Action: Reject

Panel Statement: Section 225.2 and its table already provide a generic reference to Article 250. Section 225.32 provides requirements for the location of a disconnecting means and would not be an appropriate area to reference grounding and bonding requirements.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-43 Log #345 NEC-P04 **Final Action: Accept**

(225.33(A))

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise text to read as follows:

Change "per" to "for each".

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-44 Log #2528 NEC-P04 **Final Action: Reject**

(225.34(B))

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Revise text to read as follows:

(B) Additional Disconnecting Means. The one or more additional disconnecting means for fire pumps or for <u>the</u> emergency <u>or</u> legally required ~~or optional standby~~ system permitted by 225.30 shall be installed sufficiently remote from the one to six disconnecting means for normal supply to minimize the possibility of simultaneous interruption of supply.

Substantiation: For the purpose of "locating" the disconnecting means for "optional standby systems" **remote from other disconnecting means**, the treatment of optional standby systems as though they were critical loads to be maintained in the ON condition in all possible cases is unnecessary. In fact, safety would be INCREASED if the disconnecting means for "optional loads" was grouped with the other "normal load" disconnecting means where fire incidences are concerned. Electrical feeders (or services) that do NOT supply life safety equipment or other legally required loads should be capable of being quickly de-energized during emergency events by locating all of the disconnecting means in close proximity. Added words are for grammatical accuracy.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented any technical rationale to support his assumption that locating the disconnects adjacent to one another enhances safety. Even though the systems he references are not legally required, these optional systems could provide assistance to building occupants or responding emergency personnel. There are requirements for proper labeling of these disconnects as to where other disconnects are located this should provide the additional safety the submitter has mentioned.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-45 Log #3282 NEC-P04 **Final Action: Reject**

(225.34(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete and substitute:

The supply conductors and disconnecting means for circuits permitted in 225.30(A) for fire pumps, emergency systems, and legally required or optional standby systems shall be installed remote from all other supply systems to minimize the likelihood of an occurrence in one system affecting the supply of another system.

Substantiation: Edit. the supply wiring system, including supply conductors, not just disconnecting means should be separated for reliability. "Sufficiently" is subjective and a term to be avoided per the Style Manual. The panel statement for Proposal 4-21 (Log 1103) in the 2007 ROP indicated disconnects for these loads (systems) must be located remote from ANY other disconnects.

Panel Meeting Action: Reject

Panel Statement: The purpose of this requirement is to prevent accidental operation of the switches. Separation of circuits is adequately covered in 700 and 701.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-46 Log #4591 NEC-P04 **Final Action: Reject**

(225.36)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise to read as follows:

The disconnecting means specified in 225.31 shall be comprised of a circuit breaker, molded case switch, or a general use switch. Where applied in accordance with 250.32(B) Exception, the disconnecting means shall be suitable for use as service equipment.

Substantiation: The suitability for use as service equipment means it is capable of providing for regrounding of the neutral supply conductor. This is only permitted in accordance with the exception, and in other applications it is unnecessary. The syntax of this proposal makes it possible to leave the wording of the exception unchanged.

Panel Meeting Action: Reject

Panel Statement: There are more requirements for a device to be suitable for service use, including larger spacing. The submitter has not made it clear as to his proposed changes in accordance with Section 4.3.3 content of proposals.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-47 Log #4706 NEC-P04 **Final Action: Reject**

(225.36, FPN (New))

Submitter: Clyde V. Carl, North Carolina Dept. of Administration/State Construction Office

Recommendation: Add new text as follows:

<u>FPN: Refer to UL 869A, *Reference Standard for Service Equipment*, fourth edition, for the criteria that determines a disconnecting means to be "Suitable for Service Equipment."</u>

Substantiation: Common misunderstandings are that service entrance equipment is manufactured with special bracing and that breakers for service entrance equipment are especially listed for use in service entrance equipment. In UL 869A, *Reference Standard for Service Equipment*, fourth edition, one learns in Section 14.2, <u>Insulated neutral</u>, Paragraph 14.2.1, that, "Equipment having a neutral insulated from the enclosure, intended for use as service equipment, and that can accommodate not more than six main disconnecting means shall be marked "Suitable for use as service equipment."

Panel Meeting Action: Reject

Panel Statement: Equipment that is suitable for use as service equipment is investigated and marked accordingly as part of the listing. A user does not need to reference UL 869A. If the equipment is not marked "suitable for use as service equipment" or "service equipment" it cannot be used as such.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-48 Log #1869 NEC-P04 **Final Action: Reject**
(225.36 Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise exception: For garages and ~~outbuildings on residential property~~ accessory buildings or structures for a dwelling unit(s) snap switches ~~or sets~~ of ~~3-way or 4-way snap switches~~ shall be permitted to be the disconnecting means provided they comply with 404.14. Such switches installed in the supply circuit from its origin to and including the disconnecting switch for the building or structure shall have an ampere rating not less than the circuit rating.
Substantiation: The provision should cover buildings and structures not deemed buildings. "Residential" may be perceived as not including dwellings on a farm. "Snap switches" covers all types and referencing 3-way and 4-way types is superfluous. A snap switch used as the main building or structure disconnecting means should have a rating not less than the supply circuit since the calculated load on a va/sq. ft. or per outlet may not require such rating but the load capability of the circuit could be equal to its rating.
Panel Meeting Action: Reject
Panel Statement: The reference to 3-way and 4-way switches should be retained. These may be snap switches but the disconnecting functionality of these devices is quite different and could be interpreted as not being acceptable as a disconnect for a building.
In this proposal the submitter has made an effort to mark the additional wording and the deleted wording but there is wording in the proposal that is not identified as new or changed that is not in the Code.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal. I recommend that the submitter change the proposal to simply address potential safety concerns with allowing 3 way or four way switches to serve as a building disconnecting means and resubmit i in the comment period.

4-49 Log #2943 NEC-P04 **Final Action: Reject**
(225.36 Exception)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text to read as follows:
225.36 Suitable for Service Equipment.
The disconnecting means specified in 225.31 shall be suitable for use as service equipment.
Exception: For garages and outbuildings on residential property, a snap switch ~~or a set of 3-way or 4-way snap switches~~ shall be permitted as the disconnecting means.
Substantiation: The portion of the exception that permits a set of 3-way or 4-way switches to be used as the disconnecting means for garages and outbuildings should be deleted as it violates the very reason behind requiring disconnecting means which is that the electrical circuit can be safely isolated while work is being performed on conductors and equipment.
Panel Meeting Action: Reject
Panel Statement: The reference to 3-way and 4-way switches should be retained. These may be snap switches but the disconnecting functionality of these devices is quite different and could be interpreted as not being acceptable as a disconnect for a building.
In this proposal the submitter has made an effort to mark the additional wording and the deleted wording but there is wording in the proposal that is not identified as new or changed that is not in the code.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 8 Negative: 2
Explanation of Negative:
ROGERS, J.: I agree with the submitter that if a switch is to be used as a disconnecting means it should truly disconnect the energized conductors.
STAFFORD, T.: This panel member determines that submitter's substantiation is correct as provided in original proposal.

4-50 Log #3396 NEC-P04 **Final Action: Reject**
(225.37)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
Section 225.37 Identification. Where a building or structure has any combination of feeders, branch circuits, service-entrance conductors, or services passing through it or supplying it, a permanent plaque or directory shall be installed at each feeder and branch disconnect location denoting all other services, feeders, or branch circuits supplying that building or structure and the area served by each. (Text to remain the same.)
Substantiation: Service-entrance conductors is one of the items to be considered that is associated with the existing text "or services". Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: These conductors are not always service-entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-51 Log #2946 NEC-P04 **Final Action: Reject**
(225.38 Exception)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text to read as follows:
225.38 Disconnect Construction.
Disconnecting means shall meet the requirements of 225.38(A) through (D).
Exception: For garages and outbuildings on residential property, a snap switch ~~or a set of 3-way or 4-way snap switches~~ shall be permitted as the disconnecting means.
Substantiation: The portion of the exception that permits a set of 3-way or 4-way switches to be used as the disconnecting means for garages and outbuildings should be deleted as it violates the very reason behind requiring disconnecting means which is that the electrical circuit can be safely isolated while work is being performed on conductors and equipment.
Panel Meeting Action: Reject
Panel Statement: The reference to 3-way and 4-way switches should be retained. These may be snap switches but the disconnecting functionality of these devices is quite different and could be interpreted as not being acceptable as a disconnect for a building.
In this proposal the submitter has made an effort to mark the additional wording and the deleted wording but there is wording in the proposal that is not identified as new or changed that is not in the code.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 8 Negative: 2
Explanation of Negative:
ROGERS, J.: I agree with the submitter that if a switch is to be used as a disconnecting means it should truly disconnect the energized conductors.
STAFFORD, T.: This panel member determines that submitter's substantiation is correct as provided in original proposal.

4-52 Log #1770 NEC-P04 **Final Action: Reject**
(225.39(A), (B), and (D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (A) ONE CIRCUIT INSTALLATION. For installations ~~to supply only limited loads~~ consisting of a single branch circuit, the feeder and branch circuit disconnecting means shall have a rating not less than 15 amperes.

(B) TWO CIRCUIT INSTALLATION. For installations consisting of ~~not more than~~ two 2-wire circuits or a 2-wire feeder ~~branch circuit~~ disconnecting means shall have a rating not less than 30 amperes and not less than the calculated load. The disconnecting means for a feeder supplying two multiwire branch circuits or two three-phase branch circuits shall have a rating not less than 30 amperes and not less than the calculated load.

(D) For all other installations the branch circuit and feeder disconnecting means shall have a rating not less than the calculated load ~~60 amperes.~~
Substantiation: In (A), the feeder disconnecting means should be included in the 15 ampere minimum rating. A 15 ampere circuit supplying a 15 ampere circuit breaker or fused switch is a feeder by definition.

In (B), the phrase "not more than two 2-wire circuits" includes "one" branch circuit, which is covered by (A). Two 2-wire 15 ampere branch circuits supplied by a 15 ampere 3-wire circuit (feeder) does not warrant a 30 ampere feeder disconnecting means or a 30 ampere branch circuit disconnecting means, and where a circuit breaker is used as the disconnecting means does not warrant a 30 ampere rating for a feeder rated 15 or 20 amperes.

In (D), "all other installations" includes two multiwire branch circuits or two 3-phase branch circuits, which if rated 15 amperes requires a 60 ampere disconnect which is excessive and not required for safety.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any technical data to support the recommended changes he has presented. There is no reason to limit Part B to buildings with 2-wire feeders. The existing language allows 1 or 2 branch circuits to be installed for single circuits larger than specified in Part A and anything other than two 2-wire circuits is intended to require a minimum rating of 60 amperes for the disconnecting means.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-53 Log #3557 NEC-P04 **Final Action: Reject**
(225.41)

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Add new text to read as follows:
225.41 Dwelling Unit Surge Protection.
(A) Surge Protective Device. All dwelling units shall be provided with a surge protective device (SPD) installed in accordance with Article 285.
(B) Location. The surge protective device shall be an integral part of the service disconnecting means or shall be located immediately adjacent thereto.
(C) Type. The surge protective device shall be a Type 1 or Type 2 SPD.
(D) Replacement. Where equipment is upgraded, all of the requirements of this section shall apply.
Substantiation: This proposed requirement is submitted for consideration by the Technical Committee for the sole purpose of personnel safety. The NEC requires GFCI and AFCI protective devices throughout dwelling units. Additionally, 120-smoke alarms are required by most local building codes in all new dwelling units. In essence we have mandated electronic based protection, designed to prevent shock, fire and to alarm residents in the event of a fire. These devices have all proven that when installed and maintained properly, they will and have saved lives. This proposal seeks a level of protection for these life saving devices as well as general surge protection throughout the home.

All GFCI's, AFCI's and smoke alarms may be damaged when a surge occurs due to lighting or other sources. In many cases these devices can be damaged and rendered inoperable by a surge.

It is practical to require a "whole house" SPD to provide a general level of protection. Home owners regularly buy and use Type 3 (point of utilization) SPD's which are cord and plug connected to protect computers, plasma TV's and other electronic equipment. However, in almost all new installations as well as upgrades, no consideration is given to providing a general level of protection to the "whole house."

Typical homeowners have no problem buying multiple Type 3 (point of utilization) SPD's to protect equipment for entertainment purposes, the additional cost of a Type 1 or Type 2 SPD for the purpose of personnel safety will not represent a financial burden.

First level subdivision (D) is included to require that when an upgrade occurs, an SPD is to be installed. Residents of existing dwelling units deserve the same level of protection as those in new homes.

Note that a sister proposal has been submitted as a new 230.67.
Panel Meeting Action: Reject
Panel Statement: The submitter has not submitted any technical data that supports the statement relative to the installation of SPDs saving lives. These devices may protect some electronic equipment but there is no submitted documentation relative to smoke detector failures due to surges with or without SPDs. In addition, the proposal as written requires these devices as a part of a service installation and Article 225 does not address service installations.

This is not an appropriate item for Article 225, which covers outside branch circuits and feeders.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

STAFFORD, T.: This panel member determines that submitter's substantiation is correct as provided in original proposal.

ARTICLE 230 — SERVICES

4-56 Log #3368 NEC-P04 **Final Action: Reject**
(230.1)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:

230.1 Scope. This article covers service-entrance conductors and equipment for control and protection of services and their installation requirements.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: Article 230 still covers all service conductors that are

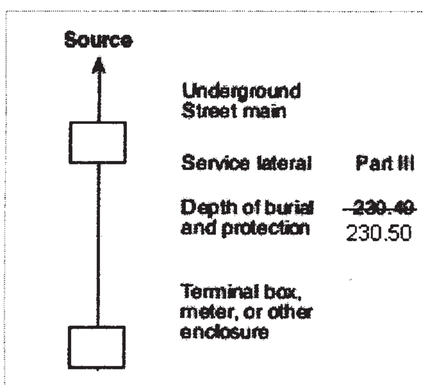
installed on the customer side of the service point, not just service-entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-57 Log #2141 NEC-P04 **Final Action: Accept**
(Figure 230.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: William Svensson, National Fuel Gas
Recommendation: Revise text as follows:
~~Source~~ Serving Utility
The word "Source" near the top of Figure 230.1 Services is incorrect, it should be deleted and replaced with the words "Serving Utility".
Substantiation: The use of the word "Source" is not defined, whereas the "serving utility" is contained in the definition of "Service" in Article 100.
By definition, the "Service" is supplied only from the "Serving Utility".
This correction will help to eliminate confusion and misapplication of Article 230 to Article 215. This correction will also help to remove confusion of when to apply 250.24 or 250.30, especially with the installation of distributed generation systems.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-58 Log #3687 NEC-P04 **Final Action: Accept in Principle**
(Figure 230.1)

Submitter: Thomas A. Domitrovich, Eaton Corp.
Recommendation: Replace "230.49" with "230.50" in Figure 230.1.



Substantiation: This figure references section 230.49 which previously, as per the 2005 NEC, was entitled "Protection Against Physical Damage - Underground". This section has been moved into section 230.50, "Protection Against Physical Damage". Figure 230.1 should accurately reference the current section.
Panel Meeting Action: Accept in Principle
Replace "230.49" with "230.32" in Figure 230.1.
Panel Statement: The correct reference is 230.32 under part III of Article 230.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-59 Log #2052 NEC-P04 **Final Action: Reject**
(230.2)

Submitter: Joseph Amato, Delaware County Code Compliance
Recommendation: Revise text to read as follows:
For the purpose of 230.2, Exception No. 2. only, underground sets of conductors, ~~1/0 AWG and larger,~~ running to the same location and connected together at their supply end but not connected together at their load end shall be considered to be supplying one service.
Substantiation: My thought is 1.0 or larger is intended for service laterals only. The way it is worded in 230.2 in the same paragraph that refers to 230.40, Exception No. 2 confuses people. It sounds like even underground service conductors have to be 1/0 or larger. Article 230.42 addresses size of service conductors. I don't think their size should be any different if underground, unless paralleled (that is addressed in 310.4).
Panel Meeting Action: Reject
Panel Statement: The original language for requiring 1/0 as a minimum size appeared in the 1978 NEC. Research that the panel performed at that time utilized that size based on a combination of a minimum physical size, fault currents at the service disconnecting means, and industry practice. The submitter has not presented any technical data for reducing the minimum size of the conductors when utilizing Section 230.40 Exception No. 2 for multiple sets of service conductors from one lateral. When using this allowance the conductors must be a minimum of 1/0. These conductors are not parallel conductors since they are not connected at the load end.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-60 Log #3397 NEC-P04 **Final Action: Reject**
(230.2)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
Section 230.2 Number of Services. A Building or other structure served shall be supplied by only one service unless permitted in 230.2(A) through (D). For the purpose of 230.40, Exception No. 2 only, underground sets of service-entrance conductors, 1/0 AWG and larger, running to the same location and connected together at their supply end but not connected together at their load end shall be considered to be supplying one service. (Text to remain the same.)
Substantiation: Service-entrance conductors are what are considered for the underground sets. Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Statement: These conductors are not always service-entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-61 Log #4408 NEC-P04 **Final Action: Reject**
(230.2)

Submitter: Dean Hunter, Hunter Electric
Recommendation: Revise text as follows:
230.2 Number of Services.
(C) Capacity Requirements. Additional services shall be permitted under any of the following conditions:
(1) Where the capacity requirements are calculated load is in excess of 2000 amperes at a supply voltage of 600 volts or less
Substantiation: Enforcement of the term "capacity" is an enforcement challenge. Some inspectors believe that if the existing service is rated 1200 amperes at 480/277 an additional 800 amp 480/277 volt service can be installed using this allowance regardless of the demand on the original service. Does "capacity" mean the actual electrical demand of the facility or the amp rating of the service disconnect switch(es)?
Panel Meeting Action: Reject

Panel Statement: The submitter is incorrect in the assumption that the existing language is not clear. The only way to determine "capacity requirements" is to calculate the loads to be supplied by the service.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-62 Log #1692 NEC-P04 **Final Action: Reject**
(230.2(C)(2)(1))

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise text to read as follows:
230.2 Number of Services.
(C) Capacity Requirements. Additional services shall be permitted under any of the following:
(1) Where the ~~capacity requirements are~~ numerical sum of the service mains will be at least ~~in excess of~~ 2000 amperes at a supply voltage of 600 volts or less.
Substantiation: This proposal is a clarification of the requirement in 230.2(C)(1) that the total sum of the service mains, after an additional service is installed for the building or structure, will be more than 2000 amperes at 600 volts or less. Some jurisdictions require the existing load plus the additional load to be calculated and exceed 2000 amperes, before an additional service is permitted. This clarification will make 230.2(C)(1) easier to understand and to apply correctly.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that the requirement is clear as written. The submitter is incorrect in the use of the allowance for because use of this requirement is not simply based on the additive sum of the service disconnecting means, it is based on capacity requirements due to the load on the service.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, the panel statement should be revised by changing the second sentence to read as follows: "The submitter is incorrect in his assertion that this allowance should be based on over-current device ratings rather than calculated loads. This is well defined in existing Sections 230.79 and 230.90."

