(C) Feeder Source. Where a feeder source is provided in accordance with 695.3(B)(2), transformers supplying the fire pump system shall be permitted to supply other loads. All other loads shall be calculated in accordance with Article 220, including demand factors as applicable.
(1) Size. Transformers shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the remaining load supplied by the transformer.
(2) Overcurrent Protection. The transformer size, the feeder size, and the overcurrent protective device(s) shall be coordinated such that overcurrent protection is provided for the transformer in accordance with 450.3 and for the feeder in accordance with 215.3, and such that the overcurrent protective device(s) is selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s), the pressure maintenance pump motor(s), the full-load current of the associated fire pump accessory equipment, and 100 percent of the remaining loads supplied by the transformer. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).
695.6 Power Wiring.
Power circuits and wiring methods shall comply with the requirements in 695.6(A) through (H), and as permitted in 230.90(A), Exception No. 4; 230.94, Exception No. 4; 230.95, Exception No. 2; 240.13; 230.208; 240.4(A); and 430.31.
(A) ~~Service~~ Supply Conductors. ~~Supply conductors shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with Article 230. Where supply conductors cannot be physically routed outside buildings, they shall be permitted to be routed through buildings where installed in accordance with 230.6(1) or 230.6(2). Where a fire pump is wired under the provisions of 695.3(B)(2), this requirement shall apply to all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump.~~
(1) Services and On-Site Power Production Facility. Service conductors and conductors supplied by an on-site power production facility shall be physically routed outside a building(s) and shall be installed as service conductors in accordance with 230.6, 230.9 and Part III and Part IV of Article 230. Where supply conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
(2) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.4(B)(4), all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
Exception: Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement shall apply only to those conductors on the load side of that point of automatic connection between sources.

(3) ~~(B)~~ **~~Circuit Conductors.~~ Supervised or On-Site Standby Generator Connections.** Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) or conductors that connect directly to an onsite generator shall comply with all the following:
a. Independent Routing. The conductors shall be kept entirely independent of all other wiring.
b. Associated Fire Pump Loads. The conductors ~~They~~ shall supply only loads that are directly associated with the fire pump system.
c. Protection From Potential Damage. The conductors ~~and they~~ shall be protected to resist potential damage by fire, structural failure, or operational accident.
d. Inside a Building. When routed through a building the conductors ~~They~~ shall be ~~permitted~~ installed to be routed ~~through a building(s)~~ using one of the following methods:
(1) Be encased in a minimum 50 mm (2 in.) of concrete
(2) Be ~~within an enclosed construction~~ protected by a fire rated assembly listed to achieve a minimum fire rating of two hours and dedicated to the fire pump circuit(s). ~~and having a minimum of a 1 hour fire resistive rating~~
(3) Be a listed electrical circuit protective system with a minimum ~~1~~ 2-hour fire rating
Exception: The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum ~~1~~ 2-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.
FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
~~(C)~~ (B) Conductor Size.
(1) Fire Pump Motors and Other Equipment. Conductors supplying a fire pump motor(s), pressure maintenance pumps, and associated fire pump accessory equipment shall have a rating not less than 125 percent of the sum of the fire pump motor(s) and pressure maintenance motor(s) full-load current(s), and 100 percent of the associated fire pump accessory equipment.
(2) Fire Pump Motors Only. Conductors supplying only a fire pump motor shall have a minimum ampacity in accordance with 430.22 and shall comply with the voltage drop requirements in 695.7
~~(D)~~ (C) Overload Protection. Power circuits shall not have automatic protection against overloads. Except for protection of transformer primaries provided in 695.5(C)(2), ~~Branch~~ branch-circuit and feeder conductors shall be protected against short circuit only. Where a tap is made to supply a fire pump, the wiring shall be treated as service conductors in accordance with 230.6. The applicable distance and size restrictions in 240.21 shall not apply.
Exception No. 1: Conductors between storage batteries and the engine shall not require overcurrent protection or disconnecting means.
Exception No. 2: For on-site standby generator(s) rated to produce continuous current in excess of 225 percent of the full-load amperes of the fire pump motor, the conductors between the on-site generator(s) and the combination fire pump transfer switch controller or separately mounted transfer switch shall be installed in accordance with 695.6(B). ~~or protected in accordance with 430.52.~~The protection provided shall be in accordance with the short-circuit current rating of the combination fire pump transfer switch controller or separately mounted transfer switch.
~~(E)~~ (D) Pump Wiring. All wiring from the controllers to the pump motors shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit Type LFNC-B, listed Type MC cable with an impervious covering, or Type MI cable.
~~(F)~~ (E) Junction Points. Where wire connectors are used in the fire pump circuit, the connectors shall be listed. A fire pump controller or fire pump power transfer switch, where provided, shall not be used as a junction box to supply other equipment, including a pressure maintenance (jockey) pump(s). A fire pump controller and fire pump power transfer switch, where provided, shall not serve any load other than the fire pump for which it is intended.
~~(G)~~ (F) Mechanical Protection. All wiring from engine controllers and batteries shall be protected against physical damage and shall be installed in accordance with the controller and engine manufacturer's instructions.
~~(H)~~ (G) Ground Fault Protection of Equipment. Ground fault protection of equipment shall not be permitted for fire pumps.
(H) Onsite Standby Generator Disconnecting Means. Where the power source is supplied by on-site generator(s), the supply conductors shall connect to a generator disconnecting means dedicated for the purpose of serving the fire pump. The disconnecting means shall be located in a separate enclosure from other generator disconnecting means.
695.7 Voltage Drop.
~~The voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor starting conditions. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.~~
~~*Exception: This limitation shall not apply for emergency run mechanical starting. [NFPA 20:9.4]*~~
(A) Starting Voltage Drop. The voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor starting conditions.
(B) Mechanical Operator. The requirements of 695.7(A) shall not apply to emergency- run mechanical starting.
(C) Running Voltage Drop. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor. [NFPA 20:9.4]

695.10 Listed Equipment.
Diesel engine fire pump controllers, electric fire pump controllers, electric motors, fire pump power transfer switches, foam pump controllers, and limited service controllers shall be listed for fire pump service. [NFPA 20:9.5.1.1, 10.1.2.1, 12.1.3.1] . [NFPA 20:9.5.1.1, 10.1.2.1, 10.8.3.1, 12.1.3.1]

695.11 Listed Electrical Circuit Protective System to Controller Wiring.
(A) Single Conductors. Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box in accordance with this Code. [NFPA 20:9.3.7.1]
FPN This is to avoid violating the enclosure type rating, and/or the controller short-circuit (withstand) rating. See also 300.20 and Article 322. [NFPA 20:A.9.3.7.1]
(B) Single conductors (individual conductors) shall not enter the fire pump enclosure separately. [NFPA 20:9.3.7.2]
(C) Smoke Seal. Where required by the listing of the electrical circuit protective system, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency. [NFPA 20:9.3.7.2]
FPN When so required, this seal is to prevent flammable gases from entering into the fire pump controller. [NFPA 20:A.9.3.7.2]
(D) Standard wiring between junction box and controller is acceptable. [NFPA 20:9.3.7.3]

695.12 Equipment Location.
(A) Controllers and Transfer Switches. Electric motor-driven fire pump controllers and power transfer switches shall be located as close as practicable to, and within sight of, the motors that they control. [NFPA 20:10.2.1]
(B) Engine-Drive Controllers. Engine-drive fire pump controllers shall be located as close as is practical to, and within sight of, the engines that they control. [NFPA 20:12.2.1]
(C) Storage Batteries. Storage batteries for fire pump engine drives shall be supported above the floor, secured against displacement, and located where they are not subject to physical damage, flooding with water, excessive temperature, or excessive vibration. [NFPA 20:11.2.5.2.5]
(D) Energized Equipment. All energized equipment parts shall be located at least 300 mm (12 in.) above the floor level. [NFPA 20:11.2.5.2.6]
(E) Protection Against Pump Water. Fire pump controllers and power transfer switches shall be located or protected so that they are not damaged by water escaping from pumps or pump connections. [NFPA 20:10.2.2, 12.2.2]
(F) Mounting. All fire pump control equipment shall be mounted in a substantial manner on noncombustible supporting structures. [NFPA 20:10.3.2, 12.3.2]

695.14 Control Wiring.
(A) Control Circuit Failures. External control circuits that extend outside the fire pump room shall be arranged so that failure of any external circuit (open or short circuit) shall not prevent the operation of a pump(s) from all other internal or external means. Breakage, disconnecting, shorting of the wires, or loss of power to these circuits could cause continuous running of the fire pump but shall not prevent the controller(s) from starting the fire pump(s) due to causes other than these external control circuits. All control conductors within the fire pump room that are not fault tolerant shall be protected against physical damage. [NFPA 20:10.5.2.6, 12.5.2.5]
(B) Sensor Functioning. No undervoltage, phase-loss, frequency-sensitive, or other sensor(s) shall be installed that automatically or manually prohibit actuation of the motor contactor. [NFPA 20:10.4.5.6]
Exception: A phase loss sensor(s) shall be permitted only as a part of a listed fire pump controller.
(C) Remote Device(s). No remote device(s) shall be installed that will prevent automatic operation of the transfer switch. [NFPA 20:10.8.1.3]
(D) Engine-Drive Control Wiring. All wiring between the controller and the diesel engine shall be stranded and sized to continuously carry the charging or control currents as required by the controller manufacturer. Such wiring shall be protected against physical damage. Controller manufacturer's specifications for distance and wire size shall be followed. [NFPA 20:12.3.5.1, 12.6.4.1]
(E) Electric Fire Pump Control Wiring Methods. All electric motor-driven fire pump control wiring shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit Type B (LFNC-B), listed Type MC cable with an impervious covering, or Type MI cable.
(F) Generator Control Wiring Methods. Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) encased in 50 mm (2 in.) of concrete or within enclosed construction dedicated to the fire pump circuits and having a minimum 1-hour fire resistance rating, or circuit protective systems with a minimum of 1-hour fire resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used. [NFPA 20:A.9.2.4(3)]

695. 15 Alternate Power.
(A) When Required. Except for an arrangement described in 695.15(C), at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus or when required by the AHJ. The alternate source shall, as a minimum, comply with the requirements of this section. [NFPA 20:9.3.1]
FPN: Local codes and/or AHJ often require alternate power for certain occupancies, such as high rise buildings, places of assembly and etc. These alternate power sources are considered to be the Emergency Source of Power for a motor driven fire pump as opposed to the Normal Source of Power.
(B) Unreliable Source. Except for an arrangement described in 695.15(C), at least one alternate source of power shall be provided where the normal source is not reliable. [NFPA 20:9.3.2]
FPN: See Alternate Power, Other Sources in NFPA-20, *Standard for the Installation of Stationary Pumps for Fire Protection*, for specifics. [NFPA 20:A.9.3.2]
(C) Back-up Pump. An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard. [NFPA 20:9.3.3]
FPN: See NFPA-20 for requirements of engine driven or steam turbine fire pumps. In either case, operation of the pump is intended to be independent of the source of electrical power.
(D) Alternate Source. When provided, the alternate source of power shall be supplied from one of the following sources:
(1) A generator installed in accordance with 695.16.
(2) One of the sources identified in 695.3(E)(4)(a), 695.3(E)(4)(b), 695.3(E)(4)(c) or 695.3(E)(4)(e) when the power is provided independent of the normal source of power. [NFPA 20:9.3.4]
(E) Overhead Lines. When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations. [NFPA 20:9.3.5]

695.16 On-Site Standby Generator Systems.
(A) Capacity.
(1) Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 695.15(B), they shall be of sufficient capacity to allow normal starting and rung of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of 695.7 [NFPA 20:9.6.1]
(2) A tap ahead of the on-site generator disconnecting means shall not be required.
(B) Power Sources.
These power sources shall comply with 695.7 and shall meet the requirements of Level 1, Type 10 emergency power systems. [NFPA 20:9.6.2.1]
FPN: Type 10 systems are required to make emergency power available in 10 or less seconds. See NFPA-110 *Standard for Emergency and Standby Power Systems* for definition of Level 1Emergency Power System. See NFPA-20 for fuel capacity requirements. [NFPA 20:9.6.2.2]
(C) Sequencing. Automatic sequencing of the fire pumps shall be permitted as a means of meeting the voltage drop requirements of 695.7. [NFPA 20:9.6.3]
(D) Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.
(E) Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load. [NFPA 20:9.6.4]
FPN: This is to prevent any Generator Protective Devices from tripping when the fire pump load is transferred to the generator. The generator will instantaneous pickup the full pump room load, including the starting any and all connected fire pumps in the across-the-line (direct on line) full voltage staring mode. This is always the case when the fire pump(s) is running by use of the Emergency Mechanical Operator of the fire pump controller(s). (See NFPA-20 9.6 On-Site Standby Generator Systems).

695.17 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met. [NFPA 20:9.3.6]
(A) Mounting. The junction box shall be securely mounted. [NFPA 20:9.3.6(1)]
(B) Controller Enclosure Integrity. Mounting and installing of a junction box shall not violate the enclosure type (NEMA) rating of the fire pump controller(s). [NFPA 20:9.3.6(2)]
(C) Controller Short Circuit Rating Integrity. Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the
short-circuit rating of the controller(s). [NFPA 20:9.3.6(3)]
(D) Type Rating. As a minimum, a Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed for the subject to match the fire pump controller enclosure Type rating. [NFPA 20:9.3.6(4)]
FPN See Article 430.91 Motor Controller Enclosure Types for further information. See UL-50, *Standard for Enclosures for Electrical Equipment*, for requirements.
(E) Terminals. Terminals, junction blocks, splices, and the like, when used, shall be listed. [NFPA 20:9.3.6(5)]

695.18 Raceway Terminations.

(A) Hubs. Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller. [NFPA 20:9.3.8.1]
(B) Type Rating. The type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller. [NFPA 20:9.3.8.2]
(C) Installation. The installation instructions of the manufacturer of the fire pump controller shall be followed. [NFPA 20:9.3.8.3]
(D) Controller Alterations. No alterations other than installation of raceway(s) and multiconductor cable(s) shall be made to the fire pump controller. [NFPA 20:9.3.8.4]
Substantiation: 1) The Extant Article 695 extracted text is from the 2003 Edition of NFPA-20 which has been extensively rewritten in the 2007 Edition.
2) Article (Clause) 90.9(C)(2), although related to Units of Measure requires that extracted text not be compromised.
3) Since I don't know the status of the work by the NFPA-20 – NEC task group on this topic, I'm submitting this Public Proposal as a contingency proposal.
4) The statement in the Scope that the test is extracted from NFPA 20-2007 is not correct. It's still at the 2003 version.
Note that I'm also submitting another Public Proposal to eliminate the extracted text if it can not, or will not, be made to agree with that in NFPA-20 since the difference is causing field confusion. This is an important life safety issue.
Panel Meeting Action: Reject
Panel Statement: The panel has looked at this proposed revision of Article 695 as a collective body of work and determined that there are too many correlation, style, and technical issues that cannot be resolved within the time frame of the ROP meeting. This proposal is similar in nature to Proposal 13-77 for the 2008 NEC, which also proved too cumbersome for the panel to act on and ensure proper technical correlation with NFPA 20. To that end, CMP-13 has acted on Proposals 13-60a, 13-77a, and 13-95a to provide correlation between important sections of NFPA 20 and Article 695. These actions are based on the recommended changes for the 2010 edition of NFPA 20 as accepted by the NFPA 20 technical committee in their ROP and ROC actions.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-52 Log #4308 NEC-P13 **Final Action: Reject**
(695)

Submitter: James S. Nasby, Columbia Engineering
Recommendation: If the extracted text relating to power supplies can not be made to agree with the 2007 Edition of NFPA-20 it should be deleted, leaving only the text relating to Installation that is native to NFPA-70 (the NEC).
Substantiation: 1) The Extant Article 695 extracted text is from the 2003 Edition of NFPA-20 which has been extensively rewritten in the 2007 Edition.
2) Article (Clause) 90.9(C)(2), although related to Units of Measure requires that extracted text not be compromised.
3) Since I don't know the status of the work by the NFPA-20 – NEC task group on this topic, I'm submitting this Public Proposal as a contingency proposal.
4) The statement in the Scope that the test is extracted from NFPA 20-2007 is not correct. It's still at the 2003 version.
Note that I'm also submitting another Public Proposal to synchronize (update) the extracted text. This is an important life safety issue. There is significant confusion in the field due to the substantial difference between the two documents.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided specific text. This proposal does not meet the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-53 Log #4181 NEC-P13 **Final Action: Reject**
(695.1)

Submitter: James E. Degnan, Sparling
Recommendation: Revise text to read as follows:
695.1 Scope
(A) Covered This article covers the installation of the following:
(1) Electric power sources and interconnecting circuits.
(2) Switching and control equipment dedicated to the fire pump drivers.
(3) Pressure maintenance (jockey or makeup) pumps, when these pumps are connected to the same utility service connection as the fire pump.
(B) Not Covered. This article does not cover the following
(1) The performance …(retain text)…the system.
(2) Pressure maintenance (jockey or makeup) pumps, when these pumps are not connected to the same utility service connection as the fire pump.
Substantiation: Section 695.1 (B) now states that Article 695 does not apply to the pressure maintenance pump. This is appropriate because the pressure maintenance pump does not require the same level of integrity under various circumstances that is needed by the fire pump. However there is text throughout Article 695 covering the pressure maintenance pump. This change clarifies when the text in 695 applies to the pressure maintenance pump. In effect, it leaves the choice of feeding the pressure maintenance pump from the same source as the fire pump up to the design engineer.
Panel Meeting Action: Reject
Panel Statement: The choice of the power supply for the jockey pump remains with the designer, installer, or inspector. A jockey pump can be treated as any other motor, based on Article 430, and does not require the separation and continuity of power requirements based on Article 695 for the fire pump and other related critical loads.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
DEGNAN, J.: My substantiation statement and the panel statement agree on the intent of the code, however the language of the code could be made more readily understandable through the addition of text within Article 695 that clearly explains why 695.1(B)(2) states that the pressure maintenance pump is not within the scope of the article, and yet the article contains numerous references to it. I will evaluate language that permits the panel to accept this proposal in principle, as the code development process continues.

13-54 Log #73 NEC-P13 **Final Action: Reject**
(695.1(A) and (B))

Note: This Proposal appeared as Comment 13-109 on Proposal 13-79 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-79 was:
Revise text to read as follows:
695.1 Scope.
(A) Covered. This article covers the installation of the following:
(1) Electric power sources and interconnecting circuits
(2) Switching and control equipment dedicated to fire pump drivers
(3) Pressure maintenance (jockey or makeup) pumps
(4) Associated fire pump accessory equipment
(B) Not Covered. This article does not cover the following:
(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system
~~**(2) Pressure maintenance (Jockey or makeup) pumps**~~
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Suggested revision:
Replace (3) with "Wiring, Overcurrent Protection and other aspects of loads connected to the power supply or interconnecting circuits."
Substantiation: Direction of the TCC to clarify panel action. Suggested wording.
The intent is to indicate that there is proscriptive code regarding other connected loads, but, not the loads themselves. Also note that most, but not all, fire pump systems have pressure maintenance (jockey) pumps which may or may not be connected to the fire pump power supply.
Panel Meeting Action: Reject
Panel Statement: The suggested text covering overcurrent protection is already adequately covered in the scope in existing (A)(1) and (2) so the additional text is unnecessary. See the panel action and statement on Proposal 13-54. The panel understands that their actions on scope statements are advisory to the Technical Correlating Committee.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MOUTON, C.: The panel statement should have the sentence "See the panel action and statement on Proposal 13-54." removed, since it does not apply to this Proposal.

13-55 Log #74 NEC-P13 **Final Action: Reject**
(695.1(A) and (B))

Note: This Proposal appeared as Comment 13-110 on Proposal 13-79 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-79 was:
Revise text to read as follows:
695.1 Scope.
(A) Covered. This article covers the installation of the following:
(1) Electric power sources and interconnecting circuits
(2) Switching and control equipment dedicated to fire pump drivers
(3) Pressure maintenance (jockey or makeup) pumps
(4) Associated fire pump accessory equipment
(B) Not Covered. This article does not cover the following:
(1) The performance, maintenance, and acceptance testing of the fire

pump system, and the internal wiring of the components of the system
~~(2) Pressure maintenance (Jockey or makeup) pumps~~
Submitter: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
Recommendation: Revise text to read as follows:
695.1 Scope.
(A) Covered. This article covers the installation of the following:
(1) Electric power sources and interconnecting circuits.
(2) Switching and control equipment dedicated to fire pump drivers.
<u>(3) Pressure maintenance (jockey or makeup) pumps.</u>
<u>(4) Associated fire pump accessory equipment for alarms that signal an alarm for improper conditions that exist in a fire pump.</u>
(B) Not Covered. This article does not cover the following:
(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system
~~(2) Pressure maintenance (jockey or makeup) pumps.~~
Substantiation: We DO need to state that jockey or makeup pump motors are covered because they do exist in fire pump installations. The present language, by not including them, is a very bad format even if we do go to Article 430 for jockey pumps. Accessory equipment also needs to be covered because the alarms that are part of the fire pump installation indicate improper conditions in fire pump equipment if something occurs that is wrong. 695.5(A), (B), and (C)(2) tell us to include jockey and makeup pumps in load calculations.
Panel Meeting Action: Reject
Panel Statement: The suggested text covering overcurrent protection is already adequately covered in the scope in existing (A)(1) and (2) so the additional text is unnecessary. See the panel action and statement on Proposal 13-54. The panel understands that their actions on scope statements are advisory to the Technical Correlating Committee. Adding a new (4) covering associated fire pump accessory equipment for alarm is already covered in existing (2) for switching and control equipment dedicated to fire pump drivers. The alarm equipment is part of the accessory equipment for the fire pump controller.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
DEGNAN, J.: I agree with the submitter that the current language within Article 695 should be improved.
MOUTON, C.: The panel statement should have the first sentence removed, since it does not apply to the recommendation of the Proposal. Also, the reference to panel action and statement should have 13-53 added. Both 13-53 and 13-54 have components that address the recommendation.

13-56 Log #75 NEC-P13 **Final Action: Reject**
(695.1(A) and (B))

Note: This Proposal appeared as Comment 13-111 on Proposal 13-79 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-79 was:
Revise text to read as follows:

~~(2) Pressure maintenance (Jockey or makeup) pumps~~
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Suggest revision:
Replace (3) with "Wiring, Overcurrent Protection and other aspects of loads connected to the power supply or interconnecting circuits."
Substantiation: Direction of the TCC to clarify panel action. Suggested wording.
The intent is to indicate that there is proscriptive code regarding other connected loads, but, not the loads themselves.
Also note that most, but not all, fire pump systems have pressure maintenance (jockey) pumps which may or may not be connected to the fire pump power supply.
Panel Meeting Action: Reject
Panel Statement: The suggested text covering overcurrent protection is already adequately covered in the scope in existing (A)(1) and (2) so the additional text is unnecessary. See the panel action and statement on Proposal 13-54. The panel understands that their actions on scope statements are advisory to the Technical Correlating Committee.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-57 Log #76 NEC-P13 **Final Action: Reject**
(695.1(A) & (B))

Note: This Proposal appeared as Comment 13-112 on Proposal 13-79 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-79 was:
Revise text to read as follows:
695.1 Scope.
(A) Covered. This article covers the installation of the following:
(1) Electric power sources and interconnecting circuits
(2) Switching and control equipment dedicated to fire pump drivers
<u>(3) Pressure maintenance (jockey or makeup) pumps</u>
<u>(4) Associated fire pump accessory equipment</u>
(B) Not Covered. This article does not cover the following:
(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system
~~(2) Pressure maintenance (Jockey or makeup) pumps~~
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee rejects the Panel Action until the Panel Action has been clarified regarding the deletion of (B)(2) and acceptance of the underlined (4).
The Technical Correlating Committee directs the Panel to clarify the Panel Action relative to the addition of Item 4, associated fire pump accessory equipment, since that equipment appears to be related to mechanical equipment rather than the electrical installation.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Reject
Panel Statement: The suggested text covering overcurrent protection is already adequately covered in the scope in existing (A)(1) and (2) so the additional text is unnecessary. See the panel action and statement on Proposal 13-54. The panel understands that their actions on scope statements are advisory to the Technical Correlating Committee. The committee notes that this is a recommendation from the Technical Correlating Committee.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MOUTON, C.: The reference to panel action and statement should have 13-55 added. Both 13-54 and 13-55 have components that address the recommendation.

13-58 Log #1411 NEC-P13 **Final Action: Reject**
(695.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "may" to "can".
Substantiation: Edit. "May" is subjective and a term to be avoided per the Style Manual. "Can" is more readily determined.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided specific reasons that the term "may" is incorrect in the context it is used in 695.2. The NEC Style Manual does not prohibit the use of the term "may" provided it is not used to denote a requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-59 Log #3957 NEC-P13 **Final Action: Reject**
(695.2.On-Site Standby Generator)

Submitter: James E. Degnan, Sparling
Recommendation: Revise text to read as follows:
695.2 Definitions
On -Site Standby Generator A facility producing ~~electric power~~ <u>electricity</u> on site as the ~~alternate supply of electric~~ <u>emergency source of</u> power. It differs from an on-site power production facility in that it is not constantly producing <u>electrical</u> power.
Substantiation: The term "On-Site Standby Generator" is used in NFPA 20, *Installation of Stationary Pumps for Fire Protection*, however the term "Standby" has unwanted linkage to Article 702.
The desired linkage is to Article 700, see Section 700.1, FN 3. In Section 700.12 the closest term is "emergency source of power". This proposal provides a clearer link between Article 695 and Article 700, while retaining ties to the terms in NFPA 20.
In NFPA 110, *Emergency and Standby Power Systems*, the closest formal term is "Energy Converter", although "generator" is also used. "Energy Converter" is not recommended due to the complexity of the definition.
Panel Meeting Action: Reject

Panel Statement: The correct term is an "on-site standby generator." The fact that the standby generator supplies an emergency system does not impact the name of the power source. The panel disagrees that there is confusion with Article 702. The panel notes that this definition in the NEC correlates with Section 3.3.35 in the 2007 edition of NFPA 20.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-60 Log #3956 NEC-P13 **Final Action: Reject**
(695.2.On-Site Standby Generator and 695.3(B))

Submitter: James E. Degnan, Sparling
Recommendation: Revise text to read as follows:
695.2 Definitions
~~**On -Site Standby**~~ **Emergency Generator** A facility producing ~~electric power~~ electricity on site as the ~~alternate supply of electric~~ emergency source of power. It differs from an on-site power production facility in that it is not constantly producing electrical power.695.3(B) Where reliable…(retain existing text)…in combination with an emergency ~~on-site standby~~ generator complying with 695.3(B)1) and (B)(3).
Similarly: " emergency ~~on-site standby~~ generator" where it appears in the balance of Article 695.
Substantiation: The term "On-Site Standby Generator" is used in NFPA 20, *Installation of Stationary Pumps for Fire Protection*, however the term "Standby" has unwanted linkage to Article 702.
The desired linkage is to Article 700, see Section 700.1, FN 3. In Section 700.12. The term "Emergency Generator" provides a clear link to Article 700. This moves away from NFPA 20. The term "On-Site" is superfluous when it comes to emergency generators.
In NFPA 110, *Emergency and Standby Power Systems*, the closest formal term is "Energy Converter", although "generator" is also used. "Energy Converter" is not recommended due to the complexity of the definition.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-59.
Number Eligible to Vote: 14

(695.3)

Submitter: Code-Making Panel 13,
Recommendation: Revise Section 695.3 to read:
695.3 Power Source(s) for Electric Motor-Driven Fire Pumps. Electric motor-driven fire pumps shall have a reliable source of power.
(A) Individual Sources. Where reliable, and where capable of carrying indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply, the power source for an electric motor driven fire pump shall be one or more of the following.
(1) Electric Utility Service Connection. A fire pump shall be permitted to be supplied by a separate service, or from a connection located ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with 230.82(5). The service equipment shall comply with the labeling requirements in 230.2 and the location requirements in 230.72(B). [20:9.2.2(1)]
(2) On-Site Power Production Facility. A fire pump shall be permitted to be supplied by an on-site power production facility. The source facility shall be located and protected to minimize the possibility of damage by fire. [20:9.2.2(3)]
(3) Dedicated Feeder. A dedicated feeder shall be permitted where it is derived from a service connection as described in 695.3(A)(1). [20:9.2.2(3)]
(B) Multiple Sources. If reliable power cannot be obtained from a source described in 695.3(A), power shall be supplied by one of the following:[20:9.3.2]
(1) Individual Sources. An approved combination of two or more of the sources from 695.3(A).
(2) Individual Source and On-site Standby Generator. An approved combination of one or more of the sources in 695.3(A) and an on-site standby generator complying with 695.3(D).[20:9.3.4]
(C) Multibuilding Campus-Style Complexes. If the sources in 695.3(A) are not practicable and the installation is part of a multibuilding campus style complex, feeder sources shall be permitted if approved by the authority having jurisdiction and installed in accordance with (C)(1) through (C)(3).
(1) Feeder Sources. Two or more feeders shall be permitted as more than one power source if such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).
(2) Feeder and Alternate Source. A feeder shall be permitted as a normal source of power if an alternate source of power independent from the feeder is provided. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).
(3) Selective Coordination. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).
(D) On-site Standby Generator as Alternate Source. An on-site standby generator(s) used as an alternate source of power shall comply with (D)(1) through (D)(3):[20:9.6.2.1]
(1) Capacity. The generator shall have sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s). [20:9.6.1.1]
Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted.
(2) Connection. A tap ahead of the generator disconnecting means shall not be required. [NFPA 20:9.6.1.2]
(3) Adjacent Disconnects. The requirements of 430.113 shall not apply.
(E) Arrangement. All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards. [NFPA 20:9.1.4]
Multiple power sources shall be arranged so that a fire at one source will not cause an interruption at the other source.
Substantiation: This revision incorporates the concepts contained in the public proposals on which the panel accepted in whole, in part or in principle. The revision provides correlation and proper extract attribution between Article 695 and the recommendation for Chapter 9 in the 2010 edition of NFPA 20 based on the ROP and ROC actions of the NFPA 20 Technical Committee.
Panel Meeting Action: Accept

(695.3)

Note: This Proposal appeared as Comment 13-114 on Proposal 13-81 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-81 was:
~~**9.2.1.x**~~ **Phase Converters. Phase converters shall not be permitted to be used for fire pump service.**
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Add the following text as a new first level subdivision at the end of 695.3. It is the intent of the panel that this be the last first level subdivision that appears in Section 695.3.
Phase Converters. Phase converters shall not be permitted to be used for fire pump service. [20:9.1.7]
Panel Statement: The panel accepts the TCC direction to clarify their action. This action correlates with NFPA 20 to prohibit the use of phase converters for fire pump service. This requirement was accepted unanimously by the NFPA 20 committee on Proposal 20-54 in the ROP for the 2010 edition of NFPA 20. No comments were submitted to supplement, modify, or reject the unanimous action of the NFPA 20 TC to prohibit the use of phase converters for fire pump service.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MOUTON, C.: The panel action on this proposal needs to be coordinated with the revision to 695.3 provided in Panel Proposal 13-60a. The recommended addition accepted in this proposal is not currently included in the revision proposed in 13-60a.

13-62 Log #78 NEC-P13 **Final Action: Reject**
(695.3)

Note: This Proposal appeared as Comment 13-115 on Proposal 13-82 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-82 was:

Revise 695.3, 695.4, 695.5, as required to match corresponding text from NFPA-20 Clauses 9.2 and etc.

Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Accept in Principle per CMP-13 Panel Action. Do not Reject the proposal.
Substantiation: This proposal does meet the requirements of Section 4-3.3 Regulations Governing Committee Projects since five pages of supporting material were on file with the NFPA as stated in the ROP. This material was part of the proposal material sent to CMP-13 members. This material is essentially identical with the text proposed in Proposal 13-77.

I don't know why the TCC changed the Panel vote from AIP to Reject. TCC doesn't state how 4.3.3 is violated.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided text to be added after the scope of each article. This proposal does not meet the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects.

Note: This Proposal appeared as Comment 13-116 on Proposal 13-77 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-77 was:

Revise extracted text from NFPA 20 to reflect 2006 edition revisions. Following is the NFPA 20 - Chapter 9 text as it has been voted on by the NFPA 20 Committee to date.

NFPA 20 - DRAFT

Chapter 9 Electric Drive for Pumps

9.1 General.

9.1.1 This chapter covers the minimum performance and testing requirements of the sources and transmission of electrical power to motors driving fire pumps.

9.1.2 Also covered are the minimum performance requirements of all intermediate equipment between the source(s) and the pump, including the motor(s) but excepting the electric fire pump controller, transfer switch, and accessories (see Chapter 10).

9.1.3 All electrical equipment and installation methods shall comply with NFPA 70, National Electrical Code, Article 695, and other applicable articles.

9.1.4* All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.

9.1.5 All power supplies shall have the capacity to run the fire pump on a continuous basis.

9.1.6 All power supplies shall comply with the voltage drop requirements of Section 9.7.

9.2 Normal Power.

9.2.1 An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.

9.2.2 The normal source of power required in 9.2.1 and its routing shall be arranged in accordance with one of the following:

(1) Service connection dedicated to the fire pump installation.

(2) On-site power production facility connection dedicated to the fire pump installation.

(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.

(4) As a feeder connection where all of the following conditions are met:

a. The protected facility is part of a multi-building campus style arrangement.

b. A back-up source of power is provided from a source independent of the normal source of power.

c. It is impractical to supply the normal source of power through arrangement 9.2.2(1), 9.2.2(2), 9.2.2(3) or 9.2.2(5).

d. The arrangement is acceptable to the authority having jurisdiction.

e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).

(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695 of NFPA 70.

9.2.3 For fire pump installations using the arrangement of 9.2.2(1), 9.2.2(2),9.2.2(3), 9.2.2(5) for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.

9.2.3.1 Where the disconnecting means permitted by 9.2.3 is installed, the disconnecting means shall meet all of the following:

(1) Identified as being suitable for use as service equipment.

(2) Lockable in the closed position.

(3) * Located remote from other building disconnecting means.

(4) * Located remote from other fire pump source disconnecting means.

(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers.

9.2.3.2 Where the disconnecting means permitted by 9.2.3 is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.

9.2.3.3 Where the disconnecting means permitted by 9.2.3 is installed, the disconnect shall be supervised in the closed position by one of the following methods:

(1) Central station, proprietary or remote station signal device

(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location

(3) Locking the disconnecting means in the closed position

(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner

9.2.3.4 Where the overcurrent protection permitted by 9.2.3 is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment.

9.3 Alternate power.

9.3.1 Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus.

9.3.2* Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided where the normal source is not reliable.

9.3.3 An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.

9.3.4 When provided, the alternate source of power shall be supplied from one of the following sources:

(1) A generator installed in accordance with Section 9.8.

(2) One of the sources identified in 9.2.2(1); 9.2.2(2); 9.2.2(3); or 9.2.2(5) when the power is provided independent of the normal source of power.

9.3.5 When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations.

9.4 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.

9.4.1 The junction box shall be securely mounted.

9.4.2* Mounting and installing of a junction box shall not violate the enclosure Type (NEMA) rating of the fire pump controller(s).

9.4.3* Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the Short Circuit Rating of the controller(s).

9.4.4 As a minimum, a National Electrical Manufacturers Association (NEMA) Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed f or the subject to match the fire pump controller enclosure Type rating.

9.4.5 Terminals, junction blocks, splices, and the like, when used, shall be listed.

9.5* Listed Electrical Circuit Protective System to Controller Wiring.

9.5.1* Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with NFPA 70.

9.5.2 Single (individual conductors) shall not enter the fire pump enclosure separately.

9.5.3* Where required by the manufacturer of a listed Electrical Circuit Protective System or by NFPA 70 or by the Listing agency, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.

9.5.4 Standard wiring between junction box and controller is acceptable.

9.6* Raceway Terminations.

9.6.1 Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.

9.6.2 The NEMA Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

9.6.3 The installation instructions of the manufacturer of the fire pump controller shall be followed.

9.6.4 No alterations to the fire pump controller, other than conduit entry as allowed by NFPA 70, shall be approved by the authority having jurisdiction.

9.7* Voltage Drop.

9.7.1 Unless the requirements of 9.4.2 are met, the voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor-starting conditions.

9.7.2 The requirements of 9.7.1 shall not apply to emergency run mechanical starting. (See 10.5.3.2.)

9.7.3 The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.

9.8 Motors.

9.8.1 General.

9.8.1.1 All motors shall comply with NEMA MG-1, Motors and Generators, shall be marked as complying with NEMADesign B standards, and shall be specifically listed for fire pump service. (See Table 9.8.1.1.)

Table 9.8.1.1 Horsepower and Locked Rotor Current Motor Designation for NEMA Design B Motors

9.8.1.2 The requirements of 9.8.1.1 shall not apply to direct-current, high-voltage (over 600 V), large-horsepower [over 373 kW (500 hp)], single-phase, universal-type, or wound-rotor motors, which shall be permitted to be used where approved.

9.8.1.3 Motors used with variable speed controllers shall additionally meet the applicable requirements of NEMA MG1, Part 31 and shall be marked for inverter duty.

9.8.1.4* The corresponding values of locked rotor current for motors rated at other voltages shall be determined by multiplying the values shown by the ratio of 460 V to the rated voltage in Table 9.8.1.1.

9.8.1.5 Code letters of motors for all other voltages shall conform with those shown for 460 V in Table 9.8.1.1.

9.8.1.6 All motors shall be rated for continuous duty.

9.8.1.7 Electric motor–induced transients shall be coordinated with the provisions of 10.4.3.3 to prevent nuisance tripping of motor controller protective devices.

9.8.1.8 Motors for Vertical Shaft Turbine–Type Pumps.

9.8.1.8.1 Motors for vertical shaft turbine–type pumps shall be dripproof, squirrel-cage induction type.

9.8.1.8.2 The motor shall be equipped with a nonreverse ratchet.

9.8.2 Current Limits.

9.8.2.1 The motor capacity in horsepower shall be such that the maximum motor current in any phase under any condition of pump load and voltage unbalance shall not exceed the motor-rated full-load current multiplied by the service factor.

9.8.2.2 Where the motor is used with a variable speed pressure limiting controller, the service factor shall not be used.

9.8.2.3 The maximum service factor at which a motor shall be used is 1.15.

9.8.2.4 These service factors shall be in accordance with NEMA MG-1, Motors and Generators.

9.8.2.5 General-purpose (open and dripproof) motors, totally enclosed fan-cooled (TEFC) motors, and totally enclosed nonventilated (TENV) motors shall not have a service factor larger than 1.15.

9.8.2.6 Motors used at altitudes above 1000 m (3300 ft) shall be operated or derated according to NEMA MG-1, Motors and Generators, Part 14.

9.8.3 Marking.

9.8.3.1 Marking of motor terminals shall be in accordance with NEMA MG-1, Motors and Generators, Part 2.

9.8.3.2 A motor terminal connecting diagram for multiple lead motors shall be furnished by the motor manufacturer.

9.9 On-Site Standby Generator Systems.

9.9.1 Capacity.

9.9.1.1 Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 9.3.2, they shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of Section 9.7.

9.9.1.2 A tap ahead of the on-site generator disconnecting means shall not be required.

9.9.2* Power Sources.

9.9.2.1 These power sources shall comply with Section 9.7 and shall meet the requirements of Level 1, Type 10, Class X systems of NFPA 110, Standard for Emergency and Standby Power Systems.

9.9.2.2 The fuel supply capacity shall be sufficient to provide 8 hours of fire pump operation at 100 percent of the rated pump capacity in addition to the supply required for other demands.

9.9.3 Sequencing. Automatic sequencing of the fire pumps shall be permitted in accordance with 10.5.2.5.

9.9.4 Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.

9.9.5* Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump.

Submitter: Jim Pauley, Square D Company

Recommendation: Revise 695.3 from the ROP Draft to read as follows:

695.3 Power Source(s) for Electric Motor-Driven Fire Pumps. Electric motor-driven fire pumps shall have a reliable source of power.

(A) Individual Sources. Where reliable, and where capable of carrying indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply, the power source for an electric motor driven fire pump shall be one or more of the following.

(1) Electric Utility Service Connection. A fire pump shall be permitted to be supplied by a separate service, or from a connection located ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with 230.82(5). The service equipment shall comply with the labeling requirements in 230.2 and the location requirements in 230.72(B). [NFPA 20:9.2.2]

(2) On-Site Power Production Facility. A fire pump shall be permitted to be supplied by an on-site power production facility. The source facility shall be located and protected to minimize the possibility of damage by fire. [NFPA 20:9.2.3]

(3) Dedicated Feeder. A dedicated feeder shall be permitted where it is derived from a service connection as described in 695.3(A)(1).

(B) Multiple Sources. Where reliable power cannot be obtained from a source described in 695.3(A), power shall be supplied one of the following:

(1) Two Individual Sources. ~~from a~~ An approved combination of two or more of ~~either of such sources~~ the sources from 695.3(A).

(2) Individual Source and Generator. An approved combination of one or more of the sources in 695.3(A) and an on-site generator complying with 695.3(D). ~~or from an approved combination of feeders constituting two or more power sources as covered in 695.3(B)(2), or from an approved combination of one or more of such power sources in combination with an on-site standby generator complying with 695.3(B)(1) and (B)(3).~~

(C) Multibuilding Campus-Style Complexes. Where the sources in 695.3(A) are not practicable and the installation is part of a multibuilding campus style complex, feeder sources shall be permitted where approved by the authority having jurisdiction and installed in accordance with (1) or (2).

(1) Two Feeder Sources. Two feeders shall be permitted as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).

(2) Feeder and Alternate Source. A feeder shall be permitted as a normal source of power when an alternate source of power independent from the feeder is provided. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).

~~**(1) Generator Capacity.** An on-site generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the on-site generator disconnecting means shall not be required. The requirements of 430.113 shall not apply. [NFPA 20:9.6.1]~~

~~**(2) Feeder Sources.** This section applies to multibuilding campus-style complexes with fire pumps at one or more buildings. Where sources in 695.3(A) are not practicable, and with the approval of the authority having jurisdiction, two or more feeder sources shall be permitted as one power source or as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B). [NFPA 20:9.2.5.3]~~

~~**(3) Arrangement.** The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:9.2.5.1]~~

(~~1~~D) Generator ~~Capacity~~ as Alternate Source. ~~An~~ Where an on-site generator(s) is used ~~to comply with this section~~ as an alternate source of power. The following shall apply:

(1) Capacity. The generator shall have ~~shall be of~~ sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted.

(2) Connection. A tap ahead of the on-site generator disconnecting means shall not be required.

(3) Adjacent Disconnects. The requirements of 430.113 shall not apply.

~~**(3)**~~ **(E) Arrangement.** The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:9.2.5.1]

Substantiation: This comment is to revise the layout and arrangement of 695.3 to provide a more logical approach to the power sources. The following list explains each of the revisions:

1. 695.3(A)(1) and (2) are unchanged from the present text
2. 695.3(A)(3) is new and intended to pick up the provision that recognizes a feeder derived from a service connection. The reference to 695.3(A)(1) would recognize that the feeder may come from a dedicated service (but the service conductors don’t go directly to the FP controller) or from a tap ahead of the main. This is the same provision accepted by the panel in Proposal 13-77 as 695.4(B)(3)
3. 695.3(B) is rearranged to create a list of the two provisions dealing with combinations of sources. Item 1 captures the combination of two of the sources

recognized in 695.3(A). Item 2 captures the basic combination of a 695.3(A) source and an on-site generator. The provisions for the generator are moved to create a new 695.3(D), so that reference is given here. These two provisions of this list are recognized in the current text of 695.3(B).
4. 695.3(C) is a new section to cover the multi-building campus installations with more clarity. The intro paragraph captures the three requirements in the present text that the sources in 695.3(A) are not practicable, that the AHJ approve the use of the feeder source and that you have a multi-building campus application. The paragraph then allows either of two options to be used
a. Item (1) covers the application of two feeder sources. This provision is already allowed in the current 695.3(B) and recognizes that you can utilize two feeders from separate utility services as more than one power source. The provision that any disconnects and overcurrent devices comply with 695.4(B) is captured.
b. Item (2) will recognize a feeder along with an alternate source. This provision was accepted by the panel in Proposal 13-77 as section 695.4(B)(4). This addition will correct what has been a significant issue in Article 695 since the present article did not recognize a feeder and on-site generator as an acceptable combination. It should be noted that the text maintains the panel accepted text (from Proposal 13-77) of "alternate power source independent of the feeder" instead of referencing an on-site generator specifically.
c. It is also important to point out that the provision from Proposal 13-77 regarding selective coordination of the overcurrent devices is specifically omitted. This provision (regardless of whether it is in NFPA 20 or not) creates significant technical concern. Keep in mind that the overcurrent devices in the fire pump feeder must be capable of carrying locked rotor current. So a 100A fire pump would have a 600A overcurrent device upstream. If for example, this were an 800A service, the next feeder device upstream (which may be shared with other parts of the system) may have to be 1200A to gain pure selectivity. This could potentially require that the entire system be much larger than needed for the installation, just to accomplish selective coordination. There is no technical basis for requiring that the fire pump feeder be selectively coordinated.
5. The "Generator Capacity" section is moved from 695.3(B)(1) to become 695.3(D). This section is also editorially rearranged to break the three requirements of the generator into three sections titled "Capacity", "Connection" and "Adjacent Disconnects".
695.3(E) is the old 695.3(B)(3) regarding arrangement of the power sources. This placement will allow it to apply to the multiple sources of both (B) and (C).
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on panel proposal 13-60a meets the intent of the recommendation.
Number Eligible to Vote: 14

(695.3)

Note: This Proposal appeared as Comment 13-117 on Proposal 13-81 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-81 was:
~~9.2.1.x~~ **Phase Converters. Phase converters shall not be permitted to be used for fire pump service.**
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Accept the Proposal to prohibit phase converters.
Substantiation: Phase converters are prohibited by NFPA-20. My substantiation is confusing; but, the NFPA-20 Technical Committee via Action on Proposal 20-71 (Log #59) and on Comments 20-8 (Log #38) and 20-42 (Log #37) prohibits phase converters as unsuitable for fire pump service. One reason is imbalances that occur with varying loads. Another is adding another energy converter in the critical path. Another problem is keeping the controller energized at all times.
This is consistent with Panel Action on Proposal 13-77 and also with my Comment suggesting revisions to 13-77.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 13-61 meets the intent of the recommendation.

13-66 Log #82 NEC-P13 **Final Action: Reject**
(695.3, FPN (New))

Note: This Proposal appeared as Comment 13-120 on Proposal 13-83 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-83 was:
Insert a fine print note ahead of 695.3(A) as follows:
FPN: NFPA 20, Standard for the Installation of Stationary Pumps for Fire Protection, provides information on the characteristics of reliable power sources in Annex A, item A.9.2.4.
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Accept in Principle Public Proposal 13-83.
Substantiation: At the risk of a small amount of redundancy, this reference back to NFPA-20 on characteristics of a "reliable power source" is vital and a source of daily confusion and conflicts. The intent is to aid plan approval and inspection agencies and other AHJs in resolving conflicts. Note that the submitter of Proposal 13-81, F. Hartwelll, is both an AHJ and is also very familiar with fire pump installations; but, is seeking this additional guidance. This is also important since NFPA-70 has far wider distribution than NFPA-20. Hopefully, this reference will lead readers to NFPA-20 clause A.9.3.2 which has several paragraphs of guidance on this topic.
Panel Meeting Action: Reject

13-67 Log #83 NEC-P13 **Final Action: Accept**
(695.3(A)(3) (New))

Note: This Proposal appeared as Comment 13-121 on Proposal 13-84 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-84 was:
Revise text to read:
695.3(A)(3) In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, a fire pump shall be permitted to be supplied by a single feeder from a site-wide power distribution system.
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Reject this proposal.
Substantiation: This is extract text from NFPA-20. The proposal should go to the NFPA-20 Technical Committee.
Five methods are now allowed for supplying fire pump controllers. Included is the transformer connection which can be and is used at low voltage, medium voltage and high voltage.
Panel Meeting Action: Accept
Panel Statement: This panel action is to reject the concept recommended in Proposal 13-84 in the 2008 NEC ROP. The panel continues to reject the intent of Proposal 13-84. The power supply for a fire pump is under the purview of NFPA 20. A single feeder is not considered a reliable source of power.
A single feeder supply from a site wide power distribution system must still have appropriate reliability and this reliability is not dependent upon an industrial facility or any other facility. The reliability is determined on the power source and how often loss of power occurs.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
DEGNAN, J.: The panel should refine the statement " A single feeder is not considered a reliable source of power" to agree with the intent of 695.3(A).

13-68 Log #84 NEC-P13 **Final Action: Accept**
(695.3(A)(3) (New))

Note: This Proposal appeared as Comment 13-122 on Proposal 13-85 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-85 was:
Add new text to read:
695.(A)(3): Where redundant fire pumps are installed to protect a facility, and where the power source to each fire pump is independent (or where a diesel fire pump serves as the redundant pump for an electric pump), a single feeder shall be permitted as a reliable source.
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Reject this proposal.
Substantiation: This is extract text from NFPA-20. The proposal should go to the NFPA-20 Technical Committee.
Five methods are now allowed for supplying fire pump controllers. Included is the transformer connection which can be and is used at low voltage, medium voltage and high voltage.
The issue of deviation being justified by a redundant pump is proper matter for the AHJ and the specific installation.
Panel Meeting Action: Accept
Panel Statement: See the panel action and statement on Proposal 13-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-69 Log #85 NEC-P13 **Final Action: Reject**
(695.3(A)(3) (New))

Note: This Proposal appeared as Comment 13-123 on Proposal 13-84 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-84 was:
Revise text to read:
695.3(A)(3) In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, a fire pump shall be permitted to be supplied by a single feeder from a site-wide power distribution system.
Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Add text to read as follows:
<u>695.3(A)(3) In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, a fire pump controller shall be permitted to be supplied power by a single feeder from disconnect dedicated to the fire water pump in a site-wide power distribution system located sufficiently remote from the facilities served as to minimize the possibility of damage to the fire pump service by fire from within the facilities.</u>
Substantiation: This comment modifies the original proposal to address comments concerning security, segregation and safety of the feeder to the fire pump controller during a fire. The intent of this change is to address the needs of large industrial concerns which purchase power at a high voltage where a second disconnect and transformer for a fire pump service as required 695.3(A)(1) is impractical while still maintaining the ability of the fire fighters to quickly isolate power to the facility on fire while retaining a power supply to the fire pumps. This proposal permits these large industrial concerns to provide service to fire water pumps which is identical physically to that used by concerns which purchase power at a medium voltage. This modified proposal adds the requirement that the service be separate from the disconnect for power to the facilities and is sufficiently remote from the facilities to not be at risk of damage by the fire. Since power purchased at higher voltage is generally more reliable and the additional high voltage disconnect and transformer are not required, this installation is actually more reliable than what is permitted.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
MOUTON, C.: I'm voting against the panel action. The panel action should have been to accept the proposal. The panel action and statement references to the action taken on Proposal 13-67 which is not appropriate for this proposal. Proposal 13-69 has substantial additions to the referenced 2008 Proposal 13-84 referenced in Proposal 13-67. Proposal 13-69 provides additional language to address concerns for security, segregation, and safety of the feeder to the fire pump controller for industrial establishments. The panel action taken on Proposal 13-67 should not have been carried over to this proposal without greater consideration and discussion about the particular aspects of this proposal. Industrial establishments have a long history of highly reliable electrical power distribution on single feeders to very important services. Industrial power systems are frequently served by two power sources, with a low frequency of loss of power to the facility. Qualified persons service the installation, which maintains a high degree of reliability in the supply to dedicated important services. The panel statement says that the "power supply is under the purview of NFPA 20. This is correct, but in many situations the AHJ judges specifically on the literal wording of the NEC, and does not reference NFPA 20.

13-70 Log #86 NEC-P13 **Final Action: Reject**
(695.3(A)(3) (New))

Note: This Proposal appeared as Comment 13-124 on Proposal 13-85 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-85 was:
Add new text to read:
695.(A)(3): Where redundant fire pumps are installed to protect a facility, and where the power source to each fire pump is independent (or where a diesel fire pump serves as the redundant pump for an electric pump), a single feeder shall be permitted as a reliable source.
Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Add text to read as follows:
<u>695.3 (A)(3) An alternative source of power to the electric fire pump motor is not required where a back-up engine or back-up steam turbine driven fire pump is installed. [NFPA 20:9.3.3]</u>
Substantiation: The revised wording is a direct quote from NFPA 20 and addresses part of the intent of the original proposal.
Panel Meeting Action: Reject
Panel Statement: The requirements of Article 695 cover electrically driven fire pumps. Coordination between the power supply performance requirements in Chapter 9 of NFPA 20 with the electrical installation requirements in Article 695 has to occur during the design phase of the project. NFPA 20 contains several performance based requirements in addition to the one that is being proposed. Approval of fire pump installations is typically not the sole responsibility of the electrical AHJ.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
LITTLE, L.: We agree with the part of the panel statement that states: coordination between the performance requirements in Chapter 9 of NFPA 20 and the electrical installation requirements in Article 695 must occur during the design phase of a project.
However, the submitter is correct. NFPA 20 does not require an alternate source of electrical power if a back-up engine driven or back-up steam turbine driven fire pump is installed as follows:
"NFPA 20, 9.3.3. An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard."
This information should be inserted in Article 695 as a fine print note for clarity and usability. Users of the NEC do not necessarily own a copy of NFPA 20, nor are they familiar with this document. Users of the NEC including the enforcement community, rely on Article 695 for all prescriptive electrical requirements necessary. We believe that it is necessary to inform the user of the NEC that an alternate source of electrical power is not required if a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with NFPA 20.

13-71 Log #87 NEC-P13 **Final Action: Reject**
(695.3(B))

Note: This Proposal appeared as Comment 13-125 on Proposal 13-95 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-95 was:
Add new text to read:
695(B)(3) Phase Converters. Where the only source of utility power is a single-power source, a phase converter may be utilized as one of the multiple sources of supply to a three-phase fire pump motor. [Note: Change current B(3) to B(4).]
Submitter: Patrick Gaffney, Ronk Electrical Industries, Inc.
Recommendation: New text as proposed in Proposal 13-95 should be Accepted. "Reliable" sources are defined in 695.3(A). All other sources by definition, are not "reliable", and, therefore, require multiple sources. If no utility supplied three-phase source is available but a single-phase source is, a phase converter could be utilized as one of the "unreliable" multiple sources, either as back-up or primary to the generator source(s). Many rural or suburban areas do not have readily available three-phase sources of utility power available, and at least with a phase converter, they would have a utility supplied source available. Also, the proposal limits their use, by stating "where the only source of utility power is a single-phase source,...".
Substantiation: Generators, unless considered an "on-site power production facility" [per 695.3(A)], are also considered "unreliable" by definition. If multiple sources are required, wouldn't a utility supplied source be preferable to multiple generators? Maintenance of generator systems is not always as it should be, and even if it is, that is not always a guarantee of proper performance. Phase converters at least give the option of using a utility

supplied source as either a back-up (or primary) source to a generator system. Phase converters have been utilized in many pumping systems, including fire pumps, for many decades with success, and are a recognized part of the code (Article 455).

Panel Meeting Action: Reject

Panel Statement: See panel actions and statements on Proposals 13-61 and 13-64. NFPA 20 prohibits the use of phase converters for fire pump service. This requirement is under the purview of the NFPA 20 technical committee and any action on this requirement has to be addressed to the committee.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-72 Log #660 NEC-P13 **Final Action: Reject**
(695.3(B)(1))

Submitter: Harold F. Willman, Colorado Code Consulting

Recommendation: Revise text to read as follows:

(1) Generator Capacity. An onsite generator(s) used to comply with this section shall be of sufficient capacity to <u>indefinitely carry the locked-rotor current of the fire pump motors(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment</u> ~~allow normal starting and running of the motor(s) driving the fire pump(s)~~ while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the onsite generator disconnecting means shall not be required. The requirements of 430.113 shall not apply. [20:9.6.1]

Substantiation: The current text of 695.4(B)(1) requires the overcurrent protective device(s) to be the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment. The generator cannot provide this amount of power if the capacity is only normal starting and running of the motor(s) driving the fire pump(s). Why would the capacity of the generator not be at least equal to the overcurrent protective device requirements? When the generator also supplies other emergency loads with separate transfer switches, the generator should not fail if the fire pump goes into a locked-rotor condition.

Panel Meeting Action: Reject

Panel Statement: Section 9.6.1.1 of NFPA 20-2007 does not require a standby generator to carry locked rotor current indefinitely.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-73 Log #2318 NEC-P13 **Final Action: Reject**
(695.3(B)(1))

Submitter: Dale Rooney, Municipality of Anchorage

Recommendation: Add a second paragraph to read - <u>Where an on-site standby generator also supplies an Emergency System, a legally Required Standby System or both the generator capacity shall not be less than 225% of the fire pump motor plus 100% the calculated loads of the required systems.</u>

Substantiation: The present language, based on NFPA 20, is only intended to insure operation of the fire pump itself and does not recognize the importance of protecting other systems. This prescriptive requirement will provide a margin of safety that will help protect required systems.

Panel Meeting Action: Reject

Panel Statement: Requirements for standby generators supplying emergency and legally required standby systems are addressed in Articles 700 and 701. The substantiation does not provide the technical basis for the recommended sizing requirements.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-74 Log #2909 NEC-P13 **Final Action: Reject**
(695.3(B)(1))

Submitter: Thomas Guida, TJG Services, Inc.

Recommendation: Revise text to read as follows:

695.3(B)(1) Generator Capacity. An onsite generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. ~~A tap ahead of the onsite generator disconnecting means shall not be required. The requirements of 430.113 shall not apply.~~ [**20:**9.6.1]

Substantiation: 695.4(A) requires a dedicated disconnect at the generator source, which implies a tap ahead of the generator disconnecting means is required.

Panel Meeting Action: Reject

Panel Statement: The purpose of not requiring a tap ahead of the generator disconnecting means is so the generator complies with the requirements in Section 445.18 for disconnecting the power from the generator for maintenance purposes. A single disconnect can be installed in the generator and the feeder to the fire pump transfer switch can be supplied from the load side of the generator disconnecting means. See the panel action on Panel Proposal 13-77a.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-75 Log #4043 NEC-P13 **Final Action: Reject**
(695.3(B)(1))

Submitter: Michael Kirchner, Generac Power Systems

Recommendation: Revise text to read as follows:

(1) Generator Capacity. An on-site generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the on-site generator disconnecting means shall not be required. <u>The on-site generator overcurrent protective device(s) for the electric-drive fire pump are not required to be sized for locked-rotor current of the fire pump motor(s). Rather, the circuit components of the alternative source are permitted to be sized according to Article 430, provided they are selected or set to allow instantaneous pickup and running of the fire pump load. The requirements of 430.113 shall not apply.</u>

Substantiation: As a generator manufacturer, we see a significant amount of confusion on this section of code in the market. We receive numerous requests for fire pump breakers on the generator that are mag-only or thermal magnetic breakers sized to carry locked rotor amps indefinitely. We believe that this confusion is caused by the various other statements in 695 seeming to call for this action. In particular, statements like “set to carry indefinitely the sum of locked rotor current” (695.4(B)(1)) and “power circuits shall not have automatic protection against overloads...conductors shall be protected against short circuit only” (695.6(D)) are driving the confusion about breaker(s) sizing from the generator source to the fire pump controller. In general, it is our opinion that the market is not understanding that the requirements from the alternative generator source are significantly different than the utility source.

We are particularly concerned that the market is often using mag-only breakers in fire pump applications. This concerns us because mag-only breakers are only UL listed to be used in motor starters which utilize associated overcurrent protection.

To rectify this confusion, we are requesting that the text that has been in the NEC handbook since 1996 be moved into the code to clarify the codes intent in relative to overcurrent devices from the alternative power source.

Panel Meeting Action: Reject

Panel Statement: In the second to the last sentence in the second paragraph of Section 695.4(B), it is already stated: “Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized according to 430.62 (for motor feeder applications) to provide short circuit protection only,” so adding the recommended text to 695.3(B)(1) is unnecessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-76 Log #1410 NEC-P13 **Final Action: Reject**
(695.3(B)(1) and (3))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text of as follows:

(1) An onsite generator(s) used to comply with this section shall be ~~of sufficient capacity~~ <u>capable of allowing</u> normal starting and running of the motors...”. (remainder unchanged).

(3) The power sources shall be <u>located</u> ~~arranged~~ so that a <u>localized</u> fire <u>or other occurrence</u> at one source <u>is not likely to</u> cause an interruption at the other source <u>or the circuits supplied from it.</u>

Substantiation: Occurrences other than fire should be included. Locations cannot ensure that a fire at one source will not spread to another location. "Likely" is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: The existing text in (1) is the text from Section 9.6.1.1 in NFPA 20-2007 covering "sufficient capacity" and is necessary for continuity between the two documents on this issue. The proposed changes to (3) are specifically dealing with fire at a power source not affecting another source. There was no technical substantiation provided to justify these changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-77 Log #3756 NEC-P13 **Final Action: Accept in Principle**
(695.3(B)(2))

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Replace the text of 695.3(B)(2) with the following:
(2) Feeder Sources. The normal power source to supply a fire pump installation shall be permitted to be a feeder in accordance with a or b [20:9.2.2]:
a. Dedicated Feeder. Where the feeder is dedicated to the fire pump and the feeder derived from a service that is dedicated to the fire pump. b. Multi-Building Campus Style Arrangements. Where installed in accordance with all of the following conditions:
1. The protected building is part of a multi-building campus style arrangement.
2. An additional power source is supplied that is independent of the normal power source
3. It is impractical to supply the normal source of power through arrangement specified in 695.3(A)
4. The arrangement is acceptable to the authority having jurisdiction.
Substantiation: The provisions for 695.3(B) are currently out of sync with the requirements of NFPA 20. Originally in FNPA 20, there were a number of convoluted rules involving feeder sources to fire pumps that were carried over to the NEC. Since that time, the NFPA 20 committee has revised the feeder requirements to be more practical but the NEC provisions have not been revised.

This proposal will replace the current NEC text dealing with feeder sources with text extracted from NFPA 20. The extract reference is shown directly after the main paragraph language in proposed (2).

Item "a" is added to recognize that a fire pump can be supplied by a dedicated service, but through a feeder arrangement. This is what happens each time a service connection specified in 695.3(A)(1) becomes a supervised connection with a disconnect and overcurrent device as recognized in 695.4(B). When the OCP is placed in the circuit, it now becomes a feeder and this new text simply recognizes that as an acceptable source.

Item "b" becomes the multi-building campus arrangement text. In the current NEC, the text requires that you have two feeders for the single normal power source. This need for two feeders is now eliminated from NFPA 20 and the text here can be simplified. The list of items 1 through 4 comes directly from NFPA 20 9.2.2(4).

This greatly simplifies the feeder source requirements and makes it consistent with NFPA 20.

It is important to note that there is an additional 5th provision in NFPA 20 9.2.2 that was not extracted. The provision states: "The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s)."

The rational for not extracting this provision into the NEC is that it creates significant electrical system issues. Keep in mind that that Article 695 requires that devices installed in the circuit dedicated to the fire pump be sized at locked rotor current. So for a 100A fire pump the first overcurrent device upstream would be a 600A circuit breaker. If this 600a circuit breaker was being supplied from an 800a service (which is not impractical a size for a building with a 100A fire pump) – you would have to upsize the entire service to the building just to accommodate the selective coordination aspect of the fire pump. This is a huge expense for absolutely no gain in safety. When would the selectivity requirement add any value? The fire pump controller already handles overloads and even high short circuits that would occur on the fire pump itself. If the actual normal feeder is the source of the fault, selectivity for purposes of the fire pump is irrelevant because either the 600A CB is going to open or the main is going to open. Either way, there is still no normal power to the fire pump.

In short, this provision needs to be removed from NFPA 20 – not extracted into the NEC. The NFPA 20 committee has created a rule that significantly impacts the balance of the electrical system which is outside of their committee scope.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts the recommendation to revise 695.3(B). See the panel action on panel proposal 13-60a. The selective coordination requirement exists as part of the performance requirements in Section 9.2.2 in NFPA 20, and this panel cannot amend those requirements.

(695.4)

Submitter: Code-Making Panel 13,
Recommendation: Revise Section 695.4 to read:
695.4 Continuity of Power.
Circuits that supply electric motor-driven fire pumps shall be supervised from inadvertent disconnection as covered in 695.4(A) or (B).
(A) Direct Connection. The supply conductors shall directly connect the power source to either a listed fire pump controller or listed combination fire pump controller and power transfer switch.
(B) Connection Through Disconnecting Means and Overcurrent Device.
(1) Number of Disconnecting Means.
a. General. A single disconnecting means and associated overcurrent protective device(s) shall be permitted to be installed between the fire pump power source(s) and one of the following: [20:9.1.2]
(1) A listed fire pump controller
(2) A listed fire pump power transfer switch
(3) A listed combination fire pump controller and power transfer switch
b. Feeder Sources. For systems installed under the provisions of 695.3(B)(2) only, additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this Code.
c. On-Site Standby Generator. Where an on-site generator is used to supply a fire pump, an additional disconnecting means and associated overcurrent protective device(s) shall be permitted.
(2) Overcurrent Device Selection. Overcurrent devices shall comply with a or b.
a. Individual Sources. Overcurrent protective device(s)shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. Where the locked rotor current value does not correspond to a standard overcurrent device size, the next standard overcurrent device size shall be used in accordance with 240.6. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).[20:9.2.3.4]
b. On-Site Standby Generators. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized to allow for instantaneous pickup of the full pump room load, but shall not be larger than the value selected to comply with 430.62 to provide short-circuit protection only. [20:9.6.1.1]
(3) Disconnecting Means. All disconnecting devices that are unique to the fire pump loads shall comply with items a through d. [20:9.2.3.1]
a. Features and Location. The disconnecting means shall comply with all of the following:
(1) Be identified as suitable for use as service equipment
(2) Be lockable in the closed position
(3) Not be located within equipment that feeds loads other than the fire pump
(4) Be located sufficiently remote from other building or other fire pump source disconnecting means such that inadvertent operation at the same time would be unlikely
b. Disconnect Marking. The disconnecting means shall be marked "Fire Pump Disconnecting Means." The letters shall be at least 25 mm (1 in.) in height, and they shall be visible without opening enclosure doors or covers. [20:9.2.3.1(5)
c. Controller Marking. A placard shall be placed adjacent to the fire pump controller, stating the location of this disconnecting means and the location of the key (if the disconnecting means is locked). [20:9.2.3.2]
d. Supervision. The disconnecting means shall be supervised in the closed position by one of the following methods: [20:9.2.3.3]
(1) Central station, proprietary, or remote station signal device
(2) Local signaling service that causes the sounding of an audible signal at a constantly attended point
(3) Locking the disconnecting means in the closed position
(4) Sealing of disconnecting means and approved weekly recorded inspections when the disconnecting means are located within fenced enclosures or in buildings under the control of the owner [20:9.2.3.3]
Substantiation: This revision incorporates the concepts contained in the public proposals on which the panel accepted in whole, in part or in principle. The revision provides correlation and proper extract attribution between Article 695 and the recommendation for Chapter 9 in the 2010 edition of NFPA 20 based on the ROP and ROC actions of the NFPA 20 Technical Committee.

Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
CARON, D.: Although I agree with the panel decision and statement, the revised section 695.4 (B)(3) now requires the disconnecting means from an on-site standby generator to comply with the provisions of "sufficiently remote". I do not believe this is the intent of NFPA 20. Additional wording, or an exception should be provided to clarify the requirements for the disconnecting means from an on-site standby generator.

13-78 Log #464 NEC-P13 **Final Action: Accept**
(695.4(A))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Delete text to read as follows:
(A) Direct Connection. The supply conductors shall directly connect the power source to either a listed fire pump controller or listed combination fire pump controller and power transfer switch. ~~Where the power source is supplied by on-site generator(s), the supply conductors shall connect to a generator disconnecting means dedicated for the purposes of serving the fire pump. The disconnecting means shall be located in a separate enclosure from the other generator disconnecting means.~~
Substantiation: The above text (strikethrough) was added to this section during the 2008 NEC process. Unfortunately, it was placed under direct connection and is in conflict with the intent and requirements of the section. The section is specific to a direct connection. Once a disconnecting means is placed in the circuit, it is no longer a direct connection. More appropriately, it is a supervised connection. The requirements for a supervised connection are noted in Section 695.4(B). In addition, the general requirements of the strikethrough text are already noted in subsection (B), so this is redundant text (See Section 695.4(B)(2)). If necessary, this text should have been incorporated into subsection (B) for Supervised Connection.
Panel Meeting Action: Accept

13-80 Log #788 NEC-P13 **Final Action: Reject**
(695.4(A) Exception)

Submitter: Lawrence W. Forshner, Town of Natick
Recommendation: Add an exception at the end of the second paragraph of 695.4(A):
Exception: Individual disconnect enclosures, shall not be required when a single enclosure, factory or field installed, on gen-sets, containing two or more circuit breakers supplying feeders, are equipped with barriers, that provide separation for the load side conductors.
Substantiation: It is common practice to have multiple feeder breakers mounted on the side of Gen-Set alternators. There are space limitations making it difficult to comply with the requirements for separate enclosures. The line side of the multiple feeder disconnects are fed with short feeder tap conductors from a common bus on the generator alternator. They are common in the alternator housing which is the common voltage source. I am in agreement with the addition of 700.9(B (5)c. to the 2008 Code, however, how far back to the source is it practical to require separation. Partitioning on the load side of the breakers, separating the load side feeder conductors, satisfies the intent of this section.
Panel Meeting Action: Reject
Panel Statement: The text added in the 2008 NEC cycle is removed. There is no need for this exception. See panel action on Proposals 13-78 and 13-79.

Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Accept in Principle Public Proposal 13-89.
Substantiation: The Proposer, J. Pauley proposes clarification of extant Article 695.4(B) "Supervised Connection." However, this is extracted text and is part of the Power Supply section which has been completely re-written and submitted as Proposal 13-77. My Public Comment in P13-77 hopes to clarify the new text sufficiently to satisfy the proposer.
Panel Meeting Action: Accept in Principle
Panel Statement: The intent of this recommendation is met by the Panel action on Panel Proposal 13-77a. The panel notes that the revisions made in 13-77a are based on the 2008 edition of the NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-84 Log #465 NEC-P13 **Final Action: Reject**
(695.4(B))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Delete text to read as follows:
For systems installed under the provisions of 695.3(B)(2) only, such additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this Code. ~~Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized according to 430.62 to provide shortcircuit protection only.~~ All disconnecting devices and overcurrent protective devices that are unique to the fire pump loads shall comply with 695.4(B)(1) through (B)(5).
Substantiation: The above text (strikethrough) is unnecessary and in conflict with the last sentence of the paragraph that requires the overcurrent protective device to comply with sections 695.4(B)(1) through (B)(5). In particular, subsection 695.4(B)(1) requires that "The overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply." Allowing any overcurrent protection in the motor circuit that is sized at less than required by this section is a code violation. It can also cause conflicts with selective coordination issues noted in Articles 700 and 701, and conflicts with feeder installations, such as for multibuilding campus-style complexes. In addition, the allowance to size per 430.62 can create a violation when a transformer is inserted into the system too (see Section 695.5(B)) — does the more restrictive requirement for transformers apply or the less restrictive requirement as presently allowed apply? In the interest of consistency in code enforcement, eliminate the confusing and conflicting text of this section. Removing this text will not change minimum code requirements! It will also correlate with requirements of NFPA 20 for Fire Pump Installations.
Panel Meeting Action: Reject
Panel Statement: Section 9.6.1.1 of NFPA 20-2007 does not require a standby generator to carry locked rotor current indefinitely.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-85 Log #2319 NEC-P13 **Final Action: Reject**
(695.4(B))

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Delete the second sentence in the second paragraph which starts with '~~Overcurrent protective devices between and on-site standby generator...~~'

Add a second paragraph to sub-section (B)(1) to read... 'Overcurrent devices between an on-site standby generator and a fire pump controller shall not be smaller than 225 % of the full load current of the fire pump but shall not exceed the maximum permitted by 430.62.
Substantiation: The present language referring to 430.62 provides a maximum size overcurrent device but not a minimum size and creates confusion since the last sentence also refers to sub-part (B)(1). Based on present language any device that exceeds the overload requirements of 430.32 could be construed as meeting the requirement of only providing short current protection. This change will specify a minimum OCP for generator supplied fire pumps and clarify that the locked rotor requirement should not apply to on-site stand-by generators.
Panel Meeting Action: Reject
Panel Statement: The minimum and maximum sizing will be determined by the requirements in 430.62. There was no technical substantiation provided for the 225 percent minimum size overcurrent protective device.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-86 Log #3757 NEC-P13 **Final Action: Accept in Principle**
(695.4(B))

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise 695.4(B) as shown below to read as follows:
(B) Supervised Connection.
(1) Number of Disconnecting Means.
a. General. A single disconnecting means and associated overcurrent protective device(s) shall be permitted to be installed between ~~a remote~~ the fire pump power source(s) and one of the following:
(1) A listed fire pump controller
(2) A listed fire pump power transfer switch
(3) A listed combination fire pump controller and power transfer switch
b. Feeder Sources. For systems installed under the provisions of 695.3(B)(2) only, ~~such~~ additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this Code.
c. On-Site Standby Generator. Where an on-site generator is used to supply a fire pump, an additional disconnecting means and associated overcurrent protective device(s) shall be permitted to be located on or at the generator.
(2) Overcurrent Device Selection.
a. General. ~~The overcurrent~~ Overcurrent protective device(s), other than those installed between the on-site generator and the fire pump controller or fire pump transfer switch, that are unique to the fire pump loads shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. Where the locked rotor current value does not correspond to a standard overcurrent device size, the next standard overcurrent device size shall be used in accordance with 240.6. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).
b. On-Site Standby Generators. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized to allow for instantaneous pickup of the full pump room load, but shall not be larger than the value selected to comply with ~~according to~~ 430.62 to provide short-circuit protection only.
(3) Disconnecting Means. All disconnecting devices ~~and overcurrent protective devices~~ that are unique to the fire pump loads shall comply with items a through d. ~~695.4(B)(1) through (B)(5).~~
a. ~~(2)~~ **Features and Location.** [keep existing 2008 text from 695.4(B)(2)]
b. ~~(3)~~ **Disconnect Marking.** [keep existing 2008 text from 695.4(B)(3)]
c. ~~(4)~~ **Controller Marking.** [keep existing 2008 text from 695.4(B)(4)]
~~(5)~~ **Supervision.** [keep existing 2008 text from 695.4(B)(5)]
Substantiation: The objective of this proposal is to provide the user with an easier means to find the rules applicable to a supervised disconnect and overcurrent device. The current language of 695.4(B) mixes the following elements in an unclear manner:
1) Number of disconnecting means allowed (B – main paragraph)
2) Overcurrent protection for generator supplied circuits (B – last paragraph)
3) Feeder requirements (B – last paragraph)
4) Overcurrent protection (again) – (B)(1)
5) Disconnecting means features and markings (B)(2), (3), (4) and (5)

The user is left with a few potential conflicts and some gaps to fill. For example, the requirement for generator OCP sizing is in conflict with (B)(1) – which applies. It is unclear whether the "single disconnecting means" requirement includes or excludes a disconnect that may be on the generator itself.

The proposal is an effort to rearrange the material to make it more usable and remove the perceived conflicts. Titles have been provided to better direct the user to the specific rule they are looking for. In the existing text, it is very difficult to even find the requirement for sizing the overcurrent devices between the stand-by gen set and the FP controller because it is buried in a paragraph at the end of 695.4(B) main text, even though the issue deals with OCP sizing which is covered in (B)(1).

Here is a synopsis of the changes:

1) The requirements are split into three basic sets of rules. Those for the number of disconnecting means, those for the overcurrent protection and those for the disconnecting means itself. They are split in this manner to avoid having more than three levels of subdivision which is prohibited in the style manual.

2) Number of disconnecting means is split into the General Requirements and uses the existing text from 695.4 (B). The words "remote" were deleted from the source because it is redundant. All sources are remote unless the electric fire pump generates its own power.

3) The "Feeder Source" provisions that were in the last paragraph of 695.4(B) are now their own sublevel and the text from the existing code is used. The word "such" is deleted because it is no longer needed since the text is in its own identified rule.

4) A new item "c" is added to clarify that the "single disconnecting means" is not intended to prohibit the on-site generator from having its own disconnect. This is a point of confusion today. If you interpret the current language literally, a disconnect would not be permitted downstream of the generator supplied disconnect. The general interpretation today is that the "single disconnecting means" referred to in the main rule is in addition to a disconnect at the generator.

5) Proposed (B)(2) is intended to cover the rules applicable to overcurrent protective devices. The main rule in item "a" is the existing rule requiring that the OCP be sized to carry locked rotor current. The additional underlined wording in this rule is to eliminate the conflict between locked rotor sizing and 430.62 sizing for the generator circuit OCP. In addition the words "that are unique to the fire pump loads" come from the last sentence of 695.4(B) last sentence. Text is also added to clarify the requirement to round up to the next standard overcurrent device. Currently, the text just says use the next standard size – what if the LRC equals a standard size? The revision applies the rule as it is applied elsewhere – if the calc results in a nonstandard size, you round up.

6) New item (B)(2)b is a relocation of the text from the second sentence of existing 695.4(B) last paragraph regarding the sizing of the OCP in the generator circuits. A revision has been made to this text to pick up the requirement in NFPA 20 [9.6.5] that the OCP in the generator circuit be sized to pick up the instantaneous pump room load. However, the maximum sizing of the OCP should still be directed by the reference to 430.62 as in the present code.

7) New item (B)(3) is to pick up all of the rules associated with the Disconnecting Means itself. The main paragraph is the text from the last sentence of the last paragraph of 695.4(B). The text has been modified to remove the reference to overcurrent protection since it is now covered in (B)(2).

8) The existing 695.4(B) (2), (3), (4) and (5) now become items a, b, c and d under new item (3). Since all of these rules deal with the disconnecting means in some manner, this relocation is appropriate. The text from the 2008 NEC remains in all of these sections. The title "Features and Location" was chosen for item "a" because the list of items apply to the features expected of the disconnect and the location of the disconnect.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on panel proposal 13-77a meets the intent of the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-87 Log #91 NEC-P13 **Final Action: Accept in Principle**
(695.4(B)(1))

Note: This Proposal appeared as Comment 13-129 on Proposal 13-90 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-90 was:
Revise as follows:
Overcurrent Device Selection. The overcurrent protective device shall be selected or set to carry indefinitely the sum of the locked rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The next standard overcurrent device shall be used in accordance with 240.6.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.

Technical Correlating Committee understands that the Panel Action was to add a new second sentence in 695.4(B)(1) and the existing second sentence now becomes the third sentence.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on panel proposal 13-77a meets the intent of the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-88 Log #1267 NEC-P13 **Final Action: Accept in Principle**
(695.4(B)(1))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:
695.4(B) **Supervised Connection.** A single disconnecting means and associated overcurrent protective devices(s) shall be permitted to be installed between a remote power source and one of the following:
~~(1)~~ a. A listed fire pump controller
~~(2)~~ b. A listed fire pump power transfer switch.
~~(3)~~ c. A listed combination fire pump controller and power transfer switch.
Substantiation: It was discovered in class that if you were to reference section 695.(4)(B)(1), a NEC user would have two places with the same section identifiers. If the list items under 695.4(B) are changed to small case letters as was done in 240.4(D)(1)(2)(a.-c.) it would eliminate this confusion.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on panel proposal 13-77a meets the intent of the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-89 Log #4473 NEC-P13 **Final Action: Reject**
(695.4(B)(1))

Submitter: Darrel Miller, LSW Engineers Arizona, Inc.
Recommendation: Revise text to read as follows:
695.4(B)(1) Overcurrent Device Selection. The overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The next standard overcurrent device shall be used in accordance with 240.6. The requirement to carry the locked-rotor currents indefinitely shall only ~~not~~ apply to ~~conductors or devices other than~~ overcurrent devices in the fire pump motor circuit(s). Where the alternate source is an on-site standby generator, the alternate source disconnecting means and the alternate source overcurrent protective device(s) for the electric-drive fire pump shall not be required to be sized for locked-rotor current of the fire pump motor(s).
Substantiation: NFPA 20 (2007 edition) handles the “normal” supply and the “alternate” supply differently than NFPA 70-article 695. NFPA 20-9.2 deals with the requirements for the “Normal Power”, while 9.3 deals with the “Alternate Power”. NFPA 70 article 695 has been updated to better align with the requirements listed in NFPA 695 over the last couple of code cycles and has generally accomplished that. However, NFPA 70 article 695 has overlooked the paragraph hierarchy in NFPA 20, 9.2 and 9.3 and lumped all the requirements for the “normal” and “alternate” power into a single set of requirements. This has effectively lost the intention set forth in NFPA 20, 9.2 & 9.3.
Specifically, NFPA 20, 9.2.3.4 indicates the normal source …”overcurrent protective device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full load current of the associated fire pump accessory equipment.” NFPA 20, 9.3 applying to the alternate source does not contain the locked-rotor sizing requirement.
The NEC 2008 Handbook supports the position of NFPA 20, refer to handbook page 1093, 695.3(B)(1) comment.
To align NFPA 70 with NFPA 20, NEC-695.4(B)(1) should be changed as proposed.
Panel Meeting Action: Reject
Panel Statement: The intent of the recommendation is met by the existing requirements in Section 695.4(B)(1).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-90 Log #4474 NEC-P13 **Final Action: Reject**
(695.4(B)(1))

Submitter: Darrel Miller, LSW Engineers Arizona, Inc.
Recommendation: Revise text to read as follows:
695.4(B)(1) Overcurrent Device Selection. The overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The next standard overcurrent device shall be used in accordance with 240.6. The requirement to carry the locked-rotor currents indefinitely shall only ~~not~~ apply to ~~conductors or devices other than~~ overcurrent devices in the fire pump motor circuit(s). Where the alternate source is an on-site standby generator, the alternate source disconnecting means and the alternate source overcurrent protective device(s) for the electric-drive fire pump shall not be required to be sized for locked-rotor current of the fire pump motor(s).
Substantiation: This section has regionally been a challenge since there are conflicts between the applicable standards. NFPA 20 (2007 edition) handles the “normal” supply and the “alternate” supply differently than NFPA 70 article 695. NFPA 20-9.2 deals with the requirements for the “Normal Power”, while 9.3 deals with the “Alternate Power” which is further defined in 9.6 “On-Site Standby Generator Systems”. NFPA 70 article 695 has been updated to better align with the requirements listed in NFPA 695 over the last couple of code cycles and has generally accomplished that. However, NFPA 70 article 695 has overlooked the paragraph hierarchy in NFPA 20, 9.2 and 9.3 and lumped all the requirements for the “normal” and “alternate” power into a single set of requirements. This has effectively lost the intention set forth in NFPA 20, 9.2 & 9.3 which is further supported in 9.6.5.
Specifically, NFPA 20, 9.2.3.4 indicates the normal source …”overcurrent protective device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full load current of the associated fire pump accessory equipment.” NFPA 20, 9.3 applying to the alternate source does not contain the locked-rotor sizing requirement.
NFPA 20, 9.6.5 states “where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load.” This specific requirement makes no mention of sizing protective device(s) to handle continuously the lock-rotor current of the fire pump motor(s).
The NEC 2008 Handbook supports the position of NFPA 20, refer to handbook page 1093, 695.3(B)(1) comment.
The proposed text will better align NFPA 70 with NFPA 20.
Panel Meeting Action: Reject
Panel Statement: The intent of the recommendation is met by the existing requirements in Section 695.4(B)(1).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-91 Log #92 NEC-P13 **Final Action: Reject**
(695.4(B)(2)(3))

Note: This Proposal appeared as Comment 13-130 on Proposal 13-91 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-91 was:
Revise as follows:
Overcurrent Device Selection. The overcurrent protective device shall be selected or set to carry indefinitely the sum of the locked rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The next standard overcurrent device shall be used in accordance with 240.6.
Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Add text to read as follows:
Exception: In industrial establishments, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, a metal clad disconnecting means may be located within equipment that feeds loads other than the fire pump if the other provisions of 695.4 (B)(2) are met.
Substantiation: The original comment was modified to include the requirement for metal clad equipment addressing the need for a secure enclosure. The addition of separate switchgear, cable/bus, six cable terminators and bus connections to meet the “not located within equipment that feeds other loads...” requirement added in 2005 actually lowers the installation’s reliability in these industrial installations since additional equipment must be connected to the bus.
Panel Meeting Action: Reject
Panel Statement: The purpose of the existing text in 695.4(B)(2)(3) is to provide separation for the fire pump disconnect from equipment supplying other loads. This requirement provides increased reliability for the fire pump circuit because an incident within a shared equipment enclosure could affect adversely impact the overcurrent protective device for the fire pump.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
DEGNAN, J.: The term “metalclad” has limited industry understanding, a better term is “Metal Enclosed Switchgear”, as defined by UL 1558. The submitter(or others) is(are) encouraged to submit additional information during the comment stage documenting the following: 1) Provide supporting material clarifying the construction benefits of metal enclosed switchgear, with photographic information showing the construction standard for separation of vertical sections and isolation of devices within vertical sections. 2) Photographic or infrared information demonstrating the potential for error with field fabricated separation of devices, including taps, splices, etc versus the quality assurance that comes with factory assembled equipment. 3) Other

reliability or field performance data supporting metal enclosed switchgear. 4) Alternative proposals that are not restricted to industrial establishments. 5) Comparative information between the reliability of factory assembled equipment vs field fabrications.

MOUTON, C.: I'm voting against the panel action, the panel action should have been to accept in principle. The proposal intends to increase the reliability to fire pumps by eliminating components subject to failure that will reduce the overall reliability of the power supply to the fire pump. The panel action should have been accept in principle with an addition in wording to address the concern for common mode failure of two disconnect devices being in a common vertical section. To address this concern, the Exception should be reworded to include the words "located in a separate dedicated vertical section" so as to ensure that the fire pump disconnect is not adversely affected by an incident on another feeder in the equipment.

13-92 Log #1409 NEC-P13 **Final Action: Reject**
(695.4(B)(2)(3) and (4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

(3) Not be located within enclosures that contain equipment or conductors ~~that feeds loads other than~~ not associated with the fire pump.

Delete (B)(2)(4).

Substantiation: All equipment and conductors whether or not feeding other loads should be included in (3). The disconnecting means is required to be marked and lockable, and those provisions make inadvertent (accidental) operation very unlikely. "Sufficiently" is subjective and a term to be avoided per the Style Manual. "...at the same time does not necessarily mean simultaneously; one PM on Monday is the same time as one PM on Tuesday.
Panel Meeting Action: Reject
Panel Statement: Section 695.4(B)(2) applies to disconnecting means, not conductors or other equipment therefore the proposed changes are not appropriate for the text in this section.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-93 Log #3973 NEC-P13 **Final Action: Reject**
(695.4(B)(2)(4))

Submitter: Justin B. Biller, Roanoke County Office of Building Safety / Rep. NFPA Building Code Development Committee (BCDC)
Recommendation: Add new text as follows:

695.4 Continuity of Power.

Circuits that supply electric motor-driven fire pumps shall be supervised from inadvertent disconnection as covered in 695.4(A) or 695.4(B)....

...(2) Disconnecting Means. The disconnecting means shall comply with all of the following:

(1) Be identified as suitable for use as service equipment
(2) Be lockable in the closed position
(3) Not be located within equipment that feeds loads other than the fire pump
(4) Be located sufficiently remote by a minimum distance of 1.8 m (6 ft) from other building or other fire pump source disconnecting means such that inadvertent contemporaneous operation at the same time would be unlikely

Substantiation: The current language in these sections is vague and permits a large variation of interpretations from AHJs on what would be considered remote. By codifying a specific distance, the code user and enforcers can apply specific language to determine remoteness of disconnects to ensure that fire pumps, emergency systems, legally required or optional standby power systems are not inadvertently operated simultaneously. The use of 1.8 m or 6 ft is somewhat arbitrary, but would be considered an acceptable distance for an individual that would be servicing equipment or an emergency responder to be unable to physically operate both sets of disconnects. This proposal is also intended to establish dialogue for the code-making panel to consider alternative minimum dimensions based on other quantifiable data.

See also similar proposal to 230.72(B).

Panel Meeting Action: Reject
Panel Statement: There is insufficient technical substantiation to support the minimum 6-foot distance. Establishing a particular distance, noted in the substantiation as an arbitrary distance, would then require exceptions to take into consideration architectural appurtenances, landscaping, and other installation differences for the fire pump disconnecting means. The existing text here is consistent with the text in 230.72(B) for separation of the fire pump disconnect from other service disconnecting means.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-94 Log #93 NEC-P13 **Final Action: Reject**
(695.4(B)(2)(b))

Note: This Proposal appeared as Comment 13-131 on Proposal 13-89 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-89 was:

Revise 695.4(B) as shown below to read as follows:

(B) Supervised Connection.

(1) Number of Disconnecting Means.

a. General. A single disconnecting means and associated overcurrent protective device(s) shall be permitted to be installed between ~~a remote~~ the fire pump power source(s) and one of the following:

(1) A listed fire pump controller
(2) A listed fire pump power transfer switch
(3) A listed combination fire pump controller and power transfer switch

b. Feeder Sources. For systems installed under the provisions of 695.3(B)(2) only, ~~such~~ additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this Code.

c. On-Site Standby Generator. Where an on-site generator is used to supply a fire pump, an additional disconnecting means and associated overcurrent protective device(s) shall be permitted to be located on or at the generator.

(2) Overcurrent Device Selection.

a. General. ~~The overcurrent~~ Overcurrent protective device(s), other than those installed between the on-site generator and the fire pump controller or fire pump transfer switch, that are unique to the fire pump loads shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

b. On-Site Standby Generators. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized to allow for instantaneous pickup of the full pump room load, but shall not be larger than the value selected to comply with ~~according to~~ 430.62 to provide short-circuit protection only.

(3) Disconnecting Means. All disconnecting devices ~~and overcurrent protective devices~~ that are unique to the fire pump loads shall comply with items a through d. ~~695.4(B)(1) through (B)(5).~~

a. ~~(2)~~ Features and Location. [keep existing 2005 text]
b. ~~(3)~~ Disconnect Marking. [keep existing 2005 text]
c. ~~(4)~~ Controller Marking. [keep existing 2005 text]
d. ~~(5)~~ Supervision. [keep existing 2005 text]

Submitter: Lawrence A. Bey, Cummins Power Generation
Recommendation: Change "full pump room load" to "fire pump" so that the clause reads: "sized to allow for instantaneous pickup of the fire pump" (same wording to the end of the sentence).
Substantiation: Each fire pump is required to have a dedicated transfer switch and other loads are not allowed to be connected to it. Therefore, the generator feeder overcurrent device is sized based on the fire pump only. Where there are additional fire pump rooms loads (jockey pumps, lighting, etc.), they must be served by a separate feeder and transfer switch.
Panel Meeting Action: Reject
Panel Statement: In Section 695.4(B)(2), the overcurrent protection device unique to the fire pump loads include the fire pump motor or motors, the pressure maintenance pump motor, plus associated fire pump accessory equipment. Only the locked rotor size requirement applies to the fire pump, but the overcurrent device must be able to handle the fire pump and accessory loads.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-95 Log #94 NEC-P13 **Final Action: Reject**
(695.4(B)(3))

Note: This Proposal appeared as Comment 13-132 on Proposal 13-89 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-89 was:

Revise 695.4(B) as shown below to read as follows:

(B) Supervised Connection.

(1) Number of Disconnecting Means.

a. General. A single disconnecting means and associated overcurrent protective device(s) shall be permitted to be installed between ~~a remote~~ the fire pump power source(s) and one of the following:

(1) A listed fire pump controller
(2) A listed fire pump power transfer switch
(3) A listed combination fire pump controller and power transfer switch

b. Feeder Sources. For systems installed under the provisions of 695.3(B)

(2) only, ~~such~~ additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this Code.
c. On-Site Standby Generator. Where an on-site generator is used to supply a fire pump, an additional disconnecting means and associated overcurrent protective device(s) shall be permitted to be located on or at the generator.
(2) Overcurrent Device Selection.
a. General. ~~The overcurrent~~ Overcurrent protective device(s), other than those installed between the on-site generator and the fire pump controller or fire pump transfer switch, that are unique to the fire pump loads shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).
b. On-Site Standby Generators. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized to allow for instantaneous pickup of the full pump room load, but shall not be larger than the value selected to comply with ~~according to~~ 430.62 to provide short-circuit protection only.
(3) Disconnecting Means. All disconnecting devices ~~and overcurrent protective devices~~ that are unique to the fire pump loads shall comply with items a through d. ~~695.4(B)(1) through (B)(5).~~
a. ~~(2)~~ Features and Location. [keep existing 2005 text]
b. ~~(3)~~ Disconnect Marking. [keep existing 2005 text]
c. ~~(4)~~ Controller Marking. [keep existing 2005 text]
d. ~~(5)~~ Supervision. [keep existing 2005 text]
Submitter: Lawrence A. Bey, Cummins Power Generation
Recommendation: Change “All disconnecting devices” to “All disconnecting devices except standby generator disconnects” (same wording to the end of sentence).
Substantiation: Confusion exists between service supplied feeders and on-site generator set feeders. Use of the term “all disconnects” in this section is read by some to apply to both. The intent of Proposal 13-89 is to clear up the confusion, but it does not address this point.
Panel Meeting Action: Reject
Panel Statement: The proposal provided no substantiation to exclude the on-site generator disconnect from compliance with the four provisions to be suitable for use as service equipment, be lockable in the closed position, not be located within equipment supplying other loads, and be located sufficiently remote preventing inadvertent disconnection. See the panel action and statement on panel proposal 13-60a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
DEGNAN, J.: See panel proposal 13-77a which addresses 695.4, “accept in part” may be a more accurate assessment of the panel’s action.