4-63 Log #3376 NEC-P04 **Final Action: Reject**
(230.3)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.3 One building or Other Structure Not to be Supplied Through Another. Service-entrance conductors supplying a building or other structure shall not pass through the interior of another building or other structure.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-64 Log #3144 NEC-P04 **Final Action: Reject**
(230.6)

Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: Add a new list item (5) and (6) as shown below to 230.6
230.6 Conductors Considered Outside the Building.
Conductors shall be considered outside of a building or other structure under any of the following conditions:
(1) Where installed under not less than 50 mm (2 in.) of concrete beneath a building or other structure
(2) Where installed within a building or other structure in a raceway that is encased in concrete or brick not less than 50 mm (2 in.) thick
(3) Where installed in any vault that meets the construction requirements of Article 450, Part III
(4) Where installed in conduit and under not less than 450 mm (18 in.) of earth beneath a building or other structure
(5) Where installed physically outside the building including attached to the wall surface on the outside of the building
(6) Where installed in overhead service masts on the outside surface of the building traveling through the eave of that building to meet the requirements of 230.24.
Substantiation: This new list item (5) clarifies that conductors installed on the outside of a building including ones that are attached to the wall surface on the outside of the building are "outside the building."
During a deposition, I had to make an argument that conductors actually installed on the wall surface outside of a building were considered as conductors installed outside of the building. It seemed common sense to me. However, the opposing discussion related to a conductor on wall whose construction was not concrete, brick or masonry. Since the first four conditions of this section are related to concrete, brick or masonry construction, was a conductor installed on an outside surface of a wall not constructed by these materials actually considered "outside the building"?
The purpose of this proposal is to clear up this issue that it does not relate to the type of wall construction and that conductors physically outside the building are considered outside the building.
The new list item (6) is necessary to discuss the standard practice of installing a service mast through the eave of a building. One could argue that penetrating the roof eave with a service mast brings the service entrance conductors inside the building at this point and therefore requiring a service disconnecting means per 230.70.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that the requirement is clear as written. The panel agrees that the submitter's proposal does not add clarification to the rules with regard to the outside of the building. The conditions that the submitter has proposed are clearly outside the building.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-65 Log #2821 NEC-P04 **Final Action: Reject**
(230.6(2))

Submitter: James Harvey, University of Michigan Hospitals / Rep. Manager of Electrical Engineering
Recommendation: Add text to read as follows:
(2) Where installed within a building or other structure in a raceway in concrete or brick not less that 50 mm (2 in) thick or in rigid metal conduit that is properly supported and enclosed within a architectural enclosure having a three hour (minimum) fire smoke rating.
Substantiation: Installing concrete or brick encased raceways is very difficult, especially when these service conductors must ascend many floors into a building to reach the service entrance switch gear on an upper floor and/or on the roof. The weight, installation difficulties, and costs associated with the concrete (or brick) enclosure are often extreme.
I am reasonably sure reason for the 50 mm (2 in) of concrete (or brick) encasement was to protect the building from the energy that would be released into the building, if the service conductors were to fault on the line side of the building's service disconnect. While protecting the service cables is important, this was not the driving force for these requirements.
Panel Meeting Action: Reject
Panel Statement: The existing requirement serves to provide additional protection for the service conductor installation and not simply limit the potential of fire spread either onto or from the service conductors.

The concrete or brick is to provide physical protection. A 3-hr rated enclosure may not provide this protection.

Service-entrance conductors are subject to high arc flash energies that may burn through metallic conduit and blow through architectural treatments that provide a 3-hour fire rating (typically 2 layers of ½-inch dry wall). The masonry requirement has effectively protected buildings from service-entrance conductor failures and the resulting generation of heat and gas. The masonry requirement should remain. Designs should consider service-entrance disconnects and overcurrent devices to be located as close as practical to the entry of the service conductors into the building. Feeders extending up into the building will have overcurrent protection to protect the building from conductor failures.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-66 Log #1325 NEC-P04 **Final Action: Reject**

(230.7)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Conductors other than service conductors <u>of the same class</u> shall not be installed in the same raceway, <u>auxiliary gutter,</u> service cable, or other enclosure.

<u>*Exception: Enclosures for metering equipment.*</u>

Substantiation: Auxiliary gutters are not indicated in the definition of raceway and should be included, likewise boxes and other enclosures that are not part of the service. Service conductors include those for ac, dc, single-phase, 3-phase, 600 volts or less, over 600 volts. 300.3(1) permits ac and dc circuits in the same wiring enclosure and 490.35(B) has provisions where low-voltage and high-voltage can be in the same compartment. Metering equipment such as current transformers may have conductors installed to remote meter and this equipment doesn't meet the definition of service as it doesn't deliver energy.

Panel Meeting Action: Reject

Panel Statement: The requirement is intended to allow only service conductors in a service raceway or service cable. It has nothing to do with other enclosures.

An auxiliary gutter used for service conductors is a wiring method recognized in Section 230.43. Section 490.35 (B) does not pertain to service conductors and recognizes that wiring rated 600 Volts or less is required to be located in medium voltage equipment enclosures for control and metering such as relaying, metering, cubicle heaters, etc.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal as the section referenced does deal with raceways and auxiliary gutters could be considered raceways as the definition of raceways in Article 100 does state not limited to and includes wireways. Section 230.43 of course does recognize auxiliary gutters but the proposal needs to be more expansive in my opinion. The current code requirements do not address medium voltage just 600 volts and under and over 600 volts and the proposal should be reviewed in that manner. The submitter is correct in the necessity for some clarification on the requirements for possible separation for different classifications of service in the same raceway as 230.7 does not address that if all of the conductors are service conductors. The submitter should modify the proposal and resubmit it in the comment period.

4-67 Log #3392 NEC-P04 **Final Action: Reject**

(230.7)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

230.7 Other Conductors in Raceway or Cable. Conductors other than service<u>-entrance</u> conductors shall not be installed in the same service raceway or service<u>-entrance</u> cable. (Exception No. 1 and No. 2 text to remain the same.)

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.

Service<u>-Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service<u>-entrance</u> conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: These conductors are not always service-entrance conductors.

Number Eligible to Vote: 10

230.24 Clearances. Overheadservice ~~drop~~ conductors, etc.
Substantiation: This proposal is being submitted by a task group that has been formed by Panel Chair, Ronald Toomer, in response to instructions that were presented to Code-Making Panel 4 by the Technical Correlating Committee as a result of some proposals that were submitted in the last cycle. These proposals spurred some discussion that resulted in differing opinions relative to the use of the term "Service Lateral". The members of the task group are as follows: Larry D. Cogburn, Chair, Robert J. Deaton, James J. Rogers, John A. Sigmund, and John W. Young.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

4-79 Log #2747 NEC-P04 **Final Action: Reject**
(230.24(A) Exception No. 2)

Submitter: Allen L. Clapp, Power & Communication Utility Training Center
Recommendation: Revise text to read as follows:
Exception No. 2: Where the voltage between conductors does not exceed 300 ~~and the roof has a slope of 100 mm in 300 mm (4 in. in 12 in.) or greater~~, a reduction in clearance to 900 mm (3 ft) shall be permitted.
Substantiation: The requirement to have a roof slope exceeding a 4-inch drop in a 12-inch run is not necessary, not desirable, and not in the best overall interest of safety.

Section 230.24 already requires that service drop conductors shall not be readily accessible. As a result, service drops are only accessible to workers on the roof. By requiring a relatively steep slope, the chance that a worker on the roof may lose footing if startled by inadvertent contact with the service drop is increased.

A startle reaction may occur if the worker backs into the service drop, even though no electrical contact occurs. If the worker turns too quickly to see what he has touched, or if the worker realizes that it is a power service drop and tries to jump away too fast, the worker can lose footing and fall from the roof.

This issue was discussed in depth by NESC Subcommittee 4 on overhead clearances during the 1977 revision and again during the mid-1980s. Available accident data did not support requiring a steep roof. The consensus was reached that, should inadvertent contact with the service drop occur by a worker on the roof, it would be preferable that the worker not be on a steep roof. Thus, the NESC does not have the steep slope requirement in the comparable NESC rule.

The NEC requirement for a steep roof has caused confusion for some electrical inspectors when they observe service drops installed by utilities in accordance with NESC requirements over roofs with slopes less than 4 inches of drop in a 12-inch run.

I am a licensed Professional Engineer with over 400 electric and communication utilities and large industrial complexes as clients. I am a member of NFPA, IEEE, and IAEI. I have used both the National Electrical Code and the National Electrical Safety Code in my work since 1964. I have been a member of NESC subcommittees since 1971 and have served several times over the years on NESC/NEC coordination task forces. I have reviewed over 20 years of electrical accident data in that capacity. I have also been involved in over 600 accident investigation and litigation assignments over the years. The above proposal is made to (a) improve safety and (b) harmonize certain requirements of the NEC with those of the NESC to limit the opportunity for confusion.
Panel Meeting Action: Reject
Panel Statement: The NEC requirement is not a requirement as to how to build a roof it simply states that when these conductors are installed over a roof a reduction in the clearance distance to three feet is only allowed when the roof meets or exceeds the slope as defined. If these conductors are installed as part of the utility supply system then the NEC does not apply and the NESC distances would be utilized.

The slope of the roof referenced permits a lower clearance because pedestrian traffic is less likely on steep roofs.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-80 Log #3373 NEC-P04 **Final Action: Accept in Principle**
(230.24(A) Exception No. 3)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.24 Clearances.
(A) Above Roofs.
Exception No. 3: Where the voltage between conductors does not exceed 300, a reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (1) not more than 1.8 m (6 ft)of service-~~drop~~ entrance conductors, (The rest of the text to remain the same).
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept in Principle
Replace "service-entrance" with "overhead service".
Panel Statement: Change the term to be consistent with the panel action on Proposal 4-75. Not all service conductors are service-entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: See comment on 4-75.

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-81 Log #3733 NEC-P04 **Final Action: Reject**
(230.24(A) Exception No. 3)

Submitter: Allen L. Clapp, Power & Communication Utility Training Center
Recommendation: Revise text as follows:

Exception No. 3: Where the voltage between conductors does not exceed 300, a reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (1) not more than 1.8 m (6 ft) of service-drop conductors, 1.2 m (4 ft) horizontally, pass above the roof ~~overhang~~, and (2) they are terminated at a through-the-roof raceway or approved support.

Substantiation: Delete the word *overhang*. As presently worded, the language prevents the through-the-roof mast from coming up inside the wall, since the wall itself is not overhang. This issue came up several years ago with the National Electrical Safety Code and the word *overhang* was removed. This change will match NECS language and limit confusion.

Panel Meeting Action: Reject

Panel Statement: The word overhang is needed to link and clarify the requirement since it is only applicable to the "overhanging portion of the roof".

This requirement does not address the installation of a service mast. It simply addresses the maximum distance that service drop conductors can cross the roof at a particular height to connect to the service mast. The requirement does not address whether or not the mast is in the wall. However, there are other code sections that address such an installation.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-82 Log #454 NEC-P04 **Final Action: Accept**
(230.24(A) Exception No. 5 (New))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Add New Exception 5 as follows:

Exception No. 5: Where the voltage between conductors does not exceed 300 and the roof area is guarded or isolated, a reduction in clearance to 900 mm (3 ft) shall be permitted.

Substantiation: This new exception is intended to correlate with allowances in the National Electrical Safety Code (NESC). Currently, there is a minor conflict with the Exceptions in the NEC and the NESC. Generally, the NESC allows the service entrance conductors to be a minimum of 3 foot above the roof if the area is guarded or inaccessible. This new exception will allow correlation between the two documents. Although the NESC allows this clearance for up to 750 volts, the proposed NEC exception is restricted to 300 volts. The requirement that the roof area be guarded or isolated will provide equivalent safety as currently allowed in Exceptions 2, 3 and 4.

Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-83 Log #2744 NEC-P04 **Final Action: Reject**
(230.24(B))

Submitter: Allen L. Clapp, Power & Communication Utility Training Center
Recommendation: Revise text to read as follows:

(B) Vertical Clearance for Service-Drop Conductors. Service-drop conductors, where not in excess of 600 volts, nominal, shall have the following minimum clearance from final grade when at maximum final sag resulting from ice loading or thermal line losses, whichever is greater:

FPN: New, unstretched wires are installed at initial sag conditions. Over time, the weight, wind, and ice loading received in service will cause inelastic (nonrecoverable) deformation (permanent stretching) in the wire. Final sag conditions occur when further inelastic deformation is reduced to a negligible amount. Maximum sag occurs when the combination of (a) elastic (recoverable) deformation due to thermal or ice loading and (b) inelastic deformation is the greatest. Rule 230A4, Rule 232A, and Appendix B of the National Electrical Safety Code ANSI C2-2007 contain information on (a) calculating the inelastic deformation due to conductor/cable weight, ice loading, and wind loading that is appropriate for various loading areas and useful in calculating maximum final sag and (b) appropriate conductor temperatures and ice loading useful in determining conditions that will produce maximum final sag, respectively.

(1) 3.0 m (10 ft) — at the electrical service entrance to buildings, also at the lowest point of the drip loop of the building electrical entrance, and above areas or sidewalks accessible only to pedestrians, measured from final grade or other accessible surface only for service-drop cables supported on and cabled together with a grounded bare messenger where the voltage does not exceed 150 volts to ground

(2) 3.7 m (12 ft) — over portions of residential property and residential driveways~~, and those commercial areas~~ where (a) such portions are not subject to truck traffic and ~~where~~ (b) the voltage does not exceed 300 volts to ground

(3) 4.5 m (15 ft) — for those areas listed in the 3.7-m (12-ft) classification where the voltage exceeds 300 volts to ground

(4) 5.5 m (18 ft) — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, portions of driveways on residential property subject to truck traffic, and other land such as cultivated, grazing, forest, and orchard.

Substantiation: This proposal contains three types of changes. The first addresses the need to assure that the service drop cables or conductors will not sag enough after installation to produce vertical clearances less than those required by this NEC section. The second addresses the need to recognize that the front portions of most residential driveways are general-use driveways and subject to truck traffic. The third prohibits use of the reduced clearance of 12 ft for service drops to commercial buildings.

To assure that service drops are installed high enough to maintain the required clearance throughout their life, and not just at installation, consideration of sag changes due to their own weight, ice loading, and thermal loading is necessary. The National Electrical Safety Code contains appropriate information for use in calculating maximum final sags to assure that vertical clearances are met and is, therefore, a good reference.

Many portions of residential property are subject to truck traffic. In particular, the front portion of most residential driveways is subject to moving vans, delivery trucks, and ambulances. As a result of hundreds of service drops being torn down in the 1980s, the NESC raised the clearances required for service drops above driveways and limited the application of the reduced clearance of 12 ft to only those *residential* buildings where the height of the building did not allow achieving the full clearance value of 16.0 ft required by NESC Table 232-1. Some of the service-drop teardown accidents reviewed had serious safety consequences. In some cases, service drops torn down by moving vans and delivery trucks (which often exceed 12 ft in height) were touched in a damaged area by personnel trying to move them out of the way. In others, ambulances cut off the lights and power to houses to which they were making an emergency response call.

In essence, NESC Rule 234C and Table 234-1, Footnote 7 essentially limited application of the reduced clearances over driveways to those houses with so-called *hip* roofs that slope upward toward the peak on all sides; it was recognized that most owners that were spending the extra money to have a hip roof would were also spending the money to get underground service, thus reducing the number of houses with such low service drops. Although a flat-roofed house would qualify to use the footnote, few flat-roofed houses are constructed today. Most or all of the required table clearance of 16 ft can be achieved by attaching at the gable end of houses of that design. In essence, the NESC has prohibited using the reduced 12-ft clearance to through-the-roof service masts on the rear of most single-story houses, since most single story houses have a gable on each end and the peak of the gable is available to gain the extra height.

At the time of limiting the application of the reduced clearances over driveways, the members of NESC Subcommittee 4 on clearances came within one vote of prohibiting overhead service drops to houses if they could not meet the full 16-ft table clearance. The compromise was to limit application of the reduced clearances only to those buildings that were not tall enough to allow the full clearances. The subcommittee was unanimous at that time that, if this limitation did not solve the problems, we would reconsider requiring underground service for such short residences.

NESC SC4 also considered whether commercial buildings should be allowed to have reduced clearances and concluded that it would not be appropriate to allow reduced clearances for service drops to commercial buildings—the probability of access by a truck during the life of the installations was too great to allow the reduced clearances. Under the NESC, if the full table value of 16 ft cannot be met, the service drop must go underground. It is recommended that the NEC match the NESC in this regard to eliminate confusion and assure that appropriate consideration is given during building design to the need for either an underground service drop or appropriate locations for an overhead service drop and weatherhead.

The above proposal was worded in a manner to make the least changes to the existing language as practical. However, you may find that the following language may be preferable for subpart 4:

4) 5.5 m (18 ft) — over public streets, alleys, roads, parking areas, driveways (excluding portions of driveways on residential property not subject to truck traffic), and other lands (such as cultivated, grazing, forest, and orchard lands) subject to truck traffic, ~~driveways on other than residential property, and other land such as cultivated, grazing, forest, and orchard~~

Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 4-93. Not all service conductors are service entrance-conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

YOUNG, J.: See comment on 4-92.

(230, Part III)

Submitter: James J. Rogers, Bay State Inspectional Agency

Recommendation: Revise text to read as follows:

III. Underground Service ~~Laterial~~ Conductors.

Substantiation: This proposal is being submitted by a task group that has been formed by Panel Chair, Ronald Toomer, in response to instructions that were presented to Code-Making Panel 4 by the Technical Correlating Committee as a result of some proposals that were submitted in the last cycle. These proposals spurred some discussion that resulted in differing opinions relative to the use of the term "Service Lateral". The members of the task group are as follows: Larry D. Cogburn, Chair, Robert J. Deaton, James J. Rogers, John A. Sigmund, and John W. Young.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

4-93 Log #3506 NEC-P04 **Final Action: Accept in Principle**
(230.30)

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Revise text to read as follows:
230.30 ~~Insulation.~~ Installation
(A) Insulation. Underground service conductors shall be insulated for the applied voltage.
Exception: A grounded conductor shall be permitted to be uninsulated as follows:
(1) Bare copper used in a raceway.
(2) Bare copper for direct burial where bare copper is judged to be suitable for the soil conditions.
(3) Bare copper for direct burial without regard to soil conditions where part of a cable assembly identified for underground use.
(4) Aluminum or copper-clad aluminum without individual insulation or covering where part of a cable assembly identified for underground use in a raceway or for direct burial.
(B) Wiring Methods. Underground service conductors shall be installed in accordance with the applicable requirements of this code covering the type of wiring method used and shall be limited to the following methods:
(1) Type RMC conduit
(2) Type IMC conduit
(3) Type NUCC conduit
(4) Type HDPE conduit
(5) Type PVC conduit
(6) Type RTRC conduit
(7) Listed direct-burial conductors.
Substantiation: This proposal is intended to provide a definition of acceptable wiring methods to be utilized for the installation of underground service conductors. This proposal is being submitted by a task group that has been formed by Panel Chair, Ronald Toomer, in response to instructions that were presented to CMP 4 by the Technical Correlating Committee as a result of some proposals that were submitted in the last cycle. These proposals spurred some discussion that resulted in differing opinions relative to the use of the term “Service Lateral”. The member of the task group are as follows: Larry D. Cogburn, Chair, Robert J. Deaton, James J. Rogers, John A. Sigmund, and John W. Young.

4-94 Log #3375 NEC-P04 **Final Action: Accept in Principle**
(230.31(A))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.31(A) Size and Rating. Service-~~lateral~~ entrance conductors shall have sufficient ampacity to carry the current for the load as calculated in accordance with Article 220 and shall have adequate mechanical strength.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

4-100a Log #CP403 NEC-P04 **Final Action: Accept**
(230.40 Number of Service-Entrance Conductor Sets)

Submitter: Code-Making Panel 4,
Recommendation: Change the language in 230.40 to read as follows:
Each service drop, set of overhead service conductors, set of underground service conductors, or service lateral shall supply only one set of service-entrance conductors.
Substantiation: The panel is submitting this proposal to harmonize these definitions with the remainder of the changes made to the terms service drop and service lateral.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

4-101 Log #4592 NEC-P04 **Final Action: Reject**
(230.40 Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following wording to the end of the existing exception: "If the number of service disconnect locations for any given classification of service does not exceed six, the requirements of 230.2(E) shall apply at each location. If the number of service disconnect locations exceeds six for any given supply classification, all service disconnect locations for all supply characteristics shall be clearly described using suitable graphics or text or both on one or more plaque(s) located in an approved, readily accessible location(s) on the building or structure served and as near as practicable to the point(s) of attachment or entry(ies) for each service drop or lateral.
Substantiation: On the literal text of the present NEC, it is permitted to group six of seven service disconnects for a seven family dwelling at one point. Then, one can run a set of service conductors around the outside of the building to a remote location and spot the seventh disconnect. In fact, the service conductors need not run outside the building; they could be run in a wall as long as there was two inches of concrete encasement.
Section 230-2 does not apply, since there is only one service. Therefore, it is not even necessary to provide a directory at either disconnect location to inform the fire service of the remote, still energized disconnect. If there is any justification for 230.2(E), and I believe there is, then surely this instance is equally compelling. This proposal addresses a critical safety concern. A ten-family apartment house might have 60 service disconnects. If there are two classes of service, there could be even more disconnects, with the total somewhat in doubt because the prior clarification has been removed.
In prior cycles there has been extensive discussion of the use of 90.4. The submitter happens to be the author of the present version of that section, and the panel should bear in mind that there are limits to the use of that section that apply in these cases. First, the authority to interpret the Code is not and never has been the authority to reinvent the Code or to remove clearly stated permissions in the Code, including 230.40 Exception No. 1. Second, the equivalent safety allowance provision is just that, an allowance. There is no way an inspector can reach the objectives of this proposal, which adds a restriction, by considering some alternate procedure to present Code wording that provides equivalent safety. On the other hand, if this proposal is accepted and proved burdensome in some particular case, then 90.4 could then be used to consider some alternative procedure.
For six code cycles, the Commonwealth of Massachusetts was unsuccessful in persuading CMP 4 that this exception should only apply by special permission. This is a compromise: Allow the exception by right, but address the most significant hazard.
Panel Meeting Action: Reject
Panel Statement: The submitter is correct in his concern for identifying placarding separate service disconnecting means. However, different language is needed to identify classification of services to harmonize with the requirements in Section 230.2(E).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-101a Log #CP404 NEC-P04 **Final Action: Accept**
(230.40 Exception No. 2)

Submitter: Code-Making Panel 4,
Recommendation: Change the language in 230.40, Exception No. 2 to read as follows:
Where two to six service disconnecting means in separate enclosures are grouped at one location and supplying separate loads from one service drop, set of overhead service conductors, set of underground service conductors, or service lateral, one set of service-entrance conductors shall be permitted to supply each or several such service equipment enclosures.
Substantiation: The panel is submitting this proposal to harmonize these definitions with the remainder of the changes made to the terms service drop and service lateral.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1

(230.40 Exception No. 3)

Submitter: Code-Making Panel 4,
Recommendation: Change the language in 230.40, Exception No. 3 to read as follows:
A single-family dwelling unit and a separate structure shall be permitted to have one set of service-entrance conductors run to each from a single service drop, set of overhead service conductors, set of underground service conductors, or service lateral.
Substantiation: The panel is submitting this proposal to harmonize these definitions with the remainder of the changes made to the terms service drop and service lateral.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.

4-102 Log #1261 NEC-P04 **Final Action: Accept**
(230.40 Exception No. 3)

Submitter: Charles Eldridge, Indianapolis, IN
Recommendation: Revise text to read as follows:
A single-family dwelling unit and a separate structure(s) shall be permitted to have one set of service-entrance conductors run to each from a single service drop or lateral.
Substantiation: It has come to my attention that some inspectors are permitting only a single separate structure to be served in this manner. The intent is to permit more than one additional structure to be served. As an example, this revision will make it clear that a detached garage and a utility building could be served with separate sets of service entrance conductors.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: The proposal should be accepted in principle and the section changed to remove the word a before the word separate

4-103 Log #1693 NEC-P04 **Final Action: Reject**
(230.40 Exception No. 3)

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise 230.40 Exception No. 3 to allow up to two separate buildings or structures, in addition to the house, to be supplied by a single service drop or lateral.

230.40 Number of Service-Entrance Conductor Sets.

Exception No. 3: A single-family dwelling unit and ~~a~~ two separate buildings or structures shall be permitted to have one set of service-entrance conductors run to each from a single service drop or lateral.

Substantiation: Many single-family dwellings are located on lots that are large enough to permit two accessory buildings or structures to be located on the same property with the house. It would seem that one additional accessory building or structure [a total of two additional to the house] will not present any increased hazard for such an installation and will save the expense of a service disconnecting means being installed at the service pole or pedestal location in order to comply with the requirements of 230.40 when the third building or structure is added.

Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any technical data to support the limiting of the number of sets of additional service conductors to two. If more than one additional building is allowed to have a separate set of service conductors then there should be no limit of such installations on the same property. See the action on Proposal 4-102 for further clarification.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-104 Log #3213 NEC-P04 **Final Action: Reject**
(230.40 Exception No. 3)

Submitter: John I. Williamson, Maple Grove, MN
Recommendation: Delete all of 230.40 Exception No. 3.
Substantiation: NEC 230.40 Exception No. 3 has been misinterpreted to require that service equipment be installed at a common distribution point on a residential premises if more then two buildings are supplied, and that service equipment be installed at a common distribution point on a non-residential premises if more than one building is supplied. This is not correct and I don't believe it was the intent of NEC 230.40 Exception No. 3 when it was introduced into the NEC in 1996.

Example premises: A small parcel of land has a one-family dwelling, a detached accessory garage and a detached storage building. There is a center yard pole and pole-top utility transformer. The service point is the secondary terminals of the transformer. The service riser runs down the pole to a self-contained meter and a terminal box. From the terminal box three separate service laterals are extended to each of the three buildings. NEC 230.40 Exception No. 3 has been misinterpreted to require the service equipment be installed on the pole because "more than two" buildings are supplied. Dispite the lack of any supporting language in the NEC, it has been assumed that for a non-residential premises that service equipment would be required on the pole if "more than one" building is supplied.

Considerable research has been done relative to NEC 230.40 Exception No. 3 and the proposed language that was part of the 1996 National Electrical Code development process.

NEC 230.40 Exception No. 3 is completely unnecessary - the basic rules in the NEC have always allowed what the proposer was attempting to accomplish. There is nothing inherently wrong with the language - it is simply not necessary.

Unfortunately, the presence of the unnecessary language in 230.40 Exception No. 3 has caused much confusion for installers and inspectors. One or more states have amended 230.40 Exception 3 out of the NEC during their respective code adoption processes. There is no language in the NEC that correlates with 230.40 Exception No. 3. It should not be assumed that the presence of 230.40 Exception No. 3 in the NEC has some special meaning, or that other historical, fundamental code concepts somehow have a new or different meaning.

The following fundamentals will help to illustrate and substantiate the need to delete 230.40 Exception No. 3:

- Article 100 in the NEC has several definitions related to services (conductors, equipment, etc.)
- Every occurrence of the word "building" in the various service definitions is in the singular form, not the plural form
- The NEC does not regulate the number of buildings on a premises
- The NEC does not regulate the number of utility-supplied metered services on a multi-building premises. In other words, on a multi-building premises, a separate utility-metered service could be installed to each building - this may not be very practical or economically feasible if the buildings are in close proximity to one another, but it is not regulated by the NEC.
- In part, Article 225 contains rules for outside branch circuits and feeders run on or between buildings, structures, or poles (unlike service conductors, branch circuits and feeders are provided with short-circuit and ground-fault protection at their supply end)
- Article 230 in the NEC contains rules for service conductors and equipment for control and protection of services and their installation requirements
- Unlike branch circuits and feeders, service conductors do not have short-circuit and ground-fault protection at their supply end (service conductors are provided with "overload" protection at their load end)
- Various rules in the NEC are in place to ensure that service conductors that are subjected to a catastrophic overcurrent event do not, in theory, compromise the safety of the building to which they are connected or attached. Ideally, service conductors subjected to a catastrophic event would burn clear of the building.
- As an absolute minimum, the first occurrence of disconnection and overload protection for service conductors is inside the building nearest the point of entrance of the service conductors (the allowable length of service conductors inside a building will vary from job to job, but they shall always be kept to an absolute minimum). In some cases the disconnecting means and overload protection may be upstream from this inside location (e.g. installed on the exterior wall of the building).
- Where the service equipment is located outside on the exterior of the building, there may not be any service-entrance conductors, or they may be entirely outside the building.
- Notwithstanding other rules in the NEC (e.g. rules in Article 547 that establish a common distribution point on a multi-building agricultural premises), there is no limit to the quantity of "unfused" conductors that can be installed outside of a building on a premises, or outside of more than one building on a multi-building premises
- Notwithstanding any applicable exceptions, a building shall be supplied by only one service drop or service lateral (230.2) and the service drop or service lateral shall supply only one set of service-entrance conductors (230.40).
- Service conductors that supply a building or other structure shall not pass through the interior of another building or structure (230.3). In other words, if a service drop or service lateral supplies more than one building on a multi-building premises, the service drop or service lateral conductors are permitted to be installed on the exterior of Building A in order to supply a service in Building B, but they are not permitted to pass through the interior of Building A to get to Building B. There is no limitation in the NEC as to how many buildings could be supplied with one set of properly-sized service drop or service lateral conductors.
- Service drop conductors (e.g. at pole tops), service lateral conductors, and service-entrance conductors are permitted to be spliced in accordance with various rules in the NEC. The definition of a run of service conductors does not necessarily and automatically change simply because the run of conductor is interrupted by a terminal box, enclosure, pole, pedestal, or splice. Although not desirable, practical or workmanlike, one properly-sized service lateral could be subdivided (via underground splicing) into several properly-sized sets of service lateral conductors for distribution to multiple buildings on multi-building premises. Overhead service drops have been installed in this manner for decades on multi-building sites.
- On the contrary, a defined set of service lateral conductors automatically may become defined as a set of service-entrance conductors where the underground service lateral conductors penetrate the basement wall of a building (where there is no terminal box, meter, or other enclosure). The point of connection (or transition) from service lateral conductors to service-entrance conductors is the point of entrance of the conductors into the building essentially where the conductors pass through the basement wall.

In an effort to counteract the notion that NEC 230.40 Exception No. 3 has some special significance with regard to safety in the code, I offer the following code-compliant examples - some examples are real and very common; other examples are very extreme, but they help to illustrate the elementary concepts of the NEC.

- (NEC 230.2 and 230.40) Three structurally independent attached "townhouse" buildings (as defined in the International Residential Code) under a common roof line (there may or may not be real property lines between the units - that is not relevant for the purpose of the electrical code). Each townhouse is considered a separate building in the building code, the units are separated by fire-rated wall assemblies, and each townhouse is required to have a separate service lateral or service drop. The first occurrence of overload protection is inside each townhouse at the service panel. The service disconnecting means shall not consist of more than six switches or circuit breakers. (A maximum of six throws of the hand would be permitted to turn off power in each townhouse).
- (NEC 230.2 and 230.40 Exception No. 1) One six-unit apartment building or condominium building (a multifamily dwelling as defined in the NEC): The building is only permitted to have one service lateral or service drop. The service lateral or service drop is permitted to be subdivided into separate sets of service-entrance conductors, one set for each occupant (dwelling unit). The first occurrence of overload protection is inside each dwelling unit at the service panel. The service disconnecting means for each set of service-entrance conductors shall not consist of more than six switches or circuit breakers. (A maximum of 36 throws of the hand would be permitted to turn off power to the entire building).
- (NEC 230.2 and 230.40) An old resort with several cabins is turned into a Common Interest Community (the legal declaration that is used to establish a condominium, cooperative, or association type of property). From a pad-mounted transformer, each building on the multi-building premises would be permitted to be supplied with a separate set of service drop or service lateral conductors. The first occurrence of overload protection is inside each cabin at the service panel. The service disconnecting means at each cabin shall not consist of more than six switches or circuit breakers. (A maximum of six

throws of the hand would be permitted to turn off power in each cabin).

- (NEC 230.2 and 230.40) An old resort with several cabins. From a pad-mounted transformer, one service lateral or service drop could be daisy-chained to a terminal box on each building (remaining outside each building as per 230.3). From the exterior terminal box, a set of service-entrance conductors would supply the service equipment in each cabin. The first occurrence of overload protection is inside each cabin at the service panel. The service disconnecting means at each cabin shall not consist of more than six switches or circuit breakers. (A maximum of six throws of the hand would be permitted to turn off power in each cabin).

- (NEC 230.2 and 230.40 Exception No. 2) A large manufacturing building: The building is only permitted to have one service lateral or service drop. The service lateral or service drop is permitted to be subdivided into separate sets of service-entrance conductors to supply loads, in this case the Business Office, Heating and Cooling, and Manufacturing. The three service disconnects in separate enclosures shall be grouped at one location. The first occurrence of overload protection is inside the building at the three grouped service disconnects. (A maximum of 3 throws of the hand would be necessary to turn off power to the entire building).

- (NEC 230.2 and 230.40 Exception No. 1) A large strip mall building (10 stores/occupants): The building is only permitted to have one service lateral or service drop. The service lateral or service drop is permitted to be subdivided into separate sets of service-entrance conductors to supply each occupant. The service disconnect for each set of service-entrance conductors to supply each occupant. The service disconnect for each set of service-entrance conductors for each occupant shall consist of not more than six switches or circuit breakers. The first occurrence of overload protection is inside the building at the service disconnect. (A maximum of 6 throws of the hand would be necessary to turn off power at each occupant space, with a possible 60 throws of the hand to turn off power to the entire building).

- (NEC 230.2 and 230.40 Exception No. 1) A two-family dwelling building: The building is only permitted to have one service lateral or service drop. The service lateral or service drop is permitted to be subdivided into separate sets of service-entrance conductors to supply each dwelling unit. The service disconnect for each set of service-entrance conductors for each dwelling unit shall consist of not more than six switches or circuit breakers. The first occurrence of overload protection is inside the dwelling unit at the service disconnect. (A maximum of 6 throws of the hand would be necessary to turn off power at each dwelling unit, with 12 throws of the hand necessary to turn off power to the entire building).