13-95a Log #CP1302 NEC-P13 **Final Action: Accept**
(695.6)

TCC Action: The Technical Correlating Committee directs that the panel clarify the location of the Fine Print Note from existing 695.6(B).
This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 13,
Recommendation: Revise Section 695.6(A) to read:
(A) Supply Conductors.
(1) Services and On-Site Power Production Facilities. Service conductors and conductors supplied by on-site power production facilities shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with 230.6, 230.9 and Parts III and IV of Article 230. Where supply conductors cannot be physically routed outside of buildings, the conductors shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
(2) Feeders. Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) or conductors that connect directly to an on-site standby generator shall comply with all of the following:
a. Independent Routing. The conductors shall be kept entirely independent of all other wiring.
b. Associated Fire Pump Loads. The conductors shall supply only loads that are directly associated with the fire pump system.
c. Protection from Potential Damage. The conductors shall be protected from potential damage by fire, structural failure, or operational accident.
d. Inside a Building. When routed through a building, the conductors shall be installed using one of the following methods:
(1) Be encased in a minimum 50 mm (2 in.) of concrete
(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and dedicated to the fire pump circuit(s).
(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating

Exception to (A)(2)(d): The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 2-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.
(3) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.3(B)(2), all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
Exception to (A)(3): Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement for routing outside of the building(s) shall apply only to those conductors on the load side of that point of automatic connection between sources.
Delete existing 695.6(B) and renumber the existing (C) through (H) to become (B) through (G).
Substantiation: This revision incorporates the concepts contained in the public proposals on which the panel accepted in whole, in part or in principle. The revision provides correlation and proper extract attribution between Article 695 and the recommendation for Chapter 9 in the 2010 edition of NFPA 20 based on the ROP and ROC actions of the NFPA 20 Technical Committee.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
CARON, D.: Although I agree with the Panel decision and statement, the language in 695.6 (A)(3) could be interpreted to require the normal feeder for the fire pump, under a multi-building campus style arrangement, to be encased in concrete all the way to the fire pump controller. In the case where a disconnecting means is provided under (the proposed) 695.4 (B) (see Proposal 13-77a), it should be clarified that the feeder from this disconnecting means to the fire pump can be installed in accordance with (the proposed) 695.6 (A)(2)d. (see proposal 13-60a).

13-96 Log #95 NEC-P13 **Final Action: Accept in Principle**
(695.6)

Note: This Proposal appeared as Comment 13-133 on Proposal 13-97 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-97 was:
Revise 695.6(A) as shown below:
~~(A) Service~~ Supply Conductors.
(1) Services and On-Site Power Production Facility. Service conductors and s~~upply~~ conductors supplied by an on-site power production facility shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with Article 230. Where supply conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
(2) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.3(B)(2), ~~this requirement shall apply to~~ all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
Exception to (A)(2): Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement for routing outside of the building(s) shall apply only to those conductors on the load side of that point of automatic connection between sources.
(3) Supervised or On-Site Standby Generator Connections. ~~(B) Circuit Conductors.~~ Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) or conductors that connect directly to an on-site generator shall comply with all of the following:
(1) a. Independent Routing. The conductors shall be kept entirely independent of all other wiring.
(2) b. Associated Fire Pump Loads. ~~They~~ The conductors shall supply only loads that are directly associated with the fire pump system.
(3) c. Protection from Potential Damage. ~~, and they~~ The conductors shall be protected to resist potential damage by fire, structural failure, or operational accident.
(4) d. Inside a Building. When routed through a building, ~~they~~ the conductors shall be installed ~~be permitted to be routed through a building(s)~~ using one of the following methods:
(1) Be encased in a minimum 50 mm (2 in.) of concrete
(2) Be within an enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 1-hour fire resistive rating

(3) Be a listed electrical circuit protective system with a minimum 1-hour fire rating

Exception to (3)(d): The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.

In addition,

Delete 695.6(B)

Renumber the existing (C) through (H) to become (B) through (G).

Submitter: Jim Pauley, Square D Company

Recommendation: The panel should reconsider and Accept the Proposal.

Substantiation: The proposal provides a logical rearrangement of the existing material making it easier to use. Rather than attempt a complete rewrite at the comment stage, the better path would be to accept proposal the clean up the language and arrangement in the existing Article 695. This proposal would help to reduce a number of questions that arise from the present text.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action on panel proposal 13-95a meets the intent of the recommendation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-97 Log #4392 NEC-P13 **Final Action: Accept in Principle**

(695.6)

Submitter: John R. Kovacik, Underwriters Laboratories Inc.

Recommendation: Add new paragraphs (I) and (J) to existing 695.6 as follows;

695.6 Power Wiring.

Power circuits and wiring methods shall comply with the requirements in 695.6(A) through (H) (K), and as permitted in 230.90(A), Exception No. 4; 230.94, Exception No. 4; 240.13; 230.208; 240.4(A); and 430.31. (Remainder unchanged)

(I) Listed Electrical Circuit Protective System to Controller Wiring. Where single conductors (individual conductors) are used, the following requirements shall be met:

(1) The conductors shall be terminated in a separate junction box. Single conductors (individual conductors) shall not enter the fire pump enclosure separately.

(2) Where required by the manufacturer of a listed electrical circuit protective system or by the listing, or as required elsewhere in this Code, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and in accordance with the instructions of the manufacturer.

(3) Standard wiring between the junction box and the controller shall be permitted.

(J) Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met:

(1) The junction box shall be securely mounted.

(2) Mounting and installing of a junction box shall not violate the enclosure type rating of the fire pump controller(s).

(3) Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the short circuit rating of the controller(s).

(4) As a minimum, a Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed to match the fire pump controller enclosure type rating.

(5) Terminals, junction blocks, and splices, when used, shall be listed.

(K) Raceway Terminations. Where raceways are terminated at a fire pump controller, the following requirements shall be met:

(1) Listed conduit hubs shall be used.

(2) The type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

(3) The installation instructions of the manufacturer of the fire pump controller shall be followed.

(4) Alterations to the fire pump controller, other than conduit entry as allowed elsewhere in this Code, shall be approved by the authority having jurisdiction.

Substantiation: The added text represents electrical installation requirements from NFPA 20, Standard for the Installation of Stationary Pumps for Fire Protection. The text is essentially verbatim from NFPA 20, Sections 9.3.6, 9.3.7 and 9.3.8. These installation requirements are needed to supplement those already in Article 695.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(I) Listed Electrical Circuit Protective System to Controller Wiring. Electrical circuit protective system installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used and the following:

(1) A junction box shall be installed ahead of the fire pump controller a minimum of 12 in. beyond the fire-rated wall or floor bounding the fire zone.

(2) Where required by the manufacturer of a listed electrical circuit protective system or by the listing, or as required elsewhere in this *Code*, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and in accordance with the instructions of the manufacturer. [**20:**9.8.2]

(3) Standard wiring between the junction box and the controller shall be permitted. [**20:**9.8.3]

(J) Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met:

(1) The junction box shall be securely mounted. [**20:**9.7(1)]

(2) Mounting and installing of a junction box shall not violate the enclosure type rating of the fire pump controller(s). [**20:**9.7(2)]

(3) Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the short circuit rating of the controller(s). [**20:**9.7(3)]

(4) As a minimum, a Type 2, drip-proof enclosure (junction box) shall be used where installed in the fire pump room. The enclosure shall be listed to match the fire pump controller enclosure type rating. [**20:**9.7(4)]

(5) Terminals, junction blocks, wire connectors, and splices, where used, shall be listed. [**20:**9.7(5)]

(6) A fire pump controller or fire pump power transfer switch, where provided, shall not be used as a junction box to supply other equipment, including a pressure maintenance (jockey) pump(s).

(K) Raceway Terminations. Where raceways are terminated at a fire pump controller, the following requirements shall be met: [**20:**9.9]

(1) Listed conduit hubs shall be used. [**20:**9.9.1]

(2) The type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller. [**20:**9.9..2]

(3) The installation instructions of the manufacturer of the fire pump controller shall be followed. [**20:**9.9.3]

(4) Alterations to the fire pump controller, other than conduit entry as allowed elsewhere in this *Code*, shall be approved by the authority having jurisdiction. [**20:**9.9.4]

Revise existing 695.6(F) to read:

(F) Loads Supplied by Controllers and Transfer Switches. A fire pump controller and fire pump power transfer switch, where provided, shall not serve any load other than the fire pump for which it is intended.

Panel Statement: The panel action adds requirements from existing Section 695.6(F) to the recommendation for clarity. Revisions for compliance with the NEC Style Manual have been made. The panel action incorporates the parent text and item (1) as recommended in Proposal 13-105 into Section 695.6(I). The panel notes that the extract references are based on the recommended actions by the NFPA 20 Technical Committee in their ROP and ROC actions for the 2010 edition of that standard.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-98 Log #2675 NEC-P13 **Final Action: Accept in Part**

(695.6(A))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise:

~~SERVICE~~ SUPPLY CONDUCTORS. Where practicable, supply conductors shall be physically routed outside a building or structure and shall be installed as service conductors ~~in accordance with 230.6, 230.9 and Parts III and IV of article 230~~. (remainder unchanged).

Substantiation: Edit. The supply conductors may not be service conductors. “Where practical” removes a conflict between the first and second sentence. The provision should apply to structures not deemed “buildings” and not be limited to installation as service-entrance conductors but include other supply conductors such as service laterals. All applicable provisions of Article 230 should apply, as inferred by the requirement to be installed as service conductors. The heading should be “Supply” since that includes conductors supplied by other than services. (695.3(A)(2) and (B)(1)).

Panel Meeting Action: Accept in Part

Accept the change from “Service Conductors” to “Supply Conductors” in the title to (A) and reject the remainder of the proposal.

Panel Statement: There is not a conflict between the first sentence and the second sentence. The first sentence states the conductors must be routed outside the building. If that is not possible, then the conductors must be installed under 2 in. of concrete inside the building encased in 2 in. of concrete or brick. Adding “where practicable” to the first sentence could cause confusion to the user. The suggested deletion of the references to Sections 230.6 and 230.9 and Parts III and IV of Article 230 were not deleted since these references are necessary to provide installation requirements to treat these conductors, even though the conductors may be feeders, as service conductors. Structure was not accepted since there was no technical substantiation provided to include structures in these requirements. The intent is to protect the fire pump supply conductors to and through the building to ensure operation of the fire pump for people safety.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-99 Log #3746 NEC-P13 **Final Action: Accept in Principle**
(695.6(A))

Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise 695.6(A) as shown below:
~~(A) Service~~ Supply Conductors.
(1) Services and On-Site Power Production Facility. Service conductors and s~~upply~~ conductors supplied by an on-site power production facility shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with 230.6, 230.9 and Parts III and IV of Article 230. Where supply conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
(2) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.3(B)(2), ~~this requirement shall apply to~~ all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
Exception to (A)(2): Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement for routing outside of the building(s) shall apply only to those conductors on the load side of that point of automatic connection between sources.
(3) Supervised or On-Site Standby Generator Connections. ~~(B) Circuit Conductors.~~ Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) or conductors that connect directly to an on-site generator shall comply with all of the following:
(1) a. Independent Routing. The conductors shall be kept entirely independent of all other wiring.
(2) b. Associated Fire Pump Loads. ~~They~~ The conductors shall supply only loads that are directly associated with the fire pump system.
(3) c. Protection from Potential Damage. ~~, and they~~ The conductors shall be protected to resist potential damage by fire, structural failure, or operational accident.
(4) d. Inside a Building. When routed through a building, ~~they~~ the conductors shall be installed ~~be permitted to be routed through a building(s)~~ using one of the following methods:
(1) Be encased in a minimum 50 mm (2 in.) of concrete
(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and dedicated to the fire pump circuit(s).
(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating
Exception to (3)d: The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.
In addition,
Delete existing 695.6(B) and renumber the existing (C) through (H) to become (B) through (G).
Substantiation: The objective of this proposal is intended to rearrange the material in 695.6(A) and (B) to make it clear to the user how the rules apply. The present text mixes rules for service conductors (the first two sentences of 695.5(A)) with feeder rules (last sentence of 695.6(A)) and then has "other conductors" in item (B). This creates confusion because the exception in (A) deals with feeders only (because it applies on the load side of the automatic connection), but is located in a manner that is being interpreted to apply to service conductors.
The rearrangement breaks the paragraph into services, multi-building campus applications and finally supervised connections. The following is a summary of the changes:
1) The wording has been revised to specifically apply (1) to both service conductors and the conductors from an on-site power production facility. This clears up the confusion in the present text where the title says "service conductors", but the text starts out with "supply conductors". It would appear that the conductors in question are either service conductors, supply conductors from an on-site supply (which are not service conductors by definition).
2) The campus distribution provision is broken out into its own section and given a title. Feeders which are covered in (A)(2) for the campus style distribution permission in 695.3(B)(2) or feeders covered by 695.6(B) which are on the load side of the supervised disconnect. In addition, since these are by definition feeder conductors so a reference has been added to Article 225 to ensure that the wiring methods and installation are covered. Finally, a sentence has been added to allow routing through the building in accordance with 230.6(1) or (2) to parallel the provision for services.
3) The exception is now placed under (A)(2) and is modified to specifically note what it applies to. The wording "for routing outside of the building" has been added to make it clear what is being "excepted" by the exception.
4) The old 695.6(B) now becomes 695.6(A)(3) so that all of the conductor routing rules appear in a single subsection. Text has been added to the main paragraph to make it clear that the provisions not only apply on the load side of the final disconnecting means, but also to the conductors that connect directly to a gen set that has no overcurrent protection. Article 445 would allow a direct connection to the generator if the conductors are sized at 115% of the full load current. Presently it is not clear what should be done with the conductors from a generator. In addition, the revision applies to "direct connection" since the assumption would be that a gen set that has OCP and a disconnect would already be covered by the language "on the load side of the final disconnecting means".
5) The main paragraph presently contains four separate provisions (independent routing, associated loads, protection from damage and routing inside a building) that are applicable to these conductors. The revision breaks these elements out into separately numbered items so that they are clearly identified.
6) The exception modified to make it clear that it applies to (3)(d) which covers the 1 hour fire rating issue.
7) 695.6(B) is deleted because it is now part of (A)(3) and the remaining sections are renumbered.
Panel Meeting Action: Accept in Principle

(2) Be within an enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 1-hour fire resistive rating
(3) Be a listed electrical circuit protective system with a minimum 1-hour fire rating
Exception to (3)(d): The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.
In addition,
Delete 695.6(B)
Renumber the existing (C) through (H) to become (B) through (G).
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Revise text to read as follows:
Re-consider Accepting, or Accept in Principle or Accepting In Principle in Part Proposal 13-97. However, do not completely eliminate extant 695.6(B) “Conductor Size.”
Substantiation: This Proposal was considered by the panel to be part of the consolidation of Public Proposals on sections of Article 695 into the rewrite of Proposal 13-77 in error. This largely my oversight. In fact, these clauses are not extract text. Note that extant section 695.6 changes to 695.7 under the 13-77 re-write. This section is otherwise untouched by 13-77. The information in extant 695.6(B)(1) regarding other loads is vital. The Voltage Drop information in 695.6(B)(2) is also important since this is a very frequent problem with the Transformer Connection and also with the Alternate Supply.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on panel proposal 13-95a meets the intent of the original recommendation.
Number Eligible to Vote: 14

13-102 Log #2910 NEC-P13 **Final Action: Reject**
(695.6(B))

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Revise text to read as follows:
695.6(B) Circuit Conductors. Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) shall be kept entirely independent of all other wiring. They shall supply only loads that are directly associated with the fire pump system, and they shall be protected to resist potential damage by fire, structural failure, or operational accident. They shall be permitted to be routed through a building(s) using one of the following methods:
(1) Be encased in ~~a minimum 50 mm (2 in.) of~~ concrete **with a sufficient thickness to achieve a minimum 2 hour fire rating**.
(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and dedicated to the fire pump circuit(s).
(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating
FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
Exception: The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.
Substantiation: Methods (2) and (3) are 2 hour fire ratings. Method (1) should be changed to be consistent, hence the addition of the 2 hour rating. In various applications e.g. slabs versus columns or with different concrete, e.g. lightweight, siliceous, or carbonate; different concrete thickness may be required to meet the rating, hence the deletion of the 2 inches of concrete.
Panel Meeting Action: Reject
Panel Statement: The 2 in. of concrete has provided the industry with a prescriptive benchmark that has served the industry well. The substantiation does not demonstrate that use of 2 in. of concrete has compromised the integrity of the circuit. The recommendation does not provide an alternative prescriptive requirement that can be easily applied.
Number Eligible to Vote: 14

13-105 Log #2905 NEC-P13 **Final Action: Accept in Principle**
(695.6(B)(3))

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Add new text as follows:
695.6(B)(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating.
Electrical circuit protective system installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used and the following:
(1) A junction box shall be installed ahead of the fire pump controller a minimum of 12 in. beyond the fire-rated wall or floor bounding the fire zone.
(2) The raceway between the junction box and the fire pump controller shall be sealed at the junction box end with an identified compound in accordance with the instructions of the manufacturer of the electrical circuit protective system.
(3) Standard wiring between the junction box and the controller is acceptable.
Substantiation: The introductory wording is from 695.14(F) and notes that there are other restrictions to electrical circuit integrity systems. This is similar to wording presently in NFPA 20-2007 section 9.3.7 and section 9.3.7.2 modified to be like that proposed for the NFPA 20-2010. Single conductors may require cutting of slots per 300.20(B) and may violate the NEMA rating, which is what is noted in NFPA 20 section 9.7.3.1. Since a junction box is being required for a seal in NFPA 20 section 9.7.3.2, section NFPA 20 section 9.7.3.1 was modified to just require a junction box. The wording on 12 inches into the fire zone is from the UL system listings.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 13-97 meets the intent of the recommendation.

13-107 Log #4822 NEC-P13 **Final Action: Reject**
(695.6(C))

Submitter: Robert Konnik, South Windsor, CT
Recommendation: Add text to read as follows:
695.6(C) Conductor Size.
(1) Fire Pump Motors and Other Equipment. Conductors supplying a fire pump motor(s), pressure maintenance pumps, and associated fire pump accessory equipment shall have a rating not less than 125 percent of the sum of the fire pump motor(s) and pressure maintenance motor(s) full-load current(s), and 100 percent of the associated fire pump accessory equipment. Table 310.16 shall be used to determine the conductor size.
Substantiation: NFPA 20 references NEMA standards publication ICS 14, 2.1.1c), suggests conductors to be sized per NEC 310.15 and Table 310.16. The 75C column is used, but 110.14(c) must be complied with as well. Breakers are qualified using a cable sized per table 310.16, and the conductor is a heat sink in this qualification. Grounding may be undersized if other means to size ampacity are used. The conductor may be undersized for short circuit considerations and may melt. Under emergency conditions, the cable may be hot enough to cause damage to other equipment or cause a fire to start (300% load).
Panel Meeting Action: Reject
Panel Statement: Based on Section 90.3 of the NEC, Chapters 1 through 4 apply except as supplemented or amended by Chapters 5, 6, or 7. Because there is no modification of the requirements, Section 110.14, 310.15 and the appropriate Tables in 310.15, such as Table 310.16, apply without adding the proposed text to 695.6(C). The concern expressed in the substantiation for undersized conductors and wire melting has not been supported with technical documentation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-108 Log #1283 NEC-P13 **Final Action: Reject**
(695.6(C)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Insert "ampacity" ahead of "rating."
Substantiation: Edit for clarity and specificity.
Panel Meeting Action: Reject
Panel Statement: The rating is determined based on the full-load current of the fire pump motor, pressure maintenance motor, and the accessory equipment, making the existing text very clear and concise so the change is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-109 Log #1426 NEC-P13 **Final Action: Reject**
(695.6(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise penultimate sentence: Where a tap is made to supply a fire pump in accordance with 695.3(A)(1) the wiring shall be treated as service conductors in accordance with 230.6.
Substantiation: Edit. Proposal clarifies where the tap is made.
Panel Meeting Action: Reject
Panel Statement: Because the conductors being referenced in 695.6(D) are power conductors, Section 695.6(A) already applies to these conductors, so the proposed reference is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-110 Log #3026 NEC-P13 **Final Action: Reject**
(695.6(D))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
(D) Overload Protection. Power circuits shall not have automatic protection against overloads. Except for protection of transformer primaries provided in 695.5(C)(2), branch-circuit and feeder conductors shall be protected against short circuits and ground-faults only. Where a tap is made to supply a fire pump, the wiring shall be treated as service conductors in accordance with 230.6. The applicable distance and size restrictions in 240.21 shall not apply.
Exception No. 1: Text to remain unchanged.
Exception No. 2: Text to remain unchanged.
Substantiation: Protection against short circuits but not ground-faults is extremely difficult, if not impossible.
Panel Meeting Action: Reject
Panel Statement: In the last sentence of Section 240.4(A), it is stated that conductor overload protection is not required but short circuit protection is required where interruption of the circuit would create a hazard. A ground fault may or may not be an issue since the first ground fault to an ungrounded system would not necessarily create a hazard, as noted in 250.4(B)(4), but a second ground fault would then create a phase- to phase-fault.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-111 Log #3417 NEC-P13 **Final Action: Reject**
(695.6(D))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
695.6(D) Overload Protection. Power circuits shall not have automatic protection against overloads. Except for protection of transformer primaries provided in 695.5(C)(2), branch-circuit and feeder conductors shall be protected against short circuit only. Where a tap is made to supply a fire pump, the wiring shall be treated as service-entrance conductors in accordance with 230.6. (The remaining text is unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.

It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: The recommendation is contingent on the acceptance of proposals to CMP-4, which intend to modify service-related definitions. The global implications of such a change would require task group action to correlate the use of these terms throughout the document. CMP-13 requests that the TCC direct CMP-4 to comment on this proposal and a task group be formed if necessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-112 Log #1282 NEC-P13 **Final Action: Reject**
(695.6(D) Exception No. 1)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise:

Conductors between storage batteries used for starting and control and the engine of an engine-driven fire pump shall not ~~require~~ be provided with overcurrent protection or disconnecting means other than the terminal connections.

Substantiation: Clarification of conductors and engine. Present wording does not prohibit overcurrent protection or disconnecting means.

Panel Meeting Action: Reject

Panel Statement: There was no technical substantiation provided to revise the text from permissive to a mandatory requirement that no protection be provided. Section 240.21(H) is also non-mandatory (permissive) overcurrent protection for battery cables that permits overcurrent protection of the cables.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-113 Log #98 NEC-P13 **Final Action: Reject**
(695.6(E))

Note: This Proposal appeared as Comment 13-141 on Proposal 13-105 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-105 was:

Add "flexible metal conduit".

Submitter: Andre R. Cartal, Princeton Borough Building Dept. / Rep. Princeton Borough Building Dept.

Recommendation: Please reconsider and accept the proposal.

Substantiation: 348.12(1) permits flexible metal conduit in wet locations when the conductors are approved for the specific conditions and a "W" type conductor would be required. The Panel seems to feel that the installation of a sprinkler head creates a wet location. If that's the case, then we have a problem with all the electrical equipment in the fire pump room and throughout the building.

Panel Meeting Action: Reject

Panel Statement: Based on a change in 348.12(1) in the 2008 NEC, flexible metal conduit is no longer acceptable in a wet location. It is not the panel's position that the presence of a sprinkler head in the fire pump room necessitates the area be designated as a wet location.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-114 Log #99 NEC-P13 **Final Action: Accept**
(695.6(E))

Note: This Proposal appeared as Comment 13-142 on Proposal 13-106 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-106 was:

Add "electrical metallic tubing".

Submitter: Andre R. Cartal, Princeton Borough Building Dept. / Rep. Princeton Borough Building Dept.

Recommendation: Please review and reconsider the proposal.

Substantiation: The Panel expresses concern that the EMT from the controller to the pump should not be permitted as EMT does not have "sufficient mechanical strength to prevent damage to the conductors". However, 695.6(B) Exception, does not restrict the use of EMT to supply the controller so where is the logic that the inspector needs for enforcement?

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-115 Log #100 NEC-P13 **Final Action: Accept**
(695.6(E))

Note: This Proposal appeared as Comment 13-143 on Proposal 13-106 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-106 was:

Add "electrical metallic tubing".

Submitter: William A. Wolfe, Steel Tube Institute of North America

Recommendation: This Proposal should be Accepted.

Substantiation: The concern in 695.6(E) is for physical protection of the conductors between the controller and the pump. Article 358 allows the use of electrical metallic tubing in areas where it is not exposed to *severe* physical damage. MC cable, even with an impervious covering, is not allowed where subject to any physical damage. The impervious covering only protects the MC against corrosive conditions. The Panel should really remove the permission for MC cable but if they continue to allow that use, EMT should certainly be allowed.

The physical properties of EMT are more robust than those of MC cable. Chapter 3 allows the use of EMT where exposed to physical damage but does not allow the use of MC cable where so exposed. The 1999 NEC was very clear about the use of MC cable. Section 334-3 Uses Permitted stated: *ÒUnless specifically prohibited elsewhere in the Code and **where not subject to physical damage,** Type MC cables shall be permitted as follows:Ó* During the 2002 NEC cycle, the cable articles were reformatted, leading to current language that causes confusion about the use of MC cables where exposed to physical damage.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-116 Log #956 NEC-P13 **Final Action: Accept**
(695.6(E))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add: "electrical metallic tubing" after "intermediate metal conduit".

Substantiation: EMT is as suitable as LFMC and FNMC.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-117 Log #1425 NEC-P13 **Final Action: Reject**
(695.6(E))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise latter part: "...listed Type MC ~~with an impervious covering~~ cable complying with 330.10(A)(11) or Type MI cable." (See my proposal for 330.10(A))

Substantiation: Edit. "Impervious" is defined as not capable of damaged or harmed. Type MC cable is not impervious to damage with or without covering material. Section 330.12 indicates Type MC cable shall not be installed where subject to physical damage.

Panel Meeting Action: Reject

Panel Statement: The text in Section 330.10(A)(11) uses the term "impervious" with the intent to help protect the MC cable from corrosion and other deleterious effects. Deleting this term and simply referencing the section is not user-friendly and does not add anything useful to this section.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-135 Log #1281 NEC-P13 **Final Action: Reject**
(695.6(G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
~~MECHANICAL~~ PHYSICAL PROTECTION. All wiring from engine controllers and batteries shall be protected against where likely to be subject to physical damage and shall be installed in accordance with any instructions of the controller and engine manufacturers ~~instructions~~.
Substantiation: Edit. Proposal clarifies uses of batteries. "Likely" is defined as such a nature or circumstance as to make something probable and it used in many sections.
Panel Meeting Action: Reject
Panel Statement: The panel understands this proposal to be on 695.6(G). The physical protection could be an NEC wiring method or the mechanical protection could be within the engine controllers or the fire pump itself. The proposed text does not have any technical substantiation for the change and is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-118 Log #3827 NEC-P13 **Final Action: Accept in Principle**
(695.6(I) (New))

Submitter: James S. Nasby, Skokie, IL
Recommendation: Add Text from NFPA-20-2007 Clause **9.3.6 Junction Boxes**, except for the two annex items, and renumber to the NEC Manual of Style.
A copy of the proposed text to be added from NFPA-20 is on sheet two of this submittal.
Substantiation: Although this text is in NFPA-20, it is installation related and proper material to be extracted to the NEC.
Problems occur in the field when junction boxes are installed in a manner not suitable for the environment or in a manner which is deleterious to fire pump controllers.
Note that there are two other companion Public Proposals related to this topic.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 13-97 meets the intent of the recommendation. The submitter should be aware that Section 4.3.3 of the NFPA Rules and Regulations Governing Committee Projects requires recommendation to contain the actual text to be inserted into the NEC, in the proper format. It is not the panel's job to do the conversion.
Number Eligible to Vote: 14

13-121 Log #794 NEC-P13 **Final Action: Accept in Part**
(695.7)

Submitter: Carol Pafford, City and County of Denver
Recommendation: Revise text to read as follows:
The voltage drop at the fire pump controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor surge conditions.
Substantiation: The existing language is modified to eliminate confusion between the fire pump controller and any other controllers associated with the fire pump system, such as the foam pump controller and limited service controller. This particular section specifically refers to the fire pump controller.
Panel Meeting Action: Accept in Part
The panel accepts the inclusion of the term "fire pump" and rejects the remainder of the recommendation.
Panel Statement: The word "drop" was deleted as unnecessary within the context of the sentence.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-121a Log #2320 NEC-P13 **Final Action: Accept in Principle**
(695.7)

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Add parts (A) and (B) as follows...(A) Starting, (existing text from first sentence) Exception: (existing text from exception) (B) Running, (existing text from second sentence).
Substantiation: This change will better reflect the requirements and exceptions included in NFPA 20. The exception should not apply to voltage drop requirements while a fire pump is running.
Panel Meeting Action: Accept in Principle
Revise Section 695.7 to read:
695.7 Voltage Drop.
(A) Starting. The voltage at the fire pump controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor starting conditions.
Exception: This limitation shall not apply for emergency run mechanical starting. [**20:**9.4.2]
(B) Running. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.
Exception: This limitation shall not apply for emergency run mechanical starting. [**20:**9.4.2]
Panel Statement: The panel action includes the recommendation of Proposal 13-121. In addition, the action reorganizes the recommendation to clearly demonstrate the text to which the exception applies.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-122 Log #101 NEC-P13 **Final Action: Accept**
(695.8 (New))

Note: This Proposal appeared as Comment 13-144 on Proposal 13-107 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-107 was:

Add text to read as follows:

695.8 Protective Devices. Where protective devices are installed in the onsite power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load.

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.

This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts in principle the recommendation of Proposal 13-107 contained in the 2008 NEC ROP.

Panel Statement: The panel accepts the direction to reconsider the recommendation of Proposal 13-107 contained in the 2008 NEC ROP. The panel action on Panel Proposal 13-95a meets the intent of the recommendation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-123 Log #102 NEC-P13 **Final Action: Accept in Principle**
(695.8 (New))

Note: This Proposal appeared as Comment 13-145 on Proposal 13-107 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-107 was:

Add text to read as follows:

695.8 Protective Devices. Where protective devices are installed in the onsite power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load.

Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Accept in Principle.
Substantiation: This was already correlated with 13.77. It is now clause 695.9(E). Note: This proposal originated with NEMA SC-10, Sub-committee on Fire Pump controllers. This requirement is not the same as the requirement to carry locked rotor current indefinitely. 1) Starting a single Design “B” Code “F” or “G” motor can incur first half cycle offset currents of over 12 times motor FLC (FLA). 2). The OCP in the Emergency (Alternate) power supply path must be able to start a fire pump motor in the Across-the-Line (Full Voltage Starting) mode regardless of whether or not the fire pump controller is of the reduced inrush starting type, due to the use of the Manual Mechanical Emergency Operator. 3) The same OCP must be able to start all such pumps plus any other connected loads. This is especially vital where fire pumps are connected either in series (high rise) or in parallel (large facilities such as aircraft hangers).

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action on panel proposal 13-95a meets the intent of the recommendation.

Or renumber as appropriate.

Note: Text Strikeouts (~~Text Strikeouts~~) and <u>Text Underlines</u> are FIM-AAA Committee ROP Actions.

Note: There was <u>no</u> Public Comments on this Proposal.

Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Accept in Principle Proposal 13-109.
Substantiation: This proposal was/is correlated with Proposal 13-77 as clause 695.10.
This is extracted text. This text was added to NFPA-20 due to substantial numbers of compromised installations and confusion in the field over this topic. Junction boxes are frequently used due to the prohibition of using the fire pump controller as a junction box. Numerous controllers have been ruined or compromised regarding both reliability and personnel safety due to the high short circuit ratings -- usually 100,000 Arms Sym., but up to 200 Ka -- of typical controllers. Countless others are in the same condition; but, are unknown. This is to give both guidance and clout to inspection personnel.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 13-97 meets the intent of the recommendation.

13-128 Log #105 NEC-P13 **Final Action: Accept**
(695.14 (New))

Note: This Proposal appeared as Comment 13-148 on Proposal 13-110 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-110 was:

Revise text to read as follows:

~~9.3.2.2.8*~~ 695.14 Raceway Terminations.

~~9.3.2.2.8.1~~ 695.14(A) Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.

~~9.3.2.2.8.2~~ 695.14(B) The ~~NEMA~~ Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

~~9.3.2.2.8.3~~ 695.14(C) The installation instructions of the manufacturer of the fire pump controller shall be followed.

~~9.3.2.2.8.4~~ 695.14(D) ~~No alterations~~ <u>Alterations</u> to the fire pump controller <u>shall be approved by the authority having jurisdiction.</u> ~~without the express specific approval of the manufacturer of the controller.~~

~~A.9.3.2.2.8~~ FPN: All fire pump controllers are required to be rated as NEMA (UL) Type 2 as a minimum. Conduit hobs must be also. Controllers rated at higher levels, such as Type 12, Type 4, Type 4X and etc., require correspondingly rated hubs in order for the controller Type rating to be valid. Failing to do so ~~will void the controller's warranty and~~ may cause controller damage or destruction by entry of water into the controller.

Note: Text Strikeouts (~~Text Strikeouts~~) and <u>Text Underlines</u> are FIM-AAA Committee ROP Actions.

Note: There were Comments Logs #19 & #21 on this proposal, both APA, APR or APP. Wording above needs to be verified against to the ROC. The FPN wording was struck.

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.

This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Accept Proposal 13-110 from the 2008 NEC ROP in principle.
Panel Statement: The panel accepts the direction of the NEC TCC to reconsider the action from the 2008 NEC revision cycle. The panel action on Proposal 13-97 meets the intent of the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-129 Log #106 NEC-P13 **Final Action: Accept in Principle**
(695.14 (New))

Note: This Proposal appeared as Comment 13-149 on Proposal 13-110 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-110 was:

Revise text to read as follows:

~~9.3.2.2.8*~~ 695.14 Raceway Terminations.

~~9.3.2.2.8.1~~ 695.14(A) Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.

~~9.3.2.2.8.2~~ 695.14(B) The ~~NEMA~~ Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

~~9.3.2.2.8.3~~ 695.14(C) The installation instructions of the manufacturer of the fire pump controller shall be followed.

~~9.3.2.2.8.4~~ 695.14(D) ~~No alterations~~ <u>Alterations</u> to the fire pump controller <u>shall be approved by the authority having jurisdiction.</u> ~~without the express specific approval of the manufacturer of the controller.~~

~~A.9.3.2.2.8~~ FPN: All fire pump controllers are required to be rated as NEMA (UL) Type 2 as a minimum. Conduit hobs must be also. Controllers rated at higher levels, such as Type 12, Type 4, Type 4X and etc., require correspondingly rated hubs in order for the controller Type rating to be valid. Failing to do so ~~will void the controller's warranty and~~ may cause controller damage or destruction by entry of water into the controller.

Note: Text Strikeouts (~~Text Strikeouts~~) and <u>Text Underlines</u> are FIM-AAA Committee ROP Actions.

Note: There were Comments Logs #19 & #21 on this proposal, both APA, APR or APP. Wording above needs to be verified against to the ROC. The FPN wording was struck.

Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Accept in Principle Proposal 13-110.
Substantiation: This proposal was /is correlated with Proposal 13-77 as clause 695.12.

This is extracted text. This text was added to NFPA-20 due to substantial numbers of compromised installations and confusion in the field over this topic. Numerous controllers have been ruined or compromised due to flooding because of inadequate raceway (conduit) terminations. Numerous others are vulnerable to the same problem, especially the use of star nuts on 3" and larger top entry or exit conduit. One instance known which nearly required the evacuation of the top two thirds of a high rise hotel due to a flooded middle zone controller. This is a pervasive problem. Fire protection is often interrupted when a sole source controller needs extensive repair or replacement. This is exacerbated by the fact that many, if not most of these controllers are used as service entrance equipment.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 13-97 meets the intent of the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-130 Log #107 NEC-P13 **Final Action: Reject**
(695.14)

Revise text to read as follows:
~~9.3.2.2.8*~~ 695.14 Raceway Terminations.
~~9.3.2.2.8.1~~ 695.14(A) Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.
~~9.3.2.2.8.2~~ 695.14(B) The ~~NEMA~~ Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.
~~9.3.2.2.8.3~~ 695.14(C) The installation instructions of the manufacturer of the fire pump controller shall be followed.
~~9.3.2.2.8.4~~ 695.14(D) ~~No alterations~~ Alterations to the fire pump controller shall be approved by the authority having jurisdiction. ~~without the express specific approval of the manufacturer of the controller.~~
~~A.9.3.2.2.8~~ FPN: All fire pump controllers are required to be rated as NEMA (UL) Type 2 as a minimum. Conduit hobs must be also. Controllers rated at higher levels, such as Type 12, Type 4, Type 4X and etc., require correspondingly rated hubs in order for the controller Type rating to be valid. Failing to do so ~~will void the controller's warranty and~~ may cause controller damage or destruction by entry of water into the controller.
Note: Text Strikeouts (~~Text Strikeouts~~) and Text Underlines are FIM-AAA Committee ROP Actions.
Note: There were Comments Logs #19 & #21 on this proposal, both APA, APR or APP. Wording above needs to be verified against to the ROC. The FPN wording was struck.
Submitter: Elliot Rappaport, Electro Technology Consultants
Recommendation: Reject the proposal.
Substantiation: The proposed text gives the AHJ authority that neither the manufacturer or the testing agency would accept without appropriate testing. Alterations to the structure should void the listing.
Panel Meeting Action: Reject
Panel Statement: Sections 110.2, 90.4, and new 695.6(K)(4) of the NEC already provides the inspector with this authority so the substantiation is incorrect. See the panel action and statement on Proposal 13-97.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-131 Log #2911 NEC-P13 **Final Action: Accept in Part**
(695.14(F))

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Revise text to read as follows:
695.14(F) Generator Control Wiring Methods. Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) **using one of the following methods:**
(1) Be encased in ~~50 mm (2 in.) of~~ concrete **with a sufficient thickness to achieve a minimum 2 hour fire rating.**
(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and ~~or within enclosed construction~~ dedicated to the fire pump circuits ~~and having a minimum 1-hour fire resistance rating~~,
(3) Be a listed electrical ~~or~~ circuit protective system~~s~~ with a minimum of **2**~~1~~-hour fire **rating** ~~resistance~~. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.
FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
Substantiation: This will make the format and wording the same as what is proposed for 695.6(B) in a companion proposal. Note, this also corrects the control wiring to a 2 hour rating to be the same as 695.6(B).
Panel Meeting Action: Accept in Part
The panel rejects the recommendation for 695.14(F)(1). The panel accepts the remainder of the recommendation.
Panel Statement: See the panel action and statement on Proposal 13-102.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-132 Log #108 NEC-P13 **Final Action: Accept**
(695.15 (New))

Note: This Proposal appeared as Comment 13-151 on Proposal 13-111 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-111 was:
Revise text to read as follows:
~~9.3.2.2.7*~~ 695.15 Listed Electrical Circuit Protective System to Controller Wiring.
~~9.3.2.2.7.1*~~ 695.15(A) ~~When used, Type MI (Mineral Insulated) cable~~ Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with NFPA 70. Single (Individual) conductors shall not enter the fire pump enclosure separately.
~~A.9.3.2.2.7.1~~ FPN Cutting slots or rectangular cutouts in a fire pump controller will violate the ~~NEMA~~ Enclosure Type rating, and the controller's Short Circuit (Withstand) rating and will void the manufacturer's warrantee. See also NFPA 70 Articles 300.20 and 322, for example, for further information.
~~9.3.2.2.7.2*~~ 695.15(B) Where required by the manufacturer of a ~~Listed~~ listed Electrical Circuit Protective System or by NFPA 70 or by the Listing ~~agency~~, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer ~~or listing agency.~~
~~A.9.3.2.2.7.2~~ FPN When so required, this seal is to prevent flammable gases from entering into the fire pump controller.
Note: Text Strikeouts (~~Text Strikeouts~~) and Text Underlines are FIM-AAA Committee ROP or ROC Actions.
Note: There were Comments Logs #17, #18 & #20 on this proposal, both APA, APR, or APP. Wording above needs to be verified against to the ROC. The FPN wording was struck.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.
This action will be considered by the Panel as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Accept Proposal 13-111 from the 2008 NEC ROP in principle.
Panel Statement: The panel accepts the direction of the NEC TCC to reconsider the action from the 2008 NEC revision cycle. The panel action on Proposal 13-97 meets the intent of the recommendation.

Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Continue to Accept in Principle Proposal 13-110.
Substantiation: This proposal was/is correlated with Proposal 13-77 as clause 695.11.
This is extracted text. This text was added to NFPA-20 due to substantial numbers of compromised installations and confusion in the field over this topic. Numerous controllers have been ruined or compromised due major hacking (modifications by way of large cut-outs to accommodate individual conductors. An unknown number of others exist. This is a poorly understood area. Use of individual conductors is increasing. This is partly due to the placement of fire pumps in the middle of high rise buildings. Both the Normal Source and the Emergency Source are so connected in many cases. Guidance is needed for both installers and inspection agencies. This is a matter of both

reliability of the equipment, protecting it from flooding, and personal safety due to the high short circuit ratings of typical fire pump controllers.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 13-97 meets the intent of the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-134 Log #110 NEC-P13 **Final Action: Reject**
(695.15)

13-136 Log #484 NEC-P13 **Final Action: Reject**
(695.19 through 695.30 (New))

Submitter: Troy Meissner, Douglas County, Colorado
Recommendation: Add new text as follows:

II. Residential Fire Pumps

695.19 Scope. Part II covers the installation for one- and two-family dwellings.
695.20 Power Source(s). Electric motor-driven fire pumps shall have a reliable source of power.
(A) Electric Utility Service Connection. A fire pump shall be permitted to be supplied by a separate service, or from a connection location ahead of and not within the same cabinet, enclosure, or panelboard as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with 230.82(5). The service equipment shall comply with the labeling requirements in 230.72(B).
(B) On-Site Power Production Source. A fire pump shall be permitted to be supplied by an on-site power production source. Where this source is a generator, the generator shall comply with 695.3(B)(1).
695.21 Continuity of Power. Circuits that supply electric motor-driven fire pumps shall be installed to prevent inadvertent disconnection.
(A) Direct Connection. The supply conductors shall directly connect the power source to the fire pump disconnect. The supply conductors shall be continuous without a splice.
Where the power source is supplied by on-site generator(s), the supply conductors shall comply with 695.4(A).
(B) Overcurrent Device Selection. The overcurrent protective device(s) shall comply with 695.4(B)(1). If the overcurrent protective device is a breaker, it shall be provided with a lock on device.
(C) Disconnecting Means. The disconnecting means shall comply with all of the following:
(1) The disconnecting means shall comply with 695.4(B)(2)
(2) The disconnecting means shall be marked per 695.4(B)(3)
695.23 Power Wiring. Power circuits and wiring methods shall comply with the requirements in 695.23(A) and 695.23(B).
(A) Conductor Size. Conductors supplying a fire pump motor(s) shall comply with 695.6(C)(1) or 695.6(C)(2).
(B) Wiring Methods. Cable shall be installed within finished wall cavities. Conductors in accessible areas shall be installed in an approved raceway as per 695.6(E).
695.24 Voltage Drop. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.
695.27 Listed Equipment. All equipment used for the fire pump(s) system shall be listed.
695.29 Equipment Location.
(A) Feeder-Circuit Equipment. Equipment for feeder circuits shall be located in spaces fully protected by approved automatic fire suppression systems (sprinklers) or in spaces with one hour fire resistance rating required by 700.9(D)(2).
(B) Energized Equipment. All energized equipment parts shall be located at least 300 mm (12 in.) above the floor level. All energized equipment parts shall be located or protected so that they are not damaged by water escaping from pumps or pump connections.
(C) Mounting. All fire pump control equipment shall be mounted in a substantial manner on supporting structures.
695.31 Control Wiring. External control circuits that extend outside the fire pump room shall be arranged so that failure of any external circuit (open or short circuit) shall not prevent the operation of a pump(s) from all other internal or external means.
Substantiation: More and more single family dwellings are installing Fire Suppression systems that require pumps. This extraction language from Article 695 2008 NEC, is proposed to assist and clarify an important requirement necessary to the designer, user and enforcer of the NEC. It will further harmonize the NFPA family of codes and provide the information necessary to comply with the installation standard.
Panel Meeting Action: Reject
Panel Statement: Fire pumps covered within the scopes of NFPA 13 and NFPA 20 must comply with all of the requirements of Article 695. Requirements for water pumps and associated equipment used for fire protection, such as those that are covered in NFPA 13D, are not appropriate for inclusion in Article 695.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 700 — EMERGENCY SYSTEMS

13-137 Log #2321 NEC-P13 **Final Action: Reject**
(700)

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Add the words '(Life Safety)' after the word 'Emergency' in the title and throughout Article 700.
Substantiation: The words 'emergency system' are misused extensively by those who don't know it's specific meaning within the NEC and frequently by those who should. This change is intended to be the first step in a three cycle process (similar to the process used for Luminaires) which will rename Article 700 and more clearly identify the purpose for which the system is used. It will allow the term 'Emergency System' to encompass the combined 700, 701 and 702 system which is in line with the way the term is used in Article 517. The extended process will allow related standards to adapt their language.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided specific locations throughout the article where new text is to be added. This proposal does not meet the requirements of 4.3.3(b) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-138 Log #3028 NEC-P13 **Final Action: Reject**
(700)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Renumber Article 700 as follows:
I. General
700.1 Scope.
The provisions of this article apply to the electrical safety of the installation, operation, and maintenance of emergency systems consisting of circuits and equipment intended to supply, distribute, and control electricity for illumination, power, or both, to required facilities when the normal electrical supply or system is interrupted.
~~Emergency systems are those systems legally required and classed as emergency by municipal, state, federal, or other codes, or by any governmental agency having jurisdiction. These systems are intended to automatically supply illumination, power, or both, to designated areas and equipment in the event of failure of the normal supply or in the event of accident to elements of a system intended to supply, distribute, and control power and illumination essential for safety to human life.~~
FPN No. 1: Text to remain unchanged.
FPN No. 2: Text to remain unchanged.
~~FPN No. 3: Emergency systems are generally installed in places of assembly where artificial illumination is required for safe exiting and for panic control in buildings subject to occupancy by large numbers of persons, such as hotels, theaters, sports arenas, health care facilities, and similar institutions. Emergency systems may also provide power for such functions as ventilation where essential to maintain life, fire detection and alarm systems, elevators, fire pumps, public safety communications systems, industrial processes where current interruption would produce serious life safety or health hazards, and similar functions.~~
FPN No. 3~~4~~: For specification of locations where emergency lighting is considered essential to life safety, see NFPA 101®-2006, Life Safety Code®.
FPN No. 4~~5~~: For further information regarding performance of emergency and standby power systems, see NFPA 110-2005, Standard for Emergency and Standby Power Systems.
700.2 Definition
Emergency System.
Emergency systems are those systems legally required and classed as emergency by municipal, state, federal, or other codes, or by any governmental agency having jurisdiction. These systems are intended to automatically supply illumination, power, or both, to designated areas and equipment in the event of failure of the normal supply or in the event of accident to elements of a system intended to supply, distribute, and control power and illumination essential for safety to human life.
FPN: Emergency systems are generally installed in places of assembly where artificial illumination is required for safe exiting and for panic control in buildings subject to occupancy by large numbers of persons, such as hotels, theaters, sports arenas, health care facilities, and similar institutions. Emergency systems may also provide power for such functions as ventilation where essential to maintain life, fire detection and alarm systems, elevators, fire pumps, public safety communications systems, industrial processes where current interruption would produce serious life safety or health hazards, and similar functions.
~~700.2~~ 700.3 Application of Other Articles. Text to remain unchanged.
~~700.3~~ 700.4 Equipment Approval. Text to remain unchanged.
~~700.4~~ 700.5 Tests and Maintenance. Text to remain unchanged.
~~700.5~~ 700.6 Capacity.
(A) Capacity and Rating. Text to remain unchanged.
(B) Selective Load Pickup, Load Shedding, and Peak Load Shaving. The alternate power source shall be permitted to supply emergency, legally required standby, and optional standby system loads where the source has adequate capacity or where automatic selective load pickup and load shedding is provided as needed to ensure adequate power to (1) the emergency circuits, (2) the legally required standby circuits, and (3) the optional standby circuits, in that order of priority. The alternate power source shall be permitted to be used for peak load shaving, provided these conditions are met.
Peak load shaving operation shall be permitted for satisfying the test requirement of 700.5(B) ~~700.4(B)~~, provided all other conditions of 700.5 ~~700.4~~ are met.
A portable or temporary alternate source shall be available whenever the emergency generator is out of service for major maintenance or repair.
~~700.6~~ 700.7 Transfer Equipment. Text to remain unchanged.
~~700.7~~ 700.8 Signals. Text to remain unchanged.
~~700.8~~ 700.9 Signs. Text to remain unchanged.

(A) Identification. Text to remain unchanged.
(B) Wiring. Text to remain unchanged.
(C) Text to remain unchanged.
(D) Fire Protection. Emergency systems shall meet the additional requirements in ~~700.9~~(D)(1) and (D)(2) in assembly occupancies for not less than 1000 persons or in buildings above 23 m (75 ft) in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and mercantile.
(1) Feeder-Circuit Wiring. Feeder-circuit wiring shall meet one of the following conditions:
(1) Text to remain unchanged.
(2) Text to remain unchanged.
(3) Text to remain unchanged.
(4) Text to remain unchanged.
(5) Text to remain unchanged.
(6) Text to remain unchanged.
(2) Feeder-Circuit Equipment. Text to remain unchanged.
(3) Generator Control Wiring. Control conductors installed between the transfer equipment and the emergency generator shall be kept entirely independent of all other wiring and shall meet the conditions of 700.10(D)(1) ~~700.9(D)(1)~~.
III. Sources of Power
700.12 General Requirements. Text to remain unchanged.
(A) Storage Battery. Text to remain unchanged.
(B) Generator Set.
(1) Prime Mover-Driven. For a generator set driven by a prime mover acceptable to the authority having jurisdiction and sized in accordance with 700.6 ~~700.5~~, means shall be provided for automatically starting the prime mover on failure of the normal service and for automatic transfer and operation of all required electrical circuits. A time-delay feature permitting a 15-minute setting shall be provided to avoid retransfer in case of short-time reestablishment of the normal source.
(2) Internal Combustion as Prime Movers. Text to remain unchanged.

(3) Text to remain unchanged.
(4) A relaying device arranged to energize the lamps automatically upon failure of the supply to the unit equipment
The batteries shall be of suitable rating and capacity to supply and maintain at not less than 87½ percent of the nominal battery voltage for the total lamp load associated with the unit for a period of at least 1½ hours, or the unit equipment shall supply and maintain not less than 60 percent of the initial emergency illumination for a period of at least 1½ hours. Storage batteries, whether of the acid or alkali type, shall be designed and constructed to meet the requirements of emergency service.
Unit equipment shall be permanently fixed in place (i.e., not portable) and shall have all wiring to each unit installed in accordance with the requirements of any of the wiring methods in Chapter 3. Flexible cord-and-plug connection shall be permitted, provided that the cord does not exceed 900 mm (3 ft) in length. The branch circuit feeding the unit equipment shall be the same branch circuit as that serving the normal lighting in the area and connected ahead of any local switches. The branch circuit that feeds unit equipment shall be clearly identified at the distribution panel. Emergency luminaires that obtain power from a unit equipment and are not part of the unit equipment shall be wired to the unit equipment as required by 700.10 ~~700.9~~ and by one of the wiring methods of Chapter 3.
Exception: Text to remain unchanged.
IV. Emergency System Circuits for Lighting and Power

700.15 Loads on Emergency Branch Circuits. Text to remain unchanged.
700.16 Emergency Illumination. Text to remain unchanged.
700.17 Circuits for Emergency Lighting. Text to remain unchanged.
700.18 Circuits for Emergency Power. Text to remain unchanged.
V. Control — Emergency Lighting Circuits
700.20 Switch Requirements. Text to remain unchanged.
700.21 Switch Location. Text to remain unchanged.
700.22 Exterior Lights. Text to remain unchanged.
700.23 Dimmer Systems. Text to remain unchanged.
VI. Overcurrent Protection
700.25 Accessibility. Text to remain unchanged.
700.26 Ground-Fault Protection of Equipment.

The alternate source for emergency systems shall not be required to have ground-fault protection of equipment with automatic disconnecting means. Ground-fault indication of the emergency source shall be provided per 700.8(D) ~~700.7(D)~~.

700.27 Coordination. Text to remain unchanged.

Substantiation: This proposal is part of a series of proposals intended to create a parallel numbering system for Articles 700, 701 and 702.
Panel Meeting Action: Reject
Panel Statement: Panel 13 recommends rejecting the proposed action since, even though the existing text in 700.1 appears to be a definition of emergency systems, there are too many "existing" definitions of emergency systems so adding another one that is different from the others is not productive. For example, there is a definition for emergency system in 517.2 as it applies to health care facilities and the origin is from NFPA 99, the health care standard. The proposed parallel numbering system for Articles 700, 701, and 702 is unnecessary since the articles are not large and complex articles. While there are some common titles and text, there are also titles and text that are different from one article to another.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-139 Log #2900 NEC-P13 **Final Action: Reject**
(700.1)

Submitter: Wendell Whistler, Whistler Consulting & Technical Services
Recommendation: Add new text to read as follows:

Relocate text to a 700.2 **Emergency systems** are those systems legally required and classed as emergency by municipal, state, federal, or other codes, or by any governmental agency having jurisdiction. These systems are intended to automatically supply illumination, power, or both, to designated areas and equipment in the event of failure of the normal supply or in the event of accident to elements of a system intended to supply, distribute, and control power and illumination essential for safety to human life.

Substantiation: Move definition of emergency system from 700.1 to 700.2 as the definitions should be in this section according to the style manual.
Panel Meeting Action: Reject
Panel Statement: Panel 13 recommends rejecting the proposed action because, even though the existing text in 700.1 appears to be a definition of emergency systems, there are too many "existing" definitions of emergency systems so adding another one that is different from the others is not productive. For example, there is a definition for emergency system in 517.2 as it applies to health care facilities and the origin is from NFPA 99, the health care standard.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

CZARNECKI, N.: The definition of "emergency systems" belongs in Art 700.2, as per the Style Manual. Additionally, CMP 15 accepted proposal 15-7 which will remove the definition of emergency system from Article 517. There are no other definitions of "Emergency System" other than Article 700, so the panel statement is incorrect.

13-140 Log #4109 NEC-P13 **Final Action: Reject**
(700.1)

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Delete text to read as follows:

700.1 Scope The provisions... (retain existing text)... human life.

~~FPN No. 1: for further information regarding performance and maintenance of emergency systems in healthcare facilities, see Article 517.~~

~~FPN No. 2: for further information regarding performance and maintenance of emergency systems in healthcare facilities, see NFPA 99.205, Standard for Healthcare facilities.~~

FPN No. ~~3~~1: Emergency systems are generally installed in places of assembly where artificial illumination is required for sage exiting and of panic control in buildings subject to occupancy by large numbers of persons, such as hotels, theaters, sports arenas, ~~healthcare facilities~~ and similar institutions. Emergency...

Substantiation: The electrical distribution systems in health care facilities are different from those in other kinds of buildings, and they are called on to perform differently than those in other kinds of buildings, and they are called on to perform differently than those in other kids of buildings. Accordingly, the general requirements for emergency systems in 700, good as they are, do not, in many cases, work when applied to health care facilities. Indeed, as noted in other proposals, they can often compromise the performance of the very systems they seek to protect. Accordingly, it is vital to ensure the proper definition of performance of these systems clearly and distinctively so as to meet the many complicated demands on the systems. Exactly these issues are the subject of much debate on the Electrical Systems Technical Committee of NFPA 99, which I chair. That committee, composed of many electrical engineers with hundreds of years of experience designing and operating health care facilities between them, together with the medical expertise in the form of physicians on the committee allow that committee to focus on, and best define the peculiar needs of these buildings. This proposal will bring NFPA 70 into conformance with NFPA 99, and thus, reduce confusion.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the recommendation because removing the references to Article 517 and NFPA 99 and not applying any of the requirements in Article 700 to Article 517 health care installations would leave Article 517 emergency systems (life safety and critical branches) and equipment systems without any requirements for emergency generators. The life safety system branch in Part III of Article 517 uses all of the requirements in Article 700, with the critical branch using much of the requirements in Article 700. This is a broader issue than what Panel 13 has jurisdiction over and should be cleared up at the NEC Technical Correlating Committee level and the NFPA Standards Council.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

DEGNAN, J.: The scope noted in 700.1 should coordinate with the language of NFPA 99, and the proposals undertaken by CMP 15 for Article 517.

13-142 Log #2811 NEC-P13 **Final Action: Accept**
(700.2)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text

~~700.2 Application of Other Articles.~~

~~Except as modified by this article, all applicable articles of this Code shall apply.~~

Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 700.2 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-143 Log #3625 NEC-P13 **Final Action: Reject**
(700.2)

Submitter: David A. Williams, Delta Township
Recommendation: Revise text to read as follows:
700.2 Application of Other ~~Articles~~ Requirements.
Except as modified by this article, all applicable articles of this Code shall apply. Emergency systems shall be installed in accordance with this Code and NFPA 110 and NFPA 111.
Substantiation: The provisions of NFPA 110 and 111 are very important to the installations of emergency systems and these requirements should be referenced in the NEC. The International Building and Fire Codes have similar wording in Section 2702. Electrical installers need to be aware of these requirements.
Panel Meeting Action: Reject
Panel Statement: The proposed reference to NFPA 110 and NFPA 111 is not in compliance with Section 4.2 in the NEC Style Manual that states, "references to other standards shall not be in mandatory text. References to other standards shall be in the fine print notes."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-144 Log #4676 NEC-P13 **Final Action: Reject**
(700.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following sentence: "The requirements in this article do not supersede specific requirements and allowances in Part III of Article 517 regarding emergency systems within the scope of that article."
Substantiation: Conflicts between articles in Chapters 5, 6, and 7 must be reciprocally correlated or the result is a stand-off. It is now abundantly clear, for example, that small hospitals are not going to give up the common transfer switch allowance in 517.30(B)(4) which directly conflicts with the dedicated transfer switch rule in 700.6(D). This proposal provides a vehicle to eliminate the conflict. As a matter of Code administration, articles covering specific occupancies must usually be allowed, subject to the review of the TCC, to write specialized rules that may modify general rules. Remember that the reach of an occupancy article will always be more limiting than the reach of a special condition article such as Article 700, which applies everywhere unless specific exception is taken.
Panel Meeting Action: Reject
Panel Statement: Section 517.26 addresses the concern expressed in the recommendation. This requirement that Article 700 applies except as amended by Article 517 already accomplishes the recommendation. In addition, the panel action on Proposal 13-142 deletes Section 700.2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-145 Log #3231 NEC-P13 **Final Action: Accept in Principle**
(700.2.Relay, Automatic Load Control (New))

TCC Action: The Technical Correlating Committee understands that the panel's intent is to insert a new 700.2 to replace the one deleted by Proposal 13-142 with the title "700.2 Definitions" and has accepted the modified definition from this proposal.
Submitter: Steven R. Terry, Electronic Theatre Controls Inc.
Recommendation: Add new section to Article 700 and renumber the balance of sections to accommodate a new section as follows:
700.2(New) Definitions
Relay, Automatic Load Control. A device listed for use as Emergency Lighting and Power Equipment and used to energize switched or normally-off emergency equipment from an emergency supply in the event of loss of the normal supply, and to de-energize or return the equipment to normal status when the normal supply is restored.
Substantiation: Stand-alone Automatic Load Control Relays are a new class of device that has been introduced in the last few years. In my separate proposal for **700.24 (New) Emergency Lighting Automatic Control**, the Automatic Load Control Relay is introduced to the NEC. Therefore, a definition of the device is required. This definition should be in Article 700 and not Article 100 because these devices are only used for emergency applications. The proposed definition is in alignment with the definition of this device in UL924. In addition, the definition must make clear that the device is listed as Emergency Lighting and Power Equipment so that the reader can determine which standard in Annex A applies to these devices.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
Relay, Automatic Load Control. A device ~~listed for use as Emergency Lighting and Power Equipment and~~ used to energize switched or normally-off ~~emergency~~ lighting equipment from an emergency supply in the event of loss of the normal supply, and to de-energize or return the equipment to normal status when the normal supply is restored.
Panel Statement: The panel action to revise the definition meets the requirement of Section 2.2.2 of the NEC Style Manual regarding definitions containing requirements.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-146 Log #187 NEC-P13 **Final Action: Accept**
(700.3)

Submitter: Bryan P. Holland, City of North Port
Recommendation: Delete the following text:
~~700.3 Equipment Approval. All equipment shall be approved for use on emergency systems.~~
Substantiation: This section is redundant and unnecessary. Sections 90.7, 110.2, and 110.3 already contain this provision. There is no special listing, labeling, or marking which identifies equipment as suitable for this type of system, thus, no special evaluation beyond 90.7, 110.2, and 110.3 is needed.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-147 Log #3027 NEC-P13 **Final Action: Reject**
(700.4(A))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
700.4 Tests and Maintenance.
(A) Conduct or Witness Test. The authority having jurisdiction shall conduct or witness a test of the complete system upon installation ~~and periodically afterward~~.
Substantiation: The requirement for periodic testing is already in 700.4(B), so the proposed deletion is simply removing redundant text.
Panel Meeting Action: Reject
Panel Statement: The existing text requires the AHJ to actually witness the initial and subsequent tests. The proposed revision simply requires the AHJ to approve the testing schedule for periodic testing. It is the intent of the panel to ensure that the AHJ conducts or witnesses both the initial and approved periodic testing.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-148 Log #3330 NEC-P13 **Final Action: Reject**
(700.5)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
~~CAPACITY and~~ RATINGS. An emergency system shall have ~~adequate capacity and~~ rating(s) not less than required for all loads to be operated simultaneously.
Substantiation: Edit. "Capacity" is not Code-defined. "Adequate" is subjective and a term to be avoided per the Style Manual. Proposal is specific and conforms to Code language.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to change the existing text. Adequate capacity for all loads to operate simultaneously is very clear so change is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-149 Log #2009 NEC-P13 **Final Action: Reject**
(700.5(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: An emergency system shall have ~~adequate capacity and~~ ratings not less than required for all loads to be operated simultaneously. The emergency system equipment shall be ~~suitable~~ identified for the maximum available fault current at its terminals.
Substantiation: Edit. "Adequate" and "suitable" are subjective and terms to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to change the existing text. Adequate capacity for all loads to operate simultaneously is very clear so change is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-150 Log #3329 NEC-P13 **Final Action: Reject**
(700.6(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
BYPASS ISOLATION DEVICES ~~SWITCHES.~~ Identified means shall be permitted to bypass and isolate the transfer equipment and ~~approved~~ identified means shall be provided to prevent parallel operation.
Substantiation: Edit. Circuit breakers can also be used for this function. The means for bypass, isolation, and parallel operation should be identified for the use. "Approved" is not necessarily the same as "identified".
Panel Meeting Action: Reject
Panel Statement: Section 110.3 provides general requirements for the use of the equipment for the function of a bypass isolation device, and the word "identified" may cause confusion and is unnecessary in this requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-151 Log #2920 NEC-P13 **Final Action: Reject**
(700.7)

Submitter: Merv Lapp, Hillsboro, OR
Recommendation: Revise text to read as follows:
700.7 Signals.
Audible and visual signal devices shall be provided, ~~where practicable~~, for the purpose described in 700.7(A) through (D).
Substantiation: This wording is not enforceable. All new installations can be purchased with the needed contacts to provide the signal.
NOTE: Related section NEC 701.8.
Panel Meeting Action: Reject
Panel Statement: "Where practicable" leaves the decision up to the authority having jurisdiction and the circumstances of being able to see and hear the signaling devices. Many of the new systems are linked to computers systems and can be transferred through these systems to security, the building engineer's office, and other similar locations, so the word "practicable" provides the ability to signal these alternative locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
DEGNAN, J.: The intent of the panel's statement would be met by accepting the submitter's proposal. Deletion of the word's "where practicable" would leave the requirement for the alarms, but not specify where they are to be seen and heard. Rhetorically, if an audible and visual signal isn't in an area where it can be acted upon, is it practicable? Perhaps the submitter's and the panel's intent can be met by: "...provided, and located where practicable, for...".

13-152 Log #2922 NEC-P13 **Final Action: Reject**
(700.7)

Submitter: Merv Lapp, Hillsboro, OR
Recommendation: Revise text to read as follows:
700.7 Signals.
Audible and visual signal devices shall be provided, where practicable, for the purpose described in 700.7(A) through ~~(D)~~ (E).
(E) Generator Trouble. To provide a generator trouble signal to the Fire Alarm Panel.
Substantiation: This addition will permit the generator to be supervised 24/7 the same as the rest of the Fire Alarm Life Safety equipment. The existing generator remote annunciator is normally located in the Fire Command Room that is not manned 24/7. A problem may exist for several days, stopping the generator from functioning, which could jeopardize the lives of the building occupants.
NOTE: Related section NEC 701.8.
Panel Meeting Action: Reject
Panel Statement: Many of the new systems are linked to computers systems and can be transferred through these systems to security, the building engineer's office, and other similar locations, so monitoring by the fire alarm system is not required but certainly can be done. It is permissible by the existing NEC, and there was no technical substantiation provided to justify requiring monitoring by the fire alarm panel.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-153 Log #2921 NEC-P13 **Final Action: Reject**
(700.7(A))

Submitter: Merv Lapp, Hillsboro, OR
Recommendation: Revise text to read as follows:
700.7 Signals.
Audible and visual signal devices shall be provided, where practicable, for the purpose described in 700.7(A) through (D).
(A) Derangement. To indicate derangement of the emergency source.
(1) Generator main circuit breaker to be alarmed in the off position (Not-in-Auto).
Substantiation: Clarification of the derangement signal: The generator engine control can be in the auto position, indicating it is in the ready state, when the main circuit breaker is in the open, or off, position. In this mode, you do not have an emergency generator available to power the Life Safety Systems; Egress Lighting, Fire Pumps, Pressurization fans.
NOTE: Related section NEC 701.8(A).
Panel Meeting Action: Reject
Panel Statement: A signal is already required to indicate the disruption of the generator, so the proposed new text is unnecessary. In addition, emergency systems must be tested periodically and must be maintained on a regular basis.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-154 Log #3984 NEC-P13 **Final Action: Reject**
(700.8)

Submitter: Michael A. Anthony, University of Michigan Business Operations
Recommendation: Add text to read as follows:
700.8 Illumination of Emergency Source Switchgear. The area around the service equipment and emergency switchgear in non-dwelling unit occupancies 200 amperes and above shall be automatically illuminated upon loss of power. For a period of 90 minutes illumination levels shall be 1-footcandle on the egress path from the switchgear and 3-footcandles on the vertical surfaces of the service equipment.
Substantiation: The need for illumination during power outages should be intuitive. It provides illumination for a) the electrician who is working in the service equipment area without a flashlight, b) for the maintenance mechanic who may neither be an electrician nor familiar with the electric service equipment to work on it in the dark.
Electric service panels are not always installed along either the primary or secondary egress path required by the Life Safety Code and CMP-1 should not leave it to other standards to assert this requirement.
Other NFPA documents have been examined and a short summary of this examination appears below. [Underline emphasis has been added]
NFPA 101
There is no provision for any emergency illumination other than egress illumination for occupant safety in Section 7.8 of NFPA 101-2009. Egress safety for the occupants of an electrical room is not specifically addressed. In some cases, the cause of a building outage originates in the electrical service switchgear area. In any case, it is likely that there will be activity to and from the electrical service equipment area during a power outage.
NFPA 110
An excerpt from this standard is copied below for your convenience:
7.3 Lighting.
7.3.1 The Level 1 or Level 2 EPS equipment location(s) shall be provided with battery-powered emergency lighting. This requirement shall not apply to units located outdoors in enclosures that do not include walk-in access.
7.3.2 The emergency lighting charging system and the normal service room lighting shall be supplied from the load side of the transfer switch.
7.3.3* The intensity of illumination in the separate building or room housing the EPS equipment for Level 1 shall be 32.3 lux (3.0 ft-candles), unless otherwise specified by a requirement recognized by the authority having jurisdiction.
Although this standard is seen four times in the NEC, all appearances are Fine Print Notes, and may be unenforceable at the local level, even if it is known to be applicable.
NFPA 70E
An excerpt is copied below for your convenience:
130.6 Other Precautions for Personnel Activities.
(B) Blind Reaching. Employees shall be instructed not to reach blindly into areas that might contain exposed energized electrical conductors or circuit parts where an electrical hazard exists.
(C) Illumination.
(1) General. Employees shall not enter spaces containing electrical hazards unless illumination is provided that enables the employees to perform the work safely.
(2) Obstructed View of Work Area. Where lack of illumination or an obstruction precludes observation of the work to be performed, employees shall not perform any task within the Limited Approach Boundary of energized electrical conductors or circuit parts operating at 50 volts or more or where an electrical hazard exists…
Without this specific provision, emergency illumination "falls between the cracks" and remains a design option.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided justifying the foot-candle level for all electrical service equipment and emergency switchgear. There was no indication of whether these requirements applied to indoor or outdoor locations. There was no technical explanation for the required illumination for the service switchgear. Service switchgear is covered in Article 230, not in Article 700.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-155 Log #2008 NEC-P13 **Final Action: Reject**
(700.8(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part: ....that shall identify all emergency and ~~normal~~ other sources and their location ~~connected~~ grounded at that location.
Substantiation: "Normal" is not defined; does it include photovoltaic systems, optional standby systems, legally required standby systems, fire pump services, electric welder services? Location of sources should be provided.
Panel Meeting Action: Reject
Panel Statement: There are emergency sources, and all other sources are considered normal sources. Normal sources could include photovoltaic sources, utility supplied sources, or any other normal source of power that is not emergency. The suggested change in text is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-156 Log #4677 NEC-P13 **Final Action: Reject**
(700.8(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows: "Where the removal of a main or system bonding jumper interrupts the continuity of the grounding connection to an alternate source grounded conductor, a permanent sign shall be installed on or at the equipment in which the bonding jumper is installed identifying all alternate sources having grounded conductors connected to ground through the main or system bonding jumper."
Substantiation: With changes in grounding terminology, the intent of this section is being lost. Some think this is about a connection between a grounding electrode and a grounding electrode conductor, for example. This requirement resulted from an actual case where the emergency source was supplying power, and during that period maintenance personnel disconnected the normal source grounded conductor for testing purposes. The personnel did not realize that they were also disconnecting the grounding connection for the emergency source at the same time, since the grounded system conductor was only connected to the grounding electrode conductor in the main switchboard. This rewrite makes the intent very clear.
Panel Meeting Action: Reject
Panel Statement: The suggested text is much more complex than is necessary in applying this requirement. The recommended text does not identify at which electrical equipment the sign is to be installed. The recommended text is not user friendly and the change is unnecessary since the existing text is clear and concise in the requirements for signage.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LITTLE, L.: This proposed revision clarifies the intent of this requirement and enhances usability. The proposed text is not more complex than the existing requirement. This revision provides clear, prescriptive text on where the required sign is to be located. It is the removal of a main or system bonding jumper that would interrupt the continuity of the grounding connection to an alternate source grounded conductor that this first level subdivision seeks to prevent.
The submitter is correct. The proposed revision makes the intent of this requirement very clear.

13-157 Log #3977 NEC-P13 **Final Action: Reject**
(700.9 (New))

Submitter: Michael A. Anthony, University of Michigan Business Operations
Recommendation: Add text to read as follows:
700.9 Illumination of Emergency Source Switchgear. The area around the service equipment and emergency switchgear in non-dwelling unit occupancies 200 amperes and above shall be automatically illuminated upon loss of power. For a period of 90 minutes illumination levels shall be 1-footcandle on the egress path from the switchgear and 3-footcandles on the vertical surfaces of the service equipment.
Substantiation: The need for illumination during power outages should be intuitive. It provides illumination for a) the electrician who is working in the service equipment area without a flashlight, b) for the maintenance mechanic who may neither be an electrician nor familiar with the electric service equipment to work on it in the dark.
Electric service panels are not always installed along either the primary or secondary egress path required by the Life Safety Code and CMP-1 should not leave it to other standards to assert this requirement.

An excerpt is copied below for your convenience:
130.6 Other Precautions for Personnel Activities.
… (B) Blind Reaching. Employees shall be instructed not to reach blindly into areas that might contain exposed energized electrical conductors or circuit parts where an electrical hazard exists.
(C) Illumination.
(1) General. *Employees shall not enter spaces containing electrical hazards unless illumination is provided that enables the employees to perform the work safely.*
(2) Obstructed View of Work Area. Where lack of illumination or an obstruction precludes observation of the work to be performed, employees shall not perform any task within the Limited Approach Boundary of energized electrical conductors or circuit parts operating at 50 volts or more or where an electrical hazard exists…
Without this specific provision, emergency illumination "falls between the cracks" and remains a design option.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-154.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-158 Log #734 NEC-P13 **Final Action: Reject**
(700.9(A))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
700.9 Wiring, Emergency System.
(A) Identification. All boxes and enclosures (including transfer switches, generators, and power panels) for emergency circuits shall be permanently marked so they will be readily identified as a component of an emergency circuit or system. The identification marking shall not be permitted to include the word "Standby", unless otherwise permitted in (B)(1) through (B)(5).
Substantiation: Manufacturers of surface raceways, both metal (*NEC*® Article 386) and nonmetallic (*NEC*® Article 388), and of multi-outlet assemblies (*NEC*® Article 380) derived from surface raceways have had numerous inquiries from specifiers and installers for applications of surface raceways where used for Emergency Systems (*NEC*® Article 700) AND for either Legally Required Standby Systems (*NEC*® Article 701) or Optional Standby Systems (*NEC*® Article 702) AND for other general wiring (power, lighting, signaling) in the same installation. Despite the requirement of 900.9(B), these specifiers and installers are believed to be marking raceways with "EMERGENCY STANDBY", without distinction between "EMERGENCY" (*NEC*® Article 700 circuits) and "STANDBY" (*NEC*® Article 701 or Article 702 circuits), leading to confusion as to the identity of the circuit (*NEC*® Article 700 or Article 701 or Article 702) within the single-channel or multiple-channel surface raceway (or multi-outlet assembly) overall or within a specific channel of a multiple-channel surface raceway.
Panel Meeting Action: Reject
Panel Statement: The substantiation is based on applying identification to raceways. The requirement in 700.9(A) applies to boxes and equipment enclosures. Article 700 does not require raceways to be marked. The AHJ is responsible for approval of the required marking on boxes and equipment enclosures.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-159 Log #735 NEC-P13 **Final Action: Reject**
(700.9(B))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
700.9 Wiring, Emergency System.
(B) Wiring. Wiring of two or more emergency circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring from an emergency source or emergency source distribution overcurrent protection to emergency loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through (5):
(1) Wiring from the normal power source located in transfer equipment enclosures
(2) Wiring supplied from two sources in exit or emergency luminaires
(3) Wiring from two sources in a common junction box, attached to exit or emergency luminaires
(4) Wiring within a common junction box attached to unit equipment, containing only the branch circuit supplying the unit equipment and the emergency circuit supplied by the unit equipment
(5) Wiring from an emergency source to supply any combination of emergency, legally required, or optional loads in accordance with (a), (b), and (c):
a. From separate vertical switchboard sections, with or without a common bus, or from individual disconnects mounted in separate enclosures.
b. The common bus or separate sections of the switchboard or the individual enclosures shall be permitted to be supplied by single or multiple feeders without overcurrent protection at the source.
Exception to (5)(b): Overcurrent protection shall be permitted at the source or for the equipment, provided the overcurrent protection is selectively coordinated with the downstream overcurrent protection.
c. Legally required and optional standby circuits shall not originate from the same vertical switchboard section, panelboard enclosure, or individual disconnect enclosure as emergency circuits.
For the purpose of keeping emergency system wiring entirely independent of all other wiring and equipment, the separate channels, whether adjacent or not, of multiple-channel raceway sharing any common enclosure components (raceway enclosure base, raceway enclosure cover, or contiguous barrier) other than supporting means and containing other wiring other than emergency system wiring shall not be considered as entirely independent equipment.
Substantiation: Manufacturers of surface raceways, both metal (*NEC*® Article 386) and nonmetallic (*NEC*® Article 388), and of multi-outlet assemblies (*NEC*® Article 380) derived from surface raceways have received numerous inquiries from specifiers and installers for applications of surface raceways where used for Emergency Systems (*NEC*® Article 700) AND for either Legally Required Standby Systems (*NEC*® Article 701) or Optional Standby Systems (*NEC*® Article 702) AND for other general wiring (power, lighting, signaling) in the same installation. Despite the requirement of 900.9(B), some of these specifiers and installers not versed in "*Code*-speak" chose to focus on keeping the emergency system wiring "independent of all other wiring" (ignoring "equipment" as encompassing the multiple-channel raceway shared in common as being a violation) and are believed to be installing *NEC*® Article 700 circuits in raceway channel separate from channels of the SAME raceway used for *NEC*® Article 701 or Article 702 circuits or for circuits of other general wiring (power, lighting, signaling). A Formal Interpretation Request was submitted to get an answer in black-and-white (see attached), but definitive clarification in the *Code* would resolve these misinterpretations in a more visible and uniformly enforceable manner.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The term "entirely independent" precludes the use of a compartmentalized raceway sharing a common base and/or cover. The recommended text does not provide additional clarity in the application of the requirement of Section 700.9(B).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-160 Log #3958 NEC-P13 **Final Action: Reject**
(700.9(B))

Submitter: James E. Degnan, Sparling
Recommendation: Revise text to read as follows:
(B) Wiring. Emergency system wiring includes any wiring between the emergency source and any transfer switch. Emergency system wiring includes one or more emergency transfer switches dedicated to emergency loads, and the wiring from the emergency transfer switch(es) to the emergency load(s). ~~Wiring of two or more emergency circuits supplied form the same source shall be permitted in the same raceway, cable, box or cabinet.~~ Wiring from an emergency source or emergency source distribution overcurrent protection device to emergency loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through(5):
(1) Wiring from…(retain text to end of (4))…the unit equipment.
(5) Wiring of two or more emergency circuits supplied from the same source in the same raceway, cable, box or cabinet.
(5) ~~Wiring from and emergency source to supply any combination of emergency, legally required, or optional loads. in accordance with (a), (b), and (c).~~
~~a. From…~~ (Delete the rest of the text in a, b, and c)….~~emergency circuits.~~
Substantiation: The first two sentences help to define the emergency wiring system, something that is not explicitly done in 700.1 through 700.9.
The third sentence (previously the first sentence) is simply relocated from the opening down to where it should be, given the structure of the sentence that follows it.
Paragraph 700.9(B)(5) should be deleted. Some of the reliability and intent of this paragraph is met by insertion of the first two sentences in (B) Wiring noted above. The intent to require separation of emergency distribution systems ahead of the transfer switches should not be required because if these systems are all considered part of the emergency system they will retain the reliability offered by separating them from the normal power system. The emergency source has to be split apart at some point, this point should be at the transfer switches, and not as currently required in the NEC, for the following reasons:
1. It would be an extremely rare event that a fault on one emergency system feeder would propagate and affect multiple emergency feeders. No record of these events was included in the substantiation that added this requirement to the 2008 NEC.
2. Even if the separation in the switchboard is constructed it may not achieve what it is intended to. Most faults result in some consumption of material with associated vaporization, hazardous gasses, etc. The materials often leave deposits throughout a switchboard, compromising components in adjacent sections and often throughout the room.
3. The proposed language notes that group mounted switches comply with the code. Considering the expense and space requirements of switchboards, using a wireway to serve individual overcurrent devices is a cost effective alternative to switchboard vertical sections.. However, a wireway with field made taps to switches, has a much better chance of erroneous assembly than a regulated product like a panelboard or even a single switchboard section. The attempt to improve reliability may result in a less reliable system.
4. The code language requires separate vertical sections but is not really clear on the degree of isolation that the vertical sections are suppose to offer. Switchboards can be constructed with separate vertical sections that are not barriered between the sections. If barriers are the intent, then do they extend all the way to the rear and across the horizontal bus or is it adequate to just isolate the feeders? At some point there still must be a separate definition of emergency system vs legally required, where does this occur?
This section of the 2008 NEC forces an increase in building size and electrical cost against no historical record of performance problems.
Panel Meeting Action: Reject
Panel Statement: The referenced change in the 2008 NEC was the result of a task group comprised of NEC Panel 13 members, NFPA 99 health care members, and NFPA 110, Standard for Emergency and Standby Power committee members. The submitter did not provide any technical substantiation for deleting the text that was developed as a result of the task group. There was substantiation provided that indicated there was a safety issue with feeders from the generator source supplying a switchboard with common busing and separate vertical sections. The action on this proposal in the 2008 NEC revision cycle clarified that the required separation of emergency system wiring from wiring of other systems in switchboards is accomplished through the use of barriers to separate the vertical sections.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
DEGNAN, J.: Defining the emergency system as I've noted in this proposal will increase the reliability of emergency and legally required standby power systems, and provide a clear point of separation between the emergency, legally required standby, and optional standby power systems.

13-161 Log #4397 NEC-P13 **Final Action: Accept in Principle in Part**
(700.9(B))

Submitter: Michael S. Shulman, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
700.9 Wiring, Emergency System.
(A) Identification. (no change)
(B) Wiring. Wiring of two or more emergency circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring from an emergency source or emergency source distribution overcurrent protection device to emergency loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through (5):
(1) Wiring from the normal power source located in transfer equipment enclosures
(2) Wiring supplied from two sources in exit or emergency luminaires
(3) Wiring from two sources in a common junction box, attached to or supplying only exit or emergency luminaires
(4) Wiring within a common junction box attached to unit equipment, containing only the branch circuit supplying the unit equipment and the emergency circuit supplied by the unit equipment
(5) (no change)
(C) Wiring Design and Location. (no change)
(D) Fire Protection. (no change)

Substantiation: 700.9(B) 3 currently only allows junction boxes physically attached to emergency luminaires to include both normal and emergency wiring. But the physical attachment of the junction box to the luminaire is not a very relevant factor. The likelihood of emergency lighting system disruption due to a fault on the normal power system is based on proximity of the two systems' wires within the common junction box and not on the physical location of the junction box itself.

It has become a desirable building feature to use (UL 924) Listed load control relays within wall mounted switch boxes, to control ceiling mounted emergency luminaires. This promotes energy conservation by allowing luminaires for sections of buildings that are frequently unoccupied for extended periods of time to be de-energized. It also allows (emergency) luminaires within rooms used for presentations to be dimmed. In both situations, the Listed load control relay will automatically restore full emergency lighting levels upon loss of normal power or activation of a fire alarm. The UL 924 requirements provide for electrical and physical separation between normal and emergency power circuitry of the load control relay and of its wiring terminals.

These wall mounted lighting control boxes are not physically "attached to" the luminaires they control but do not present any more risk of emergency lighting disruption than boxes mounted directly to the luminaire. The proposed revision would make installation of these physically 'remote' but electrically connected common junction boxes permissible by the Code.

As an editorial-only matter, the word "device" seems needed in the base paragraph of 700.9(B).

Panel Meeting Action: Accept in Principle in Part

Revise text for (3) to read:

(3) Wiring from two sources <u>in a listed load control relay supplying exit or emergency luminaires</u> or in a common junction box attached to exit or emergency luminaires.

Reject the addition of "device" in the first paragraph.

Panel Statement: Wiring installations utilizing a listed load control relay must have both normal and emergency circuit conductors enter into the relay enclosure, but only the emergency circuit conductors exit from the enclosure to supply the exit lights or emergency lights. Addition of this text correlates with the panel action on Proposal 13-188. The panel has rejected the recommendation to add "device" because it does not improve clarity.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

DEGNAN, J.: The submitter has not substantiated the omission of the requirement for limiting selective coordination to downstream devices, which is what is noted in the 2008 NEC. The submitter's substantiation statement makes reference to the exceptions of 700.27, but that is not the key impact of this proposed change.

13-162 Log #4475 NEC-P13 **Final Action: Reject**
(700.9(B))

Submitter: Gordon Pierret, Ring & DuChateau, Inc. / Rep. WHEA Code and Advocacy Committee, Tim O'Rorke

Recommendation: Revise text to read as follows:

(B) Wiring. Wiring of two or more emergency circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring from an emergency source or emergency source distribution overcurrent protection to emergency loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through (5):

(1) Wiring from the normal power source located in transfer equipment enclosures

(2) Wiring supplied from two sources in exit or emergency luminaires

(3) Wiring from two sources in a common junction box, attached to exit or emergency luminaires

(4) Wiring within a common junction box attached to unit equipment, containing only the branch circuit supplying the unit equipment and the emergency circuit supplied by the unit equipment

(5) Wiring from an emergency source to supply any combination of emergency, legally required, or optional loads in accordance with (a), (b), (c) and (d):

(a) From separate vertical switchboard sections, with or without a common bus, or from individual disconnects mounted in separate enclosures.

(b) The common bus or separate sections of the switchboard or the individual enclosures shall be permitted to be supplied by single or multiple feeders without overcurrent protection at the source.

Exception to (5)(b): Overcurrent protection shall be permitted at the source or for the equipment, provided the overcurrent protection is selectively coordinated with the downstream overcurrent protection.

(c) Legally required and optional standby circuits shall not originate from the same vertical switchboard section, panelboard enclosure, or individual disconnect enclosure as emergency circuits.

(d) <u>For large facilities with large alternate power system (greater than 500 kW), an additional generator distribution point(s) shall be permitted if the distribution point is supplied by redundant feeders. The redundant feeders shall follow two separate routes and not supported from the same building structural member. The additional generator distribution point shall comply with the requirements of (a), (b) and (c) above. If the generator system voltage is greater than the utilization voltage, redundant step-down transformers shall be provided. See Exhibit 700.5a and 700.5b.</u>

Substantiation: The above proposal would allow the alternate power distribution system to either easily expand as the building expands.

Example: An office building is originally built with a small generator just to provide the minimum code required emergency and legally required power. The building is expanded and new larger alternate power system is required to supply the building and its emergency, legally required and optional standby loads. This proposal also allows for large campus style installations where there is a central generating plant serving either a very large single building or multiple buildings in a campus style installation.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Based on the recommended text and the drawings, the NEC does not prohibit this type of installation, especially where installed in accordance with 700.9(B)(5); therefore the recommendation is unnecessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-163 Log #1163 NEC-P13 **Final Action: Accept**
(700.9(B)(5))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise the Exception to read as follows:

Exception to (5)(b): Overcurrent protection shall be permitted at the source or for the equipment, provided ~~the overcurrent protection is selectively coordinated with the downstream overcurrent protection~~ <u>the overcurrent protection complies with the requirements of 700.27.</u>

Substantiation: In the CMP-13 Panel Statements to Comment 13-157 in the 2007 ROC, the CMP stated that: "Item (5)(b) gives permission to omit the overcurrent protection in the supply feeders, with the subsequent Exception to (5)(b) allowing overcurrent protection as long as the protective devices are selectively coordinated." It continued, "Selective coordination has nothing to do with the objectives of 700.9, and furthermore, selectivity is not a substitute for circuit separation." Certainly, if selective coordination is not a substitute for circuit separation, it is also certain that selective coordination should not be included in 700.9 unless all the exceptions of **700.27 Coordination** are included. 700.9 is improved by linking the Exception to (5)(b) to 700.27 where the concept of selective coordination is fully outlined.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-164 Log #4476 NEC-P13 **Final Action: Reject**
(700.9(B)(5)(a), 700.9(B)(5)(b), and 700.9(B)(5)(c))

Submitter: Gordon Pierret, Ring & DuChateau, Inc. / Rep. WHEA Code and Advocacy Committee, Tim O'Rorke

Recommendation: Revise text to read as follows:

(B) Wiring. Wiring of two or more emergency circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring from an emergency source or emergency source distribution overcurrent protection to emergency loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through (5):

(1) Wiring from the normal power source located in transfer equipment enclosures

(2) Wiring supplied from two sources in exit or emergency luminaires

(3) Wiring from two sources in a common junction box, attached to exit or emergency luminaires

(4) Wiring within a common junction box attached to unit equipment, containing only the branch circuit supplying the unit equipment and the emergency circuit supplied by the unit equipment

(5) Wiring from an emergency source to supply any combination of emergency, legally required, or optional loads in accordance with (a), (b), and (c) and (d):

(a) From ~~separate vertical switchboard sections,~~ <u>overcurrent device in individually barriered compartments of distribution equipment,</u> with or without a common bus, or from individual disconnects mounted in separate enclosures.

(b) The common bus or separate sections of the ~~switchboard~~ <u>distribution equipment</u> or the individual enclosures shall be permitted to be supplied by single or multiple feeders without overcurrent protection at the source.

Exception to (5((b): Overcurrent protection shall be permitted at the source or for the equipment, provided the overcurrent protection is selectively coordinated with the downstream overcurrent protection.

(c) Legally required and optional standby circuits shall not originate from the same ~~vertical switchboard section, panelboard enclosure,~~ <u>unbarriered distribution equipment</u> or individual disconnect enclosure as emergency circuits.

Substantiation: The above proposal revises the language "separate vertical switchboard sections" to "overcurrent device in individually barriered compartment of distribution equipment". The purpose of this proposed revision is to:

1. Provide flexibility by allowing the overcurrent devices serving multiple branches (emergency, legally required, or optional loads) to be located in common vertical sections but requiring compartmentalization for each overcurrent device.

2. Requiring that all overcurrent devices serving common branches (emergency, legally required, or optional loads) to be compartmentalized, therefore enhancing the level of protection between these devices.

3. The present code language does not reflect current industry design and equipment manufacturing methods. Emergency distribution additions at many current facilities would in many cases impracticable.

Panel Meeting Action: Reject

Panel Statement: There was no technical substantiation provided to permit emergency overcurrent protective devices to be installed in the same vertical section as legally required standby or optional standby devices. The substantiation did not address the availability of switchgear to be manufactured with individual barriers for separation of these devices within the same vertical section. In addition, there is no reason to require individual barriers where only legally required and optional standby are in the same vertical section.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

DEGNAN, J.: This proposal would permit the use of highly reliable Metal Enclosed Switchgear per UL 1558 to serve combinations of emergency, legally required standby, and optional standby power systems without vertical separation. The reliability of this equipment will exceed field fabricated assemblies of splices serving individually mounted overcurrent protective devices, and therefore offers an increase in safety beyond what is in the 2008 NEC.

13-165 Log #789 NEC-P13 **Final Action: Reject**
(700.9(B)(5)c. Exception)

Submitter: Lawrence W. Forshner, Town of Natick

Recommendation: Add exception after 700.9(B)(5)c. to read as follows:

Exception: Individual disconnect enclosures, shall not be required when a single enclosure, factory or field installed, on gen-sets, containing two or more circuit breakers supplying feeders, are equipped with barriers, that provide separation for the load side conductors.

Substantiation: It is common practice to have multiple feeder breakers mounted on the side of Gen-Set alternators. There are space limitations making it difficult to comply with the requirement for separate enclosures. The line side of the multiple feeder disconnects are fed with short feeder tap conductors from a common bus on the generator alternator. They are common in the alternator housing which is the common voltage source. I am in agreement with the addition of 700.9(B)(5)c. to the 2008 Code, however, how far back to the source is it practical to require separation? Partitioning on the load side of the breakers, separating the load side feeder conductors, satisfies the intent of this section.

Panel Meeting Action: Reject

Panel Statement: The proposed exception does not provide any information on the types of barriers to be installed within the single enclosure and the installation requirements of these barriers.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-166 Log #2912 NEC-P13 **Final Action: Reject**
(700.9(C)(1) (New))

Submitter: Thomas Guida, TJG Services, Inc.

Recommendation: Add new paragraph below:

700.9(C) Wiring Design and Location. Emergency wiring circuits shall be designed and located so as to minimize the hazards that might cause failure due to flooding, fire, icing, vandalism, and other adverse conditions.

<u>**(1) Floodplain Protection.** Where emergency wiring circuits are installed below the level of the 100-year floodplain, the circuit conductors shall be listed for use in a wet location in accordance with 310.8(C) and be installed in a wiring method that is permitted for use in wet locations.</u>

Substantiation: This is equivalent to wording in 708.10(C)(3) to protect cables and wiring methods for cables to be functional in a wet location.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that the level of protection contained in the recommendation is not necessary for emergency system wiring installed in locations that are not wet, but are included in the 100 year flood plain. For all indoor and outdoor installations that are in wet locations, the present requirements of Article 300 apply.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-167 Log #29 NEC-P13 **Final Action: Reject**
(700.9(D))

NOTE: This proposal appeared as Comment 13-162 on Proposal 13-123 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-123 was:

Revise Feeder-Circuit Wiring to Emergency Circuit Wiring. Emergency circuit wiring shall meet one of the following conditions.

Submitter: Edward Walton, Draka Cableteq

Recommendation: Add new text to 700.9(D) as follows:

<u>(3) Branch Circuit Wiring. Branch circuits that originate in a location remote from the area being served shall meet one of the following conditions:</u>

<u>(1) Be installed in spaces or areas that are fully protected by an approved automatic fire suppression system</u>

<u>(2) Be a listed electrical circuit protective system with a minimum 1-hr fire rating</u>

<u>(3) Be protected by a listed thermal barrier system for electrical system components</u>

<u>(4) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 1 hr</u>

<u>(5) Be embedded in not less than 50 mm (2 in.) of concrete</u>

<u>(6) Be a cable listed to maintain circuit integrity for not less than 1 hr when installed in accordance with the listing requirements.</u>

Revise reference in 700.9(D) to read:

<u>700.9(D)(1), (D)(2), and (D)(3)</u>

Optional. Add FPN as follows:

<u>FPN: A remote location is defined as an area separate from the Emergency System Circuit load such as a different floor in a multistory building or a different fire zone in a place of assembly or stadium.</u>

Substantiation: This proposal has been modified to resolve the panel's concern that this "level of protection" is not warranted for all branch circuits. The branch circuit for which this protection is required is now defined as a remotely located branch circuit.

5-a. Even though a fire caused circuit failure would be more catastrophic for the feeder cable, the remotely located branch circuit is far more vulnerable if it is run through the protected premises before connected to the load.

5-b. Presently the emergency branch circuit panel could be located in the basement of a multistory building (7 stories or higher) or on the opposite side of an assembly hall or stadium far from the emergency circuit load and without the required fire protection of 700.9(D).

5-c. One code user misinterpretation is that the feeder-circuit wiring terminates at the transfer switch and anything beyond that does not require fire protection. Adopting this proposal would help clarify this misinterpretation.

I have included an optional FPN if the panel feels it needs to define remote location.

This proposal could be located in Section IV if the panel believes this is a more proper location.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided sufficient technical substantiation to require all emergency branch circuits in assembly occupancies for not less than 1000 persons or in buildings above 75 ft in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and mercantile. The stipulation that this only applies to branch circuits that originate in a location remote from the area being served by the branch circuit would result in confusion in application. The suggested definition of remote location is not clear, as "an area separate from the emergency system circuit load" is not definitive.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-168 Log #1523 NEC-P13 **Final Action: Accept**
(700.9(D))

TCC Action: The Technical Correlating Committee understands that the panel action on this proposal modifies the panel action on Proposal 13-170.

Submitter: L. Keith Lofland, IAEI

Recommendation: Revise text to read as follows:

700.9(D) Fire Protection. Emergency systems shall meet the additional requirements in 700.9(D)(1) <u>through (D)(3)</u> in assembly occupancies for not less than 1000 persons or in buildings above 23 m (75 ft) in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and mercantile.

Substantiation: 700.9(D)(3) dealing with generator control wiring was added for the 2008 NEC. This is an additional requirement that emergency system feeder-circuit wiring is required to meet. Previous language only required these emergency system feeders to meet 700.9(D)(1) and (D)(2).

Panel Meeting Action: Accept

13-170 Log #3938 NEC-P13 **Final Action: Accept**
(700.9(D))

Submitter: James Kelley, Sargent & Lundy
Recommendation: Revise text to read:
(D) Fire Protection. Emergency systems shall meet the additional requirements in 700.9(D)(1) and (D)(2) in assembly occupancies for not less than 1000 persons or in buildings above 23 m (75 ft) in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and
mercantile.
FPN For the definition of *0ccupancv Classification*, see Section 6.1 of NFPA *101-2006, Life Safety Code.*
(1) Feeder-Circuit Wiring. Feeder-circuit wiring shall meet one of the following conditions:
(1) Be installed in spaces or areas that are fully protected by an approved automatic fire suppression system
(2) Be a listed electrical circuit protective system with a minimum 1-hour fire rating
FPN: UL guide information for electrical circuit protection systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
(3) Be protected by a listed thermal barrier system for electrical system components
(4) Be protected by a listed fire-rated assembly that has a minimum fire rating of 1 hour and contains only emergency wiring circuits.
(5) Be embedded in not less than 50 mm (2 in.) of concrete
(6) Be a cable listed to maintain circuit integrity for not less than 1 hour when installed in accordance with the listing requirements
(2) Feeder-Circuit Equipment. Equipment for feeder circuits (including transfer switches, transformers, and panelboards) shall be located either in spaces fully protected by approved automatic fire suppression systems (including sprinklers, carbon dioxide systems) or in spaces with a 1-hour fire resistance rating.
~~*FPN: For the definition of Occupancy Classification, see Section 6.1 of NFPA 101 2006, Life Safety Code.*~~
Substantiation: Editorial change for the placement of the Fine Point Note (FPN) that follows 700.9(D)(2) to be relocated to follow 700.9(D). Though the 2003 National Electrical Code Style Manual amended January 15, 2003 does not address the placement of FPNs, their placement should, like those of "Exceptions" (Ref. Style Manual in 2.6.1), "immediately follow the main rule to which they apply." In the case of the subject FPN, which provided additional information about Occupancy Classification, it would be better served following 700.9(D) because of its mention of "occupancy classes".
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-171 Log #2913 NEC-P13 **Final Action: Accept**
(700.9(D)(1))

TCC Action: The Technical Correlating Committee understands that the panel actions on proposals 13-172, 13-173, and 13-174 modified the panel action on this proposal.
Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Delete method 6 as shown below.
700.9(D) Fire Protection. Emergency systems shall meet the additional requirements in 700.9(D)(1) and (D)(2) in assembly occupancies for not less than 1000 persons or in buildings above 23 m (75 ft) in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and mercantile.
(1) Feeder-Circuit Wiring. Feeder-circuit wiring shall meet one of the following conditions:
(1) Be installed in spaces or areas that are fully protected by an approved automatic fire suppression system
(2) Be a listed electrical circuit protective system with a minimum 1-hour fire rating
FPN: UL guide information for electrical circuit protection systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
(3) Be protected by a listed thermal barrier system for electrical system components
(4) Be protected by a listed fire-rated assembly that has a minimum fire rating of 1-hour and contains only emergency wiring circuits.
(5) Be embedded in not less than 50 mm (2 in.) of concrete
~~(6) Be a cable listed to maintain circuit integrity for not less than 1 hour when installed in accordance with the listing requirements.~~
Substantiation: Item (6) is encompassed by item (2). A "listed cable to maintain circuit integrity" is covered as a listed electrical circuit protective system for power. All UL FHJR fire resistive cables are listed as an electrical circuit protective system (FHIT).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-172 Log #2914 NEC-P13 **Final Action: Accept in Principle in Part**
(700.9(D)(1))

TCC Action: The Technical Correlating Committee understands that the panel action on this proposal modifies the panel action on Proposal 13-171.
Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Revise text as follows:
700.9(D) Fire Protection. Emergency systems shall meet the additional requirements in 700.9(D)(1) and (D)(2) in assembly occupancies for not less than 1000 persons or in buildings above 23 m (75 ft) in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and mercantile.
(1) Feeder-Circuit Wiring. Feeder-circuit wiring shall meet one of the following conditions:
(1) Be installed in spaces or areas that are fully protected by an approved automatic fire suppression system
(2) Be a listed electrical circuit protective system with a minimum 2~~1~~-hour fire rating
FPN: UL guide information for electrical circuit protection systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
(3) Be protected by a listed thermal barrier system for electrical system components **that has a minimum fire rating of 2 hours and contains only emergency wiring circuits.**
(4) Be protected by a listed fire-rated assembly that has a minimum fire rating of 2~~1~~-hour and contains only emergency wiring circuits.
(5) Be embedded in ~~not less than 50 mm (2 in.) of~~ concrete **with a sufficient thickness to achieve a minimum 2 hour fire rating**.
~~(6) Be a cable listed to maintain circuit integrity for not less than 1 hour when installed in accordance with the listing requirements.~~
Substantiation: This proposal increases the time from 1 hour to 2 hours as was done last code cycle in 695.6(B). The extended time is to allow occupants to exit the building as well as give fire fighters additional time to operate the fire fighting equipment once people exit the building by extending the time the emergency circuits operate.
Method (3) adds the duration of the fire rating and the same wording as method 4.
Method (5) has deleted the 2 inches because in various applications e.g. slabs versus columns or with different concrete, e.g. lightweight, siliceous, or carbonate; different concrete thickness may be required to meet the rating.
Method (6) is encompassed by method (2). A "cable listed to maintain circuit integrity" is covered as a listed electrical circuit protective system for power.

All UL FHJR fire resistive cables are listed as an electrical circuit protective system (FHIT).

Panel Meeting Action: Accept in Principle in Part

The panel accepts the recommended revisions to 700.9(D)(1)(2), (4), and (6) and accepts in principle the recommended revision to 700.9(D)(1)(3). The panel rejects the remainder of recommended revisions.

Panel Statement: See the panel action on Proposal 13-173 relative to the panel action on 700.9(D)(1)(3). In regard to the rejected portion of the recommendation on 700.9(D)(1)(5), the 2 in. of concrete has provided the industry with a prescriptive benchmark that has served the industry well. The substantiation does not demonstrate that use of 2 in. of concrete has compromised the integrity of the circuit. The recommendation does not provide an alternative prescriptive requirement that can be easily applied.

Number Eligible to Vote: 14

13-177 Log #4879 NEC-P13 **Final Action: Reject**
(700.12, FPN (New))

Submitter: Michael A. Anthony, University of Michigan Business Operations / Rep. Association of Education Facilities Executives
Recommendation: Add FPN 3 to the list as shown below:

700.12 General Requirements.

Current supply shall be such that, in the event of fauilure of the normal supply to, or within, the building or group of buildings concerned, emergency lighting, emergency power, or both shall be available within the time required for the application but not to exceed 10 seconds. The supply system for emergency purposes, in addition to the normal services to the building and meeting the general requirements of this section, shall be one or more of the types of systems described in 700.12(A) through (E). Unit equipment in accordance with 700.12(E) shall satisfy the applicable requirements of this article.

In selecting an emergency source of power, consideration shall be given to the occupancy and the type of service to be rendered, whether of minimum duration, as for evacuation of a theater, or longer duration, as for supplying emergency power and lighting due to an indefinite period of current failure from trouble either inside or outside the building.

Equipment shall be designed and located so as to minimize the hazards that might cause complete failure due to flooding, fires, icing, and vandalism.

Equipment for sources of power as described in 700.12(A) through (E) where located within assembly occupancies for greater than 1000 persons or in buildings above 23 m (75 ft) in height with any of the following occupancy classes — assembly, educational, residential, detention and correctional, business, and mercantile — shall be installed either in spaces fully protected by approved automatic fir suppression systems (sprinklers, carbon dioxide systems, and so forth) or in spaces with a 1-hour rating.

FPN No. 1: For the definition of Occupancy Classification, see Section 6.1 of NFPA 101-2006, Life Safety Code.

FPN No. 2: Assignment of degree of reliability of the recognized emergency supply system depends on the careful evaluation of the variables at each particular installation.

FPN No. 3: Quantitative methods provide more consistent results in reliability studies. For further information see ANSI/IEE Standard 493: Recommended Practice for the Design of Reliable Industrial and Commercial Power Systems.

Substantiation: The IEEE "Gold Book" is the most comprehensive document on quantitative methods for reliability in the world. Since reliable power systems are as important to life safety as fire safety, all NFPA committees and NEC users should become more familiar with the terms and art of reliability engineering.
Panel Meeting Action: Reject
Panel Statement: Fine Print Note No. 2 already provides the assignment of the degree of reliability for the evaluation of the variables making the addition of this new FPN No. 3 unnecessary.

13-179 Log #3950 NEC-P13 **Final Action: Reject**
(700.12(B)(3))

Submitter: James Kelley, Sargent & Lundy
Recommendation: Revise text to read as follows:

(3) Dual Fuel Supplies. Prime movers shall not be solely dependent on a public utility gas system for their fuel supply or municipal water supply for their cooling systems. Means shall be provided for automatically transferring from one fuel supply to another where dual fuel supplies are used.

Substantiation: Editorial change for the insertion of "Fuel" in the title of 700.12(B)(3) because it is the adjective of the subject and this would be consistent with the title of a parallel topic in 701.11(B)(3).
Panel Meeting Action: Reject
Panel Statement: The requirement covers other than fuel supplies.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-180 Log #3454 NEC-P13 **Final Action: Reject**
(700.12(B)(6))

Submitter: Joseph A. Ross, Haverhill, MA
Recommendation: Revise 700.12(B)(6) and add a new *Exception* as follows:

Where an outdoor housed generator set, equipped with a readily accessible disconnecting means, is located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure. The disconnecting means shall ~~meet the requirements of 225.36~~ be marked to identify it as being suitable for use as service equipment.

Exception: For installations under single management, where conditions of maintenance and supervision ensure that only qualified persons will monitor and service the installation and where documented safe switching procedures are established and maintained for disconnection, the generator set shall not be required to be located within sight of the building or structure served.

Substantiation: We are aware of the concerns that CMPs 10 and 13 have had with this issue. The concept of this proposal is to address confusion in the field. The first sentence clarifies that it's the generator set (housed or not housed) that is to be "within sight" of the building and not the disconnecting means. Over zealous AHJs have had generator sets lifted and rotated so the disconnecting means faced the building. The second sentence clarifies that conductors from the generator may be "outside feeders" (225.36) or could be "service conductors" (230.66), therefore, the revision. The Exception gives practical relief to some establishments that may desire to locate the generator at the edge of their parking lots and not in the middle of it (premium space, snow plowing, noise pollution, etc.). Also, the generator may serve more than one building (alarm systems, etc.).
Panel Meeting Action: Reject
Panel Statement: The intent is for the generator disconnecting means to be in line of sight of the building, not the generator. The recommendation changes the intent of the existing requirement. The output conductors of the generator do not involve service conductors, as alluded to in the substantiation. The output conductors of a generator are feeder conductors and, if the generator is located outside the building and assuming the generator is a structure, the feeders and their disconnecting means are covered by Part II of Article 225. Where the generator is located in a parking lot not in close proximity to the building, an additional disconnecting means must be installed at the building to comply with Part II of Article 225. No technical substantiation was provided to permit the disconnecting means to not be located at the point where the feeder enters into the building in accordance with 225.32 with the accompanying four exceptions that would permit alternatives to this requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

MOUTON, C.: I'm voting against the panel action. The panel action should have been to accept in principle. The proposal intends to provide the same exception for installations under single management to outdoor housed generator sets, as provided by Exception 1 of Article 225.32 for other types of outside feeders. The proposed changes in the main paragraph related to the reference to Article 225.36 should be eliminated. And the proposed exception should have been accepted in principle and modified to replace the wording "generator set" in the Exception with "generator disconnecting means". This will correctly identify the exception as applying to the disconnecting means and not the generator set. As indicated in the panel statement, the intent of the referenced Article 700.12(B)(6) is for the disconnecting means to be in line of sight of the building. As allowed by Exception 1 of Article 225.32, the additional disconnecting means should not be required to be within site of the building or structure served, and can be located "elsewhere on the premises". The application of this exception to an outdoor housed generator set is technically no different than any other type of outside feeder to the building. The exception provides the conditions upon which the installation can be operated and maintained safely, i.e. the use of qualified persons for the maintenance and supervision and documented safe switching procedures are established and maintained. Similar installations of outdoor feeders serving a building or structure, without the installation of a disconnect device installed either inside or outside of the building or structure and not within site of the building or structure, are operated and maintained safely when the conditions stated in the exception are present.

13-181 Log #4707 NEC-P13 **Final Action: Reject**
(700.12(B)(6))

Submitter: Clyde V. Carl, North Carolina Dept. of Administration/State Construction Office
Recommendation: Delete text as follows:
~~The disconnecting means shall meet the requirements of 225.36.~~
Substantiation: The sentence that was added to 700.12(B)(6) is superfluous with consideration to the requirements of UL 869A and UL 2200. The physical requirements that determine a disconnecting means to be "suitable for use as service equipment" are not found in NEC®. Consequently, the mandate that equipment must be suitable for use a service equipment, without clear definition of how equipment may be suitable, may foster misunderstandings about how the requirement may be satisfied. This is the thesis by which the proposed fine print note should be added to 225.36 to mitigate a misapplication for the "suitable for service equipment" requirement of 700.12(B)(6) that was revised for the 2008 edition of the NEC®.

In UL 869A, *Reference Standard for Service Equipment,* fourth edition, one learns in Section 14.2, Insulated neutral, Paragraph 14.2.1, that, "Equipment having a neutral insulated from the enclosure, intended for use as service equipment, and that can accommodate not more than six main disconnecting means shall be marked "Suitable for use as service equipment." The NEC® definition for service equipment expands on UL 869A by stating, "The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service conductors to a building or other structure, or an otherwise designated area, and intended to constitute the main control and cutoff of the supply." The problem is that generator sets are, by the NEC® definition, separately derived systems. A separately derived system is, "A premises wiring system whose power is derived from a source of electrical energy or equipment other than a service. Such systems have no direct electrical connection, including a solidly connected grounded circuit conductor, to supply conductors originating in another system." A generator set is a separately derived system, therefore, there is no justification for 700.12(B)(6) to require the disconnecting means of a generator set to be suitable for service equipment. 700.12(B)(6) is ambiguous in another way.

In UL 2200, *Stationary Engine Generator Assemblies,* Section 25 discusses overcurrent protection, a requirement of equipment suitable for service equipment, and output circuit grounding. UL 2200 does not specifically call out a requirement for a neutral that is insulated from the generator set enclosure, but Section 14, Output Circuit Grounding, in paragraph 14.1.2 requires that "an output alternating current power circuit shall be grounded" when in sub-paragraph (a) "the circuit has no electrical connection, including a solidly connected grounded circuit conductor, to supply conductors originating in another wiring system." Conversely, the alternating current output power circuit must be insulated from ground at the generator if the circuit shares a neutral conductor ground reference with another system, or a service. If the grounded conductor is not to be shared with another system, or service, UL 2200 goes on in paragraph 14.1.4 to describe the application and sizing of a bonding jumper to ground conductors of output circuit configurations listed in paragraph 14.1.3. A bonding jumper would not be required if a generator output circuit was bonded to ground at the factory. If this were the case, the generator set output, though a separately derived system, could only be utilized in the manner of service entrance equipment, and if UL 2200 was similar to UL 869A, it would require the generator set to be labeled, "Suitable only for use as service equipment", unless its output enclosure can accommodate more than six disconnecting means, and then it would be required to be labeled. "Suitable only for use as service equipment. Install not more than six main disconnecting means."
Panel Meeting Action: Reject
Panel Statement: In the substantiation the submitter states that as far as the NEC is concerned, generators are separately derived systems and that is incorrect. To determine whether the generator is a separately derived system, both the transfer switch and the bonding and grounding within the generator must be determined. If the generator is manufactured with the neutral isolated from the frame, then the transfer switch can either switch all of the conductors, including the neutral, if there is one, or switches only the phase conductors and not the neutral. Where the neutral is not tied down and not switched by the transfer switch, the system is not separately derived so Section 250.30 is not followed. Where the neutral is tied internal to the generator and not accessible to the installer to isolate, the generator must be installed as a separately derived system and must comply with 250.30 with the neutral switched by the transfer switch, if there is a neutral. These issues are key to the generator feeder (generators are not considered by the NEC to be services) disconnecting means, and critical to that issue is whether the neutral, where provided, is able to be isolated from the frame of the disconnecting means at the building. Compliance with 225.36 is essential to the disconnecting means to be able to have the neutral isolated from the disconnect enclosure or not, depending upon whether the generator is a separately derived system, so deleting the last sentence is not acceptable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-182 Log #1496 NEC-P13 **Final Action: Accept in Principle**
(700.12(F), Exceptions No. 1 and No. 2)

Submitter: Robert G. Fahey, City of Janesville
Recommendation: Add new text as follows:
700.12(F)
Exception No. 1: In a separate and uninterrupted area supplied by a minimum of three normal lighting circuits, a separate branch circuit for unit equipment shall be permitted if it originates from the same panelboard as that of the normal lighting circuits and is provided with a lock-on feature.
Exception No. 2: Unit equipment located on the exterior of buildings, outside of exit doors shall be permitted to be on the same emergency lighting circuit as is the unit equipment illuminating the area immediately inside the same exit door.
Substantiation: The addition of the 2nd Exception will allow a practice which is commonly done in the State where I inspect electrical wiring, this practice also appears to take place in other areas of the United States, as Electrical Engineers from other areas of the United States designs include this concept. The present wording in 700.12(F) requires the outside unit equipment to be supplied off of the outside lighting circuit, the common practice is to use the unit equipment inside the exit door, typically an exit/emergency light with the capability of supplying remote heads, thus the electrician will install 2 remote lights outside the exit door, utilizing the emergency lighting circuit inside the building and not the lighting circuit which supplies the outside lights, normally wall packs. This exception would, in my mind, not reduce safety, as when the interior normal lighting circuit is compromised, the interior emergency lights will activate both the emergency lights inside and outside the exit door(s), giving the occupants a safe passage to the exit and away from the building.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Exception No. 2: Remote heads providing lighting for the exterior of an exit door shall be permitted to be supplied by the unit equipment serving the area immediately inside the exit door.
Panel Statement: The panel action clarifies the intent of the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-183 Log #2244 NEC-P13 **Final Action: Reject**
(700.12(F)(4))

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Add new text to read as follows:
The branch circuit feeding the unit equipment shall be the same branch circuit as that serving the normal lighting in the area and connected ahead of any local switches without energizing unit equipment in other lit areas.
Substantiation: In a large new building, the emergency battery units where not wired on the normal lighting branch circuit. The problem was resolved by adding many relays, wired that when any circuit tripped or was shut off all the emergency battery units would energize in that area, room or corridor when the normal lighting was on draining the other battery units that were not needed.
Panel Meeting Action: Reject
Panel Statement: The third sentence in the second paragraph of 700.12(F), clearly requires the branch circuit feeding the unit equipment to be the same branch circuit as that serving the normal lighting in the area and connected ahead of any local switches. The other unit equipment in those other areas must be connected to the lighting branch circuit in that area so the proposed additional is unnecessary and misleading.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MOUTON, C.: The panel statement should be modified to reflect that the correct reference is 700.12(F)(4).

13-184 Log #1585 NEC-P13 **Final Action: Reject**
(700.12(F)(4) Exception)

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
Exception: In a separate and uninterrupted area supplied by a minimum of three normal lighting circuits, a separate branch circuit for unit equipment shall be permitted if it originates from the same panelboard as that of the normal lighting circuits and is ***lockable in the closed position*** *~~provided with a lock-on feature.~~*
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: The substantiation does not support the recommended change. The current text is clear as to the intended function of this device.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-185 Log #111 NEC-P13 **Final Action: Reject**
(700.16)

Note: This Proposal appeared as Comment 13-173 on Proposal 13-133 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-133 was:
Revise text to read as follows:
"...failure of any individual lighting element such as ~~the burning out of a light bulb~~ a lamp, cannot...".
Submitter: Samuel Goble, Department of General Services / Rep. Commonwealth of Virginia
Recommendation: Revise text to read:
"...failure of any individual lighting ~~element~~ component such as the burning out of a ~~light bulb~~ lamp or ballast, cannot...".
Substantiation: The term "element" is often confused for a "filament". Using an example can often confuse the intent of the code section, such as in this example. Replacing the word "element" with "component" does not change the intent or meaning of this code section and replaces a layman's term such as the "element" often misused as the filament of a lamp. Using the term "component" covers all parts of all types of luminaries.
Panel Meeting Action: Reject
Panel Statement: The phrase "light bulb" was replaced with the word "lamp" in the 2008 NEC. The proposed change from "element" to "component" can be misleading and confusing. There was no technical substantiation for adding "ballast" to the requirement for the failure of any one element. A ballast is not an element of individual lighting. Acceptance of this proposed text would require redundant ballast for no reason.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-186 Log #656 NEC-P13 **Final Action: Reject**
(700.16)

Submitter: Samuel J. Goble, Just Good Electrical Code Training
Recommendation: Revise text to read as follows:
"...failure of any individual lighting ~~element~~ component such as the burning out of a lamp or ballast cannot...".
Substantiation: The term "element" is often confused for a "filament". Using an example can often confuse the intent of the code section, such as in this example. Replacing the word "element" with "component" does not change the intent or meaning of this code section and replaces a layman's term such as the word "element" often misused as the "filament" of a lamp. Using the term "component", covers all parts of all types of luminaries.
Panel Meeting Action: Reject

13-187 Log #3512 NEC-P13 **Final Action: Accept in Principle**
(700.17)

Submitter: Mark R. Hilbert, Wolfeboro, NH
Recommendation: Revise 700.17 as follows:
700.17 Branch Circuits for Emergency Lighting.
Branch circuits that supply emergency lighting shall be installed to provide service from a source complying with 700.12 when the normal supply for lighting is interrupted. Such installations shall provide either of the following:
(1) An emergency lighting supply, independent of the ~~general~~ normal lighting supply, with provisions for automatically transferring the emergency lights upon the event of failure of the ~~general~~ normal lighting ~~system~~ branch circuit, ~~supply~~
(2) Two or more branch circuits supplied from separate and complete systems with independent power ~~supply~~ sources. One of the two power sources and systems shall be part of the emergency system and the other shall be permitted to be part of the normal power source and system. ~~each~~ Each system shall provide ~~providing~~ sufficient current for emergency lighting purposes.
Unless both systems are used for regular lighting purposes and are both kept lighted, means shall be provided for automatically energizing either system upon failure of the other. Either or both systems shall be permitted to be a part of the general lighting ~~system~~ of the protected occupancy if circuits supplying lights for emergency illumination are installed in accordance with other sections of this article.
Substantiation: Revising this section as proposed will clarify that the requirements of the section are branch circuit level requirements and how these branch circuits are installed. Although the term "branch circuit" is used in the opening sentence, including it in the title of the section will heighten the awareness that this section provides information for branch circuits supplying emergency lighting.
Section 700.17 is often misunderstood and the proposed revisions to (1) and (2) should provide a clearer understanding of how branch circuits for emergency lighting purposes should be installed and operate.
By replacing the words "general" with "normal" and adding the term "branch circuit" as indicated in 700.17(1) will make it clear that the emergency lighting supply must be independent of the normal lighting supply and that it must automatically operate when there is a failure of the branch circuit supplying the normal lighting. The fact that the emergency lighting must operate upon a failure of the normal lighting branch circuit is often overlooked.
Revising 700.17(2) as recommended will clarify that the requirement of this section is for the area requiring the emergency lighting to be supplied by a minimum of two branch circuits that originate from separate systems with different power sources. These facts and the fact this section is also addressing times when the normal power is present are often overlooked. Unlike 700.17(1) where a failure of the normal lighting branch circuit will activate the emergency lighting supply, an area supplied by only one emergency lighting branch circuit will be in total darkness if there is a failure of that branch circuit. For example; it is not uncommon to find installations where a single branch circuit from an emergency lighting branch circuit panelboard, which is being used as part of the general lighting, has been run to a stairwell (means of egress). In this example, any time there is a failure of the branch circuit supplying the stairwell, the stairwell would be in total darkness. If two branch circuits from separate systems had been run to the stairwell as required by 700.17(2) and there is a failure of one branch circuit, the other would still provide the necessary lighting.
The word "systems" has been removed from the last paragraph as indicated to provide a clearer understanding that both systems are actually permitted to provide general lighting for the protected occupancy.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
700.17 Branch Circuits for Emergency Lighting.
Branch circuits that supply emergency lighting shall be installed to provide service from a source complying with 700.12 when the normal supply for lighting is interrupted. Such installations shall provide either of the following:
(1) An emergency lighting supply, independent of the ~~general~~ normal lighting supply, with provisions for automatically transferring the emergency lights upon the event of failure of the ~~general~~ normal lighting ~~system~~ branch circuit, ~~supply~~
(2) Two or more branch circuits supplied from separate and complete systems with independent power ~~supply~~ sources. One of the two power sources and systems shall be part of the emergency system and the other shall be permitted to be part of the normal power source and system. ~~each~~ Each system shall provide ~~providing~~ sufficient power ~~current~~ for emergency lighting purposes.
Unless both systems are used for regular lighting purposes and are both kept lighted, means shall be provided for automatically energizing either system upon failure of the other. Either or both systems shall be permitted to be a part of the general lighting ~~system~~ of the protected occupancy if circuits supplying lights for emergency illumination are installed in accordance with other sections of this article."
The remainder of the proposed text accepted as is.
Panel Statement: The panel has replaced the term "current" with "power" to ensure that proper voltage is maintained at the equipment being supplied.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-188 Log #3232 NEC-P13 **Final Action: Accept in Principle**
(700.24 (New))

Submitter: Steven R. Terry, Electronic Theatre Controls Inc.
Recommendation: Add new section as follows:

700.24 (new) Emergency Lighting Automatic Control. Where an emergency lighting load is automatically energized upon loss of the normal supply, an automatic load control relay shall be permitted to energize the load. Where an emergency lighting load is automatically energized, upon loss of the normal supply, by transferring the load from a normal supply branch circuit to a different, unswitched, emergency supply branch circuit, an automatic transfer switch shall be used for such energization.

Substantiation: Two new classes of device have emerged in the last few years:

1. Listed stand-alone Automatic Load Control Relays. This device was traditionally part of emergency unit equipment but UL now lists stand-alone devices under UL924.

2. UL 1008-listed Automatic Transfer switches of one to 48 circuits specifically designed for transferring emergency loads between a normal branch circuit and a different, emergency branch circuit. Previously, listed ATSs were used primarily in feeder applications, not on branch circuit loads.

There is ongoing confusion in the specification and installation community concerning the proper application of these two devices on branch circuits. The UL924 Load Control Relay is often misapplied as an Automatic Transfer Switch in a branch circuit application. UL has publicly asserted that UL924 Load Control Relays are not to be used to transfer a load between two non-synchronous power sources, and that only a UL1008 device is suitable for this application. In the Spring 2005 issue of “The Code Authority” (UL’s newsletter on Code issues), the article “Focus on Emergency Lighting Equipment “ appears on page 3 (see Exhibit A provided with this proposal). In the second paragraph, that article states:

“An important issue to recognize is that an LCR does not switch the load between the normal and emergency supplies. Load switching of this type should only be performed by a transfer switch listed in accordance with UL1008, Standard for Safety for Transfer Switch Equipment. An LCR has only one power input source, and that is connected to the emergency power supply.”

In addition the UL white book clearly differentiates Automatic Transfer Switches (product category WPWR) and Automatic Load Control Relays (product cateory FTBR).

Nevertheless, misapplication of these devices continues, perhaps because it is so easy to misunderstand the limitations of Load Control relays. This is not helped by the fact that at least 3 manufacturers of stand-alone UL924 Load Control Relays describe these products as “Transfer” devices in their literature (see Exhibit B provided with this proposal). Such literature also encourages misapplication of these devices as transfer switches through installation diagrams that show transfer of the load between normal and emergency sources, in direct contravention to UL’s statement above.

Load Control Relays are not suitable for transfer between two non-synchronous power sources because:

A. They do not have mechanisms required by UL1008 to prevent inadvertent connection of the normal and emergency sources, and

B. They do not undergo fault-current evaluation that is required of UL1008 transfer switches.

Because it is so easy for engineers and installers to misapply Load Control Relays as transfer devices on branch circuits, Article 700 should clarify the correct application of these two devices. Efforts by UL alone have been unsuccessful in preventing field misapplication of Load Control Relays as transfer switches.

I have made a separate proposal in this cycle to add a definition of Automatic Load Control Relays in 700.2(new).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

700.24 Automatic Load Control Relay. If an emergency lighting load is automatically energized upon loss of the normal supply, a listed automatic load control relay shall be permitted to energize the load. The load control relay shall not be used as transfer equipment.

Panel Statement: The panel action clarifies the permitted use of this equipment and that this type of equipment cannot be used as transfer equipment. The action also imposes a requirement for this type of equipment to be listed.

(700.26)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:

Change “per” to “in accordance with”.

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.

Panel Meeting Action: Accept

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-190 Log #3690 NEC-P13 **Final Action: Reject**
(700.26)

Submitter: Christopher G. Walker, Eaton Corp.
Recommendation: Add new text to read as follows:

<u>(A) Feeders</u>

<u>Where ground-fault protection has been provided for the operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load.</u>

<u>Such protection shall consist of overcurrent devices, current transformers, or other equivalent protective equipment that shall cause the feeder disconnecting devices to open.</u>

<u>The additional levels of ground-fault protection shall NOT be installed as follows:</u>

<u>1. On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground, but not more than 600 volts phase-to-phase.</u>

<u>2. On electrical systems where a non-orderly shutdown of power will introduce additional or increased hazards.</u>

<u>Where ground-fault protection has been provided for the operation of service level or feeder level disconnecting means, these means shall be selectively coordinated such that the feeder level device, but not the service level device, shall open on ground faults on the load side of the feeder level device.</u>

<u>A 6-cycle minimum separation time between the service and feeder ground fault trip response bands shall be provided.</u>

Substantiation: Ground faults are typically believed to be the most common type of fault experienced in operating energized electrical systems, per ANSI/IEEE Std 242-1986 Buff book, chapter 7. Professional design engineers tell stories of ballast or small motor failures that have caused main or feeder devices to open. Why is this so? In some instances, a ground fault condition existed that went undetected and precipitated the protective device to open. In other cases, ground fault protective devices were improperly set, or not set at all. In others, a selective coordination study may not have been done, or may have been done improperly.

Therefore, with the goal of using selective coordination as the process by which electrical systems may achieve maximum uptime, it is important that all he key areas of impact are addressed in the design of these electrical systems.

The NEC has for many years required ground fault protection of equipment, but only at the service disconnect level (with noted special exceptions), per Article 230.95. The relatively recent 2005 and 2008 NEC versions, requires selective coordination in applications related to life safety, public safety, and/or national security applications where reliable electrical power systems are required.

These relatively new requirements for selective coordination in these types of applications are needed throughout the entire service level, feeder and branch levels of the electrical system.

With the goal in mind of maximizing the reliability and uptime of electrical systems, and giving consideration that the most common types of faults are ground fault related, it becomes a reasonable approach that whenever selective coordination is required by the Code, that the requirements for ground fault protection of equipment be extended to all appropriate areas in the electrical system beyond just the service level.

This proposal mirrors a similar requirement for ground fault protection of equipment that currently exists in NEC Article 708.52 for Critical Operations Power Systems (COPS). This proposal therefore recommends enhancing the reliability of the electrical system by requiring ground fault protection of equipment in all appropriate levels of the system whenever there are also requirements for selective coordination in that system.

Panel Meeting Action: Reject

Panel Statement: Section 700.26 permits the alternate source for emergency systems to not have ground-fault protection of equipment with automatic disconnecting means. Where it alarms, the ground-fault indication of the emergency source must be provided in accordance with 700.7(D). This means that the GFP would alarm and notify the facility-engineering department or other designated entity so there is no reason to require an additional level of GFP as is required for health care facilities in 517.17.

It seems to be the intent of this proposal to make sure that the emergency system remains selectively coordinated for all fault conditions, including ground faults. The selective coordination required by 700.27 already includes all types of overcurrent, including, but not limited to, phase-to-phase and three phase faults, and phase-to-ground, double phase-to-ground, and three phase-to-ground faults. As such, the intent of this proposal is already met in the existing text, since total selective coordination is already required for all types of overcurrent, including ground faults in 700.27.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-191 Log #3933 NEC-P13 **Final Action: Reject**
(700.26)

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association (NEFA)
Recommendation: Add a second paragraph.
<u>Ground fault relays on the normal source side (line side of the transfer switch) that supply emergency systems are permitted to be restrained from operating for ground faults on the loadside of the transfer switch if the system complies with both of the following:</u>
<u>(A) Ground fault protection relays on the normal source side (line side of the transfer switch) are not restrained from operation for ground faults on the normal source side (line side of the transfer switch)</u>
<u>(B) Audible and visual signal devices indicate whenever a ground fault relay has been restrained. Instructions on the course of action to be taken in the event of an indicated ground fault shall be located at or near the sensor location.</u>
Substantiation: For life-safety purposes and system reliability for the prevention of blackouts, it is desirable that a ground-fault on the load side of a transfer switch in an emergency system not take out the ground fault protection on the normal source. This proposal allows the ground fault protection on the normal source to be restrained from operating and taking down all or large portions of the normal system because of a ground fault on the load side of the transfer switch. For these critical life-safety-related applications, it requires both audible and visual signaling that a ground fault has occurred and that it is being restrained. Restraining the normal system ground fault protection relays for faults on the load side of the transfer switch is consistent with the concept of continuity of service for emergency systems (700.26 & 700.7(D)), legally required standby systems (701.17), and healthcare essential electrical systems (517.17(B).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided for installing ground fault protection relays on the normal source side of the transfer switch. Determining the fault on the emergency (load) side of the transfer switch requires specialized sensors and ground fault protection relays with a design system and additional equipment not provided as part of the substantiation. This technical information must be provided to the panel with operational design information, safety features, and other technical information to ensure the proper operation of this sensing system.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-192 Log #3934 NEC-P13 **Final Action: Reject**
(700.26)

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association (NEFA)
Recommendation: Revise 700.26.
700.26 Ground-Fault Protection of Equipment.
<u>(A) Alternate Source</u>. The alternate source for emergency systems shall not be required to have ground-fault protection of equipment with automatic disconnecting means. Ground-fault indication in the emergency <u>(alternate)</u> source shall be provided per 700.7(D).
<u>(B) Normal Source. Ground-fault protection shall not be required for a disconnecting means in the normal source supplying an emergency system where the disconnecting means supplies only fire pumps, emergency systems, or legally required standby systems. Ground-fault indication in the emergency (normal) source shall be provided per 700.7(D).</u>
Substantiation: Where a disconnecting means supplies only fire pumps, emergency loads, and legally required standby loads, that disconnecting means should be allowed to operate as long as possible during a ground-fault, without opening the life-safety-related loads. Keep the loads on as long as possible. Because ground-fault operation of the disconnecting means would not be required, signaling would be necessary. This proposal provides the same ‘’safety logic” for the normal source as the Code already provides for the alternate source.
700.7(D) does not need to change if this proposal is accepted, since 700.7(D) now requires the sensor to be located ahead of the disconnecting means for the “emergency source”, and the source for the emergency system can be either the ‘normal” or the ‘alternate” source.
Panel Meeting Action: Reject
Panel Statement: The requirements of Section 695.6(H) already addresses ground-fault protection of equipment in the normal and alternate supplies to a fire pump. However, short circuit and ground fault protection still must be provided for the normal circuit supplying other critical loads. A ground fault or a short circuit anywhere in the feeder or on a branch circuit could cause loss of the entire power source, such as a generator, a UPS system, a fuel cell system, or similar power source, resulting in the loss of more than just the one feeder.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-193 Log #4908 NEC-P13 **Final Action: Reject**
(700.26)

Submitter: James Brozek, Acton, MA
Recommendation: Delete 700.26 entirely. This is a companion proposal in association with a proposal covering new 240.27 and 240.28, which consolidates requirements from 240.13, 230.95, 700.26, 215.10, 517.17, and 708.52.
Substantiation: If the proposal for new 240.27 and 240.28 is accepted, 700.26 will no longer be necessary.
Panel Meeting Action: Reject
Panel Statement: Sections 240.27 and 240.28 are not under the jurisdiction of Panel 13; therefore, there is no information on what is covered by the “companion” proposals or what action Panel 10 will have taken on these proposals. In addition, the submitter has not provided any technical substantiation to support his recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-194 Log #3692 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Christopher G. Walker, Eaton Corp.
Recommendation: Add new text to read as follows:
Overcurrent devices shall be selected by a qualified person to optimize selective coordination and arc flash protection (NFPA 70E).
Substantiation: Designing electrical systems with overcurrent protective devices that are to be selectively coordinated involves using data from the device manufacturers, and conducting analyses of the various conditions that the electrical system may experience. The choice of overcurrent protective devices involves the study and analysis of both phase and ground fault currents, and cover currents that ranges from low level overloads up to high short circuit fault current levels.
In addition, there are applications that are justified per NFPA 70E-2004 that allow installation and maintenance personnel to perform work close to energized conductors. For these applications where personnel are working in close contact with energized conductors, design studies are to be conducted to determine the possible levels of arc flash energy that personnel may be exposed to, and the subsequent levels of protective equipment that should be in place.
It should be evident that the correct selection of protective devices is very important to minimize damage to equipment, minimize the loss of power in key electrical systems, and minimize the arc flash energy exposure to personnel whenever electrical fault conditions occur. The correct selection of the protective devices that will satisfy these conditions must be done by persons that are qualified to perform the appropriate types of analysis and studies. A thorough analysis is needed to ensure optimal selection of protective devices, otherwise, it may result in excessive equipment damage and/or personnel injury.
The current National Electric Code specifies the types of systems that require selective coordination. The Code does not identify who is responsible for ensuring that the electrical systems meet the selective coordination requirements.
Therefore, this proposal simply adds verbiage to clarify who is responsible for ensuring that the electrical systems meet the current selective coordination requirements, while also addressing equipment protection and personnel safety.
Panel Meeting Action: Reject
Panel Statement: In Section 215.5, an authority having jurisdiction (AHJ) can require a diagram showing feeder details prior to the installation of the feeders and then can require a certain level of expertise for the design of these feeders. Section 240.12 already permits selective coordination for orderly shutdown of the system as a permissive rule.
Section 110.16 requires a sign be posted at the distribution equipment, panelboards, switchboards, and similar equipment warning qualified personnel of the potential electric arc flash hazard. The NEC covers the installation of the electrical system, and NFPA 70E provides coverage once the system has been energized. There may be many reasons a designer provides a particular type of overcurrent protective device for a certain system, with arc flash as one of the many considerations and selective coordination as another.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
CARON, D.: See my comments to Proposal 13-195.
DEGNAN, J.: The panel’s statement notes that arc flash and selective coordination are considerations, as if they have equal stature, if this is true the vote should be to accept the proposal. Design engineers that utilize circuit breakers to comply with 700.27 are limited in their ability to set limits on the level of arc flash explosions that will injure or kill electricians who work on live systems. The 2008 NEC mandates selective coordination at the expense of arc flash management and the well being of electricians. See my statement on proposal 13-195.

MOUTON, C.: I'm voting against the panel action. The panel action should have been to accept in principle in part. The proposal should not have been rejected since it properly indicates that selective device coordination should be an optimization. To make the correction, the recommended rewording of the submitter's proposal is as follows;

"Overcurrent devices shall be selected by a qualified person to optimize selective coordination using the best possible compromise between maximum equipment protection, maximum service continuity, and arc flash protection".

The recommended wording for the balance of the first two criteria is taken from Chapter 15 of IEEE 242 (the Buff Book), the IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems. As stated in IEEE 242 on page 607 in Section 15.7.1, "complete selective coordination may not be achieved in all systems". The current language of 700.27, 701.18, and 708.54 does not allow the flexibility for a qualified person to make the compromise between these two criteria, which has been the common practice in selective protective device coordination for decades. Additional substantiation for this rewording of the proposal comes from NFPA 110 which says in Article 6.5.1 that "The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs". The current language in these NEC Articles for 100% coordination has had the affect of inappropriately restricting the options available for a qualified person, and has led to the use of a limited set of options to achieve 100% coordination, giving a windfall advantage to a certain specific class of equipment. The recommended change would make the necessary adjustment in the language to allow more flexible coordination in accordance with the methodology recommended in IEEE 242. In addition, the addition of the wording "a qualified person" will incorporate the panel judgement from Proposal 13-203 which was to accepted in principle in part, additional language to indicated the qualifications of persons performing the coordination.

13-195 Log #3953 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: James E. Degnan, Sparling
Recommendation: Revise text to read as follows:

700.27 Coordination Emergency system(s) overcurrent devices shall be selectively coordinated with all <u>emergency system</u> supply side overcurrrent protective devices <u>for faults with a duration of 0.1 seconds and longer.</u>
Substantiation: The text used in the comment is preferred over the original text for the following reasons:

1. Language similar to this language is being utilized by some states, for example Oregon & Florida, as a means to apply the intent of selective coordination.

2. Article700.1 states that the scope of Article 700 is: "The provisions of this article apply to the electrical safety of the installation, operation and maintenance of emergency systems ….to required facilities when the normal electrical supply or system in interrupted." If the normal system has been interrupted there is no need for the emergency system to selectively coordinate with it. Changing "all supply side" to "all emergency system supply side" will make this intent clear.
This clarification also prevents mandating the complete use of fuses on facilities that have over 100,000 amperes of fault current available on the normal side. If normal side fault current exceeds 100,000 amperes automatic transfer switches must have fuses on the supply side. Almost always, once a current limiting fuse is used in a selectively coordinated system, every overcurrent protective device downstream must also be a fuse.

3. The addition of the 0.1 second criteria will permit the use of interchangeable data to determine selective coordination that is not dependent on a single manufacturer. When analysis is done for fault currents in excess of 0.1 seconds, graphic time current curves can be used to determine selective coordination. When time periods are shorter than 0.1 seconds, and especially when they are shorter than a quarter cycle, manufacturers must be consulted to determine if devices selectively coordinate. These manufacturers will only provide proprietary selective coordination data, limiting competition.

4. The addition of the 0.1 second criteria will make energized electrical systems safer to work on than what is obtained with the present language. If circuit breakers are used for selective coordination the upstream circuit breakers must rely on delayed tripping to give downstream circuit breakers the opportunity to trip first. Delaying the tripping of circuit breakers increases the amount of arc flash energy that is delivered to a fault. Calculations comparing the arc fault current and associated requirements for personal protective equipment worn by electricians on a selectively coordinated system and a partial selectively coordinated system are shown in the following Table. The partial selectively coordinated system does not delay the instantaneous tripping of circuit breakers, but is selectively coordinated for fault conditions lasting longer than 0.1 seconds.

See Table 1 on page 951

<u>Table 1. Personal Protective Equipment Requirements for Two Systems at Various Fault Current Intervals.</u>
Table Notes:

1. On this model system there is 100 feet of wire between each of the circuit breaker sizes indicated in the first column. Calculations were made per IEEE 1584 using software furnished by SKM. Similar results are obtained using NFPA 70E for faults rated below 50,000 amperes.
2. Fault current levels are indicated by 10kA=10,000 amperes, 100kA=100,000 amperes, etc.
3. The goal of Personal Protective Equipment (PPE) is to limit injury to *second degree burns or less* if the wearer experiences an arc flash. PPE Category 0 clothing approaches everyday construction clothing in appearance, PPE Category 4 is a completely enclosing jumpsuit. There is no protective clothing available above Category 4, hence these situations are designated as dangerous.
4. This table is a single example, but gives an appropriate indication of overall trends. There will be various alternatives and exceptions that comprise a minority of applications.
5. Worker safety distance increases with the rating of the protective device.

The Table clearly shows that PPE hazard Cat 3 and Cat 4 conditions are far more prevalent on a fully coordinated system.

Emergency systems are always required in larger facilities and many of these facilities operate 24 hours a day. Although working on live systems is to be avoided wherever possible, maintenance and modification of energized switchboards and panelboards in large facilities is often risked to avoid interrupting usage. Some maintenance and inspection activities such as voltage checks and infrared scans can only be done while the equipment is energized. Electricians working on energized equipment and any others that are within the arc flash boundary may be subject to injury if a fault occurs.
Although selective coordination of the emergency system was added to NFPA 70 in 2005, it is still too early to track and directly attribute an increase of electrician injuries on selectively coordinated systems. Large projects that were designed to the 2005 NEC are just now completing construction and it will be some years before these systems require significant maintenance or will undergo modifications. However some selectively coordinated systems are starting to appear and the potential for injury to electricians is increasing. Arc flash hazards affect the lives of electricians (and others that work in the vicinity of electricians) everyday, the following information was taken from various NFPA publications:

● *Every day in the United States, at least one person dies from electrocution on the job. Each year, thousands of workers are treated in emergency rooms and burn centers.* (NFPA Catalog Website, July 2008)

● *On January 1, 2007, this person was working on energized equipment using all the required PPE for his 480-volt job, including FR coveralls, arc shield, electrical-rated hard hat, Class 0 rubber gloves, and insulated tools. Behind him, another electrician who was also working on energized 480-volt equipment had no protective equipment but cotton clothing. When confronted about his lack of PPE, the man said that he had been doing this work for more than 20 years and knew what he was doing. Shortly after the protected worker left area, a loud arc flash took place, and the man began to scream. When the protected worker went to help, he smelled the man's flesh burning. His clothes had been burned and blown completely off his body.*("Hey Electricians" NFPA Electrical Section Website October, 2008.)

● *In 2003, municipal fire departments responded to an estimated 40 institutional electrical rescues.* (NON- FIRE ELECTRICAL RESCUE INCIDENTS REPORTED TO FIRE DEPARTMENTS IN 2003, Jennifer D. Flynn, NFPA, August 2007)

● *The IBEW will support any effort which helps to identify and acknowledge the increasing problem of electrical arc blasts and flashes.* (IBEW statement in NFPA 70 2002 ROC 1-152, regarding an accepted proposal to add Section 110-116 Flash Protection to NFPA 70)

Additional information on electrical injuries and deaths can be found by searching "electrician" on OSHA's website. It's clear from historical records that electrical systems are hazardous, that people become exposed to live electrical systems even though they are not suppose to be, and that injuries and deaths occur. It is also evident from the above calculations that selective coordination will increase the amount of energy available to injure or kill, and accordingly we will eventually see additional deaths and more severe injuries in the work place.
Circuit breakers are used for the examples in this substantiation statement, which the author finds to be the predominant choice of those that own and operate facilities. If a facility owner prefers to have fuses throughout their system, the issues identified in this substantiation are still present, but to a lesser extent.

5. When selective coordination was added to NFPA 70 in 2005 there was no documentation citing historical injuries or loss of life as a result of electrical systems that were not selectively coordinated, hence the consequences of reducing the selective coordination requirements of 700.27 to what is stated herein are minimal.

Note that the proposed comment also applies to NEC 701.18.
Panel Meeting Action: Reject
Panel Statement: The 0.1 second limit in this proposal could reduce the level of safety by limiting the types of overcurrents that would need to be isolated to the nearest upstream device. Requiring selective coordination down to only 0.1 seconds will cover only overloads and a few minor phase-to-phase and minor ground faults.

Explanation of Negative:

CARON, D.: With respect to the panel actions that leave the present wording of Article 700.27, 701.18 and 708.54 to require coordination above all other factors (such as arc flash concerns), I disagree with the panel action for the following reasons:

1. According to Article 90.1 (C) "This Code is not intended as a design specification…". It is intended to be installation guide. Coordination is an engineering design issue. IEEE has an extensive document on the subject of coordination (IEEE Buff Book) that is a design guide to assist engineers in balancing the desire to coordinate a system vs. maintaining a safe system.

2. When coordination takes precedence over all else (including safety), arc flash hazards increase. This is a fact. When devices are completely selectively coordinated, certain overcurrent protective devices in the distribution system are either inherently designed, or physically manipulated thru trip settings to "wait" to open in order to give downstream devices the opportunity to open first, whether or not the fault is downstream of another device. In all cases, as you move upstream of the first device, the devices that "wait" the longest are the largest devices. When any overcurrent protective devices wait to open during a fault, arc flash energy is increased. When it's the largest device in the circuit waiting the longest, arc flash energy increases proportionally.

3. Engineers are not opposed to coordinated power systems. Engineers are opposed to the strict interpretation that system coordination takes precedence over all other issues within a power system design. The engineering community has been balancing coordination and safety in electrical distribution systems quite effectively for decades. There is little justification to defend this strict requirement for selective coordination.

4. I am not aware of, nor am I aware of anyone who has offered, any documented accounts of individuals hurt or killed as a result of an electrical distribution system being improperly coordinated. There are endless accounts of people hurt and killed as a result of arc flash.

5. The requirement does not specify the value of the fault, so it has to be assumed to be the worst case condition, which is a bolted 3 phase fault at the circuit breaker terminals. This is unrealistic for countless reasons. One of note; manufacturers I have talked to have tried to simulate bolted faults in laboratory settings. It's nearly impossible. The way it is simulated is to prepare the fault in advance and close the overcurrent protective devices into it. This scenario could be possible in reality if inadvertently wired this way during construction, but would have been corrected prior to building occupancy. However, this does not reflect a realistic short circuit when it occurs. Most faults begin with two energized sources or one energized source and ground (or the neutral). In this scenario, there is high impedance arcing prior to the fault that reduces the available short circuit current for the first few cycles. The first device upstream of the fault generally sees the lower amperage fault first and opens, thus showing that a system that is not selectively coordinated on paper, is actually coordinated very well. We achieve a balance between coordination and arc flash energy, which is the designers goal.

6. How does one add to an existing emergency system as part of a renovation or expansion and meet the requirement as written?

7. The NEC seeks to provide a nationally recognized standard. Relief to this strict requirement has already been granted, in varying forms, from many jurisdictions.

DEGNAN, J.: The submitted proposal contains clear substantiation linking selective coordination requirements to decreasing safety for electricians that work on energized systems. The panel statement does not address this issue and there is no substantiation offered to refute the analysis presented in the proposal. The panel statement notes that the proposal "could reduce the level of safety" however none of the following have ever substantiated that anyone has been injured or killed as a result of non-selectively coordinated emergency systems: the panel's statement, the original selective coordination proposal 13-135 to the 2005 NEC, and those who opposed removing selective coordination in the 2008 NEC through comments. On the other hand there is clear evidence that electricians who work on live systems get injured, and that selective coordination will likely increase the severity and number of injuries. The panel is encouraged to accept this proposal, it will reduce future injuries to electricians while retaining the aspect of selective coordination where it is most needed, outside of the instantaneous range. Also see my response to proposal 13-199.

MOUTON, C.: I'm voting against the panel action. The panel action should have been to accept in principle in part. The proposal should not have been rejected since it properly indicates that selective device coordination should be an optimization, with the 0.1 seconds limitation one of many methods to achieve the optimization. See my comments to Panel Action for Proposal 13-194 for additional comments about optimization and why it is needed. The panel should have accepted the proposal in principle in part, eliminating the additional wording for "Emergency system". Additionally, the panel statement is incorrect in stating that the 0.1 second limit "could reduce the level of safety by limiting the types of overcurrent that would need to be isolated to the nearest upstream device". The 0.1 second limit will not provide coordination for only "overloads and few minor phase-to-phase and minor ground faults". These were incorrect statements taken from the substantiation for another Proposal 13-198, that are technically unsubstantiated (see my comments to Proposal 13-198). Faults that are not overloads, minor phase-to-phase faults, and minor ground faults will be cleared by protective devices, but 100% coordination may not be achievable when balancing equipment protection and maximum service continuity in this small percentage of the operating range of protective devices. This optimization has been the practice for decades where qualified persons made practical judgements about protective device coordination design.

13-196 Log #3954 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: James E. Degnan, Sparling
Recommendation: Revise text to read as follows:

700.27 Coordination ~~Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrrent protective devices.~~ <u>The first emergency system branch circuit overcurrent protective device upstream of outlets or utilization equipment shall selectively coordinate with all upstream overcurrent protective devices. Additional selective coordination is not required between overcurrent protective devices that are upstream of the first overcurrent protective device that serves outlets and utilization equipment.</u>

Substantiation: 1. Real world overcurrent conditions most commonly occur near the load, for example too many items of equipment plugged into electrical outlets or a short circuit occurring during a light fixture change out.. This proposal focuses selective coordination language where it is needed most.

2. This proposal also reduces arc flash hazards. It does not do so as completely as the "0.1 second criteria" does, but there is some benefit. There is only one layer of delay, not multiple cascading layers. By limiting the selective coordination to the first node, subsequent supply side overcurrent protective devices don't need cascaded operational delays, with an associated increase of the arc flash hazard

3. By limiting the extent of selective coordination this proposal permits facility power system designers some flexibility in how distribution panels are configured and placed. System maintenance, arc flash hazards and economics can be considered with selective coordination.

4. This proposal offers benefits to circuit breaker manufacturers who won't have to resort to ANSI rated switchgear to achieve selectively coordinated systems. One fuse manufacturer recently introduced a combination circuit breaker and fuse branch circuit panelboard that can be used to an advantage under this proposal, because applying fuses to the first overcurrent protective device will make coordination with all upstream overcurrent protective devices easier to achieve.

If this proposal is accepted a similar proposal should be made for Section 701.18.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-195.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

CARON, D.: See my comments to Proposal 13-195.

DEGNAN, J.: See my statement on 13-195. This is an alternative proposal that places a different focus on selective coordination, however it should only be considered if the panel wants to address where selective coordination can offer the best economic return for the investment.

13-197 Log #4326 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Malcolm Allison, Ferraz Shawmut
Recommendation: Amend 700.27 as follows.

700.27 Coordination.

<u>**(A) Normal System.** Normal system overcurrent protective devices on the supply side of the emergency system overcurrent protective devices shall not be required to be selectively coordinated with other supply side, normal system overcurrent protective devices.</u>

<u>**(B) Emergency System.**</u> Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices <u>unless one of the following conditions in (1) through (5) are met.</u>

(1) <u>Transformer Overcurrent Protective Devices.</u> Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exists on the transformer secondary.

<u>(2) Overcurrent Protective Devices of the Same Size.</u> Between overcurrent protective devices of the same size (ampere rating) installed in series.

<u>(3) Expansion of an Existing Emergency System - Existing Overcurrent Protective Devices. Between existing emergency system overcurrent protective devices and any existing supply side overcurrent protective devices, where the emergency system is expanded.</u>

<u>(4) Expansion of an Existing Emergency System - New Overcurrent Protective Devices. Between new emergency system overcurrent protective devices and any existing supply side overcurrent protective devices, where the emergency system is expanded.</u>

<u>(5) Designed Under Engineering Supervision. Where a licensed professional engineer, engaged primarily in the design of electrical installations, provides stamped documentation showing the specific circuit that cannot be selectively coordinated, and substantiation of the design alternatives that were analyzed in the failed attempt to achieve selective coordination. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system.</u>

FPN: These are several techniques that help to selectively coordinate an electrical distribution
system
(a) Where transfer switches are utilized, utilizing several smaller transfer switches rather than one larger transfer switch, and moving the transfer switches down in the system, closer to the loads.
(b) Utilizing short-time delay
(c) Utilizing devices with an adjustable instantaneous trip
(d) Utilizing smaller downstream devices
(e) Utilizing several smaller downstream devices rather than one larger downstream device
(f) Utilizing upstream devices with larger frame sizes
(g) Utilizing fuse manufacturers' ratio charts
(h) Utilizing circuit breaker manufacturers' selective coordination charts
(i) Utilizing differential relays
(j) Utilizing isolation transformers
(k) Minimizing the number of levels in a distribution system
(l) Utilizing a greater number of smaller feeders, rather than a smaller number of larger feeders
(m) Utilizing impedance grounded systems
(n) Utilizing high-instantaneous trip circuit breakers

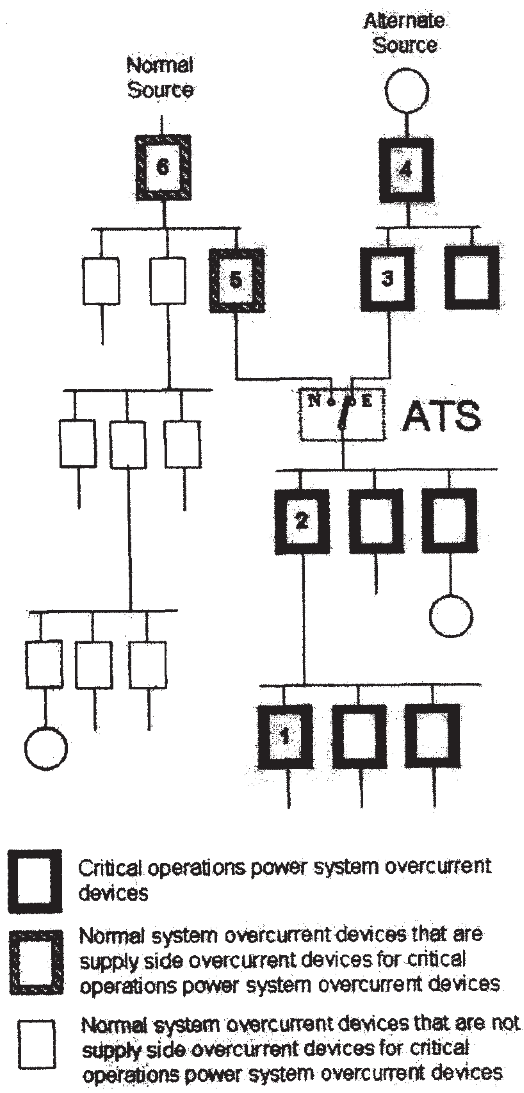

Figure 700.27 Clarification of Selective Coordination Requirements

Substantiation: This proposal is an attempt to clarify the confusion concerning selective coordination requirements.

(1) Figure 700.27 has been added to clarify which devices are emergency side devices, and which are normal side devices. This figure should be included in the NEC® text. Figure 700.27 was based upon a figure from an necdigest® article, Keep The Power On For Vital Loads, by Evangelos Stoyas, December 2007
Copyright© 2007, National Fire Protection Association, Quincy, MA.

(2)"(A) Normal System" was added because there have been questions about the need for selective coordination of the overcurrent devices on the normal side, on the line side of the transfer switch. Since Devices 5 and 6 are not really part of the emergency system, 700.27 does not apply, and therefore 5 and 6 dc not need to selectively coordinate with each other.

(3)"(B) (1)" and "(B)(2)" are taken from existing text. No changes made

(4) "(B)(3)" was added because there have been questions about the need for existing devices to selectively coordinate when an emergency system is expanded or modified. This proposal clarifies that existing devices do not have to be replaced if they do not already selectively coordinate.

(5) "(B)(4)" was added because there have been questions about the need for new devices to selectively coordinate with existing devices when an emergency system is expanded or remodeled. This clearly states that new devices do not have to selectively coordinate with the existing devices.

(6) "(B)(5)" was added for those few cases where selective coordination is simply not possible. It is not meant to be a "blank check" to allow designers to avoid their responsibility to provide a selectively coordinated system. The requirements are very similar to those found in 240.86 and are meant to ensure that all reasonable attempts have been made to achieve the objective. Once all attempts have been exhausted, the engineer simply documents the circuit in question and shows the techniques that were attempted.

(7) The FPN was added to provide some of the common methods that experienced engineers utilize to obtain selective coordination. It is not all-inclusive, and has been carefully worded so as not to include any requirements.

Panel Meeting Action: Reject

Panel Statement: The proposal for "(A) Normal System" covers devices in the normal source that are outside the scope of Article 700. While the concept is correct, the additional text is unnecessary. The proposed figure is also unnecessary.

While the concepts in (B), (B)(1), and (B)(2) are basically unchanged from the 2008 NEC, the change is not needed because all other portions of this proposal are also rejected.

(B)(3) is rejected because 700.27 is not retroactive for existing systems.

(B)(4) is rejected because no technical substantiation was provided to justify the reduced continuity of service that would result from the elimination of the requirement of new devices to selectively coordinate with upstream existing devices.

(B)(5) is rejected because no technical justification was provided as to why selective coordination cannot be achieved in all situations. In addition, no information was provided as to which or how many design alternatives the consulting engineer needs to analyze and submit in the required documentation.

The FPN is rejected because technical substantiation was not provided for any of the 14 listed techniques.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

CARON, D.: See my comments to Proposal 13-195.

Comment on Affirmative:

DEGNAN, J.: I agree with rejection of this proposal, however the panel's statements regarding (B)(3) and (B)(4) are contradictory, with (B)(3) being the correct response. When it comes to existing systems the best available NEC reference is Annex G 80.9 (B).

13-198 Log #4342 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Dan Giblin, National Electric Fuse Assn. (NEFA)

Recommendation: Revise text as follows:

700.27 Coordination.

(Keep present text and add the following at the end)

Selective coordination is required for the full range of overcurrents up to the highest available short-circuit current available at the lineside of each overcurrent protective device. The consideration shall include evaluation for the available short-circuit current from the normal supply and alternate supply as well as the transfer switch type.

Substantiation: The purpose of this addition is to clarify that selective coordination is for the full range of available overcurrents. Some people in the industry have contended that the present requirement is not clear on the range of overcurrent that must be considered. When 700.27 was voted as a requirement during the 2005 NEC cycle and then reaffirmed during the 2008 cycle, Code Making Panel 13 substantiated that this requirement is for the full range of overcurrents. For instance, Comment 20-13 in part "…*Selective coordination increases the reliability of the emergency system. The current wording of the NEC® is adequate.* ***The instantaneous portion of the time-current curve is no less important than the long time portion.***"
The available short-circuit current must be considered for the worst case from the normal source, alternate source, or both for a closed transition transfer switch. If a fault occurs on an emergency load being supplied by the normal source and both the emergency branch circuit overcurrent protective device and emergency feeder overcurrent protective device open, then when the power is transferred to the alternate source, loads supplied by the affected feeder will unnecessarily be interrupted.

There is no simple alternative to use other than for the full range of available short-circuit currents. Some in the industry are advocating changing the selective coordination requirement to only times greater than 0.1 second. The paragraphs below illustrate why this is not viable.

Permitting the selective coordination requirement to be for times only greater than 0.1 second will allow non-coordinated operation of multiple levels of overcurrent protective devices (cascading) under short-circuit current (fault) conditions, which reduces the reliability of the system to deliver power to vital loads. Requiring selective coordination for times only greater than 0.1 second provides coordination for only overloads and does not provide assurance that typical ground faults and arcing faults will not cascade multiple levels of overcurrent protective devices, thereby unnecessarily losing power to critical loads. While both overloads and short-circuits occur on branch circuits, the predominance of overcurrent interruptions on feeder and service circuits are short-circuits (of all types). Graphs A and B depict the time-current curves of the same 30A, 200A, and 800A system. Graph A shows the portion of the circuit breaker time-current curves that would be analyzed for selective coordination for times only down to 0.1 seconds. Graph B depicts the circuit breaker curves showing the crossover of the circuit breakers in their instantaneous trip region. The cross over is a lack of selective coordination for overcurrents at that level and greater. Graph B shows a lack of coordination between the 30A and 200A circuit breakers for ground, arcing, and any combination of phase faults as low as 800A. Any type of fault as low as 2200A can take out the 800A circuit breaker as well. These are low available fault currents, easily achieved in almost every essential electrical system via a line-ground fault, line-line fault or three phase fault.

All circuit breakers with an instantaneous trip will open in less than 0.1 seconds when fault current is above the instantaneous trip setting. Requiring selective coordination for times only greater than 0.1 second will permit the design of vital electrical systems without regard to proper engineering attention being given to the instantaneous trip region.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The existing text of 700.27 already requires selective coordination for the full range of overcurrents, from overloads through the available short-circuit current, with all upstream devices. Specific additional text is not necessary. Substantiation was not provided for the reference to the transfer switch type.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

DEGNAN, J.: I agree with rejection of the proposal, however with regard to the panel's statement, the present text of 700.27 only requires what is says and no more. The proposal ignores the increasing arc flash hazard created by cascaded delays of selectively coordinated overcurrent protective devices and the associated potential of injuring electricians that work on energized systems.

MOUTON, C.: I'm voting in the affirmative for the panel action, but would like to make the following comments regarding the proposal, which need to be added into the panel statement in whole or in part, to correctly address incorrect statements made in the proposal substantiation by the submitter. These incorrect statements have been used by the panel in another panel statement that improperly distributes this misinformation to the public. The 0.1 second limit discussed by some in the industry will not as indicated provide coordination for only "overloads". The 0.1 second portion of some protective device curves constitute a very small percentage of the operating range of these devices and typically includes operation at currents approximately 10x the normal overload trip setting for most devices. Faults that are not overloads, minor phase-to-phase faults, and minor ground faults will be cleared by protective devices and will typically coordinate for large current values in the time zone greater than 0.1 second. Coordination at operating times less than 0.1 second may not be achievable always when balancing equipment protection and maximum service continuity, as indicated in IEEE 242 (See my comments for Proposal 13-194). Optimization of protective device coordination has been the practice for decades where qualified persons made practical judgements about protective device coordination design. For example, in the Graph B, provided as a supporting document for the proposal, an 800A breaker is shown to have a portion of its operating range that does not coordinate with the downstream devices. This is an exaggeration since this device would typically have a definite time delay on the short time (instantaneous) portion of the curve, to allow it to coordinate with the downstream devices. Of course, this coordination technique will come at the price of a longer operating time for the larger upstream breaker, which will increase the arc flash energy to a fault cleared by this breaker. It is important to note that these incorrect statements come from the same segment of the protective device industry that has seen a windfall in the preference for their products by the 100% coordination currently required in the NEC language that has been selected for Articles 700.27, 701.18, and 708.54.

13-199 Log #4379 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Alan Manche, Square D Company/Schneider Electric

Recommendation: Add a new sentence to the end of the main paragraph of 700.27:

Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. <u>A means to intentionally defeat selectivity shall not be permitted.</u>

Substantiation: Although no data was presented during the 2005 or the 2008 NEC to support the requirement for selective coordination, the panel clearly acted to include the requirement for life safety reasons. Establishing selectively coordinated systems can increase the arc-flash hazard when maintenance is performed on the system depending upon the design of the system. The concern of increased arc-flash hazard was presented to the panel in past cycles and the panel accepted those risks in favor of the benefit of selectivity on these systems. Some system designers are now including a means to defeat selectivity by installing systems that can turn the selectivity off by temporarily changing breaker settings via a switch or sensor in order to protect the electrical worker. There is no prohibition established in the NEC to restrict defeating selectivity, or the life safety aspect for which it was installed, in order to protect the electrical worker.

Unfortunately the enhanced protection for the electrical worker can be a trade-off by defeating the life safety function of the selectively coordinated system in the emergency system. The most likely time for an incident to happen that would require the system to be selective is when a working is doing maintenance on the system. If the selectivity is defeated, an arc event small or large could initiate a fire hazard or take down lighting, ventilation, or emergency circuits in a hospital leaving a system inoperable which places the life safety of others in a dangerous position.

There are solutions available to support the reduction of arc-flash in selectively coordinated system without intentionally defeating selectivity to enhance worker safety.

Panel Meeting Action: Reject

Panel Statement: The panel supports the use of energy reduction means for the protection of personnel during periods of maintenance of energized equipment. Use of these types of devices should be left to the discretion of the facility operator. The panel recognizes that the selective coordination is not available in the system at the time the energy reduction means is operational.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Abstain: 1

Explanation of Abstention:

DEGNAN, J.: I abstain because the preferred approach is to minimize the arc flash hazard as part of the design, and not as a halfway developed afterthought. By supporting the means for an energy reduction switch the panel acknowledges that selective coordination increases the arc flash hazard. The panel is encouraged to extend its attention to the arc flash hazard in developing a more complete statement in its response to proposal 13-195.

The panel should direct additional attention to the safety implications of their statement in this proposal prior to continuing endorsement of the means to limit energy. There are well documented industry standards for locking out and tagging out electrical systems to assure electrician safety during maintenance. Nothing in the panel's statement identifies if their endorsement includes requirements for lockout and tag out of this device. To endorse an energy limiting device without requiring it to have lock-out tag-out provisions will compromise electrician safety. There is no discussion as to what level of arc flash labeling is necessary per 110.16, is it with the device on or off? Use of this devices requires an integrated system protection concept and should have labeling similar to what is in use on series rated systems, although there really should be code requirements for labeling to address and maintain the integrity of all components in a selectively coordinated system.

There is also several question of logic and the need for substantiating varying degrees of protection. If selective coordination is important enough to mandate(which field experience indicates that it is not) why would it be okay to turn it off in a facility that operates 24/7? Why does it make sense to turn the integrity of a selectively coordinated system over to a building operator for an undefined period of time and use, but not to an engineer during design? Should the panel note that "The instantaneous portion of the time current curve is no less important than the long time portion, unless a facility operator chooses to turn it off."?

This proposal raises significant questions and issues regarding the application of selective coordination, all of which can be answered by accepting proposal 13-195. and then rejecting this proposal because of the lack of answers to the identified safety issues. Trying to add a number of safety provisions in the code to address the shortcomings of selective coordination would add additional cost and expense on top of a code provision that can already require a substantial investment with no record of a reasonable expectation that the investment is needed to protect life and safety. See my proposal 13-195, which provides a much more reasonable approach to selective coordination and protecting the welfare of electricians, while at the same time setting an appropriate level of protection for emergency systems.

13-200 Log #4479 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Darrel Miller, LSW Engineers Arizona, Inc.
Recommendation: Revise text to read as follows:

700.27 Coordination. Emergency system(s) overcurrent devices shall be ~~selectively~~ coordinated with ~~all~~ supply side overcurrent protective devices. Selectivity shall meet the requirements of (A), (B), or (C).

(A) Selectivity shall be established, in the form of an engineering study, by a licensed professional engineer engaged regularly in the design or maintenance of coordinated electrical systems. The study shall be stamped by a licensed professional engineer and at a minimum include overcurrent device settings, supporting documentation, and a summary of limitations. This study shall be available to those authorized to design, install, inspect, maintain, and operate the system.

(B) Selectivity shall be established under engineering supervision by use of the selected overcurrent device manufactures tables and charts derived from tested combinations of devices. Applicability for each table and chart utilized shall be rigidly adhered to. All tables and charts shall be from the same manufacturer as the installed overcurrent devices.

(C) Selectivity shall be established under engineering supervision in existing installations. The engineer shall determine the extent of selectivity achievable based on review of the existing conditions. Use of methods (A), (B), or combination of each shall be permitted. A summary of limitations and recommendations shall be stamped by a licensed professional engineer and submitted to the authority having jurisdiction prior to the start of construction. Once accepted, the recommendations will establish the extent of retrofit required.

Exception: Selective coordination shall not be required in the following:

(1) Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exist on the transformer secondary.

(2) Between overcurrent protective devices or set of overcurrent protective devices ~~of the same ampere rating in series.~~ in series on opposite ends of the same feeder.

FPN: Overcurrent protective devices used for emergency circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system. A similar increase in overall reliability can be experienced on the normal power system side.

Substantiation: Present text restricts the design professional from making appropriate judgments and technical decisions necessary to effectively coordinate the overcurrent protective devices. Historically, the design professional has had the responsibility of evaluating and selecting the appropriate equipment based on the individual project circumstances, refer to the ANSI/IEEE color series of recommended practice manuals. The modifications proposed loosen the prescriptive mandate which is creating compliance difficulties. It will also restore the design professionals' freedom to select the appropriate overcurrent devices for use within the emergency, legally required standby, and critical operations power systems. As you will see in the following discussions, coordination has never been expected to be 100% selective. There are often circumstances that are just "best case" even in the most highly coordinated systems. The ANSI/IEEE repeatedly uses language which conveys this understanding.

Many jurisdictions have considered and adopted codification of a 0.1 second fault duration time to establish a reasonable coordination point. In fact, until published Time-Current Curves (TCC's) are available from the majority of manufactures starting at a time line less than the 1st half cycle, 0.0083 seconds, this approach would provide a design basis that is universally workable. We understand the argument that this is an arbitrary point at which to start coordination. Accordingly, we have taken a different approach. The text presented was modeled after NEC 240.86. This article establishes a method for the design professional to make judgment for existing systems. We have provide options in stead of a one size fits all mentality, which is know to have issues; as evidenced by the large number of proposals surrounding this issue. The real concern is with the existing NEC text. It puts the engineer in a position that is contrary to other equally important recommended practices, of which we are also held accountable. The professional engineer does want to follow and is concerned with compliance with all applicable codes. In Arizona, as with other states, Rules of Professional Conduct have been established for the professional registrant. He/she is charged with protecting the public safety, much like the inspections departments are. By the nature of granting a license to practice engineering, the grantor (State) is agreeing that the professional registrant is competent to make such decisions.

In the proposed change, the issue of existing conditions and implementation has been addressed.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Proposed (B) contains unenforceable language, such as "rigidly adhered to" and "selectively shall be established." The text in (C) is outside the normal application of the NEC since the authority having jurisdiction, the municipality, and the licensing board for engineers have control over the issues covered within this proposed text, such as what is necessary to be done before the start of construction. The designer, engineer, AHJ, electrical contractor, and owner may often be involved in the decisions related to selective coordination. The submitter states in his substantiation that the professional engineer has the mandate to select the appropriate overcurrent device and thus would be the sole decision-maker on the selective coordination. Again, this procedure is under the jurisdiction of the AHJ, the municipality, and the licensing board. The recommended FPN does not provide any additional information and is unnecessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

CARON, D.: See my comments to Proposal 13-195.

DEGNAN, J.: See my comment on proposal 13-195. While I agree with the panel's statement regarding (B) and (C), the panel did not directly address part (A) of the proposal. The submitter has presented detailed information citing standards and supporting data that substantiate acceptance of part (A) and that have not been refuted by the panel. The panel has accepted part of this proposal in its action on proposal 13-203. See my comment on 13-194 which is similar in intent to this proposal, and and my proposal 13-195.

13-201 Log #3718 NEC-P13 **Final Action: Reject**
(700.27, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add a fine print note to read as follows:

FPN: Selective coordination includes coordination between standard overcurrent devices and ground fault devices.

Substantiation: Fault and over current conditions may result from a variety of conditions that range from the rare and difficult to achieve bolted three phase fault to the more probable arcing single phase ground fault. Nevertheless it is a common oversight to consider phase protection selectivity and ground fault protection selectivity separately. A phase protective device considers all current over threshold to be an overload whereas ground fault devices are able to separate a ground current from other current. Because of this, in the case of the more probable ground faults, both devices may operate simultaneously or with either device ahead of the other if ground fault selectivity between the two devices is not planned. Hence, a well-coordinated system must consider ground fault protection and standard phase overcurrent protection simultaneously.

Panel Meeting Action: Reject

Panel Statement: Automatic opening of overcurrent protective devices under a ground-fault condition is not required by Article 700.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

CZARNECKI, N.: The proposal should be accepted. The panel action and statement does not address the concerns expressed in this proposal. The requirements in 700.26 do not prohibit the installation of ground fault protection of equipment for emergency systems. Selective coordination for phase to ground, phase to phase, and three phase short circuits is insufficient where ground fault protection of equipment is installed. The ground fault protective device used for equipment protection must be included for a selectively coordinated system.

13-202 Log #1162 NEC-P13 **Final Action: Accept in Principle**
(700.27 Exception)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Proposed change deletes Exceptions 1 & 2 and replaces them as shown below:

~~Exception: Selective coordination shall not be required in (1) or (2):~~

~~(1) Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exist(s) on the transformer secondary, or~~

~~(2) Between overcurrent protective devices of the same size (ampere rating) in series.~~

Exception: Selective coordination shall not be required between two overcurrent devices in series with one another when no loads are connected in parallel with the downstream device.

Substantiation: The intent of selective coordination is to have only the overcurrent device closest to the fault (first upstream device) to open to clear that fault. This prevents unnecessary outages to other loads on the electrical systems.

The exceptions were added as 2 specific examples where no additional loads are affected if a second upstream device also opens.

The intent of this proposal is to clarify that so long as no additional loads are affected by the opening of the second upstream device, selective coordination offers no additional benefit, and should not be required.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

Exception: Selective coordination shall not be required between two overcurrent devices located in series ~~with one another~~ ~~when~~ if ~~where~~ no loads are connected in parallel with the downstream device.

Panel Statement: The changes are editorial to improve clarity and not intended as technical changes.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
DEGNAN, J.: The proposed language simplifies the code by using fewer words, and therefore is an improvement. However, this exception, and the two exceptions added in 2008, can be determined to be redundant to the definition of “Coordination, (Selective)” in Article 100.

13-203 Log #4678 NEC-P13 **Final Action: Reject**
(700.27 Exception No. 2 and FPN (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as “Reject” because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee
Recommendation: Designate the existing exception as Exception No. 1 and add a second exception and fine print note to read as follows:
Exception No. 2: Where the emergency system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the extent practicable. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction.
FPN: Overcurrent protective devices used for emergency circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system.
Substantiation: The current NEC rule is being improperly used to drive the market share of a particular species of overcurrent protective device, often frustrating legitimate design objectives of the engineering community, and without any documented loss experience to justify such a consequence. We have received compelling testimony from engineers that have been subjected to extraordinary hardship resulting from the lack of flexibility in the current NEC provisions. This proposal is consistent with NFPA 110 (which language underlies the fine print note) and provides the necessary flexibility to allow competent engineering work that maintains selective coordination as an important element in the electrical design process, but not to the exclusion of all other issues.
Panel Meeting Action: Accept in Principle in Part
Revise Section 700.27 to read:
700.27 Coordination. Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. The selectively coordinated devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system.
Panel Statement: The panel action rejects the wording “where practicable” as this is not defined and subjective. The recommendation on the qualifications for those who design the system has been revised to use the text from 240.86 as this provides a more definitive description of those who can design these systems.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 5
Explanation of Negative:
CZARNECKI, N.: The Panel should revisit this Proposal and evaluate the merits of wording in an Exception versus a Main Rule.
DEGNAN, J.: The panel has completely changed the intent of the submitter by deletion of “where practicable”. If the panel wishes to assure appropriate engineering judgement the panel should consider proposal 13-194. All of the data engineers use, whether its tables or TCCs, comes from manufacturers, and much of it is developed without a common standard. Engineers must rely on this information, and often write performance based criteria for manufacturers to follow. For government projects, that are competitively bid, this requirement could force coordination studies to be done three or four times, with the engineer basing a design on one manufacturer, other manufacturers or contractors doing it during bidding, and then again by the design engineer during construction to meet the code requirement with the actual product selected. In reality, compliance is determined by the manufacturer of the overcurrent protective devices.
It may also necessitate engineers doing designs twice, once before bidding and again after bidding, or deprive owners of competitive bids.
LITTLE, L.: We agree with the negative comment as written by Mr. Ode.
MOUTON, C.: I’m voting against the panel action. The panel action should have been to reject the proposal, even though it does have some merit, and the submitter properly characterizes the current environment in the industry resulting from the current selective device coordination language in Articles 700.27, 701.18, and 708.54. The proposal should have been rejected in preference of Proposal 13-194, which should have been accepted in principle in part (see my comments to Proposal 13-194). The proposal properly indicates that selective device coordination should be an optimization. The panels indifference to the wording “extent practicable” could have been easily dealt with in a manner similar to that proposed in Proposal 13-194, and spoken about in the NFPA 110 and IEEE 242 (the Buff Book), the IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems. The language that was accepted in principle in part by the panel action only adds additional bureaucracy in the process and does not adds any technical value to selective device coordination, since a 100% selectively coordinated system continues to be required. For many of the methods to achieve 100% coordination, a professional engineer is not needed, since it is an application of manufacturers data based on their testing of the devices. As stated in IEEE 242 on page 607 in Section 15.7.1, “complete selective coordination may not be achieved in all systems”. The original intent of the submitter’s proposal was completely stripped from the proposal by the panel action. Referencing the text used in 240.86 is inappropriate. The code requirements in 240.86 are technically more challenging to substantiate and provide sufficient documentation. Additionally, in public installations, most state electrical codes already require oversight of new installations by a licensed professional engineer to validate the engineering work for a facility. Restating this in the NEC is not required, unless it is for a specific and unique purpose, such as Article 240.86.
ODE, M.: The substantiation in the proposal and the panel statement for the Panel Action provided absolutely no technical substantiation to require selectively coordinated device installation design in an emergency, a legally required standby system, or a critical operations power system to be selected, documented, and stamped by a licensed professional engineer. The requirement for a licensed professional engineer to design and stamp drawings for these systems is overly restrictive, adds unnecessary cost to the installation, and negates a very viable resource in the use of manufacturers who provide this service on a regular basis. The owner, the electrical equipment manufacturer, the plant engineer, the electrical contractor, the AHJ, the utility company, as well as the design engineer are often involved in determining the requirements for initial design of new systems and to the extent that older systems must comply with selective coordination. In addition, 90.1(C) of the National Electrical Code states that the NEC is not intended as a design specification and, yet, the proposed text requiring a licensed professional engineer adds design requirements into the selective coordination process.
Comment on Affirmative:
CARON, D.: Although I agree with the panel action to accept this proposal, the submitters intent has been lost in the Panel’s rewrite. Also, the panel statement indicates “The panel action rejects the wording “where practicable” as this is not defined and subjective”. Yet, in Proposal 13-151, this same panel defends the word “practicable” stating “’Where practicable” leaves the decision up to the authority having jurisdiction...”. The word “practicable” appears in the National Electrical Code in no less than 70 other instances. See also my comments to Proposal 13-195.

ARTICLE 701 — LEGALLY REQUIRED STANDBY SYSTEMS

13-204 Log #2322 NEC-P13 **Final Action: Reject**
(701)

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: Add ‘(Essential Safety)’ after the word ‘Standby’ in the title and throughout Article 701.
Substantiation: This change is a companion to a proposal for Article 700 and is intended to be the first step in a three cycle process (similar to the process used for Luminaires) which will more clearly identify the purpose for which the system is used. The extended process will allow related standards to adapt their language.
Panel Meeting Action: Reject
Panel Statement: Article titles and scope statements are the jurisdiction of the NEC Technical Correlating Committee. Panel 13 can only make recommendations to the TCC on proposed revisions. Panel 13 recommends rejecting the proposed action because adding “essential safety” does not add any more meaning than the present title. See the panel action and statement on Proposal 13-137.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-205 Log #3030 NEC-P13 **Final Action: Reject**
(701)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
ARTICLE 701 Legally Required Standby Systems
I. General
701.1 Scope. Text to remain unchanged.
701.2 Definition. Text to remain unchanged.
701.3 Application of Other Articles. Text to remain unchanged.
701.4 Equipment Approval. Text to remain unchanged.
701.5 Tests and Maintenance ~~for Legally Required Standby Systems.~~ Text to remain unchanged.
701.6 Capacity and Rating. Text to remain unchanged.
701.7 Transfer Equipment. Text to remain unchanged.
701.8 Signals. Text to remain unchanged.
701.9 Signs.
(A) Text to remain unchanged.
Exception: A sign shall not be required for individual unit equipment as specified in 701.12(G) ~~701.11(G)~~.
(B) Grounding. Where the grounded circuit conductor connected to the legally required standby power source is connected to a grounding electrode conductor at a location remote from the legally required standby power source, there shall be a sign at the grounding location that shall identify all legally required standby power and normal sources connected at that location.
II. Circuit Wiring
~~701.10~~ 701.11 Wiring Legally Required Standby Systems. Text to remain unchanged.
III. Sources of Power
701.12 General Requirements.~~701.11 Legally Required Standby Systems.~~ Current supply shall be such that, in the event of failure of the normal supply to, or within, the building or group of buildings concerned, legally required standby power will be available within the time required for the application but not to exceed 60 seconds. The supply system for legally required standby purposes, in addition to the normal services to the building, shall be permitted to comprise one or more of the types of systems described in ~~701.11~~ 701.12(A) through (F). Unit equipment in accordance with ~~701.11~~ 701.12(G) shall satisfy the applicable requirements of this article.
In selecting a legally required standby source of power, consideration shall be given to the type of service to be rendered, whether of short-time duration or long duration.
Consideration shall be given to the location or design, or both, of all equipment to minimize the hazards that might cause complete failure due to floods, fires, icing, and vandalism.
FPN: Assignment of degree of reliability of the recognized legally required standby supply system depends on the careful evaluation of the variables at each particular installation.
(A) Storage Battery. Text to remain unchanged.
(B) Generator Set. Text to remain unchanged.
(C) Uninterruptible Power Supplies. Uninterruptible power supplies used to provide power for legally required standby systems shall comply with the applicable provisions of ~~701.11~~ 701.12(A) and (B).
(D) Separate Service. Text to remain unchanged.
(E) Connection Ahead of Service Disconnecting Means. Text to remain unchanged.
(F) Fuel Cell System. Text to remain unchanged.
(G) Unit Equipment. Text to remain unchanged.
IV. Overcurrent Protection
701.25 ~~701.15~~ Accessibility. Text to remain unchanged.
701.26 ~~701.17~~ Ground-Fault Protection of Equipment. Text to remain unchanged.
701.27 ~~701.18~~ Coordination. Text to remain unchanged.
Substantiation: This proposal is part of a series of proposals intended to create a parallel numbering system for Articles 700, 701 and 702.
Panel Meeting Action: Reject
Panel Statement: The proposed parallel numbering system for Articles 700, 701, and 702 is unnecessary since the articles are not large and complex articles. While there are some common titles and text, there are also titles and text that are different from one article to another. Code Making Panel 13 recommends rejection of the renumbering of Article 701.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-206 Log #2812 NEC-P13 **Final Action: Accept**
(701.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text
~~701.3 Application of Other Articles.~~
~~Except as modified by this article, all applicable articles of this Code shall apply.~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 701.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-207 Log #3626 NEC-P13 **Final Action: Reject**
(701.3)

Submitter: David A. Williams, Delta Township
Recommendation: Revise text to read as follows:
701.3 Application of Other ~~Articles~~ Requirements.
Except as modified by this article, all applicable articles of this Code shall apply. Legally required standby systems shall be installed in accordance with this Code and NFPA 110 and NFPA 111.
Substantiation: The provisions of NFPA 110 and 111 are very important to the installations of emergency systems and these requirements should be referenced in the NEC. The International Building and Fire Codes have similar wording in Section 2702. Electrical installers need to be aware of these requirements.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-143.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-208 Log #4292 NEC-P13 **Final Action: Accept**
(701.3)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Delete this section.
~~701.3 Application of Other Articles.~~
~~Except as modified by this article, all applicable articles of this Code shall apply.~~
Substantiation: NEC 90.3 indicates Chapters 1-4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 701.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 14

13-209 Log #188 NEC-P13 **Final Action: Accept**
(701.4)

Submitter: Bryan P. Holland, City of North Port
Recommendation: Delete the following text:
~~701.4 Equipment Approval. All equipment shall be approved for the intended use.~~
Substantiation: This section is redundant and unnecessary. Sections 90.7, 110.2, and 110.3 already contain this provision. There is no special listing, labeling, or marking which identifies equipment as suitable for this type of system, thus, no special evaluation beyond 90.7, 110.2 and 110.3 is needed.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-210 Log #1407 NEC-P13 **Final Action: Reject**
(701.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first paragraph as follows: A legally required standby system shall have ~~adequate capacity and~~ rating(s) not less than required for the supply of all equipment intended to be operated simultaneously. ~~at one time.~~ Legally required standby systems shall be ~~suitable~~ identified for the maximum available fault current at its terminals.
(1) Where the alternate means has ~~adequate capacity~~ ratings not less than required to ~~handle~~ supply all ~~connected~~ calculated loads
(2) Where automatic selective load pickup and load shedding is provided that will ensure ~~adequate~~ continuous power to the legally required standby system circuits.
Substantiation: Edit. "Adequate" and "suitable" are subjective and terms to be avoided per the Style Manual. "Connected" loads are not identified. The provision should apply to calculated loads whether or not actually connected equipment.
Panel Meeting Action: Reject
Panel Statement: The panel rejects all of the proposed editorial revisions. While the NEC style manual may list terms to be avoided, it is not a prohibition of those terms. The context of this section is clear and the suggested revisions do not improve clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-211 Log #3029 NEC-P13 **Final Action: Reject**
(701.6)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
701.6 Capacity ~~and Rating.~~
A legally required standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. ~~Legally required standby system equipment shall be suitable for the maximum available fault current at its terminals.~~
Remainder of text to be unchanged.
Substantiation: This requirement is already found in 110.9/110.10, and a similar requirement is not found in 700.5. For the purposes of consistency, if nothing else, this sentence should be removed.
Alternatively, it could be added into 700.5. A similar proposal is being made to 702.5 for correlation.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided for removing "and Rating" from the title. For purposes of consistency, the second sentence should not be removed, as 700.5 contains the same language.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-212 Log #2902 NEC-P13 **Final Action: Accept**
(701.7)

Submitter: Wendell Whistler, Whistler Consulting & Technical Services
Recommendation: Add new text to read as follows:
701.7 Transfer Equipment.
(A) General. Transfer equipment, including automatic transfer switches, shall be automatic and identified for standby use and approved by the authority having jurisdiction. Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and alternate sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 705.
(B) Bypass Isolation Switches. Means to bypass and isolate the transfer switch equipment shall be permitted. Where bypass isolation switches are used, inadvertent parallel operation shall be avoided.
(C) Automatic Transfer Switches. Automatic transfer switches shall be electrically operated and mechanically held. Automatic transfer switches, rated 600 VAC and below, shall be listed for ~~legally required standby system~~ emergency use.
Substantiation: UL white book references emergency use transfer switch, however, the legally required standby system refers you back to emergency use.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-213 Log #1406 NEC-P13 **Final Action: Reject**
(701.7(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "inadvertent" in (A).
Revise last sentence of (B) as follows: Where bypass operation switches or circuit breakers are used ~~inadvertent~~ parallel operation in the closed position shall be ~~avoided~~ prevented by approved identified means.
Substantiation: Edit. (A) should apply whether or not interconnection is "inadvertent". (B) should include circuit breakers, and parallel operation should be prevented.
Panel Meeting Action: Reject
Panel Statement: Legally required standby power sources can be connected to the utility company power grid as interconnected electric power production sources in accordance with Article 705. The word "inadvertent" emphasizes that the power source must not be inadvertently connected in a parallel with the normal source unless the system is designed as an interconnected electric power production source.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-214 Log #2923 NEC-P13 **Final Action: Reject**
(701.8)

Submitter: Merv Lapp, Hillsboro, OR
Recommendation: Revise text to read as follows:
701.8 Signals.
Audible and visual signal devices shall be provided, ~~where practicable~~, for the purpose described in 701.8(A), (B), and (C).
Substantiation: This wording is not enforceable. All new installations can be purchased with the needed contacts to provide the signal.
NOTE: Related section NEC 700.7.
Panel Meeting Action: Reject
Panel Statement: There may be older equipment still in operation without the necessary contacts for this functions; therefore, "where practicable" must remain.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-215 Log #2925 NEC-P13 **Final Action: Reject**
(701.8)

Submitter: Merv Lapp, Hillsboro, OR
Recommendation: Revise text to read as follows:
701.8 Signals.
Audible and visual signal devices shall be provided, where practicable, for the purpose described in 701.8(A), (B), and ~~(C)~~ (D).
(D) Generator Trouble. To provide a generator trouble signal to the Fire Alarm Panel.
Substantiation: This addition will permit the generator to be supervised 24/7 the same as the rest of the Fire Alarm Life Safety equipment. The existing generator remote annunciator is normally located in the Fire Command Room that is not manned 24/7. A problem may exist for several days, stopping the generator from functioning, which could jeopardize the lives of the building occupants.
NOTE: Related section NEC 700.7.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-152.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-216 Log #2924 NEC-P13 **Final Action: Reject**
(701.8(A))

Submitter: Merv Lapp, Hillsboro, OR
Recommendation: Revise text to read as follows:
701.8 Signals.
Audible and visual signal devices shall be provided, where practicable, for the purpose described in 701.8(A), (B), and (C).
(A) Derangement. To indicate derangement of the standby source.
(1) Generator main circuit breaker to be alarmed in the off position (Not-in-Auto).
Substantiation: Clarification of the derangement signal: The generator engine control can be in the auto position, indicating it is in the ready state, when the main circuit breaker is in the open, or off, position. In this mode you do not have an emergency generator available to power the Life Safety Systems; Egress Lighting, Fire Pumps, Pressurization fans.
NOTE: Related section NEC 700.7(A).
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-153.