- (NEC 230.2 and 230.40 Exception No. 1 and Exception No. 5) The same scenario as above with an additional set of service-entrance conductors to supply common area branch circuits as identified in 210.25. The first occurrence of overload protection is inside the building at each service disconnect. (A maximum of 6 throws of the hand would be necessary to turn off power at each dwelling unit and at the "common area" service, with 18 throws of the hand necessary to turn off power to the entire building).

If all of the above scenarios are permitted by the NEC and the first occurrence of overload protection in each case is inside the respective buildings, and the NEC does not limit the quantity of "unfused" electrical infrastructure on a premises, why does 230.40 Exception No. 3 need to be in the NEC?

Panel Meeting Action: Reject

Panel Statement: The submitter is incorrect in the statement that the existing requirement mandates that the service equipment be placed at a central location. In fact, just the opposite is accomplished. The main rule is that only one service be supplied from one drop or lateral. The exception allows one additional set to one additional structure for a single-family dwelling only. The submitter is incorrect in many of his assumptions relative to the number of buildings under single management that may be supplied by a single service lateral. The rule is very clear one lateral, one service other than multi-occupancy or up to six disconnects at one location.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-105 Log #3830 NEC-P04 **Final Action: Accept**
(230.40 Exception No. 4)

Submitter: James H. Maxfield, Dover, NH

Recommendation: Revise text to read as follows:

Exception No. 4: ~~A~~ Two-family dwellings, ~~or a~~ multifamily dwellings and multiple occupancy structures shall be permitted to have one set of service-entrance conductors installed to supply the circuits covered in 210.25.

Substantiation: The current exception only applies to two family and multifamily dwellings. It would appear that the intent of the exception is to permit an additional disconnecting means to comply with the minimum standards of 210.25 where common area branch circuits are installed on existing two family and multifamily structures.

The current language does not permit the addition of service conductors of the same voltage to an existing multiple occupancy structure.

For example, an existing multifamily dwelling consisting of six individual dwelling units which requires the installation of smoke alarms within the common areas or site illumination of any other common load could use the current exception to install a "house panel" to accommodate the new circuits without performing alterations to an existing code compliant electrical service. While a multiple occupancy structure which may need to add common area branch circuits as described in 210.25(B) of the 2008 edition would need to perform some service alterations to an existing code compliant service to accommodate the necessary new branch circuits. This could be very impracticable depending on the size and location of the existing compliant installation.

Acceptance of this revised language would avoid the need to perform service alterations to an existing code compliant service of a multiple occupancy structure.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-106 Log #1278 NEC-P04 **Final Action: Reject**
(230.41)

Submitter: Stephen Drayton, Eastern Idaho Electrical JATC / Rep. IBEW

Recommendation: Revise text to read as follows:

230.41 Insulation of Service-Entrance Conductors. Service-entrance conductors entering or on the exterior of buildings or other structures shall be insulated. A grounded conductor shall be permitted to be uninsulated if used in an auxiliary gutter, or it meets the insulation requirements of an under ground service-lateral conductor. See 230.30 and 230.30 exception.

Substantiation: To further the desire to use exceptions sparingly (see NEC Style Manual 3.1.4) and to make this section a positive rule. We believe this revision would simplify and clarify the intent of the section.

Panel Meeting Action: Reject

Panel Statement: The panel agrees that the revision would not add clarity. The present wording is correct. 230.41 is applicable to service-entrance conductors and the reference to 230.30 is to service laterals, which is not the same.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-107 Log #3043 NEC-P04 **Final Action: Accept**
(230.42(A))

Submitter: Mike Holt, Leesburg, FL

Recommendation: Add the following new text:

(A) General. The ampacity of the service-entrance conductors before the application of any adjustment or correction factors shall not be less than either (A)(1) or (A)(2). Loads shall be determined in accordance with Part III, IV, or V of Article 220, as applicable. Ampacity shall be determined from 310.15. The maximum allowable current of busways shall be that value for which the busway has been listed or labeled.

(1) The sum of the noncontinuous loads plus 125 percent of continuous loads

Exception: Grounded conductors that are not connected to an overcurrent device shall be permitted to be sized at 100 percent of the continuous and noncontinuous load.

(2) The sum of the noncontinuous load plus the continuous load if the service-entrance conductors terminate in an overcurrent device where both the overcurrent device and its assembly are listed for operation at 100 percent of their rating.

Substantiation: This proposal is intended to provide consistency with the rules for sizing branch circuits and feeders in 210.19(A)(1) and 215.2(A)(1).

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-108 Log #1718 NEC-P04 **Final Action: Reject**
(230.42(A), FPN No. 1 (New))

Submitter: Larry T. Smith, National Electrical Seminars, Inc.

Recommendation: Add new text as follows:

FPN No. 1: See 110.14(C)(1)(a) and (b) for termination provisions of equipment.

Substantiation: Ignoring the temperature rating of equipment is the most common mistake being made in conductor sizing today. Entirely too many wiremen take no notice of the temperature limitations of 110.14(C) when sizing conductors. They disregard the temperature rating of equipment, and use the 90°C column of Table 310.16 when 90°C rated conductors, such as THHN, are being used. I've even had engineers stand up in seminars and yell "Larry, how are we supposed to know that!?"

At the very least, there should be a Fine Print Note directing the reader to the rules of 110.14(C)(1)(a) and (b).

Panel Meeting Action: Reject

Panel Statement: The NEC already adequately covers this requirement. The problems described by the submitter are best handled through education and enforcement.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-109 Log #4749 NEC-P04 **Final Action: Reject**
(230.42(B))

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Delete Section 230.42(B) Specific Installations
Substantiation: Section 230.42(B) requires ungrounded service conductors to have an ampacity not less than the minimum rating of the service disconnecting means required by 230.79(A) through (D). This conflicts with 230.90(A) Exception No. 3 which permits the sum of the ratings of the circuit breakers or fuses to exceed the ampacity of the service conductors, provided the calculated load does not exceed the ampacity of the service conductors.
Panel Meeting Action: Reject
Panel Statement: There is no conflict. 230.42(B) requires the conductors to have an ampacity not less than the service disconnecting means. Section 230.90 deals with overcurrent protection, not disconnecting means.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-109a Log #4739 NEC-P04 **Final Action: Accept**
(230.43(11))

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
230.43 Wiring Methods for 600 Volts, Nominal, or Less.
Service-entrance conductors shall be installed in accordance with the applicable requirements of this Code covering the type of wiring method used and shall be limited to the following methods:
(1) Open wiring on insulators
(2) Type IGS cable
(3) Rigid metal conduit
(4) Intermediate metal conduit
(5) Electrical metallic tubing
(6) Electrical nonmetallic tubing (ENT)
(7) Service-entrance cables
(8) Wireways
(9) Busways
(10) Auxiliary gutters
(11) Rigid ~~nonmetallic~~ <u>Polyvinyl Chloride Conduit</u> <u>(PVC)</u>
(12) Cablebus
(13) Type MC cable
(14) Mineral-insulated, metal-sheathed cable
(15) Flexible metal conduit not over 1.8 m (6 ft) long or liquidtight flexible metal conduit not over 1.8 m (6 ft) long between raceways, or between raceway and service equipment, with equipment bonding jumper routed with the flexible metal conduit or the liquidtight flexible metal conduit according to the provisions of 250.102(A), (B), (C), and (E)
(16) Liquidtight flexible nonmetallic conduit
<u>(17) High Density Polyethylene Conduit (HDPE)</u>
<u>(18) Non-metallic Underground Conduit with Conductors (NUCC)</u>
<u>(19) Reinforced Thermosetting Resin Conduit (RTRC)</u>
Substantiation: This is an addition from the result of the 2008 NEC adding of new code articles for each of the specific nonmetallic raceways and the conditions for their intended use. Remove the reference of "nonmetallic" in item 11 and add in each of the specific raceway types as acceptable for service entrance conductors as limited by the conditions of the articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-110 Log #2412 NEC-P04 **Final Action: Accept in Principle**
(230.43(11))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Revise text to read as follow:
240.43(11) Rigid ~~nonmetallic~~ <u>PVC</u> conduit.
Substantiation: Conforming to style manual Article 352.
Panel Meeting Action: Accept in Principle
Panel Statement: See Proposal 4-109a for the revised wording.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-111 Log #4174 NEC-P04 **Final Action: Reject**
(230.43(15))

Submitter: David Mercier, Southwire Company
Recommendation: Revise text to read as follows:
(15) Flexible metal conduit not over 1.8 m (6 ft) long or liquidtight flexible metal conduit not over 1.8 m (6 ft) long between raceways, or between raceway and service equipment, with equipment bonding jumper routed with the flexible metal conduit or the liquidtight flexible metal conduit according to the provisions of 250.102(A), (B), (C), and (E). <u>Liquidtight flexible metal conduit shall be permitted to be installed in one continuous length between service equipment when listed for service entrance use.</u>
Substantiation: This change would allow the use of a single run of LFMC for service applications. The conduit would require listing to meet the performance of similar wiring methods allowed for service entrance.
Panel Meeting Action: Reject
Panel Statement: LFMC is already permitted to be used in one continuous length up to 6 ft.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-112 Log #1519 NEC-P04 **Final Action: Accept**
(230.44)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 4-113.
See the Technical Correlating Committee action on Proposal 4-113.
This action will be considered by the panel as a public comment.
Submitter: L. Keith Lofland, IAEI
Recommendation: Revise text to read as follows:
230.44 Cable Trays. Cable tray systems shall be permitted to support service-entrance conductors. Cable trays used to support service-entrance conductors shall contain only service-entrance conductors. <u>Such cable trays shall be identified with permanently affixed labels with the wording "Service-Entrance Conductors." The labels shall be located so as to be visible after installation and placed so that the service-entrance conductors may be readily traced through the entire length of the cable tray.</u>
Exception: Conductors other than service-entrance conductors shall be permitted to be installed in a cable tray with service-entrance conductors, provided a solid fixed barrier of a material compatible with the cable tray is installed to separate the service-entrance conductors from other conductors installed in the cable tray. ~~Cable trays shall be identified with permanently affixed labels with the wording "Service-Entrance Conductors." The labels shall be located so as to be visible after installation and placed so that the service-entrance conductors may be readily traced through the entire length of the cable tray.~~
Substantiation: Move last two sentences of the exception into the main body of 230.44. As 230.44 is now currently written, permanently affixed labels are <u>not required</u> for a cable tray containing service-entrance conductors <u>unless</u> the cable tray contains both service-entrance conductors and other conductors per the exception.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-113 Log #1740 NEC-P04 **Final Action: Accept**
(230.44)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with respect to both the placement of the added text and the accepted text of the second sentence.
This action will be considered by the panel as a public comment.
Submitter: Lowell Reith, Interstates Construction Services Inc.
Recommendation: Add new text to read as follows:
Cable tray systems shall be permitted to support service-entrance conductors. Cable trays used to support service-entrance conductors shall contain only service-entrance conductors and <u>shall be limited</u> to the following methods:
<u>1. Service-entrance cables</u>
<u>2. Type MC cable</u>
<u>3. Mineral-insulated, metal-sheathed cable</u>
<u>4. Type IGS cable</u>
<u>5. Single Thermoplastic-Insulated Conductors 1/0 and Larger with CT rating</u>
Substantiation: 230.44 lists service entrance cable as being allowed for use on a Cable tray. THHN conductors may be used for service entrance conductors in raceways, and for feeders and branch circuits in cable tray if listed and marked with a CT rating. If SE cable can be used as a single conductor in a cable tray as service entrance conductors, why not other Thermoplastic-Insulated conductors. I personally feel that is allowed, but have run into engineers and others who disagree. By putting a list of the types of cables allowed like what is found in 230.43 for Wiring methods for 600 volts or less, this would be made clear to all. THHN is typically installed in a raceway system for mechanical protection and because it has not undergone the same type of flammability testing as a building type cable such as SE cable. However, when it is marked "CT" as indicated in the ZLGR guide information, then it has undergone the proper flammability test for exposed cables in cable trays which is a more stringent flammability test than is done for SE cable.
Types TW, THW, THW-2, THHN, THHW, THWN, THWN-2, PFA, PFAH and Z in sizes 4 to 1 AWG for grounding conductors only and in sizes 1/0 AWG and larger for circuit and grounding conductors that are marked "Cable Tray Use" or "CT" comply with a vertical-tray cable flame test.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-113a Log #2687 NEC-P04 **Final Action: Reject**
(230.50)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:
PROTECTION AGAINST PHYSICAL DAMAGE.
(A) UNDERGROUND SERVICE CONDUCTORS. Direct-buried service conductors and cables shall be protected in accordance with 300.5 D)(1)
(B) OTHER SERVICE CONDUCTORS. Above ground service conductors and cables, other than service drops, where likely to be subject to physical damage, shall be protected by any of the wiring methods specified in 230.43 that are identified for the use.
(C) INDIVIDUAL OPEN CONDUCTORS. Individual open conductors and aboveground cables, other than Type SE cable, shall not be installed less than 3.0 m (10 ft) above outside finished grade or where likely to be subject to physical damage unless protected in accordance with 250.50(B).
Exception: Type MC and Type MI cables shall be permitted less than 3.0 m (10 ft) above finished grade where not likely to be subject to physical damage or where protected in accordance with 230.50(B).
Substantiation: Underground conductors should be noted as direct buried and include service laterals. (B) should cover all above-ground service conductors except service drops. Protection means should be referenced to specific means of 230.43 which does not include "other approved means". Service cables in present (B) (2) should be service-entrance cables since they are not limited to height above grade. Service-entrance cables exposed to physical damage are covered by 338.12(A)(2).
Panel Meeting Action: Reject
Panel Statement: The panel agrees that the proposed revised wording does not add clarity to existing wording.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-114 Log #3438 NEC-P04 **Final Action: Accept**
(230.50(B)(1))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.50(B)(1) Service-Entrance Cables. Service-entrance cables, where subject to physical damage, shall be protected by any of the following: (The remainder of the text to remain the same.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 10

(230.51)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.51 Mounting Supports. Service-entrance c~~C~~ables or individual open service-entrance conductors, shall be supported as specified in 230.51(A), (B), or (C). (The remainder of the text to remain the same.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-118 Log #3386 NEC-P04 **Final Action: Accept**
(230.51(A))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.51(A) Service-Entrance Cables. Service-entrance cables shall be supported by straps or other approved means within 300 mm (12 in.) of every service head, gooseneck, or connection to a raceway or enclosure and at intervals not exceeding 750 mm (30 in.).
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-119 Log #646 NEC-P04 **Final Action: Reject**
(Table 230.51(C))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text to read as follows:
For approach boundaries to live parts for shock protection, see NFPA 70E, Standard for Electrical Safety in the Workplace.
Substantiation: The approach boundaries of NFPA 70E, Table 130.2(C), are related to the installation requirements of Table 230.51(C) and this information will be helpful in understanding this relationship.
Panel Meeting Action: Reject
Panel Statement: Table 230.51(C) is for supports and has nothing to do with approach boundaries. The NEC addresses clearance around electrical equipment with reference to NFPA 70E in Chapter 1; the submitter's concerns are adequately addressed there.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-120 Log #3299 NEC-P04 **Final Action: Reject**
(230.53)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal and identify the specific lack of conformance with 4.3.3(b) of the NFPA Regulations Governing Committee Projects.
This appears to be an NEC Style Manual issue concerning "possibly unenforceable and vague" terms.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Where exposed to the weather raceways, meter assemblies, conduit bodies, and other enclosures containing service conductors shall be ~~suitable~~ identified for use in wet locations and if practicable, raceways shall be arranged to drain.
Substantiation: "Suitable" is subjective and a term to be avoided per the Style Manual. The provision should apply to all exposed components. Weatherproof components should be covered by protocols for listing as to whether drain provisions are necessary. Conduit bodies for wet locations normally do not have drain holes and drilling holes may void listing. Draining for raceways is widely ignored, and while not justifying a violation does indicate a problem with the provision. In many areas raceway masts are installed through the roof and run inside a wall to service equipment inside the structure or inside a wall where it is not practical to provide drainage. This provision doesn't cover other enclosures or auxiliary gutters which are not listed as raceways in the Article 100 definition of raceway.
Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-121 Log #3422 NEC-P04 **Final Action: Accept in Principle**
(230.54)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.54 Overhead Service Locations.
(A) Service Head. Service raceways shall be equipped with a service head at the point of connection to service-drop conductors. The service head shall comply with the requirement for fittings in 314.15.
(B) Service-Entrance Cable Equipped with Service Head or Gooseneck. Service-entrance cables shall be equipped with a service head. The service head shall comply with the requirement for fittings in 314.15. (The text of the Exception to remain the same.)
(C) Service Heads and Goosenecks Above Service-Drop Attachment. Service heads and goosenecks in service-entrance cables shall be located above the point of attachment of the service-drop conductors to the building or other structure. (The text of the Exception to remain the same.)
(D) Secured. Service-entrance cables shall be held securely in place.
(E) Separately Bushed Openings. Service heads shall have conductors of different potential brought out through separately bushed openings.
Exception: For jacketed multiconductor service-entrance cable without splice.
(F) Drip Loops. Drip loops shall be formed on individual conductors. To prevent the entrance of moisture, service-entrance conductors shall be connected to the service-drop conductors either (1) below the level of the service head or (20 below the level of the termination of the service-entrance cable sheath.
(G) Arranged That Water Will Not Enter Service Raceway or Equipment. S~~ervice-drop conductors and s~~ervice-entrance conductors shall be arranged so that water will not enter service raceway or equipment.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept in Principle
Add “or overhead service” immediately after service-drop in “A”.
Add “or overhead service” immediately after service-drop in two locations in “C”.
Add “or overhead service” after the word service-drop in “F”.
Add “and overhead service” immediately after “service-entrance” in “G”.
Panel Statement: Some installations may have overhead service conductors and no service-entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
YOUNG, J.: The revision does not add clarity to the Code. There is insufficient substantiation for the change.
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all “service-laterals” and “service drops” are always installed by utility companies.