(701.8(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Substitute “supplying” for “carrying”.
Substantiation: Edit.
Panel Meeting Action: Reject
Panel Statement: “Edit” is not sufficient substantiation and does not explain the need for this change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-218 Log #2813 NEC-P13 **Final Action: Accept**
(701.8(D))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Add new 701.8(D) as follows:
701.8(D) Ground Fault. To indicate a ground fault in solidly grounded wye legally required standby systems of more than 150 volts to ground and circuit-protective devices rated 1000 amperes or more. The sensor for the ground-fault signal devices shall be located at, or ahead of, the main system disconnecting means for the legally required standby source, and the maximum setting of the signal devices shall be for a ground-fault current of 1200 amperes, Instructions on the course of action to be taken in event of indicated ground fault shall be located at or near the sensor location.
FPN: For signals for generator sets, see NFPA 110-2005, Standard for Emergency and Standby Power Systems.
Substantiation: Companion proposal has been submitted to section 701.17 to require ground-fault indication for legally required standby systems. For general applications, ground fault protection of equipment is required for grounded wye feeders, 1,000 amperes or greater for nominal 480Y/277 volt systems. The basis for the general requirement in 215.10 is the unusually high number of burndowns reported on feeders in this voltage range. While the requirement to automatically disconnect the circuit has been relaxed in Article 700 for emergency systems, provisions for indication and potential actions are required for these emergency systems. Currently, Article 701 would allow a ground-fault to occur without shut down or even an indication.
Panel Meeting Action: Accept
Panel Statement: The panel understands that the existing fine print note is to be relocated to follow the recommended text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-219 Log #3979 NEC-P13 **Final Action: Reject**
(701.9 (New))

Submitter: Michael A. Anthony, University of Michigan Business Operations
Recommendation: Add text to read as follows:
700.9 Illumination of Emergency Source Switchgear. The area around the service equipment and emergency switchgear in non-dwelling unit occupancies 200 amperes and above shall be automatically illuminated upon loss of power. For a period of 90 minutes illumination levels shall be 1-footcandle on the egress path from the switchgear and 3-footcandles on the vertical surfaces of the service equipment.
Substantiation: The need for illumination during power outages should be intuitive. It provides illumination for a) the electrician who is working in the service equipment area without a flashlight, b) for the maintenance mechanic who may neither be an electrician nor familiar with the electric service equipment to work on it in the dark.
Electric service panels are not always installed along either the primary or secondary egress path required by the Life Safety Code and CMP-1 should not leave it to other standards to assert this requirement.
Other NFPA documents have been examined and a short summary of this examination appears below. [Underline emphasis has been added]
NFPA 101
There is no provision for any emergency illumination other than egress illumination for occupant safety in Section 7.8 of NFPA 101-2009. Egress safety for the occupants of an electrical room is not specifically addressed. In some cases, the cause of a building outage originates in the electrical service switchgear area. In any case, it is likely that there will be activity to and from the electrical service equipment area during a power outage.
An excerpt from this standard is copied below for your convenience:
NFPA 110
An excerpt from this standard is copied below for your convenience:
7.3.1 The Level 1 or Level 2 EPS equipment location(s) shall be provided with battery-powered emergency lighting. This requirement shall not apply to units located outdoors in enclosures that do not include walk-in access.
7.3.2 The emergency lighting charging system and the normal service room lighting shall be supplied from the load side of the transfer switch.
7.3.3* The intensity of illumination in the separate building or room housing the EPS equipment for Level 1 shall be 32.3 lux (3.0 ft-candles), unless otherwise specified by a requirement recognized by the authority having jurisdiction.
Although this standard is seen four times in the NEC, all appearances are Fine Print Notes, and may be unenforceable at the local level, even if it is known to be applicable.
NFPA 70E
An excerpt is copied below for your convenience:
130.6 Other Precautions for Personnel Activities.
(B) Blind Reaching. Employees shall be instructed not to reach blindly into areas that might contain exposed energized electrical conductors or circuit parts where an electrical hazard exists.
(C) Illumination.
(1) General. Employees shall not enter spaces containing electrical hazards unless illumination is provided that enables the employees to perform the work safely.
(2) Obstructed View of Work Area. Where lack of illumination or an obstruction precludes observation of the work to be performed, employees shall not perform any task within the Limited Approach Boundary of energized electrical conductors or circuit parts operating at 50 volts or more or where an electrical hazard exists…
Without this specific provision, emergency illumination “falls between the cracks” and remains a design option.

(701.9(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part: That shall identify all legally required standby system and ~~normal~~ other sources and their location(s) that are grounded ~~connected~~ at that location.
Substantiation: Edit. Location of the sources is an important consideration. There may be other sources than “normal” such as fire pump and emergency systems.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-155.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-221 Log #4679 NEC-P13 **Final Action: Reject**
(701.9(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows: “Where the removal of a main or system bonding jumper interrupts the continuity of the grounding connection to an alternate source grounded conductor, a permanent sign shall be installed on or at the equipment in which the bonding jumper is installed identifying all alternate sources having grounded conductors connected to ground through the main or system bonding jumper.”
Substantiation: With changes in grounding terminology, the intent of this section is being lost. Some think this is about a connection between a grounding electrode and a grounding electrode conductor, for example. This requirement resulted from an actual case where the emergency source was supplying power, and during that period maintenance personnel disconnected the normal source grounded conductor for testing purposes. The personnel did not realize that they were also disconnecting the grounding connection for the emergency source at the same time, since the grounded system conductor was only connected to the grounding electrode conductor in the main switchboard. This rewrite makes the intent very clear.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-156.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LITTLE, L.: This proposed revision clarifies the intent of this requirement and enhances usability. The proposed text is not more complex than the existing requirement. This revision provides clear, prescriptive text on where the required sign is to be located. It is the removal of a main or system bonding jumper that would interrupt the continuity of the grounding connection to an alternate source grounded conductor that this first level subdivision seeks to prevent.
The submitter is correct. The proposed revision makes the intent of this requirement very clear.

13-222 Log #736 NEC-P13 **Final Action: Reject**
(701.10)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text and a new Fine Print Note to read as follows:
701.10 Wiring, Legally Required Standby Systems.
The legally required standby system wiring shall be permitted to occupy the same raceways, cables, boxes, and cabinets with other general wiring.
All boxes and enclosures (including transfer switches, generators, and power panels) for legally required standby circuits shall not be permitted to be marked with the words "Emergency" or "Emergency Circuit" or "Emergency System", so that they will be readily distinguishable from those boxes and enclosures identified as a component of an emergency circuit or system, unless otherwise permitted in 700.9(B)(1) through 700.9(B)(5).
FPN: See 700.9(A) for identification of an emergency circuit or system.
Substantiation: Manufacturers of surface raceways, both metal (*NEC*® Article 386) and nonmetallic (*NEC*® Article 388), and of multi-outlet assemblies (*NEC*® Article 380) derived from surface raceways have had numerous inquiries from specifiers and installers for applications of surface raceways where used for Emergency Systems (*NEC*® Article 700) AND for either Legally Required Standby Systems (*NEC*® Article 701) or Optional Standby Systems (*NEC*® Article 702) AND for other general wiring (power, lighting, signaling) in the same installation. Despite the requirement of 900.9(B), these specifiers and installers are believed to be marking raceways with "EMERGENCY STANDBY", without distinction between "EMERGENCY" (*NEC*® Article 700 circuits) and "STANDBY" (*NEC*® Article 701 or Article 702 circuits), leading to confusion as to the identity of the circuit (*NEC*® Article 700 or Article 701 or Article 702) within the single-channel or multiple-channel surface raceway (or multi-outlet assembly) overall or within a specific channel of a multiple-channel surface raceway.
Editorial: Comma added in title, consistent with the similar title in Article 700.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-158.

13-223 Log #1403 NEC-P13 **Final Action: Reject**
(701.11)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
(A) A storage battery shall ~~be suitable~~ have ratings not less than required to supply and maintain...". (remainder unchanged).
In (B)(4) insert "identified" in lieu of "suitable"
In (G) revise the first sentence of the last paragraph: Unit equipment shall be permanently fixed in place ~~(i.e., not portable)~~ and shall have all supply wiring installed ~~in accordance with the requirements of any of the wiring methods of Chapter 3~~ with an identified wiring method.
Revise the last sentence of (G): Legally required standby Luminaires and lampholders that obtain power from a unit equipment and are not an integral part of the unit equipment shall be wired to the unit equipment by ~~one of the~~ an identified wiring method(s) ~~of Chapter 3.~~
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual. "Any wiring method" can be construed as modifying "not permitted uses". Lampholders should be included in (G). Remote luminaries are a part of the unit equipment, but not an integral part.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation for the proposed changes. The term "suitable" is more than descriptive enough to provide the user with the description of the type and size of battery necessary for the application and the proposed text, therefore, is unnecessary. The definition of "identified" uses the term "suitable." The substantiation has not identified a problem with the use or misuse of the term "suitable" in this particular application. The phrase "in accordance with the wiring methods of Chapter 3" provides the user of the NEC specific direction on what wiring methods to use and where to obtain the requirements for the wiring methods, whereas the suggested text does not. There was not technical substantiation to include lampholders with luminaires.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MOUTON, C.: The last sentence of the panel statement should be edit to change "not" to "no".

13-224 Log #4680 NEC-P13 **Final Action: Accept**
(701.11(B)(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following sentence: "Where power is needed for the operation of the fuel transfer pumps to deliver fuel to a generator set day tank, this pump shall be connected to the legally required standby power system.
Substantiation: This rule now appears in 700.12(B)(2) for emergency systems it only seems to be a matter of common sense that a legally-required system should have the same protection. A generator without fuel is no standby source at all.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-224a Log #CP1304 NEC-P13 **Final Action: Accept**
(701.11(B)(3))

Submitter: Code-Making Panel 13,
Recommendation: Revise the title of the section to read:
(3) Dual ~~Fuel~~ Supplies.
Substantiation: This section covers water supplies in addition to fuel supplies. This action correlates with similar actions taken on proposals for Articles 700 and 708.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-225 Log #1309 NEC-P13 **Final Action: Accept in Part**
(701.11(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence:
The legally required standby service shall be ~~sufficiently~~ separated from ~~the normal main~~ all other service(s) ~~disconnecting means~~ to ~~prevent~~ minimize the likelihood of simultaneous interruption of supply ~~through~~ due to an occurrence in another electrical supply system ~~within~~ for the building(s) or premises or groups of buildings served.
Substantiation: For reliability, separation should apply to all other services. Separation can minimize simultaneous interruption, but not prevent it (such as caused by utility power outage). Separation should apply to the entire service (such as service drops) not just the disconnecting means. 702.12 for example does not limit failure to within the building.
Panel Meeting Action: Accept in Part
The Panel accepts only the word "minimize" to replace "prevent" and rejects the remainder of the recommendation.
Panel Statement: Use of the phrase "the likelihood of" does not provide additional clarity. There is insufficient substantiation to support the remainder of the recommendation, and the proposed editorial revisions do not improve the clarity of the existing requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-226 Log #3286 NEC-P13 **Final Action: Accept in Part**
(701.11(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Where acceptable to the authority having jurisdiction, a legally required standby system shall be permitted to be supplied by connections located ahead of and not within the same cabinet, enclosure, or vertical switchboard or motor control section as the normal service disconnecting means. ~~Shall be permanent.~~ The legally required standby service shall be ~~sufficiently~~ separated from the ~~normal~~ other services disconnecting means except at the point of connection to the normal service to ~~prevent~~ minimize the likelihood of simultaneous interruption of supply through due to an occurrence in any other service ~~within the buildings or groups of buildings served~~.
Substantiation: Connections should be specified as ahead of the "normal" service disconnecting means since "service" can include emergency or fire pump services. Separation should apply to all other services and can minimize simultaneous interruption but not prevent interruption due to power outages. Subsection (D) uses the word "minimize". Separation should be intended to minimize interruption of power whether or not the "occurrence" is within the building served.
Panel Meeting Action: Accept in Part
The panel accepts the only the word "minimize" to replace "prevent" and rejects the remainder of the recommendation.
Panel Statement: Use of the phrase "the likelihood of" does not provide additional clarity. The title of the Section 701.11 contains the term "legally required standby system"; and it is not necessary to repeat it in 701.11(E). It is not necessary to add "motor control" because it is encompassed by the terms "enclosure" and "cabinet". The substantiation does not support the remainder of the recommended revisions and does not demonstrate that the intent of the current text is misunderstood. See the panel action and statement on Proposal 13-225.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-227 Log #1586 NEC-P13 **Final Action: Reject**
(701.11(G)(4) Exception)

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
Exception: In a separate and uninterrupted area supplied by a minimum of three normal lighting circuits, a separate branch circuit for unit equipment shall be permitted if it originates from the same panelboard as that of the normal lighting circuits and is ***lockable in the closed position.*** ~~*provided with a lock-on feature.*~~
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-184.

Ballot Results: Affirmative: 14

13-228 Log #2814 NEC-P13 **Final Action: Accept in Principle**
(701.17)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
701.17 Ground-Fault Protection of Equipment.
The alternate source for legally required standby systems shall not be required to have ground-fault protection of equipment <u>with automatic disconnecting means. Ground-fault indication of the legally required standby source shall be provided per 701.8(D).</u>
Substantiation: Companion proposal has been submitted to add new section 701.8(D) that is similar to text currently located in 700.7(D) for ground-fault indication. For general applications, ground fault protection of equipment is required for grounded wye feeders, 1,000 amperes or greater for nominal 480Y/277 volt systems. The basis for the general requirement in 215.10 is the unusually high number of burndowns reported on feeders in this voltage range. While the requirements to automatically disconnect the circuit has been relaxed in Article 700 for emergency systems, provisions for indication and potential actions are required for these emergency systems. Currently, Article 701 would allow a ground-fault to occur without shut down or even an indication.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read:
701.17 Ground-Fault Protection of Equipment. The alternate source for legally required standby systems shall not be required to have ground-fault protection of equipment with automatic disconnecting means. Ground-fault indication of the legally required standby source shall be provided <u>in accordance with</u> ~~per~~ <u>701.8(D).</u>
Panel Statement: The panel action meets the NEC Style Manual and correlates with the panel action on Proposal 13-189.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-229 Log #3691 NEC-P13 **Final Action: Reject**
(701.17)

Submitter: Christopher G. Walker, Eaton Corp.
Recommendation: Add new text to read as follows:
<u>(A) Feeders</u>
<u>Where ground-fault protection has been provided for the operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load.</u>
<u>Such protection shall consist of overcurrent devices, current transformers, or other equivalent protective equipment that shall cause the feeder disconnecting devices to open.</u>
<u>The additional levels of ground-fault protection shall NOT be installed as follows:</u>
<u>1. On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground, but not more than 600 volts phase-to-phase.</u>
<u>2. On electrical systems where a non-orderly shutdown of power will introduce additional or increased hazards.</u>
<u>Where ground-fault protection has been provided for the operation of service level or feeder level disconnecting means, these means shall be selectively coordinated such that the feeder level device, but not the service level device, shall open on ground faults on the load side of the feeder level device.</u>
<u>A 6-cycle minimum separation time between the service and feeder ground fault trip response bands shall be provided.</u>
Substantiation: Ground faults are typically believed to be the most common type of fault experienced in operating energized electrical systems, per ANSI/IEEE Std 242-1986 Buff book, chapter 7. Professional design engineers tell stories of ballast or small motor failures that have caused main or feeder devices to open. Why is this so? In some instances, a ground fault condition existed that went undetected and precipitated the protective device to open. In other cases, ground fault protective devices were improperly set, or not set at all. In others, a selective coordination study may not have been done, or may have been done improperly.
Therefore, with the goal of using selective coordination as the process by which electrical systems may achieve maximum uptime, it is important that all he key areas of impact are addressed in the design of these electrical systems.
The NEC has for many years required ground fault protection of equipment, but only at the service disconnect level (with noted special exceptions), per Article 230.95. The relatively recent 2005 and 2008 NEC versions, requires selective coordination in applications related to life safety, public safety, and/or national security applications where reliable electrical power systems are required.
These relatively new requirements for selective coordination in these types of applications are needed throughout the entire service level, feeder and branch levels of the electrical system.
With the goal in mind of maximizing the reliability and uptime of electrical systems, and giving consideration that the most common types of faults are ground fault related, it becomes a reasonable approach that whenever selective coordination is required by the Code, that the requirements for ground fault protection of equipment be extended to all appropriate areas in the electrical system beyond just the service level.
This proposal mirrors a similar requirement for ground fault protection of equipment that currently exists in NEC Article 708.52 for Critical Operations Power Systems (COPS). This proposal therefore recommends enhancing the reliability of the electrical system by requiring ground fault protection of equipment in all appropriate levels of the system whenever there are also requirements for selective coordination in that system.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-190.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(Note: Sequence 13-230 moved to follow 13-232 on page 962)

13-231 Log #3928 NEC-P13 **Final Action: Reject**
(701.17)

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association (NEFA)
Recommendation: Revise 701.17.
701.17 Ground-Fault Protection of Equipment.
<u>(A) Alternate Source.</u> The alternate source for legally required standby systems shall not be required to have ground-fault protection of equipment. <u>Ground-fault indication in the legally required standby (alternate) source shall be provided per the requirements in 700.7(D).</u>
<u>(B) Normal Source. Ground-fault protection shall not be required for a disconnecting means in the normal source supplying a legally required standby system where the disconnecting means supplies only fire pumps, emergency systems, or legally required standby systems. Ground-fault indication in the legally required standby (normal) source shall be provided per the requirements in 700.7(D).</u>
Substantiation: Where a disconnecting means supplies only fire pumps, emergency loads, and legally required standby loads, that disconnecting means should be
allowed to operate as long as possible during a ground fault, without opening the life-safety-related loads. Keep the loads on as long as possible.
Because ground-fault operation of the disconnecting means is not provided, signaling would provide an extra degree of safety. This proposal
provides the same "safety logic" for the normal source as the Code already provides for the alternate source.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-192.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-232 Log #3935 NEC-P13 **Final Action: Reject**
(701.17)

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association (NEFA)
Recommendation: Add a second paragraph.
<u>Ground fault relays on the normal source side (line side of the transfer switch) that supply legally required standby systems are permitted to be restrained from operating for ground faults on the loadside of the transfer switch if the system complies with both of the following:</u>
<u>(A) Ground fault protection relays on the normal source side (line side of the transfer switch) are not restrained from operation for ground faults on the normal source side (line side of the transfer switch)</u>
<u>(B) Audible and visual signal devices indicate whenever a ground fault relay has been restrained. Instructions on the course of action to be taken in the event of an indicated ground fault shall be located g or near the sensor location.</u>

Substantiation: For life-safety purposes and system reliability for the prevention of blackouts, it is desirable that a ground-fault on the load side of a transfer switch in a legally required standby system not take out the ground fault protection on the normal source. This proposal allows the ground fault protection on the normal source to be restrained from operating and taking down all or a large portion of the normal system because of a ground fault on the load side of the transfer switch. For these critical life-safety-related applications, it requires both audible and visual signaling that a ground fault has occurred and that it is being restrained.

Restraining the normal system ground fault protection relays for faults on the load side of the transfer switch is consistent with the concept of continuity of service for emergency systems (700.26 & 700.7(D)). legally required standby systems (701.17), and healthcare essential electrical svstems (517.17(B)).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-191.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-230 Log #3693 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Christopher G. Walker, Eaton Corp.

Recommendation: Add new text to read as follows:

Overcurrent devices shall be selected by a qualified person to optimize selective coordination and arc flash protection (NFPA 70E).

Substantiation: Designing electrical systems with overcurrent protective devices that are to be selectively coordinated involves using data from the device manufacturers, and conducting analyses of the various conditions that the electrical system may experience. The choice of overcurrent protective devices involves the study and analysis of both phase and ground fault currents, and cover currents that ranges from low level overloads up to high short circuit fault current levels.

In addition, there are applications that are justified per NFPA 70E-2004 that allow installation and maintenance personnel to perform work close to energized conductors. For these applications where personnel are working in close contact with energized conductors, design studies are to be conducted to determine the possible levels of arc flash energy that personnel may be exposed to, and the subsequent levels of protective equipment that should be in place.

It should be evident that the correct selection of protective devices is very important to minimize damage to equipment, minimize the loss of power in key electrical systems, and minimize the arc flash energy exposure to personnel whenever electrical fault conditions occur. The correct selection of the protective devices that will satisfy these conditions must be done by persons that are qualified to perform the appropriate types of analysis and studies. A thorough analysis is needed to ensure optimal selection of protective devices, otherwise, it may result in excessive equipment damage and/or personnel injury.

The current National Electric Code specifies the types of systems that require selective coordination. The Code does not identify who is responsible for ensuring that the electrical systems meet the selective coordination requirements.

Therefore, this proposal simply adds verbiage to clarify who is responsible for ensuring that the electrical systems meet the current selective coordination requirements, while also addressing equipment protection and personnel safety.

Panel Meeting Action: Reject

Panel Statement: In Section 215.5, an authority having jurisdiction (AHJ) can require a diagram showing feeder details prior to the installation of the feeders and then can require a certain level of expertise for the design of these feeders. Section 240.12 already permits selective coordination for orderly shutdown of the system as a permissive rule.

Section 110.16 requires a sign be posted at the distribution equipment, panelboards, switchboards, and similar equipment warning qualified personnel of the potential electric arc flash hazard. The NEC covers the installation of the electrical system, and NFPA 70E provides coverage once the system has been energized. There may be many reasons a designer provides a particular type of overcurrent protective device for a certain system, with arc flash as one of the many considerations and selective coordination as another.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

CARON, D.: See my comments to Proposal 13-195.

MOUTON, C.: I'm voting against the panel action. The panel action should have been to accept in principle in part. The proposal should not have been rejected since it properly indicates that selective device coordination should be an optimization. See my additional comments for Proposal 13-194 that relate to this proposal also.

13-233 Log #3955 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: James E. Degnan, Sparling

Recommendation: Revise text to read as follows:

701.18 Coordination Legally required standby system(s) overcurrent devices shall be selectively coordinated with all <u>legally required and emergency system</u> supply side overcurrrent protective devices <u>for faults with a duration of 0.1 seconds and longer.</u>

Substantiation: The text used in the comment is preferred over the original text for the following reasons:

1. Language similar to this language is being utilized by some states, for example Oregon & Florida, as a means to apply the intent of selective coordination.

2. Article701.1 states that the scope of Article 701 is: "The provisions of this article apply to the electrical safety of the installation, operation and maintenance of emergency systems ….to required facilities when the normal electrical supply or system in interrupted." If the normal system has been interrupted there is no need for the emergency system to selectively coordinate with it. Changing "all supply side" to "all legally required and emergency system supply side" will make this intent clear.

3. The balance of the substantiation is the same as is listed in my proposal on Section 700.27.

Panel Meeting Action: Reject

Panel Statement: The 0.1 second limit in this proposal could reduce the level of safety by limiting the types of overcurrents that would need to be isolated to the nearest upstream device. Requiring selective coordination down to only 0.1 seconds will cover only overloads and a few minor phase-to-phase and minor ground faults.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 3

Explanation of Negative:

CARON, D.: See my comments to Proposal 13-195.

DEGNAN, J.: See My Explanation of Negative on 13-195.

MOUTON, C.: I'm voting against the panel action. The panel action should have been to accept in principle in part. The proposal should not have been rejected since it properly indicates that selective device coordination should be an optimization, with the 0.1 seconds limitation one of many methods to achieve the optimization. See my additional comments for Proposal 13-195 that relate to this proposal also.

13-234 Log #4325 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Malcolm Allison, Ferraz Shawmut

Recommendation: Amend 701.18 as follows.

<u>**701.18 Coordination.**</u>

<u>**(A) Normal System.** Normal system overcurrent protective devices on the supply side of the legally required standby system overcurrent protective devices shall not be required to be selectively coordinated with other supply side, normal system overcurrent protective devices.</u>

<u>**(B) Legally Required Standby System.**</u> Legally Required Standby System(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices <u>unless one of the following conditions in (1) through (5) are met.</u>

(1) <u>Transformer Overcurrent Protective Devices.</u> Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exists on the transformer secondary.

<u>(2) Overcurrent Protective Devices of the Same Size.</u> Between overcurrent protective devices of the same size (ampere rating) installed in series.

<u>(3) Expansion of an Existing Legally Required Standby System - Existing Overcurrent Protective Devices. Between existing legally required standby system overcurrent protective devices and any existing supply side overcurrent protective devices, where the legally required standby system is expanded.</u>

<u>(4) Expansion of an Existing Legally Required Standby System - New Overcurrent Protective Devices. Between new legally required standby system overcurrent protective devices and any existing supply side overcurrent protective devices, where the legally required standby system is expanded.</u>

<u>(5) Designed Under Engineering Supervision. Where a licensed professional engineer, engaged primarily in the design of electrical installations, provides stamped documentation showing the specific circuit that cannot be selectively coordinated, and substantiation of the design alternatives that were analyzed in the failed attempt to achieve selective coordination. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system.</u>

<u>FPN: These are several techniques that help to selectively coordinate an electrical distribution system</u>

(a) <u>Where transfer switches are utilized, utilizing several smaller transfer switches rather than one larger transfer switch, and moving the transfer switches down in the system, closer to the loads.</u>

(b) <u>Utilizing short-time delay</u>

(c) <u>Utilizing devices with an adjustable instantaneous trip</u>

(d) <u>Utilizing smaller downstream devices</u>

(e) Utilizing several smaller downstream devices rather than one larger downstream device
(f) Utilizing upstream devices with larger frame sizes

(h) Utilizing circuit breaker manufacturers' selective coordination charts
(i) Utilizing differential relays
(j) Utilizing isolation transformers
(k) Minimizing the number of levels in a distribution system
(I) Utilizing a greater number of smaller feeders, rather than a smaller number of larger feeders
(m) Utilizing impedance grounded systems
(n) Utilizing high-instantaneous trip circuit breakers

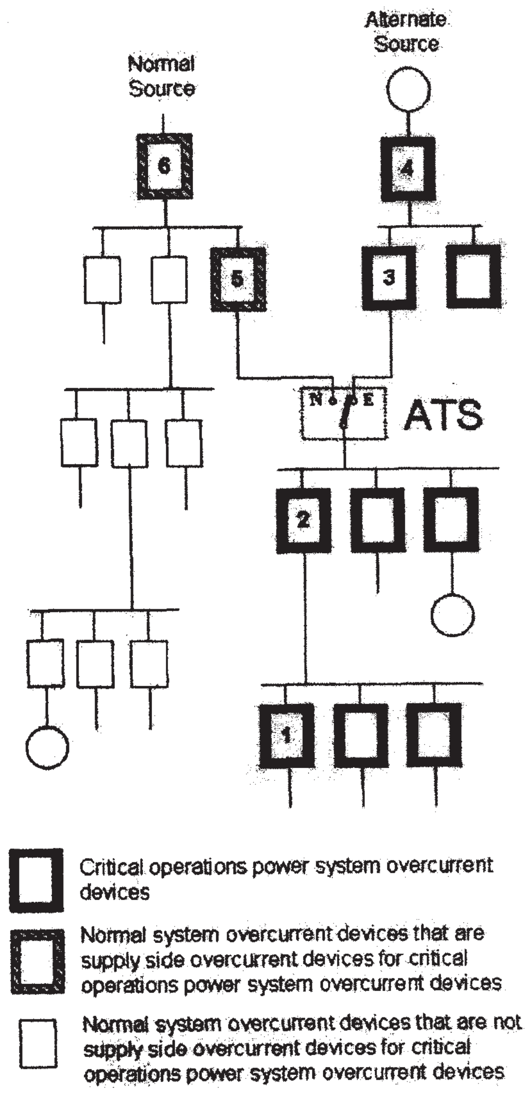

Figure 701.18 Clarification of Selective Coordination Requirements

Substantiation: This proposal is an attempt to clarify the confusion concerning selective coordination requirements.
(1) Figure 701.18 has been added to clarify which devices are legally required standby side devices, and which are normal side devices. This figure should be included in the NEC® text. Figure 701.18 was based upon a figure from an necdigest® article, Keep The Power On For Vital Loads, by Evangelos Stoyas, December 2007 Copyright© 2007,
National Fire Protection Association, Quincy, MA.
(2)"(A) Normal System" was added because there have been questions about the need for selective coordination of the overcurrent devices on the normal side, on the line side of the transfer switch. Since Devices 5 and 6 are not really part of the legally required standby system, 701.18 does not apply, and therefore 5 and 6 do not need to selectively coordinate with each other.
(3)"(B) (1)" and "(B)(2)" are taken from existing text. No changes made
(4) "(B)(3)" was added because there have been questions about the need for existing devices to selectively coordinate when a legally required standby system is expanded or modified. This proposal clarifies that existing devices do not have to be replaced if they do not already selectively coordinate.
(5) "(B)(4)" was added because there have been questions about the need for new devices to selectively coordinate with existing devices when a legally required standby system is expanded or remodeled. This clearly states that new devices do not have to selectively coordinate with the existing devices.
(6) "(B)(5)" was added for those few cases where selective coordination is simply not possible. It is not meant to be a "blank check" to allow designers to avoid their responsibility to provide a selectively coordinated system. The requirements are very similar to those found in 240.86 and are meant to ensure that all reasonable attempts have been made to achieve the objective. Once all attempts have been exhausted, the engineer simply documents the circuit in question and shows the techniques that were attempted.
(7) The FPN was added to provide some of the common methods that experienced engineers utilize to obtain selective coordination. It is not all-inclusive, and has been carefully worded so as not to include any requirements.
Panel Meeting Action: Reject
Panel Statement: The proposal for "(A) Normal System" covers devices in the normal source that are outside the scope of Article 700. While the concept is correct, the additional text is unnecessary. The proposed figure is also unnecessary.
While the concepts in (B), (B)(1), and (B)(2) are basically unchanged from the 2008 NEC, the change is not needed because all other portions of this proposal are also rejected.
(B)(3) is rejected because 700.27 is not retroactive for existing systems.
(B)(4) is rejected because no technical substantiation was provided to justify the reduced continuity of service that would result from the elimination of the requirement of new devices to selectively coordinate with upstream existing devices.
(B)(5) is rejected because no technical justification was provided as to why selective coordination cannot be achieved in all situations. In addition, no information was provided as to which or how many design alternatives the consulting engineer needs to analyze and submit in the required documentation.
The FPN is rejected because technical substantiation was not provided for any of the 14 listed techniques.

Explanation of Negative:
CARON, D.: See my comments to Proposal 13-195.

13-235 Log #4341 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Dan Giblin, National Electric Fuse Assn. (NEFA)
Recommendation: Revise text as follows:
701.18 Coordination.
(Keep present text and add the following at the end)
Selective coordination is required for the full range of overcurrents up to the highest available short-circuit current available at the lineside of each overcurrent protective device. The consideration shall include evaluation for the available short-circuit current from the normal supply and alternate supply as well as the transfer switch type.
Substantiation: The purpose of this addition is to clarify that selective coordination is for the full range of available overcurrents. Some people in the industry have contended that the present requirement is not clear on the range of overcurrent that must be considered. When 700.27 was voted as a requirement during the 2005 NEC cycle and then reaffirmed during the 2008 cycle, Code Making Panel 13 substantiated that this requirement is for the full range of overcurrents. For instance, Comment 20-13 in part "…*Selective coordination increases the reliability of the emergency system. The current wording of the NEC® is adequate.* ***The instantaneous portion of the time-current curve is no less important than the long time portion.***"
The available short-circuit current must be considered for the worst case from the normal source, alternate source, or both for a closed transition transfer switch. If a fault occurs on an emergency load being supplied by the normal source and both the emergency branch circuit overcurrent protective device and emergency feeder overcurrent protective device open, then when the power is transferred to the alternate source, loads supplied by the affected feeder will unnecessarily be interrupted.
There is no simple alternative to use other than for the full range of available short-circuit currents. Some in the industry are advocating changing the selective coordination requirement to only times greater than 0.1 second. The paragraphs below illustrate why this is not viable.
Permitting the selective coordination requirement to be for times only greater than 0.1 second will allow non-coordinated operation of multiple levels of overcurrent protective devices (cascading) under short-circuit current (fault) conditions, which reduces the reliability of the system to deliver power to vital loads. Requiring selective coordination for times only greater than 0.1 second provides coordination for only overloads and does not provide assurance that typical ground faults and arcing faults will not cascade multiple levels of overcurrent protective devices, thereby unnecessarily losing power to critical loads. While both overloads and short-circuits occur on branch circuits, the predominance of overcurrent interruptions on feeder and service circuits are short-circuits (of all types). Graphs A and B depict the time-current curves of the same 30A, 200A, and 800A system. Graph A shows the portion of the circuit breaker time-current curves that would be analyzed for selective coordination for times only down to 0.1 seconds. Graph B depicts the circuit

breaker curves showing the crossover of the circuit breakers in their instantaneous trip region. The cross over is a lack of selective coordination for overcurrents at that level and greater. Graph B shows a lack of coordination between the 30A and 200A circuit breakers for ground, arcing, and any combination of phase faults as low as 800A. Any type of fault as low as 2200A can take out the 800A circuit breaker as well. These are low available fault currents, easily achieved in almost every essential electrical system via a line-ground fault, line-line fault or three phase fault.

All circuit breakers with an instantaneous trip will open in less than 0.1 seconds when fault current is above the instantaneous trip setting. Requiring selective coordination for times only greater than 0.1 second will permit the design of vital electrical systems without regard to proper engineering attention being given to the instantaneous trip region.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The existing text of 701.18 already requires selective coordination for the full range of overcurrents, from overloads through the available short-circuit current, with all upstream devices. Specific additional text is not necessary. Substantiation was not provided for the reference to the transfer switch type.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

MOUTON, C.: I'm voting in the affirmative for the panel action, but would like to make the following comments regarding the proposal, which need to be added into the panel statement in whole or in part, to correctly address incorrect statements made in the proposal substantiation by the submitter. See my comments for Proposal 13-198 that relate to this proposal also.

13-236 Log #4380 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Alan Manche, Square D Company/Schneider Electric

Recommendation: Add a new sentence to the end of the main paragraph of 701.18:

Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. A means to intentionally defeat selectivity shall not be permitted.

Substantiation: Although no data was presented during the 2005 or the 2008 NEC to support the requirement for selective coordination, the panel clearly acted to include the requirement for life safety reasons. Establishing selectively coordinated systems can increase the arc-flash hazard when maintenance is performed on the system depending upon the design of the system. The concern of increased arc-flash hazard was presented to the panel in past cycles and the panel accepted those risks in favor of the benefit of selectivity on these systems. Some system designers are now including a means to defeat selectivity by installing systems that can turn the selectivity off by temporarily changing breaker settings via a switch or sensor in order to protect the electrical worker. There is no prohibition established in the NEC to restrict defeating selectivity, or the life safety aspect for which it was installed, in order to protect the electrical worker.

Unfortunately the enhanced protection for the electrical worker can be a trade-off by defeating the life safety function of the selectively coordinated system in the emergency system. The most likely time for an incident to happen that would require the system to be selective is when a working is doing maintenance on the system. If the selectivity is defeated, an arc event small or large could initiate a fire hazard or take down lighting, ventilation, or critical circuits leaving a system inoperable which places the life safety of others in a dangerous position.

There are solutions available to support the reduction of arc-flash in selectively coordinated system without intentionally defeating selectivity to enhance worker safety.

Panel Meeting Action: Reject

Panel Statement: The panel supports the use of energy reduction means for the protection of personnel during periods of maintenance of energized equipment. Use of these types of devices should be left to the discretion of the facility operator. The panel recognizes that the selective coordination is not available in the system at the time the energy reduction means is operational.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Abstain: 1

Explanation of Abstention:

DEGNAN, J.: See My Abstention on 13-199.

13-237 Log #4423 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Darrel Miller, LSW Engineers Arizona, Inc.

Recommendation: Revise text to read as follows:

701.18 Coordination. Legally requires standby system(s) overcurrent devices shall be ~~selectively~~ coordinated with ~~all~~ supply side overcurrent protective devices. Selectivity shall meet the requirements of (A), (B), or (C).

(A) Selectivity shall be established, in the form of an engineering study, by a licensed professional engineer engaged regularly in the design or maintenance of coordinated electrical systems. The study shall be stamped by a licensed professional engineer and at a minimum include overcurrent device settings, supporting documentation, and a summary of limitations. This study shall be available to those authorized to design, install, inspect, maintain, and operate the system.

(B) Selectivity shall be established under engineering supervision by use of the selected overcurrent device manufactures tables and charts derived from tested combinations of devices. Applicability for each table and chart utilized shall be rigidly adhered to. All tables and charts shall be from the same manufacturer as the installed overcurrent devices.

(C) Selectivity shall be established under engineering supervision in existing installations. The engineer shall determine the extent of selectivity achievable based on review of the existing conditions. Use of methods (A), (B), or combination of each shall be permitted. A summary of limitations and recommendations shall be stamped by a licensed professional engineer and submitted to the authority having jurisdiction prior to the start of construction. Once accepted, the recommendations will establish the extent of retrofit required.

Exception: Selective coordination shall not be required in the following:

(1) Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exist on the transformer secondary.

(2) Between overcurrent protective devices or set of overcurrent protective devices ~~of the same ampere rating in series.~~ in series on opposite ends of the same feeder.

FPN: Overcurrent protective devices used for legally requires standby circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system. A similar increase in overall reliability can be experienced on the normal power system side.

Substantiation:

Present text restricts the design professional from making appropriate judgments and technical decisions necessary to effectively coordinate the overcurrent protective devices. Historically, the design professional has had the responsibility of evaluating and selecting the appropriate equipment based on the individual project circumstances, refer to the ANSI/IEEE color series of recommended practice manuals. The modifications proposed loosen the prescriptive mandate which is creating compliance difficulties. It will also restore the design professionals' freedom to select the appropriate overcurrent devices for use within the emergency, legally required standby, and critical operations power systems. As you will see in the following discussions, coordination has never been expected to be 100% selective. There are often circumstances that are just "best case" even in the most highly coordinated systems. The ANSI/IEEE repeatedly uses language which conveys this understanding.

Many jurisdictions have considered and adopted codification of a 0.1 second fault duration time to establish a reasonable coordination point. In fact, until published Time-Current Curves (TCC's) are available from the majority of manufactures starting at a time line less than the 1st half cycle, 0.0083 seconds, this approach would provide a design basis that is universally workable.

We understand the argument that this is an arbitrary point at which to start coordination. Accordingly, we have taken a different approach. The text presented was modeled after NEC 240.86. This article establishes a method for the design professional to make judgment for existing systems. We have provide options instead of a one size fits all mentality, which is know to have issues; as evidenced by the large number of proposals surrounding this issue. The real concern is with the existing NEC text. It puts the engineer in a position that is contrary to other equally important recommended practices, of which we are also held accountable. The professional engineer does want to follow and is concerned with compliance with all applicable codes. In Arizona, as with other states, Rules of Professional Conduct have been established for the professional registrant. He/she is charged with protecting the public safety, much like the inspections departments are. By the nature of granting a license to practice engineering, the grantor (State) is agreeing that the professional registrant is competent to make such decisions.

In the proposed change, the issue of existing conditions and implementation has been addressed.

The design professional is responsible to assess the needs of the client and make a professional judgment as to the type of system best suited for the application, including system coordination. Professional Registration process has been set up by States, recognized by the Federal Government, to establish the minimum standards for persons competent to engage in the practice of protecting the public from engineering hazards. The professional engineer has been deemed competent to make these type judgments. This has long been the role of the design professional. The following is a list of concerns, quotes, and comments from multiple recognized standards, NFPA, ANSI/IEEE, etc.

1. The NEC definition of selective "coordination is defined in Article 100, as the localization of an overcurrent condition to restrict outages to the circuit or equipment affected, accomplished by the choice of overcurrent protective devices and their ratings or settings." Article 700.27 (701.18 similar) interjects emphasis on any question of how far the design engineer is to carry the out rule, stating "… with all supply side overcurrent protective devices".

Based on a strict interpretation of this definition, the only overcurrent protection device allowed to operate is the ***one immediately upstream from the fault or overcurrent.*** Depending on the fault level, L-L, L-G, 3Ø bolted fault, this requirement is very difficult to meet using circuit breakers and is possible using fuses. Generally, for overcurrent conditions circuit breakers or fuses can be selected to coordinate. The use of a totally fused distribution system is not recommended, especially at the branch circuit level. Only recently have fused branch circuit panelboards returned to the market. Although this equipment is a current design, there are numerous disadvantages to using fuses in lieu of circuit breakers, listed below:

a. Replacement fuses are not always readily available of the same class and rating of the blown fuse.

b. There is a tendency to replace a blown fuse with a fuse of a different class and/or rating in order to restore power immediately, which would have serious consequences in providing future protection. In order to maintain selective coordination, the exact replacement fuse must be used.

c. Even with available fuses, the amount of time to restore power would be longer.

d. The replacement of the fuse(s) would require PPE where the supply side was not de-energized.

e. When only one fuse blows in a three phase circuit, the resultant downstream panels would experience single phasing which would be detrimental to certain three phase loads.

f. Fuse replacement normally requires disconnecting the power to the affected panel as a safety precaution and therefore counteracting the benefits of selective coordination.

g. The majority of emergency, standby, and essential systems currently do not employ solely fuse overcurrent devices. Modifications of an existing facility to provide compliance to these NEC articles will most certainly result in existing distribution system equipment and downstream panel replacement. The replacement equipment in most cases will require more physical space. The result will be architectural remodeling to accommodate the larger equipment. These modifications will result in significant added construction costs and disruption of owner operations.

2. Arguments during the previous code cycle have thrown out any consideration of initial cost for the systems necessary to comply with the present NEC articles. The following quotes highlight statements within the recognized standards which have always considered system initial cost as a factor of design consideration. The use of circuit breakers on emergency, legally required standby, and critical operation power systems are preferred. However, compliance with the present NEC requirements using circuit breakers is very costly. A typical molded case circuit breaker can only be used at the branch circuit level. Upstream devised at the distribution level, in most cases must be capable of defeating the instantaneous setting. This feature is presently available on insulated case circuit breakers and occasionally on electronic trip molded case circuit breakers. The cost for this type of equipment is 2-3x the cost of a similar electronic trip molded case unit. Additionally, enclosure to house these breaker types will go up in class, panelboard to switchboard, switchboard to compartmentalized switchboard, etc. The larger class equipment footprint is most often double the depth, subsequently creating other issues for the architectural designer.

a. "It is important that the various overcurrent devices be coordinated***, as far as practicable***, to isolate faulted circuits and to protect against cascading operation on short circuit faults***. In many systems, however, full coordination is not practicable without using equipment that could be prohibitively costly or undesirable for other reasons.***" [1]. This NFPA article recognizes there is a balance between cost and protection. For reference, Webster defines "practicable" as: 1) possible to practice or perform: feasible. 2) capable of being used: usable.

b. "Safety. Safety of Life and preservation of property are two of the most important"[2] things required of system coordination. ANSI/IEEE goes on to say of reliability (continuity of service) …the system should be designed to isolate faults ***with minimum disturbance to the system*** and should have features to give the maximum dependability consistent with the plant requirements ***and justifiable cost***." This ANSI/IEEE std recognizes the balance between cost and protection.

c. "***Safety has priority*** over service continuity, equipment damage, or economics."[3] The term "safety" here is relating to the prevention of human injury from the electrical system. This includes the persons, maintenance staff or otherwise, that will be resetting the breakers and/or replacing the fuses. This should not be interchanged with "service continuity", which is a separate concern. There has been a scare tactic employed by some to associate "Life Safety" with the term "safety". In an electrical system as discussed in the ANSI/IEEE standards, the safety they are concerned with is 1) electricians or other trained operating personnel, and 2) protecting the public from inadvertent contact with electrical system components. The term "Life Safety" systems is used in the building codes relative to protecting those within the building from smoke or fire to allow safe egress during an event and only occurs in NEC 517.32 to describe a branch of the essential electrical system, similar to that of NEC Article 700. When reviewing the function of the Article 700 system, we see there are several methods of compliance, unit equipment, generator, and other reliable source. The reader must assume that unit equipment can provide the same reliability as the generation system, otherwise it could not be considered for this application. How often have we seen emergency lights out of service? Often. These units require regular testing and eventually maintenance. The batteries tend to fail prematurely in our climate, 3-5 years. These small point-of-use emergency sources do not appear to be nearly as reliable as generator systems, yet they are considered equivalent.

d. "Economic Considerations***. The cost of system protection can never be ignored***, and will determine the degree of system protection that can be feasibly designed into a system. ***Many features can be added*** that will improve performance, reliability, and flexibility***, but will increase initial cost***."[4] This ANSI/IEEE std recognizes that cost is a consideration in the selection of a protection system.

e. "First Cost. ***While first costs are important***, safety, reliability, voltage regulation, maintenance, and the potential for expansion must be considered in selecting the best [overcurrent system] from alternate plans."[5] This ANSI/IEEE std recognizes that cost is a consideration in the selection of a protection system.

3. Where is the issue of concern that introduced these articles? How many occurrences have been documented where a branch circuit level short circuit has taken out the main supply system of emergency system, or large portions of the distribution? If there were occurrences that can be studied, how many resulted from errant settings vs. engineered settings? Substantiation for the necessity of these articles appears to be missing.

4. Interpretation of the Time Current Curves. The industry standard published time current curves (TCC) start the time element at 0.01 seconds. The peak current in a faulted electrical system occurs in the first ½ cycle, or 0.0083 seconds. Therefore the engineer can not design with the traditional tools (TCC) used to coordinate the protective devices within this critical range, below 0.01 seconds. These traditional TTC's are tools which enabled the selection and specification of devices with confidence multiple manufacturers can provide similar units. Comparison between the coordination curves was direct and reliable. To assist with the 2005 selective coordination rules, many of the manufacturers have created tables which list breaker types and classes which selectively coordinate. Each set of tables is unique to each manufacturer. In table form. Because the tables contain only lists of product models, the design engineer is now forced to select a single manufactures equipment to design around. Without the data in the critical region of the TCC, less than 0.01 seconds, design engineers can not evaluate the cross over between manufacturer products. Therefore, the design engineer has no choice but to require a selective coordination study be submitted by the successful bidding manufacturer to confirm their equipment will selectively coordinate. The result of this study, if not of the same manufacture as the basis of design, will require system changes; dimensional modifications, devices frame size and overcurrent device trip changes, related feeder size changes, transformer upsizing, and similar. At the time of bid, these conditions will create a problem. Fair and equitable bidding will be severely hampered. Not to mention legal issues with proprietary

4 ANSI/IEEE Std 242-1986 Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems, 1.1.3.

5 ANSI/IEEE Std 141-1976 Recommended Practice for Electric Power Distribution in Industrial Plants, 2.2.7.

specifications for governmental projects. How will the permitting agencies handle these type of changes after there is a permit issued? Certainly a follow-up review will be necessary.

Nationally, there are many jurisdictions wrestling with the level of enforcing they can handle for this issue. The following States have implemented changes to the present text to give working parameters for this code article.

a. Tucson, Arizona, deleted the article.

b. California Office Of Statewide Health Planning And Development (OSHPD), deleted the article for hospital occupancies.

c. State of Florida Agency for Health Care Administration (AHCA), amended to 0.1 second and above for coordination.

d. State of Massachusetts, 527 CMR 12 Massachusetts Electrical Code, amended to 0.1 second and above for coordination.

e. City of New York, Interpretation only considers overload selectivity.

f. State of Wisconsin (recent vote, outcome unknown), amended to 0.1 second and above for coordination.

g. NFPA 99 Proposal 99-73 Log #CP308 HEA-ELS, amending the extent of selective coordination in part to "…selectively coordinated down to 0.1 seconds." Final Action: Accept.

5. Arguments from an equipment manufacturer (fuse) allege the mere fact that something could happen warrants a solution, ie; since a bolted fault can occur, the protection system must be able to isolate such an occurrence without affecting any other systems components. ANSI/IEEE makes the following statements regarding this issue in their discussions of coordination:

a. "Practical Limits of Protection…However, ***some fault possibilities may be legitimately considered as too improbable to justify the cost of specific protection.*** Before accepting the risk in this basis alone, the magnitude of the probable damage should also be seriously considered."[6] Here the ANSI/IEEE recognizes there are some cases where the improbability of an occurrence negates the need for elimination, rather, an evaluation and recognition of the risks is prudent action.

b. "Nature of the Problem…Operating records show ***that the majority of electric circuit faults originate as a line-to-ground failure***."[7] Here the ANSI/IEEE states the most common faults are not bolted 3-phase (the most difficult to coordinate). If this is true, why does the NEC only require Ground Fault Protection on systems operating at 277V to ground greater than 1200 amps? It seems it would be more prudent to prescriptively require GFP at lower voltages.

c. "A choice of the most suitable current and time settings is made for the device to provide the best possible protection and safety to personnel and electrical equipment and also to function selectively with other protective devices to disconnect the faulted equipment ***with as little disturbance as possible to the rest of the system.***"[8] Here the ANSI/IEEE recognizes there can be disturbance in other portions of the system and advises that the design engineer work to minimize it.

d. "The bolted fault value of short-circuit current results when the fault offers no impedance to the flow of the short-circuit current and the magnitude of current is limited only by the impedance of the circuit elements. This condition results on the maximum short-circuit current. ***Bolted short-circuits are very rare***, however, and the fault usually involves arcing and burning. Under these conditions ***fault currents may be very much lower than bolted-fault values*** and may ***present special problems of detection and isolation***"[9]

e. "The major objectives of the electrical power system designer is to design a system such that faults will be removed in the shortest period of time possible, while maintaining a high degree of service continuity. ***The area of the outage should be restricted as far as practical.*** The goals of maximum protection and maximum service continuity can most nearly be realized by proper selection and adjustment of high-speed protective devices."[10]

The proposed changes will provide a condition no worse than the existing historical situations while setting a standard for going forward in a way that can be readily achieved.

6. Existing Conditions. The NEC has not provided any suggestions as to implementation of these sections within existing system proposed to be modified, whether through remodel of additions. It is not assumed these circumstances would precipitate total replacement of existing equipment. Is there a time period that should be considered for implementation? Is there a point at which the existing system must be replaced? Washington State has implemented regulations that address this issue.

a. "The requirements for selective coordination described in NEC 700.27 are not required where the emergency system was ***installed prior to June 1, 2006***. For ***new emergency systems that are supplied from an existing emergency system installed prior to June 1, 2006***, ***the new portion of the emergency system must comply*** with NEC 700.27."[11] Here the state has resolved the conflict with new and existing systems.

The proposed change would resolve the above issues.

7. Mixing Overcurrent Protective Devices (OCPD's) from different manufacturers or mixing fuses and circuit breakers requires using time current curves (TCC) only. As previously mentioned the TCC curves do not address the region between 0 & 0.01 seconds. As a result, the system will need to be all circuit breakers or all fuses made by the same manufacturer, **for the life of the system**. Also, Fuse ratio or circuit breaker tables cannot be used. Short circuit selective coordination cannot be assured.

The proposed change would resolve the above issue.

8. Bid and Design Complications. Traditionally, the equipment manufacturer would not be selected until the bid is awarded. At this point in the design, construction documents would be completed and signed for permit submission. However, with the new requirements, before a project can go to bid, at least a preliminary selective coordination study must be conducted as it may affect the system design. This sounds simple, but the fact is that the industry conducts business does not accommodate these new requirements**. Somehow the manufacturer of the electrical equipment must be known prior to the completion of Design Development drawings.** It would appear that an Owner would have to engage a manufacturer so they could evaluate the proposed systems selectivity, based solely on their product. This must occur at the Design Development stage because at it's completion the overall building design is set, including the electrical room sizes and placement. Change after this point, other than minor coordination adjustments would be out of sequence work (as defined by the AIA) and contractually chargeable by the design team.

The suggestion has been made that electrical equipment manufacturers could be required to provide the coordination study needed as part of the bid. Also suggested has been specification language such as "vendor shall provide fully selective equipment" has been offered. The problem with this is, in order to bid the project each prospective equipment vendor (and there are at least four major ones), would have to perform a selective coordination study in order to bid. This does not take into account the real possibility of changes to the building to accommodate larger equipment at minimum. The cost of bidding just went up substantially. **Delegation of the coordination elements of design to the vendor via specification language is not practical or effective.**

Potential design changes consist of:

a. Upstream circuit breakers and fuses will need to increase in size, hence equipment sizes and costs may increase.

b. This may necessitate increasing the size of panelboards and feeder conductors.

c. Very high levels of short circuit selective coordination may be achieved by using high amp frame electronic trip circuit breakers

9 ANSI/IEEE Std 241-1983 Recommended Practice for Electric Power Systems in Commercial Buildings, 9.1.

10 ANSI/IEEE Std 241-1983 Recommended Practice for Electric Power Systems in Commercial Buildings, 9.7.

11 WAC 296-46B-700 Emergency systems. WAC 296-46B-701 Legally required standby systems..

with low amp sensors and/or lower ampere rating adjustments (but equipment may need to be larger).

d. Voltages may need to be reduced. If the desired level of selective coordination cannot be achieved using a 480Y/277Vac panelboard, feeding a 208Y/120Vac panelboard through a transformer may need to be considered.

e. Loads may need to be split up (multiple smaller transformers).

f. Impedance may need to be inserted - longer run of wire, 1:1 or higher impedance transformer or reactors.

The proposed change would resolve the above issues.

Arc Flash Concerns. Selective coordination impact on arc flash PPE levels should be considered. Typically, for the lowest PPE level, the smallest and fastest possible OCPDs will be needed upstream. But for the best levels of selective coordination, upstream devices will typically need to be larger and slower reacting. These are in opposition to each other. Arguments from an equipment manufacturer (fuse) allege these are separate issues. However, from an engineering perspective, Arch Flash is a competing directly against Selective Coordination. See discussion in 2nd and 3rd paragraphs at the beginning of this Substantiation.

Panel Meeting Action: Reject

Panel Statement: Proposed (B) contains unenforceable language, such as "rigidly adhered to" and "selectively shall be established." The text in (C) is outside the normal application of the NEC since the authority having jurisdiction, the municipality, and the licensing board for engineers have control over the issues covered within this proposed text, such as what is necessary to be done before the start of construction. The designer, engineer, AHJ, electrical contractor, and owner may often be involved in the decisions related to selective coordination. The submitter states in his substantiation that the professional engineer has the mandate to select the appropriate overcurrent device and thus would be the sole decision-maker on the selective coordination. Again, this procedure is under the jurisdiction of the AHJ, the municipality, and the licensing board. The recommended FPN does not provide any additional information and is unnecessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

CARON, D.: See my comments to Proposal 13-195.

DEGNAN, J.: See My Explanation of Negative on 13-200.

13-238 Log #3719 NEC-P13 **Final Action: Reject**

(701.18, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add a fine print note to read as follows:

FPN: Selective coordination includes coordination between standard overcurrent devices and ground fault devices.

Substantiation: Fault and over current conditions may result from a variety of conditions that range from the rare and difficult to achieve bolted three phase fault to the more probable arcing single phase ground fault. Nevertheless it is a common oversight to consider phase protection selectivity and ground fault protection selectivity separately. A phase protective device considers all current over threshold to be an overload whereas ground fault devices are able to separate a ground current from other current. Because of this, in the case of the more probable ground faults, both devices may operate simultaneously or with either device ahead of the other if ground fault selectivity between the two devices is not planned. Hence, a well-coordinated system must consider ground fault protection and standard phase overcurrent protection simultaneously.

Panel Meeting Action: Reject

Panel Statement: Automatic opening of overcurrent protective devices under a ground-fault condition is not required by Article 701.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

CZARNECKI, N.: The proposal should be accepted. The panel action and statement does not address the concerns expressed in this proposal. The requirements in 701.18 do not prohibit the installation of ground fault protection of equipment for emergency systems. Selective coordination for phase to ground, phase to phase, and three phase short circuits is insufficient where ground fault protection of equipment is installed. The ground fault protective device used for equipment protection must be included for a selectively coordinated system.

13-239 Log #1164 NEC-P13 **Final Action: Accept in Principle**

(701.18 Exception)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Proposed change deletes Exceptions 1 & 2 and replaces them as shown below:

~~Exception: Selective coordination shall not be required in (1) or (2):~~

~~(1) Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exist(s) on the transformer secondary, or~~

~~(2) Between overcurrent protective devices of the same size (ampere rating) in series.~~

Exception: Selective coordination shall not be required between two overcurrent devices in series with one another when no loads are connected in parallel with the downstream device.

Substantiation: The intent of selective coordination is to have only the overcurrent device closest to the fault (first upstream device) to open to clear that fault. This prevents unnecessary outages to other loads on the electrical system.

The exceptions were added as 2 specific examples where no additional loads are affected if a second upstream device also opens.

The intent of this proposal is to clarify that so long as no additional loads are affected by the opening of the second upstream device, selective coordination offers no additional benefit, and should not be required.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

Exception: Selective coordination shall not be required between two overcurrent devices located in series ~~with one another~~ ~~when~~ if ~~where~~ no loads are connected in parallel with the downstream device.

Panel Statement: The changes are editorial to improve clarity and not intended as technical changes.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

DEGNAN, J.: See My Affirmative with Comment on 13-202.

13-240 Log #4681 NEC-P13 **Final Action: Reject**

(701.18 Exception No. 2 and FPN (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee

Recommendation: 701.18. Designate the existing exception as Exception No. 1 and add a second exception and fine print note to read as follows:

Exception No. 2: Where the legally required standby system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the extent practicable. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction.

FPN: Overcurrent protective devices used for legally required standby circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system.

Substantiation: The current NEC rule is being improperly used to drive the market share of a particular species of overcurrent protective device, often frustrating legitimate design objectives of the engineering community, and without any documented loss experience to justify such a consequence. We have received compelling testimony from engineers that have been subjected to extraordinary hardship resulting from the lack of flexibility in the current NEC provisions. This proposal is consistent with NFPA 110 (which language underlies the fine print note) and provides the necessary flexibility to allow competent engineering work that maintains selective coordination as an important element in the electrical design process, but not to the exclusion of all other issues.

Panel Meeting Action: Accept in Principle in Part

Revise Section 700.18 to read:

700.18 Coordination. Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. The selectively coordinated devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system.

Panel Statement: The panel action rejects the wording "where practicable," as this is not defined and subjective. The recommendation on the qualifications for those who design the system has been revised to use the text from 240.86, as this provides a more definitive description of those who can design these systems.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 5
Explanation of Negative:
CZARNECKI, N.: See NEMA statement for Proposal 13-203.
DEGNAN, J.: See My Explanation of Negative on 13-203.
LITTLE, L.: We agree with the negative comment as written by Mr. Ode.
MOUTON, C.: I'm voting against the panel action. The panel action should have been to reject the proposal, even though it does have some merit, and the submitter properly characterizes the current environment in the industry resulting from the current selective device coordination language in Articles 700.27, 701.18, and 708.54. The proposal should have been rejected in preference of Proposal 13-194, which should have been accepted in principle in part (see my comments to Proposal 13-194). See my additional comments for Proposal 13-203 that relate to this proposal also.
ODE, M.: The substantiation in the proposal and the panel statement for the Panel Action provided absolutely no technical substantiation to require selectively coordinated device installation design in an emergency, a legally required standby system, or a critical operations power system to be selected, documented, and stamped by a licensed professional engineer. The requirement for a licensed professional engineer to design and stamp drawings for these systems is overly restrictive, adds unnecessary cost to the installation, and negates a very viable resource in the use of manufacturers who provide this service on a regular basis. The owner, the electrical equipment manufacturer, the plant engineer, the electrical contractor, the AHJ, the utility company, as well as the design engineer are often involved in determining the requirements for initial design of new systems and to the extent that older systems must comply with selective coordination. In addition, 90.1(C) of the National Electrical Code states that the NEC is not intended as a design specification and, yet, the proposed text requiring a licensed professional engineer adds design requirements into the selective coordination process.
Comment on Affirmative:
CARON, D.: See my comments to Proposal 13-203.

ARTICLE 702 — OPTIONAL STANDBY SYSTEMS

13-241 Log #3033 NEC-P13 **Final Action: Reject**
(702)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
ARTICLE 702 Optional Standby Systems
I. General
702.1 Scope. Text to remain unchanged.
702.2 Definition. Text to remain unchanged.
702.3 Application of Other Articles. Text to remain unchanged.
702.4 Equipment Approval. Text to remain unchanged.
702.6 ~~702.5~~ Capacity and Rating. Text to remain unchanged.
702.7 ~~702.6~~ Transfer Equipment. Text to remain unchanged.
702.8 ~~702.7~~ Signals.
Audible and visual signal devices shall be provided, where practicable, for the following purposes.
(1) Derangement. Text to remain unchanged.
(2) Carrying Load. To indicate that the optional standby source is carrying load.
Exception: Signals shall not be required for portable standby power sources.
702.9 ~~702.8~~ Signs. Text to remain unchanged.
II. ~~Circuit~~ Wiring
702.9 Wiring Optional Standby Systems.
Text to remain unchanged.
~~III. Grounding~~
702.11 ~~702.10~~ Portable Generator Grounding. Text to remain unchanged.
702.12 ~~702.11~~ Outdoor Generator Sets. Text to remain unchanged.
Substantiation: This proposal is part of a series of proposals intended to create a parallel numbering system for Articles 700, 701 and 702.
Panel Meeting Action: Reject
Panel Statement: The proposed parallel numbering system for Articles 700, 701, and 702 is unnecessary since the articles are not large and complex articles. While there are some common titles and text, there are also titles and text that are different from one article to another. Code Making Panel 13 recommends rejection of the renumbering of Article 701.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-242 Log #2815 NEC-P13 **Final Action: Accept**
(702.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text
~~702.3 Application of Other Articles~~.
~~Except as modified by this article, all applicable articles of this Code shall apply.~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 522.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept

(702.4)

Submitter: Bryan P. Holland, City of North Port
Recommendation: Delete the following text:
~~702.4 Equipment Approval. All equipment shall be approved for the intended use.~~
Substantiation: This section is redundant and unnecessary. Sections 90.7, 110.2, and 110.3 already contain this provision. There is no special listing, labeling, or marking which identifies equipment as suitable for this type of system, thus, no special evaluation beyond 90.7, 110.2 and 110.3 is needed.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-245 Log #1402 NEC-P13 **Final Action: Reject**
(702.5)

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A) change "suitable" to "identified".
Revise first sentence of (B)(1) as follows: Where manual transfer equipment is used, an optional standby system shall have ~~adequate capacity~~ ratings not less than required for the supply of all equipment ~~intended to be~~ that is operated simultaneously ~~at one time~~
Revise (B)(2)(b) as follows: Load Management. Where a system is employed that ~~will~~ automatically manage(s) the connected load, the standby source shall have ~~a capacity sufficient to~~ ratings not less than those required to supply the maximum computed load that ~~will be~~ is connected by the load management system.
Substantiation: "One time" is not necessarily the same as "simultaneously." "Adequate" and "sufficient" are subjective and terms to be avoided per the Style Manual. "Capacity" is not defined; "ratings" include voltage, ampere, frequency, etc. "Connected" load is not defined; some loads are computed even though no current utilizing equipment is connected.
Panel Meeting Action: Reject
Panel Statement: The panel rejects all of the proposed editorial revisions. While the NEC Style Manual may list terms to be avoided, it is not a prohibition of those terms. The context of this section is clear, and the suggested revisions do not improve clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-246 Log #3031 NEC-P13 **Final Action: Reject**
(702.5)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
702.5 Capacity ~~and Rating.~~
~~(A) Available Short-Circuit Current. Optional standby system equipment shall be suitable for the maximum available short-circuit current at its terminals.~~
~~(B) System Capacity.~~ The calculations of load on the standby source shall be made in accordance with Article 220 or by another approved method.
~~(1)~~ (A) Manual Transfer Equipment. Where manual transfer equipment is used, an optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. The user of the optional standby system shall be permitted to select the load connected to the system.
~~(2)~~(B) Automatic Transfer Equipment. Where automatic transfer equipment is used, an optional standby system shall comply with (B)(1) or (B)(2). ~~(2)(a) or (2)(b).~~
~~(a)~~(1) Full Load. The standby source shall be capable of supplying the full load that is transferred by the automatic transfer equipment.
~~(b)~~(2) Load Management. Where a system is employed that will automatically manage the connected load, the standby source shall have a capacity sufficient to supply the maximum load that will be connected by the load management system. Remainder of text to be unchanged.
Substantiation: This requirement is already found in 110.9/110.10, and a similar requirement is not found in 700.5. For the purposes of consistency, if nothing else, this sentence should be removed.
Alternatively, it could be added into 700.5. A similar proposal is being made to 701.6 for correlation.
Panel Meeting Action: Reject
Panel Statement: The same sentence appears in 700.5(A) and in 701.6. There are installers of generators and similar back up power that do not read the text in 110.9; therefore, providing mandatory text requiring maximum available fault rating for the equipment is re-emphasized in 702.5.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-247 Log #4315 NEC-P13 **Final Action: Reject**
(702.5)

Submitter: Chris Turner, Generac Power Systems
Recommendation: Revise text as follows:
702.5
(B) System Capacity. ~~The calculations of load on the standby source shall be made in accordance with Article 220 or by another approved method.~~ An optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. The user of the optional standby system shall be permitted to select the load connected to the system.
~~**(1) Manual Transfer Equipment.** Where manual transfer equipment is used, an optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. The user of the optional standby system shall be permitted to select the load connected to the system.~~
~~**(2) Automatic Transfer Equipment.** Where automatic transfer equipment is used, an optional standby system shall comply with (2)(a) or (2)(b).~~
~~(a) Full Load. The standby source shall be capable of supplying the full load that is transferred by the automatic transfer equipment.~~
~~(b) Load Management. Where a system is employed that will automatically manage the connected load, the standby source shall have a capacity sufficient to supply the maximum load that will be connected by the load management system.~~
(1) Automatic Transfer Systems. Where automatic transfer equipment is used, it is recommended that the optional standby system incorporate internal protective systems that monitor against overload conditions. These systems shall either automatically manage the load or shutdown the system. Systems that do not incorporate overload protections, must be sized per Article 220.
Substantiation: In a review of the ROPs submitted prior to the latest code change, 702.5 requirements became somewhat blurred. It is important to remember that this sectionrefers to optional standby systems.
The increase in generator installations, while are somewhat related to recent natural disasters, can mostly be attributed to the lowering of the cost of product and the ease of installation created by many manufacturers. As the quality and dependability of the utility is dropping the product category of optional standby systems is becoming more familiar to home owners. In attempts to maintain the quality of life expected by those home owners and their families more and more optional standby systems are being installed. Some users value high levels of system reliability and install redundant generators. Some users value the ability to support load growth and install upsized generators. And some users select generators to meet there most basic operational needs. It has been the long tradition of Article 702 to allow the user to best make this value decision relative to selecting the best sized generator to meet their unique operation needs.
Listed standby systems have been tested under overload conditions to ensure that component temperatures are the within limits of the standards being tested to and that the risk of fire is non existent.
In reviewing the ROPs that resulted in the changes to 702.5, we noticed that the primary focus was directed at the residential market. The residential market is driven by consumer choice that is significantly impacted by installed capital costs. The residential automatic standby market is dominated by air-cooled generators that cap-out at 20 Kw. The next step-up in power output moves customers into liquid cooled generators that are twice the cost. So even though the market freely offers larger generators, the market choice finds it generally unpalatable due to a significant reduction in the benefit/cost ratio. By requiring optional standby system customers to comply with utility sizing requirements as established in Article 220, the code is forcing the majority of the whole house, standby system market to transition across the 20 Kw barrier.
There is substantial data available that shows the average electrical load profile of a residential home is very low. See the table below which provides average max hourly power consumption for typical residences around the country. This shows even smaller optional standby systems are still sizable based on typical power consumption.

Typical Residence Location	Average Max Hourly Power Consumption Across 365 Days
Southern California – No Space Cooling	1.9 Kw
New Jersey – With Electric Space Heating	6.0 Kw
Baltimore – With Electric Space Heating	5.2 Kw
Source – Report prepared by NAHB Research Center, Inc., Titled Review of Electrical Residential Energy Use, dated July 16, 2001.	

The unintended consequences of this code change are that many customers may not be able to afford an inherently safe, pre-wired, automatically fueled backup system. They will instead choose to burn candles and attempt to safely use portable, gasoline powered generators. At Generac Power Systems we feel the decision as to the safest course of action, in the big picture, is to allow the market to select and size optional standby systems based on end-user operational needs.
If an optional standby system has overload protection systems built in what harm can come from the system being connected to a whole house application? What fire and/or electrical hazards present themselves if the system is overloaded but then shuts itself down?
Panel Meeting Action: Reject
Panel Statement: Deleting the requirements in 702.5(B) for proper sizing of the optional standby system feeder conductors and basing that deletion upon an automatic overload sensing device to shut the power down does not recognize the long history of safety provisions for feeders in Articles 215 and 240 and branch circuits in Articles 210 and 240, as well as the calculation requirements for sizing the system based on Article 220. Feeder circuits supplying panelboards and branch circuits supplying loads of all kinds must be calculated based on their anticipated usage based on Parts I and II of Article 220 (for branch circuits) and Parts I and III of Article 220 (for feeders) or the optional calculations based on Parts I and IV of Article 220. Section 90.3 requires compliance with Chapters 1 through 4 unless specifically modified by Chapter 7 (Article 702) in this case. Even if the existing first sentence was deleted as indicated in the proposed recommendation, feeders and branch circuits must still comply with Article 220 as the proposal text is written. Nowhere in the NEC is it permissible to intentionally overload a feeder or a branch circuit, and 240.4(B) intentionally requires the conductors to be protected at their ampacity with permission up to 800 amps to increase to the next size overcurrent protective device where the size of conductor doesn't correspond to a standard size device. The suggested change in proposed (B)(1) is already permissible based on the existing NEC as automatic load pickup and shedding systems with overload protection designed into the optional standby source.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-248 Log #3085 NEC-P13 **Final Action: Reject**
(702.5(B))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
702.5 Capacity and Rating.
(A) Text to remain unchanged.
(B) System Capacity. A load calculation shall not be required for optional standby systems.
~~(1) Manual Transfer Equipment. Where manual transfer equipment is used, an optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. The user of the optional standby system shall be permitted to select the load connected to the system.~~
~~(2) Automatic Transfer Equipment. Where automatic transfer equipment is used, an optional standby system shall comply with (2)(a) or (2)(b).~~
~~(a) Full Load. The standby source shall be capable of supplying the full load that is transferred by the automatic transfer equipment.~~
~~(b) Load Management. Where a system is employed that will automatically manage the connected load, the standby source shall have a capacity sufficient to supply the maximum load that will be connected by the load management system.~~

Substantiation: The functionality of an optional standby system should not be of concern in the code, as per the "practical safeguarding" intent of 90.1(A). If the optional standby system is inadequate, there is not a safety issue like there is for an emergency or legally required standby system.
Panel Meeting Action: Reject
Panel Statement: The code is an installation document, not a product design document. As a result, it is not possible to determine whether an automatic standby system has been designed safely enough to allow the standby source to be deliberately and repeatedly overloaded without resulting in some safety hazard. Therefore, the requirement to size the load properly or provide automatic "resizing" in the form of load management is appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-249 Log #1401 NEC-P13 **Final Action: Reject**
(702.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "inadvertent".
Substantiation: Edit. The provision should apply whether interconnection is inadvertent (accidental) or deliberate.
Panel Meeting Action: Reject
Panel Statement: The use of the term "inadvertent" is necessary for this requirement. The deletion of this term does not improve clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-250 Log #2354 NEC-P13 **Final Action: Reject**
(702.6 Exception)

Submitter: Timothy Croushore, Allegheny Power
Recommendation: Delete the Exception.
Substantiation: Deleting this exception removes the NEC permission to temporarily connect a generator to premises wiring without the use of a transfer switch. A home owner in Alabama has already killed a lineman by back feeding his home electrical wiring with a portable electrical generator without a transfer switch. Lets not continue this permission through the exception in the NEC. See the news article below.

Lineman Killed By Generator Back Feed - Victim Helping Restore Power in Alabama

Alabama, July 14, 2005 - Sumter Electric Cooperative (SECO) officials report that a South Carolina lineman helping to restore power in Alabama after the damage caused by Hurricane Dennis was killed late Tuesday, reportedly by an improperly installed customer generator.

According to SECO Director of Public Affairs Barry Bowman, the lineman was helping to restore power lost during Hurricane Dennis to customers in Alabama. The report Bowman received indicated the lineman was working on a power line that was supposed to be dead. It was not.

"Tragically, the line this technician was working on was not dead," said Bowman, "The line he was trying to repair had been re-energized by a customer who had improperly hooked up a generator and created a back feed of electricity from the generator into the supposedly dead line. The death of a lineman who was there to help the victims of Hurricane Dennis was the horrible result."

Bowman noted that the lineman's name was not immediately released, but he was from South Carolina and worked for Pike Electric, Inc. in North Carolina.

Alabama authorities are looking for the person responsible and indicate that charges are pending.

"This could happen to any lineman, anywhere, if generators are improperly used or hooked up during a power outage. That's why we caution homeowners and businesses about the proper use of generators. And, why we continually stress generator safety awareness with our SECO employees.I don't think anybody wants to be responsible for the death of another human being," said Bowman.

SECO's Director of Public Affairs noted that SECO also has 32 workers helping to restore power in the Panhandle and offered the following generator safety advice:

– Do not hook up (hard wire) a generator directly to your home or business electric panel. If you want to hard wire a generator to home or shop have a licensed electrician install a double-pole, double-throw transfer switch. This will assure that no back feed of electricity will travel out over a supposedly de-energized power line. The installation should meet the requirements of the National Electrical Code and local ordinances. Improper installation can result in serious injuries or deaths.

– One of the safest ways to use portable generators is to plug appliances, etc. directly into the generator itself rather than trying to hard wire the generator to the house. When plugging items into the generator make sure not to use undersized extension cords, keep animals and people away from the generator, and place the generator in a clean, dry, and very well ventilated area. This will avoid overheating and the potential for carbon monoxide poisoning. Installing carbon monoxide detectors in adjacent areas is a good additional safety precaution.

"We want our customers to know of the very serious consequences of improper generator use and the terrible death in Alabama underscores the importance of that type of awareness," concluded Bowman.

Panel Meeting Action: Reject
Panel Statement: Not having this exception in the NEC would not have affected the outcome of this tragic event since the homeowner did not follow the requirements in the exception and probably had no idea that the exception was even in the NEC. The exception permits "temporary connection of a portable generator without a transfer switch where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the normal supply is physically isolated by a lockable disconnecting means or by disconnection of the normal supply conductors." The homeowner was probably not qualified and did not have the normal supply physically isolated from the generator source.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

BROWN, J.: The back feed from portable generators into utility supply lines continues to be a significant hazard to lineman. Portable generators should only be connected to a premises wiring system with the use of transfer equipment that prevents the inadvertent connection between the utility supply lines and the premises wiring. Preferably, portable generators should be utilized with the loads plugged directly into the generator.

13-251 Log #3978 NEC-P13 **Final Action: Reject**
(702.8 (New))

Submitter: Michael A. Anthony, University of Michigan Business Operations
Recommendation: Add text to read as follows:

702.8 Illumination of Emergency Source Switchgear. The area around the service equipment and optional standby switchgear in non-dwelling unit occupancies 200 amperes and above shall be automatically illuminated upon loss of power. For a period of 90 minutes illumination levels shall be 1-footcandle on the egress path from the switchgear and 3-footcandles on the vertical surfaces of the service equipment.

Substantiation: The need for illumination during power outages should be intuitive. It provides illumination for a) the electrician who is working in the service equipment area without a flashlight, b) for the maintenance mechanic who may neither be an electrician nor familiar with the electric service equipment to work on it in the dark.

Electric service panels are not always installed along either the primary or secondary egress path required by the Life Safety Code and CMP-1 should not leave it to other standards to assert this requirement.

Other NFPA documents have been examined and a short summary of this examination appears below. [Underline emphasis has been added]

<u>NFPA 101</u>

There is no provision for any emergency illumination other than egress illumination for occupant safety in Section 7.8 of NFPA 101-2009. Egress safety for the occupants of an electrical room is not specifically addressed. In some cases, the cause of a building outage originates in the electrical service switchgear area. In any case, it is likely that there will be activity going to and from the electrical service equipment area during a power outage.

<u>NFPA 110</u>

An excerpt from this standard is copied below for your convenience:

7.3.1 The Level 1 or Level 2 EPS equipment location(s) shall be provided with battery-powered emergency lighting. This requirement shall not apply to units located outdoors in enclosures that do not include walk-in access.

7.3.2 The emergency lighting charging system and the normal service room lighting shall be supplied from the load side of the transfer switch.

<u>**7.3.3* The intensity of illumination in the separate building or room housing the EPS equipment for Level 1 shall be 32.3 lux (3.0 ft-candles), unless otherwise specified by a requirement recognized by the authority having jurisdiction.**</u>

Although this standard is seen four times in the NEC, all appearances are Fine Print Notes, and may be unenforceable at the local level, even if it is known to be applicable.

<u>NFPA 70E</u>

An excerpt is copied below for your convenience:

130.6 Other Precautions for Personnel Activities.

(B) Blind Reaching. Employees shall be instructed not to reach blindly into areas that might contain exposed energized electrical conductors or circuit parts where an electrical hazard exists.

(C) Illumination.

(1) General. *Employees shall not enter spaces containing electrical hazards unless illumination is provided that enables the employees to perform the work safely.*

(2) Obstructed View of Work Area. Where lack of illumination or an obstruction precludes observation of the work to be performed, employees shall not perform any task within the Limited Approach Boundary of energized electrical conductors or circuit parts operating at 50 volts or more or where an electrical hazard exists…

Without this specific provision, emergency illumination "falls between the cracks" and remains a design option.

Ballot Results: Affirmative: 14

13-252 Log #4682 NEC-P13 **Final Action: Reject**
(702.8(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows: "Where the removal of a main or system bonding jumper interrupts the continuity of the grounding connection to an alternate source grounded conductor, a permanent sign shall be installed on or at the equipment in which the bonding jumper is installed identifying all alternate sources having grounded conductors connected to ground through the main or system bonding jumper."
Substantiation: With changes in grounding terminology, the intent of this section is being lost. Some think this is about a connection between a grounding electrode and a grounding electrode conductor, for example. This requirement resulted from an actual case where the emergency source was supplying power, and during that period maintenance personnel disconnected the normal source grounded conductor for testing purposes. The personnel did not realize that they were also disconnecting the grounding connection for the emergency source at the same time, since the grounded system conductor was only connected to the grounding electrode conductor in the main switchboard. This rewrite makes the intent very clear.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-156.

LITTLE, L.: See my Negative Vote on Proposal 13-221.

13-253 Log #737 NEC-P13 **Final Action: Reject**
(702.9)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text and a new Fine Print Note to read as follows:
702.9 Wiring, Optional Standby Systems.
The optional standby system wiring shall be permitted to occupy the same raceways, cables, boxes, and cabinets with other general wiring.
All boxes and enclosures (including transfer switches, generators, and power panels) for optional standby circuits shall not be permitted to be marked with the words "Emergency" or "Emergency Circuit" or "Emergency System", so that they will be readily distinguishable from those boxes and enclosures identified as a component of an emergency circuit or system, unless otherwise permitted in 700.9(B)(1) through 700.9(B)(5).
FPN: See 700.9(A) for identification of an emergency circuit or system.
Substantiation: Manufacturers of surface raceways, both metal (*NEC*® Article 386) and nonmetallic (*NEC*® Article 388), and of multi-outlet assemblies (*NEC*® Article 380) derived from surface raceways have had numerous inquiries from specifiers and installers for applications of surface raceways where used for Emergency Systems (*NEC*® Article 700) AND for either Legally Required Standby Systems (*NEC*® Article 701) or Optional Standby Systems (*NEC*® Article 702) AND for other general wiring (power, lighting, signaling) in the same installation. Despite the requirement of 900.9(B), these specifiers and installers are believed to be marking raceways with "EMERGENCY STANDBY", without distinction between "EMERGENCY" (*NEC*® Article 700 circuits) and "STANDBY" (*NEC*® Article 701 or Article 702 circuits), leading to confusion as to the identity of the circuit (*NEC*® Article 700 or Article 701 or Article 702) within the single-channel or multiple-channel surface raceway (or multi-outlet assembly) overall or within a specific channel of a multiple-channel surface raceway.
Editorial: Comma added in title, consistent with the similar title in Article 700.
Panel Meeting Action: Reject

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-254 Log #3032 NEC-P13 **Final Action: Reject**
(702.10)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Delete the following text:
~~702.10 Portable Generator Grounding.~~
~~(A) Separately Derived System. Where a portable optional standby source is used as a separately derived system, it shall be grounded to a grounding electrode in accordance with 250.30.~~
~~(B) Nonseparately Derived System. Where a portable optional standby source is used as a nonseparately derived system, the equipment grounding conductor shall be bonded to the system grounding electrode.~~
Substantiation: This section is not needed, as compliance with Article 250 is not optional (90.3). Furthermore, there is no reason to require the connection of the equipment grounding conductor to an electrode for a nonseparately derived system, as this is accomplished automatically through the neutral in the transfer switch (otherwise it would be separately derived).
Panel Meeting Action: Reject
Panel Statement: There are installers of generators and similar back up power that do not read the text in 250.30 for separately derived systems and may not understand that portable generators not separately derived must have the equipment grounding conductor from the generator connected to the grounding electrode system; therefore, providing mandatory text references back to the information in Article 250 is re-emphasized in 702.10. The last statement in the substantiation is not necessarily correct for portable generators. The submitter should review Section 250.34.
Number Eligible to Vote: 14

13-255 Log #4574 NEC-P13 **Final Action: Reject**
(702.10)

Submitter: Mike Flegel, Reliance Controls Corp.
Recommendation: III. Grounding and Bonding
(C) For portable generators with an output of 15 kilowatts or less and 250 volts or less used as a non-separately derived system, bonding of the grounded conductor to the equipment grounding conductors can occur in two places, at the generator and at the service entrance.
Substantiation: For small portable generators, this means the equipment grounding conductor will carry some of the unbalanced neutral current from the service entrance to the generator. Depending on the load, the voltage rise at the generator frame in minimal, 3 to 4 volts in most cases. There would be no voltage rise in the equipment grounding system in the premises wiring as the dual path exists only between the generator and the service entrance. Many people do not know to switch the neutral when using a bonded neutral generator to power their house and many have done this in the past without a problem. People realize this error when they try to use a portable generator with GFCI protection to power their house. The tendency then is to disconnect the equipment grounding conductor from the generator since most generator manufacturers do not have a means to unbond the generator in the field. This leads to the undesirable condition of a generator frame without any equipment ground.
Panel Meeting Action: Reject
Panel Statement: If the grounded conductor opened on the line side of the service disconnecting means, the equipment grounding conductor and all conductive parts connected to it would carry the neutral current, raising the potential to ground of exposed metal parts not intended to carry current. For this reason, the Code continues to prohibit the creation of parallel paths for normal neutral current to flow with very few exceptions, some of which only apply to existing installations. Improper installations are not sufficient justification for changing requirements intended to increase the safety of the installation.

13-256 Log #4708 NEC-P13 **Final Action: Reject**
(702.11)

Submitter: Clyde V. Carl, North Carolina Dept. of Administration/State Construction Office
Recommendation: Delete text as follows:
~~The disconnecting means shall meet the requirements of 225.36.~~
Substantiation: The sentence that was added to 700.12(B)(6) is superfluous with consideration to the requirements of UL 869A and UL 2200. The physical requirements that determine a disconnecting means to be "suitable for use as service equipment" are not found in NEC®. Consequently, the mandate that equipment must be suitable for use a service equipment, without clear definition of how equipment may be suitable, may foster misunderstandings about how the requirement may be satisfied. This is the thesis by which the proposed fine print note should be added to 225.36 to mitigate a misapplication for the "suitable for service equipment" requirement of 700.12(B)(6) that was revised for the 2008 edition of the NEC®.
In UL 869A, *Reference Standard for Service Equipment,* fourth edition, one learns in Section 14.2, Insulated neutral, Paragraph 14.2.1, that, "Equipment having a neutral insulated from the enclosure, intended for use as service equipment, and that can accommodate not more than six main disconnecting means shall be marked "Suitable for use as service equipment." The NEC® definition for service equipment expands on UL 869A by stating, "The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service conductors to a building or other structure, or an otherwise designated area, and intended to constitute the main control and cutoff of the supply." The problem is that generator sets are, by the NEC® definition, separately derived systems. A separately derived system is, "A premises wiring system whose power is derived from a source of electrical energy or equipment other than a service. Such systems have no direct electrical connection, including a solidly connected grounded circuit conductor, to supply conductors originating in another system." A generator set is a separately derived system, therefore, there is no justification for 700.12(B)(6) to require the disconnecting means of a generator set to be suitable for service equipment. 700.12(B)(6) is ambiguous in another way.

In UL 2200, *Stationary Engine Generator Assemblies,* Section 25 discusses overcurrent protection, a requirement of equipment suitable for service equipment, and output circuit grounding. UL 2200 does not specifically call out a requirement for a neutral that is insulated from the generator set enclosure, but Section 14, Output Circuit Grounding, in paragraph 14.1.2 requires that "an output alternating current power circuit shall be grounded" when in sub-paragraph (a) "the circuit has no electrical connection, including a solidly connected grounded circuit conductor, to supply conductors originating in another wiring system." Conversely, the alternating current output power circuit must be insulated from ground at the generator if the circuit shares a neutral conductor ground reference with another system, or a service. If the grounded conductor is not to be shared with another system, or service, UL 2200 goes on in paragraph 14.1.4 to describe the application and sizing of a bonding jumper to ground conductors of output circuit configurations listed in paragraph 14.1.3. A bonding jumper would not be required if a generator output circuit was bonded to ground at the factory. If this were the case, the generator set output, though a separately derived system, could only be utilized in the manner of service entrance equipment, and if UL 2200 was similar to UL 869A, it would require the generator set to be labeled, "Suitable only for use as service equipment", unless its output enclosure can accommodate more than six disconnecting means, and then it would be required to be labeled. "Suitable only for use as service equipment. Install not more than six main disconnecting means."

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-181.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-257 Log #4767 NEC-P13 **Final Action: Reject**
(702.11)

Submitter: Brendan A. Foley, Eaton Corp.

Recommendation: Add new text to read as follows:

702.11 Outdoor Generator Sets

Where ~~an~~ a permanently -mounted outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure. The disconnecting means shall meet the requirements of 225.36.

702.12 Provisions for Connection of Portable Generator Sets

Where provisions such as inlets, or connection cabinets are installed for the connection of a portable generator set, a disconnecting means shall be required at the point of connection. If the inlet device or receptacle is rated 100 amps or greater, the inlet receptacles shall either be rated as a disconnect, or shall be interlocked with the disconnecting means to prevent access to the connection inlets under load.

Substantiation: The existing requirement which permits omission of an additional disconnection means when the generator is within sight, should be restricted to permanently mounted generators only. Portable generators are capable of being connected in situations where they will not be within sight. Since there is no way of definitely knowing which situation might exist in the future because the portable generator and it's connections can easily change, the present allowance should be permitted only for permanently mounted generators.

Due to recent storms around the country and legislation in the state of Florida, there are more installations of provisions for the connection of a portable generator. Many of the devices that are being installed to allow the generator connection to the building electrical system that are being installed are unsafe and could result in catastrophic failure and loss of life.

This code change is to address the unsafe nature of these installations and to provide a means of personnel protection that is missing from the current NEC.

Additionally, many of these installations consist of readily accessible boxes — even boxes accessible to the general public. These boxes are supplied with accessible non-load break devices such as Cam-Loks as the inlet connection. There is no safeguard to prevent the disconnection of these cables under load. If the receptacle inlet is not a load break device, the receptacle inlets should be barriered or interlocked in such a way that they may not be disconnected from a closed circuit.

Panel Meeting Action: Reject

Panel Statement: A suitable disconnecting device is always available with a portable generator – the act of shutting it down. When the prime mover rolls to a stop, it is "off" more reliably than can be done with any other form of disconnect. Many plug and receptacle combinations are listed with horsepower ratings and are acceptable as disconnecting means for motors up to and including 60 amperes 3-phase at 120/208 volts. Pin and sleeve combination units are rated for much higher ampacities with at least one type that has an internal switch combination that switches the load off before the twist-lock cord cap can be removed. There are many different methods that can be utilized to disconnect the portable generator than the method suggested in the proposed recommendation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-258 Log #4044 NEC-P13 **Final Action: Reject**
(702.12)

Submitter: Michael Kirchner, Generac Power Systems

Recommendation: 702.12 "New Section"

Ground-Fault Protection of Equipment

The alternate source of optional standby systems shall not be required to have ground-fault protection of equipment.

Substantiation: Generator cabling is defined as a feeder in Article 100. As a feeder, the generator disconnect is required to have ground fault protection when the conditions of 215.10 are met (1000 amps and greater than 150 volts to ground). The requirements for 215.10 are based upon the requirements of a service to have ground fault protection (230.95) which is directly referenced in 215.10.

The requirement for 1000 amp, 480 volt (greater than 150 volts to ground) services to have ground fault protection was added in 1971 because of the unusual number of fire incidences for services in this size range. It should be noted that 800 amp and below services don't have this requirement nor do 240 or 208 volt services. Given that the utility is the primary source of power, 99.9 percent of the time and the optional standby power system is powering the load 0.1 percent of the time, the risk of fire incidences from an 800 amp utility service must be at least 100 times greater than an optional standby power system feeding a 1000 amp feeder. The reasoning behind requiring ground fault protection on optional standby systems becomes illogical when comparing relative fire risks.

Optional standby systems play an incredibly important role in supporting our country's infrastructure and commerce. In many ways, optional standby systems utilized in data and telecommunication applications are as important as many legally required systems which don't require ground fault protection. Given the importance of continuity of power for many mission critical optional standby applications and the relatively low fire risks, removing the ground fault requirements seems prudent.

Panel Meeting Action: Reject

Panel Statement: There was no technical substantiation provided to relax the requirement in 215.10 for providing ground fault protection on feeders that are 1000 amperes or greater at 277/480 volts for optional standby systems. The data provided in the recommendation was anecdotal and was without any scientific basis. Ground fault protection of these large circuits is as important with feeders from generators as feeders supplied from utility company power since higher voltages can cause continued arcing of a ground fault and subsequent fire and arcing damage to the equipment.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-259 Log #4472 NEC-P13 **Final Action: Reject**
(702.27 (New))

Submitter: Dustin Priemer, Priemer & Associates

Recommendation: In Article 702 add New Part V and Section 702.27 to read as follows:

V. Overcurrent Protection.

702.27 Selective Coordination. Optional standby system(s) overcurrent devices shall be selectively coordinated with all line side overcurrent devices that additionally supply emergency system(s) or legally required standby system(s).

Substantiation: It is recognized through the inclusion of selective coordination requirements in articles 700 & 701 that ensuring availability of power to these systems is vitally important. A loss of power to these loads can jeopardize life-safety, create hazards and hamper fire-fighting operations. For alternate power systems where emergency, legally required standby and optional standby systems are all supplied through a common overcurrent device, a fault on the optional standby system could potentially open this common overcurrent device resulting in a power outage to emergency system(s) and/or legally required standby system(s). This requirement prevents a fault on the optional standby system from causing unnecessary power outages on the emergency and legally required standby system(s).

Panel Meeting Action: Reject

Panel Statement: Optional standby power can be supplied by emergency or legally required standby power systems; however, 700.5(B) and 701.6(2) allow automatic load shedding of the optional standby system where connected to emergency or legally required standby systems. This will handle any possible overload for the systems. Overcurrent protective devices on the optional standby systems must be able to handle any short circuit or ground fault on the system without taking the emergency or legally required system off line. Section 240.12 provides selective coordination for these systems already, and no further selective coordination is necessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

DEGNAN, J.: The submitter has identified a circumstance that could compromise selective coordination, this issue and others would be addressed by my proposal 13-160.

ARTICLE 705 — INTERCONNECTED ELECTRIC POWER PRODUCTION SOURCES

4-264 Log #4683 NEC-P04 **Final Action: Reject**
(705.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this definition.
Substantiation: This definition is not used in Article 705.
Panel Meeting Action: Reject
Panel Statement: The submitter did not specify which of the three definitions in 705.2 is to be deleted. The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-265 Log #2514 NEC-P04 **Final Action: Reject**
(705.3)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise the section as follows

705.3 Other Articles. Interconnected electrical power production sources shall comply with this article and also with applicable requirements of the other articles in Table 705.3.

Where the requirements pertaining to listed utility-interactive inverters in Article 705 differ from requirements elsewhere in this Code, the requirements of Article 705 shall apply.

Substantiation: Listed utility-interactive inverters have unique characteristics associate with their limited current output and there response to conditions on the output circuit and in the connected utility systems. These characteristics are addressed by the requirements established in Article 705. Applying contrary requirements from other articles in the Code may result in safety issues and hazardous conditions.
Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects. The information is covered in the requirements of Section 90.3.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-266 Log #3665 NEC-P04 **Final Action: Reject**
(705.6 (New))

Submitter: Keith W. Brand, Baton Rouge Area Electrical JATC
Recommendation: Add the following new text:

<u>705.6 System Installation. Installation of one or more electrical power production sources operating in parallel with a primary source(s) of electricity shall be installed by qualified persons with documented training and experience in the installation of such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation.</u>

Substantiation: Electrical power sources that operate in parallel to utility power sources, or operate alone, provide the same voltage thresholds that were previously determined to be within a cautious working environment. It follows that training and qualifications should be required before work is allowed on such systems. To prevent the unsafe conditions that have been exposed in the Photovoltaics industry and to be consistent within the area of parallel energy sources, the above proposed added text does provide a method to ensure increased adherence to the National Electrical Code. The Code Making Panel has the opportunity to help prevent unsafe conditions by being proactive within this emerging industry.

Additionally, The inclusion of the wording "qualified persons" does have precedence in the NEC.

See: 685.1 Scope.

This article covers integrated electrical systems, other than unit equipment, in which orderly shutdown is necessary to ensure safe operation. An integrated electrical system as used in this article is a unitized segment of an industrial wiring system where all of the following conditions are met:

(1) An orderly shutdown is required to minimize personnel hazard and equipment damage.

(2) The conditions of maintenance and supervision ensure that qualified persons service the system. **The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation.**

A person designated as a qualified person shall possess the skills and knowledge related to the construction and operation of the electrical equipment and installation and shall have received documented safety training on the hazards involved. **Documentation of their qualifications shall be on file with the office of the establishment in charge of the completed installation.**

(3) Effective safeguards acceptable to the authority having jurisdiction are established and maintained.

Also:

215.2(B)(3) Supervised Installations. For supervised installations, feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where all of the following conditions are met:

(1) Conditions of design and installation are provided under engineering supervision.

(2) **Qualified persons with documented training and experience** in over 600-volt systems provide maintenance, monitoring, and servicing of the system. 215.2

Panel Meeting Action: Reject
Panel Statement: The panel supports installation of these systems by qualified persons. However, the NEC cannot contain requirements relative to the qualifications of installers for any electrical system. These requirements need to be handled by local or state qualification committees or licensing boards. See Annex H of the NEC for recommendations on establishing such bodies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

STAFFORD, T.: This Panel Member has determined that extensive training is required for emerging technologies. As there are no provisions outlined in the electrical safety standards, this is an opportunity to ensure safe, reliable growth of an emerging technology and prevent the failures of the past related to other parallel energy sources. The interaction(s) of utility interconnected Power Production Sources requires detailed knowledge into electrical fundamentals and experience gained through training and actual performance working on electrical systems. A large percentage of installers have no electrical background and/or training and there is no license requirement in place to mandate this requirement. The panel statement "The NEC cannot contain requirements relative to the qualifications of the installers for any electrical system, these requirements need to be handled by local state qualification committees or licensing boards" is ineffective for the following reasons.

First, the NEC does contain requirements for qualifications of installers and maintaining documentation thereof, see Article 685 and Article 215.2B)(3) and substantiation provided in the original proposal by submitter. Article 685 describes industrial wiring system and details the importance of necessary training for the personnel involved. The same concerns are present for parallel energy sources. Specifically, an orderly shutdown of the system is required upon certain conditions, service of equipment requires someone knowledgeable in the functions and electrical characteristic thereof, and effective safeguards should be in place acceptable to the AHJ. The original proposal attempts to provide the safeguards that are critically needed by a growing industry. The panel may decide that article 685 is not relevant when determining if like requirements should be in place for article 690, but the panel cannot claim the affects are as critical to personnel and equipment.