4-122 Log #562 NEC-P04 **Final Action: Accept**
(230.54(A) and (B))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text to read as follows:
(A) Service Head. Service raceways shall be equipped with a service head at the point of connection to service-drop conductors. The service head shall ~~comply with the requirement for fittings in 314.15.~~ be listed for use in wet locations.
(B) Service Cable Equipped with Service Head or Gooseneck. Service cables shall be equipped with a service head. The service head shall ~~comply with the requirement for fittings in 314.15.~~ be listed for use in wet locations.
Substantiation: The proposal addresses usability. The requirement should appear clearly within these two rules for service weatherheads rather than needing to refer to another rule to find what is required. This proposal does not add technical revisions or requirements, just adds clarity for users and improves usability.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-123 Log #553 NEC-P04 **Final Action: Reject**
(230.54(F))

Submitter: Joe Riley, City of Arlington
Recommendation: Revise text as follows:
(F) Drip Loops. Drip loops shall be formed on individual services conductors~~.~~ and the conductors shall extend a minimum of 24 in. from the point where the conductors emerge from the service weather head. To prevent the entrance of moisture, service entrance conductors shall be connected to the service-drop conductors either (1) below the level of the service head or (2) below the level of termination of the service entrance cable sheath.
Substantiation: To form a drip loop on service conductors and provide adequate conductor length for service conductor terminations to an over head drop would require at least 24 in. of free conductor length. An NEC minimum required conductor length from the point where the conductors emerge from the service weather head would make it clear and consistent as to what would be considered adequate conductor length to form a drip loop and terminate service conductors to an overhead drop.
Panel Meeting Action: Reject
Panel Statement: This requirement has been in the NEC for many decades with no documented ongoing problems and the submitter has not presented any technical data supporting the necessity to attach a fixed minimum length to this requirement. The amount of cable required to make a drip loop will depend on the diameter of the cable and the allowable bending radius for that cable. A specific length of 24 inches may be too little for some cable and excessive for others.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-124 Log #3434 NEC-P04 **Final Action: Reject**
(230.56)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.56 Service-Entrance Conductor with the Higher Voltage to Ground. On a 4-wire, delta-connected service where the midpoint of one phase winding is grounded, the service-entrance conductor having the higher phase voltage to ground shall be durably and permanently marked by an outer finish that is orange in color, or by other effective means, at each termination or junction point.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply

service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: Section 230.56 applies to all service conductors, not just service-entrance conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-125 Log #4894 NEC-P04 **Final Action: Reject**
(230.56)

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services

Recommendation: Revise text as follows:

230.56 Service Conductor with the Higher Voltage to Ground. On a 4-wire, delta-connected service where the midpoint of one phase is grounded, the service conductor having the higher phase voltage to ground shall ~~be durably and permanently marked by an outer finish that is orange in color, or by other effective means at each termination or junction point~~ <u>be connected to the middle phase terminal in the service disconnect(s)</u>.

<u>FPN 1: See 110.15 for the requirements on marking the phase conductor having the higher voltage to ground where supplied from a 4-wire, delta-connected system.</u>

<u>FPN 2: See 408.3(E) for the phase arrangement of 3-phase buses in switchboards and panelboards.</u>

Substantiation: To make the requirement consistent with the requirement found in Article 408.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented any clearly defined reason for the removal of this basic safety requirement for this type of service installation and then inserting two fine print notes sending users to other code sections to find the information anyway. The existing wording is more user friendly. The user does not have to flip back to find the referenced section. Section 230.56 does not address where the "high leg" conductor terminates in the service-entrance switchboard.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-126 Log #828 NEC-P04 **Final Action: Reject**
(230.66)

Note: This proposal is reported as "Reject" as it did not receive the 2/3 affirmative vote.

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise first sentence:

Service equipment shall be <u>listed and</u> marked to identify it as being suitable for use as service equipment.

Substantiation: Many less critical components of wiring systems are required to be listed; it should be specifically required for service equipment.

Panel Meeting Action: Reject

Panel Statement: The change could introduce confusion. Service equipment may be listed as service equipment and if that is the case it will be marked as service equipment as opposed to being listed and marked suitable for use as service equipment. The present wording is not as specific and only covers that the equipment can be used as service equipment.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 6 Negative: 4

Explanation of Negative:

DORTA, T.: NEC already required Listed components throughout the code. Service equipment shall be no exception of critical equipment needed to be listed.

ROGERS, J.: This proposal should be accepted. Even though equipment that is marked as suitable for use as service equipment in essence is obtained through testing and listing a clear statement requiring listing for this equipment adds clarity.

STAFFORD, T.: Listed equipment is a proven method to ensure safety. Requiring listed equipment provides a verifiable level of safety above what is present when non-listed equipment is installed.

ZGONENA, T.: The panel action to reject this proposal was not appropriate. The proposal should be accepted. Although 230.2(E) does provide identification requirements when there is more than one service, it does NOT require the identification of the location of each service disconnecting means when only one service is provided. 230.2(E) only requires identification of other services, branch circuits, or feeders that supply the building or structure. If there is only one service, but multiple service disconnects for that service, it is not required to identify the location of each service disconnect. Presumably, this is because the disconnects are all grouped together in accordance with 230.72. However, the exception to 230.72 allows the water pump disconnecting means to be located remotely. Since this could be one of the six disconnects allowed, and is therefore associated with just one service, 230.2(E) is not applicable, and therefore the submitter's concerns are NOT addressed in 230.2(E).

4-127 Log #3563 NEC-P04 **Final Action: Reject**
(230.67)

Submitter: James T. Dollard, Jr., IBEW Local 98

Recommendation: Add new text to read as follows:

<u>**230.67 Dwelling Unit Surge Protection.**</u>

<u>**(A) Surge Protective Device**. All dwelling units shall be provided with a surge protective device (SPD) installed in accordance with Article 285.</u>

<u>**(B) Location**. The surge protective device shall be an integral part of the service disconnecting means or shall be located immediately adjacent thereto.</u>

<u>**(C) Type**. The surge protective device shall be a Type 1 or Type 2 SPD.</u>

<u>**(D) Replacement.** Where service equipment is upgraded, all of the requirements of this section shall apply.</u>

Substantiation: This proposed requirement is submitted for consideration by the Technical Committee for the sole purpose of personnel safety. The NEC requires GFCI and AFCI protective devices throughout dwelling units. Additionally, 120-smoke alarms are required by most local building codes in all new dwelling units. In essence we have mandated electronic based protection, designed to prevent shock, fire and to alarm residents in the event of a fire. These devices have all proven that when installed and maintained properly, they will and have saved lives. This proposal seeks a level of protection for these life saving devices as well as general surge protection throughout the home.

All GFCI's, AFCI's and smoke alarms may be damaged when a surge occurs due to lighting or other sources. In many cases these devices can be damaged and rendered inoperable by a surge.

It is practical to require a "whole house" SPD to provide a general level of protection. Home owners regularly buy and use Type 3 (point of utilization) SPD's which are cord and plug connected to protect computers, plasma TV's and other electronic equipment. However, in almost all new service installations as well as service upgrades, no consideration is given to providing a general level of protection to the "whole house."

Typical homeowners have no problem buying multiple Type 3 (point of utilization) SPD's to protect equipment for entertainment purposes, the additional cost of a Type 1 or Type 2 SPD for the purpose of personnel safety will not represent a financial burden.

First level subdivision (D) is included to require that when a service is upgraded, an SPD is to be installed. Residents of existing dwelling units deserve the same level of protection as those in new homes.

Note that a sister proposal has been submitted as a new 225.41.

Panel Meeting Action: Reject

Panel Statement: The submitter has not submitted any technical data that supports the statement relative to the installation of SPDs saving lives. These devices may protect some electronic equipment but there is no submitted documentation relative to smoke detector failures due to surges with or without SPDs. This is not an appropriate item for Article 230.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

STAFFORD, T.: This panel member determines that submitter's substantiation is correct as provided in original proposal

---

4-128 Log #234 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: Sprague Owings, Nassau County, FL

Recommendation: 230.70(A)(1) Readily Accessible Location. The service disconnecting means shall be installed at a readily accessible location either outside of a building or structure or ~~inside nearest the point of entrance of the service conductors.~~

Change to:

Readily Accessible Location. The service disconnecting means shall be

installed at a readily accessible location either outside of a building or structure or if inside, nearest the point of entrance of the conductors when encased in rigid metal conduit or encased in 2 in. of concrete.
Substantiation: Since the service entrance conductors are only protected from overcurrents by the utility company's fusing or jacks, the fault current can far exceed the rating of the entrance conductors. It would seem prudent to attempt to minimize the potential area of contact of these lines to a minimum so that a fault could be confined outside the structure or encased in such a way to lessen the potential effect of a fault.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any technical data to support such an extreme limitation on the wiring methods utilized for service conductors to enter a building. For instance type SE cable has been utilized for installation such as this, and there is no track record of failures in this wiring method when properly installed.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-129 Log #534 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: Joseph Penachio, Northeast Metro Tech H.S.
Recommendation: Revise text to read as follows:
The service disconnecting means shall be installed in accordance with 230.70(A)(1), (A)(2), and (A)(3).
(1) Readily accessible location. The service disconnecting means shall be installed at a readily accessible location, either outside of a building or structure or inside nearest the point of entrance of the service raceway, cable, or conductors.
Substantiation: As stated, the nearest point of entrance of the service conductors is where the conductors exit the raceway or cable. A legal argument can be made that a disconnect could be installed 20, 30, or even 50 feet inside a building or structure because it would still be installed at the nearest point of entrance of the service conductors as stated.
Adding the wording raceway, cable, or between the words "raceway" and "conductors" clarifies the code's intent that the service disconnect be at the nearest point of entrance to the building or structure.
Panel Meeting Action: Reject
Panel Statement: The submitter's revised wording does not address the supposed problem the submitter is referencing. The disconnect should be nearest the point of entrance.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-130 Log #1485 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: Dennis J. Cox, Elkhart County Building Dept. / Rep. IAEI
Recommendation: Add new text as follows:
Readily Accessible Location. The service disconnecting means shall be installed at a readily accessible location (within 8 ft of the electric meter) either outside of a building or structure or inside nearest the point of entrance of the service conductors.
Substantiation: 230.70(A)(1) does not state how far the overcurrent device can be from the meter. It is an AHJ call. The basis for this change is the service conductors ahead of the main overcurrent device have no protection. How far is readily accessible? By adding (within 8 ft of the electric meter) this change would make this section standard, not a guess.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation for the proposed distance of 8 ft.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: It should be further noted that although the submitter referenced IAEI, this proposal did not go through the IAEI process and therefor is not to be considered an official position of IAEI. If one were to research this issue as far back as at least the 1940s there have been proposals to define this length and the various code panels that dealt with subject have remained firm in the opinion that there is no one correct distance and the language as it exists allows the installer and the AHJ to review the physical characteristics of each installation on its own merit.

4-131 Log #3437 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.70(A)(1) Readily Accessible Location. The service disconnecting means shall be installed at a readily accessible location either outside of a building or structure or inside nearest the point of entrance of the service-entrance conductor.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: Not all service conductors are service-entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-132 Log #3578 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: George M. Stolz, II, Pierce, CO
Recommendation: Revise text to read as follows:
(1) **Readily Accessible Location.** The service disconnecting means shall be installed at a readily accessible location ~~either~~ outside of a building or structure ~~or inside nearest the point of entrance of the service conductors~~.
Substantiation: Allowing service equipment indoors poses an unnecessary risk to personnel and property, usually for asthetic reasons. Services supplied by raceway wiring methods provide pathways into a structure for both arc blast events contained in the laterals themselves as well as outdoor transformer explosions. If the NEC were to require service disconnects to be located entirely outdoors, then there would not be a direct conduit from an exploding or burning utility transformer to the vulnerable interior of the structure.
Attached are two events that occurred within a month of each other, within 20 miles of each other. In both events, there were personnel present who could have been seriously injured by the explosions and subsequent fires from service lateral and outdoor transformer faults.
There is no reason to allow deadly equipment to be installed inside a building for asthetic reasons.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The requirement presented by the submitter is far too restrictive and is not supported by technical data other than two incidents that could have happened on installations such as bottom fed switchboards or transformers. This allowance has been in the NEC for many decades without documented widespread problems.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-133 Log #4312 NEC-P04 **Final Action: Reject**
(230.70(A)(1))

Submitter: Roger D. McDaniel, Georgia Power Company
Recommendation: Add a new sentence at the end of 230.70(A)(1):
230.70(A)(1) Readily Accessible Location. The service disconnecting means shall be installed at a readily accessible location either outside of a building or structure or inside nearest the point of entrance of the service conductors. The service disconnecting means for one and two family dwellings shall be in a readily accessible location outside of the building.
Substantiation: This proposal provides added safety for the occupants of one and two family dwellings by having overcurrent protection ahead of any feeder conductors routed inside the building. When the service disconnect is inside the building, there is no overcurrent protection for the service entrance conductors routed inside the building. The primary fuse for the utility transformer is sized only to protect the transformer and not the service entrance conductors.
An added benefit of the acceptance of this proposal would be to possibly reduce property damage and increase safety of fire fighters by having a location outside of a building to de-energize all conductors within a building during a fire. Many fire departments have to wait as much as 30 minutes or more to have a utility representative to disconnect power.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any evidence to support his conclusion that the recommended change would increase safety. There is no technical data presented that would support this change. A requirement such as this would be far too restrictive.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-134 Log #663 NEC-P04 **Final Action: Reject**
(230.70(A)(1) Exception (New))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text to read as follows:
Exception: For installations under single management, where documented safe switching procedures are established and maintained for disconnection, and where the installation is monitored by qualified individuals, the disconnecting means shall be permitted to be located elsewhere on the premises.
Substantiation: This exception applies in 225.32, where buildings or structures are supplied by branch circuit(s) or a feeder(s), and it should apply to service supplied buildings or structures as well.
Panel Meeting Action: Reject
Panel Statement: The exception is correct in Article 225 where there are multiple buildings, but it is not correct in Article 230. The service disconnect is required to be readily accessible for emergency personnel.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-135 Log #829 NEC-P04 **Final Action: Reject**
(230.70(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Each service disconnecting means shall comply with 230.66 and be ~~suitable~~ identified for the prevailing conditions. See my proposal for 230.66.
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: It would be impossible to identify or mark all the prevailing conditions that a device would be suitable for. The service equipment is required to be marked in Section 230.66. The disconnect itself is not required to be marked.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-136 Log #348 NEC-P04 **Final Action: Accept**
(230.71(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change "per" to "for each".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-137 Log #4140 NEC-P04 **Final Action: Reject**
(230.71(A)(4))

Submitter: Larry LeVoir, City of Irvine
Recommendation: Add new text to read as follows:
Where the service disconnecting means is located outside the building and is within sight of the building, an additional disconnecting means shall not be required where conductors enter the building.
Substantiation: This addition would permit the disconnect to be located up to fifty feet away from the building. Under current wording, if the disconnect is located outside and not mounted on the building, then the rules in Article 225 would require an additional disconnecting means inside the building where the conductors enter. This would seem needlessly restrictive in my opinion. This proposal also parallels the existing requirements in 700.12(B)(6), 701.11(B)(5), and 702.11 which allow the disconnecting means for a feeder to be remote from the building.
Panel Meeting Action: Reject
Panel Statement: Over the past several code cycles CMP 4 has had to grapple with this issue of what distance from a building or structure is a safe distance for locating a disconnecting means, whether it be for service conductors or feeder conductors, and no agreeable distance has been found. The submitter has not presented and documented technical rationale for changing this opinion.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-138 Log #793 NEC-P04 **Final Action: Reject**
(230.72(A))

Submitter: Carol Pafford, City and County of Denver
Recommendation: Revise text to read as follows:
The two to six service disconnects as permitted in 230.71 shall be grouped together. Each disconnect shall be permanently marked to indicate the load served.
Substantiation: The existing language is revised to eliminate confusion between a service disconnect switch and feeder disconnect switches. Also, it has been assumed in practice that the disconnect switches are grouped together, but was not specifically called out as such. The term "grouped" has lead to ambiguity when deciding upon locations for service disconnect switches. Additionally, the labels of service disconnects are not currently required to have permanent labels, leading to missing or damaged non-permanent labels being installed. Requiring permanent labels will eliminate unidentified service disconnects resulting from non-permanently installed labels.
Panel Meeting Action: Reject
Panel Statement: The addition of "together" does not add clarity to "grouped". Permanent marking is subjective and would suggest it could not be changed but the installation could be modified, requiring a change in the marking.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-139 Log #2899 NEC-P04 **Final Action: Reject**
(230.72(A) and (B))

Submitter: Wendell Whistler, Whistler Consulting & Technical Services
Recommendation: Revise text to read as follows:
230.72 Grouping of Disconnects.
(A) General. The two to six disconnects as permitted in 230.71 shall be grouped. Each disconnect shall be marked to indicate the load served.
Exception: One of the two to six service disconnecting means permitted in 230.71, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means.
(B) Additional Service Disconnecting Means. The one or more additional service disconnecting means for fire pumps, emergency systems, legally required standby, or optional standby services permitted by 230.2 shall be installed remote from the one to six service disconnecting means for normal service to minimize the possibility of simultaneous interruption of supply.
Substantiation: Provide clarification as to the term remote as used in 230.72(A) and (B). Need to define a distance as this term is very vague and leaves a lot to be interpreted by the contractor and AHJ.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any change indicated or defined.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-140 Log #227 NEC-P04 **Final Action: Reject**
(230.72(A) Exception (New))

Submitter: Don A. Hursey, Durham County Inspections Department
Recommendation: Add to the end of 230.72(A):
Exception: The location of water pump service disconnecting means shall be provided at the other disconnecting means.
Substantiation: It is important to know the location of the water pump service disconnecting means. Providing information at the service disconnecting means the location of the water pump service disconnect is beneficial.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are already addressed in 230.2(E).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 7 Negative: 3

Explanation of Negative:

ROGERS, J.: I originally voted in favor of rejecting this proposal. Upon further review it is my opinion that the submitter's concerns are not addressed in 230.2 when utilizing the allowance of providing power to a fire pump with taps ahead of the service main as this is not more than one service as described in 230.2E

STAFFORD, T.: This panel member determines that submitter's substantiation is correct as provided in original proposal

ZGONENA, T.: The panel action to reject this proposal was not appropriate. The proposal should be accepted. Although 230.2(E) does provide identification requirements when there is more than one service, it does NOT require the identification of the location of each service disconnecting means when only one service is provided. 230.2(E) only requires identification of other services, branch circuits, or feeders that supply the building or structure. If there is only one service, but multiple service disconnects for that service, it is not required to identify the location of each service disconnect. Presumably, this is because the disconnects are all grouped together in accordance with 230.72. However, the exception to 230.72 allows the water pump disconnecting means to be located remotely. Since this could be one of the six disconnects allowed, and is therefore associated with just one service, 230.2(E) is not applicable, and therefore the submitter's concerns are NOT addressed in 230.2(E).