Second, local license boards are not addressing the issue at a pace to insure safety for the consumer/users of parallel energy sources and for the personnel involved.

TOOMER, R.: See Proposal 4-186.

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal, however, the submitter is correct in his concern relative to requiring "qualified persons" to install these systems. This is extremely important for these systems to assure the safety or persons and property where these systems are utilized. Unfortunately the NEC is an installation document and not a qualification document. Any areas of the country that utilize any type of electrical licensing laws should be sure that their laws extend to these installations. Any areas of the country that do not have electrical licensing laws should refer to Annex H of the NEC and consider adopting it as a guide for qualified personnel performing electrical installations.

4-267 Log #2515 NEC-P04 **Final Action: Accept in Principle**
(705.12(A))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise Section 705.12(A) as follows:
(A) Supply Side. An electrical power production source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6) <u>in accordance with 705.12(A)(1) through 705.12(A)(4)</u>
<u>(1) The sum of the ratings of all overcurrent devices connected to power production sources shall not exceed the rating of the service.</u>
<u>(2) The service conductor connection shall comply with the requirements established for services in Article 230.</u>
<u>(3) The Tap Rules of Section 240.21 shall not be applied.</u>
<u>(4) Where a main-lug-only main service panel is used, the sum of the ratings of all overcurrent devices in the panel connected to power production sources shall not exceed the rating of the service panel.</u>
Substantiation: Supply side connections of PV equipment are becoming more frequent as the size of these PV systems exceeds the allowances for load side connections. Requirements for these supply-side taps must be established which are not found elsewhere in the Code.

(1) Self explanatory.

(2) Self explanatory

(3) The Section 240.21 Tap Rules have been developed over many years with a carefully controlled system where there is only one source of current and that source is protected by an overcurrent device. With a service tap, and a PV utility-interactive inverter, there are two sources of current and one (the utility-source) is effectively not protected at anywhere near the ampacity of the conductors. Tap rules have not been developed for this type of system, and the allowances of Section 240.21 should not be applied.

(4) In some installations, a main-lug-only main service panel may be used that has one or more open breaker positions (of the allowed six) that can be used for the connection of utility-interactive inverter(s). This requirement limits the output of the added power production sources to the rating of the service panel. Without this requirement, installers may inadvertently connect two 60-amp utility-interactive inverters to a 100-amp panel.

Panel Meeting Action: Accept in Principle

Revise Section 705.12(A) as follows:

(A) Supply Side. An electrical power production source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6). <u>The sum of the ratings of all overcurrent devices connected to power production sources shall not exceed the rating of the service.</u>

Panel Statement: Add a second sentence to 705.12(A) consisting of the language submitted in item (1) in the proposal. The remainder of the proposal is not required for the following reasons: item (2) is already covered by the requirements found in Article 230 and item (3) is not necessary as this installation would not be permitted with the existing tap rules located in 240.21, item (4) is not necessary as it is covered by the language extracted from item (1) of this proposal. In addition, Section 408.36 prohibits the use of MLO panelboards in this application.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BOWER, W.: The proposal as submitted provides a better article. The panel statement that (2) is covered in the requirements of Article 230 could not be verified in my search. The prohibition of MLO panel boards is also not found in Article 408.36.

4-268 Log #4684 NEC-P04 **Final Action: Reject**
(705.12(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Insert a new (4) as follows:

(4) The interconnection point within the premises supplied shall comply with the requirements in 705.12(D)(1) through 705.12(D)(7). Where a utility-interactive inverter is specified, apply the rule as though an interconnected power production source were specified instead. In the warning label required in 705.12(D)(7), substitute “INTERCONNECTED ELECTRIC POWER PRODUCTION SOURCE CONNECTION” for “INVERTER OUTPUT CONNECTION”.

Substantiation: These rules result in many large cogeneration projects being connected downstream of the service. Remember this is any form of cogeneration, including internal combustion engines that turn large induction generators while creating hot water from their cooling systems that is used for other purposes. Such systems use electronic controls to synchronize their output to the utility network, in accordance with 705.14. These systems do not begin with the production of dc current, and therefore their connections do not involve a utility-interactive inverter.

This part has not been correlated with (D) with respect to the size limitation and the connection location limitations that apply where utility-interactive inverters connect to conventional panelboards. A connection under this paragraph is presently not limited in those ways, even though the potential current injection is far higher, which makes the problem potentially far worse. This proposal places these sources of current injection on the same footing as those from inverters.

Panel Meeting Action: Reject

Panel Statement: The wording does not fit or work with 705.12(C). This section is a list of items, all of which must be complied with, and there are variables in the proposal. Interconnection requirements for utility interactive inverters are based on UL 1741 listing for the inverters to meet IEEE 1547. The requirements in 705.12(D) are not applicable to other types of interconnected power systems.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-269 Log #2517 NEC-P04 **Final Action: Reject**
(705.12(D))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Revise 705.12(D) as follows:

(D) Utility-interactive Inverters. The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Where distribution equipment including switchboards and panelboards is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (D)(1) through (D)(<u>6</u> ~~7~~).

(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) Bus or Conductor Ampere Rating. <u>The continuous current output of the inverter(s) shall not exceed the ampere rating of the busbar or conductor to which they are connected. In systems where panelboards are connected in series, the ampere rating of the first overcurrent device connected directly to the inverter(s) shall be used in the calculations for all busbars and conductors. The busbar or conductor shall be sized for the loads connected in accordance with Article 220. One of the methods in (a)-(e) shall be used to determine the ratings of busbars in panelboards or the ampacity of conductors:</u>

<u>(a) The sum of the ampere ratings of the overcurrent devices supplying power to the busbar or conductor shall not exceed the ampacity of the busbar or conductor.</u>

FPN: This general rule assumes no limitation in the number of the loads or sources applied to a busbar or their locations.

<u>(b) Where two sources are located at opposite ends of a conductor that contains no taps, the ampere rating of the largest overcurrent device supplying power to the conductor shall not exceed the rating of the conductor. Permanent warning labels shall be applied to conductor access points, and at 2.8m (10 ft) intervals along raceways, with the following or equivalent wording:</u>

<u>WARNING</u>
<u>THIS EQUIPMENT FED BY MULTIPLE SOURCES</u>
<u>DO NOT TAP CONDUCTOR.</u>

<u>(c) Where two sources, one utility and the other an inverter, are located at opposite ends of a busbar or conductor that contains loads, the sum of the ampere ratings of the overcurrent protection supplying power to the busbar or conductor shall not exceed 120% the ampacity of the busbar or conductor. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:</u>

WARNING
INVERTER OUTPUT CONNECTION
DO NOT RELOCATE
THIS OVERCURRENT DEVICE

<u>*Exception: Panelboards with multiple ampacity buswork are not addressed by this provision.*</u>

<u>(d) The sum of the ampere ratings of all overcurrent devices on panelboards, both load and supply devices, excluding the main supply overcurrent device, shall not exceed the ampacity of the busbar. The ampere rating of the main supply overcurrent device shall not exceed the rating of the busbar. Permanent warning labels shall be applied to distribution equipment with the following or equivalent wording:</u>

<u>WARNING</u>
<u>THIS EQUIPMENT FED BY MULTIPLE SOURCES</u>
<u>TOTAL RATING OF ALL OVERCURRENT DEVICES, EXCLUDING MAIN SUPPLY OVERCURRENT DEVICE, SHALL NOT EXCEED AMPACITY OF BUSBAR.</u>

<u>(e) Connections shall be permitted on feeders where designed under engineering supervision that includes, but is not limited to, fault studies and conductor damage curves.</u>

(3) Ground-Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, where~~, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals~~ those devices are identified and listed as suitable for backfeeding.

(4) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.

(5) Suitable for Backfeed. Circuit breakers, if backfed, shall be suitable for such operation.

FPN: Circuit breakers that are marked “Line” and “Load” have been evaluated only in the direction marked. Circuit breakers without “Line” and “Load” have been evaluated in both directions.

(6) Fastening. Listed plug-in-type circuit breakers backfed from utility-interactive inverters that are listed and identified as interactive shall be permitted to omit the additional fastener normally required by 408.36(D) for such applications.

~~**(7) Inverter Output Connection.** Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall be sized for the loads connected in accordance with Article 220. In systems with panelboards connected in series, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:~~

~~WARNING~~
~~INVERTER OUTPUT CONNECTION~~
~~DO NOT RELOCATE THIS~~
~~OVERCURRENT DEVICE~~

Substantiation: 705.12(D) was edited extensively during code making panel meetings and did not receive public review. Subparagraph (D)(7) is very difficult to read and understand. New, and safe methods or connecting utility-interactive inverters to conductors and panelboards have been identified and defined. This proposed revision addresses those items and others as noted.

(D) Introduction—No change except in the numbering of the paragraph that was changed from 7 to 6 because (7) has been included in (2).

(D)(1) No change

(D)(2) Substantial changes to allow additional safe and cost effective methods of connecting the output of utility-interactive inverters to a panelboard bus bar or a conductor.

The second sentence is extracted from 690.64(B)(2) in the *2008 NEC* that was omitted in error during the transition to 705. A separate proposal has been submitted to delete 690.64 since those requirements are now in 705.12 (D).

(a) This general rule as explained by the FPN ensures that any conductor or bus bar with multiple sources and multiple loads will be protected.

(b) With these restrictions on the location of sources at each end, it is not possible to overload a conductor through the connection of any load in any position.

(c) This is a revision of 705.12(D)(7) for clarity. It belongs under (D) as it is a method of determining bus rating and protection. The warning is self explanatory.

The exception is required because center tapped bus bars cannot be protected by this method.

(d) This new method protects the busbar or conductor by limiting the sum of the ratings of all (source and load) overcurrent devices, except the overcurrent device on the main (largest) source. For example: With a 100 amp bus, the method would allow 100 amps of supply breakers and no load breakers, 100 amps of load breakers and no supply breakers, or any combination of the two adding to 100 amps or less. The rating of the main breaker need not be counted in protecting the busbar except that its rating must also not exceed the bus bar rating.

(e). This new allowance lets engineering evaluations be made by qualified people in making taps where multiple sources of power are involved.

(3) The ground-fault requirement is modified to address the unique characteristics of utility-interactive inverters where the tripping of a ground-fault protected main breaker will turn off, not only the connected loads, but also the load-side connected utility-interactive inverter. This automatically provides protection from ground-fault currents from all sources

(4), (5), and (6) no change.

(7) is deleted, the requirements revised for clarity, and placed in (D)(2).

Panel Meeting Action: Reject

Panel Statement: The proposal has insufficient substantiation for the panel to accept.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

BOWER, W.: The proposal was a significant change but did provide substantiation for safe and cost effective methods to connect the output of utility-interactive inverters and other substantiations were adequate in my opinion. I believe the public comment period will be an effective method to address the deficiency identified by the panel statement that in my opinion is deficient.

4-270 Log #2516 NEC-P04 **Final Action: Accept in Principle**
(705.12(D) Exception)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal pertaining to the use of the word "When" since "when" is a condition of time rather than a location or situation.

This action will be considered by the panel as a public comment.

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Add the following exception.

705.12(D)(2) Bus or Conductor Rating.

Exception: Where the photovoltaic system has an energy storage device to allow stand-alone operation of loads, 125% of the rated utility-interactive current from the inverter shall be permitted to be used in the calculation of bus rating or conductor ampacity instead of the rating of the overcurrent device between the inverter and the bus or conductor. In no case shall the bus or conductor have a rating less than the connected loads.

Substantiation: In many systems, these multi-mode inverters (utility-interactive inverters/stand-alone inverters/battery chargers) can process power from the utility to the batteries and to the connected output loads in *excess* of their ability to backfeed current to the utility grid. For example, several popular inverters can take 60 amps from the grid for battery charging and supplying battery-backed up loads, but can only supply 30 amps in the utility-interactive mode to the grid. For the load circuit, a circuit breaker of 80 amps (1.25 x 60 plus round up to next standard breaker) must be used in the panel supplying the system to meet *NEC* requirements. If 705.12(D)(2) is used as currently written, then the impact of this 80-amp breaker on sizing the panel is severe. Since the inverter is capable of supplying only 30 amps of utility-interactive current to the panel and to the utility grid, it is safe to allow 125% of the continuous inverter backfeed current (37.5 amps) to be used in the 705.12(D)(2) calculation rather than the rating of the required load breaker (80 amps).

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

Exception: When ~~Where~~ the photovoltaic system has an energy storage device to allow stand-alone operation of loads, the value used in the calculation of bus or conductor loading shall be 125% of the rated utility-interactive current from the inverter instead of the rating of the overcurrent device between the inverter and the bus or conductor ~~shall be permitted to be used in the calculation of bus rating or conductor ampacity instead of the rating of the overcurrent device between the inverter and the bus or conductor. In no case shall the bus or conductor have a rating less than the connected loads.~~

Panel Statement: Exception reworded for readability. Last sentence omitted since it is not relevant to the exception and is not substantiated.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-271 Log #3281 NEC-P04 **Final Action: Reject**
(705.22)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete text and substitute:

The disconnecting means for ungrounded conductors shall consist of an identified manually externally operable enclosed switch(es) or circuit breaker(s) in accordance with the following:

(1) Located where readily accessible

(2) Externally operable

(3) If power operable of a type that can be manually opened

(4) Plainly and durably marked to indicate the open (off) and Closed (on) position

(5) Have ratings not less than the calculated load and the available fault current. Disconnecting means that can be energized from load terminals shall be provided with a durable and permanent sign on the exterior with the words "Warning Load terminals may be energized from a different source."

Substantiation: Edit. Disconnecting means should be manually operable whether or not power operable. A readily accessible location is not a feature of disconnecting means but an installation requirement. The on and off positions should be marked; up and down positions may be deemed "indicating". "Externally operable" is defined in Article 100 and should apply without reference to power failure. "Both sides" is not specific.

Panel Meeting Action: Reject

Panel Statement: The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-272 Log #2518 NEC-P04 **Final Action: Accept**
(705.22(4), FPN No. 2 to (4))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Delete 705.22(4) FPN No. 2 to (4).

705.22 Disconnect Device.

The disconnecting means for ungrounded conductors shall consist of a manually or power operable switch(es) or circuit breaker(s) with the following features:

(1) Located where readily accessible

(2) Externally operable without exposing the operator to contact with live parts and, if power operable, of a type that could be opened by hand in the event of a power-supply failure

(3) Plainly indicating whether in the open (off) or closed (on) position

(4) Having ratings not less than the load to be carried and the fault current to be interrupted. For disconnect equipment energized from both sides, a marking shall be provided to indicate that all contacts of the disconnect equipment might be energized.

FPN No. 1 to (4): In parallel generation systems, some equipment, including knife blade switches and fuses, is likely to be energized from both directions. See 240.40.

~~FPN No. 2 to (4): Interconnection to an off-premises primary source could require a visibly verifiable disconnecting device.~~

(5) Simultaneous disconnect of all ungrounded conductors of the circuit

(6) Capable of being locked in the open (off) position

Substantiation: This FPN is related to utility requirements and should not be addressed, even as information, in the *NEC*. Many utilities in areas of highest PV system penetration are no longer requiring a visibly verifiable disconnecting means because of the inherent safety systems built into the listed/certified utility-interactive inverters.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-273 Log #2520 NEC-P04 **Final Action: Reject**
(705.22(6))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Delete 705.22(6).

705.22 Disconnect Device.

The disconnecting means for ungrounded conductors shall consist of a manually or power operable switch(es) or circuit breaker(s) with the following features:

(1) Located where readily accessible

(2) Externally operable without exposing the operator to contact with live parts and, if power operable, of a type that could be opened by hand in the event of a power-supply failure

(3) Plainly indicating whether in the open (off) or closed (on) position

(4) Having ratings not less than the load to be carried and the fault current to be interrupted. For disconnect equipment energized from both sides, a marking shall be provided to indicate that all contacts of the disconnect equipment might be energized.

FPN No. 1 to (4): In parallel generation systems, some equipment, including knife blade switches and fuses, is likely to be energized from both directions. See 240.40.

FPN No. 2 to (4): Interconnection to an off-premises primary source could require a visibly verifiable disconnecting device.

(5) Simultaneous disconnect of all ungrounded conductors of the circuit

~~(6) Capable of being locked in the open (off) position~~

Substantiation: The lockable disconnect requirement is a utility requirement imposed by some, but not all utilities. There is no safety reason that would require a lockable disconnect requirement in the *NEC*.
Panel Meeting Action: Reject
Panel Statement: The submitter has not submitted any technical data to support the removal of this enhanced safety requirement. There is a difference between a utility company requiring these devices to be locked to prevent access to internal parts and the ability to lock the disconnect in the off position.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

MCDANIEL, R.: Disagree with submitter's substantiation. Many utilities will still require a visually verifiable disconnect. There is no guarantee that a backfeed will not occur.

4-274 Log #3941 NEC-P04 **Final Action: Accept**
(705.32)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal pertaining to the use of "When" since "when" is a condition of time rather than a location or situation.

This action will be considered by the panel as a public comment.
Submitter: James Kelley, Sargent & Lundy
Recommendation: Revise text to read as follows:

705.32 Ground-Fault Protection.

~~here~~ When ground-fault protection is used, the output of an interactive system shall be connected to the supply side of the ground-fault protection.
Substantiation: Editorial change of the first word "[W]here" to be "When" according to the 2003 National Electrical Code Style Manual amended January 15, 2003 (in 3.3.4 Word Clarity) example of word use that shall not be permitted. "*Where* (in the sense of *when* or *if* - use *when* or *if*) instead."

The comment is based on the printed version that is missing the first letter "W" though the electronic version available to subscribers of the NFPA Codes has the "W".
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-275 Log #4685 NEC-P04 **Final Action: Accept**
(705.60(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the title of (1), so as to close up the first sentence (in 705.60) about currents being classified as continuous with the what will be the second sentence of (B), namely, the 125 percent rule in (1) followed by the last sentence regarding 240.4(B) and 240.4(C).
Substantiation: The Style Manual does not allow for a single, orphaned numbered paragraph below a lettered paragraph, and there is not paragraph (2) in this section. This proposal corrects this editorial problem.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-276 Log #4686 NEC-P04 **Final Action: Accept**
(705.65)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete paragraphs (C) and (E).
Substantiation: This is section is 690.9 verbatim except that "Photovoltaic" has been replaced by "Inverter" in the title of (C). Some of this information is highly questionable in a section supposedly designed for generic applicability. In particular, the one-ampere fuse increment rule in (C) and the express use of the word "modules" in (E) are specific to photovoltaic systems and highly questionable in a section covering generic requirements. In addition, (C) allows the use of supplementary overcurrent protective devices by right; many cogenerating sources have far higher current and available fault currents than photovoltaic panels, and a more robust branch-circuit overcurrent device would probably be required. The approach in this section needs to be thoroughly reconsidered.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-277 Log #2521 NEC-P04 **Final Action: Accept in Principle**
(705.65(B) Exception)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise the Exception as shown:
705.65(B) Power Transformers.
Exception: A power transformer with a current rating on the side connected toward the ~~PV power source~~ utility-interactive inverter output, not less than the ~~short-circuit~~ rated continuous output current of the inverter, shall be permitted without overcurrent protection from that source.
Substantiation: Under short-circuit conditions, the anti-islanding circuits required by UL Standard 1741 in all utility-interactive inverters, sense the near zero voltage and cause the inverters to immediately shut down. These inverters cannot operate when connected a short circuit. Transformer protection is more properly afforded by comparing the transformer rating to the continuous rated output of the inverter.
Panel Meeting Action: Accept in Principle

Revise the recommendation to read as follows:

Exception: A power transformer with a current rating on the side connected toward the utility-interactive inverter output that is not less than the rated continuous output current of the inverter shall be permitted without overcurrent protection from that source.
Panel Statement: This rewording improves clarity of sentence.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-278 Log #2522 NEC-P04 **Final Action: Accept**
(705.65(C))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Delete section 705.65(C)
~~**(C) Inverter Source Circuits.** Branch-circuit or supplementary-type overcurrent devices shall be permitted to provide overcurrent protection in inverter source circuits. The overcurrent devices shall be accessible but shall not be required to be readily accessible. Standard values of supplementary overcurrent devices allowed by this section shall be in one ampere size increments, starting at 1 ampere up to and including 15 amperes. Higher standard values above 15 amperes for supplementary overcurrent devices shall be based on the standard sizes provided in 240.6(A).~~
Substantiation: This section was inadvertently copied from Article 690 during the *2008 NEC* code making cycle and does not belong in a section on utility-interactive inverters. The input circuits to utility-interactive inverters are direct current outputs of the PV or other dc power system. Those requirements are addressed in Article 690 or in other articles dealing with the inputs to utility-interactive inverters.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-279 Log #2523 NEC-P04 **Final Action: Accept**
(705.65(D))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Delete Section 705.65(D).
~~**(D) Direct-Current Rating**. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a utility interactive inverter power system shall be listed for use in dc circuits and shall have the appropriate voltage, current, and interrupt ratings.~~
Substantiation: The section does not apply to the parallel connection of ac power production sources. It is related to the dc input for such devices. The requirement is addressed in other articles relating to the direct-current input of utility-interactive inverters.
Panel Meeting Action: Accept
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-281 Log #2291 NEC-P04 **Final Action: Reject**
(705.70)

Submitter: James W. Beutler, Laclede, ID
Recommendation: These installations shall comply with (1) through ~~(4)~~ (5):
(5) An inverter installed on a rooftop, where conductors or cables are installed in conduits exposed to direct sunlight, shall be installed in accordance with 310.15 (B)(2)(c).
Substantiation: This addition is inserted, because 705.70 allows for the installation of an inverter on a roof, which introduces safety factors associated with proper conductor sizing. Some installations, depending on the location on the rooftop, may require the installation of conduits to, and from the inverter for the protection of conductors or cabling from damage such as wind, debris, snow load, and person/persons climbing/scaling on the rooftop. This would require additional adjustments made to the ampacity of the conductors, because of temperature adjustments for conduits above rooftops in direct sunlight, as per 310.15(B)(2)(c). This addition would address such situations, making those installations safer.
Panel Meeting Action: Reject
Panel Statement: This proposal restates existing code language unnecessarily. The necessity to comply with this requirement is inherent in the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 708 — CRITICAL OPERATIONS POWER SYSTEMS (COPS)

13-260 Log #3553 NEC-P13 **Final Action: Reject**
(708.1)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
708.1 Scope
The provisions of this article shall apply to new construction and shall apply to the installation, operation, monitoring, control, and maintenance of the portions of the premises wiring system intended to supply, distribute, and control electricity to designated critical operations areas (DCOA) in the event of disruption to elements of the normal system.
Substantiation: The second paragraph of the Scope suggests (implicitly, not explicitly) that any “municipal, state, federal, or other code by any governmental agency having jurisdiction” can declare (perhaps arbitrarily) that a facility is a DCOA and therefore must meet the provisions of Article 708. It would be unusual for such designation to find its authorization in the Electrical Code. The Scope implies that such designation could (and probably would?) be applied to an existing facility. Some sites might be able to meet Article 708 requirements, but the great majority probably would not be able to do so without some level of renovation. In many cases (perhaps most?), the work required to come into compliance with 708 could be prohibitively expensive, disruptive, and /or impossible. For example, you can’t move your building to a different floodplain. The Code should clearly state that Article 708 should not be applied retroactively.
Panel Meeting Action: Reject
Panel Statement: The National Electrical Code (Article 708 included) is an installation code and applies only when an electrical installation is initially installed, is upgraded or is renovated. Article 708 applies only where mandated by other entities as is clearly conveyed 708.1 It is not within the scope of the NEC or Article 708 to prevent, for example, the federal government from requiring an existing installation meet the requirements of Article 708. Many existing facilities house systems with objectives vital to public safety. Annex F under Improving Availability states “The appropriate methods to use for improving availability depend on whether the facility is being designed or is already in use.” The annex offers three methods for improving availability for existing facilities where the current level of availability is unacceptable. Therefore, existing sites unable to meet Article 708 requirements in their entirety are offered alternatives and can still meet the objective of improving availability.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-261 Log #1117 NEC-P13 **Final Action: Reject**
(708.1 FPN No. 2 (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Insert the following FPN No. 2:
FPN No. 2: The provisions of Chapter 8, *Communications Systems*, cover communications circuits and equipment not deemed to serve designated critical operations areas (DCOA).
Renumber existing FPNs 2 through 8 as FPNs 3 through 9.
Substantiation: NEC users, including AHJs, may misinterpret new Article 708 as applying to communications circuits and equipment that, in their view, are critical. They should be reminded that the first place to look for communications criteria is in Chapter 8. To avoid misapplication of Article 708, the user needs to be fully aware of the distinction between the “normal” communications provisions of Chapter 8 and the more stringent, specialized provisions of 708. The proposed FPN helps to reinforce that distinction.
Panel Meeting Action: Reject
Panel Statement: The COPS systems and circuits are determined by municipal, state, federal, or other codes by any governmental agency having jurisdiction or by facility engineering documentation as stated in the scope. In addition, 90.3 states that Chapter 8 is not subject to the requirements of Chapters 1 through 7, except where the requirements are specifically referenced in Chapter 8, and since Article 708 is not referenced in Chapter 8, the requirements in Article 708 need not apply. The new fine print note is not needed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-262 Log #3946 NEC-P13 **Final Action: Accept**
(708.1, FPN No. 8 and No. 9)

Submitter: James Kelley, Sargent & Lundy
Recommendation: Add new text as follows:
FPN No. 8: See Annex ~~G~~ F for information on ~~Supervisory Control and Data Acquisition~~ Availability and Reliability for Critical Operations Power Systems; and Development and Implementation of Functional Performance Tests (FPTs) for Critical Operations Power Systems.
FPN No. 9: See Annex G for information on Supervisory Control and Data Acquisition.
Substantiation: Insert a Fine Print Note (FPN) to refer to Annex F. Insertion is preferred instead of adding at the end to provide orderly arrangement of the references to the alphabetically arranged annexes.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-263 Log #1263 NEC-P13 **Final Action: Reject**
(708.2.Category I, Category II, Category III, and Category IV)

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.
Recommendation: Add new text as follows:
Category I – Systems that have been designated to remain operational for emergency services to function.
Category II – Systems that have been designated to significantly contribute to the delivery of emergency services or are essential for disaster recovery.
Category III – Systems that have significant impact on the protection of life and property, but are not immediately essential for providing emergency services. Category III systems are typically restorable to operation within 24 hours.
Category IV – Critical systems that have significant impact on the protection of life and property, but are not immediately essential, as there are multiple facilities providing the same function. Category IV systems are typically restorable to operation within 24 hours of the time utility power, water and sewage disposal are available to the facility.

Substantiation: Having categories of critical systems provides a method to align the importance of the COPS to the protection of life and property. The definitions are needed for several companion proposals that provide a gradient scale of requirements.

The classifying governmental agency having jurisdiction would benefit from a gradient level of criticality, which provides a means to ensure the most critical systems have the resources allocated to them so that they are available when needed to deliver emergency services and provide for disaster recovery. Without a gradient scale, fewer systems can be addressed because they would all require the most extensive amount of resources.

Panel Meeting Action: Reject

Panel Statement: Article 708 provides minimum electrical installation requirements for electrical systems designated by another entity as being critical. It is not within the scope of Article 708 to determine and or specify categories of installations with respect to their being critical. Section 708.4(A) provides the necessary provisions for conducting risk assessments, and the submitter has identified one method of conducting risk assessment, and it is not the intent of this article to restrict the risk assessment to a single method.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-264 Log #140 NEC-P13 **Final Action: Accept**
(708.2.Supervisory Control and Data Acquisition)

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

Supervisory Control and Data Acquisition (SCADA). An electronic system that provides monitoring and controls for the operation of the critical operations power system. This can include the fire alarm system, security system, control of the HVAC, the start/stop/monitoring of the power supplies and electrical distribution system, annunciation and communication<u>s</u> equipment to emergency personnel, facility occupants, and remote operators.

Substantiation: Article 100 has a definition for communications equipment, not communication equipment.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-265 Log #2816 NEC-P13 **Final Action: Accept**
(708.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Ballot Results: Affirmative: 14

13-266 Log #4290 NEC-P13 **Final Action: Accept**
(708.3)

Submitter: Donald R. Cook, Shelby County Development Services

Recommendation: Delete this section.

~~708.3 Application of Other Articles.~~

~~Except as modified by this article, all applicable articles of this Code shall apply.~~

Substantiation: NEC 90.3 indicates Chapters 1-4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 708.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-267 Log #1118 NEC-P13 **Final Action: Reject**
(708.3, FPN (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)

Recommendation: Insert the proposed FPN following 708.3:

<u>FPN: See Chapter 8 for non-DCOA communications applications.</u>

Substantiation: NEC users, including AHJs, should be reminded that the first place to look for communications criteria is in Chapter 8. To avoid misapplication of Article 708, the user needs to be fully aware of the distinction between the "normal" communications provisions of Chapter 8 and the more stringent, specialized provisions of 708. The proposed FPN helps to reinforce that distinction.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-261.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-268 Log #1265 NEC-P13 **Final Action: Reject**
(708.4(A))

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.

Recommendation: Add new text to read as follows:

In critical operations power systems, risk assessment shall be performed to identify hazards, the likelihood of their occurrence, and the vulnerability of the electrical system to those hazards. <u>The thoroughness of the risk assessment shall be appropriate to the Category of the systems as follows:</u>

<u>(1) Category I risk assessment shall include probabilistic modeling, such as fault tree or reliability block diagram (RBD) for the electrical power to the Category I systems to verify an availability of 0.9999 and a mean time to repair of less than 1.0 hours. The probabilistic modeling shall also include naturally occurring hazards, such as earthquakes, floods, hurricanes and snow/ice storms to the extent that weather data is available. For hazards listed in 708.4 (B) for which there is no data available, such as human-caused events, the risk assessment shall include a systematic method analysis, such as a fault tree. The analysis shall include what types of human-caused events are most likely to cause the COPS to be taken out of service with a mitigation strategy to minimize the probability of it occurring.</u>

<u>(2) Category II risk assessment shall include probabilistic modeling, such as fault tree or reliability block diagram (RBD) for the electrical power to the Category I systems to verify an availability of 0.9995 and a mean time to repair of 4.0 hours or less. The probabilistic modeling shall also include naturally occurring hazards, such as earthquakes, floods, hurricanes and snow/ice storms to the extent that weather data is available. For hazards listed in 708.4 (B) for which there is no data available, such as human-caused events, the risk assessment shall include a systematic method analysis, such as a fault tree. The analysis shall include what types of human-caused events are most likely to cause the COPS to be taken out of service with a mitigation strategy to minimize the probability of it occurring.</u>

<u>(3) Category III risk assessment shall include probabilistic modeling, such as fault tree or reliability block diagram (RBD) for the electrical power to the Category I systems to verify an availability of 0.9973 and a mean time to repair of 24.0 hours or less. For hazards listed in 708.4 (B) the analysis shall include what types of events are most likely to cause the COPS to be taken out of service with a mitigation strategy to minimize the probability of it occurring.</u>

<u>(4) Category IV risk assessment shall include what types of events are most likely to cause the COPS to be taken out of service with a mitigation strategy to minimize the probability of it occurring. Probabilistic modeling is not required.</u>

Substantiation: The requirement for the various types of critical systems needs to align with the importance of the system to the protection of life and property. A set of specific requirements for the various levels of criticality needs to be included in the article to provide design criteria and for consistent application.

A gradient level of risk assessment with probabilistic modeling provides a quantitative method to ensure the most critical systems have designed sufficiently robust so that they are available when needed to deliver emergency services and provide for disaster recovery.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-263.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-269 Log #1262 NEC-P13 **Final Action: Reject**
(708.8(A))

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.

Recommendation: Add new text to read as follows:

A commissioning plan shall be developed, documented and <u>align with the criticality of the COPS as follows:</u>

<u>(1) Category I shall include the performance and documentation of electrical acceptance testing of the components in the critical electrical distribution system, startup and functional testing of the major subsystems such as generators, automatic transfer switches, UPS systems and the mechanical equipment for the cooling system of the critical load. An Integrated Systems Test shall also be performed in which load banks are connected to the critical distribution panels and the operation of the electrical and mechanical systems are verified under critical electrical design load conditions.</u>

<u>(2) Category II shall include the performance and documentation of electrical acceptance testing of the components in the critical electrical distribution system, startup and functional testing of the major subsystems such as generators, automatic transfer switches, UPS systems and the mechanical equipment for the cooling system of the critical load.</u>

(3) Category III shall include the performance and documentation of startup and functional testing of the major subsystems such as generators, automatic transfer switches, UPS systems and the mechanical equipment for the cooling system of the critical load.

(4) Category IV shall include the performance and documentation of startup and functional testing of the major components in the critical electrical distribution system and the mechanical equipment for the cooling system of the critical load.

Substantiation: The requirement for the various types of COPS should align with the importance of the critical systems to the protection of life and property. A set of specific requirements for the various levels of criticality provides a means for consistent application.

The classifying governmental agency having jurisdiction would benefit from a gradient level of criticality, which provides a means to ensure the most critical systems have the resources allocated to them so that they are available when needed to deliver emergency services and provide for disaster recovery. Without a gradient scale, fewer systems can be addressed because they would all require the most extensive amount of resources.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-263.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-270 Log #3742 NEC-P13 **Final Action: Accept in Principle**
(708.10)

Submitter: Michael A. Anthony, University of Michigan / Rep. Assn. of Education Facility Executives - APPA.ORG

Recommendation: REVISE TEXT AS SHOWN BELOW:

II. Circuit Wiring and Equipment

708.10 Feeder and Branch Circuit Wiring.

(A) Identification.

(1) Boxes and Enclosures. All boxes and enclosures (including transfer switches, generators, and power panels) for critical operations power system circuits shall be permanently marked so they will be readily identified as a component of the system. **(2) Receptacle Identification.** **In a building in which COPS are present with other types of power systems described in other articles of this chapter**, the cover plates for the electrical receptacles or the electrical receptacles themselves supplied from the COPS shall have a distinctive color or marking so as to be readily identifiable. **Where the COPS supplies power to a DCOA that is a stand-alone building, distinctive marking shall not be required.**

Substantiation: Requiring special outlet marking for COPS outlets in a building that is entirely a DCOA is costly and does not contribute to the safety objectives of this section.

Panel Meeting Action: Accept in Principle

Revise the recommendation of 708.10(2) to read:

(2) Receptacle Identification. In a building in which COPS are present with other types of power systems described in other sections in this article, the cover plates for the receptacles or the receptacles themselves supplied from the COPS shall have a distinctive color or marking so as to be readily identifiable.

Exception: If the COPS supplies power to a DCOA that is a stand-alone building, receptacle cover plates or the receptacles themselves shall not be required to have distinctive marking.

Panel Statement: The panel action clarifies the recommendation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-271 Log #4821 NEC-P13 **Final Action: Reject**
(708.10(C)(1)(1))

Submitter: Robert Konnik, South Windsor, CT

Recommendation: Add text to read as follows:

708.10(C)(1)(1) Rigid metal conduit, intermediate metal conduit, Type MC cable that employs a continuous, gas/vaportight metal sheath and is listed as an electrical circuit protective system or Type MI cable.

Substantiation: In just about all areas of the code, MC cable is allowed to be used where MI cable is used. The exception is in hospitals some areas of hospitals. 517.61(B)(1) allows MC cable with that employs a continuous, gas/vapor-tight metal sheath to be used. Fire rated MC cable is used in hospitals where allowed by the AHJ. This proposal only allows a small subset of MC cable that has additional positive benefits, that is ability to survive in a fire.

Panel Meeting Action: Reject

Panel Statement: Section 330.12(1) does not permit MC cable to be installed where subject to physical damage; therefore, inserting this wiring method into 708.10(C)(1) is inappropriate.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-272 Log #3606 NEC-P13 **Final Action: Reject**
(708.10(C)(1)(3)(d) (New))

Submitter: Stephen McCluer, APC by Schneider Electric

Recommendation: Add a new (d) as follows:

708.10(C)(1)(3) Where provisions must be made for flexibility at equipment connection, one or more of the following shall also be permitted:

(a) Flexible metal fittings

(b) Flexible metal conduit with listed fittings

(c) Liquidtight flexible metal conduit with listed fittings

(d) Wiring methods in accordance with article 645 when a critical operations data system is within the DCOA.

Substantiation: Information Technology Equipment Rooms are addressed in Article 645 (and in NFPA 75). IT spaces already incorporate methods and procedures to assure the highest levels of continuous operation and serve as a model for COPS. Because ITE rooms are characterized by the need for frequent and rapid expansion and relocation, the requirements for conduit beyond what is already stipulated in Article 645 would impose onerous conditions on a system that has already proven to work well. The term “critical operations data system” has already been proposed and defined in a separate proposal for Article 645.

Panel Meeting Action: Reject

Panel Statement: The recommendation does not provide specific wiring methods from Article 645 that may provide physical protection; therefore, the recommended text would not be enforceable.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-273 Log #2919 NEC-P13 **Final Action: Accept in Principle in Part**
(708.10(C)(2))

Submitter: Thomas Guida, TJG Services, Inc.

Recommendation: Revise Text as follows:

708.10(C)(2) **Fire Protection for Feeders.** Feeders shall meet one of the following conditions:

(1) Be a listed electrical circuit protective system with a minimum 2~~1~~-hour fire rating when installed in accordance with the listing requirement

(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2~~1~~ hour

(3) Be embedded in ~~not less than 50 mm (2 in.) of~~ concrete **with a sufficient thickness to achieve a minimum 2 hour fire rating**

~~(4) Be a cable listed to maintain circuit integrity for not less than 1 hour when installed in accordance with the listing requirement.~~

Substantiation: This proposal increases the time from 1 hour to 2 hours as was done last code cycle in 695.6(B). The extended time is to allow occupants to exit the building as well as give fire fighters additional time to operate the fire fighting equipment once people exit the building by extending the time the emergency circuits operate.

Method (3) has deleted the 2 inches because in various applications e.g. slabs versus columns or with different concrete, e.g. lightweight, siliceous, or carbonate; different concrete thickness may be required to meet the rating.

Method (4) is encompassed by method (1). A “cable listed to maintain circuit integrity” is covered as a listed electrical circuit protective system for power. All UL FHJR fire resistive cables are listed as an electrical circuit protective system (FHIT).

The cautionary note about the listing requirements from method (4) was moved to method (1).

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

708.10(C)(2) Fire Protection for Feeders. Feeders shall meet one of the following conditions:

(1) Be a listed electrical circuit protective system with a minimum 2-hour fire rating.

FPN: UL guide information for electrical circuit protection systems (FHIT) contains information on proper installation requirements to maintain the fire rating

(2) Be protected by a listed fire-rated assembly that has a minimum fire rating of 2 hours

(3) Be embedded in not less than 50 mm (2 in.) of concrete.

Panel Statement: The 2 in. of concrete has provided the industry with a prescriptive benchmark that has served the industry well. The substantiation does not demonstrate that use of 2 in. of concrete has compromised the integrity of the circuit. The recommendation does not provide an alternative prescriptive requirement that can be easily applied. The recommendation was revised for consistency with similar requirements in section 700.9(D) and for clarity. The inclusion of the fine print note provides desirable information on electrical circuit protective systems.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-274 Log #3568 NEC-P13 **Final Action: Reject**
(708.10(C)(2))

TCC Action: The Technical Correlating Committee understands that the reference to the "1-hour fire rating" in the panel statement should refer to a "2-hour fire rating".
Submitter: James R. Steed, Malcolm Pirnie, Inc.
Recommendation: Add text as follows:
Exception: Horizontal runs through interior areas that are entirely of non-combustible construction and do not contain combustible materials shall be permitted to be installed using only the wiring methods in 708.10(C)(1) and 708.10(C)(3).
Substantiation: In many types of installations feeders are distributed through areas where the threat of fire and propagating the fire is minimal. For example, in water and wastewater treatment plants the buildings are commonly of concrete construction and the contents are equipment and piping. In these types of installations it is not uncommon for the buildings to be linked by underground utility tunnels hundreds of feet long that carry only piping. Frequently, electrical feeders are also routed through these tunnels. Requiring fire protection for feeders in areas where there is minimal threat to the feeders results a minimal safety improvement at a large expense.
Panel Meeting Action: Reject
Panel Statement: Section 708.10(C)(2) involves fire protection for feeders. These feeders must meet the requirements for special protection with a minimum 1-hour fire rating or be imbedded in at least 2 in. of concrete for survivability. No technical substantiation was provided to relax these requirements.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-275 Log #2025 NEC-P13 **Final Action: Reject**
(708.10(C)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Where COPS ~~feeders~~ insulated conductors are installed below the level of the 100 year floodplain, the conductors shall be listed for use in wet locations and be installed in a wiring method that is ~~permitted~~ identified for the use.
Substantiation: Edit. All conductors should be included such as branch circuits and equipment grounding and bonding conductors (if insulated). "Permitted" may be at the discretion of the AHJ; "identified" is more specific and covers all conditions not just wet locations.
Panel Meeting Action: Reject
Panel Statement: The intent of the submitter is met in the present text of the NEC. All branch circuit and feeder conductors are covered by the present requirement. Branch circuits are already included per 708.10(D)(a).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(Note: Sequence 13-276 moved to follow 13-279 on page 981)

13-277 Log #2915 NEC-P13 **Final Action: Accept**
(708.14)

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Revise Text as Follows:
708.14 Wiring of HVAC, Fire Alarm, Security, Emergency Communications, and Signaling Systems. All conductors or cables shall be installed using any of the metal wiring methods permitted by 708.10(C)(1) and in addition shall comply with 708.14(1) through 708.14(8) as applicable.
(1) All cables for fire alarm, security, s~~S~~ignal systems and emergency communications ~~wires~~ shall be ~~use~~ shielded twisted pair~~s~~ cables.
(2) Shields of cables for fire alarm, security, signal systems and emergency communications ~~signal and communication wires~~ shall be continuous.
(3) Fiber optic cables shall be used for connections between two or more buildings on the property and under single management.
(4) Listed secondary protectors shall be provided at the terminals of the communication circuits.
(5) Conductors for all control circuits rated above 50V shall be ~~installed with wire~~ rated not less than 600V.
(6) Communications, fire alarm, and signaling circuits shall use relays with contact ratings that exceed circuit voltage and current ratings in the controlled circuit.
(7) ~~Riser~~ All cables for fire alarm, security, signal systems and emergency communications ~~communication cables~~ shall be riser- rated and shall be ~~2-hour fire resistive cable or~~ a listed 2-hour electrical circuit protective system.
(8) Control, monitoring, and power wiring to HVAC systems shall be ~~2-hour fire-resistive cable or~~ a listed 2-hour electrical circuit protective system.
Substantiation: To clarify which cable types require shielded twisted pairs, and which require riser rating.
Two hour fire resistive cable in conduit as required by 708.10(C) (1) is an electrical circuit protective system.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-278 Log #3993 NEC-P13 **Final Action: Reject**
(708.14)

TCC Action: The Technical Correlating Committee understands that the panel meeting action was entered inadvertently.
Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise text as follows:
708.14 Wiring of HVAC, Fire Alarm, Security, Emergency Communications, and Signaling Systems.
All conductors or cables shall be installed using any of the metal wiring methods permitted by 708.10(C)(1) and in addition shall comply with 708.14(1) through 708.14(8) as applicable.
~~(1) Signal and communication wires shall use shielded twisted pairs.~~
(2) Shields of signal and communication wires shall be continuous.
(3) Fiber optic cables shall be used for connections between two or more buildings on the property and under single management.
(4) Listed secondary protectors shall be provided at the terminals of the communication circuits.
(5) Conductors for all control circuits rated above ~~50V~~ 70V shall be installed with wire rated not less than ~~600V~~ 300V.
(6) Communications, fire alarm, and signaling circuits shall use relays with contact ratings that exceed circuit voltage and current ratings in the controlled circuit.
(7) Riser communication cables shall be 2-hour fire-resistive cable or a listed 2-hour electrical circuit protective system.
(8) Control, monitoring, and power wiring to HVAC systems shall be 2-hour fire-resistive cable or a listed 2-hour electrical circuit protective system.
Substantiation: Not all systems can use shielded twisted pair wires. Many systems today have been designed not to use shielding to allow a various types of wiring designs. Section 708.14 (1) should be deleted and the subsequent () be renumbered.
Panel Meeting Action: Reject
The panel accept the recommendation for 708.14(1) and rejects the recommendation in (5). There was no technical substantiation provided to change the voltage rating of the above 70-volt conductors from 600-volts to 300-volts.
Panel Statement: The recommendation does not provide sufficient technical substantiation to support relaxation of the current requirements in 708.14(1) and (5). The shielding requirement in (1) was discussed significantly during the 2008 NEC cycle, and it was the opinion of the committee that the shielding provided a higher level of protection against interference on control circuits for critical equipment. If there is equipment or systems that are incompatible with the use of shielded cables the panel would request such information be put forth in a comment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MOUTON, C.: To eliminate confusion, the statement provided below the Panel Meeting Action to Reject the Proposal should be eliminated, since it implies that the Proposal was Accepted in Principle in Part.

13-279 Log #4318 NEC-P13 **Final Action: Reject**
(708.14)

Submitter: Sanford E. Egesdal, Egesdal Associates PLC
Recommendation: Revise 708.14
708.14 Wiring of HVAC, Fire Alarm, Security, Emergency Communications, and Signaling Systems.
All conductors or cables shall be installed using any of the metal wiring methods permitted by 708.10(C)(1) and in addition shall comply with 708.14(1) through 708.14(8) as applicable.
~~(1) Signal and communication wires shall use shielded twisted pairs.~~
(2) Where used, s~~S~~hields of signal and emergency communication wires shall be continuous.
(3) Fiber optic cables shall be used for connections between two or more buildings on the property and under single management. This requirement shall become effective July 2014.
(4) Listed secondary protectors shall be provided at the terminals of the communication circuits, unless the circuits are installed in optical fiber cable.
(5) Conductors for all control circuits rated above 50V shall be installed ~~with wire rated not less than 600V.~~ in compliance with the requirements of Parts I and Part III of Article 725 or Article 760.
(6) Emergency c~~C~~ommunications, fire alarm, and signaling circuits shall use relays with contact ratings that exceed circuit voltage and current ratings in the controlled circuit.
(7) Riser emergency communication cables shall be 2-hour fire-resistive cable or a listed 2-hour electrical circuit protective system. This requirement shall become effective July 2014.
(8) Control, monitoring, and power wiring to HVAC systems shall be 2-hour fire-resistive cable or a listed 2-hour electrical circuit protective system. This requirement shall become effective July 2014.
Substantiation: The recommended changes are an attempt to better align the requirements with available products. Some of the present requirements would inhibit installation of some products, or products may not be available.

(1) This requirement is deleted because some products would have significant installation limitations due to the increased inter-wiring capacitance caused by a shield. Also, some temperature control systems use twisted triplets (conductors in conduit, or cable).

(2) Shields may not be appropriate for some cables.

(2), (6), & (7) Where "communication" appears change to "emergency communication" to avoid confusion with "communications" covered by Article 800.

(3) Adding an effective date for this requirement provides time for manufacturers to develop product to meet the requirement.

(4) Optical fiber cables do not need secondary protectors.

(5) Control circuits for HVAC systems and fire alarm systems may have voltage greater than 50 volts, but are powered by a power source not greater than 100VA.

(7) & (8) A 2-hour fire-resistive cable or a listed 2-hour electrical circuit protective system must be installed in accordance with the product listing. The product listing may not match the requirement set forth in 708.10(C)(1), which reads as follows: "Protection Against Physical Damage. The wiring of the COPS system shall be protected against physical damage. Wiring methods shall be permitted to be installed in accordance with the following: (1) Rigid metal conduit, intermediate metal conduit, or Type MI cable. Adding an effective date for this requirement provides time for manufacturers to develop product to meet the requirement.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-278. There was no technical substantiation provided to indicate that manufacturers don't have these products available and, in fact electrical circuit protective circuits are available so the effective dates are not necessary. The proposed changes in (5) were rejected since 725.31(A) require Class 2 or 3 circuits involving life safety issues to comply with the requirements for Class 1 circuits and 725.49(B) requires 600-volt insulation. Emergency was not added to (7) and (8) since the circuits are covered in Chapter 8 and are not labeled as "emergency" in any of the articles.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-276 Log #141 NEC-P13 **Final Action: Accept in Principle**
(708.14(1) and (2))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

(1) Signal and communication<u>s cables</u> ~~wires~~ shall use shielded twisted pairs.

(2) Shields of signal and communication<u>s cables</u> ~~wires~~ shall be continuous.

Substantiation: Article 800 has definitions for communications cable and communications wire. This section apparently deals with cables, not wires. See 800.2.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action on Proposal 13-277 meets the intent of the recommendation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-280 Log #2023 NEC-P13 **Final Action: Reject**
(708.14(2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise (2): Shields of signal and communication wires shall be continuous <u>(unbroken) between equipment(s)</u>.

Substantiation: Edit. Proposal clarifies that "continuous" does not include splicing.

Panel Meeting Action: Reject

Panel Statement: The recommendation creates redundant language rather than promoting clarity as Webster's defines "continuous" as "unbroken."

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-281 Log #142 NEC-P13 **Final Action: Accept**
(708.14(3))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

(3) ~~Fiber optic~~ <u>Optical fiber</u> cables shall be used for connections between two or more buildings on the property and under single management.

Substantiation: Article 770 uses the term "optical fiber cables," not "fiber optic cables". NEC terminology should be consistent.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-282 Log #143 NEC-P13 **Final Action: Accept**
(708.14(4))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

(4) <u>A listed primary protector shall be provided on all communications circuits.</u> Listed secondary protectors shall be provided at the terminals of the communication<u>s</u> circuits.

Substantiation: The fine print note in section 800.90(D) warns that secondary protectors are not intended to be used without primary protectors.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-283 Log #1119 NEC-P13 **Final Action: Accept in Principle in Part**
(708.14(4))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)

Recommendation: Add text as follows:

(4) Listed secondary protectors shall be provided at the terminals of the communications circuits. <u>Where a communications circuit is exposed to accidental contact with electric light or power conductors operating at over 300 volts to ground, or there exists a lightning exposure, a listed primary protector shall be utilized with each listed secondary protector.</u>

<u>FPN No. 1: Secondary protectors on communications circuits exposed to accidental contact with electric light or power conductors operating at greater than 300 volts to ground are not intended for use without primary protectors.</u>

<u>FPN No. 2: See 800.2 for the definition of 'exposed to accidental contact'.</u>

<u>FPN No. 3: See 800.90(A) FPN No. 2 for information on lightning exposure.</u>

Substantiation: Secondary protectors are not intended for use without primary protectors where there is an exposure to accidental contact with electric light or power conductors operating at over 300 volts to ground (see 800.90 (D) FPN). The present text is incomplete and may lead to the misapplication of secondary protectors beyond their listing criteria. The added text and FPN No. 1 correlates with 800.90 (D) and the listing criteria for secondary protectors. Additional FPN Nos. 2 and 3 will help the reader to better understand exposure to power and to lightning.

Panel Meeting Action: Accept in Principle in Part

The panel accepts in principle the revision to 708.14(4) and rejects the inclusion of the new fine print notes.

Panel Statement: The panel action on Proposal 13-282 meets the intent of the recommendation in regard to the use of a primary protector with secondary protectors. Article 708 requirements transcend the minimum requirements in other code articles. Those minimum requirements already apply, so the fine print notes are not needed.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-284 Log #144 NEC-P13 **Final Action: Reject**
(708.14(7))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

(7) Riser communication cables shall <u>Type CMR-CI</u> ~~be 2-hour fire-resistive cable~~ or a listed 2-hour electrical circuit protective system.

Substantiation: A riser communications cable with a 2-hour fire-resistive rating is a Type CMR-CI. See 800.179(G) for the listing requirements for circuit integrity (CI) communications cables.

Panel Meeting Action: Reject

Panel Statement: It is not necessary to provide the level of specificity that the recommendation proposes. Cables that meet the requirements of this section are covered in Chapters 7 and 8.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-285 Log #3745 NEC-P13 **Final Action: Accept in Principle**
(708.20)

Submitter: Michael A. Anthony, University of Michigan / Rep. Assn. of Education Facility Executives - APPA.ORG
Recommendation: MOVE A CHUNK OF TEXT REGARDING VENTILATION FROM 708.22 AND RE-INSERT IT IN 708.20 AS SHOWN BELOW:
708.22 Capacity of Power Sources.
(A) Capacity and Rating. A COPS shall have capacity and rating for all loads to be operated simultaneously for continuous operation with variable load for an unlimited number of hours, except for required maintenance of the power source. A portable, temporary, or redundant alternate power source shall be available for use whenever the COPS power source is out of service for maintenance or repair.
(B) Selective Load Pickup, Load Shedding, and Peak Load Sharing. The alternate power source shall be permitted to supply COPS emergency, legally required standby and optional loads where the source has adequate capacity or where automatic selective load pickup and load shedding is provided as needed to ensure adequate power to (1) the COPS and emergency circuits, (2) the legally required standby circuits, and (3) the optional standby circuits, in that order of priority. The alternate power source shall be permitted to be used for peak load shaving, provided these conditions are met.
Peak load-shaving operation shall be permitted for satisfying the test requirement of 708.6(B), provided all other conditions of 708.6 are met.
(C) Duration of COPS Operation. The alternate power source shall be capable of operating the COPS for a minimum of 72 hours at full load of DCOA with a steady-state voltage within ±10 percent of nominal utilization voltage.
~~**(D) Ventilation. Adequate ventilation shall be provided for the alternate power source for continued operation under maximum anticipated ambient temperatures.**~~
~~**FPN:**~~ **NFPA 110**~~**-2005,** ***Standard for Emergency and Standby Power Systems,*** **and**~~ **NFPA 111**~~**-2005,** ***Standard for Stored Energy Emergency and Standby Power Systems,*** **include additional information on ventilation air for combustion and cooling.**~~
DELETE FROM 708.22 (D) ABOVE AND RE-INSERT IN 708.20 AS SHOWN BELOW:
III. Power Sources and Connection
708.20 Sources of Power.
(A) General Requirements. Current supply shall be such that, in the event of failure of the normal supply to the DCOA, critical operations power shall be available within the time required for the application. The supply system for critical operations power, in addition to the normal services to the building and meeting the general requirements of this section, shall be one or more of the types of systems described in 708.20(D) through (H).
FPN: Assignment of degree of reliability of the recognized critical operations power system depends on the careful evaluation in accordance with the risk assessment.
(B) Fire Protection. Where located within a building, equipment for sources of power as described in 708.20(D) through (H) shall be installed either in spaces fully protected by approved automatic fire suppression systems (sprinklers, carbon dioxide systems, and so forth) or in spaces with a 1-hour fire rating.
(C) Grounding. All sources of power shall be grounded as a separately derived source in accordance with 250.30.
Exception: Where the equipment containing the main bonding jumper or system bonding jumper for the normal source and the feeder wiring to the transfer equipment are installed in accordance with 708.10(C) and 708.11(B).
(D) Surge Protection Devices. Surge protection devices shall be provided at all facility distribution voltage levels.
(E) Storage Battery. An automatic battery charging means shall be provided. Batteries shall be compatible with the charger for that particular installation. For a sealed battery, the container shall not be required to be transparent. However, for the lead acid battery that requires water additions, transparent or translucent jars shall be furnished. Automotive-type batteries shall not be used.
(F) Ventilation. Adequate ventilation shall be provided for the alternate power source for continued operation under maximum anticipated ambient temperatures.
FPN: NFPA 110-2005, *Standard for Emergency and Standby Power Systems,* and NFPA 111-2005, *Standard for Stored Energy Emergency and Standby Power Systems*, include additional information on ventilation air for combustion and cooling.
Substantiation: CLEARER GROUPING OF REQUIREMENTS IS POSSIBLE WITH A REVISION THAT RELOCATES THE 708.22 REQUIREMENTS FOR VENTILATION WITH OTHER GENERAL REQUIREMENTS FOR POWER SOURCES IN 708.20.
Panel Meeting Action: Accept in Principle
The panel accepts the recommendation in principle and relocates the text and associated fine print note as a new Section 708.21.
Panel Statement: The panel agrees with the recommendation but more clarity is achieved by locating this provision as a separate requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BOREK, S.: 708.22(D) should not be relocated to 708.20(D) since it is not a power source, it is a requirement to make sure that there is adequate ventilation for the alternate power source. The load for that ventilation requirement has to be included in the sizing of the alternate power source and that it is capable of maintaining that load continuously while the alternate power source is in operation.

13-286 Log #3947 NEC-P13 **Final Action: Accept**
(708.20(A))

Submitter: James Kelley, Sargent & Lundy
Recommendation: Revise text to read as follows:
(A) General Requirements. Current supply shall be such that, in the event of failure of the normal supply to the DCOA, critical operations power shall be available within the time required for the application. The supply system for critical operations power, in addition to the normal services to the building and meeting the general requirements of this section, shall be one or more of the types of systems described in 708.20(~~D~~E) through (H).
Substantiation: The change is to correct the reference to the types of systems beginning with (E) Storage Battery because (D) Surge Protection Devices are not a type of power supply system.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-287 Log #3949 NEC-P13 **Final Action: Accept in Principle**
(708.20(B))

Ballot Results: Affirmative: 14

13-288 Log #3944 NEC-P13 **Final Action: Reject**
(708.20(F)(3))

Submitter: James Kelley, Sargent & Lundy
Recommendation: Revise text to read as follows:
(3) Dual Fuel Supplies. Prime movers shall not be solely dependent on a public utility gas system for their fuel supply or municipal water supply for their cooling systems. Means shall be provided for automatically transferring from one fuel supply to another where dual fuel supplies are used.
Substantiation: Editorial change for the insertion of “Fuel” in the title of 708.20(F)(3) because it is the adjective of the subject and this would be consistent with the title of a parallel topic in 701.11(B)(3).
Panel Meeting Action: Reject
Panel Statement: The requirement covers other than fuel supplies.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-289 Log #4501 NEC-P13 **Final Action: Reject**
(708.20(F)(8) (New))

Submitter: Michael A. Anthony, University of Michigan Business Operations / Rep. APPA Higher Education Fac. Executives
Recommendation: Add new (8) as follows:
F) Generator Set.
(1) Prime Mover-Driven. Generator sets driven by a prime mover shall be provided with means for automatically starting the prime mover on failure of the normal service. A time-delay feature permitting a minimum 15-minute setting shall be provided to avoid retransfer in case of short-time reestablishment of the normal source.
(2) Power for fuel transfer pumps. Where power is needed for the operation of the fuel transfer pumps to deliver fuel to a generator set day tank, this pump shall be connected to the COPS.

(3) Dual Supplies. Prime movers shall not be solely dependent on a public utility gas system for their fuel supply or municipal water supply for their cooling systems. Means shall be provided for automatically transferring from one fuel supply to another where dual fuel supplies are used.

(4) Battery Power and Dampers. Where a storage battery is used for control or signal power or as the means of starting the prime mover, it shall be suitable for the purpose and shall be equipped with an automatic charging means independent of the generator set. Where the battery charger is required for the operation of the generator set, it shall be connected to the COPS. Where power is required for the operation of dampers used to ventilate the generator set, the dampers shall be connected to the COPS.

(5) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

(6) Mean for Connecting Portable or Vehicle-Mounted Generator. Where the COPS is supplied by a single generator, a means to connect a portable or vehicle-mounted generator shall be provided.

(7) On-Site Fuel Supply. Where internal combustion engines are used as the prime mover, an on-site fuel supply shall be provided. The on-site fuel supply shall be secured and protected in accordance with the risk assessment.

<u>(8) Cogeneration. Where a combined heat and power system is used as the COPS prime mover, a dual source of make-up water for the thermal network shall be available.</u>

Substantiation: Cogeneration systems require water for cooling the gen set but also for condensate makeup associated with the heating and/or cooling loads.

Panel Meeting Action: Reject

Panel Statement: The recommendation is better accomplished through the risk assessment process specified in Section 708.4.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-290 Log #4698 NEC-P13 **Final Action: Reject**
(708.20(H) (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. Association of Education Facilities Executivies

Recommendation: Revise text to read as follows:

<u>**(H) Microturbines.** Microturbines used as the sole source of power for COPS shall comply with all applicable industry standards and conform to all other performance requirements in this Article.</u>

Substantiation: These machines are gaining increasing acceptance and the NEC should recognize their prospect for accomplishing the goals of this Article.

Panel Meeting Action: Reject

Panel Statement: The equipment described is a type of generator and the use of such equipment is not prohibited provided it meets all of the operational requirements of this article.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-291 Log #1264 NEC-P13 **Final Action: Reject**
(708.22)

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.

Recommendation: Revise text to read as follows:

(C) Duration of COPS Operation. The alternate power source shall be capable of operating the COPS ~~for a minimum of 72 hours~~ at full load of DCOA with a steady-state voltage within ±10 percent of nominal utilization voltage as follows:.

<u>(1) Category I is required to remain operational throughout the disaster or immediately restorable to service at the end of the event; any equipment that shuts off during the disaster can be restarted without requiring equipment repair. On-site generation capable of supporting the DCOA for 72 hours with only refueling and minor servicing (no loss of power to the DCOA while servicing) is required.</u>

<u>(2) Category II is required to survive the disaster or be restored to operation with on-site parts within 4 hours. On-site generation would normally be required, unless the utility infrastructure was sufficiently robust that utility power would be restored in 4 hours.</u>

<u>(3) Category III is required to be restorable to operation within 24 hours. Temporary or on-site generation would be required if utility power could not be restored in 24 hours.</u>

<u>(4) Category IV is required to be restorable to operation within 24 hours of the time utility power, water and sewage disposal are available to the facility. Temporary or on-site generation would not be required.</u>

Substantiation: The requirement for the various types of critical systems needs to align with the importance of the system to the protection of life and property. A set of specific requirements for the various levels of criticality needs to be included in the article to provide design criteria and for consistent application.

The classifying governmental agency having jurisdiction would benefit from guidelines to use in determining which systems in their jurisdiction should be included as COPS. A gradient level of criticality provides a method to ensure the most critical systems have the resources allocated to them so that they are available when needed to deliver emergency services and provide for disaster recovery.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-263.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-292 Log #1486 NEC-P13 **Final Action: Reject**
(708.22(A))

Submitter: Marcelo C. Algrain, Caterpillar, Inc.

Recommendation: Delete text as follows:

708.22 Capacity of Power Sources

(A) Capacity and Rating. A COPS shall have capacity and rating for all loads to be operated simultaneously for continuous operation with variable load ~~for an unlimited number of hours, except for maintenance of the power source~~. A portable, temporary, or redundant alternate power source shall be available for use whenever the COPS power source is out of service for maintenance or repair.

Substantiation: The requirement for operating power sources for an unlimited number of hours is not enforceable. All power sources have finite service life. In the case of engine driven generator sets, the predicted service life depends on the type of rating selected for the application, i.e., standby, prime, or continuous. This selection should be made based on load factors and durations for the given application. If operation for an unlimited number of hours (unattainable figure) were to be required, it would force the selection of prime rated power sources over standby ones. This will have a significant negative economic impact on COPS facilities that would not require prime ratings otherwise. Furthermore, the duration of COPS operation is already covered in section 708.22(C), “minimum of 72 hours at full load”, making it unnecessary and inconsistent to be specified in section 708.22(A) as an unlimited amount of time. Finally, the intent of this article is to cover disruptions to elements of the normal systems, arisen from emergency and disaster situations, which are not to occur on a regular basis. Hence, the proposal to remove the language “for an unlimited number of hours, except for maintenance of the power source” is respectfully submitted.

Panel Meeting Action: Reject

Panel Statement: The code does not indicate the extent of maintenance of the power source. The intent of Article 708.22 (A) is to assure that the entire system is not subject to life expectancy issues, and that the power source is repairable and has no unintended availability issues, as might be the case with solar, wind, or hydroelectric power sources.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-293 Log #3942 NEC-P13 **Final Action: Accept**
(708.22(B))

Submitter: James Kelley, Sargent & Lundy

Recommendation: Revise text to read as follows:

(B) Selective Load Pickup, Load Shedding, and Peak Load ~~Sharing~~ <u>Shaving</u>. The alternate power source shall be permitted to supply COPS emergency, legally required standby and optional loads where the source has adequate capacity or where automatic selective load pickup and load shedding is provided as needed to ensure adequate power to (1) the COPS and emergency circuits, (2) the legally required standby circuits, and (3) the optional standby circuits, in that order of priority. The alternate power source shall be permitted to be used for peak load shaving, provided these conditions are met.

Peak load-shaving operation shall be permitted for satisfying the test requirement of 708.6(B), provided all other conditions of 708.6 are met.

Substantiation: Editorial correction of spelling that resulted in the word “Sharing” instead of “Shaving”

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-294 Log #4172 NEC-P13 **Final Action: Reject**
(708.52)

Submitter: Timothy Crnko, Cooper Bussmann

Recommendation: Delete Section 708.52 Ground-Fault Protection of Equipment.

Substantiation: The selective coordination requirement in 708.54 includes ground faults and therefore 708.52 is unnecessary and too prescriptive. There are design circumstances where selective coordination for all types of overcurrents can be achieved between a feeder overcurrent protective device and a ground fault relay on the service without a ground fault relay on the feeder. For these circumstances it should not be required to install another level of ground fault relay protection.

Panel Meeting Action: Reject

Panel Statement: The recommendation to delete all of the requirements of this section would then require compliance with only the requirements of 215.10 and 230.95, which do not require additional levels of ground-fault protection. Because this equipment is critical to the operation of COPS systems, a more appropriate approach might be to apply the provisions of 700.7(D) and 700.26 by prohibiting automatic opening of the circuit and requiring signal indication of the ground fault.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
DEGNAN, J.: The submitter has identified an area where there is extreme difficulty, approaching an impossibility, for design engineers to comply with selective coordination and two levels of ground fault. A modification is needed to 708.52 or 708.54 to make Article 708 reasonable.

13-295 Log #3694 NEC-P13 **Final Action: Reject**
(708.54)

Submitter: Christopher G. Walker, Eaton Corp.
Recommendation: Add new text to read as follows:
Overcurrent devices shall be selected by a qualified person to optimize selective coordination and arc flash protection (NFPA 70E).
Substantiation: Designing electrical systems with overcurrent protective devices that are to be selectively coordinated involves using data from the device manufacturers, and conducting analyses of the various conditions that the electrical system may experience. The choice of overcurrent protective devices involves the study and analysis of both phase and ground fault currents, and cover currents that ranges from low level overloads up to high short circuit fault current levels.
In addition, there are applications that are justified per NFPA 70E-2004 that allow installation and maintenance personnel to perform work close to energized conductors. For these applications where personnel are working in close contact with energized conductors, design studies are to be conducted to determine the possible levels of arc flash energy that personnel may be exposed to, and the subsequent levels of protective equipment that should be in place.
It should be evident that the correct selection of protective devices is very important to minimize damage to equipment, minimize the loss of power in key electrical systems, and minimize the arc flash energy exposure to personnel whenever electrical fault conditions occur. The correct selection of the protective devices that will satisfy these conditions must be done by persons that are qualified to perform the appropriate types of analysis and studies. A thorough analysis is needed to ensure optimal selection of protective devices, otherwise, it may result in excessive equipment damage and/or personnel injury.
The current National Electric Code specifies the types of systems that require selective coordination. The Code does not identify who is responsible for ensuring that the electrical systems meet the selective coordination requirements.
Therefore, this proposal simply adds verbiage to clarify who is responsible for ensuring that the electrical systems meet the current selective coordination requirements, while also addressing equipment protection and personnel safety.
Panel Meeting Action: Reject
Panel Statement: In Section 215.5, an authority having jurisdiction (AHJ) can require a diagram showing feeder details prior to the installation of the feeders and then can require a certain level of expertise for the design of these feeders. Section 240.12 already permits selective coordination for orderly shutdown of the system as a permissive rule.
Section 110.16 requires a sign be posted at the distribution equipment, panelboards, switchboards, and similar equipment warning qualified personnel of the potential electric arc flash hazard. The NEC covers the installation of the electrical system, and NFPA 70E provides coverage once the system has been energized. There may be many reasons a designer provides a particular type of overcurrent protective device for a certain system, with arc flash as one of the many considerations and selective coordination as another.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
CARON, D.: See my comments to Proposal 13-195.
DEGNAN, J.: See My Explanation of Negative on 13-194.
MOUTON, C.: I'm voting against the panel action. The panel action should have been to accept in principle in part. The proposal should not have been rejected since it properly indicates that selective device coordination should be an optimization. See my additional comments for Proposal 13-194 that relate to this proposal also.

13-296 Log #4324 NEC-P13 **Final Action: Reject**
(708.54)

Submitter: Malcolm Allison, Ferraz Shawmut
Recommendation: Amend 708.54 as follows:
708.54 Coordination.
(A) Normal System. Normal system overcurrent protective devices on the supply side of the critical operations power system overcurrent protective devices shall not be required to be selectively coordinated with other supply side, normal system overcurrent protective devices.
(B) Critical Operations Power System. Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices unless one of the following conditions in (1) through (5) are met.
(1) Transformer Overcurrent Protective Devices. Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exists on the transformer secondary.
(2) Overcurrent Protective Devices of the Same Size. Between overcurrent protective devices of the same size (ampere rating) installed in series.
(3) Expansion of an Existing Critical Operations Power System - Existing Overcurrent Protective Devices. Between existing critical operations power system overcurrent protective devices and any existing supply side overcurrent protective devices, where the critical operations power system is expanded.
(4) Expansion of an Existing Critical Operations Power System - New Overcurrent Protective Devices. Between new critical operations power system overcurrent protective devices and any existing supply side overcurrent protective devices, where the critical operations power system is expanded.
(5) Designed Under Engineering Supervision. Where a licensed professional engineer, engaged primarily in the design of electrical installations, provides stamped documentation showing the specific circuit that cannot be selectively coordinated, and substantiation of the design alternatives that were analyzed in the failed attempt to achieve selective coordination. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system.
FPN: These are several techniques that help to selectively coordinate an electrical distribution system
(a) Where transfer switches are utilized, utilizing several smaller transfer switches rather than one larger transfer switch, and moving the transfer switches down in the system, closer to the loads.
(b) Utilizing short-time delay
(c) Utilizing devices with an adjustable instantaneous trip
(d) Utilizing smaller downstream devices
(e) Utilizing several smaller downstream devices rather than one larger downstream device
(f) Utilizing upstream devices with larger frame sizes
(g) Utilizing fuse manufacturers' ratio charts
(h) Utilizing circuit breaker manufacturers' selective coordination charts
(i) Utilizing differential relays
(j) Utilizing isolation transformers
(k) Minimizing the number of levels in a distribution system
(I) Utilizing a greater number of smaller feeders, rather than a smaller number of larger feeders
(m) Utilizing impedance grounded systems
(n) Utilizing high-instantaneous trip circuit breakers
Selective Coordination Requirements
1. Must selectively coordinate with 2,3,4,5,6
2. Must selectively coordinate with 3,4,5,6
3. Must selectively coordinate with 4
4. Does not have to selectively coordinate with 6

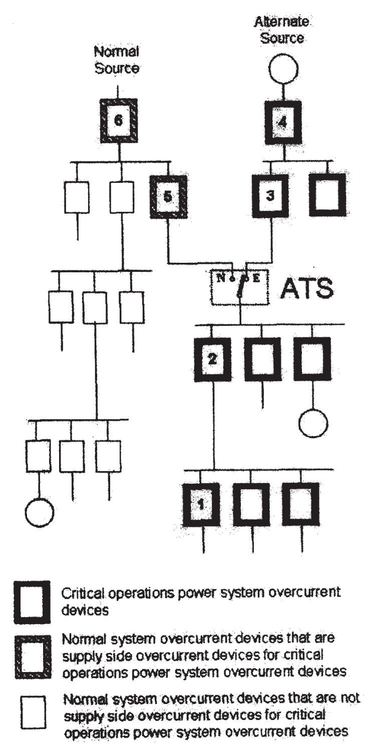

Figure 708.54 Clarification of Selective Coordination Requirements

Substantiation: This proposal is an attempt to clarify the confusion concerning selective coordination requirements.

(1) Figure 708.54 has been added to clarify which devices are critical operations power system side devices, and which are normal side devices. This figure should be included in the NEC® text. Figure 708.54 was based upon a figure from an necdigest® article, Keep the Power On For Vital Loads, by Evangelos Stoyas, December 2007 Copyright© 2007, National Fire Protection Association, Quincy, MA.

(2)"(A) Normal System" was added because there have been questions about the need for selective coordination of the overcurrent devices on the normal side, on the line side of the transfer switch. Since Devices 5 and 6 are not really part of the critical operations power system, 708.54 does not apply, and therefore 5 and 6 do not need to selectively coordinate with each other.

(3)"(B) (1)" and "(B)(2)" are added to correlate with existing 700.27 and 701.18.

(4) "(B)(3)" was added because there have been questions about the need for existing devices to selectively coordinate when a critical operations power system is expanded or modified. This proposal clarifies that existing devices do not have to be replaced if they do not already selectively coordinate.

(5) "(B)(4)" was added because there have been questions about the need for new devices to selectively coordinate with existing devices when a critical operations power system is expanded or remodeled. This clearly states that new devices do not have to selectively coordinate with the existing devices.

(6) "(B)(5)" was added for those few cases where selective coordination is simply not possible. It is not meant to be a "blank check" to allow designers to avoid their responsibility to provide a selectively coordinated system. The requirements are very similar to those found in 240.86 and are meant to ensure that all reasonable attempts have been made to achieve the objective. Once all attempts have been exhausted, the engineer simply documents the circuit in question and shows the techniques that were attempted.

(7) The FPN was added to provide some of the common methods that experienced engineers utilize to obtain selective coordination. It is not all-inclusive, and has been carefully worded so as not to include any requirements.

Panel Meeting Action: Reject

Panel Statement: The proposal for "(A) Normal System" covers devices in the normal source that are outside the scope of Article 700. While the concept is correct, the additional text is unnecessary. The proposed figure is also unnecessary.

While the concepts in (B), (B)(1), and (B)(2) are basically unchanged from the 2008 NEC, the change is not needed because all other portions of this proposal are also rejected.

(B)(3) is rejected because 700.27 is not retroactive for existing systems.

(B)(4) is rejected because no technical substantiation was provided to justify the reduced continuity of service that would result from the elimination of the requirement of new devices to selectively coordinate with upstream existing devices.

(B)(5) is rejected because no technical justification was provided as to why selective coordination cannot be achieved in all situations. In addition, no information was provided as to which or how many design alternatives the consulting engineer needs to analyze and submit in the required documentation.

The FPN is rejected because technical substantiation was not provided for any of the 14 listed techniques.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

CARON, D.: See my comments to Proposal 13-195.

13-297 Log #4340 NEC-P13 **Final Action: Reject**

(708.54)

Submitter: Dan Giblin, National Electric Fuse Assn. (NEFA)

Recommendation: Revise text as follows:

708.54 Coordination.

(Keep present text and add the following at the end)

Selective coordination is required for the full range of overcurrents up to the highest available short-circuit current available at the lineside of each overcurrent protective device. The consideration shall include evaluation for the available short-circuit current from the normal supply and alternate supply as well as the transfer switch type.

Substantiation: The purpose of this addition is to clarify that selective coordination is for the full range of available overcurrents. Some people in the industry have contended that the present requirement is not clear on the range of overcurrent that must be considered. When 700.27 was voted as a requirement during the 2005 NEC cycle and then reaffirmed during the 2008 cycle, Code Making Panel 13 substantiated that this requirement is for the full range of overcurrents. For instance, Comment 20-13 in part "…*Selective coordination increases the reliability of the emergency system. The current wording of the NEC® is adequate.* ***The instantaneous portion of the time-current curve is no less important than the long time portion***."

The available short-circuit current must be considered for the worst case from the normal source, alternate source, or both for a closed transition transfer switch. If a fault occurs on an COPS load being supplied by the normal source and both the COPS branch circuit overcurrent protective device and COPS feeder overcurrent protective device open, then when the power is transferred to the alternate source, loads supplied by the affected feeder will unnecessarily be interrupted.

There is no simple alternative to use other than for the full range of available short-circuit currents. Some in the industry are advocating changing the selective coordination requirement to only times greater than 0.1 second. The paragraphs below illustrate why this is not viable.

Permitting the selective coordination requirement to be for times only greater than 0.1 second will allow non-coordinated operation of multiple levels of overcurrent protective devices (cascading) under short-circuit current (fault) conditions, which reduces the reliability of the system to deliver power to vital loads. Requiring selective coordination for times only greater than 0.1 second provides coordination for only overloads and does not provide assurance that typical ground faults and arcing faults will not cascade multiple levels of overcurrent protective devices, thereby unnecessarily losing power to critical loads. While both overloads and short-circuits occur on branch circuits, the predominance of overcurrent interruptions on feeder and service circuits are short-circuits (of all types). Graphs A and B depict the time-current curves of the same 30A, 200A, and 800A system. Graph A shows the portion of the circuit breaker time-current curves that would be analyzed for selective coordination for times only down to 0.1 seconds. Graph B depicts the circuit breaker curves showing the crossover of the circuit breakers in their instantaneous trip region. The cross over is a lack of selective coordination for overcurrents at that level and greater. Graph B shows a lack of coordination between the 30A and 200A circuit breakers for ground, arcing, and any combination of phase faults as low as 800A. Any type of fault as low as 2200A can take out the 800A circuit breaker as well. These are low available fault currents, easily achieved in almost every essential electrical system via a line-ground fault, line-line fault or three phase fault.

All circuit breakers with an instantaneous trip will open in less than 0.1 seconds when fault current is above the instantaneous trip setting. Requiring selective coordination for times only greater than 0.1 second will permit the design of vital electrical systems without regard to proper engineering attention being given to the instantaneous trip region.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The existing text of 708.54 already requires selective coordination for the full range of overcurrents, from overloads through the available short-circuit current, with all upstream devices. Specific additional text is not necessary. Substantiation was not provided for the reference to the transfer switch type.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

MOUTON, C.: I'm voting in the affirmative for the panel action, but would like to make the following comments regarding the proposal, which need to be added into the panel statement in whole or in part, to correctly address incorrect statements made in the proposal substantiation by the submitter. See my comments for Proposal 13-198 that relate to this proposal also.

13-298 Log #4381 NEC-P13 **Final Action: Reject**

(708.54)

Submitter: Alan Manche, Square D Company/Schneider Electric

Recommendation: Add a new sentence to the end of the main paragraph of 708.54:

Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. <u>A means to intentionally defeat selectivity shall not be permitted.</u>

Substantiation: Establishing selectively coordinated systems can increase the arc-flash hazard when maintenance is performed on the system depending upon the design of the system. The concern of increased arc-flash hazard was presented to the panel in past cycles and the panel accepted those risks in favor of the benefit of selectivity on these systems. Some system designers are now including a means to defeat selectivity by installing systems that can turn the selectivity off by temporarily changing breaker settings via a switch or sensor in order to protect the electrical worker. There is no prohibition established in the NEC to restrict defeating selectivity, or the life safety aspect for which it was installed, in order to protect the electrical worker.

Unfortunately the enhanced protection for the electrical worker can be a trade-off by defeating the life safety function of the selectively coordinated system in the critical operations electrical system. The most likely time for an incident to happen that would require the system to be selective is when a working is doing maintenance on the system. If the selectivity is defeated, an arc event small or large could initiate a fire hazard or take down lighting, ventilation, or critical circuits leaving a system inoperable which can place the life safety of others in a dangerous position.

There are solutions available to support the reduction of arc-flash in selectively coordinated system without intentionally defeating selectivity to enhance worker safety.

Panel Meeting Action: Reject

Panel Statement: The panel supports the use of energy reduction means for the protection of personnel during periods of maintenance of energized equipment. Use of these types of devices should be left to the discretion of the facility operator. The panel recognizes that the selective coordination is not available in the system at the time the energy reduction means is operational.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Abstain: 1
Explanation of Abstention:
DEGNAN, J.: See My Abstention on 13-199.

13-299 Log #4421 NEC-P13 **Final Action: Reject**
(708.54)

Submitter: Darrel Miller, LSW Engineers Arizona, Inc.
Recommendation: Revise text to read as follows:
708.54 Coordination. Critical Operations Power System(s) overcurrent devices shall be ~~selectively~~ coordinated with ~~all~~ supply side overcurrent protective devices. Selectivity shall meet the requirements of (A), (B), or (C).
(A) Selectivity shall be established, in the form of an engineering study, by a licensed professional engineer engaged regularly in the design or maintenance of coordinated electrical systems. The study shall be stamped by a licensed professional engineer and at a minimum include overcurrent device settings, supporting documentation, and a summary of limitations. This study shall be available to those authorized to design, install, inspect, maintain, and operate the system.
(B) Selectivity shall be established under engineering supervision by use of the selected overcurrent device manufactures tables and charts derived from tested combinations of devices. Applicability for each table and chart utilized shall be rigidly adhered to. All tables and charts shall be from the same manufacturer as the installed overcurrent devices.
(C) Selectivity shall be established under engineering supervision in existing installations. The engineer shall determine the extent of selectivity achievable based on review of the existing conditions. Use of methods (A), (B), or combination of each shall be permitted. A summary of limitations and recommendations shall be stamped by a licensed professional engineer and submitted to the authority having jurisdiction prior to the start of construction. Once accepted, the recommendations will establish the extent of retrofit required.
Exception: Selective coordination shall not be required in the following:
(1) Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exist on the transformer secondary.
(2) Between overcurrent protective devices or set of overcurrent protective devices of the same ampere rating in series. in series on opposite ends of the same feeder.
FPN: Overcurrent protective devices used for Critical Operations Power circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system. A similar increase in overall reliability can be experienced on the normal power system side.
Substantiation:
Present text restricts the design professional from making appropriate judgments and technical decisions necessary to effectively coordinate the overcurrent protective devices. Historically, the design professional has had the responsibility of evaluating and selecting the appropriate equipment based on the individual project circumstances, refer to the ANSI/IEEE color series of recommended practice manuals. The modifications proposed loosen the prescriptive mandate which is creating compliance difficulties. It will also restore the design professionals' freedom to select the appropriate overcurrent devices for use within the emergency, legally required standby, and critical operations power systems. As you will see in the following discussions, coordination has never been expected to be 100% selective. There are often circumstances that are just "best case" even in the most highly coordinated systems. The ANSI/IEEE repeatedly uses language which conveys this understanding.
Many jurisdictions have considered and adopted codification of a 0.1 second fault duration time to establish a reasonable coordination point. In fact, until published Time-Current Curves (TCC's) are available from the majority of manufactures starting at a time line less than the 1st half cycle, 0.0083 seconds, this approach would provide a design basis that is universally workable.
We understand the argument that this is an arbitrary point at which to start coordination. Accordingly, we have taken a different approach. The text presented was modeled after NEC 240.86. This article establishes a method for the design professional to make judgment for existing systems. We have provide options in stead of a one size fits all mentality, which is know to have issues; as evidenced by the large number of proposals surrounding this issue. The real concern is with the existing NEC text. It puts the engineer in a position that is contrary to other equally important recommended practices, of which we are also held accountable. The professional engineer does want to follow and is concerned with compliance with all applicable codes. In Arizona, as with other states, Rules of Professional Conduct have been established for the professional registrant. He/she is charged with protecting the public safety, much like the inspections departments are. By the nature of granting a license to practice engineering, the grantor (State) is agreeing that the professional registrant is competent to make such decisions.
In the proposed change, the issue of existing conditions and implementation has been addressed.
The design professional is responsible to assess the needs of the client and make a professional judgment as to the type of system best suited for the application, including system coordination. Professional Registration process has been set up by States, recognized by the Federal Government, to establish the minimum standards for persons competent to engage in the practice of protecting the public from engineering hazards. The professional engineer has been deemed competent to make these type judgments. This has long been the role of the design professional. The following is a list of concerns, quotes, and comments from multiple recognized standards, NFPA, ANSI/IEEE, etc.

1. The NEC definition of selective "coordination is defined in Article 100, as the localization of an overcurrent condition to restrict outages to the circuit or equipment affected, accomplished by the choice of overcurrent protective devices and their ratings or settings." Article 700.27 (701.18 similar) interjects emphasis on any question of how far the design engineer is to carry the out rule, stating "… with all supply side overcurrent protective devices".

   Based on a strict interpretation of this definition, the only overcurrent protection device allowed to operate is the ***one immediately upstream from the fault or overcurrent.*** Depending on the fault level, L-L, L-G, 3Ø bolted fault, this requirement is very difficult to meet using circuit breakers and is possible using fuses. Generally, for overcurrent conditions circuit breakers or fuses can be selected to coordinate. The use of a totally fused distribution system is not recommended, especially at the branch circuit level. Only recently have fused branch circuit panelboards returned to the market. Although this equipment is a current design, there are numerous disadvantages to using fuses in lieu of circuit breakers, listed below:

   a. Replacement fuses are not always readily available of the same class and rating of the blown fuse.

   b. There is a tendency to replace a blown fuse with a fuse of a different class and/or rating in order to restore power immediately, which would have serious consequences in providing future protection. In order to maintain selective coordination, the exact replacement fuse must be used.

   c. Even with available fuses, the amount of time to restore power would be longer.

   d. The replacement of the fuse(s) would require PPE where the supply side was not de-energized.

   e. When only one fuse blows in a three phase circuit, the resultant downstream panels would experience single phasing which would be detrimental to certain three phase loads.

   f. Fuse replacement normally requires disconnecting the power to the affected panel as a safety precaution and therefore counteracting the benefits of selective coordination.

   g. The majority of emergency, standby, and essential systems currently do not employ solely fuse overcurrent devices. Modifications of an existing facility to provide compliance to these NEC articles will most certainly result in existing distribution system equipment and downstream panel replacement. The replacement equipment in most cases will require more physical space. The result will be architectural remodeling to accommodate the larger equipment. These modifications will result in significant added construction costs and disruption of owner operations.

2. Arguments during the previous code cycle have thrown out any consideration of initial cost for the systems necessary to comply with the present NEC articles. The following quotes highlight statements within the recognized standards which have always considered system initial cost as a factor of design consideration. The use of circuit breakers on emergency, legally required standby, and critical operation power systems are preferred. However, compliance with the present NEC requirements using circuit breakers is very costly. A typical molded case circuit breaker can only be used at the branch circuit level. Upstream devised at the distribution level, in most cases must be capable of defeating the instantaneous setting. This feature is presently available on insulated case circuit breakers and occasionally on electronic trip molded case circuit breakers. The cost for this type of equipment is 2-3x the cost of a similar electronic trip molded case unit. Additionally, enclosure to house these breaker types will go up in class, panelboard to switchboard, switchboard to compartmentalized switchboard, etc. The larger class equipment footprint is most often double the depth, subsequently creating other issues for the architectural designer.

   a. "It is important that the various overcurrent devices be coordinated***, as far as practicable***, to isolate faulted circuits and to protect against cascading operation on short circuit faults***. In many systems, however, full coordination is not practicable without using equipment that could be prohibitively costly or undesirable for other reasons.***"

[12]. This NFPA article recognizes there is a balance between cost and protection. For reference, Webster defines "practicable" as: 1) possible to practice or perform: feasible. 2) capable of being used: usable.

b. "Safety. Safety of Life and preservation of property are two of the most important"[13] things required of system coordination. ANSI/IEEE goes on to say of reliability (continuity of service) …the system should be designed to isolate faults ***with minimum disturbance to the system*** and should have features to give the maximum dependability consistent with the plant requirements ***and justifiable cost***." This ANSI/IEEE std recognizes the balance between cost and protection.

c. "***Safety has priority*** over service continuity, equipment damage, or economics."[14] The term "safety" here is relating to the prevention of human injury from the electrical system. This includes the persons, maintenance staff or otherwise, that will be resetting the breakers and/or replacing the fuses. This should not be interchanged with "service continuity", which is a separate concern. There has been a scare tactic employed by some to associate "Life Safety" with the term "safety". In an electrical system as discussed in the ANSI/IEEE standards, the safety they are concerned with is 1) electricians or other trained operating personnel, and 2) protecting the public from inadvertent contact with electrical system components. The term "Life Safety" systems is used in the building codes relative to protecting those within the building from smoke or fire to allow safe egress during an event and only occurs in NEC 517.32 to describe a branch of the essential electrical system, similar to that of NEC Article 700. When reviewing the function of the Article 700 system, we see there are several methods of compliance, unit equipment, generator, and other reliable source. The reader must assume that unit equipment can provide the same reliability as the generation system, otherwise it could not be considered for this application. How often have we seen emergency lights out of service? Often. These units require regular testing and eventually maintenance. The batteries tend to fail prematurely in our climate, 3-5 years. These small point-of-use emergency sources do not appear to be nearly as reliable as generator systems, yet they are considered equivalent.

a. "Economic Considerations***. The cost of system protection can never be ignored***, and will determine the degree of system protection that can be feasibly designed into a system. ***Many features can be added*** that will improve performance, reliability, and flexibility***, but will increase initial cost***."[15] This ANSI/IEEE std recognizes that cost is a consideration in the selection of a protection system.

b. "First Cost. ***While first costs are important***, safety, reliability, voltage regulation, maintenance, and the potential for expansion must be considered in selecting the best [overcurrent system] from alternate plans."[16] This ANSI/IEEE std recognizes that cost is a consideration in the selection of a protection system.

3. Interpretation of the Time Current Curves. The industry standard published time current curves (TCC) start the time element at 0.01 seconds. The peak current in a faulted electrical system occurs in the first ½ cycle, or 0.0083 seconds. Therefore the engineer can not design with the traditional tools (TCC) used to coordinate the protective devices within this critical range, below 0.01 seconds. These traditional TTC's are tools which enabled the selection and specification of devices with confidence multiple manufacturers can provide similar units. Comparison between the coordination curves was direct and reliable. To assist with the 2005 selective coordination rules, many of the manufacturers have created tables which list breaker types and classes which selectively coordinate. Each set of tables is unique to each manufacturer. In table form. Because the tables contain only lists of product models, the design engineer is now forced to select a single manufactures equipment to design around. Without the data in the critical region of the TCC, less than 0.01 seconds, design engineers can not evaluate the cross over between manufacturer products. Therefore, the design engineer has no choice but to require a selective coordination study be submitted by the successful bidding manufacturer to confirm their equipment will selectively coordinate. The result of this study, if not of the same manufacture as the basis of design, will require system changes; dimensional modifications, devices frame size and overcurrent device trip changes, related feeder size changes, transformer upsizing, and similar. At the time of bid, these conditions will create a problem. Fair and equitable bidding will be severely hampered. Not to mention legal issues with proprietary specifications for governmental projects. How will the permitting agencies handle these type of changes after there is a permit issued? Certainly a follow-up review will be necessary.

Nationally, there are many jurisdictions wrestling with the level of enforcing they can handle for this issue. The following States have implemented changes to the text of Articles 700.27, 701.18, and/or 708.54 to give working parameters for these code articles.

a. Tucson, Arizona, deleted the article.

b. California Office Of Statewide Health Planning And Development (OSHPD), deleted the article for hospital occupancies.

c. State of Florida Agency for Health Care Administration (AHCA), amended to 0.1 second and above for coordination.

d. State of Massachusetts, 527 CMR 12 Massachusetts Electrical Code, amended to 0.1 second and above for coordination.

e. City of New York, Interpretation only considers overload selectivity.

f. State of Wisconsin (recent vote, outcome unknown), amended to 0.1 second and above for coordination.

g. NFPA 99 Proposal 99-73 Log #CP308 HEA-ELS, amending the extent of selective coordination in part to "…selectively coordinated down to 0.1 seconds." Final Action: Accept.

4. Arguments from an equipment manufacturer (fuse) allege the mere fact that something could happen warrants a solution, ie; since a bolted fault can occur, the protection system must be able to isolate such an occurrence without affecting any other systems components. ANSI/IEEE makes the following statements regarding this issue in their discussions of coordination:

a. "Practical Limits of Protection…However, ***some fault possibilities may be legitimately considered as too improbable to justify the cost of specific protection.*** Before accepting the risk in this basis alone, the magnitude of the probable damage should also be seriously considered."[17] Here the ANSI/IEEE recognizes there are some cases where the improbability of an occurrence negates the need for elimination, rather, an evaluation and recognition of the risks is prudent action.

b. "Nature of the Problem…Operating records show ***that the majority of electric circuit faults originate as a line-to-ground failure***."[18] Here the ANSI/IEEE states the most common faults are not bolted 3-phase (the most difficult to coordinate). If this is true, why does the NEC only require Ground Fault Protection on systems operating at 277V to ground greater than 1200 amps? It seems it would be more prudent to prescriptively require GFP at lower voltages.

c. "A choice of the most suitable current and time settings is made for the device to provide the best possible protection and safety to personnel and electrical equipment and also to function selectively with other protective devices to disconnect the faulted equipment ***with as little disturbance as possible to the rest of the system.***"[19] Here the ANSI/IEEE recognizes there can be disturbance in other portions of the system and advises that the design engineer work to minimize it.

d. "The bolted fault value of short-circuit current results when the fault offers no impedance to the flow of the short-circuit current and the magnitude of current is limited only by the impedance of the circuit elements. This condition results on the maximum short-circuit current. ***Bolted short-circuits are very rare***, however, and the fault usually involves arcing and burning. Under these conditions ***fault currents may be very much lower than bolted-fault values*** and may ***present special problems of detection and isolation***"[20]

e. "The major objectives of the electrical power system designer is to design a system such that faults will be removed in the shortest period of time possible, while maintaining a high degree of service continuity. ***The area of the outage should be restricted as far as practical.*** The goals of maximum protection and maximum service continuity can most nearly be realized by proper selection and adjustment of high-speed protective devices."[21]

12 NFPA 110 Annex A, 2005 edition, A.6.5.1.
13 ANSI/IEEE Std 141-1976 Recommended Practice for Electric Power Distribution in Industrial Plants, 2.2.
14 ANSI/IEEE Std 242-1986 Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems, 1.1.1.
15 ANSI/IEEE Std 242-1986 Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems, 1.1.3.
16 ANSI/IEEE Std 141-1976 Recommended Practice for Electric Power Distribution in Industrial Plants, 2.2.7.
17 ANSI/IEEE Std 242-1986 Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems, 4.2.5.
18 ANSI/IEEE Std 141-1976 Recommended Practice for Electric Power Distribution in Industrial Plants, 4.2.1.
19 ANSI/IEEE Std 141-1976 Recommended Practice for Electric Power Distribution in Industrial Plants, 4.7.1.
20 ANSI/IEEE Std 241-1983 Recommended Practice for Electric Power Systems in Commercial Buildings, 9.1.
21 ANSI/IEEE Std 241-1983 Recommended Practice for Electric Power Systems in Commercial Buildings, 9.7.

The proposed changes will provide a condition no worse than the existing historical situations while setting a standard for going forward in a way that can be readily achieved.

5. Existing Conditions. The NEC has not provided any suggestions as to implementation of these sections within existing system proposed to be modified, whether through remodel of additions. It is not assumed these circumstances would precipitate total replacement of existing equipment. Is there a time period that should be considered for implementation? Is there a point at which the existing system must be replaced? Washington State has implemented regulations that address this issue in emergency and similarly in legally required standby systems. I extend these changes as applicable to Critical Operations Power System(s) as well.

a. "The requirements for selective coordination described in NEC 700.27 are not required where the emergency system was ***installed prior to June 1, 2006***. For ***new emergency systems that are supplied from an existing emergency system installed prior to June 1, 2006***, ***the new portion of the emergency system must comply*** with NEC 700.27."[22] Here the state has resolved the conflict with new and existing systems.

The proposed change would resolve the above issues.

6. Mixing Overcurrent Protective Devices (OCPD's) from different manufacturers or mixing fuses and circuit breakers requires using time current curves (TCC) only. As previously mentioned the TCC curves do not address the region between 0 & 0.01 seconds. As a result, the system will need to be all circuit breakers or all fuses made by the same manufacturer, **for the life of the system**. Also, Fuse ratio or circuit breaker tables cannot be used. Short circuit selective coordination cannot be assured.

The proposed change would resolve the above issue.

7. Bid and Design Complications. Traditionally, the equipment manufacturer would not be selected until the bid is awarded. At this point in the design, construction documents would be completed and signed for permit submission. However, with the new requirements, before a project can go to bid, at least a preliminary selective coordination study must be conducted as it may affect the system design. This sounds simple, but the fact is that the industry conducts business does not accommodate these new requirements**. Somehow the manufacturer of the electrical equipment must be known prior to the completion of Design Development drawings.** It would appear that an Owner would have to engage a manufacturer so they could evaluate the proposed systems selectivity, based solely on their product. This must occur at the Design Development stage because at it's completion the overall building design is set, including the electrical room sizes and placement. Change after this point, other than minor coordination adjustments would be out of sequence work (as defined by the AIA) and contractually chargeable by the design team.

The suggestion has been made that electrical equipment manufacturers could be required to provide the coordination study needed as part of the bid. Also suggested has been specification language such as "vendor shall provide fully selective equipment" has been offered. The problem with this is, in order to bid the project each prospective equipment vendor (and there are at least four major ones), would have to perform a selective coordination study in order to bid. This does not take into account the real possibility of changes to the building to accommodate larger equipment at minimum. The cost of bidding just went up substantially. **Delegation of the coordination elements of design to the vendor via specification language is not practical or effective.**

Potential design changes consist of:

a. Upstream circuit breakers and fuses will need to increase in size, hence equipment sizes and costs may increase.

b. This may necessitate increasing the size of panelboards and feeder conductors.

c. Very high levels of short circuit selective coordination may be achieved by using high amp frame electronic trip circuit breakers with low amp sensors and/or lower ampere rating adjustments (but equipment may need to be larger).

d. Voltages may need to be reduced. If the desired level of selective coordination cannot be achieved using a 480Y/277Vac panelboard, feeding a 208Y/120Vac panelboard through a transformer may need to be considered.

e. Loads may need to be split up (multiple smaller transformers).

f. Impedance may need to be inserted – longer run of wire, 1:1 or higher impedance transformer or reactors.

The proposed change would resolve the above issues.

8. Arc Flash Concerns. Selective coordination impact on arc flash PPE levels should be considered. Typically, for the lowest PPE level, the smallest and fastest possible OCPDs will be needed upstream. But for the best levels of selective coordination, upstream devices will typically need to be larger and slower reacting. These are in opposition to each other. Arguments from an equipment manufacturer (fuse) allege these are separate issues. However, from an engineering perspective, Arch Flash is a competing directly against Selective Coordination. See discussion in 2nd and 3rd paragraphs at the beginning of this Substantiation.

Panel Meeting Action: Reject

Panel Statement: Proposed (B) contains unenforceable language, such as "rigidly adhered to" and "selectively shall be established." The text in (C) is outside the normal application of the NEC since the authority having jurisdiction, the municipality, and the licensing board for engineers have control over the issues covered within this proposed text, such as what is necessary to be done before the start of construction. The designer, engineer, AHJ, electrical contractor, and owner may often be involved in the decisions related to selective coordination. The submitter states in his substantiation that the professional engineer has the mandate to select the appropriate overcurrent device and thus would be the sole decision-maker on the selective coordination. Again, this procedure is under the jurisdiction of the AHJ, the municipality, and the licensing board. The recommended FPN does not provide any additional information and is unnecessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

CARON, D.: See my comments to Proposal 13-195.

DEGNAN, J.: See My Explanation of Negative on 13-200.

13-300 Log #3720 NEC-P13 **Final Action: Reject**
(708.54, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add a fine print note to read as follows:

<u>FPN: Selective coordination includes coordination between standard overcurrent devices and ground fault devices.</u>

Substantiation: Fault and over current conditions may result from a variety of conditions that range from the rare and difficult to achieve bolted three phase fault to the more probable arcing single phase ground fault. Nevertheless it is a common oversight to consider phase protection selectivity and ground fault protection selectivity separately. A phase protective device considers all current over threshold to be an overload whereas ground fault devices are able to separate a ground current from other current.. Because of this, in the case of the more probable ground faults, both devices may operate simultaneously or with either device ahead of the other if ground fault selectivity between the two devices is not planned. Hence, a well-coordinated system must consider ground fault protection and standard phase overcurrent protection simultaneously.

Panel Meeting Action: Reject

Panel Statement: Automatic opening of overcurrent protective devices under a ground-fault condition is not required by Article 708.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

CZARNECKI, N.: The proposal should be accepted. The panel action and statement does not address the concerns expressed in this proposal. The requirements in 708.54 do not prohibit the installation of ground fault protection of equipment for emergency systems. Selective coordination for phase to ground, phase to phase, and three phase short circuits is insufficient where ground fault protection of equipment is installed. The ground fault protective device used for equipment protection must be included for a selectively coordinated system.

13-301 Log #1165 NEC-P13 **Final Action: Reject**
(708.54 Exception)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add a new exception as shown.

708.54 Coordination.

Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

<u>Exception: Unless specifically required elsewhere in the Code, selective coordination shall not be required in between the overcurrent protective devices in the critical operations power system circuit(s) and the overcurrent protective devices in the normal supply on the supply side of the automatic transfer switch.</u>

22 WAC 296-46B-700 Emergency systems. WAC 296-46B-701 Legally required standby systems..

Substantiation: In the CMP-20 Panel Statement to Comment 20-13 in the 2008 ROC the CMP stated: "The overriding theme of Article 585 is to keep the power on for vital loads. Selective coordination is obviously essential for the continuity of service required in critical operations power systems. Selective coordination increases the reliability of the COPS system."

This panel statement supports the Scope of Article 708 which reads: "The provisions of this article apply to the installation, operation, monitoring, control, and maintenance of the portions of the premises wiring system intended to supply, distribute, and control electricity to designated critical operations areas (DCOA) in the event of disruption to elements of the normal system."

The Scope and the panel statement clearly state that the intent of this Article is to ensure continuity of service for those circuits required for critical circuits. The purpose of requiring selective coordination is to ensure that these critical circuits operate if the normal supply is disrupted. Selective coordination up to the alternate source of supply ensures that there is no service disruption to these critical circuits regardless of what happens to the normal supply. Requiring selective coordination of the critical circuits back through the normal source is of little value in this regard and adds nothing to the level of reliability which is only ensured through the alternate supply.

It should also be noted that incorrect interpretations which extend the application of this requirements to non-critical circuits in the normal supply are beyond the Scope of Article 708.

Panel Meeting Action: Reject

Panel Statement: Reliable operation of the critical operations circuits is necessary regardless of the source of power for the circuits. The panel is not aware of other requirements in the NEC that would be subject to the recommended exception.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-302 Log #4687 NEC-P13 **Final Action: Reject**
(708.54 Exception and FPN (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee

Recommendation: Add the following exception and fine print note:

Exception: Where the critical operations power system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the extent practicable. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction.

FPN: Overcurrent protective devices used for critical operations power systems, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system.

Substantiation: The current NEC rule is being improperly used to drive the market share of a particular species of overcurrent protective device, often frustrating legitimate design objectives of the engineering community, and without any documented loss experience to justify such a consequence. We have received compelling testimony from engineers that have been subjected to extraordinary hardship resulting from the lack of flexibility in the current NEC provisions. This proposal is consistent with NFPA 110 (which language underlies the fine print note) and provides the necessary flexibility to allow competent engineering work that maintains selective coordination as an important element in the electrical design process, but not to the exclusion of all other issues.

Panel Meeting Action: Accept in Principle in Part

Revise Section 708.54 to read:

708.54 Coordination. Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. The selectively coordinated devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system.

Panel Statement: The panel action rejects the wording "where practicable," as this is not defined and subjective. The recommendation on the qualifications for those who design the system has been revised to use the text from 240.86, as this provides a more definitive description of those who can design these systems.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 9 Negative: 5

Explanation of Negative:

CZARNECKI, N.: See NEMA statement for Proposal 13-203.

DEGNAN, J.: See My Explanation of Negative on 13-203.

LITTLE, L.: We agree with the negative comment as written by Mr. Ode.

MOUTON, C.: I'm voting against the panel action. The panel action should have been to reject the proposal, even though it does have some merit, and the submitter properly characterizes the current environment in the industry resulting from the current selective device coordination language in Articles 700.27, 701.18, and 708.54. The proposal should have been rejected in preference of Proposal 13-194, which should have been accepted in principle in part (see my comments to Proposal 13-194). See my additional comments for Proposal 13-203 that relate to this proposal also.

ODE, M.: The substantiation in the proposal and the panel statement for the Panel Action provided absolutely no technical substantiation to require selectively coordinated device installation design in an emergency, a legally required standby system, or a critical operations power system to be selected, documented, and stamped by a licensed professional engineer. The requirement for a licensed professional engineer to design and stamp drawings for these systems is overly restrictive, adds unnecessary cost to the installation, and negates a very viable resource in the use of manufacturers who provide this service on a regular basis. The owner, the electrical equipment manufacturer, the plant engineer, the electrical contractor, the AHJ, the utility company, as well as the design engineer are often involved in determining the requirements for initial design of new systems and to the extent that older systems must comply with selective coordination. In addition, 90.1(C) of the National Electrical Code states that the NEC is not intended as a design specification and, yet, the proposed text requiring a licensed professional engineer adds design requirements into the selective coordination process.

Comment on Affirmative:

CARON, D.: See my comments to Proposal 13-203.

13-303 Log #3744 NEC-P13 **Final Action: Reject**
(708.65 (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. Assn. of Education Facility Executives - APPA.ORG

Recommendation: Add text to read as follows:

V. System Performance and Analysis

708.64 Emergency Operations Plan.

A facility with a COPS shall have documented an emergency operations plan. The plan shall consider emergency operations and response, recovery, and continuity of operations.

FPN: NFPA 1600-2007, *Standard on Disaster/Emergency Management and Business Continuity Programs*, Section 5.7, provides guidance for the development and implementation of emergency plans.

708.65 Security Considerations (NEW)

Buildings, or sections of buildings, containing elements of critical operations power systems that, in the opinion of the authority having jurisdiction, may be vulnerable to human-made damages if the technical characteristics were known to the general public, shall be permitted to restrict access to information regarding such characteristics of the critical operations power system.

Substantiation: A great deal of homeland security and local emergency management information is available to the general public that may compromise the security of DCOA's. Adoption of this proposal will permit the AHJ to make a determination how much information should be available.

A recent change to 230.205 regarding circumspect placement of disconnecting means on private property is a move in the right direction as far as power source security is concerned. Information about the specifics of prime mover fuel supply, for example, should also be managed carefully.

Panel Meeting Action: Reject

Panel Statement: The recommended text is addressed by the general risk assessment provisions in Section 708.5. It is not necessary to enumerate all of the different risk exposures that may threaten a facility.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

ARTICLE 720 — CIRCUITS AND EQUIPMENT OPERATING AT LESS THAN 50 VOLTS

3-144 Log #2971 NEC-P03 **Final Action: Reject**
(720)

Submitter: Sean Browne, Armstrong World Industries, Inc.

Recommendation: Add the following new text:

Part I. General.

720.1 Scope.

This article covers installations involving wiring for circuits and equipment operating at less than 50 volts, direct current or alternating current.

720.3 Other Articles.

Direct-current or alternating-current installations operating at less than 50 volts, as covered in 411.1 through 411.7; Part VI of Article 517; Part II of Article 551; Parts II and III and 552.60(B) of Article 552; 650.1 through 650.8; 669.1 through 669.9; Parts I and VIII of Article 690; Parts I and III of Article 725; or Parts I and III of Article 760 shall be permitted but not required to comply with this article.

Part II. Installation of Low Voltage Systems For Dwelling Unit Wiring

720.6 Conductors.

Conductors shall not be smaller than 12 AWG copper or equivalent. Conductors for appliance branch circuits supplying more than one appliance or appliance receptacle shall not be smaller than 10 AWG copper or equivalent.

Exception: Class 2 circuit conductors of sizes 18 AWG and 16 AWG or larger shall be permitted to be used, provided the conductors supply loads that do not exceed the ampacities given in 402.5 and are supplied by a listed wiring method.

720.5 Lampholders and Luminaires.
Standard lampholders and luminaires that have a rating of not less than 660 watts shall be used.

720.6 Receptacle Rating.
Receptacles shall have a rating of not less than 15 amperes.

720.7 Receptacles Required.
Receptacles of not less than 20-ampere rating shall be provided in kitchens, laundries, and other locations where portable appliances are likely to be used.

720.8 Batteries.
Installations of storage batteries shall comply with 480.1 through 480.4 and 480.8 through 480.10.

720.9 Mechanical Execution of Work.
Circuits operating at less than 50 volts shall be installed in a neat and workmanlike manner. Cables shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use.

Part III. Installation Requirements for Suspended Ceiling Power Distribution Systems.

720.41 Scope. Suspended ceiling power distribution systems shall be permanently connected in an indoor, dry location in a commercial installation. The maximum output voltage shall not exceed 30 volts ac (42.4 volts peak) supplied by a listed Class 2 power supply.

720.42(A) Uses Permitted. Suspended ceiling power distribution systems shall provide power to low voltage, electrically
operated utilization equipment, such as luminaires.

(B) Uses Not Permitted. Suspended ceiling power distribution systems shall not cover low voltage lighting systems intended for use in hazardous (classified) locations, low voltage lighting systems for use in general or critical patient care areas, or low voltage lighting systems for emergency systems.

Suspended ceiling power distribution systems shall not be permitted in other spaces used for environmental air in accordance with 300.22(C), unless listed for use in an air handling space, having adequate fire-resistant, low-smoke-producing characteristics, and is suitable for the ambient temperature.

720.43. Definitions

Bus Bar - A non insulated conductor electrically connected to the source of supply and physically supported on an insulator. The bus bar provides a power rail for connection for utilization equipment, such as a luminaire assembly.

Bus Bar Support – An insulator that runs the length of a section of suspended ceiling bus rail and serves to support the bus bars and to isolate them from the suspended grid rail.

Grid Bus Rail – A combination of the bus bar, bus bar support and the structural suspended ceiling grid system.

Connector – A term used to refer to an electro-mechanical fitting:

Connector, Load - An electro-mechanical connector used for power from the bus bar to the utilization equipment.

Connector, Pendant - An electro-mechanical or mechanical connector used to suspend a luminaire or utilization equipment below the grid rail and for power from the bus bar to the utilization equipment.

Connector, Power Feed- An electro-mechanical connector used to connect either the power supply to a power distribution cable, or directly to the bus bar, or from the power distribution cable to the bus bar.

Connector, Rail to Rail – An electro-mechanical connector used to interconnect bus bars from one ceiling grid rail to another.

Power Supply - a separate unit connected between the branch circuit power distribution system and the bus bar low voltage suspended ceiling power distribution system and is typically one of the following: a switching power supply, linear power supply, or isolating transformer.

Protection, Inverse Polarity (Backfeed Protection) - a system that prevents two interconnected power supplies connected positive to negative from passing current from one power source into a second power source.

Rail – The structural support for the suspended ceiling system typically forming the ceiling grid supporting the ceiling tile and luminaires.

Suspended Ceiling Power Distribution System – A system which serves as a support for a finished ceiling surface. It also includes a bus bar and bus bar support system to distribute power to utilization equipment, such as luminaires.

Suspended Ceiling Grid – A system which serves as a support for a finished ceiling surface. It may also support other utilization equipment such as cables, luminaires, speakers, and similar equipment.

720.45 Overcurrent and Inverse Polarity (Back Feed) Protection.

(A) Overcurrent Protection. The Class 2 power supply shall be protected at not greater than 20 amperes.

(B) Inverse Polarity (Back Feed) Protection. Class 2 or Class 3 power sources shall not have the output connections paralleled or otherwise interconnected, unless listed for such interconnection. A suspended ceiling low voltage lighting system shall be provided with inverse polarity (back feed) protection as one of the following:

(1) If the power supply is provided as part of the system, the power supply shall be provided with inverse polarity (back feed) protection; or

(2) If the power supply is not provided as part of the system, inverse polarity or back feed protection shall be provided as part of the grid rail bus bar or as a part of the power feed connector.

720.49. Sizes and Types of Conductors.

(A) Load-Side Utilization Conductor Size. Current-carrying conductors for load-side utilization equipment shall be copper, a copper alloy, or aluminum and shall be 18 AWG (0.82 mm2) minimum.

Exception – Conductors of a size smaller than 18 AWG (0.82 mm2) but not smaller than 24 AWG, shall be permitted to be used for Class 2 circuits where these conductors are completely enclosed and not subject to movement or strain.

(B) Power Feed Bus Rail Conductor Size. The power feed bus rail shall be 16 AWG (1.3 mm2) minimum or equivalent. For a bus bar with a circular cross section the diameter shall be 0.051 in. (1.29 mm) minimum, and, for other than circular bus bars, the area shall be 0.002 in2 (1.32 mm2) minimum.

720.51 Securing and Supporting.

(A) Attached to Building Structure. A suspended ceiling low voltage lighting system shall be secured to the mounting surface of the building structure by hanging wires, screws, or bolts in accordance with the installation and operation instructions. Mounting hardware, such as screws or bolts, shall either be packaged with the suspended ceiling low voltage lighting system or the installation instructions shall specify the types of mounting fasteners to be used.

(B) Attachment of Power Grid Rails. The individual power grid rails shall be mechanically secured to each other for interconnection to distribute power.

720.55 Connection Devices. A soldered connection shall be made mechanically secure before being soldered. Other means of securing leads, such as push-on terminals and spade-type connectors, shall provide a secure mechanical connection.

FPN: For quick-connect terminals, see UL 310, Standard for Electrical Quick-Connect and for mechanical splicing devices, see UL 486A and 486B, Standard for Wire Connectors.

720.57. Splices. A splice shall be provided with insulation and mechanical protection equivalent to that of the conductors involved.

720.61 Grounding and Bonding. The Class 2 low voltage supply circuit shall not be grounded.

Substantiation: Article 720, covering circuits and electrical equipment operating at less than 50 volts, was introduced into the NEC to deal with wiring for rural farms, remote location buildings, and sites not served by a utility company. Until the advent of the REA (the Rural Electrification Association) wind, water-driven, gasoline, or diesel generators were the only available power sources for these remote locations. Batteries were charged using these generators then wired to farm buildings and electrical equipment in accordance with the requirements found within the *National Electrical Code*. As rural areas and farms progressively gained access to higher voltages and more reliable power, the relevance of Article 720 began to decline.

With the current interest in alternative energy sources (e.g. photovoltaics, wind turbines, batteries, fuel cells, etc.) and the proliferation of low voltage devices (sensors, LV lighting, IT equipment, AV equipment, etc.), there is a significant need for adequate language supporting the practical safeguarding of circuits and electrical equipment operating at less than 50 volts. Therefore, the optimization of Article 720 needs to occur in order to satisfy the industry safety requirements and ensure the article's functional safety mission.

Panel Meeting Action: Reject

Panel Statement: This proposal needs technical substantiation for the panel to accept the concept of suspended ceiling power distribution systems, the primary purpose of which seems to supply low voltage lighting systems from a power grid system.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

KAHN, S.: The panel action and statement are correct and substantial additional information is required. Any further proposed revisions, however, should be such that the Article is rewritten in conformity with the Style Manual with respect to the sequence of sections.

ARTICLE 725 — CLASS 1, CLASS 2, AND CLASS 3 REMOTE-CONTROL, SIGNALING, AND POWER-LIMITED CIRCUITS

3-145 Log #2194 NEC-P03 **Final Action: Accept**
(725.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise text as follows:

725.1 Scope.

This article covers remote-control, signaling, and power-limited circuits that are not an integral part of a device or appliance.

FPN: The circuits described herein are characterized by usage and electrical power limitations that differentiate them from electric light and power circuits; therefore, alternative requirements to those of Chapters 1 through 4 are given with regard to minimum wire sizes, ampacity adjustment and correction ~~derating~~ factors, overcurrent protection, insulation requirements, and wiring methods and materials.

Substantiation: The terms "ampacity adjustment factors" and "correction" are the terms used in 310.15(B)(2)(a) and 310.16.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-146 Log #3034 NEC-P03 **Final Action: Accept**
(725.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
725.1 Scope.
This article covers remote-control, signaling, and power-limited circuits that are not an integral part of a device or appliance.
FPN: The circuits described herein are characterized by usage and electrical power limitations that differentiate them from electric light and power circuits; therefore, alternative requirements to those of Chapters 1 through 4 are given with regard to minimum wire sizes, ampacity adjustment and correction ~~derating~~ factors, overcurrent protection, insulation requirements, and wiring methods and materials.
Substantiation: The terms "adjustment factor" and "correction" are the terms used in 310.15(B)(2)(a) and 310.16.

3-147 Log #743 NEC-P03 **Final Action: Reject**
(725.2.Abandoned Class 2, Class 3, and PLTC Cable)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Delete text to read as follows:
725.2 Definitions.
~~**Abandoned Class 2, Class 3, and PLTC Cable.** Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.~~
[remainder of 725.2 unchanged by this Proposal]
Substantiation: Companion proposals have been made to add a single generalized definition in Article 100 and to delete the corresponding definitions for the various abandoned cables, supply circuits, etc., in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2.
NEC® Manual of Style 2.2.2.1. Consolidation into a new, single generalized definition in Article 100 of nearly identical definitions appear in multiple Articles, specifically in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2. Although these individual definitions served a valid transitional purpose to support the independent additions of individual requirements in 640.6(C), 645.5(F), 645.5(G), 725.25, 800.25, 820.25, and 830.25, these discreet definitions can be broadly consolidated into a single definition in Article 100.
The specific method by which identification for future use is achieved ("… with a tag") was conveyed in the definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 violates *NEC® Manual of Style* 2.2.2 ("Definitions shall not contain requirements …") and is omitted in the generalized definition for "Abandoned" being added in Article 100. This identification-with-a-tag requirement in these definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 is redundant to the actual requirement statements in 640.6(C), 645.5(G), 725.25, 800.25, 820.25, and 830.25, respectively. Also, words regarding the possibility of ceasing connection to an electric supply have been added in the generalized definition for "Abandoned" to correlate to 90.2(A)(3), since abandonment entails disconnection from either the terminating equipment or the electric supply (or both).
Panel Meeting Action: Reject
Panel Statement: To allow one single definition for "abandoned cable" would not be appropriate.
Each article has different requirements for what constitutes an abandoned cable. Some applications require that a connector be installed along with an identification tag on the cable, whereas others, such as the one for Article 725 require only that the cable not be terminated at equipment and an identification tag be installed for it to not be considered to be abandoned.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-148 Log #811 NEC-P03 **Final Action: Reject**
(725.2.Abandoned Class 2, Class 3, and PLTC Cable)

Submitter: J. L. Richardson, Engineering Services Group, Inc.
Recommendation: Delete the following text:
~~Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment other than a connector and not identified for future use with a tag.~~
Substantiation: To be replaced by general definition Article 100, Definitions.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-147.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-149 Log #3948 NEC-P03 **Final Action: Accept**
(725.2.Class 1 Circuit)

Submitter: James Kelley, Sargent & Lundy
Recommendation: Revise text to read as follows:
Class 1 Circuit. The portion of the wiring system between the load side of the overcurrent device or power-limited supply and the connected equipment.
FPN: See ~~725.21~~ 725.41 for voltage and power limitations of Class 1 circuits.
Substantiation: Editorial correction of the reference to "725.21" instead to be "725.41".
The comment is based on the printed version that has the word "725.21" though the electronic version available to subscribers of the NFPA Codes has the word "725.41 ".
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-150 Log #203 NEC-P03 **Final Action: Reject**
(725.2.Concealed Space)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]
Nonconcealed space. That portion of a building that is not a concealed space.
Substantiation: Section 725.154(E)(3) has application requirements for class 2 and class 2 cables in nonconcealed spaces. A definition of a concealed space is needed in order to define and understand what a nonconcealed space is. I have also submitted a proposal to clarify that the definition of "concealed" in Article 100 applies only to wiring methods.
Panel Meeting Action: Reject
Panel Statement: The panel contends that the proposed definitions are not appropriate in the NEC as the use of the terms "concealed space" and "nonconcealed space" in the NEC have a significantly different meaning than the preferred NFPA definition.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
EGESDAL, S.: The NEC definition of "concealed" refers to wiring. A "concealed space" may or may not contain wiring. Wiring installed in a "concealed space" may or may not be "concealed", by the NEC definition.
If the NEC is going to use the term "concealed space" or nonconcealed space", descriptive definitions should be in the NEC.
KAHN, S.: There is merit in the proposer's substantiation. I believe the NEC definition of "concealed" refers to wiring only. There should be consistency in the definition of terms used in various NFPA documents.
SEPULVEDA, M.: The NEC definition of "concealed" refers to wiring. A "concealed space" may or may not contain wiring. Wiring installed in a "concealed space" may or may not be "concealed", by the NEC definition.
If the NEC is going to use the term "concealed space" or nonconcealed space", descriptive definitions should be in the NEC.
Comment on Affirmative:
STENE, S.: The submitter has not provided any technical substantiation to link a cooking ventilation standard and its definitions to the requirements in Article 725 for remote control, power limited and signaling circuits. The submitter also points out that "non-concealed space" is used in 725.154(E)(3), however, the phrase is used to describe installations of CL2X cable as an exposed wiring method, rather than the concealed wiring method as defined in Article 100. Adding an additional definition for "concealed" would be confusing for the user of the NEC since there are many other places in the NEC, such as in 250.52(A)(1), Exception where the term "exposed" permits the grounding electrode conductor to be installed in a suspended ceiling with removable ceiling tiles. Based on the proposed definition, this grounding electrode conductor would be a violation since above a suspended ceiling would be considered to be a concealed space.

3-151 Log #3593 NEC-P03 **Final Action: Reject**
(725.2.Optical Fiber/Communications Cable Routing Assembly)

Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Add new text to read as follows:
Optical fiber /communications cable routing assembly. A flame retardant, nonmetallic assembly of pliable lengths, rigid straight sections, elbows, bends and fittings such as expansion joints, female and male adapters, and couplings used to support and protect optical fiber, communications and data cables in applications with a high density of cabling such a information technology (computer) rooms, broadcast stations and telecommunications offices. Parts of the assembly may have hinged or removable covers. The assembly is designed for cables be laid or set in place after the enclosures have been installed as a complete system.
Substantiation: Article 770 currently covers optical fiber raceways and provides applications and listing requirements for these raceways. UL lists these raceways to UL 2024, Optical Fiber and Communication Cable Raceway. UL lists optical fiber /communications cable routing assemblies to UL2024a, Outline of Investigation for Optical Fiber Cable Routing Assemblies. Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.)
For further information see the attached application guide from one of the manufacturers or got to http://www.storage-expo.com/ExhibitorLibrary/302/FiberRunner_6.pdf on the web.
The significant difference between optical fiber /communications cable routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.
Since users of the code may not be familiar with optical fiber / communications cable routing assemblies we are submitting this proposal to define them. We have submitted companion proposals to provide for a change of the scope of Article 770 to include optical fiber /communications cable routing assemblies and to provide listing and application for requirements for them. Since these routing assemblies are used for optical fiber, data and communications cables, proposals are being submitted for Articles 725, 770, 800 and 820.
Panel Meeting Action: Reject
Panel Statement: Optical fiber/communications cables are not covered in Article 725.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
EGESDAL, S.: Panel 16 changed the name of the assembly to "cable routing assembly." As this assembly can be use for cables in a number of NEC Articles, perhaps the definition should be in Article 100.
SEPULVEDA, M.: Panel 16 changed the name of the assembly to "cable routing assembly." As this assembly can be use for cables in a number of NEC Articles, perhaps the definition should be in Article 100.

3-152 Log #4898 NEC-P03 **Final Action: Accept**
(725.2, FPN)

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Revise text as follows:
FPN: See 725.~~21~~ 41 for voltage and power limitations of Class 1 circuits.
Substantiation: The current reference to 725.21 is incorrect. The voltage and power limitations for Class 1 circuits are listed in 725.41.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-153 Log #2407 NEC-P03 **Final Action: Reject**
(725.3(l))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Add text to read as follows:
(I) Underground Installations. Minimum cover requirements shall comply with Table 300.5.
Substantiation: Article 725 does not indicate any burial depths for conductors. Table 300.5 is for all installations ranging from 0 to 600 volts. Remote-controlled signaling systems do fall into that category. I understand the electrical shock hazard is not there but the possible damage to conductors that are buried correctly is a concern.
Panel Meeting Action: Reject
Panel Statement: The current 725.46 addresses the submitter's concern for Class 1 circuits. The section requires Class 1 wiring methods to follow Part 1 of Article 300, which includes meeting burial depth requirements within Table 300.5.
All other Class 2 or Class 3 circuits that involve no direct fire or life hazard do not have burial depth requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-154 Log #3660 NEC-P03 **Final Action: Reject**
(725.3)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
Circuits and equipment shall only be required to comply with the articles or sections listed in 725.3(A) through (G). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.
Substantiation: It appears that the intent of 725.3 is to exempt the installations made under this Article from most of the rules in Chapters 1 through 4, however the current wording does not specifically do that. The additional wording will make it clear that only the articles and sections listed or referenced in Article 725 apply to Article 725 installations.
Panel Meeting Action: Reject
Panel Statement: 90.3 provides the clarification requested in the proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-155 Log #2281 NEC-P03 **Final Action: Reject**
(725.3, 725.154, 725.156 and 725.179)

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Revise the indicated Sections in Article 725 to read as follows:
725.3 Other Articles. Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through (G). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits. Nonmetallic Signaling Raceways shall be selected and installed per Article 862.
(A) Number and Size of Conductors in Raceway. Section 300.17.
(B) Spread of Fire or Products of Combustion. Installation of Class 1, Class 2, and Class 3 circuits shall comply with 300.21.
(C) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22.
Exception: Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air in accordance with 725.154(A) and 862.10(E).
(D) Hazardous (Classified) Locations. Articles 500 through 516 and Article 517, Part IV, where installed in hazardous (classified) locations.
(E) Cable Trays. Article 392, where installed in cable tray.
(F) Motor Control Circuits. Article 430, Part VI, where tapped from the load side of the motor branch-circuit protective device(s) as specified in 430.72(A).
(G) Instrumentation Tray Cable. See Article 727.
725.154 Applications of Listed Class 2, Class 3, and PLTC Cables. Class 2, Class 3, and PLTC cables shall comply with any of the requirements described in 725.154(A) through (H).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other spaces used for environmental air as described in ~~300.22(C)~~ 862.10(E). Only Type CL2P or CL3P cable shall be permitted to be installed in these raceways.
(B) Riser. Cables installed in risers shall be as described in any of (B)(1), (B)(2), or (B)(3):
(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Listed riser signaling raceways and listed plenum signaling raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor as described in 862.10(F). Only Type CL2R, CL3R, CL2P, or CL3P cables shall be permitted to be installed in these raceways.
(2) Other cables as covered in Table 725.154(G) and other listed wiring methods as covered in Chapter 3 shall be installed in metal raceways, or located in a fireproof shaft having firestops at each floor.
(3) Type CL2, CL3, CL2X, and CL3X cables shall be permitted in one- and two-family dwellings. Listed general-purpose signaling raceways shall be permitted for use as described in 862.10(G) with Type CL2, CL3, CL2X, and CL3X cables.
FPN: See 300.21 for firestop requirements for floor penetrations.
725.156 Applications of Nonmetallic Signaling Raceways (OFCR).
Nonmetallic Signaling Raceways (OFCR) shall be selected and installed per Article 862.
725.179 Listing and Marking of Class 2, Class 3, ~~and~~ Type PLTC Cables, and Nonmetallic Signaling Raceways (OFCR). Class 2, Class 3, and Type PLTC cables ~~and nonmetallic signaling raceways~~ installed as wiring methods within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 725.179(A) through ~~(K)~~ (H) and shall be marked in accordance with 725.179~~(L)~~ (I).
(A) Types CL2P and CL3P. Types CL2P and CL3P plenum cable shall be listed as being suitable for use in ducts, plenums, and other space for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.

(B) Types CL2R and CL3R. Types CL2R and CL3R riser cables shall be marked as Type CL2R or CL3R, respectively, and be listed as suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.

(C) Types CL2 and CL3. Types CL2 and CL3 cables shall be marked as Type CL2 or CL3, respectively, and be listed as suitable for general-purpose use, with the exception of risers, ducts, plenums, and other space used for environmental air, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the “UL Flame Exposure, Vertical Tray Flame Test” in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA “Vertical Flame Test — Cables in Cable Trays,” as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

(D) Types CL2X and CL3X. Types CL2X and CL3X limited-use cables shall be marked as Type CL2X or CL3X respectively, and be listed as being suitable for use in dwellings and for use in raceway and shall also be listed as being resistant to flame spread.

FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical wire) flame test in ANSI/UL 1581-2001, Reference Standard for Electrical Wires, Cables and Flexible Cords.

(E) Type PLTC. Type PLTC nonmetallic-sheathed, power-limited tray cable shall be listed as being suitable for cable trays and shall consist of a factory assembly of two or more insulated conductors under a nonmetallic jacket. The insulated conductors shall be 22 AWG through 12 AWG. The conductor material shall be copper (solid or stranded). Insulation on conductors shall be rated for 300 volts. The cable core shall be either (1) two or more parallel conductors, (2) one or more group assemblies of twisted or parallel conductors, or (3) a combination thereof. A metallic shield or a metallized foil shield with drain wire(s) shall be permitted to be applied either over the cable core, over groups of conductors, or both. The cable shall be listed as being resistant to the spread of fire. The outer jacket shall be a sunlight- and moisture-resistant nonmetallic material. Type PLTC cable used in a wet location shall be listed for use in wet locations or have a moisture-impervious metal sheath.

Exception No. 1: Where a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armor is applied over the nonmetallic jacket, an overall nonmetallic jacket shall not be required. On metallic-sheathed cable without an overall nonmetallic jacket, the information required in 310.11 shall be located on the nonmetallic jacket under the sheath.

Exception No. 2: Conductors in PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the “UL Flame Exposure, Vertical Tray Flame Test” in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA “Vertical Flame Test — Cables in Cable Trays,” as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

(F) Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Cables used for survivability of critical circuits shall be listed as circuit integrity (CI) cable. Cables specified in 725.154(A), (B), (D)(1), and (E), and used for circuit integrity, shall have the additional classification using the suffix “-CI”. Cables that are part of a listed electrical circuit protective system shall be considered to meet the requirements of survivability.

FPN: One method of defining circuit integrity is by establishing a minimum 2-hour fire resistance rating when tested in accordance with UL 2196-2002, Standard for Tests of Fire Resistive Cables.

(G) Class 2 and Class 3 Cable Voltage Ratings. Class 2 cables shall have a voltage rating of not less than 150 volts. Class 3 cables shall have a voltage rating of not less than 300 volts.

(H) Class 3 Single Conductors. Class 3 single conductors used as other wiring within buildings shall not be smaller than 18 AWG and shall be Type CL3. Conductor types described in 725.49(B) that are also listed as Type CL3 shall be permitted.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the “UL Flame Exposure, Vertical Tray Flame Test” in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA “Vertical Flame Test — Cables in Cable Trays,” as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

~~**(I) Plenum Signaling Raceways.** Plenum signaling raceways shall be listed as having adequate fire-resistant and low smoke-producing characteristics.~~

~~**(J) Riser Signaling Raceways.** Riser signaling raceways shall be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.~~

~~FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the Test for Flame Propagation (Riser) in UL 2024, Standard for Optical Fiber Cable Raceway.~~

~~**(K) General-Purpose Signaling Raceways.** General-purpose signaling raceways shall be listed as being resistant to the spread of fire.~~

~~FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General use) in UL 2024, Standard for Optical Fiber Cable Raceway.~~

~~(L)~~ (I) Marking. Cables shall be marked in accordance with 310.11(A)(2), (A)(3), (A)(4), and (A)(5) and Table 725.179. Voltage ratings shall not be marked on the cables.

FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 electric light and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.

Table 725.179 Cable Marking(not submitted)

(J) Nonmetallic Signaling Raceways (OFCR). Nonmetallic Signaling Raceways (OFCR) shall be listed in accordance with 862.6.

Substantiation: This is a companion proposal to correlate with the proposal for a new optical fiber/communication raceway article. The new optical fiber/communication raceway article was proposed to Panel 16 as Article 862.

Optical fiber/communication raceways (Type OFCR) are currently listed raceways for use in plenums, risers or general purpose applications for the management of signaling, optical fiber, communication and CATV cables. This new Article and the companion proposals will clarify the selection, and installation optical fiber/communication raceways including the construction specifications. It is not the intent of the submitter to revise or change any of the currently permitted uses by this proposal, but only to enhance the usability of the Code.

Panel Meeting Action: Reject

Panel Statement: Until proposed new Article 862 has been acted upon, the panel is unable to consider the proposed changes to Article 725.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-156 Log #4361 NEC-P03 **Final Action: Reject**
(725.3(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Delete 725.3(A) and renumber remaining subsections.

~~(A) Number and Size of Conductors in Raceway. Section 300.17.~~

Substantiation: This proposal is editorial and removes an unnecessary reference.

The reference to 300.17 is already covered in 725.51 for Class 1 circuits. Additionally, 725.51 applies where Class 2 or Class 3 circuits are installed using Class 1 methods and materials.

Panel Meeting Action: Reject

Panel Statement: 725.3 establishes the other articles and sections allowed to be enforced in Article 725.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

EGESDAL, S.: Section 90.3 permits Chapters 5-7 to supplement or modify Chapters 1-4. Article 300 does not apply to Article 725, unless referenced. The reference to 300.17 is found in 725.51, making 725.3(A) redundant. There are references to sections in Chapters 1-4 throughout Article 725 that are not duplicated in 725.3 (e.g. references to 110.3(B), 300.7, 300.22, 300.17, 310.15(B)(2), 392.11, and others).

In addition, 760.3 does not have a requirement pointing to 300.17, because the reference to 300.17 is in 760.51.

KAHN, S.: I agree with the proposer’s substantiation and the proposal should have been approved. This is an editorial change.

SEPULVEDA, M.: Section 90.3 permits Chapters 5-7 to supplement or modify Chapters 1-4. Article 300 does not apply to Article 725, unless referenced. The reference to 300.17 is found in 725.51, making 725.3(A) redundant. There are references to sections in Chapters 1-4 throughout Article 725 that are not duplicated in 725.3 (e.g. references to 110.3(B), 300.7, 300.22, 300.17, 310.15(B)(2), 392.11, and others).

In addition, 760.3 does not have a requirement pointing to 300.17, because the reference to 300.17 is in 760.51.

3-157 Log #4362 NEC-P03 **Final Action: Reject**
(725.3(C))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Delete 725.3(C) and renumber remaining sections
~~(C) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22.~~
~~Exception: Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air in accordance with 725.154(A)~~
Substantiation: Section 725.3(C) is redundant. Section 725.154(A) permits installation of Type CL2P and CL3P cables and plenum signaling raceways in ducts, plenums, and other spaces used for environmental air, and permits circuits to be installed in accordance with 300.22.
Panel Meeting Action: Reject
Panel Statement: Sections within Article 300 apply to Article 725 only if referenced.

Deletion of 725.3(C) would infer that 300.22 only applies to the wiring methods for Class 2 and Class 3 cables specifically mentioned in 725.154.

To not apply 300.22 for CI cable, signaling raceways, Class 1 and the other remote control and signaling wiring methods would not be appropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

AYER, L.: This proposal should have been accepted in principle. The present wording in 725.3(C) is confusing. The exception to allow CL2P or CL3P cables in plenum signaling raceways in other spaces used for environmental air is already covered in 725.154(A). The additional wording is not necessary. By deleting the extraneous words, the exception would look similar to 770.3 and 760.3.

(C) Ducts, Plenums, and Other Air-Handling Spaces.
Class 1, Class 2, and Class 3 circuits installed in ducts, ~~plenums,~~ or other space used for environmental air
shall comply with 300.22.
Exception: **As permitted in**~~Type CL2P or CL3P cables and plenum signaling raceways shall be permitted~~
~~for Class 2 and Class 3 circuits installed in other spaces used for environmental air in accordance with~~
725.154(A).

EGESDAL, S.: The reference to 300.22 is adequately covered in 725.154(A), so is redundant in 725.3. There are references to sections in Chapters 1-4 throughout Article 725 that are not duplicated in 760.3 (e.g., references to 110.3(B), 300.7, 300.22, 300.17, 310.15(B)(2), 392.11, and others).

SEPULVEDA, M.: The reference to 300.22 is adequately covered in 725.154(A), so is redundant in 725.3. There are references to sections in Chapters 1-4 throughout Article 725 that are not duplicated in 760.3 (e.g., references to 110.3(B), 300.7, 300.22, 300.17, 310.15(B)(2), 392.11, and others).

3-158 Log #1173 NEC-P03 **Final Action: Accept**
(725.3(H))

Submitter: Merton W. Bunker, Jr., US Department of State
Recommendation: Add a new 725.3(H) to read as follows:

"(H) Raceways Exposed to Different Temperatures. Installations shall comply with 300.7(A)".
Substantiation: Condensation often forms in conduit exposed to non-conditioned and conditioned space. This change is proposed to bring the requirements of 300.7(A) into Article 725. This is a companion to a proposal submitted to 760.3(H).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

STENE, S.: The title in proposed 725.3(H) should be changed by adding "Cables, Raceways, or Sleeves" to read as follows: Cables, Raceways, or Sleeves Exposed to Different Temperatures."
The text in proposed (H) should be changed to read as follows: "Where portions of cables, raceways, or sleeves are exposed to different temperatures and condensation is known to be a problem, Class 1, Class 2, and Class 3 installations shall comply with 300.7(A)." This proposed text would provide specific information for the user with installation applications pertaining to the specific use of 300.7(A).

3-159 Log #2906 NEC-P03 **Final Action: Accept in Principle**
(725.3(H) (New))

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Add new section as follows :

725.3(H) Vertical Support For Fire Rated Cable. Installation of circuit integrity (CI) and Electrical Protective Systems shall be in accordance with 300.19(B).
Substantiation: Support requirements for fire- rated cable are critical and contained in 300.19(B). The strength of copper decreases with heat. Cables may break if not properly supported in a fire situation.
Panel Meeting Action: Accept in Principle
Revise the wording in the proposal as follows:

725.3(H) "Vertical Support for Fire Rated Cables and Conductors. Vertical installations of circuit integrity (CI) cables and conductors or cables of electrical circuit protective systems shall be in accordance with 300.19(B)."
Panel Statement: The text in the proposal was changed in the title and the section to cover both cables and conductors since circuit integrity cables and electrical circuit protective systems could be either cables or conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

EGESDAL, S.: Section 300.19(B) does not apply to circuit integrity cable (e.g., Type CL2-CI), but applies to an electrical circuit protective system. Circuit integrity is not an electrical circuit protective system. While a circuit integrity (CI) cable and an electrical circuit protective system are tested using UL 2196, the tests are not identical. Note: Section 725.154(F) title is "Circuit Integrity (CI) Cable or Electrical Circuit Protective System."

SEPULVEDA, M.: Section 300.19(B) does not apply to circuit integrity cable (e.g., Type CL2-CI), but applies to an electrical circuit protective system. Circuit integrity is not an electrical circuit protective system. While a circuit integrity (CI) cable and an electrical circuit protective system are tested using UL 2196, the tests are not identical. Note: Section 725.154(F) title is "Circuit Integrity (CI) Cable or Electrical Circuit Protective System."

3-160 Log #4346 NEC-P03 **Final Action: Reject**
(725.3(H) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.3(H)
(H) Conductors and Cables in Dry, Damp, or Wet Locations.
(1) Conductors. Conductors shall comply with the appropriate requirements of 310.8(A), (B), or (C).
(2) Cables. Class 2 or Class 3 cables shall comply with the appropriate requirements of 725.154.
Substantiation: The goal of this proposal is to develop listing and marking requirements for Class 2, and Class 3 cables installed in dry, damp, and wet locations that are equivalent to the requirements for conductors

Article 725 circuit conductors must comply with 310(A), (B), or (C). However, there are no listing and marking requirements for Class 2, or Class 3 cables installed in dry, damp, or wet locations.

There are system problems where an inappropriate cable is installed in a damp or wet location.

This proposed change has a companion proposal to establish a new 725.179(M).
Panel Meeting Action: Reject
Panel Statement: Class 1 conductors and any Class 2 or 3 conductors permitted in 725.130(A) as Class 1 wiring methods are covered by the requirements in Article 310 and specifically by 310.8(A) for dry locations, (B) for damp locations, and (C) for wet locations; therefore, a reference back to 310.8 is not necessary.

Proposed (2) is unnecessary since compliance with 725.154 is already a requirement in Part III of Article 725.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

EGESDAL, S.: The Panel Statement is correct with respect to Part II, where Part III circuits are installed using Part II methods and materials. The goal of this proposal was to clarify requirements for Part III cables and conductors that are not installed in accordance with Part II.

SEPULVEDA, M.: The Panel Statement is correct with respect to Part II, where Part III circuits are installed using Part II methods and materials. The goal of this proposal was to clarify requirements for Part III cables and conductors that are not installed in accordance with Part II.

3-161 Log #1174 NEC-P03 **Final Action: Reject**
(725.3(I))

Submitter: Merton W. Bunker, Jr., US Department of State
Recommendation: Add a new 725.3(I) to read as follows:
"(I) Number and Size of Cables and Conductors in Raceway. Installations shall comply with 300.17".
Substantiation: The FPN following 300.17 already references Article 725, but no reference exists in Article 725. This proposal seeks to impose the fill requirements to prevent abrasions and other problems associated with overfull conduit. Although conductor heating is not an issue, the reference will clarify the intent to allow installation and withdrawal of conductors without inflicting damage. This is a companion to a proposal on 760.3(I).
Panel Meeting Action: Reject
Panel Statement: The proposed text is already in the existing text of 725.3(A).
The substantiation is incorrect in that the text exists and that conductor heating can be assumed to be a non-issue.
Class 1, Class 2, and Class 3 circuits can, indeed, develop currents that could generate heating of the conductors up to the capacity of the circuit protective device.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
EGESDAL, S.: The panel statement is misleading. If derating of a Class 1 circuit is necessary, the requirement is covered in 725.51(A): where continuous load is greater than 10% of conductor ampacity. Derating does not apply to Class 2 and Class 3 circuits [See 725.130(A) Exception No. 1].
As stated in the Egesdal negative comment to 3-156, the reference to 300.17 already exists in 725.51, so would is redundant in 725.3.
SEPULVEDA, M.: The panel statement is misleading. If derating of a Class 1 circuit is necessary, the requirement is covered in 725.51(A): where continuous load is greater than 10% of conductor ampacity. Derating does not apply to Class 2 and Class 3 circuits [See 725.130(A) Exception No. 1].
As stated in the Egesdal negative comment to 3-156, the reference to 300.17 already exists in 725.51, so would is redundant in 725.3.

3-162 Log #4349 NEC-P03 **Final Action: Reject**
(725.3(I))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.3(I)
(I) Conductors and Cables Exposed to Direct Sunlight.
(1) Conductors. Conductors shall comply with 310.8(D).
(2) Cables. Class 2 and Class 3 cables shall comply with the appropriate requirements of 725.154.
Substantiation: Article 725 circuits have to comply with 310(D). However, there is marking no marking or listing requirement for Class 2 and Class 3 cables installed exposed to direct sunlight.
System problems may occur where an inappropriate cable is installed exposed to direct sunlight.
There are companion proposals to add listing requirements to 725.179 to support this proposal and to 725.154 for application requirements.
Panel Meeting Action: Reject
Panel Statement: Class 1 conductors and any Class 2 or 3 conductors permitted in 725.130(A) as Class 1 wiring methods are covered by the requirements in Article 310 and specifically by 310.8 (D) for conductors exposed to sunlight, therefore, a reference back to 310.8(D) is not necessary.
Proposed (2) is unnecessary since compliance with 725.154 is already a requirement in Part III of Article 725.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: The Panel Statement is correct with respect to Part II, where Part III circuits are installed using Part II methods and materials. The goal of this proposal was to clarify requirements for Part III cables and conductors that are not installed in accordance with Part II.
SEPULVEDA, M.: The Panel Statement is correct with respect to Part II, where Part III circuits are installed using Part II methods and materials. The goal of this proposal was to clarify requirements for Part III cables and conductors that are not installed in accordance with Part II.

3-163 Log #1175 NEC-P03 **Final Action: Reject**
(725.3(J))

Submitter: Merton W. Bunker, Jr., US Department of State
Recommendation: Add a new 725.3(J) to read as follows:
"(J) Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies. Installations shall comply with 314.16".
Substantiation: Overfilled boxes often result in shorts and overheating (non power-limited) on certain circuits. Overfilled boxes are also much more difficult to service, and could result in low system reliability. This proposal seeks to impose the fill requirements to prevent short circuits, and other problems associated with overfilled boxes. This is a companion proposal to a proposed new 760.3(J).
Panel Meeting Action: Reject
Panel Statement: 90.3 states that Chapters 1 through 4 apply, except as amended by Chapters 5, 6, and 7 for the particular conditions.
725.3 only exempts compliance with certain parts of Article 300, not all parts of the NEC.
The addition of the requirement to comply with 314.16 is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-164 Log #4351 NEC-P03 **Final Action: Reject**
(725.3(J))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.3(J)
(J) Temperature Limitations of Conductors and Cables.
(1) Conductors. Conductors installed using Class 1 methods and materials shall comply with 310.10 or 402.3.
(2) Cables. Class 2, Class 3, and PLTC cables shall comply with the appropriate requirements of 725.154.
Substantiation: All Article 725 circuits using Class 1 methods and materials must meet the temperature requirements of 310.10 or 402.3. These tables provide temperature rating options for various types of conductors.
Presently, there are no equivalent requirements for cables. There is a companion proposal to add listing requirements for cable temperature rating and marking requirements to new 725.179(Q). The companion proposal in 725.179 will have minimal cost impact on cable manufacturers.
Panel Meeting Action: Reject
Panel Statement: Class 1 conductors and any Class 2 or 3 conductors permitted in 725.130(A) as Class 1 wiring methods are covered by the requirements in Article 310 and specifically by 310.10 for conductors with temperature limitations, therefore, a reference back to 310.10 is not necessary.
Proposed (2) is unnecessary since compliance with 725.154 is already a requirement in Part III of Article 725.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: The Panel Statement is correct with respect to Part II, where Part III circuits are installed using Part II methods and materials. The goal of this proposal was to clarify requirements for Part III cables and conductors that are not installed in accordance with Part II.
SEPULVEDA, M.: The Panel Statement is correct with respect to Part II, where Part III circuits are installed using Part II methods and materials. The goal of this proposal was to clarify requirements for Part III cables and conductors that are not installed in accordance with Part II.

3-165 Log #667 NEC-P03 **Final Action: Reject**
(725.7)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: 725.7 should be 725.21.
Substantiation: The reference to the section is incorrect.
Panel Meeting Action: Reject
Panel Statement: The reference "725.7" only appears in the 2008 NEC in the index under the heading of "Accessible," and the submitter did not provide enough substantiation as to where the reference was incorrect to Accept this proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-166 Log #4344 NEC-P03 **Final Action: Reject**
(725.13(K) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.3(K)
(K) Corrosive Locations.
(1) Conductors. Conductors shall comply with 110.11, 300.6(C)(2), and 310.9, where installed in corrosive locations.
(2) Cables. Class 2 and Class 3 cables shall comply with the appropriate requirements of 725.154.
Substantiation: This proposal develops requirements for circuits installed in corrosive locations. This proposal has text parallel to 760.3(D), with the addition of requirements for cables.
Corrosive locations have the potential to degrade cable and conductor insulation and cause system malfunction.
There are companion proposals to address installation of cables in corrosive locations.
Panel Meeting Action: Reject
Panel Statement: The section reference is incorrect at the top of the proposal. It should be 725.3(K) rather than 725.13(K).
90.3 states that Chapters 1 through 4 apply except as amended by Chapters 5, 6, and 7 for the particular conditions.
725.3 only exempts compliance with certain parts of Article 300, not all parts of the NEC.

The addition of the requirement to comply with 110.11, 300.6(C)(2), and 310.9 is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: The Panel Statement is correct with respect to Part II, where Part III circuits are installed using Part II methods and materials. The goal of this proposal was to clarify requirements for Part III cables and conductors that are not installed in accordance with Part II.
SEPULVEDA, M.: The Panel Statement is correct with respect to Part II, where Part III circuits are installed using Part II methods and materials. The goal of this proposal was to clarify requirements for Part III cables and conductors that are not installed in accordance with Part II.

3-167 Log #955 NEC-P03 **Final Action: Reject**
(725.24)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
~~Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner.~~ Cables and conductors ~~installed on the surface and sidewalls~~ shall be secured in place and supported by the structural members ~~in such a manner that the cables will not be damaged by normal building use~~. (remainder unchanged)
Substantiation: Edit. “Neat” and “workmanlike” are subjective and terms to be avoided per the Style Manual, and do not necessarily have any relation to safety as long as installations comply with applicable provisions of the Code. Support should be required whether or not installed on the surface and such support doesn’t necessarily damage, which is covered by 110.27(B).
Panel Meeting Action: Reject
Panel Statement: While the submitter is correct that the terms “neat” and “workmanlike” are indeed contained in the Table 3.2.1 list in the NEC Manual of Style, the manual also states that terms “shall be reviewed in context, and, if the resulting requirement is unenforceable or vague, the term shall not be used.”
The context in which these terms are used in 725.24 is appropriate as the section further clarifies what has to be done to achieve a compliant installation, and, therefore, is enforceable.
The submitter does not substantiate the need to delete the entire first sentence or any reference to Class 1, Class 2, and Class 3 circuits.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-168 Log #2148 NEC-P03 **Final Action: Reject**
(725.24)

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Revise text as follows:
The installation shall also conform to 300.4(D), ~~and~~ 300.11~~.~~, and 334.15(C).
Substantiation: Cables ran across joists need running boards or bored holes to protect them from occupants hanging and damaging the conductors and cables.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation for Class 1, Class 2, and Class 3 circuits to comply with 300.11, therefore, the reference is inappropriate.
334.15(C) only applies to NM cable, used for exposed installations and would not apply to Class 1, Class 2, or Class 3 installations using wiring methods other than NM cable, therefore, the addition of this reference is also inappropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-169 Log #2149 NEC-P03 **Final Action: Reject**

3-171 Log #2897 NEC-P03 **Final Action: Reject**
(725.24)

Submitter: John R. Jennings, DR Electric
Recommendation: Add new text to read as follows:
Class 1, Class 2, Class 3 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(B) and 300.11.
Substantiation: It is important that cables not be supported by the ceiling grid when installed above suspended ceilings, both for the protection of the cables, and for access above the ceiling at later dates. I believe that 300.11 has been intended to apply to these installations, and the addition of this rule will make it easier to enforce.
This Article is, as it stands, almost word-for-word with similar limited energy/low voltage sections, such as 770.24, 800.24, and 830.24.
With the added wording, there will be identical requirements for all limited energy/low voltage installations.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation for Class 1, Class 2, and Class 3 circuits to comply with 300.11, therefore, the reference is inappropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(725.24)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
725.24 Mechanical Execution of Work.
Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4~~(D)~~ and 300.11.
Substantiation: This is one of a series of proposals intended to provide correlation with sections 640.6(B), 725.24, 760.24, 770.24, 800.24, 820.24 and 830.24. Due to the power limitations of these circuits, there is no reason that the requirements should be different.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation for Class 1, Class 2, and Class 3 circuits to comply with 300.11, therefore, the reference is inappropriate.
No problem was cited to expand the requirement to include all of 300.4
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-173 Log #4549 NEC-P03 **Final Action: Reject**
(725.25)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
725.25 Abandoned Cables.
The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved. Removal of abandoned cables shall be performed in a neat and workmanlike manner.
Substantiation: This proposal recommends added wording to ensure that abandoned cables are removed appropriately. Section 110.12 addresses installation and so does section 725.24. It is important to point out that similar care must be taken when removing cables.
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
Consistent wording is being proposed for other sections in the code.
For information, see relevant definitions in the NEC.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation for the proposed change, and compliance with this requirement would be unenforceable.
This is already covered under 90.4 and 110.2.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-174 Log #3239 NEC-P03 **Final Action: Reject**
(725.31(A) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows:
Exception: Remote control circuits shall not be required to be classified as Class 1 where the equipment is identified as suitable for use with Class 2 circuits.
Substantiation: Present wording requires Class I wiring for example, for a gas-fired furnace with a high limit temperature control, which, if it fails, may introduce a potentially direct fire hazard if the controlling thermostat circuit does not operate properly.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to warrant this change. High temperature controls for a gas fire boiler would not constitute a requirement for a Class 1 circuit classification.
Equipment identified as suitable for use with Class 2 circuits does not ensure that 725.31 Safety-Control Equipment concerns will be met.
By requiring the Class 2 or Class 3 remote control circuits that may introduce a fire hazard or a life hazard to be classified as Class 1 circuits, the conductors must be 600-volt as required by 725.49, not 150- or 300-volt as would normally be permitted by 725.179(G), the circuits must comply with the wiring methods of the appropriate Articles in Chapter 3 and all of the requirements in Part I of Article 300, in addition to the other requirements in Part II of Article 725.
The proposed exception would inappropriately delete all of these safety requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-175 Log #2420 NEC-P03 **Final Action: Reject**
(725.31(B))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Revise text to read as follows:
"All conductors of such remote-control circuits shall be installed in rigid metal conduit, intermediate metal conduit, rigid ~~non-metallic~~ PVC conduit, electrical metallic tubing...".
Substantiation: Conforming to the style manual Article 352.
Panel Meeting Action: Reject
Panel Statement: The current text is adequate and covers PVC. "rigid non-metallic conduit" is generic and covers all types of conduit.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-176 Log #2195 NEC-P03 **Final Action: Reject**
(725.43)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
725.43 Class 1 Circuit Overcurrent Protection.
Overcurrent protection for conductors 14 AWG and larger shall be provided in accordance with the conductor ampacity, without applying the ampacity adjustment ~~derating~~ factors of 310.15 to the ampacity calculation. Overcurrent protection shall not exceed 7 amperes for 18 AWG conductors and 10 amperes for 16 AWG.
Exception: Where other articles of this Code permit or require other overcurrent protection.
FPN: For example, see 430.72 for motors, 610.53 for cranes and hoists, and 517.74(B) and 660.9 for X-ray equipment.
Substantiation: The terms "ampacity adjustment factors" and "correction" are the terms used in 310.15(B)(2)(a) and 310.16.
Panel Meeting Action: Reject
Panel Statement: Derating factors referenced in 310.15 apply to ambient temperature correction factors and adjustment factors, therefore, the proposal is unclear as to whether or not the suggested change applies to both.
The panel suggests that the submitter provide further clarification.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-177 Log #3035 NEC-P03 **Final Action: Reject**
(725.43)

Panel Statement: See the panel statement on Proposal 3-176.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-178 Log #2390 NEC-P03 **Final Action: Reject**
(725.43 Exception No. 2 (New))

Submitter: Thomas F. Mueller, Southern Company
Recommendation: Add Exception No. 2 as follows:
Exception No. 2: Where the Class I circuit is an extension of a vendor supplied device or circuit provided with integral short circuit and ground fault protection, conductors sized #14 AWG and larger shall be permitted to be protected at not more than 300 percent of their ampacity.
Substantiation: Vendor supplied devices such as circuitry for solenoids and trip coils are frequently equipped with integral overcurrent devices sized higher than normal due to the high inrush currents present. But, the high currents are short lived. Short duration high currents (like motor starting currents) are allowed and are not injurious to conductors and/or insulations. As currently written, a device supplied with a 30 amp fuse would require a #10 AWG Class I circuit. A #10 AWG Class I circuit while certainly allowed is inconsistent with the whole intent of remote control wiring as stated in the FPN under 725.1. Such circuits are not branch circuits, and are not subject to overload, and requiring overload protection does not enhance safety. It only increases the expense associated with Class I circuit wiring. Adding the exception would align the requirements of 725.43 with 725.45(C) where the 300 percent allowance is already codified, and be similar to the requirements of 430.72(B) for control circuits that extend beyond motor control enclosures. Those sections recognize that such circuits need not be protected against overload.
Panel Meeting Action: Reject
Panel Statement: The purpose of the overcurrent protection for Class 1 circuits is protection for the conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

Comment on Affirmative:

STENE, S.: The Class 1 circuit may be a branch circuit based on the definition of branch circuit in Article 100 but modifications to the requirements of Articles 210 and 240 can be readily seen in Part II of Article 725. Section 725.43 provides a modification of the requirements for the conductors, based on 310.15, not requiring derating of the conductors in 310.15(B)(2)(a) or the ambient temperature derating in the ampacity tables, such as Table 310.16. Section 725.45, as well as 430.72, Table 450.3(B), 240.21(B) and (C), and 210.19(A)(4), Exception No. 1 would permit conductors smaller than the overcurrent device under special circumstances. The existing exception in 725.43 already permits these applications as noted above.

3-179 Log #1413 NEC-P03 **Final Action: Reject**
(725.48)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

(B) Class 1 circuits shall be permitted to be installed with power ~~supply~~ and lighting conductors as specified in 725.48(B)(1) through (B)(4).

(1) Class 1 circuits and power ~~supply~~ and lighting circuits shall be permitted to occupy the same cable, flexible cord or cable, enclosure, or raceway only where the equipment powered is functionally associated, except as permitted in 724.48(B)(2), (3), and (4).

(2) Class 1 circuits and power ~~supply~~ and lighting circuits shall be permitted to be installed in factory or field-assembled control centers. (3) Class 1 circuits and power ~~supply~~ and lighting circuits shall be permitted to be installed as underground conductors in a manhole, handhole, or box as permitted in the exception for 314.29, in accordance with one or more of the following:

(1) The power ~~supply~~ and lighting conductors or Class 1 circuit conductors are in a raceway, metal-covered cable, or multiconductor Type UF cable. Where Type UF cable is employed for both the power and lighting circuits and Class 1 circuits the cables shall be separated, grouped according to their use, and identified by approved means.

(2) The Class 1 circuit conductors are effectively and permanently separated from power ~~supply~~ and lighting conductors by a firmly fixed nonconductor such as flexible tubing or barriers in addition to the insulation on the wires.

(3) The Class 1 circuit conductors are permanently and effectively separated from other conductors and securely fastened to racks, insulators, or other approved supports where installed in manholes.

Substantiation: Edit. "Power" may imply lighting circuits are not included. Flexible cords and cables should be included, also handholes and boxes permitted in the exception for 314.29. A reference to (B)(2) in (B)(1) will remove any perceived conflict with (B)(2) which doesn't require functional association with all conductors. Type UF cable should be multiconductor type, single-conductor type is essentially no different other than conductors for general wiring. The provisions of (B)(3)(3) are generally suitable only for manholes.
Panel Meeting Action: Reject
Panel Statement: Class 1 circuits can be power-limited supply circuits where a higher voltage supplied conversion unit (power supply), such as a transformer or a solid state unit, could be used to drop the voltage of the Class 1 circuit from line voltage to maximum 30 volts so deleting "supply" and adding "lighting" is an incorrect application since the existing text deals with the power supply, not lighting.

Adding flexible cord is not appropriate since there was not technical substantiation provided to expand permission to include cords.

Cables are already covered in the existing text.

Adding the phrase "except as permitted in 725.48(B)(2), (3), and (4)" is not appropriate since (1) only applies to cables, enclosures, and raceways, whereas (2) applies specifically to factory or field assembled control centers, (3) applies in a manhole, and (4) applies in cable trays.

Since 725.46 already provides installation requirements in accordance with Chapter 3 wiring methods, Article 314 would permit handholes and UF cable to be used. However, the specific requirements for manholes are provided in the existing 725.48(B)(3) since manholes were moved to Article 110 Part V dealing with conductor and equipment spacing, not the specific Class 1 conductor and cable requirements as spelled out in (3). There is no reason to require spacing of UF cables for power and Class 1 or to add multiconductor UF cable since existing 725.48(B)(3)(1) already states the power supply conductors or Class 1 conductors are in Type UF cable. The conductors cannot be "in" a single conductor UF cable; therefore, the proposed text is unnecessary. The panel refers the submitter to 90.1(C).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-180 Log #4688 NEC-P03 **Final Action: Reject**
(725.48(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows:

Class 1 circuits and power supply circuits shall be permitted to occupy the same cable, enclosure, or raceway only where one or more Class 1 conductors are functionally associated with one or more power supply circuit conductors.
Substantiation: If there are two unrelated motors at the same general location, it is beyond question that the two sets of branch-circuit conductors to the two motors can run in a common raceway. Now, add a set of control conductors for each motor to the same conduit. Are these control conductors functionally associated with the power conductors? Obviously. However, is every control conductor functionally associated with every power conductor? Obviously not. Is this, therefore, a violation of 725.48(B)(1)? The words of the NEC say "functionally associated" and leave it at that. The answer cannot be determined based on the current literal text of the Code. This proposal affords a definitive answer.
The usual objections to this practice run to the undesirability of exposing unrelated control conductors to a fault and thereby disabling multiple motor functions in unrelated processes. Although that is a reasonable design argument, there are serious limitations to this argument as a matter of NEC minimum standards. The power and control wiring that goes to those two motors can originate in the same vertical motor control center section, as covered in 725.48(B)(2). There are no limits on running the two power circuits together to the motors, as already covered. And a fault in one of those motor circuits will certainly disable the other motor, yet that is clearly allowed. Why then object to the control conductors? There is no supportable argument that multiple functions in a single raceway (other than very rare exceptions as with fire pump and emergency circuits) rise to the level of a fire or electrocution hazard, which, as covered in 90.1, is and ought to be the controlling principle. Note further, the rule also applies to enclosures. If this were to be applied in the opposite, exclusionary direction, machine tool control wiring practice as we know it in most industrial occupancies would be disrupted, unless the functional association rule were expanded to the point of meaninglessness (as in, "sure, everything in this factory is associated with everything else"). This wording has been the source of confusion for decades.
Panel Meeting Action: Reject
Panel Statement: "Functionally associated" refers to equipment or a system that can disconnect all circuits of the system being supplied.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

STENE, S.: Class 1 control conductors are used to provide activation of motors. Even though short circuits are not an everyday occurrence, the intent of the existing text is to provide some safety provisions so a short circuit from a related power circuit would not inadvertently cause the energizing of the control circuit and thus cause the motors to operate.

3-180a Log #CP302 NEC-P03 **Final Action: Accept**
(725.49)

Submitter: Code-Making Panel 3,
Recommendation: Revise existing 725.49 as follows:

"725.49 Class 1 Circuit Conductors.

(B) Insulation. Insulation on conductors shall be ~~suitable~~ rated for 600 volts. Conductors larger than 16 AWG shall comply with Article 310. Conductors in sizes 18 AWG and 16 AWG shall be Type FFH-2, KF-2, KFF-2, PAF, PAFF, PF, PFF, PGF, PGFF, PTF, PTFF, RFH-2, RFHH-2, RFHH-3, SF-2, SFF-2, TF, TFF, TFFN, TFN, ZF, or ZFF. Conductors with other types and thicknesses of insulation shall be permitted if listed for Class 1 circuit use."
Substantiation: "Suitable" was changed to "rated" since the conductor insulation must be rated for 600-volts.

(725.51)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text to read as follows:
725.51 Number of Conductors in Cable Trays and Raceway, and ~~Derating~~ Adjustment Factors.
(A) Class 1 Circuit Conductors. Where only Class 1 circuit conductors are in a raceway, the number of conductors shall be determined in accordance with 300.17. The ~~derating~~ adjustment factors given in 310.15(B)(2)(a) shall apply only if such conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor.
(B) Power-Supply Conductors and Class 1 Circuit Conductors. Where power-supply conductors and Class 1 circuit conductors are permitted in a raceway in accordance with 725.48, the number of conductors shall be determined in accordance with 300.17. The ~~derating~~ adjustment factors given in 310.15(B)(2)(a) shall apply as follows:
[remainder of 725.51(B) and 725.51(C) unchanged by this Proposal]
Substantiation: Correlation issue. Also to improve *Code* readability. Table 310.15(B)(2)(a) referenced from here uses the specific term “adjustment factors”, not the unspecific generalization “derating factors”.
366.23(A) and 376.22(B) for the 2008 *NEC*® had been revised [Proposal 8-127/Log #2243 and Proposal 8-157/Log #2754, respectively] from the inconsistent term “correction factors” and imprecise term “derating factors”, respectively, to “adjustment factors”, the term specifically used in Table 310.15(B)(2)(a). Per the Substantiation of Proposal 8-157, Accepted In Principle by Code Panel 8, trade persons were being confused by the designation inconsistency with other ampacity-modifying factors used elsewhere in the *Code*.
A companion Proposal for 310.15(B)(2)(a) revises its Exceptions to use terminology consistent with its title and Table 310.15(B)(2)(a).
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel actions on Proposals 3-181 and 3-182 that address the submitter’s concerns.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-184 Log #4359 NEC-P03 **Final Action: Reject**
(725.52)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 725.52
~~725.52 Circuits Extending Beyond One Building.~~
~~Class 1 circuits that extend aerially beyond one building shall also meet the requirements of Article 225.~~
725.52 Class 1 Circuits Extending Beyond One Building.
Class 1 circuits that extend beyond one building and run outdoors shall meet the installation requirements of Parts II, III, and IV of Article 800, the applicable sections of Part I of Article 300, and the applicable sections of Part I of Article 225.
Substantiation: Class 1 circuits should have equivalent requirements to those required for non-power-limited fire alarm circuits. The proposed text is parallel to the requirements for non-power-limited fire alarm circuits.
Class 1 and non-power-limited fire alarm circuits are permitted to be installed together in the same cable or raceway. It is important for both types of circuits to have the same requirements where installed outdoors, and transient protection as required by Article 800.
Panel Meeting Action: Reject
Panel Statement: Only power-limited fire alarm circuits that extend beyond one building are required by 760.32 to meet the installation requirements of Parts II, III, and IV of Article 800 or meet the installation requirements of Part I of Article 300.
Class 1 non-power-limited circuits are only limited to 600 volts; therefore, to try to apply the requirements in Article 800 to these types of control voltages would be dangerous since most phone systems operate at less than 50 volts.
Article 285 covers transient protection.
The existing text adequately applies Article 225 to these circuits that extend outside the building.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
EGESDAL, S.: The purpose of this proposal was to impose the requirements of Parts II, III, & IV of Article 800, which does not specify equipment specifications. Obviously a 50 volt primary protector would be a poor choice for a 120 volt Class 1 circuit. There are lightning protection (transient protection) devices available that handle up to 600 volts. Additionally, the requirement for meeting the appropriate sections of Part I of Article 300 imposes underground requirements. Article 225 has requirements for overhead wiring installations.
KAHN, S.: I agree with the proposer’s substantiation and the proposal should have been approved. The Panel Statement is confusing.
SEPULVEDA, M.: The purpose of this proposal was to impose the requirements of Parts II, III, & IV of Article 800, which does not specify equipment specifications. Obviously a 50 volt primary protector would be a poor choice for a 120 volt Class 1 circuit. There are lightning protection (transient protection) devices available that handle up to 600 volts. Additionally, the requirement for meeting the appropriate sections of Part I of Article 300 imposes underground requirements. Article 225 has requirements for overhead wiring installations.

3-185 Log #4833 NEC-P03 **Final Action: Reject**
(725.121(A)(4), FPN)

Submitter: T. David Mills, T. David Mills Associates
Recommendation: Modify the fine print note as follows:
FPN No. 1: ~~One way to determine applicable requirements for listing of information technology (computer) equipment is to refer to UL 60950-1-2003, Standard for Safety of Information Technology Equipment.~~ Typically such circuits are used to interconnect information technology equipment for the purpose of exchanging information (data).
FPN No. 2: See {2}, Annex I.
Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.
I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-72.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-186 Log #2018 NEC-P03 **Final Action: Reject**
(725.130)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Conductors and cables installed in wet locations or where subject to direct sunlight shall be identified for such use.
Substantiation: Where conductors or cables are installed in these locations, they should be identified for such use. These conductors are not covered by 310.1 and 310.8
Panel Meeting Action: Reject
Panel Statement: This proposal is not in compliance with 4.3.3(b) of the Regulations Governing Committee Projects since it does not provide the specific location where the submitter would like this text inserted.
The proposed text would be more appropriately addressed in 725.179 covering listing of Class 2 and 3 conductors and cables, not under 725.130 for wiring methods and materials.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-187 Log #2197 NEC-P03 **Final Action: Accept**
(725.130(A) Exception No. 1)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
725.130 Wiring Methods and Materials on Load Side of the Class 2 or Class 3 Power Source.
Class 2 and Class 3 circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with either 725.130(A) or (B).
(A) Class 1 Wiring Methods and Materials. Installation shall be in accordance with 725.46.
Exception No. 1: The ampacity adjustment ~~derating~~ factors given in 310.15(B)(2)(a) shall not apply.
Substantiation: The term “ampacity adjustment factors” is the term used in 310.15(B)(2)(a).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-188 Log #3037 NEC-P03 **Final Action: Accept**
(725.130(A) Exception No. 1)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
725.130 Wiring Methods and Materials on Load Side of the Class 2 or Class 3 Power Source.
Class 2 and Class 3 circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with either 725.130(A) or (B).
(A) Class 1 Wiring Methods and Materials. Installation shall be in accordance with 725.46.
Exception No. 1: The ampacity adjustment ~~derating~~ factors given in 310.15(B)(2)(a) shall not apply.
Substantiation: The term “adjustment factor” is the term used in 310.15(B)(2)(a).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-189 Log #4489 NEC-P03 **Final Action: Accept in Principle**
(725.130(A) Exception No. 1)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text to read as follows:
725.130 Wiring Methods and Materials on Load Side of the Class 2 or Class 3 Power Source.
Class 2 and Class 3 circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with either 725.130(A) or (B).
(A) Class 1 Wiring Methods and Materials. Installation shall be in accordance with 725.46.
Exception No. 1: The ~~derating~~ adjustment factors given in 310.15(B)(2)(a) shall not apply.
[remainder of 725.130 unchanged by this Proposal]
Substantiation: Correlation issue. Also to improve *Code* readability. Table 310.15(B)(2)(a) referenced from here uses the specific term “adjustment factors”, not the unspecific generalization “derating factors”.
366.23(A) and 376.22(B) for the 2008 *NEC*® had been revised [Proposal 8-127/Log #2243 and Proposal 8-157/Log #2754, respectively] from the inconsistent term “correction factors” and imprecise term “derating factors”, respectively, to “adjustment factors”, the term specifically used in Table 310.15(B)(2)(a). Per the Substantiation of Proposal 8-157, Accepted In Principle by Code Panel 8, trade persons were being confused by the designation inconsistency with other ampacity-modifying factors used elsewhere in the *Code*.
A companion Proposal for 310.15(B)(2)(a) revises its Exceptions to use terminology consistent with its title and Table 310.15(B)(2)(a).
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 3-187 that addresses the submitter’s concerns.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-190 Log #4358 NEC-P03 **Final Action: Reject**
(725.130(B))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new text to 725.130(B)
(B) Class 2 and Class 3 Wiring Methods. Conductors on the load side of the power source shall be insulated at not less than the requirements of 725.179 and shall be installed in accordance with 725.133 and 725.154. The raceway fill tables of Chapter 3 and Chapter 9 shall not apply.
Substantiation: Part III of Article 725 is silent on whether power-limited conductors and cables have to meet the conduit fill requirements of Chapter 3 and Chapter 9. Communications cables are not required to meet the raceway fill requirements [800.110, The raceway fill tables of Chapter 3 and Chapter 9 shall not apply.]. Communications cables are permitted to substitute for fire alarm power-limited cables, so this proposal provides parallel requirements to 800.110.
Panel Meeting Action: Reject
Panel Statement: 725.3(A) reads: “Number and Size of Conductors in Raceway. Section 300.17.” for class 1, 2 & 3 circuits.
Since 725.35(2) requires Class 2 and 3 circuits comply with Parts I and III and 725.3(A) is in Part I, compliance with 300.17 is required so the raceway fill requirements do apply.
The Fine Print Note in 300.17 also references Class 1, Class 2, and Class 3 circuits in Article 725. In addition, 90.3 requires compliance with Chapter 1 through 4 generally, except as amended by Chapter 5, 6, or 7 and Article 725 does not amend raceway fill.
There was also no technical substantiation provided to make this major change.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-191 Log #4357 NEC-P03 **Final Action: Reject**
(725.130(J) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.130(J)
(J) Bushing. A bushing shall be installed where cables emerge from raceway used for mechanical support or protection in accordance with 300.15(C).
Substantiation: Conduits and other raceways are often used for mechanical support or protection of cables. A bushing is needed to protect cables from damage. Article 300 does not apply unless referenced.
Panel Meeting Action: Reject
Panel Statement: The panel does not know where to apply this text and the submitter has indicated a section reference that is completely out of sequence.
The submitter has not provided technical substantiation indicating that cable damage has occurred.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: This proposal should have been to 725.136(J) [New].
Article 300 does not apply to Article 725, unless referenced. Including a reference to 300.15(C) provides protection against abrasion for Class 2 & 3 cables that emerge from raceway (no box). A Class 2 or Class 3 cable may be installed in a raceway system with the wiring method changed to “exposed” out of a field-cut section or raceway (e.g., EMT).
Because 300.15(C) exists, it should not be required to show damage has occurred to Class 2 or 3 cables.
SEPULVEDA, M.: This proposal should have been to 725.136(J) [New]. Article 300 does not apply to Article 725, unless referenced. Including a reference to 300.15(C) provides protection against abrasion for Class 2 & 3 cables that emerge from raceway (no box). A Class 2 or Class 3 cable may be installed in a raceway system with the wiring method changed to “exposed” out of a field-cut section or raceway (e.g., EMT).
Because 300.15(C) exists, it should not be required to show damage has occurred to Class 2 or 3 cables.
Comment on Affirmative:
KAHN, S.: The panel action is correct since the Proposal is deficient in that it proposes an addition in the wrong place (it probably intended to add a new 725.136(J). There is merit to the Proposal, however, and it should receive serious consideration if resubmitted.
OWEN, R.: In addition to the panel’s statement on lack of technical substantiation, the same submitter, in Proposal 3-190 proposed eliminating the raceway fill tables in Chapters 3 & 9. If mechanical protection is needed to protect cables from damage, then Proposal 3-190 to allow unlimited raceway fill would seem to contradict this Proposal.

3-192 Log #3123 NEC-P03 **Final Action: Reject**
(725.133)

Submitter: Sanford E. Egesdal, Egesdal Associates PLC
Recommendation: Revise 725.133
725.133 Installation of Cables and Conductors, and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, **and Raceways for Class 2 and Class 3 Circuits.**
Cables, conductors, and equipment, and raceways for Class 2 and Class 3 circuits shall be installed in accordance with 725,133(A) through (H) and 725.136 through 725.143.
(A) Listing. Class 2 and Class 3 cables, conductors, and raceways shall be listed.
(B) Air Ducts and Plenums. The following cables, conductors, and raceways shall be permitted in air ducts and plenums as described in 300.22(B).
(1) Types CL2P, CL2P-CI, CL3P, and CL3P-CI
(2) Plenum signaling raceway
(3) Types CL2P and CL3P installed in plenum signaling raceway
(4) Listed cables and conductors installed in raceways that are installed in compliance with 300.22(B)
(C) Other Spaces Used For Environmental Air. The following cables, conductors, and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C).
(1) Types CL2P, CL2P-CI, CL3P, and CL3P-CI
(2) Plenum signaling raceway
(3) Types CL2P and CL3P installed in plenum signaling raceway
(4) Listed cables and conductors installed in raceways that are installed in compliance with 300.22(C)
(D) Risers-Wires and Cables in Vertical Runs. The following wires, cables, and signaling raceways shall be permitted in vertical runs penetrating more than one floor and in vertical runs in a shaft:
(1) Types CL2R, CL2R-CI, CL3R, and CL3R-CI
(2) Plenum and riser signaling raceways
(3) Types CL2P, CL3P, CL2R, and CL3R installed in plenum or riser signaling raceway
(E) Risers-Cables in Metal Raceways, Fireproof Shafts, and One- and Two-Family Dwellings. The following cables and raceways shall be permitted in metal raceway, in a fireproof shaft with firestops at each floor, and in one- and two-family dwellings:
(1) Types CL2, CL3, CL2X, and CL3X or other listed wiring methods as covered in Chapter 3
(2) Plenum, riser, and general-purpose signaling raceways
(3) Types CL2, CL3, CL2X, and CL3X installed in plenum, riser, or general-purpose signaling raceway
(F) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays.
(1) Type PLTC where installed outdoors
(2) Types PLTC, CL3P, CL3R, CL3, CL2P, CL2R, and CL2 where installed indoors
(3) Plenum, riser and general-purpose signaling raceways
(4) Types PLTC, CL3P, CL3R, CL3, CL2P, CL2R, and CL2 installed in plenum, riser or general-purpose signaling raceway
(G) Hazardous (Classified) Locations. The following cables shall be permitted to be installed in hazardous (classified) locations.
(1) Type PLTC where permitted by 501.10(B), 502.10(B), and 504.20, the cable shall be installed in cable trays, in raceways, supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or other mechanical means. Type PLTC shall be permitted to be directly buried where the cable is listed for this use.
(2) Wiring for nonincendive circuits as permitted by 501.10(B)(3), and wiring for intrinsically safe circuits as permitted by 504.20, shall be permitted for circuits derived from Class 2 sources.
(3) Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.
(4) Type PLTC cable in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, shall be permitted in accordance with either (a) or (b):
(a) Type PLTC cable, with a metallic sheath or armor in accordance with725.179(E), shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).
(b) Type PLTC cable, without a metallic sheath or armor, that complies with the crush and impact requirements of Type MC cable and identified for such use with the marking PLTC-ER, shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).
(H) Other Wiring Within Buildings. The following cables installed in building locations, other than those covered in 725.133(B) through (G), shall be permitted to be any of (H)(1) through (H)(7).
(1) Type CL2 or CL3
(2) Type CL2X or CL3X installed in a raceway or in accordance with other wiring methods covered in Chapter 3.
(3) Type CL2X and Type CL3X cables shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).
(4) Type CL2X cables less than 6 mm (0.25 in.) in diameter and Type CL3X cables less than 6 mm (0.25 in.) in diameter in one- and two-family dwellings.
(5) Type CL2X cables less than 6 mm (0.25 in.) in diameter and Type CL3X cables less than 6 mm (0.25 in.) in diameter installed in nonconcealed spaces in multifamily dwellings.
(6) Type CMUC installed under carpet.
(7) Type PLTC in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage. Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted to be exposed between the cable tray and the utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).
(F) Type CL2 or CL3 conductors or cables shall be used for cross-connect arrays.
Substantiation: This proposal is editorial and technical.
The cable and raceway applications sections of articles 725, 760, 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal moves those installation rules to section 725.133.
A companion proposal for section 725.154 greatly simplifies the statement of the applications of communications cables and raceways by using a table.
This proposal and its companion proposal for section 725.154 need to be considered together as a package.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided for this rewrite of 725.133 and the companion Proposal for 725.154. As it is presently written, 725.133 provides a requirement that Class 2 and Class 3 circuits must be installed in accordance with 725.136 through 725.143. These referenced sections are definitely installation requirements.
For example, 725.136 provides installation requirements for separation of Class 2 and 3 circuits from power, light, and similar higher voltage circuits.
In 725.133(A) of the proposed text, the submitter is requiring listing of Class 2 and Class 3 cables, conductors, and raceways. This is a 725.179 issue since existing Part IV deals with listing issues.
Proposed 725.133(B) would permit cable Types CL2P, CL2P-CI, CL3P, and CL3P-CI, plenum signaling raceways, as well as Cable Types CL2P and CL3P installed in plenum signaling raceways without any restriction on length of runs inside of the fabricated ducts. Existing 300.22(B) restricts installation of wiring methods to metal raceways and then only for connection to equipment necessary for direct action on or sensing of the contained air within the fabricated duct.
There was no technical substantiation provided for proposed 725.133(E) for Risers-Cables in Metal Raceways, Fire-Proof Shafts, and One- and Two-Family Dwellings. There was no rationale provided as to why these three installations were in the same subsection together since one- and two-family dwellings seldom deal with risers and fireproof shafts.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
CONNAUGHTON, T.: Remove installation rules from the applications section 725.154 and relocate them in the installation section 725.133. Simplify cable applications by using a table.
Comment on Affirmative:
EGESDAL, S.: This vote is a head-ups for the NEC TCC. Panel 16 accepted in principal the text and tables in proposals to Article 770, 800, and 820 that are very similar to the text and tables in Proposals 3-192, 3-198, 3-290, and 3-298.
KAHN, S.: This is one of a series of proposals that would separate installation rules and cable applications. I participated in the Task Group that worked on the simplification of the installation rules, cable applications and correlation with NFPA 90A (as directed by the Standards Council). CMP-16 improved on the series of proposals in their meeting the week following the CMP-3 meeting. This proposal, along with 3-198, was intended to remove installation rules from the applications section 725.154 and relocate them in the installation section 725.133 and to simplify cable applications by using a table. The Proposal should be reconsidered.
SEPULVEDA, M.: This vote is a head-ups for the NEC TCC. Panel 16 accepted in principal the text and tables in proposals to Article 770, 800, and 820 that are very similar to the text and tables in Proposals 3-192, 3-198, 3-290, and 3-298.

3-193 Log #953 NEC-P03 **Final Action: Reject**
(725.136(G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Class 2 and Class 3 circuit conductors shall be permitted to be installed in the same cable trays with other system conductors where the conductors of the Class 2 and Class 3 circuit conductors or all other system conductors are installed in raceways or metal covered cables.
Exception: Separation from communication circuit conductors shall not be required if the Class 2 and Class 3 circuit conductors comply with 725.139(D)(1).
Substantiation: "Electric light" implies that electric "power" conductors are not included. Effective separation can be accomplished by raceways and metal covered cables other than Type MC. Separation from conductors of communications circuits should not be required since 725.139(D)(1) and (E) permit installation in the same cable or cable tray.
Panel Meeting Action: Reject
Panel Statement: 725.139(C) allows for Class 2 and Class 3 circuits to be installed within a raceway to separate them from Class 1 circuits.
725.136(G) allows the separation to occur as a result of the control circuits being contained with Type MC cable.
Deleting and rewriting the text as proposed by the submitter is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-194 Log #2419 NEC-P03 **Final Action: Reject**
(725.136(H))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Revise text to read as follows:
In hoistways, class 2 or class 3 circuit conductors shall be installed in rigid metal conduit, rigid ~~nonmetallic~~ PVC conduit intermediate metal conduit.
Substantiation: Conforming to style manual Article 352.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-175.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-195 Log #4689 NEC-P03 **Final Action: Reject**
(725.136(I)(3) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add a third condition as follows:
(3) All of the electric light, power, Class 1, non-power limited fire alarm, and medium-power network-powered broadband communications circuit conductors are permanently separated within a listed cable assembly from all of the Class 2 and Class 3 circuit conductors through the use of sheathing that provides for system separation that does not rely on conductor or cable insulation alone.
Substantiation: There is not and has never been any express permission to include Class 2 or Class 3 conductors within a common cable assembly with power conductors. Para (2) here comes the closest, because it recognizes a "continuous and firmly fixed nonconductor." This is crucial to the production of hybrid cables, where additional separation beyond the conductor insulation is applied to the power-limited conductors in accordance with the spirit of these principles. For example, 334.116(C) expressly recognizes this type of construction for Type NMS cable, and UL has been listing such constructions for many years. This topic must be addressed in the limited-power wiring articles, and this proposal is designed to raise the issue.
Panel Meeting Action: Reject
Panel Statement: The purpose of 725.136(I)(2) is to permit flexible tubing inside of a wiring harness where the Class 2 or Class 3 conductors are enclosed by the flexible tubing and separated from the power conductors by more than just the insulation on the conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-195a Log #CP301 NEC-P03 **Final Action: Accept**
(725.139)

Submitter: Code-Making Panel 3,
Recommendation: Revise the heading of 725.139 to read as follows:
"Installation of Conductors of Different Circuits in the Same Cable, Enclosure, Cable Tray, or Raceway".
Substantiation: This action revised the heading to be consistent with the body of the text.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-196 Log #2269 NEC-P03 **Final Action: Reject**
(725.139(E))

TCC Action: The Technical Correlating Committee directs that the Chairs of Code-Making Panels 3 and 16 form a Task Group to correlate the actions taken on this proposal and Proposal 16-12.
Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise text to read as follows:
(E) Class 2 or Class 3 Cables with Other Circuit Cables. Jacketed cables of Class 2 or Class 3 circuits shall be permitted in the same enclosure, cable tray, ~~or~~ raceway or optical fiber/communications cable routing assembly, with jacketed cables of any of the following:
(1) Power-limited fire alarm systems in compliance with Article 760
(2) Nonconductive and conductive optical fiber cables in compliance with Article 770
(3) Communications circuits in compliance with Article 800
(4) Community antenna television and radio distribution systems in compliance with Article 820
(5) Low-power, network-powered broadband communications in compliance with Article 830
Substantiation: Article 770 currently covers optical fiber raceways and provides applications and listing requirements for these raceways. UL lists these raceways to UL 2024, *Optical Fiber and Communication Cable Raceway.* UL lists optical fiber /communications cable routing assemblies to UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies.* Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.)
For further information see the attached application guide from one of the manufacturers or got to http://www.storage-expo.com/ExhibitorLibrary/302/FiberRunner_6.pdf on the web.
The significant difference between optical fiber /communications cable routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.
We have submitted companion proposals to provide for a change of the scope of Article 770 to include optical fiber /communications cable routing assemblies and to provide listing and application for requirements for them. Since these routing assemblies are used for optical fiber, data and communications cables, proposals are being submitted for Articles 725, 770, 800 and 820.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Since these are optical fiber/communications routing assemblies and are to be used in information technology equipment rooms, this proposal should be forwarded to Code-Making Panel 12 for possible action.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
EGESDAL, S.: The proposed assembly is a mechanical support for cables and is suitable for use in Article 725. The cable routing assembly is not listed as a cable tray. These assemblies can be used to support Class 2 & 3 cables, or Type CM cables used as a substitute for Class 2 & 3 cables.
Note: Panel 16 changed the name of the assembly to "cable routing assembly."
KAHN, S.: The proposal should have been approved and the Panel Statement does not address the proposer's substantiation. CMP-16 changed the name to "cable routing assembly." The proposed support is a mechanical assembly and appropriate to Article 725 and is not a cable tray.
SEPULVEDA, M.: The proposed assembly is a mechanical support for cables and is suitable for use in Article 725. The cable routing assembly is not listed as a cable tray. These assemblies can be used to support Class 2 & 3 cables, or Type CM cables used as a substitute for Class 2 & 3 cables.
Note: Panel 16 changed the name of the assembly to "cable routing assembly."

3-197 Log #4360 NEC-P03 **Final Action: Reject**
(725.141)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 725.141
~~725.141 Installation of Circuit Conductors Extending Beyond One Building. Where Class 2 or Class 3 circuit conductors extend beyond one building and are run so as to be subject to accidental contact with electric light or power conductors operating over 300 volts to ground, or are exposed to lightning on interbuilding circuits on the same premises, the requirements of the following shall also apply:~~
~~(1) Sections 800.44, 800.50, 800.53, 800.93, 800.100, 800.170(A), and 800.170(B) for other than coaxial conductors~~
~~(2) Sections 820.44, 820.93, and 820.100 for coaxial conductors~~
725.141 Class 2 and Class 3 Circuits Extending Beyond One Building. Class 2 and Class 3 circuits that extend beyond one building and run outdoors shall meet the installation requirements of Parts II, III, and IV of Article 800 and shall comply with the applicable sections of Part I of Article 300.

Substantiation: Class 2 and Class 3 circuits should have equivalent requirements to those required for power-limited fire alarm circuits. The proposed text is parallel to the requirements for power-limited fire alarm circuits.

Class 2, Class 3 and non-power-limited fire alarm circuits are permitted to be installed together in the same cable or raceway. It is important for both types of circuits to have the same protection where installed outdoors, and transient protection as required by Article 800.

Panel Meeting Action: Reject

Panel Statement: Part of the intent of Article 725 is to provide alternative methods of installations including minimum installation requirements.

The current text already references the requirements necessary from Article 800.

There was no technical substantiation provided in the proposal for this change.

Not all Class 2 or Class 3 circuits installed beyond the building of origin of the circuit need to have over-voltage protection or lightning protection.

Where there is exposure to these hazards, 725.141 adequately provides the appropriate section references for the extra protection necessary for the circuit.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: The present text in 725-141 does not include 800.90, which requires primary protectors for circuits entering a building. It is important to require transient protection and the applicable sections of Part I of Article 300 (e.g., sealing for temperature differences). Because Class 2 & 3 circuits are often installed with fire alarm circuits, it is important for both types of circuits to require the same protection.

800.90, which is not a referenced requirement in 725.41, required lightning protection, and identifies where lightning protection is not required.

SEPULVEDA, M.: The present text in 725-141 does not include 800.90, which requires primary protectors for circuits entering a building. It is important to require transient protection and the applicable sections of Part I of Article 300 (e.g., sealing for temperature differences). Because Class 2 & 3 circuits are often installed with fire alarm circuits, it is important for both types of circuits to require the same protection.

800.90, which is not a referenced requirement in 725.41, required lightning protection, and identifies where lightning protection is not required.

3-198 Log #3124 NEC-P03 **Final Action: Reject**
(725.154)

Submitter: Sanford E. Egesdal, Egesdal Associates PLC

Recommendation: Revise 725.154

Add new Table 725.154(A)

Delete 725.154(A) through (F) and 725.154(H).