4-141 Log #2529 NEC-P04 **Final Action: Reject**
(230.72(B))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise text to read as follows:

(B) Additional Disconnecting Means. The one or more additional disconnecting means for fire pumps, emergency systems, or legally required standby ~~or optional standby~~ services permitted by 230.2 shall be installed remote from the one to six service disconnecting means for normal service to minimize the possibility of simultaneous interruption of supply.

Substantiation: For the purpose of "locating" the disconnecting means for "optional standby systems" **remote from other disconnecting means**, the treatment of optional standby systems as though they were critical loads to be maintained in the ON condition in all possible cases is unnecessary. In fact, safety would be INCREASED if the disconnecting means for "optional loads" was grouped with the other "normal load" disconnecting means where fire incidences are concerned. Electrical services (or feeders) that do NOT supply life safety equipment or other legally required loads should be capable of being quickly de-energized during emergency events by locating all of the disconnecting means in close proximity. Added words are for grammatical accuracy.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented any technical rationale to support his assumption that locating the disconnects adjacent to one another enhances safety. Even though the systems he references are not legally required, these optional systems could provide assistance to building occupants or responding emergency personnel. There are requirements for proper labeling of these disconnects, as to where other disconnects are located this should provide the additional safety the submitter has mentioned.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-142 Log #3974 NEC-P04 **Final Action: Reject**
(230.72(B))

Submitter: Justin B. Biller, Roanoke County Office of Building Safety
Recommendation: Add new text as follows:

230.72 Grouping of Disconnects.

(A) General. The two to six disconnects as permitted in 230.71 shall be grouped. Each disconnect shall be marked to indicate the load served.

Exception: One of the two to six service disconnecting means permitted in 230.71, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means.

(B) Additional Service Disconnecting means. The one or more additional service disconnecting means for fire pumps, emergency systems, legally required standby, or optional standby services permitted by 230.2 shall be installed a minimum remote distance of 1.8 m (6 ft) from the one to six service disconnecting means for normal service to minimize the possibility of simultaneous interruption of supply.

Substantiation: The current language in these sections is vague and permits a large variation of interpretations from AHJs on what would be considered remote. By codifying a specific distance, the code user and enforcers can apply specific language to determine remoteness of disconnects to ensure that fire pumps, emergency systems, legally required or optional standby power systems are not inadvertently operated simultaneously. The use of 1.8 m or 6 ft is somewhat arbitrary, but would be considered an acceptable distance for an individual that would be servicing equipment or an emergency responder to be unable to physically operate both sets of disconnects. This proposal is also intended to establish dialogue for the code-making panel to consider alternative minimum dimensions based on other quantifiable data.

See also similar proposal to 695.4(B)(2)(4).

Panel Meeting Action: Reject

Panel Statement: As noted in the substantiation the proposed distance is arbitrary. There is not technical substantiation to add a distance.

There is no specified distance for this requirement, nor could there be as adequate separation changes from one installation to another. This separation has to be determined onsite by designers, installers, and AHJs.

Ballot Results: Affirmative: 10

4-143 Log #3378 NEC-P04 **Final Action: Reject**
(230.74)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:

230.74 Simultaneous Opening of Poles. Each service disconnect shall simultaneously disconnect all ungrounded service-entrance conductors that it controls from the premises wiring system.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: Not all service conductors are service-entrance conductors.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-144 Log #3374 NEC-P04 **Final Action: Reject**
(230.76)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:

230.76 Manually or Power Operable. The service disconnecting means for ungrounded service-entrance conductors shall consist of one of the following:
(The rest of the text to remain the same.)

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the

service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.

It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all “service-laterals” and “service drops” are always installed by utility companies.

4-145 Log #328 NEC-P04 **Final Action: Reject**
(230.77)

Submitter: Richard R. Verrier, City of Biddeford
Recommendation: Revise as follows:
The service disconnecting means shall plainly indicate whether it is in the ~~open~~ off or ~~closed~~ on position.
Substantiation: The confusion describing the position indicator is contrary to other professions, i.e., you open a faucet to allow water flow and close it to shut it off. (open door; close door)!
Panel Meeting Action: Reject
Panel Statement: A disconnecting means is open when the contacts are open. Use of the word open implies an isolating gap. “Open” and “Closed” is well understood when describing an electrical connection.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
ZINNANTE, V.: I actually thought this proposal should have been “accept in principal” and I still stand by this position.
Art 230.71 states that the disconnecting means for a service shall consist of not more than six switches or sets of circuit breakers. Article 240.81 states: ‘Circuit breakers shall clearly indicate whether they are in the open “off” or closed “on” position.’ Why doesn’t this same logic apply when circuit breakers are used as service disconnecting means?

4-146 Log #3314 NEC-P04 **Final Action: Reject**
(230.79)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: The service disconnecting means shall have ~~a~~ an ampere rating not less than the calculated load ~~to be carried~~ determined in accordance with Part I, II, III, IV, and V as applicable. (remainder unchanged).
(A) For installations to supply only ~~limited loads of~~ a single branch circuit the service disconnecting means shall have a rating of not less than 15-amperes.
(B) For installations consisting of ~~not more than~~ two 2-wire branch circuits supplied from a 2-wire service the service disconnecting means shall have a rating of not less than 30 amperes. For installations consisting of two multiwire branch circuits or two 3-phase branch circuits the disconnecting means shall have a rating not less than 30 amperes.
(D) No change.
Substantiation: Parts I and II also have applicable load provisions. The phrase “not more than two” includes a one circuit installation covered by (A) in which “limited load” is superfluous and not defined.
The provisions of (B) should only apply where the service is 2-wire; a 3-wire 15 ampere service can supply two 2-wire branch circuits.
Since (A) is not limited to a 2-wire circuit a single multiwire or 3-phase circuit could have a service disconnecting means rated 15 amperes.
Since (A) and (B)j don’t cover two multiwire or 3-phase circuits the provisions of (D) require a rating of 60 amperes for a 15 ampere circuit multiwire or 3-phase circuit.
Panel Meeting Action: Reject
Panel Statement: The reference to Article 220 Parts III, IV, or V is correct as written. The submitter has not presented any technical data to support the recommended changes he has presented. There is no reason to limit Part B to buildings with two wire services, and anything other than two 2 wire circuits is intended to require a minimum rating of 60 amperes for the disconnecting means.
Number Eligible to Vote: 10

4-148 Log #2310 NEC-P04 **Final Action: Reject**
(230.82)

Submitter: Michael Wright, Alpha Technologies
Recommendation: Add new text as follows:
(9) Taps used to supply communications equipment at the network point of demarcation, where the connection of the communications equipment to the service provider side is optical or non-electrical, if provided with service equipment and installed in accordance with requirements for service-entrance conductors.
Exception No. 1: If a supply intended for installation in a meter base is listed for the purpose and the output is Class 2 or limited power circuits used by listed information technology equipment, a service disconnecting means for the supply is not required.

Substantiation: Problem: Currently the NEC does not allow meter base powering solutions for communications equipment applications such as fiber to the home (FTTx). There is confusion in the industry and with some AHJs on whether equipment installed at this location is under the jurisdiction of the NEC. In a survey by UL to the Electrical Council a significant number of the respondents felt these devices fall under the NEC, however no exception currently exists to accept this type of equipment. Most of the respondents also indicated that they did not object to a revision of Article 230-82 to accept this type of equipment.

Proposal: Allow for power in two basic cases where the communications equipment is isolated on the network side and energizing the network on the service provider side is not possible if a fault occurs in the communications equipment power supply. The first case would allow powering of these circuits the same as the following existing exception:

(5) Taps used only to supply load management devices, circuits for standby power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors.

The second case (exception No. 1 in the proposed text) would allow supplies that have been specifically investigated for use in a meter base with a Class 2 or limited power output to directly power communications equipment at the network demarcation point without the need for a separate service entrance.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented to the panel sufficient technical data to make a decision on this proposal.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-149 Log #4593 NEC-P04 **Final Action: Reject**
(230.82)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee

Recommendation: Revise this section to read as follows:

<u>230.82. Equipment Connected to the Supply Side of Service Disconnect.</u> Only equipment included in this section shall be permitted to be connected to the supply side of the service disconnecting means.

<u>(A) Unswitched Equipment.</u>

<u>(1)</u> Cable limiters or other current limiting devices

<u>(2)</u> Meters or meter sockets nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded in accordance with Part VII and bonded in accordance with Part V of Article 250.

<u>(3)</u> Instrument transformers (current and voltage), high-impedance shunts, load management devices, and Type I surge protective devices

<u>(4)</u> Taps used only to supply load management devices, circuits for standby power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors

<u>(5)</u> Solar photovoltaic systems, fuel cell systems, or interconnected electric power production sources

<u>(6)</u> Control circuits for power-operable service disconnecting means, if suitable overcurrent protection and disconnecting means are provided

<u>(7)</u> Ground-fault protection systems or Type 2 surge protective devices, where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided

<u>(B) Meter Disconnect Switches.</u> A disconnecting means shall be permitted to be located ahead of the service equipment provided the installation complies with 230.82(B)(1) through 230.82(B)(3). A separate service disconnecting means that complies with Part V of Article 230 shall be installed, and shall be located as provided in 230.70(A)(1).

<u>(1) Rating.</u> A meter disconnect shall be capable of interrupting the load served. It shall have a short-circuit current rating not less than the available short-circuit current.

<u>(2) Marking.</u> A meter disconnect shall be legibly field marked on its exterior in a manner suitable for the environment substantially as follows:

METER DISCONNECT
NOT SERVICE EQUIPMENT

<u>(3) Grounding.</u> A meter disconnect shall be grounded in accordance with Part VII and bonded in accordance with Part V of Article 250. The grounding connections shall be permitted to be in accordance with 250.142(A)(1).

Substantiation: This proposal should be read as fully supportive of the technical objectives of the 2002 NEC change in this section that added meter disconnects. The problem is to achieve those objectives in a way that does not create confusion and controversy around a fundamental principle of code application, namely, the determination of exactly which device located where constitutes the service disconnect.

Meter disconnects have been around for a very long time, normally consisting of a multipole circuit breaker mounted within a multifunction meter enclosure or in a self-contained metering pedestal. Theoretically a manufacturer could make any of them as convertible to either “hot sequence” (meter ahead of switch) or “cold sequence” (switch ahead of meter) in the field, to suit local utility requirements. At present, most of this market consists of hot sequence units that aren’t field-convertible. If these breakers are on the load side of the service point (the usual case), and if they provide overcurrent protection for the conductors they supply (also the usual case), then what they supply is a conventional feeder, and not a continuation of service conductors.

Although these switches can always be installed as service disconnects, the Advisory Committee understands the practical reluctance to do so in many cases. One major reason is that if they are so classified a grounding electrode would have to be provided at the metering point. If the meter is on the outside of the building that isn’t a big problem, but if the meter is hundreds of feet away, it would involve an additional electrode that would meet code but accomplish very little in terms of safety, since there would be no electrical loads at the remote metering point. It would be like requiring a grounding electrode conductor to be brought to every conventional meter socket.

The Committee also recognizes the increased, and justified, utility interest in cold sequence metering, especially on self-contained 480Y/277 volt metering systems, because of the greater safety it affords their service personnel. Pulling a meter under load at 277 volts to ground can result in a severe arc, which is why the NEC has required GFPE on 480Y/277 volt services for the last thirty-eight years. The remote switch makes sense, and clearly increases safety. Considering that the conductors run from the meter to the “service” disconnect are usually run as unprotected service conductors, requiring overload protection for these conductors has no observable safety justification. Remember also that bypass switches in meter sockets are to maintain load continuity, not load interruption, and opening a meter bypass switch under load may destroy the meter socket.

Some other utilities have also expressed interest in this concept where the metering is to be at a roadside, with the service running to the building served typically using an underground wiring method. This is true even on ordinary 120/240 volt single phase services to single family dwellings. Utility representatives point out, correctly, that here as well a remote disconnect adds an additional level of safety. Often electricians have been in the position of needing to pull a meter in order to deenergize service equipment in a flooded basement; a remote disconnect is much safer.

Unfortunately, countless NEC rules depend on a common understanding of exactly where the service is. Allowing two devices, often widely separated on the same property, that each potentially qualify as service disconnecting means is extremely troublesome. This proposal clearly covers this equipment in a way that precludes confusing meter disconnects with service disconnects.

It was only in the 1999 cycle that the following similar allowance was deleted from Section 230.82: “Fuses and disconnecting means or circuit breakers suitable for use as service equipment, in meter pedestals or otherwise provided and connected in series with the ungrounded service conductors and located away from the building supplied.” The reason this provision was deleted (Proposal 4-159 in the 1999 NEC cycle) was that such disconnecting means are in fact service disconnects and the normal requirements in Part B of Article 225 should generally apply because the conductors they supply are feeders. Further, the existence of this provision (which originated in the 1971 NEC, long before building disconnects moved from old Section 230-84 to Article 225) was leading to confusion and inconsistent application of the rules because of conflicts with Article 225. That action was essentially correct.

The meter disconnect supplies no electric equipment in its vicinity, and therefore requiring all the usual grounding provisions at a service disconnect appears to add little to safety, and discouraging its placement means reducing safety for the sake of editorial purity. On the other hand, a remote disconnect that waddles and quacks like a service disconnect will be treated accordingly by many inspectors, resulting in substantial argument and inconsistency in the application of a fundamental concept, the location of the service disconnect. This proposal provides the appropriate context for these switches, including a field-marking requirement that makes the function obvious.

This version of this previously submitted proposal responds to CMP 4’s objections during the comment stage of the 2005 cycle. The subsection (B) title now includes the word “switches” to provide a clearer contrast from (A) on unswitched equipment. The former (B)(1) (service disconnect provided) has been moved into the parent language of (B) so as to not create confusion in a section covering equipment ahead of service disconnects. In addition, for the same reason, former language covering service equipment has been dropped. A service disconnect placed ahead of a meter is not within the scope of this location.

At that time, CMP 4 also raised the issue of “it would not make any sense to locate a meter disconnecting means on the load side of the metering equipment …” The language in this proposal, however, deliberately allows for such switches on either side of the meter based on the fact that utilities differ as to which side of the meter should be disconnected. The wording has also been clarified to avoid the inference that the entire list must be installed. The second sentence for (B)(1) retains the safety ratings as presently required.

CMP 4 did not respond to the central issue addressed in the 2005 proposal, that being that the switch described here, and with the short-circuit current rating described in the current NEC, may and likely would otherwise qualify as a service disconnect as defined in Article 100, because it would be capable of constituting the main cutoff of supply. This confusion is exacerbated on systems with high available fault currents because the UL Guide Card information can be interpreted as a requirement for a fused switch at this location. The placement of a fused switch at this location will be interpreted by many as a service disconnect, however unintended. Remember that such a switch would fully comply with the overcurrent placement rule in 230.91.

This proposal is essential to avoid extensive field controversies around the location of the real service disconnect. It is highly significant that the submitter of related Proposal 4-106 is the same person as the submitter of the successful Proposal 4-159 in the 1999 cycle that deleted the prior allowance for such switches ahead of a service disconnect, precisely because of the confusion and conflicts such provisions create. We, yet again, respectfully invite CMP 4 to carefully reconsider this proposal.

CMP 4 essentially rejected the two comments supporting this proposal in the prior cycle, one from this Committee. The gravamen of the rejections was purely editorial in that the title of (A) would supposedly make the list inoperative if installed on the load side of a meter disconnect switch. Since the list includes such items as some control circuits with disconnects provided ahead of them and Type 2 surge protection provided with "suitable … disconnecting means" it is clear that the terminology "unswitched equipment" only applies to equipment that does not disconnect the entire load circuit, in contradistinction to a meter disconnect that does. However, an editorial modification could be made to retitle (A) as "Equipment Not Switched Other Than as Provided in (B)." This minor editorial quibble should not obstruct taking and does not justify the lack of effective action to address the technical merit of both the base proposal as well as the comments (4-35 and 4-36) supporting it.