Renumber Table 725.154(G) to 725.154(B)

Renumber Figure 725.154(G) to 725.154(B)

~~725.154 Applications of Listed Class 2, Class 3, and PLTC Cables.~~

~~Class 2, Class 3, and PLTC cables shall comply with any of the requirements described in 725.154(A) through (H).~~

~~(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C). Only Type CL2P or CL3P cable shall be permitted to be installed in these raceways.~~

~~(B) Riser. Cables installed in risers shall be as described in any of (B)(1), (B)(2), or (B)(3):~~

~~(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Listed riser signaling raceways and listed plenum signaling raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CL2R, CL3R, CL2P, or CL3P cables shall be permitted to be installed in these raceways.~~

~~(2) Other cables as covered in Table 725.154(G) and other listed wiring methods as covered in Chapter 3 shall be installed in metal raceways, or located in a fireproof shaft having firestops at each floor.~~

~~(3) Type CL2, CL3, CL2X, and CL3X cables shall be permitted in one- and two-family dwellings. Listed general-purpose signaling raceways shall be permitted for use with Type CL2, CL3, CL2X, and CL3X cables.~~

~~FPN: See 300.21 for firestop requirements for floor penetrations.~~

~~(C) Cable Trays. Cables installed in cable trays outdoors shall be Type PLTC. Cables installed in cable trays indoors shall be Types PLTC, CL3P, CL3R, CL3, CL2P, CL2R, and CL2.~~

~~Listed general-purpose signaling raceways, listed riser signaling raceways, and listed plenum signaling raceways shall be permitted for use with cable trays.~~

~~FPN: See 800.154(D) for cables permitted in cable trays.~~

~~(D) Hazardous (Classified) Locations. Cables installed in hazardous locations shall be as described in 725.154(D)(1) through (D)(4).~~

~~(1) Type PLTC. Cables installed in hazardous (classified) locations shall be Type PLTC. Where the use of Type PLTC cable is permitted by 501.10(B), 502.10(B), and 504.20, the cable shall be installed in cable trays, in raceways, supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or other mechanical means. The cable shall be permitted to be directly buried where the cable is listed for this use.~~

~~(2) Intrinsically Safe Circuits and Nonincendive Field Wiring. Wiring for nonincendive circuits as permitted by 501.10(B)(3), and wiring for intrinsically safe circuits as permitted by 504.20, shall be permitted for circuits derived from Class 2 sources.~~

~~(3) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.~~

~~(4) In Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type PLTC cable shall be permitted in accordance with either (1) or (2):~~

~~(1) Type PLTC cable, with a metallic sheath or armor in accordance with725.179(E), shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).~~

~~(2) Type PLTC cable, without a metallic sheath or armor, that complies with the crush and impact requirements of Type MC cable and identified for such use with the marking PLTC-ER, shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).~~

~~(E) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 725.154(A) through (D) shall be as described in any of (E)(1) through (E)(7).~~

~~(1) General. Type CL2 or CL3 shall be permitted.~~

~~(2) In Raceways or Other Wiring Methods. Type CL2X or CL3X shall be permitted to be installed in a raceway or in accordance with other wiring methods covered in Chapter 3.~~

~~(3) Nonconcealed Spaces. Type CL2X and Type CL3X cables shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).~~

~~(4) One- and Two-Family Dwellings. Type CL2X cables less than 6 mm (0.25 in.) in diameter and Type CL3X cables less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.~~

~~(5) Multifamily Dwellings. Type CL2X cables less than 6 mm (0.25 in.) in diameter and Type CL3X cables less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in nonconcealed spaces in multifamily dwellings.~~

~~(6) Under Carpets. Type CMUC undercarpet communications wires and cables shall be permitted to be installed under carpet.~~

~~(7) Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted to be exposed between the cable tray and the utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).~~

~~(F) Cross-Connect Arrays. Type CL2 or CL3 conductors or cables shall be used for cross-connect arrays.~~

~~(H) Class 2, Class 3, PLTC Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Circuit integrity (CI) cable or a listed electrical circuit protective system shall be permitted for use in remote control, signaling, or power-limited systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.~~

~~(G) Class 2 and Class 3 Cable Substitutions. The substitutions for Class 2 and Class 3 cables listed in Table 725.154(G) and illustrated in Figure 725.154(G) shall be permitted. Where substitute cables are installed, the wiring requirements of Article 725, Parts I and III, shall apply.~~

~~FPN: For information on Types CMP, CMR, CM, and CMX, see 800.179.~~

725.154 Applications of Listed CL2, CL3, and PLTC Cables and Signaling Raceways.

Permitted and non-permitted applications of listed CL2, CL3, and PLTC cables and signaling raceways shall be as indicated in Table 725.154(A). The substitutions for cables listed in Table 725.154(B) and illustrated in Figure 725.154(B) shall be permitted.

Table 725.154(A), Applications of CL2 and CL3 Cables and Signaling Raceways

Wire, Cable or Raceway Type	Applications													
	In air ducts and plenums as described in 300.22(B)	In other spaces used for environmental air as described in 300.22(C)	In risers	In building locations other than air ducts, plenums, other spaces used for environmental air, risers, cable trays, distributing frames and cross-connect arrays	In one- and two-family and in multi-family dwellings	In multifamily dwellings In nonconcealed spaces	Industrial establishments	In cable trays	Under carpets	In cross-connect arrays	In any raceway in Chapter 3	In plenum signaling raceways	In riser signaling raceways	In general-purpose signaling raceways
CL2P and CL3P	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
CL2R and CL3R	N	N	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
CL2 and CL3	N	N	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
CL2X	N	N	Y	Y	Y	N	Y	N	Y	N	Y	Y	Y	Y
CL3X	N	N	N	N	Y	Y	Y	N	N	N	Y	N	N	N
PLTC	N	N	N	N	N	N	Y	Y	N	N	N	N	N	N
CMUC	N	N	N	N	N	N	N	N	Y	N	N	N	N	N
Plenum Signaling Raceways	Y	Y	Y	Y	Y	Y	Y	Y	-	-	-	-	-	-
Riser Signaling Raceways	N	N	Y	Y	Y	Y	Y	Y	-	-	-	-	-	-
General-Purpose Signaling Raceways	N	N	N	Y	Y	Y	Y	Y	-	-	-	-	-	-

Note. Applications indicated by “Y” shall be permitted. Applications indicated by an “N” shall not be permitted. Applications with a “–“ are not addressed.

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 725, 760, 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal for section 725.154 greatly simplifies the statement of the applications of fiber cables and raceways by using a table where the permitted applications are indicated by a "Y" and the applications that are not permitted are indicted by an "x". A companion proposal moves the installation rules to section 725.113 Installation of cables and signaling raceways.

This proposal makes no changes to the existing permitted and not permitted applications of cables and raceways.

This proposal and its companion proposal for section 725.113 need to be considered together as a package.

This proposal provides parallel requirements to a group of Proposals prepared by the CMP 16 Special Editorial Task Group for articles 770, 800, 820, and 830 for the 2011 NEC. The goals of the Panel 16 task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Panel 16 Task Group members were Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson, Stan Kahn, Stan Kaufman, and Harry Odhe.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 3-192.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

AYER, L.: This proposal should have been accepted in principle with the wording shown below. This section has been confusing to user of the code for many cycles and needs to be re-written to provide necessary clarity on where specifically fire alarm cables can be used.

There are two main reasons that the wording should be changed within section 760.154.

First, several proposals have been submitted and accepted in some form by Code Panel 3 to change the terms "ducts or plenums" found in 300.22(B). The term Òducts or plenumsÓ is being changed to "ducts specifically fabricated for environmental air" for clarity. This change will help the user of the code have a clear delineation that 300.22(B) is sheet metal ducts (or equivalent) used to transport air and 300.22(C) covers areas traditionally defined and understood by trades people as plenums (traditionally as other space).

Second, the latest edition of NFPA 90A has made changes to how cables are treated should they be installed within sheet metal ductwork (or equivalent). NFPA 90A dictates that wiring can be installed within a duct only if it is associated with the airflow. It also limits the amount of cable connected to a piece of equipment within a duct to no more than 4 ft. If the present wording remains with the NEC the user of the code would be unaware that cable installed in fabricated ducts is limited in scope. The revised wording proposed would provide clear guidance on this issue and would correlate with 90A. NFPA 90A does have purview in this area and the NEC must correlate.

725.154 Applications of Listed Class 2, Class 3, and PLTC Cables. Class 2, Class 3, and PLTC cables
shall comply with any of the requirements described in 725.154(A) through (H).

(A) Ducts. Cables shall be permitted to be installed in ducts specifically fabricated for environmental
air if all of the following conditions are met:
(1) The cable shall be Type CL2P or CL3P and
(2) The cable is directly associated with the air distribution system and
(3) The cable shall not exceed 1.22m (4 ft) in length.

(B) Other Space Used for Environmental Air.~~(A) Plenums.~~ Cables installed in ~~ducts, plenums, and~~ other
spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C). Only Type CL2P or CL3P cable shall be permitted to be installed in these raceways.

(C) ~~(B)~~**Riser**. Cables installed in risers shall be as described in any of (B)(1), (B)(2), or (B)(3):

CONNAUGHTON, T.: Remove installation rules from the applications section 725.154 and relocate them in the installation section 725.133. Simplify cable applications by using a table.

Comment on Affirmative:

EGESDAL, S.: This vote is a head-ups for the NEC TCC. Panel 16 accepted in principal the text and tables in proposals to Article 770, 800, and 820 that are very similar to the text and tables in Proposals 3-192, 3-198, 3-290, and 3-298.

KAHN, S.: This is one of a series of proposals that would separate installation rules and cable applications. I participated in the Task Group that worked on the simplication of the installation rules, cable applications and correlation with NFPA 90A (as directed by the Standards Council). CMP-16 improved on the series of proposals in their meeting the week following the CMP-3 meeting. This proposal, along with 3-192, was intended to remove installation rules from the applications section 725.154 and relocate them in the installation section 725.133 and to simplify cable applictions by using a table. The Proposal should be reconsidred.

SEPULVEDA, M.: This vote is a head-ups for the NEC TCC. Panel 16 accepted in principal the text and tables in proposals to Article 770, 800, and 820 that are very similar to the text and tables in Proposals 3-192, 3-198, 3-290, and 3-298.

3-199 Log #126 NEC-P03 **Final Action: Accept in Principle**
(725.154(A))

Submitter: Gerald Lee Dorna, Belden

Recommendation: Add the following text at the end of 725.154(A):
<u>Metallic cable trays and metallic cable tray systems shall be permitted to be installed in other spaces used for environmental air. Types CL2P and CL3P cables and plenum signaling raceways shall be permitted to be installed in these cable trays and cable tray systems. Types CL2R, CL3R, PLTC, CL3, CL2, CL3X and CL2X cables, and riser and general-purpose signaling raceways shall not be permitted to be installed in these cable trays and cable tray systems.</u>

Substantiation: Article 392, Cable Trays, has requirements for cable trays in air handling spaces in section 392.4.

392.4 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

Section 300.22 has provisions for cable trays in 300.22(C), Other Space Used For Environmental Air.

(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.
Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.

Section 300.22(C)(1) permits only solid bottom metal cable tray with solid metal covers. Optical fiber, communications, CATV, signaling and fire-alarm plenum cables, and plenum raceways are often installed in metal cable trays and metal cable tray systems in plenums (other spaces used for environmental air). These installations are "neat and workmanlike" and safe. They should be permitted.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel and action and statement on Proposal 3-97.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-200 Log #4343 NEC-P03 **Final Action: Reject**
(725.154(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 725.154(A)

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum ~~signaling~~ communications raceways shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C). Only Type CL2P or CL3P cable shall be permitted to be installed in these raceways.
Substantiation: This proposal correlates with the recently published NFPA 90A-2009, which does not permit plenum signaling raceways in a plenum. The NFPA 90-2009 requirements follows:

NFPA 90A-2009, 4.3.11.2.6.4 Optical fiber and communication raceways shall be listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.5 m (5 ft) or less when tested in accordance with ANSI/UL 2024, *Standard for Safety Optical-Fiber and Communications Cable Raceway.*
Panel Meeting Action: Reject
Panel Statement: The Scope does not include communications raceways, and neither does 725.3(C).

While the basic UL standard for these raceways is UL 2024, Optical Fiber and Communication Cable Raceway, the UL product name for these raceways can be, as appropriate: ''Optical Fiber Raceway,'' ''Communications Cable Raceway,'' ''Signaling Cable Raceway,'' ''Coaxial Cable Raceway'' or ''Optical Fiber/Communications/Signaling/Coaxial Cable Raceway''; therefore, renaming the raceway to "communications raceway" appears to not meet the submitter's concern.

The panel requests input from the Technical Correlating Committee regarding correlation issues between this panel and the NFPA 90A Committee concerning the appropriate product name for these type of raceways.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

EGESDAL, S.: The name of the plenum raceway in the proposal was to correlate NFPA 90A-2009 and the NEC. The name of a raceway is not relevant to the types of cables permitted to be installed in the raceway. NFPA 90A-2009 does not identify a plenum signaling raceway as being permitted in an air handling space. Hopefully, the NEC TCC will provide guidance to CMP 3, as to the need to correlate with the requirements in NFPA 90A, where combustible material is exposed to airflow.

CMP 16 revised Article 820 to use plenum, riser, or general-purpose communications raceway for CATV cables, dropping the listing for CATV raceways.

KAHN, S.: This proposal is intended to correlate with NFPA 90A and should have been accepted.

SEPULVEDA, M.: The name of the plenum raceway in the proposal was to correlate NFPA 90A-2009 and the NEC. The name of a raceway is not relevant to the types of cables permitted to be installed in the raceway. NFPA 90A-2009 does not identify a plenum signaling raceway as being permitted in an air handling space. Hopefully, the NEC TCC will provide guidance to CMP 3, as to the need to correlate with the requirements in NFPA 90A, where combustible material is exposed to airflow.
CMP 16 revised Article 820 to use plenum, riser, or general-purpose communications raceway for CATV cables, dropping the listing for CATV raceways.

3-201 Log #1604 NEC-P03 **Final Action: Reject**
(725.154(B)(1))

Submitter: Ray R. Keden, ERICO, Inc. / Rep. BICSI
Recommendation: Revise text to read as follows:

Cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Listed riser signaling raceways and listed plenum signaling raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CL2R, CL3R, CL2P, or CL3P cables shall be permitted to be installed in these raceways.
Substantiation: Is it really our intention that cables passing between floors through a floor penetration be less than riser rated?

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel contends that the existing text does meet the panel's intention.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

KEDEN, R.: I understand that the intention of the Panel 3 majority was to allow for general use cable to be used between two floors only, but I disagree. Since Panel 16 accepted similar proposals, this will become an issue for the Correlating Committee

3-202 Log #2849 NEC-P03 **Final Action: Reject**
(725.154(D))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(D) Type PLTC and Type PLTC-ER Cables ~~Hazardous (Classified) Locations~~.
Cables shall be installed ~~in hazardous locations shall be~~ as described in 725.154(D)(1) through (D)(4).
(1) Type PLTC. ~~Cables installed in hazardous (classified) locations shall be Type PLTC.~~ Where the use of Type PLTC cable is permitted ~~by 501.10(B), 502.10(B), and 504.20~~, the cable shall be installed in cable trays, in raceways, supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or other mechanical means. The cable shall be permitted to be directly buried where the cable is listed for this use.
(2) Intrinsically Safe Circuits and Nonincendive Field Wiring. Wiring for nonincendive circuits as permitted by 501.10(B)(3), and wiring for intrinsically safe circuits as permitted by 504.20, shall be permitted for circuits derived from Class 2 sources.
(3) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.
(4) In Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation,
Type PLTC cable shall be permitted in accordance with either (1) or (2):

(1) Type PLTC cable, with a metallic sheath or armor in accordance with 725.179(E), shall be permitted to be installed exposed. The cable shall be continuously supported
and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).

(2) Type PLTC cable, without a metallic sheath or armor, that complies with the crush and impact requirements of Type MC cable and identified for such use with the marking PLTC-ER, shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).
Substantiation: This proposal removes unnecessary restrictions on installations and provides benefits to all users.

1) The hazardous (Classified) location requirements remain in Chapter 5, where permitted, as referenced in 725.3(D),

2) None of the requirements in this Article are unique to Classified locations nor required by Chapter 5,

3) This proposal makes extended run (-ER) cable available outside of a Classified location,

4) This proposal permits direct burial outside of a Classified location.
Panel Meeting Action: Reject
Panel Statement: 336.10(7) restricts Type TC-ER to industrial locations only.

No technical documentation was been provided to support the expanded use of PLTC-ER as a subset of Type TC-ER.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

STENE, S.: The intent of the submitter was to move the requirements for cables used in hazardous locations out of Article 725, while still permitting the use of Type PLTC-ER in industrial applications. Section 725.154(E)(7) permits "Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted to be exposed." The appropriate identification is Type PLTC-ER in accordance with the listing requirements, therefore, the submitter is not adding or expanding the use of PLTC-ER in industrial applications as it is already permitted. The '-ER' marking was not specifically called out in 725.154(E)(7) in the 2008 NEC but there is no reason to exclude it. If Type PLTC-ER can be used in a Class I, Division 2, Class II, Division 2, or in an intrinsically safe hazardous location, it certainly could be used for limited applications within an industrial facility. The proposed text indicates that the identification shall be 'PLTC-ER'

The requirements for thermocouple circuits currently located in 725.154(D)(3) should be relocated as 725.154(I) (new).

The panel should have voted for an Accept in Principle with the following modified text:
~~**725.154 (D) Hazardous (Classified) Locations.** Cables installed in hazardous locations shall be as described in 725.154(D)(1) through (D)(4).~~
~~**(1) Type PLTC.** Cables installed in hazardous (classified) locations shall be Type PLTC. Where the use of Type PLTC cable is permitted by 501.10(B), 502.10(B), and 504.20, the cable shall be installed in cable trays, in raceways, supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or other mechanical means. The cable shall be permitted to be directly buried where the cable is listed for this use.~~

~~**(2) Intrinsically Safe Circuits and Nonincendive Field Wiring.** Wiring for nonincendive circuits as permitted by 501.10(B)(3), and wiring for intrinsically safe circuits as permitted by 504.20, shall be permitted for circuits derived from Class 2 sources.~~
~~**(3) Thermocouple Circuits.** Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.~~
~~**(4) In Industrial Establishments.** In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation,~~
~~Type PLTC cable shall be permitted in accordance with either (1) or (2):~~
~~(1) Type PLTC cable, with a metallic sheath or armor in accordance with 725.179(E), shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).~~
~~(2) Type PLTC cable, without a metallic sheath or armor, that complies with the crush and impact requirements of Type MC cable and identified for such use with the marking PLTC-ER, shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).~~
725.154 (E) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 725.154(A) through (D) shall be as described in any of (E)(1) through (E)(7).
(7) Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable, is identified for such use with the marking PLTC-ER, shall be permitted to be exposed. ~~between the cable tray and the utilization equipment or device.~~ The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).
725.154 (I) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

3-203 Log #1814 NEC-P03 **Final Action: Reject**
(725.154(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence of (D)(4) and (E)(7): In industrial and commercial establishments... (remainder unchanged).
Delete last two sentences of (D)(4)(1) and (2) and (E)(7) and substitute: The cable shall be securely fastened to supports at intervals not exceeding 1.8 m (6 ft) and protected by approved means where likely to be subject to physical damage.
Add after (D)(4)(2) and (E)(7): Exception: The cable shall be permitted to be fished through concealed spaces in finished buildings or structures where supporting is Impractical and the cable is securely fastened and supported where it becomes accessible.
Substantiation: Commercial establishments should be included; conditions of maintenance and supervision should be the criteria, not occupancy. "Continually" supported does not allow for installation in cable trays without a solid bottom or where cable crosses open spaces. Present wording requires protection whether or not damage is likely. (D)(4) and (E)(7) same occupancy, but suggest that installation in cable tray or raceways is not considered protection. "Likely" is defined as such a nature or circumstance as to take something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The word "industrial" is an occupancy classification in the IBC, while "commercial" is not identified in either the IBC or NFPA 5000.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-204 Log #4354 NEC-P03 **Final Action: Reject**
(725.154(H))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 725.154(H)
(H) Class 2, Class 3, and PLTC Cables With Suffix Markings. Class 2, Class 3, or PLTC cables with single or multiple suffix markings shall be permitted where required to meet special applications.
(~~H~~1) Class 2, Class 3, and PLTC Circuit Integrity (CI) Cables or Electrical Circuit Protective System. Circuit integrity (CI) cables or a listed electrical circuit protective system shall be permitted for use in remote control, signaling, or power-limited systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions. Circuit integrity cable shall be marked in accordance with 725.179(F).
(2) Class 2 and Class 3 Cables for Dry, Damp, or Wet Locations. Class 2 or Class 3 cables installed in dry, damp, or wet locations shall be marked in accordance with 725.179.(M).
(3) Class 2 and Class 3 Cables Exposed to Direct Sunlight. Class 2 or Class 3 Cables installed exposed to direct sunlight shall be marked in accordance with 725.179(N).
(4) Class 2 and Class 3 Cables in Corrosive Locations. Class 2 and Class 3 cables installed in corrosive locations shall be marked in accordance with 725.179(P).
(5) Class 2 and Class 3 Very-Low-Smoke Producing Cables. Class 2 or Class 3 very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be marked in accordance with 725.179(Q).
(6) Class 2 and Class 3 Fire Hazard Cables. Class 2 or Class 3 fire hazard cables installed to provide low flame spread, very-low-smoke, and known potential heat release shall be marked in accordance with 725-179(R).
Substantiation: This proposal permits cables identified in 725.154(A), (B), (D), and (E) to have suffix markings.
This proposal establishes 725.154(H) for cables with suffixes for installation in locations requiring special cable characteristics, and moves existing 725.154(H) to 725.154(H)(1).
Panel Meeting Action: Reject
Panel Statement:
None of the suggested changes in this proposal deal with applications; all are dealing with markings more appropriately covered in 725.179.
This application section is designed to provide information where a particular cable can be installed. This proposal does not provide any application for any of the proposed cables, and there are no installation requirements for these cables.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: While the intent of the proposal was to provide application requirements, the proposal should have included more specific text, as to applications. The installation requirements for Class 2 & Class 3 cables are detailed in 725.130(B), so a proposal to these sections was unnecessary.
SEPULVEDA, M.: While the intent of the proposal was to provide application requirements, the proposal should have included more specific text, as to applications. The installation requirements for Class 2 & Class 3 cables are detailed in 725.130(B), so a proposal to these sections was unnecessary.

3-205 Log #2019 NEC-P03 **Final Action: Reject**
(725.179)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "or structures" after "buildings".
Substantiation: Edit. Structures not deemed as buildings should be included.
Panel Meeting Action: Reject
Panel Statement: The NEC definition of "buildings" uses the term "structures". "Structure" is a defined NEC term. The proposal would create confusing text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-206 Log #4355 NEC-P03 **Final Action: Reject**
(725.179)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 725.179
725.179 Listing and Marking of Class 2, Class 3, and Type PLTC Cables.
Class 2, Class 3, and Type PLTC cables and nonmetallic signaling raceways installed as wiring methods within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 725.179(A) through (K) and 725.179(M) through (R) and shall be marked in accordance with 725.179(L).
Substantiation: The revision to 725.179 is editorial and accommodates new cable listing requirements.
Panel Meeting Action: Reject
Panel Statement: Based on the lack of any applications provided in proposals for 725.154, other than marking requirements, listing requirements for these cables cannot be accepted in 725.179.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: This proposal was primarily editorial to correlate with the new cable suffix markings in companion proposals to 725.179.
SEPULVEDA, M.: This proposal was primarily editorial to correlate with the new cable suffix markings in companion proposals to 725.179.

3-207 Log #1647 NEC-P03 **Final Action: Reject**
(725.179(A), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 725.179(A) FPN as follows:
FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, ~~to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~
Substantiation: 3.1.3 of the NEC Style Manual states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."
Panel Meeting Action: Reject
Panel Statement: These fine print notes are not written in mandatory language and are simply expressing some of the maximum peak smoke and optical density or the maximum flame spread provided in the referenced NFPA 262 document.
This FPN is providing information on various methods of defining smoke producing cables or fire-resistant cables.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
SANDERS, M.: The submitter is correct by referring to 3.1.3 of the NEC Style Manual which states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language." Clearly, this FPN contains what could be determined to be mandatory language and could imply a requirement that goes well beyond the purpose of FPN's to simply inform.

3-208 Log #4558 NEC-P03 **Final Action: Accept in Principle**
(725.179(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
725.82 Listing and Marking of Class 2, Class 3, and Type PLTC Cables.
Class 2, Class 3, and Type PLTC cables installed as wiring within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 725.179(A) through 725.179 (K) and shall be marked in accordance with 725.179(L).
(A) Types CL2P and CL3P. Types CL2P and CL3P plenum cables shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.
FPN: One method of defining <u>a cable that is</u> low smoke-producing cable<u> and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.</u> ~~is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~
No change for 725.179 (B) through 725.179 (K)
Substantiation: This comment recommends a slight change in wording for the existing Fine Print Note, by recognizing that listing of plenum cable by NFPA 262 represents listing to both low smoke and low flame spread, and that cables cannot be listed separately to either property. This is basically an editorial change, as a clarification, to the existing Fine Print Note.
The same change is being proposed to the corresponding Fine Print Notes in article 760. The new language is consistent with the language in the corresponding fine print notes in articles 770, 800, 820 and 830, all of which deal with the same type of cables.
This has been proposed before but was caught in the NEC moratorium associated with plenum cables.
Panel Meeting Action: Accept in Principle
Revise the proposed fine print note to read as follows:
"FPN: One method of defining low smoke-producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces."
Panel Statement: The revised language clarifies the intent of the panel and meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
AYER, L.: NFPA 262 deals with testing of cables for low-smoke and flame travel properties. Adding the term "fire-resistant" may confuse the user since fire-resistant cables typically means cables that can withstand several hours of direct flame contact.
Comment on Affirmative:
EGESDAL, S.: The submitter's text is consistent with the text in 770, 800, 820, and 830. If the CMP 3 "tweaking" of the submitter's text is better grammar, hopefully, the NEC TCC will direct CMP 16 to revise the corresponding 770, 800, 820, and 830 FPN's.
KAHN, S.: The submitted text is identical to the corresponding FPN's in 770, 800, 820, and 830. If the revised text is better, it should be incorporated into the other Articles.
SEPULVEDA, M.: The submitter's text is consistent with the text in 770, 800, 820, and 830. If the CMP 3 "tweaking" of the submitter's text is better grammar, hopefully, the NEC TCC will direct CMP 16 to revise the corresponding 770, 800, 820, and 830 FPN's.

3-209 Log #4834 NEC-P03 **Final Action: Reject**
(725.179(A), FPN)

Submitter: T. David Mills, T. David Mills Associates
Recommendation: Modify the fine print note as follows:
FPN: ~~One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~ <u>See {3}, Annex I.</u>
Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. T This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.
I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-72.
Number Eligible to Vote: 15

Recommendation: Modify the fine print note as follows:
FPN: ~~One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the Test for Flame Propagation (Riser) in UL 2024, Standard for Optical Fiber Cable Raceway.~~ See {9}, Annex I.
Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.
I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.
Panel Meeting Action: Reject
Panel Statement: See the panel Statement on Proposal 3-72.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
SANDERS, M.: See my Explanation of Negative for Proposal 3-72.

3-222 Log #1653 NEC-P03 **Final Action: Reject**
(725.179(K), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 725.179(K) FPN as follows:
FPN: One method of ~~defining~~ determining resistance to the spread of fire is ~~that the raceways pass the requirements of the~~ testing in accordance with the Vertical-Tray Flame Test (General use) in UL 2024, Standard for Optical Fiber Cable Raceway.
Substantiation: 3.1.3 of the NEC Style Manual states “Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language.”
Panel Meeting Action: Reject
Panel Statement: These fine print notes are not written in mandatory language and are simply expressing some of the maximum flame spread provided in the referenced UL 2024 documents. This FPN is providing information on various methods of defining smoke-producing cables or fire-resistant cables.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-223 Log #4842 NEC-P03 **Final Action: Reject**
(725.179(K), FPN)

Submitter: T. David Mills, T. David Mills Associates
Recommendation: Modify the fine print note as follows:

3-224 Log #4356 NEC-P03 **Final Action: Reject**
(725.179(L) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 725.179(L).
(L) Marking. Cables shall be marked in accordance with 310.11(A)(2), (A)(3), (A)(4), and (A)(5) and Table 725.179.
(1) Voltage ratings shall not be marked on the cables.
FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 electric light and power applications.
Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.
(2) Temperature ratings greater than 60ºC shall be marked on the cable.
(3) Cables listed as suitable for installation at temperatures lower than 60ºC shall have the lowest permitted temperature marked on the cable.
(4) Cables listed as meeting the requirements of 179.(A) through (E) shall be permitted to have additional suffixes that comply with other 725.179 subsections.
Substantiation: There is no marking on cables rated at 60ºC (140ºF). There is no indication in this article as to the temperature rating. Article 310 does an excellent job of identifying temperature rating of conductors. The goal of this proposal is to provide equivalent requirements.
See companion proposal to add new 725.179(O).
The additional subsections added to 725.179(L) correlate with markings identified in other subsections of 725.179 [e.g., 725.179(F) provides for a "-CI" suffix that can be added to any of the cables identified in 725.179(A) through (E)].
Panel Meeting Action: Reject
Panel Statement: Marking requirements for cables for temperatures in excess of 60 degrees C is already covered by the UL product standard UL 13, covering power-limited circuit cables. These cables are available based on the standard requirements for temperatures up to 250 degrees C or 482 degrees F. Where an application occurs with a temperature in excess of 140 degrees F, the installer would install a cable with a high enough temperature rating for the ambient temperature.
Class 2 and Class 3 cables are not required by the standard to be marked where the cable is rated for just 60 degrees C, unlike the power conductors in Article 310. Power conductor insulation in the 600-volt and lower voltage range are normally rated at 60 degrees C, 75 degrees C, and 90 degrees C to provide an ampacity rating for the conductor where terminating on an overcurrent protective device or a load device or both with a rating of 60 degrees C or 75 degrees C. The ampacity tables will then provide the allowable ampacity based on the insulation characteristics. This method of determining the ampacity of a conductor based on the conductor insulation is not required for a Class 2 or Class 3 cable and related conductors since the ampacity range of the conductors are based on Tables 11(A) and (B) in Chapter 9 and not based on the ampacity tables in Article 310. Therefore, there is no reason to provide the marking requirements in Article 310 for Class 2 and 3 cables or conductors.
Where a high ambient temperature is encountered in the installation of Class 2 or Class 3 cables and conductors, higher temperature cables can be required, obtained, and installed. There was no technical substantiation provided to justify this requirement.
Class 2 and 3 cables can be purchased that have been subjected to a cold bend test to ensure bending capability for cold temperatures down to minus 70 degrees C; however, this is not an installation temperature; it is an application temperature.
Again, the standard provides testing for this; however, there has been no substantiation provided to insert this into the NEC.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: The purpose of this proposal is to establish requirements in Article 725 for cable; requirements that provide equivalency to Chapter 3 conductor marking requirements. The requirements in this proposal match what is in the UL standard. Cables listed to the requirements in the UL standard have provided the industry with a reliable product. The specific marking would not have a financial impact on manufacturers.
Article 725 circuits are sometimes installed in harsh environments (e.g., wet locations, exposed to sunlight, walk-in freezers, rooftops). It is important that the NEC establish requirements that are needed for application and installation of Article 725 cables, and not rely on whatever a testing organization somewhere in the world decides is appropriate. Specific marking requirements would be useful to designers, buyers, installers, and AHJ's.
SEPULVEDA, M.: The purpose of this proposal is to establish requirements in Article 725 for cable; requirements that provide equivalency to Chapter 3 conductor marking requirements. The requirements in this proposal match what is in the UL standard. Cables listed to the requirements in the UL standard have provided the industry with a reliable product. The specific marking would not have a financial impact on manufacturers.

Specific marking requirements would be useful to designers, buyers, installers, and AHJ's.

3-225 Log #4347 NEC-P03 **Final Action: Reject**
(725.179(M) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.179(M):
(M) Conductors and Cables in Dry, Damp, or Wet Locations. Cables specified in 725.154(A), (B), (D)(1), and (E) shall be listed for installation in dry, damp, or wet locations, or shall have a moisture-impervious metal sheath, and shall be marked as required in 725.179(M)(a), (b), or (c).
(a) Conductors and cables installed in dry location shall not be required to have an additional suffix marking.
(b) Conductors and cables suitable for installation in damp locations shall be identified with the suffix "-DAMP". Conductors and cables listed for damp locations shall be suitable for installation in dry locations.
FPN: One method of defining suitability for installation in damp locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
(c) Conductors and cables suitable for installation in wet locations shall be identified with the suffix "-WET". Conductors and cables listed for wet locations shall be suitable for installation in dry or damp locations.
FPN: One method of defining suitability for installation in wet locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies which Class 2, Class 3, and PLTC cables are suitable for dry, damp, or wet locations. Cables suitable for installation in dry locations that are installed in damp or wet locations have the potential to cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-206.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: See My Explanation of Negative on 3-224.
SEPULVEDA, M.: See my explanation of negative vote on Proposal 3-224.

3-226 Log #4350 NEC-P03 **Final Action: Reject**
(725.179(N) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.179(N)
(N) Class 2 and Class 3 Conductors and Cables Exposed to Direct Sunlight. Class 2 and Class 3 conductors and cables installed exposed to direct sunlight shall be listed as sunlight resistant cable. Cables specified in 725.154(A), (B), and (E), and used for installations exposed to direct sunlight shall have the additional classification using the suffix "-SR".
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies Class 2, and Class 3 conductors and cables as being suitable for installation exposed to direct sunlight. Cables that are not listed for exposure to direct sunlight and are installed exposed to direct sunlight have the potential to cause system malfunction. There have been job failures where cables supported by an aerial messenger wire failed due to sunlight exposure.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-206.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: See My Explanation of Negative on 3-224.
SEPULVEDA, M.: See my explanation of negative vote on Proposal 3-224.

3-227 Log #4352 NEC-P03 **Final Action: Reject**
(725.179(O) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.179(O)
(O) Class 2 and Class 3 Cable Temperature Ratings. Class 2 and Class 3 cables shall be listed for a temperature rating of not less than 60ºC (140ºF). Class 2 and Class 3 cables and PLTC shall be permitted to have an additional temperature rating for the lowest permitted temperature.
Substantiation: Class 2 and Class 3 cables are often installed in areas where the temperature exceeds the 60ºC (140ºF) rating, which is not marked on the cable. For example, cable installed in conduit on a rooftop could have a temperature internal to the conduit in excess of 160 ºF.
Additionally, Class 2 and Class 3 circuits are sometimes installed in cold areas (e.g., walk-in freezer or home fire alarm/security system pre-wire installation), so an indication of the minimum permitted temperature is important.
There is a companion proposal to revise 725.179(L) to add temperature marking requirements
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-224.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2

(725.179(P) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 725.179(P)
(P) Class 2 and Class 3 Conductors and Cables Installed in Corrosive Locations. Class 2 and Class 3 conductors and cables installed in corrosive locations shall be listed as suitable for corrosive locations. Cables specified in 725.154(A), (B), and (E), and used for installation in corrosive locations shall have the additional classification using the following suffixes: "-PR" for oil resistant, and "-GR" for gasoline and oil resistant.
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies which Class 2, and Class 3 cables as being suitable for installation in corrosive locations. Corrosive locations have the potential to degrade cable and conductor insulation and cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-206.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: See My Explanation of Negative on 3-224.
SEPULVEDA, M.: See my explanation of negative vote on Proposal 3-224.

3-229 Log #4353 NEC-P03 **Final Action: Reject**
(725.179(Q) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 179(Q)
(Q) Very-Low-Smoke Producing Cables. Class 2, Class 3 and PLTC cables used to provide very-low-smoke producing characteristics shall be listed as very-low-smoke producing (50) and shall be listed as having low flame spread characteristics and very-low-smoke producing characteristics. Cables specified in 725.154(A), (B), (C), (D)(1), and (E) shall have the additional classification using the suffix "-50"..
FPN: One method of defining a very-low-smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with UL 723, *"Test for Surface Burning Characteristics of Building Materials"* with the cable unslit (intact) and cut through to expose the cable core.
Substantiation: This proposal establishes a listing and marking for cable for installation where minimal smoke generation is required. This cable meets the requirement for installation in concealed spaces that permit a maximum flame spread index of 25 and a maximum smoke developed index of 50. The proposed cable has low flame spread characteristics and very-low-smoke-producing characteristics. Presently, a number of manufacturers have cables listed as meeting the proposed requirements, but do not have a unique marking permitted by the NEC.
The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.
Establishing a listing and marking for cables listed for a "-50" suffix provides cables with physical parameters (flame spread index, smoke developed index) that is consistent with requirements in other codes.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-206.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials.
SEPULVEDA, M.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials.

3-230 Log #4348 NEC-P03 **Final Action: Reject**
(725.179(R) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 179(R)
(R) Fire Hazard Cables. Class 2, Class 3 and PLTC cables used to provide low combustible loading shall be listed as fire hazard cable (FHC) and shall be listed as having low flame spread characteristics, very-low-smoke producing characteristics, and a low potential heat release value. Cables specified in 725.154(A), (B), (C), (D)(1), and (E) shall have the additional classification using the suffix "-FHC".
FPN: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with UL 723, *"Test for Surface Burning Characteristics of Building Materials"* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*
Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has low flame spread characteristics, very-low-smoke-producing characteristics, and a low potential heat release value. Presently, a number of manufacturers have cables listed to the proposed requirements.
The testing criteria are based on the requirements found in NFPA 13 and the International Mechanical Code.
NFPA 13, Section 8.14.1.2.1 follows: "Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum." The proposed cable has a very low heat of combustion. While the term "combustible loading" is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.

The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.

Establishing a listing and marking for cables listed for a "FHC" suffix provides cables with physical parameters (flame spread index, smoke developed index, potential heat release) that is consistent with requirements in other codes.

NFPA 13-2007

8.15 Special Situations.

8.15.1 Concealed Spaces.

8.15.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.15.1.2.1 through 8.15.1.2.16 and 8.15.6.

8.15.1.2* Concealed Spaces Not Requiring Sprinkler Protection.

8.15.1.2.1* Concealed spaces of noncombustible and limited-combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading, see A.8.15.1.2.1.)

8.15.1.2.2 Concealed spaces of noncombustible and limited-combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.15.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)

8.15.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.

8.15.1.2.5 Concealed spaces formed by ceilings attached directly to or within 6 in. (152 mm) of wood joist construction shall not require sprinkler protection.

Presently, there are a number of companies with cables listed, having met the test requirements in the proposed fine print note.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 3-206.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials; and a low potential heat release not greater than 8141 kJ/kg (3500 BTU/lb), as tested in accordance with UL 2424, Standard Test Method of Potential Heat of Building Materials. A number of manufacturers have products that meet this criteria. The NEC does not provide a marking requirement for this robust cable.

SEPULVEDA, M.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials; and a low potential heat release not greater than 8141 kJ/kg (3500 BTU/lb), as tested in accordance with UL 2424, Standard Test Method of Potential Heat of Building Materials. ARTICLE 727 — INSTRUMENTATION TRAY CABLE: TYPE ITC

3-231 Log #1654 NEC-P03 **Final Action: Reject**
(727.6, FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise 727.6 FPN as follows:

FPN: One method of ~~defining resistant~~ determining resistance to the spread of fire is ~~that the cables do not spread fire to the top of the tray in the~~ testing in accordance with "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of ~~defining resistant~~ determining resistance to the spread of fire is ~~for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the~~ testing in accordance with CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

Substantiation: 3.1.3 of the NEC Style Manual states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

Panel Meeting Action: Reject

Panel Statement: These Fine Print Notes are not written in mandatory language and are simply expressing some of the maximum flame spread provided in the referenced UL 1685 or CSA C22.2 documents. This FPN is providing information on various methods of defining smoke-producing cables or fire-resistant cables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-232 Log #4843 NEC-P03 **Final Action: Reject**
(727.6, FPN)

Submitter: T. David Mills, T. David Mills Associates

Recommendation: Modify the fine print note as follows:

FPN: ~~One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable. Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.~~ See {5} and {6}, Annex I.

Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.

I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.

3-238 Log #4543 NEC-P03 **Final Action: Accept**
(760.3(A))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
760.3 Other Articles.
Circuits and equipment shall comply with 760.3(A) through (G). Only those sections of Article 300 referenced in this article shall apply to fire alarm systems.
(A) Spread of Fire or Products of Combustion. Section 300.21. ~~The accessible portion of abandoned fire alarm cables shall be removed.~~
Substantiation: The text proposed for deletion is duplicative of the text in section 760.25.
For information, see section 760.25:
760.25 Abandoned Cables.
The accessible portion of abandoned fire alarm cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-239 Log #4082 NEC-P03 **Final Action: Reject**
(760.3(B))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Delete 760.3(B).
~~(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts or plenums or other spaces used for environmental air.~~
~~Exception: As permitted in 760.53(B)(1) and (B)(2) and 760.154(A).~~
Substantiation: Section 760.3(B) is redundant. Sections 760.53(B) and 760.154(A) have requirements for installation of fire alarm cables in ducts, plenums, and other spaces used for environmental air, and permits fire alarm circuits to be installed in accordance with 300.22.
Panel Meeting Action: Reject
Panel Statement: The panel contends that this is not redundant, but rather clarification. Article 760 has the exclusive control of the installations of fire alarm systems, and 760.3 identifies sections in Chapters 1 through 4 that are enforceable in Article 760.
Therefore, 760.3(B) indicates that 300.22 does apply.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 11 Negative: 4
Explanation of Negative:
AYER, L.: This proposal should have been accepted in principle. The present wording in 760.3(B) is confusing. Thetext should be rewritten to match similar text in 725, 770, and Article 800. The reference to 760.53(B)(1) inthe exception is not needed since not permitting NFPLP cables to be installed in ducts would not be incontradiction to 300.22
760.3(B) Ducts, ~~Plenums,~~ and Other Air-Handling Spaces. ~~Section 300.22, where installed in ducts or plenums or other spaces used for environmental air.~~ **Fire Alarm Circuits installed in ducts or in other spaces used for environmental air shall comply with 300.22.**
Exception: As permitted in 760.53~~(B)(1) and~~ (B)(2) and 760.154(A).
EGESDAL, S.: The reference to 300.22 is adequately covered in 760.53(B) and 760.154(A). There are many references to sections in Chapters 1-4 throughout Article 760 that are not duplicated in 760.3.
KAHN, S.: The proposer's substantiation is correct - 760.3(B) is redundant. Installation requirements are adequately covered in 760.53(B) and 760.154(A). There are many other references to Chapters 1-4 that are not included in 760.3(B).
SEPULVEDA, M.: The reference to 300.22 is adequately covered in 760.53(B) and 760.154(A). There are many references to sections in Chapters 1-4 throughout Article 760 that are not duplicated in 760.3.
Comment on Affirmative:
STENE, S.: This reference to 300.22 is necessary in 760.3 to ensure that non-power-limited and power-limited fire alarm conductors and cables comply with the requirements in environmental air ducts and other spaces used for environmental air (plenums). As can be seen in 300.22(B), only metallic wiring methods can be used in a fabricated environmental air duct and then only long enough to connect to electrical equipment that directly acts upon or sensing of the contained air. The second sentence in 760.154(A) also requires compliance with 300.22 for listed wires and cables, reinforcing the text in 760.3(B). Both references to 300.22 compliance, one in 760.3(B) and one in 760.154(A), make it totally clear that metal encasement of conductors and cables in a fabricated duct is necessary.

3-240 Log #4048 NEC-P03 **Final Action: Reject**
(760.3(D))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.3(D).
(D) Corrosive~~, Damp, or Wet~~ Locations.
(1) Conductors. Conductors shall comply with ~~Sections 110.11,~~ 300.6(C)(2) and 310.9, where installed in corrosive locations.
(2) Non-Power-Limited Fire Alarm Cables. Non-power-limited fire alarm cables shall comply with the appropriate requirements of 760.53.
(3) Power-Limited Fire Alarm Cables. Power-limited fire alarm cables shall comply with the appropriate requirements of 760.154.
Substantiation: The references in 760.3(D) apply to corrosive locations that may be dry, damp, or wet. There are dry, damp, and wet locations that are not corrosive.
Existing 760.3(D) provides requirements for Chapter 3 conductors, but does not address Article 760 cables.
There are companion proposals to 760.176 and 760.179 for listing and marking of cables suitable for installation in corrosive locations, and to 760.53 and 760.154 for application requirements.
There is a companion proposal to 760.3 to address installation of conductors of cables in dry, damp and wet locations.
Panel Meeting Action: Reject
Panel Statement: 300.6(C)(2) refers to chemical exposure, and not corrosion. The panel contends that 300.6(C)(2) is not the appropriate section, but rather 310.9.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: The goal of this proposal was to establish requirements for Part III cables and conductors that are not installed in accordance with Part II.

SEPULVEDA, M.: The goal of this proposal was to establish requirements for Part III cables and conductors that are not installed in accordance with Part II.

Comment on Affirmative:

STENE, S.: The use of the word "or" applies this section to corrosive locations, whether the locations are dry, damp, or wet but the other two locations, damp and wet, are also provided for in the text so there is no technical reason to delete coverage of damp and wet locations. Section 110.11 covers corrosive, damp or wet conditions so that reference must be retained in the existing text. In addition, 300.6 applies to cables with a nonmetallic outer jacket and internal metal armor or jacket or cable sheathing that may be affected by sunlight, chemical exposure, or other corrosive conditions so all of 300.6 must apply and be retained. Section 760.35 requires compliance with Parts I and II for non-power-limited fire alarm circuits and Parts I and III for power limited fire alarm circuits thus requiring compliance with 760.3, where applicable, for both power-limited and non-power-limited fire alarm cables.

3-241 Log #1177 NEC-P03 **Final Action: Accept**
(760.3(H))

Submitter: Merton W. Bunker, Jr., US Department of State
Recommendation: Add a new 760.3(H) to read as follows:

<u>"(H) Raceways Exposed to Different Temperatures. Installations shall comply with 300.7(A)".</u>

Substantiation: Condensation often forms in conduit exposed to non-conditioned and conditioned space. We recently experienced several fire alarm system failures because condensation dripped into the controls and shorted the equipment. This change is proposed to bring the requirements of 300.7(A) into Article 760. There are companion proposals for Article 725.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

AYER, L.: 300.7 is already a requirement of Article 760. Adding a separate sentence is redundant and not necessary.

Comment on Affirmative:

STENE, S.: The title in proposed 760.3(H) should be changed by adding "Cables, Raceways, or Sleeves" to read as follows: Cables, Raceways, or Sleeves Exposed to Different Temperatures."

The text in proposed 760.3(H) should be changed to read as follows: "Where portions of cables, raceways, or sleeves are exposed to different temperatures and condensation is known to be a problem, fire alarm system installations shall comply with 300.7(A)." This proposed text would provide specific information for the user with installation applications pertaining to the specific use of 300.7(A).

3-242 Log #2907 NEC-P03 **Final Action: Accept in Principle**
(760.3(H) (New))

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Add new section as follows :

760.3(H) Vertical Support For Fire Rated Cable. Installation of circuit integrity (CI) and Electrical Protective Systems shall be in accordance with 300.19(B).

Substantiation: Support requirements for fire- rated cable are critical and contained in 300.19(B). The strength of copper decreases with heat. Cables may break if not properly supported in a fire situation.
Panel Meeting Action: Accept in Principle
Revise the wording in the proposal as follows:

"Vertical Support for Fire Rated Cables and Conductors. Vertical installations of circuit integrity (CI) cables and conductors or cables of electrical circuit protective systems shall be in accordance with 300.19(B)."

Panel Statement: The text in the proposal was changed in the title and the section to cover both cables and conductors since circuit integrity cables and electrical circuit protective systems could be either cables or conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

EGESDAL, S.: Section 300.19(B) does not apply to circuit integrity cable (e.g., Type FPLR-CI NPLFR-CI). Circuit integrity cable (CI) is not an electrical circuit protective system, such as CIC in raceway or Type MI. While both are tested using UL 2196, the tests are not identical. The difference is recognized in Section 760.154(G), where the title is "Circuit Integrity (CI) Cable or Electrical Circuit Protective System."

Further information, as to the differences, is described in The National Fire Alarm Code: NFPA 72-2007, 6.9.10.4.2 differentiates between a "(1) A 2-hour fire rated circuit integrity (CI) cable" and a "(2) A 2-hour fire rated cable system (electrical circuit protective system)."

SEPULVEDA, M.: Section 300.19(B) does not apply to circuit integrity cable (e.g., Type FPLR-CI NPLFR-CI). Circuit integrity cable (CI) is not an electrical circuit protective system, such as CIC in raceway or Type MI. While both are tested using UL 2196, the tests are not identical. The difference is recognized in Section 760.154(G), where the title is "Circuit Integrity (CI) Cable or Electrical Circuit Protective System."
Further information, as to the differences, is described in The National Fire Alarm Code: NFPA 72-2007, 6.9.10.4.2 differentiates between a "(1) A 2-hour fire rated circuit integrity (CI) cable" and a "(2) A 2-hour fire rated cable system (electrical circuit protective system)."

3-243 Log #4051 NEC-P03 **Final Action: Reject**
(760.3(H) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.3(H)
<u>(H) Conductors and Cables in Dry, Damp, or Wet Locations.</u>
<u>(1) Conductors. Conductors shall comply with the appropriate requirements of 310.8(A), (B), or (C).</u>
<u>(2) Cables. Non-power-limited cables shall comply with the appropriate requirements of 760.176.</u>
<u>(3) Cables. Power-limited cables shall comply with the appropriate requirements of 760.179.</u>
Substantiation: The goal of this proposal is to develop listing and marking requirements for non-power-limited and power-limited fire alarm cables installed in dry, damp, and wet locations with requirements that that are equivalent to conductors

Article 760 circuit conductors must comply with 310(A), (B), or (C). However, there are no listing and marking requirements for non-power-limited and power-limited fire alarm cables installed in dry, damp, or wet locations.

There are system problems where an inappropriate cable is installed in a damp or wet location. This proposed change to marking in a companion proposal to establish marking requirements in 760.176 for non-power-limited fire alarm cables and 760.179 for power-limited fire alarm cables, and to 760.53 and 760.154 for application requirements.
Panel Meeting Action: Reject
Panel Statement: Based on sections 760.46, 760.49, and 760.130(A) covering non-power-limited conductors and power-limited conductors, using non-power-limited methods and materials, compliance with the appropriate requirements in articles in Chapter 3, including Article 310, therefore, referencing back to 310.8, is unnecessary.

In addition, non-power-limited fire alarm cables must comply with 760.176 and power-limited cables must comply with 760.179, making these two references unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

EGESDAL, S.: The Panel Statement is correct with respect to Part II. The goal of this proposal was to establish requirements for Part III cables and conductors that are not installed in accordance with Part II.

SEPULVEDA, M.: The Panel Statement is correct with respect to Part II. The goal of this proposal was to establish requirements for Part III cables and conductors that are not installed in accordance with Part II.

3-244 Log #1178 NEC-P03 **Final Action: Accept**
(760.3(I))

Submitter: Merton W. Bunker, Jr., US Department of State
Recommendation: Add a new 760.3(I) to read as follows:

<u>"(I) Number and Size of Cables and Conductors in Raceway. Installations shall comply with 300.17".</u>

Substantiation: The FPN following 300.17 already references Article 760, but no reference exists in Article 760. This proposal seeks to impose the fill requirements to prevent abrasions and other problems associated with overfull conduit. Although conductor heating is not an issue, the reference will clarify the intent to allow installation and withdrawal of conductors without inflicting damage. There are companion proposals for Article 725.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

EGESDAL, S.: The submitter's substantiation is incorrect. A reference to 300.17 is in 760.51. The submitter did not provide evidence of a problem with the present installation requirements. The Panel statement on 3-191 could have been used here to reject this proposal: "The submitter has not provided technical substantiation indicating that cable damage has occurred."

Acceptance of this proposal has the potential for undue consequences. Where a short section of raceway is used for mechanical support and the conduit fill percentage is exceeded, the local authority may not approve the installation.

KAHN, S.: I do not agree with the proposer's substantiation - there is a reference to 300.17 in 760.51.

SEPULVEDA, M.: The submitter's substantiation is incorrect. A reference to 300.17 is in 760.51. The submitter did not provide evidence of a problem with the present installation requirements. The Panel statement on 3-191 could have been used here to reject this proposal: "The submitter has not provided technical substantiation indicating that cable damage has occurred."
Acceptance of this proposal has the potential for undue consequences. Where a short section of raceway is used for mechanical support and the conduit fill percentage is exceeded, the local authority may not approve the installation.
Comment on Affirmative:

CASPARRO, P.: I support the action taken by the Panel on this proposal.

3-245 Log #4056 NEC-P03 **Final Action: Reject**
(760.3(I) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.3(I).
<u>(I) Conductors and Cables Exposed to Direct Sunlight.</u>
<u>(1) Conductors. Conductors shall comply with 310.8(D).</u>
<u>(2) Non-Power-Limited Fire Alarm Cables. Non-power-limited fire alarm cables shall comply with 760.53.</u>
<u>(3) Power-Limited Fire Alarm Cables. Power-limited fire alarm cables shall comply with 760.154.</u>
Substantiation: Article 760 fire alarm non-power-limited fire alarm circuit conductors have to comply with 310(D). However, there is no marking to identify cable as being sunlight resistant.
System problems may occur where an inappropriate cable is installed exposed to direct sunlight. This proposed change to marking in companion proposals will clearly identify the installation location permitted for cables.
There are companion proposals to add listing requirements to 760.176 and 760.179 to support this proposed requirement, and to 760.53 and 760.154 for application requirements.
Panel Meeting Action: Reject
Panel Statement: Individual conductors based on 760.46 and 760.49 must already comply with 310.8(D), making this reference unnecessary.
Cables covered with a listed sunlight resistant material may change the flame rating of a cable and leave it unsuitable for the installation and may cause obscuration of other cable marking.
Non-power-limited fire alarm cables must already comply with 760.53 and power-limited fire alarm cables must comply with 760.154; therefore, this proposed reference is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: The Panel Statement is correct with respect to Part II. The goal of this proposal was to establish requirements for Part III cables and conductors that are not installed in accordance with Part II.
SEPULVEDA, M.: The Panel Statement is correct with respect to Part II. The goal of this proposal was to establish requirements for Part III cables and conductors that are not installed in accordance with Part II.

3-246 Log #1179 NEC-P03 **Final Action: Reject**
(760.3(J))

Submitter: Merton W. Bunker, Jr., US Department of State
Recommendation: Add a new 760.3(J) to read as follows:
<u>“(J) Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies. Installations shall comply with 314.16”.</u>
Substantiation: Overfilled boxes often result in shorts and overheating (non power-limited) on certain circuits. Overfilled boxes are also much more difficult to service, and could result in low system reliability. This proposal seeks to impose the fill requirements to prevent short circuits, and other problems associated with overfilled boxes. There are companion proposals for Article 725.
Panel Meeting Action: Reject
Panel Statement: 760.46 requires compliance with “other appropriate articles in Chapter 3,” including 314.16 for box fill.
There was no technical substantiation to apply 314.16 to power-limited fire alarm systems using 760.130(B) wiring methods.
If non-power-limited wiring methods were used, then compliance with 760.46 would also require compliance with 314.16 for box fill.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-247 Log #4059 NEC-P03 **Final Action: Reject**
(760.3(J) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.3(J).
<u>(J) Temperature Limitations of Conductors and Cables.</u>
<u>(1) Conductors. Conductors installed using non-power-limited fire alarm methods and materials shall comply with 310.10 or 402.3.</u>
<u>(2) Non-power-limited fire alarm cables shall comply with the appropriate requirements of 760.53.</u>
<u>(3) Power-Limited Fire Alarm Cables. Power-limited fire alarm cables shall comply with the appropriate requirements of 760.154.</u>
Substantiation: All Article 760 circuits using non-power-limited methods and materials must meet the temperature requirements of 310.10 or 402.3. These tables provide temperature rating options for various types of conductors.
Presently, there are no equivalent requirements for cables. There are companion proposals to 760.176 and 760.179 that provide requirements for marking cable that will have minimal cost impact on cable manufacturers.
Panel Meeting Action: Reject
Panel Statement: Individual conductors based on 760.46 and 760.49 must already comply with 310.10 or 402.3, making this reference unnecessary.
Non-power-limited fire alarm cables must already comply with 760.53 and power-limited fire alarm cables must comply with 760.154; therefore, this proposed reference is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: The Panel Statement is correct with respect to Part II. The goal of this proposal was to establish requirements for Part III cables and conductors that are not installed in accordance with Part II.
SEPULVEDA, M.: The Panel Statement is correct with respect to Part II. The goal of this proposal was to establish requirements for Part III cables and conductors that are not installed in accordance with Part II.

3-248 Log #4696 NEC-P03 **Final Action: Reject**
(760.7 (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. Association of Education Facilities Executivies
Recommendation: Revise text to read as follows:
760.7 +(NEW) Mechanical Execution of Work.
Fire alarm circuits shall be installed in a neat workmanlike manner <u>**and shall be permitted to be installed without conduit unless noted otherwise in NFPA 72.**</u> Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with <u>300.4(D)</u>.
Substantiation: This requires that the user looking for savings refer to the Fire Alarm Code to determine where conduit is required (verticals, surviveables, etc). There could be a net increase in overall safety if the cost savings can be deployed in a more risk-informed manner elsewhere in the life safety infrastructure.
Panel Meeting Action: Reject
Panel Statement: The NEC Style Manual prohibits direct references to other standards within mandatory text in the NEC. “Neat” and “workmanlike” are already covered in 760.24; therefore, it is unnecessary in this suggested new section.
Installing non-power-limited or power-limited fire alarm cable without conduit is already accepted in Parts II and III of Article 760; therefore, adding this to a new section is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-249 Log #2073 NEC-P03 **Final Action: Reject**
(760.21)

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Revise text to read as follows:
The installation shall also comply with 300.4(D) <u>and 334.15(C).</u>
Substantiation: Cables and conductors run across joists need running boards or bored holes to protect them from occupants hanging and damaging the conductors.
Panel Meeting Action: Reject
Panel Statement: The proposed text is not in 760.21, rather, it is in 760.24.
334.15(C) only applies to NM cable used for exposed installations. This section would not apply to fire alarm system installations using wiring methods other than NM cable; therefore, the addition of this reference is inappropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-250 Log #2898 NEC-P03 **Final Action: Reject**
(760.24)

Submitter: John R. Jennings, DR Electric
Recommendation: Add new text to read as follows:
Fire alarm circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, and cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(B) <u>and 300.11</u>.
Substantiation: It is important that cables not be supported by the ceiling grid when installed above suspended ceilings, both for the protection of the cables, and for access above the ceiling at later dates. I believe that 300.11 has been intended to apply to these installations, and the addition of this rule will make it easier to enforce.
This Article is, as it stands, almost word-for-word with similar limited energy/low voltage sections, such as 770.24, 800.24, and 830.24.
With the added wording, there will be identical requirements for all limited energy/low voltage installations.

Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation for power-limited fire alarm circuits to comply with all of 300.11; therefore, the proposed reference is inappropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-251 Log #3087 NEC-P03 **Final Action: Reject**
(760.24)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
Fire alarm circuits shall be installed in a neat workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4~~(D)~~ and 300.11.
Substantiation: This is one of a series of proposals intended to provide correlation with sections 640.6(B), 725.24, 760.24, 770.24, 800.24, 820.24 and 830.24. Due to the power limitations of these circuits, there is no reason that the requirements should be different.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-250.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-252 Log #4070 NEC-P03 **Final Action: Reject**
(760.24)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add a fine print note to 760.24 Mechanical Execution of Work.
FPN: Accepted industry practices are described in ANSI/NECA 301-2001, Standard for Fire Alarm System Job Practices.
Substantiation: This proposal provides the fire alarm industry a specific reference to a ANSI/NECA standard and complements 110.12, which follows.
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
There are other NEC Articles that have fine print notes referencing ANSI/NECA standards: 427, 770, 800, and 820.
Panel Meeting Action: Reject
Panel Statement: 110.12, FPN, already contains reference to workmanship; therefore, this reference is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
EGESDAL, S.: Section 110.12 addresses mechanical execution of work, so manufacturers' instructions would certainly be covered by 110.12, and not necessary to repeat in Article 760. But, the ANSI/NECA standard is not a manufacturer's instruction document. The ANSI/NECA standard addresses job execution practices from drawings through testing and maintenance. This standard for a life safety system provides value to users of the NEC. It may be more appropriate to reference this ANSI/NECA Standard as a new FPN in 760.1 Scope.
There are FPN's for similar types of documents (ANSI/NECA/BICSI) in 770.24, 800.24, 820.24, and 830.24.
KAHN, S.: Addition of this FPN is consistent with many other instances where the NEC refers to workmanship. They are placed in many NEC sections where they are appropriate and are consistent with 110.12 Mechanical Execution of Work. ANSI/NECA 301-2001 is an approved ANSI standard that has been subjected to public review prior to its adoption.
SEPULVEDA, M.: Section 110.12 addresses mechanical execution of work, so manufacturers' instructions would certainly be covered by 110.12, and not necessary to repeat in Article 760. But, the ANSI/NECA standard is not a manufacturer's instruction document. The ANSI/NECA standard addresses job execution practices from drawings through testing and maintenance. This standard for a life safety system provides value to users of the NEC. It may be more appropriate to reference this ANSI/NECA Standard as a new FPN in 760.1 Scope.
There are FPN's for similar types of documents (ANSI/NECA/BICSI) in 770.24, 800.24, 820.24, and 830.24.

3-253 Log #4550 NEC-P03 **Final Action: Reject**
(760.25)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
760.25 Abandoned Cables.
The accessible portion of abandoned fire alarm cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved. Removal of abandoned cables shall be performed in a neat and workmanlike manner.
Substantiation: This proposal recommends added wording to ensure that abandoned cables are removed appropriately. Section 110.12 addresses installation and so does section 760.24. It is important to point out that similar care must be taken when removing cables.
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
Consistent wording is being proposed for other sections in the code.
For information, see relevant definitions in the NEC.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation for the proposed change, and compliance with this requirement would be unenforceable.
This is already covered under 90.4 and 110.2.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-254 Log #4075 NEC-P03 **Final Action: Reject**
(760.32, 760.52 (New), and 760.141 (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to the NFPA 72 Technical Correlating Committee Task Group on Wiring for information.
Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Delete 760.32 and replace with 760.52 [New] and 760.141 [New].
~~760.32 Fire Alarm Circuits Extending Beyond One Building.~~
~~Power-limited fire alarm circuits that extend beyond one building and run outdoors either shall meet the installation requirements of Parts II, III, and IV of Article 800 or shall meet the installation requirements of Part I of Article 300. Non–power-limited fire alarm circuits that extend beyond one building and run outdoors shall meet the installation requirements of Part I of Article 300 and the applicable sections of Part I of Article 225.~~
760.52 Non-Power-Limited Fire Alarm Circuits Extending Beyond One Building.
Non-Power-limited fire alarm circuits that extend beyond one building and run outdoors shall meet the installation requirements of Parts II, III, and IV of Article 800, the applicable sections of Part I of Article 300, and the applicable sections of Part I of Article 225.
760.141 Power-Limited Fire Alarm Circuits Extending Beyond One Building.
Power-limited fire alarm circuits that extend beyond one building and run outdoors shall meet the installation requirements of Parts II, III, and IV of Article 800 and shall comply with the applicable sections of Part I of Article 300.
Substantiation: This proposal is primarily editorial with a change to correlate with NFPA 72-2007, National Fire Alarm Code.
This proposal revises 760.32 to correlate with the requirements of NFPA 72-2007, National Fire Alarm Code. NFPA 72, 4.4.4.3 requires transient protection for all fire alarm circuits extending outside a building. The main purpose or the NFPA 72 requirements is to protect fire alarm circuits from transients due to lightning. The National Fire Alarm Code requirement follows:
NFPA 72-2007, 4.4.4.3 Transient Protection. To reduce the possibility of damage by induced transients, circuits and equipment shall be properly protected in accordance with the requirements of NFPA 70, National Electrical Code, Article 800.
It is important to note that the overcurrent protection required for all non-power-limited circuits is not a substitute for transient protection. While the general requirement is to meet Article 800, Parts II, III, and IV, the key requirement is found in 800.90: lightning protection at the point of entrance to the building.
There is a proposed change in progress to revise NFPA 72 to revise the reference to Article 800 to Parts ii, III, and IV of Article 800. The reference to Parts II, III, and IV of Article 800 presently in 760.32 is correct, as Parts 1 and V or Article 800 do not apply.
This proposal establishes section numbers to parallel Article 725.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that this is an editorial change.
Based on 760.41(A), the power source of non-power-limited fire alarm circuits shall have an output voltage not greater than 600 volts.
Requiring non-power-limited fire alarm circuits extending beyond one building to comply with Parts II, III, and IV of Article 800 would be a safety hazard at the very least, if not a potential fire hazard.

Compliance with Parts II and III of Article 800 would require primary and secondary protectors to be installed on these non-power-limited conductors or cables where entering into the second building based on 800.50(C).

Primary protectors are not rated for the permissible voltage of the non-power-limited circuit of up to 600 volts and with ampere ratings based on 310.15.

Most technicians are familiar with primary protectors for phone systems and would not associate primary protectors with system voltage of greater than the 48 volts used for communications system circuits and could inadvertently be connected into a circuit with possible electrocution.

Part IV of Article 800 deals with grounding methods for primary protectors and, thus, non-power-limited fire alarm circuits, which would require the grounding conductor of at least a No. 14 be installed to the non-power-limited circuit and be within 20 ft of the entrance of the circuit into the building.

If a grounding electrode was not provided at the second building, a 5-ft ground rod could be installed for the grounding electrode for the non-power-limited system. These are violations of the requirements in Article 225 and the appropriate sections in Article 250 for power circuits.

The correlation with the requirement in 4.4.4.3 on page 30 in NFPA 72 is unrealistic for non-power-limited fire alarm circuits.

Article 800 should not be referenced in 4.4.4.3 since power circuit transient protection is located in Article 285, and not in Article 800.

The panel requests that the Technical Correlating Committee contact the NFPA 72 Technical Correlating Committee, Task Group on Wiring, and the NFPA 780 Technical Committee to address the correlation issues between NFPA 70, 72, and 780.

There was no technical substantiation provided to require compliance with both Article 800 and Article 300 requirements.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

EGESDAL, S.: The proposal should have been accepted in part in principal: accept splitting the requirements in 760.32 (Part I) to sections in Part II and III that match the section numbers in Article 725. Also, accept the change of "or" to "and" in the requirements for power-limited circuits to correlate with NFPA 72-2007, 4.4.4.3. The present text in 760.32 permits power-limited circuits extending beyond one building to not install transient protection that is required by NFPA 72-2007, 4.4.4.3. That is, the existing text permits installers to meet the applicable sections of Part I of Article 300 and ignore the transient protection requirement. Subsequent to the job approval by the electrical inspector, the fire marshal may force compliance with the NFPA 72 requirement. The NEC should correlate with NFPA 72.

KAHN, S.: This proposal should have been "Accepted in Part in Principle" so that there is correlation with NFPA 72-2007 while considering the points raised in the Panel Statement.

SEPULVEDA, M.: The proposal should have been accepted in part in principal: accept splitting the requirements in 760.32 (Part I) to sections in Part II and III that match the section numbers in Article 725. Also, accept the change of "or" to "and" in the requirements for power-limited circuits to correlate with NFPA 72-2007, 4.4.4.3. The present text in 760.32 permits power-limited circuits extending beyond one building to not install transient protection that is required by NFPA 72-2007, 4.4.4.3. That is, the existing text permits installers to meet the applicable sections of Part I of Article 300 and ignore the transient protection requirement. Subsequent to the job approval by the electrical inspector, the fire marshal may force compliance with the NFPA 72 requirement. The NEC should correlate with NFPA 72.

3-255 Log #1171 NEC-P03 **Final Action: Reject**
(760.33)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to the NFPA 72 Technical Correlating Committee Task Group on Wiring for information.

Submitter: Merton W. Bunker, Jr., US Department of State

Recommendation: Add a new 760.33 to read as follows:

"760.33 Transient Protection. All circuits extending beyond one building shall be protected in accordance with the requirements of Article 800."

Substantiation: Non power-limited circuits are not immune to transient s caused by lightning. Power-limited circuits run outdoors are sometimes reclassified as permitted by 760.130(A), Exception 3. However, reclassified circuits are just as susceptible to transients, but are not subject to the requirements for transient protection afforded by Article 800.

This change is intended to clarify code requirements for transient protection and correlate with Section 4.4.4.3 of NFPA 72, National Fire Alarm Code, which requires transient protection on all circuits that extend outdoors.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 3-254.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-256 Log #4078 NEC-P03 **Final Action: Reject**
(760.35)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Revise 760.35 as follows:

760.35 Fire Alarm Circuit Requirements.

Fire alarm circuits shall comply with 760.35(A), ~~and~~ (B) or (C).

(A) All systems shall test free of grounds.

Exception:

Parts of circuits or equipment that are intentionally and permanently grounded to provide ground-fault detection, noise suppression, emergency ground signaling, and circuit protection grounding shall be permitted.

(B~~A~~) Non–Power-Limited Fire Alarm (NPLFA) Circuits. See Parts I and II.

(C~~B~~) Power-Limited Fire Alarm (PLFA) Circuits. See Parts I and III.

II. Non–Power-Limited Fire Alarm (NPLFA) Circuits.

Substantiation: Article 250 applies to fire alarm equipment. However, most fire alarm circuits on the load side of the power supply have ground detection circuits. It is important for proper system operation that fire alarm circuits are installed free of grounds, and that equipment be grounded in accordance with Article 250.

Panel Meeting Action: Reject

Panel Statement: 110.7 covering wiring integrity already states the same information, and applies to Chapters 1 through 7 wiring methods.

The text reads as follows:

"110.7 Wiring Integrity. Completed wiring installations shall be free from short circuits, ground faults, or any connections to ground other than as required or permitted elsewhere in this Code."

The only way to determine that the circuit is not inadvertently grounded is by testing. Ground-fault protection and detection as well as other grounding requirements for noise suppression are already covered in Article 250, where applicable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: It is important for installers to understand that fire alarm circuits are not required to be grounded, but the power wiring to a fire alarm panel must meet Article 250. Article 250 has many requirements, so it is difficult to find fire alarm requirements. The text in the proposal correlates well with the requirements in NFPA 72, National Fire Alarm Code.

SEPULVEDA, M.: It is important for installers to understand that fire alarm circuits are not required to be grounded, but the power wiring to a fire alarm panel must meet Article 250. Article 250 has many requirements, so it is difficult to find fire alarm requirements. The text in the proposal correlates well with the requirements in NFPA 72, National Fire Alarm Code.

3-257 Log #1422 NEC-P03 **Final Action: Reject**
(760.36 (New))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add new text to read as follows:

760.XX Listing. Fire alarm system cables and equipment shall be listed and identified for the use.

Substantiation: Listing should be a requirement.

Panel Meeting Action: Reject

Panel Statement: Listing requirements of fire alarm equipment are outside the scope of Code-Making Panel 3 and are under the jurisdiction of NFPA 72 where 4.3.1, on page 26, requires "equipment constructed and installed in conformity with NFPA 72 shall be listed for the purpose for which it is used."

The cables are already required to be listed based on 760.176 for NPLFA and 760.179 for PLFA.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-258 Log #4076 NEC-P03 **Final Action: Reject**
(760.37 (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Add new 760.37.

760.37 Class A Fire Alarm Circuits

Class A circuits using physical conductors shall be installed such that the outgoing and return conductors, exiting from and returning to the control unit, respectively, are routed separately. The outgoing and return circuit conductors shall not be run in the same cable assembly enclosure, or raceway. Where the power to a device is supplied over a separate circuit from the signaling line circuit or initiating device circuit, the operation of the power circuit shall meet the performance requirements of the initiating device circuit or signaling line circuit.

Exception:

The outgoing and return (redundant) circuit conductors shall be permitted to be run in the same cable assembly, enclosure, or raceway under any of the following conditions:

(1) For a distance not to exceed 3 m (10 ft) where the outgoing and return conductors enter or exit the initiating device, notification appliance, or control unit enclosures

(2) Single conduit/raceway drops to individual devices or appliances
(3) Single conduit/raceway drops to multiple devices or appliances installed within a single room not exceeding 92.9 m2 (1000 ft2) in area.

Substantiation: Class A circuits require special routing, compared to Class B circuits that do not have special routing requirements. It is important for system operation to keep the outbound and return circuits separated. A Class A circuit will permit all devices to operate when both circuit conductors are cut. If the outbound and return circuits are in the same cable or raceway, severing that part of the circuit will disable a portion of the system.

Panel Meeting Action: Reject

Panel Statement: The class of fire alarm system will determine the installation requirements for each different style of fire alarm circuit. As stated in 6.4.2.1 of the NFPA 72, 2007 edition, initiating device circuits, notification appliance circuits, and signaling line circuits can be designated as Class A or B, depending upon their performance during non-simultaneous single-circuit fault conditions.

There are too many different conditions and details contained within NFPA 72 to extract the information and insert it into the NEC.

The installer must have a total understanding of all of these issues before attempting the installation.

Extracting some of the information into the NEC and not the remainder will not provide the installer with the required information to install the system and will cause confusion.

To truly understand what is being proposed would require definitions of Class A, Class B, initiating line circuits, signaling line circuits, and notification appliances.

Since NFPA 72 and the NEC are not in the same cycle, any change in NFPA 72 may make the two requirements different, leaving the installer with the requirement to install the circuits in accordance with two different standards.

The suggested text uses the term “appliances,” which has a different definition in the NEC then that provided in NFPA 72.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

EGESDAL, S.: Class A fire alarm circuits require special installation methods: outgoing and return circuit separated throughout the entirety of the installation (with some special case exceptions). Class B circuits use standard installation methods detailed in Article 760, so do not have to be covered in the NEC. If a Class A circuit is opened (cut apart), the outgoing and return conductors continue to connected to all devices on the Class A circuit. Installers sometime install the outgoing and return circuits in the same cable or raceway, which defeats the life safety robustness of the Class A circuit.

KAHN, S.: I agree with the proposer’s substantiation.

SEPULVEDA, M.: Class A fire alarm circuits require special installation methods: outgoing and return circuit separated throughout the entirety of the installation (with some special case exceptions). Class B circuits use standard installation methods detailed in Article 760, so do not have to be covered in the NEC. If a Class A circuit is opened (cut apart), the outgoing and return conductors continue to connected to all devices on the Class A circuit. Installers sometime install the outgoing and return circuits in the same cable or raceway, which defeats the life safety robustness of the Class A circuit.

3-259 Log #4079 NEC-P03 **Final Action: Accept in Principle in Part**
(760.41)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Revise 760.41 as follows:

760.41 NPLFA Circuit Power Source Requirements.

(A) Power Source.

(1) The dedicated branch circuit between the power source and fire alarm equipment controlling ~~of~~ non–power-limited fire alarm circuits shall comply with Chapters 1 through 4.

Exception: The dedicated branch circuit shall be permitted to connect to multiple pieces of fire alarm equipment.

(2) ~~, and~~ The output voltage shall ~~be~~ not be greater ~~more~~ than 600 volts, nominal.

(B) Branch Circuit.

(1) A~~n individual~~ dedicated branch circuit shall be required for the supply of the power source.

Exception: The dedicated branch circuit shall be permitted to connect to multiple pieces of fire alarm equipment.

(2) The~~is~~ dedicated branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

FPN: See 210.8(A)(5), Exception, for receptacles in dwelling-unit unfinished basements that supply power for fire alarm systems.

(3) The dedicated branch circuit(s) and connections shall be mechanically protected.

(4) The circuit disconnecting means shall have a red marking, shall be accessible only to authorized personnel, and shall be identified as “FIRE ALARM CIRCUIT.”

(5) The location of the circuit disconnecting means shall be permanently identified at the fire alarm control unit.

Substantiation: This proposal provides correlation with NFPA 72-2007, National Fire Alarm Code. NFPA 72 uses the term “dedicated branch circuit” rather than the generic “individual branch circuit.” It is important for continued fire alarm system operation that the fire alarm system, and only the fire alarm system, be connected to a branch circuit.

The proposed changes are from NFPA 72-2007, 4.4.1.4.2.

Panel Meeting Action: Accept in Principle in Part

Revise the existing code text of 760.41 to read as follows:

“**(A) Power Source.** The power source of non-power-limited fire alarm circuits shall comply with Chapter 1 through 4, and the output voltage shall be not more than 600 volt, nominal. Fire alarm disconnect shall be permitted to be secured in the “on” position.

(B) Branch Circuit. The branch circuit supplying the fire alarm equipment(s) shall supply no other loads. The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control panel. This branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

FPN: See 210.8(A)(5), Exception, for receptacles in dwelling-unit unfinished basements that supply power for fire alarm systems.”

The remainder of the proposed text is rejected.

Panel Statement: The new text in (A) is provided to address the concern of inadvertent disconnection as determined by the Code-Making Panel 3, and the new text in (B) is provided to address the submitter’s concerns related to the need for dedicated branch circuits.

“Dedicated branch circuit” is not defined in Article 100 of the NEC, whereas “individual branch circuit” is defined as “a branch circuit that supplies only one utilization equipment.” The use of individual branch circuit in 760.41 determines that this branch circuit can supply only fire alarm equipment (can consist of multiple pieces of the same equipment), so the suggested changes are not consistent with the NEC style. The branch circuit must be installed based on the wiring methods in Chapter 3 and, if there is a possibility for physical damage, then an appropriate wiring method must be used, so mechanically protecting the circuit is not consistent with any requirements in Chapter 3 wiring methods.

A new sentence was added as a second sentence to 760.41(B) to read as follows: “The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control panel.” This added sentence provides marking of the location of the overcurrent protective device on the fire alarm panel so a maintenance person can quickly determine where to locate the overcurrent device.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

AYER, L.: While I agree with the panel action, this proposal along with proposal 3-280 will add the same requirements in two sections of Article 760. It would be more appropriate to add branch circuit requirements for fire alarm circuits in one place regardless of whether the circuit is power-limited or non-power limited. Revised wording to 760.35, 760.41, and 760.121 is as follows:

760.35 Fire Alarm Circuit Requirements. Fire alarm circuits shall comply with 760.35 (A), (B) and ~~(B)~~ (C).

(A) Branch Circuit. The branch circuit supplying the fire alarm equipment(s) shall supply no other loads. The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control panel. This branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

~~(A)~~ (B) Non-Power-Limited Fire Alarm (NPLFA) Circuits…..

~~(B)~~ (C) Power-Limited Fire Alarm (PLFA) Circuits …….

760.41 NPLFA Circuit Power Source Requirements.

(A) Power Source…..

~~(B) Branch Circuit. An individual branch circuit shall be required for the supply of the power source. This branch circuit not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.~~

760.121 Power Sources for PLFA Circuits.

(A) Power Source…..

~~(B) Branch Circuit. An individual branch circuit shall be required for the supply of the power source. This branch circuit not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.~~

OWEN, R.: See my Comment on Affirmative on Proposal 3-260 (Log #3762).

3-260 Log #3762 NEC-P03 **Final Action: Reject**
(760.41(B))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as “Reject” because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Jebediah J. Novak, Cedar Rapids Electrical JATC / Rep. Int’l Brotherhood of Electrical Workers

Recommendation: Delete text to read as follows:

(B) Branch Circuit. An individual branch circuit shall be required for the supply of the power source. ~~This branch circuit shall not be supplied through ground fault circuit interrupters or arc fault circuit interrupters.~~

Substantiation: This requirement should be deleted. Both AFCI and GFCI devices are intended to protect people and property from fire and shock hazards. The substantiation used in the past to justify this requirement was that de-energizing the fire alarm control panel (FACP) would result in the system ceasing to function with no indication of the loss of power,or that nuisance tripping would be an issue. This requirement seems to imply that is better to have an arcing condition persist and grow into a fire scenario, because the FACP will be able to notify the building occupants of the fire that was started by it's own branch-circuit. Similar arguments could be made in regards to a ground-fault that could result in shock or electrocution.

However, the building occupants will be aware of the loss of power if the fire alarm is installed in accordance with NFPA 72, the National Fire Alarm Code. Section 4.4.1.5.3 of NFPA 72 requires that fire alarm systems be provided with a minimum of 24 hours of standby power, with enough power available at the end of the 24 hour period for the system to go into full alarm for 5 minutes (15 minutes of maximum connected load for emergency voice communications systems). Section 4.4.7.3.1 of NFPA 72 requires that failure of either the primary or secondary power supplies to be annunciated with a trouble signal in accordance with Section 4.4.3.5, that requires the trouble condition to be annunciated within 200 seconds at a location where it is likely to be heard.

The loss of primary power is also required to be transmitted to any supervising station that is monitoring the system. Unless prohibited by the AHJ, loss of power trouble signals may have a delayed transmission to the remote supervising stations by a period of 60-180 minutes in case of a widespread power outage to prevent overwhelming the stations communications equipment. This is still well within the time-frame of the 24 hours required standby capacity. Upon receipt of the power supply failure transmission, Chapter 8 of NFPA 72 gives specific instructions to the personnel in the supervising stations to ensure appropriate action is taken.

As I read through the past proposals and comments addressing this issue, it became very apparent that there is a lack of understanding when differentiating between single/multiple station smoke alarms and smoke detectors. As a panel member of NFPA 72, it is important to distinguish that single/multiple station smoke alarms do not meet the criteria of a fire alarm system as defined by Chapter 3 of NFPA 72, and therefore are still subject to the GFCI requirements of 210.8 and the AFCI requirements of 210.12. Household fire alarm systems are defined by 3.3.67.3 as having a fire alarm control unit (panel) that is interconnected to the devices that are used for initiation and notification.

Another substantiation used in past revision cycles was that often times the batteries are not provided, are missing, are dead, or smoke detectors are "rendered inoperable by, e.g., a shower cap. This quoted material was proposal 3-236, Log #1598 in the Report on Proposals from May of 2004. The CMP-accepted this proposal at that time. This substantiation implies that since the systems may not be properly installed, inspected or tested that the NEC will allow other potentially dangerous conditions to exist as well.

Again, loss of the secondary power supply is required to be annunciated with a trouble signal within 200 seconds of the condition occurring. Furthermore, Chapter 10 of NFPA 72 details specific inspection and testing procedures that are to be performed at required intervals. A visual inspection of the primary and secondary power supplies is required to be performed at the time of initial acceptance or during any reacceptance of the system. Batteries, depending on the type, are required to be visually inspected at either monthly or seminannual intervals depending on the type use. The primary and secondary power supplies are required to be tested at regular intervals as well, with Table 10.4.2.2 detailing how those tests are to be performed. For a system to be up and running, the batteries would have to be in place and operating correctly.

To summarize my position on this proposal:

1. Building occupants will be notified of a loss of power
2. GFCI's and AFCI's have been shown to increase safety for personnel and property from hazards arising from the use of electricity, as evidenced by each type of protection being applied to increasing locations in 210.8 and 210.12, respectively
3. It is the building owner's responsibility to properly maintain the fire alarm system
4. If the AFCI or GFCI is tripping the branch-circuit supplying the FACP, it is because a potentially hazardous condition exists and the situation needs to be corrected.

Panel Meeting Action: Accept

The panel understands that the action taken on this proposal modifies the action taken on Proposal 3-259.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 8 Negative: 7

Explanation of Negative:

CONNAUGHTON, T.: A Local Fire Alarm System could be rendered useless with the tripping of a GFCI device

EGESDAL, S.: This proposal should have been rejected to correlate with the action on 3-259 and for life safety reasons.

The submitter did not identify specific job problems. The submitter did not show that a GFCI would not trip when a fire alarm circuit (initiating, notification, signaling line) was grounded. The submitter did not show that an AFCI would not trip when the contacts of a fire alarm relay "arc" when being connected or disconnected to a highly inductive load.

Connecting a Local Fire Alarm System to a GFCI or an AFCI creates a potential life safety situation. A Local Fire Alarm System that receives standby power from an emergency generator will have 4 hours of battery power. If this type of fire alarm system is connected to a GFCI or an AFCI that has an inadvertent trip, here's the probably outcome: (1) The FA panel, which is probably locked in a remote electrical room, will sound a trouble signal until the battery is depleted; (2) The emergency generator will not start, as it starts when power to the build is lost; (3) The building, such as a condo, will be without a fire alarm system, and nobody may be aware.

KAHN, S.: This proposal should have been rejected to correlate with the panel's action on 3-259.

OWEN, S.: The submitter's first sentence, quoted from the 2008 NEC, has been modified by Panel Action on ROP 3-259 and is therefore rejected here in 3-260. The submitter's strikethrough of the present 2008 NEC second sentence has the effect of deleting the present requirement to prohibit arc-fault circuit interrupters or ground-fault circuit interrupters on non-power-limited fire alarm circuits without technical substantiation or documentation. This proposal should be rejected.

SANDERS, M.: The panel action should be "Accept in Principle" since by accepting the proposal in total with the phrase "to read as follows" implies that the final wording negates entirely the panel action taken on Proposal 3-259, which is not the intent of the panel.

SEPULVEDA, M.: This proposal should have been rejected to correlate with the action on 3-259 and for life safety reasons.

The submitter did not identify specific job problems. The submitter did not show that a GFCI would not trip when a fire alarm circuit (initiating, notification, signaling line) was grounded. The submitter did not show that an AFCI would not trip when the contacts of a fire alarm relay "arc" when being connected or disconnected to a highly inductive load.

Connecting a Local Fire Alarm System to a GFCI or an AFCI creates a potential life safety situation. A Local Fire Alarm System that receives standby power from an emergency generator will have 4 hours of battery power. If this type of fire alarm system is connected to a GFCI or an AFCI that has an inadvertent trip, here's the probably outcome: (1) The FA panel, which is probably locked in a remote electrical room, will sound a trouble signal until the battery is depleted; (2) The emergency generator will not start, as it starts when power to the build is lost; (3) The building, such as a condo, will be without a fire alarm system, and nobody may be aware.

SLEIGHTS, J.: The required annunciation of a trouble signal from the fire alarm in response to the loss of primary power is often effective in calling attention to the condition. However, in practice it sometimes is not. The signal may be ignored or there may not be anyone on-premises during the duration the secondary power supply (typically battery) is capable of operating the signal. Since it is the intent of CMP-3 to coordinate with the National Fire Alarm Code and require the fire alarm equipment to be supplied by an 'individual branch circuit' it is not likely that the nonfunctionality of some other equipment or lighting will in any way call attention to the loss of primary power to the specific circuit for the fire alarm system. In some situations the signal is transmitted off-premises, but not in all cases. Thus the detection of the loss of power falls to inspection or in the worse case scene investigation after a loss has occurred. Inspection is by nature periodic with some duration of time expected where the system is left to itself. The 2007 edition of NFPA 72 National Fire Alarm Code, Table 10.3.1 Visual Inspection Frequencies indicates that a 'Weekly' visual inspection is required of 'Fire Alarm Control Unit Trouble Signals'. If inspections were actually performed at that interval it could still leave a 5-6 day window of questionable performance for a system with a 24 hour secondary power supply.

Notwithstanding what may be added or removed in this Code cycle, Article 210 in the 2008 edition permits GFCI protection be omitted only for a dedicated receptacle in an unfinished basement supplying a permanent fire alarm system (210.8(A)(5) Exception) with an FPN referencing the Article 760 sections we are currently pondering. 210.12 currently requires AFCI protection for some branch circuits only in the dwelling unit areas listed in 210.12(B). It does however permit AFCI protection to be omitted from the branch circuit supplying a fire alarm system in 210.12(B) Exception 2 where the branch circuit is installed with the specific wiring methods listed. A FPN is also included referencing the Article 760 sections we are currently pondering.

What is not discussed until Article 760 is the permission to use a GFCI or AFCI on any circuit supplying a fire alarm system in other than a dwelling unit. Without the prohibition in Article 760 it will be permitted and likely required if the circuit location falls under one requiring such protection in Article 210 (absent the specific wiring methods in the Exception) or is specified above minimum Code requirements by a designer. Also, it needs to be kept in mind that the branch circuit ultimately used MAY predate the fire alarm installation and as such may have older GFCI or AFCI equipment installed. Simple circuit breaker 'locks' will not protect against tripping via the test button on most circuit breakers.

The argument that NFPA 72 does not specifically prohibit a fire alarm system from being supplied by a branch circuit protected by a GFCI or AFCI and is therefore permits it is hollow. That document was able to look to the NEC and read the requirements in Article 760 that specifically prohibits the devices.

Finally, if the fire alarm system is located within a dwelling unit the scope of coverage is usually limited to the unit. On a larger scale, the 'fire alarm system' may be installed in a common space to provide service to sections or floors of a building, an entire building, complex or larger entity. These installations are not likely covered by the Article 210 sections.

The submitter of the proposals did not provide any technical substantiation that the current arrangement presents any increased hazard in locations where the Code currently requires GFCI or AFCI protection. It also does not examine in detail the increased risk of power loss to fire alarm systems that may arise from inadvertent tripping of these devices, nor the compatibility of the vast array of fire alarm equipment that may be required to function on a circuit so protected.

Based on my experience and evaluation of this issue I vote to REJECT proposals ROP 3-260 and 3-281 that remove the prohibition of GFCI and AFCI protection on fire alarm system branch circuits.

Comment on Affirmative:

AYER, L.: Article 760 provides the necessary requirements for using cables and conductors to wire a fire alarm system. NFPA 72 fills in the other blanks by providing the performance, reliability and and other pertinent installation requirements. NFPA 72 includes such items as when a secondary power supply is required, how long should batteries last, does the system require a dedicated branch circuit, and what are the proper marking requirements of the branch circuit disconnect.

The requirement to prohibit arc-fault or ground-fault protection on a fire alarm circuit should rest entirely with NFPA 72. This issue only rears its ugly head in residential fire alarm systems. It is highly unlikely that you would see arc-fault or ground fault protection on a branch circuit feeding a commercial fire alarm system.

Chapter 11 of the fire alarm code deals with Household Fire Alarm Systems. The text within this section permits fire alarm systems (panels) or smoke detectors to be installed on arc-fault devices if they are provided with some sort of secondary power. Section 11.6.3.5 is a new addition to the fire alarm code which mandates that any smoke alarm powered by an AFCI must have a secondary power source. Section 11.6.2 covers power for fire alarm panels in residential settings. NFPA 72 does not specifically dictate that fire alarm panels can be wired on an arc-fault breaker, however, it would be inferred that it would be acceptable since fire alarm systems or panels must be provided with a secondary power source.

Any wording placed in the NEC in Article 760 regarding this issue will create confusion. Telling someone that is not okay to wire fire alarm panels or detectors to an arc-fault or ground-fault device when it is permitted in various locations in NFPA 72 would not be appropriate. It is better to delete the last sentence so the user of the code understands that the responsibility over home fire alarm systems reside in NFPA 72 and Article 210.

The National Electrical Code is an installation document. It is not intended to provide or solve performance and reliability issues of fire alarm systems or devices. The authority to address those issues should reside with NFPA 72.

KEDEN, R.: I vote affirmative but expect that NFPA 72 will take a position on this issue in the future.

OWEN, R.: This action should probably have been "accept in principle" and accept the modification of the first sentence per Proposal 3-259 and the deletion of the second sentence of existing text in part (B).

The Panel changed the wording in the first sentence of (B) in Proposal 3-259 to "The branch circuit supplying the fire alarm equipment(s) shall supply no other loads." By accepting 3-260 the panel may have created confusion because the first sentence in this proposal matches the original NEC text, not the change from 3-259.

3-261 Log #2198 NEC-P03 **Final Action: Accept**
(760.43)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise text as follows:

760.43 NPLFA Circuit Overcurrent Protection.

Overcurrent protection for conductors 14 AWG and larger shall be provided in accordance with the conductor ampacity without applying the <u>ampacity adjustment and correction</u> ~~derating~~ factors of 310.15 to the ampacity calculation. Overcurrent protection shall not exceed 7 amperes for 18 AWG conductors and 10 amperes for 16 AWG conductors.

Exception: Where other articles of this Code permit or require other overcurrent protection.

Substantiation: The terms "ampacity adjustment factors" and "correction" are the terms used in 310.15(B)(2)(a) and 310.16.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-262 Log #3038 NEC-P03 **Final Action: Accept**
(760.43)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise text to read as follows:

760.43 NPLFA Circuit Overcurrent Protection.

Overcurrent protection for conductors 14 AWG and larger shall be provided in accordance with the conductor ampacity without applying the <u>ampacity adjustment and correction</u> ~~derating~~ factors of 310.15 to the ampacity calculation. Overcurrent protection shall not exceed 7 amperes for 18 AWG conductors and 10 amperes for 16 AWG conductors.

Exception: Where other articles of this Code permit or require other overcurrent protection.

Substantiation: The terms "adjustment factor" and "correction" are the terms used in 310.15(B)(2)(a) and 310.16.

Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

3-263 Log #2916 NEC-P03 **Final Action: Accept**
(760.46)

Submitter: Thomas Guida, TJG Services, Inc.

Recommendation: Revise text to read as follows:

760.46 NPLFA Circuit Wiring. Installation of non–power-limited fire alarm circuits shall be in accordance with 110.3(B), 300.7, 300.11, 300.15, 300.17, <u>300.19(B)</u> and other appropriate articles of Chapter 3.

Exceptions 1 and 2 are unchanged.

Substantiation: Support requirements for fire- rated cable are critical and contained in 300.19(B). The strength of copper decreases with heat. Cables may break if not properly supported in a fire situation.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: Section 300.19(B) does not apply to circuit integrity cable (e.g., Type FPLR-CI NPLFR-CI). Section 300.19(B) Circuit integrity (CI) cable is not an electrical circuit protective system, such as CIC in raceway or Type MI. While both are tested using UL 2196, the tests are not identical. The difference is recognized in Section 760.154(G), where the title is "Circuit Integrity (CI) Cable or Electrical Circuit Protective System."

Further information, as to the differences, is described in The National Fire Alarm Code: NFPA 72-2007, 6.9.10.4.2 differentiates between a "(1) A 2-hour fire rated circuit integrity (CI) cable" and a "(2) A 2-hour fire rated cable system (electrical circuit protective system)."