Panel Meeting Action: Reject

Panel Statement: The current language adequately covers the submitter's concerns. The panel never intended that "meter disconnect switches" would serve as a service disconnecting means and that is why they are allowed "ahead of the service disconnecting means". The combination devices that the submitter references and their use as a service disconnecting means, whether they be at the building or remote from such, is a totally different requirement. A meter disconnecting switch is intended to be a separate device and in some jurisdictions is under the exclusive control of the utility company. In the last several code cycles the panel had a great deal of discussion as to why these devices had to be referenced in the NEC when they are under utility control. It was finally decided that it was best to reference these devices and to require some mandatory ratings.

The submitter offers no clarity but possibly some confusion. The group identified as "unswitched" does include devices (e.g., cable limiters and ground fault systems) that could be considered switching.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-150 Log #2005 NEC-P04 **Final Action: Reject**
(230.82(3))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise last sentence: A meter disconnect shall be ~~capable of interrupting~~ identified as suitable to interrupt the maximum calculated load served.

Substantiation: Edit. A disconnect switch is an inanimate object and not capable in itself of interrupting the load. The load should be the maximum calculated load since (actual) load served could be less.

Panel Meeting Action: Reject

Panel Statement: The current wording in the referenced section is clear.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-151 Log #1729 NEC-P04 **Final Action: Reject**
(230.82(5))

Submitter: Joe Riley, City of Arlington

Recommendation: Revise text to read as follows:

230.82(5) Taps used only to supply load management devices, circuits for standby power systems, ~~fire pump equipment~~, and fire protection systems ~~and fire and sprinkler alarms~~, if provided with service equipment and installed in accordance with requirements for service entrance conductors.

Substantiation: The NEC does not have provisions for fire protection systems such as exhaust systems to be permitted for connection on the supply side of the disconnecting means as required in the 2006 International Building Code (IBC) Section [F] 910.4.4 Wiring and control. Wiring for operation and control of smoke exhaust fans shall be connected ahead of the main disconnect and protected against exposure to temperatures in excess of 1,000°F (538°C) for a period of not less than 15 minutes. Controls shall be located so as to be immediately accessible to the fire service from the exterior of the building and protected against interior fire exposure by fire barriers having a fire-resistance rating not less than 1 hour.

In IBC Section [F] 910.4.4, smoke exhaust fans installed under this section are not just permissible for connection ahead of the main disconnect, they are required to be connected ahead of the main disconnect. An NEC change allowing fire protective systems to be connected on the supply side of the disconnecting means will permit fire pumps, exhaust fans, and fire and sprinkler alarms for this type of connection and will be more consistent with the International Building Code and Fire Life Safety.

Panel Meeting Action: Reject

Panel Statement: The term "fire protection systems" is too general. Each item permitted to be installed on the line side of the service disconnect should be properly justified.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this item, however, the submitter has raised a legitimate issue and I encourage them to more clearly define his recommendation and resubmit it in the comment period.

4-152 Log #2881 NEC-P04 **Final Action: Accept**
(230.82(5))

Submitter: William Gross, Electric Service of Clinton

Recommendation: Revise text to read as follows:

(5) ~~Taps~~ Connections used only to supply load management devices, circuits for standby power systems, fire pump equipment and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service entrance conductors.

Substantiation: The word "Taps" as used in this section is similar to the definition used in Article 240 for "Tap Conductors." Since this is not an Article 240 application and the definition of the word "Tap" is not defined in Article 100 the wording should be changed.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

ZGONENA, T.: The panel action to accept this proposal was not appropriate. The proposal should be rejected. The word "Taps" is the correct word, in that it requires applying the requirements for tap conductors in this situation. Changing "taps" to connections would allow the connection of conductors which **may** ~~do~~ not meet the requirements of taps.

4-153 Log #2223 NEC-P04 **Final Action: Reject**
(230.82(9))

Submitter: Allen Forbes, L & A Electric, Inc.

Recommendation: Add new text to read as follows:

230.82(9) Terminal boxes.

Substantiation: It is common practice to install terminal boxes on the supply side of service equipment. This change will make Article 230 consistent with the definition of Service Lateral in Article 100.

Panel Meeting Action: Reject

Panel Statement: A terminal box is already permitted as it is an element of the wiring system and is considered an enclosure, not equipment. This is not needed. Conduit and raceways could also be installed.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-154 Log #2226 NEC-P04 **Final Action: Reject**
(230.90)

Submitter: Allen Forbes, L & A Electric, Inc.

Recommendation: Revise text to read as follows:

Each ungrounded service conductor terminated in a service disconnecting means shall have overload protection.

Substantiation: The existing wording implies that all service conductors shall have overload protection. This change will clarify that service conductors with taps do not require overload protection.

Panel Meeting Action: Reject

Panel Statement: The concern the submitter has raised is clearly described in the next paragraph – 230.90(A).

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-155 Log #3390 NEC-P04 **Final Action: Reject**
(230.90)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

230.90 Where Required. Each ungrounded service-entrance conductor shall have overload protection.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: Not all service conductors are service-entrance conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-156 Log #228 NEC-P04 **Final Action: Reject**
(230.90(A))

Submitter: Don A. Hursey, Durham County Inspections Department

Recommendation: Add to the end of 230.90(A):

The ampacity of the conductor shall be at least the ampere rating of the service entrance enclosure.

Substantiation: As an electrical inspector for 30 years, I have experienced where a MLO service entrance enclosure was rated much higher than the conductors that supply it. So many times engineers assume the conductors are already size for the service enclosure rating instead of the calculated load. This has caused problems when another service disconnect is added to the MLO service equipment enclosure.

Panel Meeting Action: Reject

Panel Statement: Service equipment can have a higher rating. As an example a 200A service panelboard could have a 100A main circuit breaker installed and in this instance the rating of the service equipment is 100A and it would be wired to that rating and not the possible rating of the service equipment. The conductors are not required to have a rating the same as the MLO service equipment. Clarification for that is located in 230.90 (A) Exception No.3. These conductors do have to be rated for the calculated load on all of the two to six disconnecting means located in the MLO equipment.

The problem the revision is attempting to resolve is an education and enforcement issue.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-157 Log #3426 NEC-P04 **Final Action: Reject**
(230.90(A))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

230.90(A) Ungrounded Conductor. Such protection shall be provided by an overcurrent device in series with each ungrounded service-entrance conductor that has a rating or setting not higher than the allowable ampacity of the conductor. (The rest of the text of this Section and Exceptions No. 1 and No. 2 to remain the same.)

Exception No. 3: Two to six breakers or sets of fuses shall be permitted as the overcurrent device to provide the overcurrent protection. The sum of the ratings of the circuit breakers or fuses shall be permitted to exceed the ampacity of the service-entrance conductors, provided the calculated load does not exceed the ampacity of the service-entrance conductors. (The rest of the text in Exceptions No. 4 and No. 5 to remain the same.)

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. Panel Statement: Not all service conductors are service-entrance conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all "service-laterals" and "service drops" are always installed by utility companies.

4-158 Log #230 NEC-P04 **Final Action: Reject**
(230.90(A) Exception No. 2)

Submitter: Don A. Hursey, Durham City-County Inspections Department

Recommendation: Delete text as follows:

~~Exception No. 2: Fuses and circuit breakers with a rating or setting that complies with 240.4(B) or (C) and 240.b shall be permitted.~~

Substantiation: 240.21(B) and 240.21(C) does not allow the provisions of 240.4(B) or (C). This should also not be permitted for service conductors which have no overcurrent protection on the line side of the conductors.

Panel Meeting Action: Reject

Panel Statement: The submitter has not submitted any technical data to support the deletion of the allowance of utilizing the next standard size rules in accordance with the limitations expressed in Article 240 for service conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

ZGONENA, T.: The panel action to reject this proposal was not appropriate. The proposal should be accepted. As the submitter noted, 240.21(B) specifically prohibits the application of 240.4(B) to protection for a feeder tap. If it is unacceptable for a feeder tap, certainly it should also be unacceptable to apply this rule to protection for an ungrounded service conductor.

4-159 Log #3395 NEC-P04 **Final Action: Reject**
(230.90(B))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force

Recommendation: Revise text to read as follows:

230.90(B) Not in Grounded Conductor. No overcurrent device shall be inserted in a grounded service-entrance conductor except a circuit breaker that simultaneously opens all conductors of the circuit.

Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:

Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.

Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. 4-163 Log #223 NEC-P04 **Final Action: Reject**
(230.95)

Submitter: Kim Hovey, Howard R. Green Company

Recommendation: Where 1000A (or more) service or feeder terminates in a factory listed device distribution device, ground fault protection is not required. Where any branch circuit of the listed device is 1000A or more, provide ground fault detection.

Substantiation: I think the intent of the 1000A or more ground fault requirement is not clear, especially, when the handbook explanatory notes make it clear that the ground fault protection is only for the line side, not the supply. Since most service (or feeders) utilize the tap rules, and terminate at a main breaker of a factory listed device, it should be clarified whether the ground fault rule is necessary. To me, there is a large difference between factory distribution devices and field installed conduit and wires.

I have submitted the same proposal to sections 215.10, 240.13, and 240.21(C).

Panel Meeting Action: Reject

Panel Statement: The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-164 Log #4784 NEC-P04 **Final Action: Reject**
(230.95)

Submitter: Martin Camargo, Popov Engineers, Inc.

Recommendation: Revise the existing text in the second paragraph of 230.95 to read:

The rating of the service disconnect shall be considered to be the rating of the ~~largest~~ actual fuse installed or the ~~highest continuous current trip setting for which~~ rating of the actual ~~overcurrent device installed in a~~ circuit breaker installed in accordance with 240.6 ~~is rated or can be adjusted~~.

Substantiation: This proposal clarifies that the rating of a service disconnect is the rating of the actual fuse installed or the rating of the actual circuit breaker installed in accordance with 240.6.

For circuit breakers, 240.4(B) or (C) identifies considerations for adjustable trip circuit breakers. Per 240.6(B), the rating of an adjustable trip circuit breaker, not meeting 240.6(C), is the maximum setting possible. Per 240.6(C), the rating of an adjustable trip circuit breaker is considered the actual adjusted setting of the long-time trip if restricted access to the adjusted means is provided by either; removable and sealable covers, bolted equipment doors or locked doors are used. The construction of fused switches provides restricted access to the fuses similar to adjustable trip circuit breakers that meet the provisions of 240.6(C). As such, the actual fuse size installed should be considered to be the rating of the service disconnect.

If this proposal is not accepted, the NEC will continue to add undue cost to users who properly size the service equipment overcurrent protection below 1,000A. The fact that fuses sized less than 1,000A and installed in a 1,200A fused service disconnect, properly sized to comply with the Code, require Ground Fault Protection of Equipment places an unnecessary cost on the user. This is no different than the existing provisions for adjustable trip circuit breakers with restricted access provisions in accordance with 240.4(C) to not require ground fault protection of equipment if the actual setting is less than 1,000A. The ability to increase this rating is achievable for both fused switches and adjustable trip circuit breakers and as such, they should be treated the same. In fact, it is much easier and less costly to change the setting on an adjustable trip circuit breaker, complying with 240.4(C), after the fact with the simple adjustment of a dial than it is to replace lower fuses rated less than 1,000A with fuses rated 1,000A or higher which can cost in excess of $1,500. What happens after the system is installed and inspected, for both fuses and adjustable trip circuit breakers, is out of control of the NEC.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented any technical data to support the reduction in this requirement other than a potential cost savings. The installation of GFPE equipment can save end users substantial expenses by preventing unwanted catastrophic failures and the resultant loss of use of the facility. This requirement is intended to be treated separately from the requirements found in Article 240.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-165 Log #3932 NEC-P04 **Final Action: Reject**

(230.95 Exception No. 2 (New))

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association (NEFA)

Recommendation: Add a second exception after the second paragraph, designating the existing exception as Exception No. 1.

Exception No 2: Ground fault relays on the normal source side (line side of the transfer switch) that supply emergency svstems, legally required standby systems, or healthcare essential electrical svstems, are permitted to be restrained from operating for ground faults on the loadside of the transfer switch if the system complies with both of the following:

(a) Ground fault protection relays on the normal source side (line side of the transfer switch) are not restrained from operation for ground faults on the normal source side (line side of the transfer switch)

(b) Audible and visual signal devices indicate whenever a sround fault relay has been restrained. Instructions on the course of action to be taken in the event of an indicated ground fault shall be located at or near the sensor location.

Substantiation: For life-safety purposes and system reliability for the prevention of blackouts, it is desirable that a ground-fault on the load side of a transfer switch in an emergency system, legally required standby system, or healthcare essential electrical system, not take out the ground fault protection on the normal source. This proposal allows the ground fault protection on the normal source to be restrained from operating and taking down all or major portions of the normal system because of a ground fault on the load side of the transfer switch. For these critical life-safety-related applications, it requires both audible and visual signaling that a ground fault has occurred and that it is being restrained.

Restraining the normal system ground fault protection relays for faults on the load side of the transfer switch is consistent with the concept of continuity of service for emergency systems (700.26 & 700.7(D)), legally required standby systems (701.17), and healthcare essential electrical svstems (5I7.17(B)).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This is a coordination issue and can be handled without revising the NEC. The requirement should be dealt with in Articles 517, 700, 701, and 708.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-166 Log #3959 NEC-P04 **Final Action: Reject**

(230.95(C))

Submitter: Roderic Hageman, PRIT Service, Inc.

Recommendation: Revise text to read as follows:

(C) Performance Testing. The ground-fault protection system shall be performance tested when first installed on site. The test shall be conducted in accordance with instructions that shall be provided with the equipment and shall be conducted by primary current injection to functionally test current pickup, time delay, and, if applicable, zone interlocking. A written record of this test shall be made and shall be available to the authority having jurisdiction.

Substantiation: PRIT Service, Inc. is a third-party, independent electrical testing firm accredited by the International Electrical Testing Association. In the over forty years of performing testing of ground fault systems, we have found a significant percentage of them that do not function as intended. We have found everything from faulty equipment to improper placement of primary conductors that defeat the actual ground fault protection while still allowing the push-to-test feature to function.

Time delay tests are important to ensure that the designed delays allow proper coordination with downstream protective equipment. Otherwise, unnecessary total power outages result when only a single feeder should trip. The use of zone interlocking can provide instantaneous tripping and reduce arc-flash incident energy and equipment damage. However, if this feature is not wired correctly, loss of coordination will result.

Panel Meeting Action: Reject

Panel Statement: It is not always possible to do primary current injection on an installation. The additional words could be in conflict with the words in the beginning of the same sentence that instruct to follow the instructions with the equipment. Mandating a particular method to conduct performance tests is not within the scope of the NEC.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-167 Log #4085 NEC-P04 **Final Action: Reject**

(230.95(C))

Submitter: Ron Widup, Shermco Inustries, Inc. / Rep. InterNational Electrical Testing Association

Recommendation: Revise text to read as follows:

(C) Performance Testing. The ground-fault protection system shall be performance tested when first installed on site. The test shall be conducted in accordance with instructions that shall be provided with the equipment and shall be conducted by primary current injection. A written record of this test shall be made and shall be available to the authority having jurisdiction.

Substantiation: As an Accredited Member of the InterNational Electrical Testing Association, we perform third-party performance testing on thousands of newly-installed ground fault protection systems. In the process of executing the performance testing, there is a large quantity of performance-related failures uncovered during the performance testing activities. The problems range from relatively minor modes of failure, such as an indicating lamp not functioning; to major modes of failure, such as no trip under primary fault current conditions.

Ground fault *systems* are not limited to components, but rather, they are a complete system that must be validated and performance tested as a system if the owner and Authority Having Jurisdiction are to be assured of a properly functioning ground fault protective system. Many of the instructions provided with ground fault protection systems only address the protective relay, and only require a "push to test" simulation that does not verify that the other essential components are operational and interconnected properly. The "push to test function", because it is not done by primary current injection, does not completely verify nor validate the performance of the primary sensor, the current transformer windings, the control wiring, and the control power. Because of this, it puts the owner at risk of a non-functioning ground fault protection system, increasing the possibility of extensive equipment damage and fires under ground fault conditions.

The procedures for performance testing of both newly-installed and service-aged ground fault protection systems is recognized by industry under the national consensus testing standards ANSI/NETA MTS-2007, Standard for Maintenance Testing Specifications for Electrical Power Distribution Equipment and Systems, and NETA ATS-2007, Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

As an easily-executed field test procedure for the performance testing of ground fault protection systems, industry standard procedures (from NETA) dictate the following electrical tests, and of note is item No. 4. And while it is not the author's intent to add all of the industry consensus standard procedures listed below as NEC requirements, item No. 4 is highlighted as a normal and recognized practice for the performance testing of ground fault protection systems, and would not introduce undo burden to the installing contractor nor the industry:

1. Perform resistance measurements through bolted connections with a low-resistance ohmmeter, if applicable, in accordance with Section 7.14.1.
2. Measure the system neutral-to-ground insulation resistance with the neutral disconnect link temporarily removed. Replace the neutral disconnect link after testing.
3. Perform insulation resistance test on all control wiring with respect to ground. Applied potential shall be 500 volts dc for 300-volt rated cable and 1000 volts dc for 600-volt rated cable. Test duration shall be one minute. For units with solid-state components or control devices that cannot tolerate the applied voltage, follow manufacturer's recommendation.
4. **Perform ground fault protective device pickup tests using primary injection.**
5. For summation type systems utilizing phase and neutral current transformers, verify correct polarities by applying current to each phase-neutral current transformer pair. This test also applies to molded-case breakers utilizing an external neutral current transformer.
6. Measure time delay of the ground fault protective device at a value equal to or greater than 150 percent of the pickup value.
7. Verify reduced control voltage tripping capability is 55 percent for ac systems and 80 percent for dc systems.
8. Verify blocking capability of zone interlock systems.

Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 4-166.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-168 Log #3391 NEC-P04 **Final Action: Reject**
(230.200)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.200 General. Service-entrance conductors and equipment used on circuits exceeding 600 volts, nominal, shall comply with all the applicable provisions of the preceding sections of this article and with the following sections that supplement or modify the preceding sections. (The rest of the text to remain the same.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: Not all service conductors are service-entrance conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, in addition the submitter is incorrect in the statement that under current code requirements that all “service-laterals” and “service drops” are always installed by utility companies.

4-169 Log #4594 NEC-P04 **Final Action: Accept**
(230.205(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following wording at the end: “provided the disconnecting means can be operated by mechanical linkage from a readily accessible point, or electronically in accordance with 230.205(C) where applicable.”
Substantiation: The literal text of the 2008 NEC amendment, however unconscionable, now considers it to be acceptable to install a pole-top switch with no linkage to the pole base, thereby relying on personnel working with a hot stick out of a bucket truck to open the switch. This was very unlikely to have been the intent. This equipment is commonly used, and routinely provided with such linkage which can be padlocked to prevent inadvertent operation. The requirement should be appropriately stated.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
SIGMUND, J.: I am voting against the panel action to accept. Use of fuse cutouts are common in industrial occupancies, with sufficient expertise and supervision to maintain this type of installation. I would propose adding an exception that mechanical linkage or electrical operation is not required in industrial occupancies where conditions of maintenance and supervision ensure that only qualified personnel will be operating and maintaining these disconnect switches.

4-170 Log #3401 NEC-P04 **Final Action: Reject**
(230.205(B))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
230.205(B) Type. Each service disconnect shall simultaneously disconnect all ungrounded service-entrance conductors that it controls and shall have a fault-closing rating that is not less than the maximum short-circuit current available at its supply terminals. (The rest of the text to remain the same.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. 4-173 Log #3609 NEC-P04 **Final Action: Reject**
(230.213)

Submitter: G. Scott Peele, Progress Energy
Recommendation: Add new text to read as follows:
Current -Voltage Diversion Trip (CVDT) shall be provided as an integral part of the service disconnect to protect from unwanted current paths or voltage shifts on the service conductors. The circuit should provide trip protection on residential of no more than 10 amps diversion for 30 seconds continuous and/or + - 10% voltage diversion (deviation) on the service conductors. Current sensing will be prior to supply-side equipment bonding jumper.
Substantiation: Background information and pictures, data, and diagrams are supporting material.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented sufficient data to require this equipment on every service. In addition, the submitter references single family dwelling services in his substantiation and the proposed requirement is for services over 600 volts.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 240 — OVERCURRENT PROTECTION

10-9 Log #1549 NEC-P10 **Final Action: Reject**
(240.2.Current-Limiting Overcurrent Protective Device)

Submitter: John Warren, I.B.E.W. Electrician/Apprentice Instructor / Rep. I.B.E.W. Local #176
Recommendation: Add new text as follows:
240.2 Definitions.
Current-Limiting Overcurrent Protective Device. A device that, when interrupting currents in its current-limiting range, reduces the current flowing in the faulted circuit to a magnitude substantially less than that obtainable in the same circuit if the device were replaced with a solid conductor having comparable impedance.
A current-limiting protective device is one that cuts off a fault current in less than one-half cycle. It thus prevents available short-circuit currents from building up to their full magnitude.
Substantiation: This statement is an important characteristic of all current limiting devices and should be added to improve the understanding of how the magnitude is reduced.
Panel Meeting Action: Reject
Panel Statement: The proposal is not in agreement with the definition of a current-limiting circuit breaker in the UL Standard for circuit breakers (UL 489). The proposed language is too restrictive. The NEC is not a design specification or an instruction manual for untrained persons per section 90.1(C).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-10 Log #2560 NEC-P10 **Final Action: Reject**
(240.2.Tap Conducors)

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Delete the definition of “Tap Conductors” in 240.2.
Substantiation: This proposal and a sister proposal to include the definition of “Tap Conductors” in Article 100 would more accurately adhere to the Scope of Article 100, since the phrase “tap conductors”, as defined in 240.2, is used in more than one Article. Specifically, 430.28 and 210.19(A)(3) Ex 1. In addition, there would be less uncertainty by code users about whether the use of the term “tap conductors” used in articles other than 240 has a different meaning than as defined in 240.2.
Panel Meeting Action: Reject
Panel Statement: The definition of the term “tap conductor” must remain in Article 240. The term “tap conductor” is used in the NEC for applications other than those in Article 240. See panel action and statement on proposal 10-8.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-11 Log #3440 NEC-P10 **Final Action: Reject**
(240.2.Tap Conductors)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
240.2 Definitions.
Tap Conductors. As used in this article, a tap conductor is defined as a conductor, other than a service-entrance conductor, that has overcurrent protection ahead of its point of supply that exceeds the value permitted for similar conductors that are protected as described in 240.4. (The remainder of the text in 240.2 to be unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles.

That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: The recommendation is contingent on the acceptance of proposals to CMP-4 which intend to modify service related definitions. The global implications of such a change would require task group action to correlate the use of these terms throughout the document. CMP-10 requests that the TCC direct CMP-4 to comment on this proposal and a task group be formed if necessary.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-12 Log #539 NEC-P10 **Final Action: Reject**

(240.4, FPN (New))

Submitter: James W. Moore, Samaritan's Purse World Medical Mission, Gregory P. Bierals

Recommendation: Add new text to read as follows:

FPN: For overcurrent protection requirements for transformers, see 450.3, 450.4, 450.5, and 450.6.

Substantiation: A fine print note is included in 450.3 which references four sections of Article 240 for overcurrent protection of conductors. This new FPN will serve as an aid to users of the Code where transformers are to be installed or are already installed.

Panel Meeting Action: Reject

Panel Statement: The intent of the submitter is met in the present text of the NEC and the overcurrent protection requirement reference for transformers is addressed in NEC 240.3.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-13 Log #618 NEC-P10 **Final Action: Reject**

(240.4, FPN)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission

Recommendation: Add new text to read as follows:

FPN: See ICEA P32-382 for information on allowable short-circuit currents for insulated copper and aluminum conductors.

Substantiation: Overcurrent protection of conductors is based on protection against overload, as well as short-circuit and ground-fault conditions. Simply providing this protection based upon the listed ampacities from the tables in Article 310 will not always provide this protection, possibly causing damage or total failure of the insulation.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation that the tables of Section 310 are inadequate.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

FREDERICKS, C.: I'm voting against the panel action, the panel action should have been to accept. It is broadly known that especially for higher short circuit currents, additional considerations may be needed beyond existing NEC rules to ensure that conductors are protected against all possible short circuit conditions. One reference that is widely considered in these determinations is ICEA P32-382, as referenced in the proposal. The proposed addition of the FPN would help alert NEC users to this design issue.

OCKULY, G.: I vote negative on Panel action.

The proposed FPN would absolutely improve safety by alerting the Code user that conductors must be protected for their full range of overcurrents. This includes both overload and short-circuit currents. The NEC does a sufficient job providing requirements for overload protection; however, protection against short-circuit is somewhat vague. Proper, full range conductor protection is necessary to comply with NEC Section 110.10. For example: an AWG 10 copper conductor with THW insulation has a nominal 35 ampere allowable ampacity (Table 310.16). It is important to note that this same conductor has a short-circuit rating of 4,300 amperes for one cycle. Proper conductor protection mandates providing protection over the full range of overcurrents. The proposed FPN is a valuable addition to this Section.

10-14 Log #3110 NEC-P10 **Final Action: Accept**

(240.4(B))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise the existing title of 240.4(B) of the 2008 NEC as follows:

(B) Overcurrent Devices Rated 800 Amperes or Less.

Substantiation: The definition of "device" in Article 100 was changed in the 2008 NEC. Even without the change, it is clear fuses and circuit breakers meet the definition of "device" including conductors. So, it seems the addition of the word "Overcurrent" will make it clear the type of "device" contemplated in this section.

Panel Meeting Action: Accept

10-15 Log #4813 NEC-P10 **Final Action: Reject**

(240.4(B)(4) (New))

Submitter: Charles M. Williams, Stealth Electric

Recommendation: New Subsection (4) If the conductors being protected supply a service, or distribution sub-panel, have lesser ampacity than the overcurrent protection device or equipment they terminate on, an identification plate shall be placed on the equipment.

Substantiation: Anyone installing electrical circuits subsequent to the installation of these kinds of equipment may assume conductors meet the same level of ampacity. The hazard is decreased in the case of branch circuits, as these are less likely to be increased in load demand.

Panel Meeting Action: Reject

Panel Statement: The submitter has provided no substantiation that a safety issue exists when the conductor's overcurrent protection is sized according to 240.4(B).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-16 Log #2944 NEC-P10 **Final Action: Accept**

(240.4(C))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise the existing title of 240.4(C) of the 2008 NEC as follows:

(C) Overcurrent Devices Rated Over 800 Amperes.

Substantiation: The definition of "device" in Article 100 was changed in the 2008 NEC. Even without the change, it is clear fuses and circuit breakers meet the definition of "device." But, many other components used in electrical systems also meet the definition of "device" including conductors. So, it seems the addition of the word "Overcurrent" will make it clear the type of "device" contemplated in this section.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-17 Log #2984 NEC-P10 **Final Action: Reject**

(240.4(C))

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Delete the following text:

~~(C) Devices Rated over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than the rating of the overcurrent device defined in 240.6.~~

Substantiation: 240.4(C) provides no relief to the general requirement of 240.4.

Items (A), (B), (D), (E), (F) and (G) are exceptions to the rule of 240.4, but 240.4(C) simply makes you comply with the general rule of 240.4. 240.4(C) is simply an unneeded redundancy.

Panel Meeting Action: Reject

Panel Statement: 240.4(C) is not intended to supply relief to the general requirement of 240.4. Section 240.4(C) specifically addresses devices rated over 800 amperes. Since 240.4(B) is for devices rated 800 amperes or less, it is logical to have an additional first level subdivision for devices rated over 800 amperes for the purpose of increased clarity and usability.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

COOK, D.: Submitter's substantiation is correct. The required action to comply with current NEC 240.4 and 240.4(C) is exactly the same. I also agree with Panel statement that maintaining 240.4(C) is logical and useful to users. I would suggest an Accept in Principal action, maintain existing 240.4(C), and revise the main paragraph in 240.4 to read:

Protection of Conductors. Conductors, other than flexible cords, flexible cables, and fixture wires, shall be protected against overcurrent in accordance with their ampacities specified in 310.15, ~~unless otherwise~~ as permitted or required in 240.4(A) through (G).

10-18 Log #1271 NEC-P10 **Final Action: Reject**
(240.4(F))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:

240.4(F) Transformer Secondary Conductors. Single-phase (other than 2-wire) and multiphase (other than delta-delta, 3-wire) transformer secondary conductors shall not be considered to be protected by the primary overcurrent protective device. ~~Conductors supplied by the secondary side of a single-phase transformer having a 2-wire (single-voltage)secondary, or a three-phase,delta-delta connected transformer having a 3-wire (single-voltage) secondary, shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with 450.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio.~~

FPN: See 240.21(C)(1) Protection by Primary Overcurrent Device

Substantiation: In the interest of not repeating NEC rules in multiple sections, we believe this is a good way to keep the intent of both sections intact. We will propose the opposite change to 240.21(C)(1).
Panel Meeting Action: Reject
Panel Statement: The requirements in 240.4 are general in nature and the inclusion of 240.4(F) is necessary to clarify where conductors on the secondary of a transformer are considered to be protected by the primary overcurrent protective device. The proposed deletion of the qualifiers for the protection of the secondary conductors would cause confusion and misapplication of the NEC. The inclusion of an informational fine print note is not as user friendly as including the requirement. The duplication in 240.21(C)(1) is necessary to differentiate conductors meeting the general requirements of 240.4(F) from those considered as not being protected at their point of supply in 240.21(C)(2) through (6).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

COOK, D.: The existing text in 240.4 (F) and 240.21 (C) (1) is difficult to read and understand.

The rating of the overcurrent protective device and the location of that device are two separate requirements. The submitter's statement that both sections include requirements for the rating and location of the overcurrent protective device seem true.

The general requirement in 240.4 requires the rating of the device to match the ampacity of the conductor unless alternate permission is provided in items (A) through (G).

The general requirement in 240.21 requires the overcurrent device that is sized in 240.4 to be located at the supply end of the conductor that it protects unless an alternate location is provided in items (A) through (H).

Item 240.21(C) (1) allows an alternate location for protection for secondary conductors of single phase, 2-wire transformer and three phase, delta-delta, 3-wire transformers. It also includes the conditions for this alternate location (including the overcurrent protection sizing requirement). This item includes the complete set of requirements. It seems the text in 240.4 (F) could simply provide permission to use the complete set of requirements in 240.21 (C) (1) to determine the rating of the overcurrent device.

It seems the proposal could be accepted in principal and the text in 240.4(F) revised to read: Transformer Secondary Conductors. Where transformer secondary conductors are protected by primary overcurrent device in accordance with 240.21(C) (1).

10-19 Log #1329 NEC-P10 **Final Action: Reject**
(240.5(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence:

Fixture wire shall be protected against overcurrent in accordance with its ampacity as specified in Table 402.5 <u>unless otherwise permitted or required elsewhere in this Code</u>:

Substantiation: Present wording appears to conflict with 240.5(B)(2) and Table 430.72(B) where fixture wire is used for motor control circuits per 725.49(B) and Table 240.4(G) reference to article 430 motor control circuits. Without the proposed wording, the requirement of 402.12 may confuse code users as to whether Table 240.4(G) reference to Article 430 or the reference to tables applies.
Panel Meeting Action: Reject
Panel Statement: The main paragraph clearly states that protection shall be provided in accordance with either 240.5(A) or 240.5(B) so no conflict resides between 240.5(A) and 240.5(B)(2). There is no conflict with 725.49(B) since Chapters 5 through 7 supplement or modify Chapters 1 through 4 in accordance with NEC 90.3. NEC 240.3 clearly provides permission for the protection of fixture conductors in accordance with specific equipment articles found in Table 240.3.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-20 Log #1197 NEC-P10 **Final Action: Reject**
(240.5(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

(1) 20-ampere <u>and less</u> circuits, -18 AWG up to 15m (50 ft) of run length
(2) 20-ampere <u>and less</u> circuits, 16 AWG up to 30m (100ft) of run length
(3) 20-ampere <u>or less circuits</u> -14 AWG and larger
(4) <u>over 20 to</u> 30-ampere circuits -14 AWG and larger
(5) <u>over 30 to</u> 40-ampere circuits 12 AWG and larger
(6) <u>over 40 to</u> 50-ampere circuits -12 AWG and larger

Substantiation: Edit. Intermediate ampere rated circuits and nonstandard ratings should be incorporated.
Panel Meeting Action: Reject
Panel Statement: The lower rated overcurrent devices are permitted to be used in the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-21 Log #4280 NEC-P10 **Final Action: Reject**
(240.7)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 240.7.

<u>240.7 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:</u>

<u>(1) Equipment listing or labeling</u>

<u>(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation</u>

<u>(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment</u>

Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: Listing and third party evaluation are methods to support approval of equipment and should be considered in NEC 110.2; however, they may not be the only methods. The concept of providing fundamental guidance for making the approval decision has merit. Since the approval issue spans several articles, the panel requests that this be taken up by the TCC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

COOK, D.: The discussion of Proposals 10-21 through 10-25 did not include an expectation from CMP-10 that AHJ's should be able to evaluate overcurrent devices in the field and use that evaluation as a basis for the required approval of that equipment. Without that self evaluation in the field, it is obvious some other basis will be required. The panel statement indicates "listing" and "third party evaluation" (otherwise known as "field evaluations") are methods to support approval, but not the only methods. While indicating other methods should be included, the panel offers no suggestion for other acceptable methods (basis) for approval. As a representative of code enforcement, I believe the easiest, most consistent and predictable basis for equipment (overcurrent device) approval is listing. As an AHJ working to approve overcurrent devices that protect equipment and circuits operating at very low voltage and current levels to equipment and circuits operating as high as 115 KV, my desire is to see `listing" for all overcurrent devices. Note that product standards for this equipment include testing (some that could be destructive) and verification of prescriptive construction requirements that cannot be performed in the field. I realize a revision to immediately require listing of all overcurrent devices is not financially feasible and from a timing standpoint, may not be possible by 2011. Therefore item 3 was included to allow AHJ's to use methods they have been utilizing as the basis for their equipment approval. The basis of the 2017 date was to allow time for industry to achieve certification of uncertified products.

That time may not be reasonable. Establishing a direction for certification and a reasonable time frame to achieve that goal was the purpose of the proposal. The dated selected was a random guess at what might be reasonable and the exact time frame is less important than achieving the objective. While it is obvious the examples included in item 3 are not popular, but no other examples were offered as a basis for approval. Some organizations represented have taken public positions to oppose manufacturers self declaration of conformity, but choose not to support requirements for independent third party certification of equipment. Without some action for this issue, Article 240 leaves the +-40,000 local enforcement jurisdictions in the US and any other enforcement jurisdictions around the world no direction to establish a reasonable basis for approval of overcurrent protection equipment. Not providing that direction leaves owners, designers, installers, manufacturers, and enforcement to politically and economically negotiate the direction and level of safety afforded by the overcurrent protective devices at the local level. That local political and economic negotiation will result in inconsistent enforcement of the overcurrent protection requirements. I fail to understand how that approach is a benefit to designers, installers, manufacturers, enforcement, and owners that will be left uncertain about what is required to get their investment approved. While I would be perfectly satisfied to see criteria for equipment approval included in NEC 110.2, CMP-10 has no responsibility for the requirements in NEC 110.2.

10-22 Log #4281 NEC-P10 **Final Action: Reject**
(240.7)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 240.7.
<u>240.7 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:</u>
<u>(1) Equipment listing or labeling</u>
<u>(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation</u>
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject

Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