SEPULVEDA, M.: Section 300.19(B) does not apply to circuit integrity cable (e.g., Type FPLR-CI NPLFR-CI). Section 300.19(B) Circuit integrity (CI) cable is not an electrical circuit protective system, such as CIC in raceway or Type MI. While both are tested using UL 2196, the tests are not identical. The difference is recognized in Section 760.154(G), where the title is "Circuit Integrity (CI) Cable or Electrical Circuit Protective System."

Further information, as to the differences, is described in The National Fire Alarm Code: NFPA 72-2007, 6.9.10.4.2 differentiates between a "(1) A 2-hour fire rated circuit integrity (CI) cable" and a "(2) A 2-hour fire rated cable system (electrical circuit protective system)."

3-264 Log #3088 NEC-P03 **Final Action: Reject**
(760.46)

Submitter: Mike Holt, Leesburg, FL

Recommendation: Revise text as follows:

760.46 NPLFA Circuit Wiring.

Installation of non–power-limited fire alarm circuits shall be in accordance with 110.3(B), 300.7, 300.11, 300.15, 300.17, and other appropriate articles of Chapter 3. <u>Where non-power-limited fire alarm systems contain outlets in areas requiring AFCI protection, the circuit(s) shall be installed in RMC, IMC, EMT, or steel armored cable, Type AC, meeting the requirements of 250.118, with metal outlet and junction boxes.</u>

Exception No. 1: As provided in 760.48 through 760.53.

Exception No. 2: Where other articles of this Code require other methods.

Substantiation: This proposal is intended to clarify that compliance with 210.12(B) Ex. No 2 is not optional. The code user that installs fire alarm systems is often not aware of Article 210 requirements, such as Ex No 2 to 210.12(B).

Panel Meeting Action: Reject

Panel Statement: This text is already provided in 210.12, and since Chapters 1 through 4 apply, unless supplemented or modified by Article 760, the proposed text is unnecessary.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-265 Log #2468 NEC-P03 **Final Action: Reject**
(760.48)

Submitter: Daniel G. Decker, Safety Systems, Inc.
Recommendation: Revise text to read as follows:

760.48 Conductors of Different Circuits in Same Cable, Enclosure, or Raceway.

(A) Class 1 with NPLFA Circuits. Class 1 and non-power-limited fire alarm circuits shall be permitted to occupy the same cable, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conductors are insulated for the maximum voltage of any conductor in the enclosure or raceway.

(B) ~~Fire Alarm with Power Supply Circuits.~~ Electric Light and Power with NPLFA Circuits. ~~Power supply~~ Electric Light and Power and non-power limited fire alarm circuit conductors shall be permitted in the same cable, enclosure, or raceway only where connected to the same equipment.

Substantiation: The phrase “power supply” and “Electric Light and Power” are apparently used interchangeably in Article 760 (760.48 and 760.136 for example). The term “power supply circuits” may confuse users assuming this refers to circuits connected to the fire alarm power supply. Use of the term “Electric Light and Power” is consistent with other references in this section to the same type of circuit. The term “non-power limited” should be inserted ahead of “fire alarm circuit” in 760.48(B) for consistency with 760.48(A).

Panel Meeting Action: Reject

Panel Statement: The use of “power supply” is intentional since the fire alarm power supply conductors can only occupy the same cable, enclosure, or raceway if the conductors are connected to the same equipment (functionally associated).

This section does not provide permission to put normal light and power conductors supplying power to other loads into the same cable, enclosure, or raceway.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-265a Log #CP303 NEC-P03 **Final Action: Accept**
(760.49)

Submitter: Code-Making Panel 3,
Recommendation: Revise the existing code text to read as follows:

“760.49 NPLFA Circuit Conductors.

(B) Insulation. Insulation on conductors shall be ~~suitable~~ rated for 600 volts. Conductors larger than 16 AWG shall comply with Article 310. Conductors 18 AWG and 16 AWG shall be Type KF-2, KFF-2, PAFF, PTFF, PF, PFF, PGF, PGFF, RFH-2, RFHH-2, RFHH-3, SF-2, SFF-2, TF, TFF, TFN, TFFN, ZF, or ZFF. Conductors with other types and thickness of insulation shall be permitted if listed for non–power-limited fire alarm circuit use.”

Substantiation: “Suitable” was changed to “rated” since the conductor insulation must be rated for 600-volts.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-266 Log #2904 NEC-P03 **Final Action: Reject**
(760.49(A))

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Revise text to read as follows:

760.49 NPLFA Circuit Conductors.

(A) Sizes and Use. Only copper conductors shall be permitted to be used for fire alarm systems. Size 18 AWG and 16 AWG conductors shall be permitted to be used, provided they supply loads that do not exceed the ampacities given in Table 402.5 and are installed in a raceway, an approved enclosure, or a listed cable. Conductors larger than 16 AWG shall not supply loads greater than the ampacities given in 310.15, as applicable. For circuit integrity (CI) cable and electrical circuit protective systems minimum conductor size shall be 16 AWG.

Substantiation: The strength of copper decreases under a fire. UL 2196 has added a strength test to determine the maximum distance between supports in a vertical run. Only 2 manufacturers have achieved a listing for vertical use on an 18 AWG, one is 16 feet and the other is 27 feet. This distance is not practical for most vertical installations. The vertical limit for 16 AWG is 53 feet for one manufacturer and 100 feet for the other. The other manufacturers’ 18 AWG cannot be used in a vertical run. The majority of the fire rated cable is used vertically and is 18 AWG. Since the limits are not practical, the concern is that it will be used beyond its limits.

Panel Meeting Action: Reject

Panel Statement: 300.19 and the accompanying Table 300.19 permits 18-gauge copper conductors installed in vertical raceways to be supported at 100 feet or greater.

There was no technical substantiation provided in the proposal for the exclusion of 18-gauge conductors and to require all circuit integrity cable and electrical circuit protective systems to be sized at 16-gauge conductor size.

Many installations using 18-gauge conductors may never be installed in a vertical distance in excess of 10 or 15 feet in a raceway.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-267 Log #2199 NEC-P03 **Final Action: Accept in Principle**
(760.51)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:

760.51 Number of Conductors in Cable Trays and Raceways, and Ampacity Adjustment. ~~Derating.~~

(A) NPLFA Circuits and Class 1 Circuits. Where only non–power-limited fire alarm circuit and Class 1 circuit conductors are in a raceway, the number of conductors shall be determined in accordance with 300.17. The adjustment ~~derating~~ factors given in 310.15(B)(2)(a) shall apply if such conductors carry continuous load in excess of 10 percent of the ampacity of each conductor.

(B) Power-Supply Conductors and Fire Alarm Circuit Conductors. Where power-supply conductors and fire alarm circuit conductors are permitted in a raceway in acrodance with 760.48, the number of conductors shall be determined in accordance with 300.17. The adjustment ~~derating~~ factors given in 310.15(B)(2)(a) shall apply as follows:

(1) Text to remain unchanged.
(2) Text to remain unchanged.
(3) Text to remain unchanged.

Substantiation: The term “ampacity adjustment factors” is the term used in 310.15(B)(2)(a).

Panel Meeting Action: Accept in Principle

In the proposed text, add “Factors” after “Adjustment” in the title to read as follows:

760.51 Number of Conductors in Cable Trays and Raceways, and Ampacity Adjustment Factors.”

(A) NPLFA Circuits and Class 1 Circuits. Where only non–power-limited fire alarm circuit and Class 1 circuit conductors are in a raceway, the number of conductors shall be determined in accordance with 300.17. The ampacity adjustment factors given in 310.15(B)(2)(a) shall apply if such conductors carry continuous load in excess of 10 percent of the ampacity of each conductor.

(B) Power-Supply Conductors and Fire Alarm Circuit Conductors. Where power-supply conductors and fire alarm circuit conductors are permitted in a raceway in accordance with 760.48, the number of conductors shall be determined in accordance with 300.17. The ampacity adjustment factors given in 310.15(B)(2)(a) shall apply as follows:

(No other changes are to be made to the existing text.)

Panel Statement: The panel added the word “factors” to the title to make it consistent with the text in the subsection.

The phrase “ampacity adjustment factors” is more technically correct since it is the ampacity of the conductors that are being adjusted by the factor in 310.15(B)(2)(a).

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-268 Log #2467 NEC-P03 **Final Action: Reject**
(760.51)

Submitter: Daniel G. Decker, Safety Systems, Inc.
Recommendation: Revise text to read as follows:

760.51 Number of Conductors in Cable Trays and Raceways, and Derating.

(A) NPLFA Circuits and Class I Circuits. Where only non-power-limited fire alarm circuit and Class 1 circuit conductors are in a raceway, the number of conductors shall be determined in accordance with 300.17. The derating factors given in 310.15(B)(2)(a) shall apply if such conductors carry continuous load in excess of 10 percent of the ampacity of each conductor.

(B) ~~Power-Supply Conductors and Fire Alarm Circuit Conductors.~~ NPLFA Circuits and Electric Light and Power Circuits. Where ~~power supply~~ electric light and power conductors and non-power limited fire alarm circuit conductors are permitted in a raceway in accordance with 760.48, the number of conductors shall be determined in accordance with 300.1 7. The derating factors given in 310.15(B)(2)(a) shall apply as follows:

(1) To all conductors where the fire alarm circuit conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the total number of conductors is more than three

(2) To the ~~power supply~~ electric light and power conductors only, where the fire alarm circuit conductors do not carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the number of ~~power supply~~ electric light and power conductors is more than three.

Substantiation: The phrase “power supply” and “electric light and poower” are apparently used interchangeably in Article 760 (760.51 and 760.136 for example). The term “power supply circuits” may confuse users assuming this refers to circuits connected to the fire alarm power supply. Use of the term “electric light and power” is consistent with other references in this section to the same type of circuit. The term “non-power limited” should be inserted ahead of “fire alarm circuit” in 760.51(B) for consistency with 760.51(A).

(760.53)

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A)(1) change "adequately" to "securely"; in (A)(2) change "adequate protection can be afforded" to "approved protection is provided"; in (A)(3) add "liquidtight flexible metal conduit".
Substantiation: "Adequately" and "adequate" are subjective terms to be avoided per the Style Manual. Liquidtight flexible metal conduit is as suitable as liquidtight flexible nonmetallic conduit.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided that "adequately supported" is the same as "securely supported" in the recommendation and that the existing text is a safety issue. The same applies to the recommended change "adequate protection can be afforded."

There was no technical substantiation provided to add liquidtight flexible metal conduit. Various wiring methods can be used in hoistways, but still must comply with the special requirements in other parts of the NEC, such as those requirements for restricted lengths of certain raceways within the hoistway as provided in 620.21(A)(1).

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-272 Log #4071 NEC-P03 **Final Action: Reject**
(760.53(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.53(A).

No change to 760.53(B).

760.53 Multiconductor NPLFA Cables.

Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.176 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.53(A) and (B).

(A) NPLFA Wiring Method. Multiconductor non–power-limited fire alarm circuit cables shall be installed in accordance with 760.53(A)(1), (A)(2), ~~and~~ (A)(3) and (A)(4).

(1) Exposed or Fished in Concealed Spaces. In raceway or exposed on surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

(2) Passing Through a Floor or Wall. In metal raceway or rigid nonmetallic conduit where passing through a floor or wall to a height of 2.1 m (7 ft) above the floor unless adequate protection can be afforded by building construction such as detailed in 760.53(A)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 620.21 for elevators and similar equipment.

(4) Bushing. A bushing shall be installed where cables emerge from raceway used for mechanical support or protection in accordance with 300.15(C).

Substantiation: Conduits and other raceways are often used for mechanical support or protection of cables. A bushing is needed to protect cables from damage. Article 300 does not apply unless referenced.
Panel Meeting Action: Reject
Panel Statement: 760.46 requires compliance with 300.15 for non-power-limited fire alarm circuits; therefore, adding this requirement in 760.53(A) is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

EGESDAL, S.: The Panel's substantiation is correct and incomplete. There is an exception to 760.46 that permits installation of non-power-limited cable (760.53). The purpose of the proposal was to assure that non-power-limited cable that used short lengths of raceway or tubing would have a bushing where the cable emerges from the raceway or tubing: 760.53 does not reference 300.15.

SANDERS, M.: The panel action should have been Accept in Principle with the following modification to the proposed text to read, "(4) If a Box or Conduit Body is Not Required. If a box or conduit body is not required, as permitted in 300.15(C), a fitting, such as a bushing, shall be installed where cables emerge from raceway used for mechanical support or protection." This rewording addresses the concern of the submitter to have information specifically included in 760.53(A) providing protection of cables without relying on the inferred requirement to follow 300.15(C) via 760.46.

SEPULVEDA, M.: The Panel's substantiation is correct and incomplete. There is an exception to 760.46 that permits installation of non-power-limited cable (760.53). The purpose of the proposal was to assure that non-power-limited cable that used short lengths of raceway or tubing would have a bushing where the cable emerges from the raceway or tubing: 760.53 does not reference 300.15.

3-273 Log #4073 NEC-P03 **Final Action: Reject**
(760.53(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.53(A).

760.53 Multiconductor NPLFA Cables.

Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.176 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.53(A) and (B).

(A) NPLFA Wiring Method. Multiconductor non–power-limited fire alarm circuit cables shall be installed in accordance with 760.53(A)(1), (A)(2), and (A)(3). <u>The raceway fill tables of Chapter 3 and Chapter 9 shall not apply.</u>
(1) Exposed or Fished in Concealed Spaces. In raceway or exposed on surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

(2) Passing Through a Floor or Wall. In metal raceway or rigid nonmetallic conduit where passing through a floor or wall to a height of 2.1 m (7 ft) above the floor unless adequate protection can be afforded by building construction such as detailed in 760.53(A)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 620.21 for elevators and similar equipment.

Substantiation: Part II of Article 760 is silent on non-power-limited cable must meet the raceway fill requirements of Chapter 9, Table 1. Non-power-limited is normally installed exposed, but may use short lengths of raceway for support or protection (e.g., to 7 feet above the floor).

Panel Meeting Action: Reject

Panel Statement: 760.46 requires compliance with both 300.17 for raceway fill and other appropriate articles in Chapter 3. Most wiring methods in Chapter 3 require compliance with Table 1, Chapter 9, therefore, non-power-limited fire alarm cables must comply with any raceway fill requirements where the raceway is used for enclosing non-power-limited fire alarm cables. Chapter 9, Table 1, Note 9 permits a multiconductor cable to be treated as a single conductor for calculation purposes.

There was no technical substantiation provided to justify exempting the raceway fill tables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: The Panel's substantiation is correct and incomplete. There is an exception to 760.46 that permits installation of non-power-limited cable (760.53). The purpose of the proposal was to assure that non-power-limited cable that used short lengths of raceway would not have to meet the raceway fill requirements. While it makes sense to meet the raceway fill requirements, the NEC appears to be silent on the requirements for non-power-limited cable (760.53) installed in a complete raceway system.

SEPULVEDA, M.: The Panel's substantiation is correct and incomplete. There is an exception to 760.46 that permits installation of non-power-limited cable (760.53). The purpose of the proposal was to assure that non-power-limited cable that used short lengths of raceway would not have to meet the raceway fill requirements. While it makes sense to meet the raceway fill requirements, the NEC appears to be silent on the requirements for non-power-limited cable (760.53) installed in a complete raceway system.

3-274 Log #4083 NEC-P03 **Final Action: Accept in Principle**
(760.53(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.53(A) as follows:

760.53 Multiconductor NPLFA Cables.

Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.176 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.53(A) and (B).

(A) NPLFA Wiring Method. Multiconductor non–power-limited fire alarm circuit cables shall be installed in accordance with 760.53(A)(1), (A)(2), and (A)(3).

(1) <u>In Raceway or</u> Exposed or Fished in Concealed Spaces. ~~In raceway or exposed on surface of ceiling and sidewalls or fished in concealed spaces.~~ Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

(2) Passing Through a Floor or Wall. <u>Cables shall be installed in</u> ~~In~~ metal raceway or rigid nonmetallic conduit where passing through a floor or wall to a height of 2.1 m (7 ft) above the floor unless adequate protection can be afforded by building construction such as detailed in 760.53(A)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. <u>Cables shall be installed in</u> ~~In~~ rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 620.21 for elevators and similar equipment.

Substantiation: This proposal is editorial.

Panel Meeting Action: Accept in Principle

In the proposed wording, add an "s" to Raceway in the title of (A)(1) and add "on Ceilings or Sidewalls" to the title of (A)(1) to read as follows:

"760.53 Multiconductor NPLFA Cables.

(A) NPLFA Wiring Method. Multiconductor non–power-limited fire alarm circuit cables shall be installed in accordance with 760.53(A)(1), (A)(2), and (A)(3).

(1) In Raceways, Exposed on Ceilings or Sidewalls, or Fished in Concealed Spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.)."

(All other changes in the proposal accepted as submitted.)

Panel Statement: An "s" was added to make the raceway plural and the phrase "on ceilings and sidewalls" was added to ensure that the exposed cable installation only applies to exposed ceiling and sidewalls, not the floor or other areas of a building.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-275 Log #1423 NEC-P03 **Final Action: Reject**
(760.53(A)(1) and (A)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (A)(1) and (A)(2) and substitute with the following:

(A)(1) In identified raceways, Type MI cable, auxiliary gutters, or exposed and not in raceways. Splices and terminations shall be made in identified boxes, fire alarm system devices, or other identified enclosures. Exposed conductors and cables not in raceways shall be securely supported and fastened at intervals not to exceed 1.4 m (4 1/2 ft). Where likely to be exposed to physical damage or where installed less than 2.1 m (7 ft) above a floor, platform or other standing surface exposed conductors and cables not in raceways shall be protected by identified means.

Exception: Fire alarm conductors and cables shall not be required to be installed in raceways or supported at intermediate points where fished between access points in finished buildings and structures where supporting is impractical provided support and fastening is provided where conductors and cable become accessible.

(A)(2) Where exposed, identified metal raceways or rigid nonmetallic conduit where passing through a floor, platform, ceiling, wall, or other partition at a height less than 2.1 m (7 ft) above the standing surface.

Substantiation: Raceways should be identified for the use so as not to imply "not permitted" use is not amended. Type MI cable is as suitable as nonmetallic covered conductors. The "exposed" provisions should apply to conductors and cables not in raceways since raceways installed on the surface are exposed. "Adequately" and "equivalent" are subjective and terms to be avoided. Per the Style Manual, support should be defined by specific methods. "Maximum" protection is not defined. The proposed exception for the conductors and cables not in raceways to permit fished installation may not be acceptable since these spaces are generally concealed and conductors that are not exposed are required to be installed in raceways.

Panel Meeting Action: Reject

Panel Statement: 760.53 deals with multiconductor non-power-limited fire alarm cables, not individual conductors as proposed in the rewrite of the text.

Adding MI cable to the text is not applicable since non-power-limited fire alarm cable is a specific listed cable based on 760.176.

The term "exposed" does not apply to conductors since the installation is dealing with fire alarm cables.

"Adequately supported," "adequately protected," and "equivalent" all provide requirements that an AHJ can use to make a determination of compliance based on the installation. The proposed exception is not required since the existing text in (A)(1) already covers fished cables in a concealed location.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-276 Log #4064 NEC-P03 **Final Action: Reject**
(760.53(B) and 760.53(C) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: 760.53(A) does not change.

760.53(B) Revise text as shown.

760.53(C).Add new text as shown.

760.53 Multiconductor NPLFA Cables.

Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.176 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.53(A) and (B).

(B) Applications of Listed NPLFA Cables. The use of non–power-limited fire alarm circuit cables shall comply with 760.53(B)(1) through (B)(4) and shall be permitted to have suffixes in accordance with 760.53(C).

(1) Ducts and Plenums. Multiconductor non–power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts or plenums.

FPN: See 300.22(B).

(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type NPLFP.

Exception No. 1: Types NPLFR and NPLF cables installed in compliance with 300.22(C).

Exception No. 2: Other wiring methods in accordance with 300.22(C) and conductors in compliance with 760.49(C).

~~Exception No. 3: Type NPLFP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable~~.

(3) Riser. Cables installed in vertical runs and penetrating more than one floor or cables installed in vertical runs in a shaft shall be Type NPLFR. Floor penetrations requiring Type NPLFR shall contain only cables suitable for riser or plenum use.

Exception No. 1: Type NPLF or other cables that are specified in Chapter 3 and are in compliance with 760.49(C) and encased in metal raceway.

Exception No. 2: Type NPLF cables located in a fireproof shaft having firestops at each floor.

FPN: See 300.21 for firestop requirements for floor penetrations.

~~Exception No. 3: Type NPLF-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~

(4) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 760.53(B)(1), (B)(2), and (B)(3) shall be Type NPLF.

Exception No. 1: Chapter 3 wiring methods with conductors in compliance with 760.49(C).

Exception No. 2: Type NPLFP or Type NPLFR cables shall be permitted.

~~Exception No. 3: Type NPLFR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable~~.

(C) Non-Power-Limited Cables With Suffix Markings. Non-power-limited cables with single or multiple suffix markings shall be permitted where required to meet special applications.

(1) Non-Power-Limited Cables or Electrical Circuit Protective System. Non-power-Limited circuit integrity (CI) cables or a listed electrical circuit protective system shall be permitted for use in fire alarm systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions. Non-power-limited circuit integrity cables shall be marked in accordance with 760.176(F).

(2) Non-Power-Limited Cables for Dry, Damp, or Wet Locations. Non-ower-limited cables installed in dry, damp, or wet locations shall be marked in accordance with 760.176.(I).

(3) Non-Power-Limited Cables Exposed to Direct Sunlight. Non-power-limited Cables installed exposed to direct sunlight shall be marked in accordance with 760.176(J).

(4) Non-Power-Limited Fire Hazard Cables. Non-power-limited fire hazard cables installed to provide low flame spread, very-low-smoke, and known potential heat release shall be marked in accordance with 760-176(M).

(5) Non-Power-Limited Very-Low-Smoke Producing Cables. Non-power-limited very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be marked in accordance with 760.176(L).

(6) Non-Power-Limited Cables in Corrosive Locations. Non-power-limited cables installed in corrosive locations shall be marked in accordance with 760.176(H).

Substantiation: This proposal adds text to the first paragraph of 760.53(B) to permit cables to have suffix markings.

This proposal establishes 760.53(C) for cables with suffixes for installation in locations requiring special cable characteristics.

This proposal removes the cable survivability requirement from 760.53(B)(2), (3), and (4), and establishes the requirements in 760.53(C) with text parallel to Article 725.

Panel Meeting Action: Reject

Panel Statement: The proposed text for 760.53(C)(1) through (C)(6) does not deal with applications of listed non-power-limited fire alarm cables, however is providing suffix markings for these cables; therefore, (C)(1) through (C)(6) were not accepted.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: While the intent of the proposal was to provide application requirements, the proposal should have included more specific text, as to applications. The installation requirements for non-power-limited cables are detailed in 760.53, so a proposal to these sections was unnecessary.

SEPULVEDA, M.: While the intent of the proposal was to provide application requirements, the proposal should have included more specific text, as to applications. The installation requirements for non-power-limited cables are detailed in 760.53, so a proposal to these sections was unnecessary.

3-277 Log #4077 NEC-P03 **Final Action: Reject**
(760.53(B)(1))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.53(B)(1) as follows:

(1) Ducts and Plenums.

(a) Multiconductor non–power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts or plenums.

FPN: See 300.22(B).

(b) Type NPLFP cables shall be permitted installed exposed in ducts or plenums where used as a wiring material for power-limited circuits.

Substantiation: This proposal eliminates and inconsistence between 760.53(B)(1) and 760.130(A) Exception No. 2.

Exception No. 2 below permits power-limited circuits to be installed using non-power-limited multiconductor cable.

[NFPA 70-2008] 760.130 Wiring Methods and Materials on Load Side of the PLFA Power Source.

Fire alarm circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with 760.130(A), (B), or a combination of (A) and (B).

(A) NPLFA Wiring Methods and Materials. Installation shall be in accordance with 760.46, and conductors shall be solid or stranded copper.

Exception No. 1: The derating factors given in 310.15(B)(2)(a) shall not apply.

Exception No. 2: Conductors and multiconductor cables described in and installed in accordance with 760.49 and 760.53 shall be permitted.

Panel Meeting Action: Reject

Panel Statement: 760.130(A), Exception No. 2 does not permit non-power-limited fire alarm cable to be installed exposed in ducts or plenums. 760.53(B)(1) very clearly states that these exposed cables shall not be installed in ducts or plenums.

Exposed cables in a fabricated duct results in numerous problems.

Duct dampers cannot operate properly to control the air movement where cables may be installed through the dampers. Deflecting hardware (vanes) can have sharp edges with resulting damage to the cable. 300.22(B) only permits metal wiring methods internal to a fabricated duct and then only long enough to connect to electrical equipment that has direct action on or sensing of the environmental air.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

AYER, L.: The proposal should have been accept in principle. Proposals have been submitted and accepted by Code Panel 3 to change the term While I agree with the panel action, this proposal along with Proposal 3-280 will add the same requirements in two sections of Article 760. It would be more appropriate to add branch circuit "ducts or plenums" found in 300.22(B). The term "ducts or plenums" is being changed to "ducts specifically fabricated for environmental air". This change will help the user of the code have a clear delineation that 300.22(B) is sheet metal ducts used to transport air and 300.22(C) covers areas traditionally defined and understood by trades people as plenums. The proposed wording is as follows:

(B) Applications of Listed NPLFA Cables. The use of non–power-limited fire alarm circuit cables shall comply with 760.53(B)(1) through (B)(4).

(1) Ducts and Plenums**.** Multiconductor non–power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts **specifically fabricated for environmental air** or plenums.

Exception to (1): As permitted in 760.154(A)

FPN: See 300.22(B).

(2) Other Spaces Used for Environmental AirÉÉ

Exception No. 1:

Exception No. 2:

Exception No. 3:

(3) Riser

Exception No. 1:

Exception No. 2:

Exception No. 3:

(4) Other Wiring Within Buildings

Exception No. 1:

760.154 Applications of Listed PLFA Cables. PLFA cables shall comply with the requirements described in either 760.154(A), (B), or (C) or where cable substitutions are made as shown in 760.154(D).

(A) Ducts. Cables shall be permitted to be installed in ducts specifically fabricated for environmental air if all of the following conditions are met:

(1) The cable shall be Type FPLP and

(2) The cable is directly associated with the air distribution system and

(3) The cable shall not exceed 1.22m (4 ft) in length.

~~(A) Plenums.~~ **(B) Other Spaces used for Environmental Air.** Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity cable.

(A) Riser

(D) Other Wiring Within Buildings

EGESDAL, S.: The committee action fails to address the issue described in the submitter's substantiation. Power-limited cable is permitted in air ducts by 760.154(A). Power-limited circuits are permitted to use non-power-limited wiring methods and materials. This proposal detailed a requirement that would allow a permitted application (power-limited circuit in an air duct) to use a more robust cable (Type NPLFAP). The rejection of the proposal did not answer the proposed change to eliminate the conflict on permitted wiring methods and materials for power-limited circuits in an air duct.

SEPULVEDA, M.: The committee action fails to address the issue described in the submitter's substantiation. Power-limited cable is permitted in air ducts by 760.154(A). Power-limited circuits are permitted to use non-power-limited wiring methods and materials. This proposal detailed a requirement that would allow a permitted application (power-limited circuit in an air duct) to use a more robust cable (Type NPLFAP). The rejection of the proposal did not answer the proposed change to eliminate the conflict on permitted wiring methods and materials for power-limited circuits in an air duct.

3-278 Log #1605 NEC-P03 **Final Action: Reject**
(760.53(B)(3))

Submitter: Ray R. Keden, ERICO, Inc. / Rep. BICSI
Recommendation: Revise text to read as follows:

Cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~ or cables installed in vertical runs in a shaft shall be Type NPLFR. Floor penetrations requiring Type NPLFR shall contain only cables suitable for riser or plenum use.

Exception No. 1: Type NPLF or other cables that are specified in Chapter 3 and are in compliance with 760.49(C) and encased in metal raceway.

Exception No. 2: Type NPLF cables located in a fireproof shaft having firestops at each floor.

FPN: See 300.21 for firestop requirements for floor penetrations.

Exception No. 3: Type NPLF-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

Substantiation: Is it really our intention that cables passing between floors through a floor penetration be less than riser rated?

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel contends that the existing text does meet the panel's intention.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

KEDEN, R.: See 3-201.

3-279 Log #1431 NEC-P03 **Final Action: Reject**
(760.53(N))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete third sentence and substitute: Cables shall be securely fastened and supported by approved methods, and protected by approved methods were likely to be exposed to physical damage.

Revise last sentence: Where exposed and located within less than 2.1 m (7 ft) above a floor or other standing surface cables shall be securely fastened and supported in an approved manner at intervals of not more than 450 mm (18 in.)

Add: Where fished between access points through concealed spaces in finished buildings or structures and supporting is impractical, supporting and fastening shall be provided where the cable is accessible.

Substantiation: "Maximum" protection is subjective and not defined. "Adequately" is a term to be avoided per the Style Manual. Protection by building construction implies other means are not suitable, such as raceways. The last sentence should specify "exposed" to correlate with the heading, and include standing surfaces other than floors, such as platforms and catwalks. Provision for fishing should be included.

Panel Meeting Action: Reject

Panel Statement: The text in the existing third sentence is more clear than the recommended text.

Adding "exposed and located within less than 7 ft" to the text in place of the existing text of "where installed exposed" introduces more complexity into the application than is necessary.

Cables can be installed in building construction where the building construction provides protection for the cables. The existing text is dealing with non-power-limited fire alarm cable that is acceptable in exposed applications, and by careful placement of the cables, the building construction can protect the cables from damage.

The submitter uses the phrase "or other standing surface" without providing any information in the mandatory text on what a "standing surface" is.

The submitter has stated in the substantiation that a standing surface is a platform and a catwalk but has given no technical reason to indicate the necessity of this proposed requirement.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-280 Log #4080 NEC-P03 **Final Action: Accept in Principle in Part**
(760.121)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.121 as follows:

760.121 Power Sources for PLFA Circuits.

(A) Power Source. The power source for a power-limited fire alarm circuit shall be as specified in 760.121(A)(1), (A)(2), or (A)(3).

FPN ~~No. 1~~: Tables 12(A) and 12(B) in Chapter 9 provide the listing requirements for power-limited fire alarm circuit sources.

(1) A listed PLFA or Class 3 transformer.

(2) A listed PLFA or Class 3 power supply.

(3) Listed equipment marked to identify the PLFA power source.

FPN: Examples of listed equipment are a fire alarm control panel with integral power source; a circuit card listed for use as a PLFA source, where used as part of a listed assembly; a current-limiting impedance, listed for the purpose or part of a listed product, used in conjunction with a non–power-limited transformer or a stored energy source, for example, storage battery, to limit the output current.

(B) Branch Circuit.

(1) A~~n individual~~ dedicated branch circuit shall be required for the supply of the power source.

Exception: The dedicated branch circuit shall be permitted to connect to multiple pieces of fire alarm equipment.

(2) The~~is~~ dedicated branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

FPN ~~No. 2~~: See 210.8(A)(5), Exception, for receptacles in dwelling-unit unfinished basements that supply power for fire alarm systems.

(3) The dedicated branch circuit(s) and connections shall be mechanically protected.

(4) The circuit disconnecting means shall have a red marking, shall be accessible only to authorized personnel, and shall be identified as "FIRE ALARM CIRCUIT."

(5) The location of the circuit disconnecting means shall be permanently identified at the fire alarm control unit.

Substantiation: This proposal provides correlation with NFPA 72-2007, National Fire Alarm Code. NFPA 72 uses the term "dedicated branch circuit" rather than the generic "individual branch circuit." It is important for continued fire alarm system operation that the fire alarm system, and only the fire alarm system, be connected to a branch circuit.

The proposed changes are from NFPA 72-2007, 4.4.1.4.2.

Panel Meeting Action: Accept in Principle in Part

Add an additional sentence after the existing first sentence in the current NEC to read as follows:

"**(B) Branch Circuit.** An individual branch circuit shall be required for the supply of the power source. The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control panel."

The remainder of the proposed text is Rejected.

Panel Statement: "Dedicated branch circuit" is not defined in Article 100 of the NEC, whereas "individual branch circuit" is defined as "a branch circuit that supplies only one utilization equipment." The use of individual branch circuits in 760.41 determines that this branch circuit can supply only fire alarm equipment (can consist of multiple pieces of the same equipment); therefore, the suggested changes are not consistent with the NEC style.

The branch circuit must be installed based on the wiring methods in Chapter 3, and if there is a possibility for physical damage, then an appropriate wiring method must be used; therefore, mechanically protecting the circuit is not consistent with any requirements in Chapter 3 wiring methods.

Painting circuit breakers or other types of branch circuit disconnecting means may impede operation of the breaker or disconnect, therefore, this method of identification is discouraged. Identification of the branch circuit is already a requirement in 110.22 and 408.4 for the specific purpose of the branch circuit, therefore, further identification should not be required.

A new sentence was added as a second sentence to 760.121(B) to read as follows: "The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control panel." This added sentence provides marking of the location of the overcurrent protective device on the fire alarm panel so a maintenance person can quickly determine where to locate the overcurrent device.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

AYER, L.: See Statement on Proposal 3-259.

3-281 Log #3763 NEC-P03 **Final Action: Reject**
(760.121(B))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Jebediah J. Novak, Cedar Rapids Electrical JATC / Rep. Int'l Brotherhood of Electrical Workers

Recommendation: Delete text to read as follows:

(B) Branch Circuit. An individual branch circuit shall be required for the supply of the power source. ~~This branch circuit shall not be supplied through ground fault circuit interrupters or arc fault circuit interrupters.~~

Substantiation: This requirement should be deleted. Both AFCI and GFCI devices are intended to protect people and property from fire and shock hazards. The substantiation used in the past to justify this requirement was that de-energizing the fire alarm control panel (FACP) would result in the system ceasing to function with no indication of the loss of power,or that nuisance tripping would be an issue. This requirement seems to imply that is better to have an arcing condition persist and grow into a fire scenario, because the FACP will be able to notify the building occupants of the fire that was started by it's own branch-circuit. Similar arguments could be made in regards to a ground-fault that could result in shock or electrocution.

However, the building occupants will be aware of the loss of power if the fire alarm is installed in accordance with NFPA 72, the National Fire Alarm Code. Section 4.4.1.5.3 of NFPA 72 requires that fire alarm systems be provided with a minimum of 24 hours of standby power, with enough power available at the end of the 24 hour period for the system to go into full alarm for 5 minutes (15 minutes of maximum connected load for emergency voice communications systems). Section 4.4.7.3.1 of NFPA 72 requires that failure of either the primary or secondary power supplies to be annunciated with a trouble signal in accordance with Section 4.4.3.5, that requires the trouble condition to be annunciated within 200 seconds at a location where it is likely to be heard.

The loss of primary power is also required to be transmitted to any supervising station that is monitoring the system. Unless prohibited by the AHJ, loss of power trouble signals may have a delayed transmission to the remote stations communications equipment. This is still well within the time-frame of the 24 hours required standby capacity. Upon receipt of the power supply failure transmission, Chapter 8 of NFPA 72 gives specific instructions to the personnel in the supervising stations to ensure appropriate action is taken.

As I read through the past proposals and comments addressing this issue, it became very apparent that there is a lack of understanding when differentiating between single/multiple station smoke alarms and smoke detectors. As a panel member of NFPA 72, it is important to distinguish that single/multiple station smoke alarms do not meet the criteria of a fire alarm system as defined by Chapter 3 of NFPA 72, and therefore are still subject to the GFCI requirements of 210.8 and the AFCI requirements of 210.12. Household fire alarm systems are defined by 3.3.67.3 as having a fire alarm control unit (panel) that is interconnected to the devices that are used for initiation and notification.

Another substantiation used in past revision cycles was that often times the batteries are not provided, are missing, are dead, or smoke detectors are "rendered inoperable by, e.g., a shower cap. This quoted material was proposal 3-236, Log #1598 in the Report on Proposals from May of 2004. The CMP-accepted this proposal at that time. This substantiation implies that since the systems may not be properly installed, inspected or tested that the NEC will allow other potentially dangerous conditions to exist as well.

Again, loss of the secondary power supply is required to be annunciated with a trouble signal within 200 seconds of the condition occurring. Furthermore, Chapter 10 of NFPA 72 details specific inspection and testing procedures that are to be performed at required intervals. A visual inspection of the primary and secondary power supplies is required to be performed at the time of initial acceptance or during any reacceptance of the system. Batteries, depending on the type, are required to be visually inspected at either monthly or semiannual intervals, depending on the type. The primary and secondary power supplies are required to be tested at regular intervals as well, the Table 10.4.2.2 detailing how those tests are to be performed. For a system to be up and running, the batteries would have to be in place and operating correctly.

To summarize my position on this proposal:

1. Building occupants will be notified of a loss of power
2. GFCI's and AFCI's have been shown to increase safety for personnel and property from hazards arising from the use of electricity, as evidenced by each type of protection being applied to increasing locations in 210.8 and 210.12, respectively
3. It is the building owner's responsibility to properly maintain the fire alarm system
4. If the AFCI or GFCI is tripping the branch-circuit supplying the FACP, it is because a potentially hazardous condition exists and the situation needs to be corrected.

Panel Meeting Action: Accept

Panel Statement: The panel understands that the action taken on this proposal modifies the panel action taken on Proposal 3-280.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 9 Negative: 6

Explanation of Negative:

CONNAUGHTON, T.: A Local Fire Alarm System could be rendered useless with the tripping of a GFCI device

EGESDAL, S.: This proposal should have been rejected to correlate with the action on 3-280.

The submitter did not identify specific job problems. The submitter did not show that a GFCI would not trip when a fire alarm circuit (initiating, notification, signaling line) was grounded. The submitter did not show that an AFCI would not trip when the contacts of a fire alarm relay "arc" when being connected or disconnected to a highly inductive load.

Connecting a Local Fire Alarm System to a GFCI or an AFCI creates a potential life safety situation. A Local Fire Alarm System that receives standby power from an emergency generator will have 4 hours of battery power. If this type of fire alarm system is connected to a GFCI or an AFCI that has an inadvertent trip, here's the probably outcome: (1) The FA panel, which is probably locked in a remote electrical room, will sound a trouble signal until the battery is depleted; (2) The emergency generator will not start, as it starts when power to the build is lost; (3) The building, such as a condo, will be without a fire alarm system, and nobody may be aware.

KAHN, S.: This proposal should have been rejected to correlate with the panel's action on 3-280.

OWEN, S.: The submitter's strikethrough of the present 2008 NEC second sentence has the effect of deleting the present requirement to prohibit arc-fault circuit interrupters or ground-fault circuit interrupters on power-limited fire alarm circuits without technical substantiation or documentation. This proposal should be rejected.

SEPULVEDA, M.: This proposal should have been rejected to correlate with the action on 3-280.

The submitter did not identify specific job problems. The submitter did not show that a GFCI would not trip when a fire alarm circuit (initiating, notification, signaling line) was grounded. The submitter did not show that an AFCI would not trip when the contacts of a fire alarm relay "arc" when being connected or disconnected to a highly inductive load.

Connecting a Local Fire Alarm System to a GFCI or an AFCI creates a potential life safety situation. A Local Fire Alarm System that receives standby power from an emergency generator will have 4 hours of battery power. If this type of fire alarm system is connected to a GFCI or an AFCI that has an inadvertent trip, here's the probably outcome: (1) The FA panel, which is probably locked in a remote electrical room, will sound a trouble signal until the battery is depleted; (2) The emergency generator will not start, as it starts when power to the build is lost; (3) The building, such as a condo, will be without a fire alarm system, and nobody may be aware.

SLEIGHTS, J.: The required annunciation of a trouble signal from the fire alarm in response to the loss of primary power is often effective in calling attention to the condition. However, in practice it sometimes is not. The signal may be ignored or there may not be anyone on-premises during the duration the secondary power supply (typically battery) is capable of operating the signal. Since it is the intent of CMP-3 to coordinate with the National Fire Alarm Code and require the fire alarm equipment to be supplied by an 'individual branch circuit' it is not likely that the nonfunctionality of some other equipment or lighting will in any way call attention to the loss of primary power to the specific circuit for the fire alarm system. In some situations the signal is transmitted off-premises, but not in all cases. Thus the detection of the loss of power falls to inspection or in the worse case scene investigation after a loss has occurred. Inspection is by nature periodic with some duration of time expected where the system is left to itself. The 2007 edition of NFPA 72 National Fire Alarm Code, Table 10.3.1 Visual Inspection Frequencies indicates that a 'Weekly' visual inspection is required of 'Fire Alarm Control Unit Trouble Signals'. If inspections were actually performed at that interval it could still leave a 5-6 day window of questionable performance for a system with a 24 hour secondary power supply.

Notwithstanding what may be added or removed in this Code cycle, Article 210 in the 2008 edition permits GFCI protection be omitted only for a dedicated receptacle in an unfinished basement supplying a permanent fire alarm system (210.8(A)(5) Exception) with an FPN referencing the Article 760 sections we are currently pondering. 210.12 currently requires AFCI protection for some branch circuits only in the dwelling unit areas listed in 210.12(B). It does however permit AFCI protection to be omitted from the branch circuit supplying a fire alarm system in 210.12(B) Exception 2 where the branch circuit is installed with the specific wiring methods listed. A FPN is also included referencing the Article 760 sections we are currently pondering.

What is not discussed until Article 760 is the permission to use a GFCI or AFCI on any circuit supplying a fire alarm system in other than a dwelling unit. Without the prohibition in Article 760 it will be permitted and likely required if the circuit location falls under one requiring such protection in Article 210 (absent the specific wiring methods in the Exception) or is specified above minimum Code requirements by a designer. Also, it needs to be kept in mind that the branch circuit ultimately used MAY predate the fire alarm installation and as such may have older GFCI or AFCI equipment installed. Simple circuit breaker 'locks' will not protect against tripping via the test button on most circuit breakers.

The argument that NFPA 72 does not specifically prohibit a fire alarm system from being supplied by a branch circuit protected by a GFCI or AFCI and is therefore permits it is hollow. That document was able to look to the NEC and read the requirements in Article 760 that specifically prohibits the devices.

Finally, if the fire alarm system is located within a dwelling unit the scope of coverage is usually limited to the unit. On a larger scale, the 'fire alarm system' may be installed in a common space to provide service to sections or floors of a building, an entire building, complex or larger entity. These installations are not likely covered by the Article 210 sections.

The submitter of the proposals did not provide any technical substantiation that the current arrangement presents any increased hazard in locations where the Code currently requires GFCI or AFCI protection. It also does not examine in detail the increased risk of power loss to fire alarm systems that may arise from inadvertent tripping of these devices, nor the compatibility of the vast array of fire alarm equipment that may be required to function on a circuit so protected.

Based on my experience and evaluation of this issue I vote to REJECT proposals ROP 3-260 and 3-281 that remove the prohibition of GFCI and AFCI protection on fire alarm system branch circuits.

Comment on Affirmative:

AYER, L.: See Statement on Proposal 3-260.

KEDEN, R.: See 3-260.

3-282 Log #3878 NEC-P03 **Final Action: Reject**
(760.124(A))

Submitter: Joe Diehl, E Light Electric Services

Recommendation: Add new text as follows:

<u>PFLA conductor's insulation shall be color coded to clearly designate its system. All signaling loop conductors (SLC) shall be solid red in color. Notification loop conductors shall be Red with a white stripe for A riser and Red with a black stripe for B riser. All power supply cables shall be Red with a different colored stripe.</u>

Substantiation: Identifying the conductors will allow maintenance personnel to more readily recognize systems and allow for repair and troubleshooting without disabling the system.

Panel Meeting Action: Reject

Panel Statement: The proposed text uses terms that are not adequately defined in Article 760 or in the NEC. This color coding of conductors is more appropriately addressed by the NFPA 72 Committee. Color coding these circuits is already permissible by the NEC and NFPA 72.

The submitter did not provide technical substantiation that there were safety issues involved, just that the color of conductors would permit easier identification.

The systems can be troubleshot and repaired in an energized condition without disabling the system.

The intent of 760.124 is to require marking of the circuits to indicate that the circuits are power limited so the installer can determine that the conductors and cables must comply with Parts I and III of Article 760 and should not be mixed with non-power-limited or power cables or conductors.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-283 Log #3089 NEC-P03 **Final Action: Reject**
(760.127)

Submitter: Mike Holt, Leesburg, FL

Recommendation: Revise text as follows:

760.127 Wiring Methods on Supply Side of the PLFA Power Source. Conductors and equipment on the supply side of the power source shall be installed in accordance with the appropriate requirements of Part II and Chapters 1 through 4. Transformers or other devices supplied from power-supply conductors shall be protected by an overcurrent device rated not over 20 amperes.<u> Where power-limited fire alarm systems contain outlets in areas requiring AFCI protection, the circuit(s) shall be installed in RMC, IMC, EMT, or steel armored cable, Type AC, meeting the requirements of 250.118, with metal outlet and junction boxes.</u>

Exception: The input leads of a transformer or other power source supplying power-limited fire alarm circuits shall be permitted to be smaller than 14 AWG, but not smaller than 18 AWG, if they are not over 300 mm (12 in.) long and if they have insulation that complies with 760.49(B).

Substantiation: This proposal is intended to clarify that compliance with 210.12(B) Ex. No 2 is not optional. The code user that installs fire alarm systems is often not aware of Article 210 requirements, such as Ex No 2 to 210.12(B).

Panel Meeting Action: Reject

Panel Statement: This text is already provided in 210.12, and, since Chapters 1 through 4 apply, unless supplemented or modified by Article 760, the proposed text is unnecessary.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-284 Log #2972 NEC-P03 **Final Action: Accept in Principle**
(760.130(A) Exception No. 1)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise text to read as follows:

(A) NPLFA Wiring Methods and Materials. Installation shall be in accordance with 760.46, and conductors shall be solid or stranded copper.

Exception No. 1: The <u>adjustment</u> ~~derating~~ factors given in 310.15(B)(2)(a) shall not apply.

Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a).

Panel Meeting Action: Accept in Principle

Revise Exception No. 1 of the proposed text to read as follows:

"*Exception No. 1: The ampacity adjustment factors given in 310.15(B)(2)(a) shall not apply."*

Panel Statement: The word "ampacity" was added to make the wording technically correct and to provide consistency with other sections in the NEC that use this phrase.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-285 Log #4491 NEC-P03 **Final Action: Accept in Principle**
(760.130(A) Exception No. 1)

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Revise text to read as follows:

760.130 Wiring Methods and Materials on Load Side of the PLFA Power Source.

Fire alarm circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with 760.130(A), (B), or a combination of (A) and (B).

(A) NPLFA Wiring Methods and Materials. Installation shall be in accordance with 760.46, and conductors shall be solid or stranded copper.

Exception No. 1: The ~~derating~~ <u>adjustment</u> factors given in 310.15(B)(2)(a) shall not apply.

[remainder of 760.130 unchanged by this Proposal]

Substantiation: Correlation issue. Also to improve *Code* readability. Table 310.15(B)(2)(a) referenced from here uses the specific term "adjustment factors", not the unspecific generalization "derating factors".

366.23(A) and 376.22(B) for the 2008 *NEC*® had been revised [Proposal 8-127/Log #2243 and Proposal 8-157/Log #2754, respectively] from the inconsistent term "correction factors" and imprecise term "derating factors", respectively, to "adjustment factors", the term specifically used in Table 310.15(B)(2)(a). Per the Substantiation of Proposal 8-157, Accepted In Principle by Code Panel 8, trade persons were being confused by the designation inconsistency with other ampacity-modifying factors used elsewhere in the *Code*.

A companion Proposal for 310.15(B)(2)(a) revises its Exceptions to use terminology consistent with its title and Table 310.15(B)(2)(a).

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 3-284.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-286 Log #4072 NEC-P03 **Final Action: Reject**
(760.130(B))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Revise 760.130(B).

(B) PLFA Wiring Methods and Materials. Power-limited fire alarm conductors and cables described in 760.179 shall be installed as detailed in 760.130(B)(1), (B)(2), ~~or~~ (B)(3)<u>, or (B)(4)</u> of this section and 300.7. Devices shall be installed in accordance with 110.3(B), 300.11(A), and 300.15.

(1) Exposed or Fished in Concealed Spaces. In raceway or exposed on the surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

(2) Passing Through a Floor or Wall. In metal raceways or rigid nonmetallic conduit where passing through a floor or wall to a height of 2.1 m (7 ft) above the floor, unless adequate protection can be afforded by building construction such as detailed in 760.130(B)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 620.21 for elevators and similar equipment.

Bushing. A bushing shall be installed where cables emerge from a conduit or other raceway used for mechanical support or protection.

<u>(4) Bushing. A bushing shall be installed where cables emerge from raceway used for mechanical support or protection in accordance with 300.15(C).</u>

Substantiation: Conduits and other raceways are often used for mechanical support or protection of cables. A bushing is needed to protect cables from damage. Article 300 does not apply unless referenced.

Panel Meeting Action: Reject

Panel Statement: Since 300.15(C) applies to wiring methods, adding this as a new (4) is unnecessary.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: The reason for the proposal is that the text in 760.130(B) seems to address devices: "Devices shall be installed in accordance with 110.3(B), 300.11(A), and 300.15." The purpose of the proposal is to provide protection of cable as it emerges from a section of raceway of tubing used for mechanical support…hence a reference to 300.15(C). For example, a power-limited circuit could be installed in a complete raceway system, and then emerge from a short section of raceway (no box). This is where cables can be damaged, due to sharp edges from a field cut section of raceway.

SEPULVEDA, M.: The reason for the proposal is that the text in 760.130(B) seems to address devices: "Devices shall be installed in accordance with 110.3(B), 300.11(A), and 300.15." The purpose of the proposal is to provide protection of cable as it emerges from a section of raceway of tubing used for mechanical support…hence a reference to 300.15(C). For example, a power-limited circuit could be installed in a complete raceway system, and then emerge from a short section of raceway (no box). This is where cables can be damaged, due to sharp edges from a field cut section of raceway.

3-287 Log #4074 NEC-P03 **Final Action: Reject**
(760.130(B))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new text to 760.130(B).

(B) PLFA Wiring Methods and Materials. Power-limited fire alarm conductors and cables described in 760.179 shall be installed as detailed in 760.130(B)(1), (B)(2), or (B)(3) of this section, and 300.7. Devices shall be installed in accordance with 110.3(B), 300.11(A), and 300.15. The raceway fill tables of Chapter 3 and Chapter 9 shall not apply.

(1) Exposed or Fished in Concealed Spaces. In raceway or exposed on the surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

(2) Passing Through a Floor or Wall. In metal raceways or rigid nonmetallic conduit where passing through a floor or wall to a height of 2.1 m (7 ft) above the floor, unless adequate protection can be afforded by building construction such as detailed in 760.130(B)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 620.21 for elevators and similar equipment.

Substantiation: Part III of Article 760 is silent on whether power-limited conductors and cables have to meet the conduit fill requirements of Chapter 3 and Chapter 9. Communications cables are not required to meet the raceway fill requirements [800.110, The raceway fill tables of Chapter 3 and Chapter 9 shall not apply.]. Communications cables are permitted to substitute for fire alarm power-limited cables, so this proposal provides parallel requirements to 800.110.

Panel Meeting Action: Reject

Panel Statement: 760.46 requires compliance with both 300.17 for raceway fill and other appropriate articles in Chapter 3. Most wiring methods in Chapter 3 require compliance with Table 1, Chapter 9, therefore, power-limited fire alarm cables must comply with any raceway fill requirements where the raceway is used for enclosing power-limited fire alarm cables. Chapter 9; Table 1, Note 9 permits a multiconductor cable to be treated as a single conductor for calculation purposes.

There was no technical substantiation provided to justify exempting the raceway fill tables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: The Panel's substantiation, while correct, is incomplete. There is an exception to 760.46 that permits installation of non-power-limited cable (760.53), which exempts the 760.46 requirement. Power-limited circuits may be installed using non-power-limited cable or power-limited cable. Short lengths of raceway used for mechanical support should not have to meet the fill requirement.

SEPULVEDA, M.: The Panel's substantiation, while correct, is incomplete. There is an exception to 760.46 that permits installation of non-power-limited cable (760.53), which exempts the 760.46 requirement. Power-limited circuits may be installed using non-power-limited cable or power-limited cable. Short lengths of raceway used for mechanical support should not have to meet the fill requirement.

3-288 Log #4084 NEC-P03 **Final Action: Accept in Principle**
(760.130(B))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.130(B) as follows:

(B) PLFA Wiring Methods and Materials. Power-limited fire alarm conductors and cables described in 760.179 shall be installed as detailed in 760.130(B)(1), (B)(2), or (B)(3) of this section and 300.7. Devices shall be installed in accordance with 110.3(B), 300.11(A), and 300.15.

(1) In Raceway or Exposed or Fished in Concealed Spaces. ~~In raceway or exposed on the surface of ceiling and sidewalls or fished in concealed spaces.~~ Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

(2) Passing Through a Floor or Wall. Cables shall be installed in ~~In~~ metal raceways or rigid nonmetallic conduit where passing through a floor or wall to a height of 2.1 m (7 ft) above the floor, unless adequate protection can be afforded by building construction such as detailed in 760.130(B)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. Cables shall be installed in ~~In~~ rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 620.21 for elevators and similar equipment.

Substantiation: This proposal is editorial.

Panel Meeting Action: Accept in Principle

Revise the wording in proposed (1) to read as follows:

"(1) In Raceways, Exposed on Ceilings or Sidewalls, or Fished in Concealed Spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, and ledges. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

The panel "accepts" the remainder of the proposed text.

Panel Statement: An "s" was added to make the raceway plural, and the phrase "on ceilings and sidewalls" was added to ensure that the exposed cable installation only applies to exposed "ceilings and sidewalls", not floor or other areas of a building.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-289 Log #1424 NEC-P03 **Final Action: Reject**
(760.130(B)(1) and (B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (B)(1) and (B)(2) and substitute:

(B)(1) In identified raceways, Type MI cable, auxiliary gutters, or exposed and not in raceways. Splices and terminations shall be made in identified fittings, boxes, fire alarm system devices, or other identified enclosures. Exposed conductors and cables not in raceways shall be securely supported and fastened by identified means at intervals not to exceed 1.4 m (4 1/2 ft). Where likely to be subject to physical damage or where installed less than 2.1 m (7 ft) above a floor, platform or other standing surface exposed conductors and cables shall not in raceways shall be protected by identified means.

Exception: Fire alarm conductors and cables shall not be required to be installed in raceways or supported at intermediate points where fished between access points in finished buildings or structures and supporting is impractical provided support and fastening is provided where conductors and cables become accessible.

(B)(2) Where exposed, identified metal raceways or rigid nonmetallic conduit where passing through a floor, platform, ceiling, wall, or other partition at a height less than 2.1 m (7 ft) above the standing surface.

Substantiation: Raceways should be identified for the use so as not to imply "not permitted use" is not amended. Type MI cable is as sutiable as nonmetallic covered conductors. The "exposed" provisions should apply to conductors and cables not in raceways since raceways installed on the surface are exposed. "Adequately" and "equivalent" are subjective and terms to be avoided per the Style Manual. Support should be defined by specific methods. "Maximum" protection is not defined.

Panel Meeting Action: Reject

Panel Statement: Adding MI cable to the text in (B) is not necessary since MI cable is a wiring method in Chapter 3 and, based on 760.130(A), is already permitted.

"Exposed" does not apply to individual conductors, only to cables; therefore, the proposed change is inappropriate for the application of individual conductors and cables are already covered.

"Adequately supported," "adequately protected," and "equivalent" are all providing requirements that an AHJ can use to make a determination of compliance based on the installation.

The proposed exception is not required since the existing text in (B)(1) already covers fished cables in a concealed location and fishing individual conductors would not be acceptable.

There was no technical substantiation provided for the suggested changes in (B)(2), and standing surface is not explained in the mandatory text or in the substantiation.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-290 Log #3125 NEC-P03 **Final Action: Reject**

(760.133)

Submitter: Sanford E. Egesdal, Egesdal Associates PLC

Recommendation: Revise 760.133

760.133 Installation of Cables and Conductors, and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, **and Raceways for Class 2 and Class 3 Circuits.**

Conductors, and equipment, and raceways for non-power limited circuits shall be installed in accordance with 725,133(A) through (C) and 760.136 through 760.143.

(A) Listing. Non-power limited cables and conductors shall be listed.

(B) Air Ducts and Plenums. The following cables shall be permitted in air ducts and plenums as described in 300.22(B).

(1) Type FPLP or FPLP-CI

(2) Types FPLP, FPLR, and FPL installed in raceways in compliance with 300.22(B)

(C) Other Spaces Used For Environmental Air. The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C).

(1) Type FPLP or FPLP-CI

(2) Types FPLP, FPLR, and FPL installed in raceways that are installed in compliance with 300.22(C)

(D) Risers-Wires and Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating more than one floor and in vertical runs in a shaft:

(1) Types FPLR or FPLR-CI

(2) Plenum and riser signaling raceways

(3) Types FPLP, FPLR, and FPL installed in plenum or riser signaling raceway

(E) Risers-Cables in Metal Raceways, Fireproof Shafts, and One- and Two-Family Dwellings. The following cables and raceways shall be permitted in metal raceway, in a fireproof shaft with firestops at each floor, and in one- and two-family dwellings:

(1) Types FPLR or FPLR-CI

(2) Non-power limited cables installed in metal raceways or located in a fireproof shaft

(3) Type FPL installed in one- and two-family dwellings

(F) Other Wiring Within Buildings. The following cables installed in building locations, other than those covered in 760.133(B) through (E), shall be permitted to be any of (F)(1) through (H)(4).

(1) Types FPL or FLP-CI

(2) Non-power limited cables installed in a raceway

(3) Cables specified in Chapter 3 and meeting the requirements of 760.179(A) and (B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).

(4) Portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 725, 760, 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal moves those installation rules to section 760.133.

A companion proposal for section 760.154 greatly simplifies the statement of the applications of communications cables and raceways by using a table.

This proposal and its companion proposal for section 760.154 need to be considered together as a package.

Panel Meeting Action: Reject

Panel Statement: There was no technical substantiation provided for this rewrite of 760.133 and the companion proposal for 760.154.

As it is presently written, 760.133 provides a requirement that power-limited fire alarm circuits must be installed in accordance with 760.136 through 760.143. These referenced sections are definitely installation requirements. For example, 760.136 provides installation requirements for separation of power-limited fire alarm circuits from power, light, and similar higher voltage circuits.

In 760.133(A) of the proposed text, the submitter is requiring listing of power-limited fire alarm cables, conductors, and raceways. This is a 760.179 issue since existing Part IV deals with listing issues.

Existing Section 300.22(B) restricts installation of wiring methods to metal raceways and then for connection to equipment necessary for direct action on or sensing of the contained air within the fabricated duct.

There was no technical substantiation provided for proposed 760.133(E) for Risers-Cables in Metal Raceways, Fire-Proof Shafts, and One- and Two-Family Dwellings. There was no rationale provided on why these three installations were in the same subsection together since one- and two-family dwellings seldom deal with risers and fireproof shafts.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

CONNAUGHTON, T.: Remove installation rules from the applications section 725.154 and relocate them in the installation section 725.133. Simplify cable applications by using a table.

Comment on Affirmative:

EGESDAL, S.: This vote is a head-ups for the NEC TCC. Panel 16 accepted in principal the text and tables in proposals to Article 770, 800, and 820 that are very similar to the text and tables in Proposals 3-192, 3-198, 3-290, and 3-298.

KAHN, S.: This is one of a series of proposals that would separate installation rules and cable applications. I participated in the Task Group that worked on the simplification of the installation rules, cable applications and correlation with NFPA 90A (as directed by the Standards Council). CMP-16 improved on the series of proposals in their meeting the week following the CMP-3 meeting. This proposal, along with 3-298, was intended to remove installation rules from the applications section 760.154 and relocate them in the installation section 760.133 and to simplify cable applications by using a table. The Proposal should be reconsidered.

SEPULVEDA, M.: This vote is a head-ups for the NEC TCC. Panel 16 accepted in principal the text and tables in proposals to Article 770, 800, and 820 that are very similar to the text and tables in Proposals 3-192, 3-198, 3-290, and 3-298.

3-291 Log #1430 NEC-P03 **Final Action: Reject**

(760.136)

Submitter: Dan Leaf, Seneca, SC

Recommendation: In (A) delete “similar” and substitute “other”. In (B) insert “fixed identified” ahead of “barrier”.

Substantiation: Present wording implies that a cable is a fitting. A barrier should be suitable for the use; unless fixed a 1/4 in. separation is not likely to be maintained.

Panel Meeting Action: Reject

Panel Statement: The use of “fitting” in the existing text does not imply that a cable is a fitting as stated in the substantiation.

300.15(F) and 760.136(A) use the term “fitting” that can be used rather than a box or similar enclosure. Fittings and connectors can be used with the specific wiring methods for which they are designed and listed.

For example, where a rigid metal conduit is stubbed out of the ground, a threaded coupling can be installed on the end of the rigid metal conduit with a liquidtight flexible connector screwed into the rigid coupling.

There are also transition fittings that are specifically listed for transitioning from one wiring method to another.

There was no technical substantiation provided to require fixed identified barriers or a definition of “fixed identified barriers.”

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-292 Log #4524 NEC-P03 **Final Action: Reject**

(760.136(B))

Submitter: Justin B. Biller, Roanoke County Office of Building Safety / Rep. Building Code Development Committee (BCDC)

Recommendation: Revise text to read as follows:

760.136(B) Separated by Barriers. Power-limited fire alarm circuit cables shall be permitted to be installed together with Class 1, non–power-limited fire alarm, and medium-power network-powered broadband communications circuits where they are separated by an approved barrier.

Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee’s endorsement.

As written, anything can be used as a barrier. There may be cases where barriers are considered inappropriate by the AHJ. This will give the AHJ the authority to approve barriers. Consideration should be given to clarifying what type of barrier could or could not be used.

Panel Meeting Action: Reject

Panel Statement: 110.2 already requires the installation to be approved; therefore, adding “approved” to “barrier” is unnecessary.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-293 Log #1428 NEC-P03 **Final Action: Reject**
(760.136(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: In hoistways power-limited fire alarm circuit conductors shall be installed in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, flexible metal conduit, electrical metallic tubing or wireways. *All wiring methods shall be identified for the use.*
Substantiation: The additional proposed methods are as substantial as liquidtight flexible nonmetallic conduit if identified for the use.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to add the wiring methods into hoistways. Most wiring methods covered in Chapter 3 are listed wiring methods.
110.3(A), as well as the individual articles within Chapter 3, already require wiring methods to be suitable for the installation.
"For the use" is a phrase that the NEC Technical Correlating Committee has targeted as vague. The specific use must be provided rather than "listed for the use" or "identified for the use."
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-294 Log #4690 NEC-P03 **Final Action: Reject**
(760.136(G)(3) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add a third condition as follows:
(3) All of the electric light, power, Class 1, non-power limited fire alarm, and medium-power network-powered broadband communications circuit conductors are permanently separated within a listed cable assembly from all of the power-limited fire alarm circuit conductors through the use of sheathing that provides for system separation that does not rely on conductor or cable insulation alone.
Substantiation: There is not and has never been any express permission to include power-limited fire alarm conductors within a common cable assembly with power conductors. Para (2) here comes the closest, because it recognizes a "continuous and firmly fixed nonconductor." This is crucial to the production of hybrid cables, where additional separation beyond the conductor insulation is applied to the power-limited conductors in accordance with the spirit of these principles. For example, 334.116(C) expressly recognizes this type of construction for Type NMS cable, and UL has been listing such constructions for many years. This topic must be addressed in the limited-power wiring articles, and this proposal is designed to raise the issue.
Panel Meeting Action: Reject
Panel Statement: The purpose of 760.136(G)(2) is to permit flexible tubing inside of a wiring harness where the Class 2 or Class 3 conductors are enclosed by the flexible tubing and separated from the power conductors by more than just the insulation on the conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-295 Log #2917 NEC-P03 **Final Action: Reject**
(760.142)

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Revise text to read as follows:
760.142 Conductor Size. Conductors of 26 AWG shall be permitted only where spliced with a connector listed as suitable for 26 AWG to 24 AWG or larger conductors that are terminated on equipment or where the 26 AWG conductors are terminated on equipment listed as suitable for 26 AWG conductors. Single conductors shall not be smaller than 18 AWG. For circuit integrity (CI) cable and electrical circuit protective systems minimum conductor size shall be 16 AWG.
Substantiation: The strength of copper decreases under a fire. UL 2196 has added a strength test to determine the maximum distance between supports in a vertical run. Only 2 manufacturers have achieved a listing for vertical use on an 18 AWG, one is 16 feet and the other is 27 feet. This distance is not practical for most vertical installations. The vertical limit for 16 AWG is 53 feet for one manufacturer and 100 feet for the other. The other manufacturers' 18 AWG cannot be used in a vertical run. The majority of the fire rated cable is used vertically and is 18 AWG. Since the limits are not practical, the concern is that it will be used beyond its limits.
Panel Meeting Action: Reject
Panel Statement: 300.19 and the accompanying Table 300.19 permit 18 AWG copper conductors installed in vertical raceways to be supported at 100 feet or greater.
There was no technical substantiation provided in the proposal for the exclusion of 18 AWG conductors and to require all circuit integrity cable and electrical circuit protective systems to be 16 AWG conductor size.
Many installations using 18 AWG conductors may never be installed in a vertical distance in excess of 10 or 15 ft in a raceway.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-296 Log #1462 NEC-P03 **Final Action: Reject**
(760.143)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Power-limited fire alarm circuit conductors shall not be ~~strapped, taped, or~~ attached by any means to the exterior of any ~~conduit or other~~ raceway, cable, or conductor as a means of support, except a raceway mast shall be permitted to support aerial spans.
Substantiation: Edit. "Strapped or taped" is superfluous, as is "conduit". Cables and open individual conductors should be included. The provision should permit support and attachment to a raceway mast.
Panel Meeting Action: Reject
Panel Statement: Deleting the phrase "conduit or other" provides the restriction to not attach power-limited fire alarm cables to any raceway.
There was no technical substantiation to delete strapped or taped to a raceway.
There was no technical substantiation to also include cables and conductors to the prohibition.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-297 Log #2918 NEC-P03 **Final Action: Accept in Principle**
(760.143)

Submitter: Thomas Guida, TJG Services, Inc.
Recommendation: Revise text to read as follows:
760.143 Support of Conductors. Power-limited fire alarm circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any conduit or other raceway as a means of support. For circuit integrity (CI) cable and electrical circuit protective systems the vertical support requirements in 300.19(B) shall apply.
Substantiation: The strength of copper decreases with heat. Cables may break if not properly supported in a fire situation.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 3-242.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: Section 300.19(B) does not apply to circuit integrity cable (e.g., Type FPLR-CI NPLFR-CI). Section 300.19(B) Circuit integrity (CI) cable is not an electrical circuit protective system, such as CIC in raceway or Type MI. While both are tested using UL 2196, the tests are not identical. The difference is recognized in Section 760.154(G), where the title is "Circuit Integrity (CI) Cable or Electrical Circuit Protective System."
Further information, as to the differences, is described in The National Fire Alarm Code: NFPA 72-2007, 6.9.10.4.2 differentiates between a "(1) A 2-hour fire rated circuit integrity (CI) cable" and a "(2) A 2-hour fire rated cable system (electrical circuit protective system)."
SEPULVEDA, M.: Section 300.19(B) does not apply to circuit integrity cable (e.g., Type FPLR-CI NPLFR-CI). Section 300.19(B) Circuit integrity (CI) cable is not an electrical circuit protective system, such as CIC in raceway or Type MI. While both are tested using UL 2196, the tests are not identical. The difference is recognized in Section 760.154(G), where the title is "Circuit Integrity (CI) Cable or Electrical Circuit Protective System."
Further information, as to the differences, is described in The National Fire Alarm Code: NFPA 72-2007, 6.9.10.4.2 differentiates between a "(1) A 2-hour fire rated circuit integrity (CI) cable" and a "(2) A 2-hour fire rated cable system (electrical circuit protective system)."

3-298 Log #3126 NEC-P03 **Final Action: Reject**
(760.154)

Submitter: Sanford E. Egesdal, Egesdal Associates PLC
Recommendation: Revise 760.154
Add new Table 760.154(A)
Delete 760.154(A) through (C).
Renumber Table 760.154(D) to 760.154(B)
Renumber Figure 760.154(D) to 760.154(B)
~~760.154 Applications of Listed PLFA Cables.~~
~~PLFA cables shall comply with the requirements described in either 760.154(A), (B), or (C) or where cable substitutions are made as shown in 760.154(D).~~
~~(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~
~~(B) Riser. Cables installed in risers shall be as described in either (1), (2), or (3):~~

~~(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~
~~(2) Other cables shall be installed in metal raceways or located in a fireproof shaft having firestops at each floor.~~
~~(3) Type FPL cable shall be permitted in one- and two-family dwellings.~~
~~FPN: See 300.21 for firestop requirements for floor penetrations.~~
~~(C) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 760.154(A) or (B) shall be as described in either (C)(1), (C)(2), (C)(3), or (C)(4). Type FPL-CI cable shall be permitted to be installed as described in either (C)(1), (C)(2), (C)(3), or (C)(4) to provide a 2-hour circuit integrity rated cable.~~
~~(1) General. Type FPL shall be permitted.~~
~~(2) In Raceways. Cables shall be permitted to be installed in raceways.~~
~~(3) Nonconcealed Spaces. Cables specified in Chapter 3 and meeting the requirements of 760.179(A) and (B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).~~
~~(4) Portable Fire Alarm System. A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.~~

760.154 Applications of Listed PLFA Cables.

~~**PLFA cables shall comply with the requirements described in either 760.154(A), (B), or (C) or where cable substitutions are made as shown in 760.154(D)**~~**)**

Permitted and non-permitted applications of PLFA cables shall be as indicated in Table 760.154(A). The substitutions for cables listed in Table 760.154(B) and illustrated in Figure 725shall be permitted.

(B~~D~~) Fire Alarm Cable Substitutions. The substitutions for fire alarm cables listed in Table 760.154(B~~D~~) and illustrated in Figure 760.154(B~~D~~) shall be permitted. Where substitute cables are installed, the wiring requirements of Article 760, Parts I and III, shall apply.

FPN: For information on communications cables (CMP, CMR, CMG, CM), see 800.179.

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 725, 760, 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal for section 760.154 greatly simplifies the statement of the applications of fiber cables and raceways by using a table where the permitted applications are indicated by a "Y" and the applications that are not permitted are indicted by an "x". A companion proposal moves the installation rules to section 760.113 Installation of cables and signaling raceways.

This proposal makes no changes to the existing permitted and not permitted applications of cables and raceways.

This proposal and its companion proposal for section 760.113 need to be considered together as a package.

Table 760.154(A), Applications of Listed Non-Power Limited Fire Alarm Cables

Cable or Raceway Type	Applications												
	In air ducts and plenums as described in 300.22(B)	In other spaces used for environmental air as described in 300.22(C)	In risers	In building locations other than air ducts, plenums, other spaces used for environmental air and, risers	In one- and two-family dwellings	In multifamily dwellings	In nonconcealed spaces	In cable trays	In any Chapter 3 raceway				
FPLP and FPLP-CI	Y	Y	Y	Y	Y	Y	Y	N	Y				
FPLR and FPLR-CI	N	N	Y	Y	Y	Y	Y	N	Y				
FPL and FPL-CI	N	N	Y	Y	Y	Y	Y	N	Y				
	N	N	Y	Y	Y	Y	Y	N	Y				

Note. Applications indicated by "Y" shall be permitted. Applications indicated by an "N" shall not be permitted. Applications with a "–" are not addressed.

This proposal provides parallel requirements to a group of Proposals prepared by the CMP 16 Special Editorial Task Group for articles 770, 800, 820, and 830 for the 2011 NEC. The goals of the Panel 16 task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Panel 16 Task Group members were Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson, Stan Kahn, Stan Kaufman, and Harry Odhe.

Panel Meeting Action: Reject

Panel Statement: 760.133 is an installation section dealing with power-limited fire alarm circuits, whereas 760.154 is an application section.

By following the requirements in 725.154, the proper fire alarm cabling can be applied within the various areas of a building.

For example, where "an other space for environmental air (plenum)" is installed, 760.154 provides wiring method applications, such as plenum cables, and requires compliance with 300.22 for the wiring methods that are permitted to be applied within the other space.

The proposed table does not provide the same critical application information already located within 760.154.

There was no technical substantiation provided in the proposal to justify the changes found in the proposed Table 760.154(A), such as unlimited lengths and use of plenum cable in a fabricated duct in 300.22(B).

Permitting FPL cable for a riser is an incorrect application.

The table loses much of the application information provided in the existing written text.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

CONNAUGHTON, T.: Remove installation rules from the applications section 725.154 and relocate them in the installation section 725.133. Simplify cable applications by using a table.

Comment on Affirmative:

EGESDAL, S.: This vote is a head-ups for the NEC TCC. Panel 16 accepted in principal the text and tables in proposals to Article 770, 800, and 820 that are very similar to the text and tables in Proposals 3-192, 3-198, 3-290, and 3-298.

KAHN, S.: This is one of a series of proposals that would separate installation rules and cable applications. I participated in the Task Group that worked on the simplification of the installation rules, cable applications and correlation with NFPA 90A (as directed by the Standards Council). CMP-16 improved on the series of proposals in their meeting the week following the CMP-3 meeting. This proposal, along with 3-290, was intended to remove installation rules form the applicaitons section 760.154 and relocate them in the installation section 760.133 and to simplify cable applications by using a table. The Proposal should be reconsidered.

SEPULVEDA, M.: This vote is a head-ups for the NEC TCC. Panel 16 accepted in principal the text and tables in proposals to Article 770, 800, and 820 that are very similar to the text and tables in Proposals 3-192, 3-198, 3-290, and 3-298.

3-299 Log #127 NEC-P03 **Final Action: Accept in Principle**
(760.154(A))

Submitter: Gerald Lee Dorna, Belden

Recommendation: Add the following text at the end of 760.154(A):

<u>Metallic cable trays and metallic cable tray systems shall be permitted to be installed in other spaces used for environmental air. Type FPLP cables shall be permitted to be installed in these cable trays and cable tray systems. Types FPLR and FPL cables shall not be permitted to be installed in these cable trays and cable tray systems.</u>

Substantiation: Article 392, Cable Trays, has requirements for cable trays in air handling spaces in section 392.4.

392.4 Uses Not Permitted.

Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

Section 300.22 has provisions for cable trays in 300.22(C), Other Space Used For Environmental Air.

(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.

Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.

Section 300.22(C)(1) permits only solid bottom metal cable tray with solid metal covers. Optical fiber, communications, CATV, signaling and fire-alarm plenum cables, and plenum raceways are often installed in metal cable trays and metal cable tray systems in plenums (other spaces used for environmental air). These installations are "neat and workmanlike" and safe. They should be permitted.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel actions and statements on Proposals 3-97 and 3-199.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-300 Log #4065 NEC-P03 **Final Action: Reject**
(760.154(A), (B), (C), and 760.154(E) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Delete text from 760.154(A), 760.154(B), and 760.154(C).

Add new 760.154(E).

760.154(D) does not change.

760.154 Applications of Listed PLFA Cables.

PLFA cables shall comply with the requirements described in either 760.154(A), (B), or (C) or where cable substitutions are made as shown in 760.154(D) <u>or have suffixes in accordance with 760.154(E) requirements</u>.

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. ~~Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~

(B) Riser. Cables installed in risers shall be as described in either (1), (2), or (3):

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. ~~Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~

(2) Other cables shall be installed in metal raceways or located in a fireproof shaft having firestops at each floor.

(3) Type FPL cable shall be permitted in one- and two-family dwellings.

FPN: See 300.21 for firestop requirements for floor penetrations.

(C) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 760.154(A) or (B) shall be as described in either (C)(1), (C)(2), (C)(3), or (C)(4). ~~Type FPL-CI cable shall be permitted to be installed as described in either (C)(1), (C)(2), (C)(3), or (C)(4) to provide a 2-hour circuit integrity rated cable.~~

(1) General. Type FPL shall be permitted.

(2) In Raceways. Cables shall be permitted to be installed in raceways.

(3) Nonconcealed Spaces. Cables specified in Chapter 3 and meeting the requirements of 760.179(A) and (B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).

(4) Portable Fire Alarm System. A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.

<u>(E) Power-Limited Cables With Suffix Markings. Power-limited cables with single or multiple suffix markings shall be permitted where required to meet special applications.</u>

<u>(1) Power-Limited Cables or Electrical Circuit Protective System. Power-Limited circuit integrity (CI) cables or a listed electrical circuit protective system shall be permitted for use in fire alarm systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions. Power-limited circuit integrity cables shall be marked in accordance with 760.179(G).</u>

<u>(2) Power-Limited Cables for Dry, Damp, or Wet Locations. Power-limited cables installed in dry, damp, or wet locations shall be marked in accordance with 760.179.(L).</u>

<u>(3) Power-Limited Cables Exposed to Direct Sunlight. Power-limited Cables installed exposed to direct sunlight shall be marked in accordance with 760.179(M).</u>

<u>(4) Power-Limited Fire Hazard Cables. Power-limited fire hazard cables installed to provide low flame spread, very-low-smoke, and known potential heat release shall be marked in accordance with 760-179(P).</u>

<u>(5) Power-Limited Very-Low-Smoke Producing Cables. Power-limited very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be marked in accordance with 760.179(O).</u>

<u>(6) Power-Limited Cables in Corrosive Locations. Power-limited cables installed in corrosive locations shall be marked in accordance with 760.179(K).</u>

Substantiation: This proposal adds text to the first paragraph of 760.154 to permit cables to have suffix markings.

This proposal establishes 760.154(E) for cables with suffixes for installation in locations requiring special cable characteristics.

This proposal removes the cable survivability requirement from 760.154(A), (B), and (C), and establishes the requirements in 760.154(E)(1) with text parallel to Article 725.

Panel Meeting Action: Reject

Panel Statement: The proposed text for 760.154 does not deal with applications of listed power-limited fire alarm cables, however is providing suffix markings for these cables; therefore, 760.154 is an incorrect location for this information.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: While the intent of the proposal was to provide application requirements, the proposal should have included more specific text, as to applications. The installation requirements for power-limited cables are detailed in 760.130(B), so a proposal to these sections was unnecessary.

SEPULVEDA, M.: While the intent of the proposal was to provide application requirements, the proposal should have included more specific text, as to applications. The installation requirements for power-limited cables are detailed in 760.130(B), so a proposal to these sections was unnecessary.

3-301 Log #1606 NEC-P03 **Final Action: Reject**
(760.154(B)(1))

Submitter: Ray R. Keden, ERICO, Inc. / Rep. BICSI

Recommendation: Revise text to read as follows:

Cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

Substantiation: Is it really our intention that cables passing between floors through a floor penetration be less than riser rated?

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel contends that the existing text does meet the panel's intention.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

KEDEN, R.: See 3-201.

3-302 Log #4066 NEC-P03 **Final Action: Reject**
(760.176)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Revise 760.176 1st paragraph.

760.176 Listing and Marking of NPLFA Cables.

Non–power-limited fire alarm cables installed as wiring within buildings shall be listed in accordance with 760.176(A) and (B) and as being resistant to the spread of fire in accordance with 760.176(C) through (F) and (H) through (M), and shall be marked in accordance with 760.176(G). ~~Cable used in a wet location shall be listed for use in wet locations or have a moisture-impervious metal sheath.~~

Substantiation: The revision to 760.179 accommodates new cable listing requirements in 760.176(H) through (M). Requirements for cables installed in wet locations are in the companion proposal to establish new 760.176(I).

Panel Meeting Action: Reject

Panel Statement: 760.53(B) does not provide an application for the proposed various types of non-power-limited fire alarm cables that the submitter is attempting to place into 760.176.

Since there are no applications for these cables, inserting listing and marking text is inappropriate.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: This proposal was primarily editorial to correlated with the new cable suffix markings in companion proposals to 760.176.

SEPULVEDA, M.: This proposal was primarily editorial to correlated with the new cable suffix markings in companion proposals to 760.176.

3-303 Log #1445 NEC-P03 **Final Action: Accept in Principle**
(760.176(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise first sentence: Insulated conductors shall be ~~suitable for~~ rated not less than 600 volts.

Substantiation: Edit. "suitable" is subjective and a term to be avoided per the Style Manual.

Panel Meeting Action: Accept in Principle

The panel revised the proposed wording to read as follows:

"760.176 Listing and Marking of NPLFA Cables.

(B) Insulated Conductors. Insulated conductors shall be rated for 600 volts. Insulated conductors 14 AWG and larger shall be one of the types listed in Table 310.13(A) or one that is identified for this use. Insulated conductors 18 AWG and 16 AWG shall be in accordance with 760.49."

Panel Statement: The submitter is correct that the NEC Manual of Style includes "suitable" in Table 3.2.1

"Possibly Unenforceable and Vague Terms," and the suggested wording needs to be modified.

The term "suitable" was changed to "rated" rather than the suggested text in the proposal, since the conductor insulation must be rated for 600 volts, not 600 volts or greater as would be implied by the suggested change.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-304 Log #1655 NEC-P03 **Final Action: Reject**
(760.176(C), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise 760.176(C) FPN as follows:

FPN: One method of ~~defining~~ determining fire resistance and low smoke-producing characteristics is testing in accordance ~~low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance~~ with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~

Substantiation: 3.1.3 of the NEC Style Manual states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

Panel Meeting Action: Reject

Panel Statement: Use of the phrase "determining resistance" rather than "defining resistance" and "testing in accordance with" provides text that could be interpreted as mandatory more than the existing text.

Definitions cannot contain mandatory text; however, the FPN for the definition can provide dimensions and amounts of materials or current.

For example, GFCI protection in Article 100 has defined values of trip current provided for a Class A GFCI device.

These fine print notes are not written in mandatory language and are simply expressing some of the maximum flame spread provided in the referenced NFPA 262 document. This FPN is giving information on various methods of defining smoke-producing cables or fire-resistant cables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-305 Log #4559 NEC-P03 **Final Action: Accept in Principle**
(760.176(C), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Recommendation: Revise text as follows:

760.176 Listing and Marking of NPLFA Cables.

Non–power-limited fire alarm cables installed as wiring within buildings shall be listed in accordance with 760.176(A) and 760.176(B) and as being resistant to the spread of fire in accordance with 760.176(C) through 760.176(F), and shall be marked in accordance with 760.176(G).

(A) NPLFA Conductor Materials. Conductors shall be 18 AWG or larger solid or stranded copper.

(B) Insulated Conductors. Insulated conductors shall be suitable for 600 volts. Insulated conductors 14 AWG and larger shall be one of the types listed in Table 310.13 or one that is identified for this use. Insulated conductors 18 AWG and 16 AWG shall be in accordance with 760.27.

(C) Type NPLFP. Type NPLFP non–power-limited fire alarm cable for use in other space used for environmental air shall be listed as being suitable for use in other space used for environmental air as described in 300.22(C) and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~

No change for 760.176 (D) through 760.176 (G)

Substantiation: This comment recommends a slight change in wording for the existing Fine Print Note, by recognizing that listing of plenum cable by NFPA 262 represents listing to both low smoke and low flame spread, and that cables cannot be listed separately to either property. This is basically an editorial change, as a clarification, to the existing Fine Print Note.

The same change is being proposed to the other corresponding Fine Print Note in article 760 and to that in article 725. The new language is consistent with the language in the corresponding fine print notes in articles 770, 800, 820 and 830, all of which deal with the same type of cables.

This has been proposed before but was caught in the NEC moratorium associated with plenum cables.

Panel Meeting Action: Accept in Principle

Revise the proposed fine print note to read as follows:

"FPN: One method of defining low smoke-producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces."

Panel Statement: The revised language clarifies the intent of the panel and meets the intent of the submitter.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

AYER, L.: See statement on Proposal 3-208.

Comment on Affirmative:

EGESDAL, S.: The submitter's text is consistent with the text in 770, 800, 820, and 830. If the CMP 3 "tweaking" of the submitter's text is better grammar, hopefully, the NEC TCC will direct CMP 16 to revise the corresponding 770, 800, 820, and 830 FPN's.

KAHN, S.: The submitted text is identical to the corresponding FPNs in 770, 800, 820, and 830. If the revised text is better, it should be incorporated into the other Articles.

SEPULVEDA, M.: The submitter's text is consistent with the text in 770, 800, 820, and 830. If the CMP 3 "tweaking" of the submitter's text is better grammar, hopefully, the NEC TCC will direct CMP 16 to revise the corresponding 770, 800, 820, and 830 FPN's.

3-306 Log #4845 NEC-P03 **Final Action: Reject**
(760.176(C), FPN)

Submitter: T. David Mills, T. David Mills Associates

Recommendation: Modify the fine print note as follows:

FPN: ~~One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~ <u>See {3}, Annex I.</u>

Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.

I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 3-72.

3-314 Log #4047 NEC-P03 **Final Action: Reject**
(760.176(G))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.176(G)
(G) NPLFA Cable Markings.
(1) Multiconductor non–power-limited fire alarm cables shall be marked in accordance with Table 760.176(G).
(2) Non–power-limited fire alarm circuit cables shall be permitted to be marked with a maximum usage voltage rating of 150 volts.
~~Cables that are listed for circuit integrity shall be identified with the suffix "CI" as defined in 760.176(F).~~
(3) Temperature ratings greater than 60ºC shall be marked on the cable.
(4) Cables suitable for installation at temperatures lower than 60ºC shall have the lowest permitted temperature marked on the cable.
(5) Cables listed as meeting the requirements of 760.179(C), (D), and (E) shall be permitted to have additional suffixes identified in other subsections of 760.176.
Substantiation: There is no marking on cables rated at 60ºC (140ºF). There is no indication in this article as to the temperature rating for cables. Article 310 does an excellent job of identifying temperature ratings for conductors. The goal of this proposal is to provide equivalent requirements.
See companion proposal to add new 760.176(K).
The circuit integrity marking requirement is covered in 760.179(F). Cables with additional suffixes are permitted by proposal 760.176(G)(5).
Panel Meeting Action: Reject
Panel Statement: Based on the lack of any applications provided in proposals for 760.53(B), other than marking requirements, listing requirements for these cables cannot be accepted in 760.176.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: The purpose of this proposal is to establish requirements in Article 760 for cable; requirements that provide equivalency to Chapter 3 conductor marking requirements. The requirements in this proposal match what is in the UL standard. Cables listed to the requirements in the UL standard have provided the industry with a reliable product. The specific marking would not have a financial impact on manufacturers.
Article 760 circuits are sometimes installed in harsh environments (e.g., wet locations, exposed to sunlight, walk-in freezers, rooftops). It is important that the NEC establish requirements that are needed for application and installation of Article 760 cables, and not rely on whatever a testing organization somewhere in the world decides is appropriate for the application. Specific marking requirements would be useful to designers, buyers, installers, and AHJ's.
SEPULVEDA, M.: The purpose of this proposal is to establish requirements in Article 760 for cable; requirements that provide equivalency to Chapter 3 conductor marking requirements. (760.176(J) and FPN (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.176(J).
(J) Cables Exposed to Direct Sunlight. Cables specified in 760.176(C, (D), and (E) installed exposed to direct sunlight shall be listed and shall be marked with the suffix "-SR".
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies fire alarm cables as being suitable for installation exposed to direct sunlight. Cables that are not listed for exposure to direct sunlight and are installed exposed to direct sunlight have the potential to cause system malfunction. There are knows job failures where cables supported by an aerial messenger wire failed due to sunlight exposure.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-314.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: See My Explanation of Negative on 3-314.
SEPULVEDA, M.: See my explanation of negative vote on Proposal 3-314.

3-318 Log #4060 NEC-P03 **Final Action: Reject**
(760.176(K) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.176(K).
(K) Non-Power-Limited Fire Alarm Cable Temperature Ratings. Non-power-limited fire alarm cables shall be listed for a temperature rating of not less than 60ºC (140ºF). Non-power-limited fire alarm cables shall be permitted to have an additional temperature rating for the lowest permitted temperature.
Substantiation: Fire alarm cables are often installed in areas where the temperature exceeds the 60ºC (140ºF) rating, which is not marked on the cable. For example, cable installed in conduit on a rooftop could have an temperature internal to the conduit in excess of 160 ºF. NFPA 90A permits the temperature in a HVAC system to be as high as 250ºF. Additionally, fire alarm cables are sometimes installed in cold areas (e.g., walk-in freezer), so an indication of the minimum permitted temperature is important.
There is a companion proposal to revise 760.176 to add temperature marking requirements.
Panel Meeting Action: Reject
Panel Statement: Marking requirements for cable temperatures in excess of 60 degrees C is already covered by the UL product standard UL 1425, covering non-power-limited fire alarm cables. These cables are available based on the standard requirements for temperatures up to 250 degrees C or 482 degrees F.
Where an application occurs with a temperature in excess of 140 degrees F, a corresponding cable requirement would be to install a cable with a high enough temperature rating for the ambient temperature. Non-power-limited fire alarm cables would have very limited exposure to higher than normal ambient temperature and would certainly be installed in a very limited length in a metal wiring method within a fabricated duct based on 300.22(B)
Non-power-limited fire alarm cables are intended for use and tested for an operating temperature of 60 degrees C, unless a higher temperature rating is marked on the cable. Section 1.1 of UL 1425 reads as follows:
"This Standard states the construction, test, and marking requirements covering the safety of electrical and electrical/optical-fiber cables rated 60 degrees C to 250 degrees C and intended for 150-volt and lower-potential non-power-limited circuits that are controlled and powered by a fire-alarm system."
Where a high ambient temperature is encountered in the installation of non-power-limited fire alarm cables and conductors, higher temperature cables can be required, obtained, and installed.
There was no technical substantiation provided to justify adding this requirement to the NEC.
Where a low ambient temperature is encountered, non-power-limited fire alarm cables can be purchased that have been subjected to a cold bend test to ensure bending capability for cold temperatures down to minus 70 degrees C; however, this is not an installation temperature; it is an application temperature.
Once the cable has been installed and connected, there would not normally be any bending of the conductor insulation. Again, the standard provides testing for this; however, there has been no substantiation provided to insert this into the NEC.

SEPULVEDA, M.: See my explanation of negative vote on Proposal 3-314.

3-319 Log #4062 NEC-P03 **Final Action: Reject**
(760.176(L) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.176(L) very low smoke cables.
(L) Very-Low-Smoke Producing Cables. Non-power-limited cables used to provide very-low-smoke producing characteristics shall be listed as very-low-smoke producing (50) and shall be listed as having low flame spread characteristics and very-low-smoke producing characteristics. Cables specified in 760.53(B)(2), (3), and (4) shall have the additional classification using the suffix "-50".
FPN: One method of defining a very-low-smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with UL 723, *"Test for Surface Burning Characteristics of Building Materials"* with the cable unslit (intact) and cut through to expose the cable core.
Substantiation: This proposal establishes a listing and marking for cable for installation where minimal smoke generation is required. This cable meets the requirement for installation in concealed spaces that permit a maximum flame spread index of 25 and a maximum smoke developed index of 50. The proposed cable has low flame spread characteristics and very-low-smoke-producing characteristics. Presently, a number of manufacturers have cables listed as meeting the proposed requirements, but do not have a unique marking permitted by the NEC.
The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.

Establishing a listing and marking for cables listed for a "-50" suffix provides cables with physical parameters (flame spread index, smoke developed index) that is consistent with requirements in other codes.

Panel Meeting Action: Reject

Panel Statement: Based on the lack of any applications provided in proposals for 760.53(B), other than marking requirements, acceptance of listing requirements for these cables cannot be Accepted in 760.176.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials.

SEPULVEDA, M.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials.

3-320 Log #4054 NEC-P03 **Final Action: Reject**
(760.176(M) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Add new 760.176(M)

<u>(M) Fire Hazard Cables. Non-power-limited cables used to provide low combustible loading shall be listed as fire hazard cable (FHC) and shall be listed as having low flame spread characteristics, very-low-smoke producing characteristics, and a low potential heat release value. Cables specified in 760.53(B)(2), (3), and (4) shall have the additional classification using the suffix " -FHC".</u>

<u>FPN No. 1: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>

Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has <u>low flame spread characteristics, very-low-smoke-producing characteristics,</u> and <u>a low potential heat release value.</u>

The testing criteria are based on the requirements found in NFPA 13 and the International Mechanical Code, as revised.

NFPA 13, Section 8.14.1.2.1 follows: "Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum." The proposed cable has a very low heat of combustion. While the term "combustible loading" is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.

The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.

Establishing a listing and marking for cables listed for a "FHC" suffix provides cables with physical parameters (flame spread index, smoke developed index, potential heat release) that is consistent with requirements in other codes.

NFPA 13-2007

8.15 Special Situations.

8.15.1 Concealed Spaces.

8.15.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.15.1.2.1 through 8.15.1.2.16 and 8.15.6.

8.15.1.2* Concealed Spaces Not Requiring Sprinkler Protection.

8.15.1.2.1* Concealed spaces of noncombustible and limited-combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading, see A.8.15.1.2.1.)

8.15.1.2.2 Concealed spaces of noncombustible and limited-combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.15.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)

8.15.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.

8.15.1.2.5 Concealed spaces formed by ceilings attached directly to or within 6 in. (152 mm) of wood joist construction shall not require sprinkler protection.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 3-319.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials; and a low potential heat release not greater than 8141 kJ/kg (3500 BTU/lb), as tested in accordance with UL 2424, Standard Test Method of Potential Heat of Building Materials. A number of manufacturers have products that meet this criteria. The NEC does not provide a marking requirement for this robust cable.

SEPULVEDA, M.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials; and a low potential heat release not greater than 8141 kJ/kg (3500 BTU/lb), as tested in accordance with UL 2424, Standard Test Method of Potential Heat of Building Materials. A number of manufacturers have products that meet this criteria. The NEC does not provide a marking requirement for this robust cable.

3-321 Log #4067 NEC-P03 **Final Action: Accept**
(760.179)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Revise 760.179.

760.179 Listing and Marking of PLFA Cables and Insulated Continuous Line-Type Fire Detectors.

~~Type FPL~~ <u>PLFA</u> cables installed as wiring within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 760.179(A) through (H) and shall be marked in accordance with 760.179(I). Insulated continuous line-type fire detectors shall be listed in accordance with 760.179(J). Cable used in a wet location shall be listed for use in wet locations or have a moisture-impervious metal sheath.

Substantiation: This proposal is primarily editorial. The first sentence of 760.170 applies to all power-limited cables, not just Type FPL cables.

Panel Meeting Action: Accept

Panel Statement: The panel notes that the reference to 760.170 in the substantiation is incorrect. The correct reference is 760.179.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-322 Log #4068 NEC-P03 **Final Action: Reject**
(760.179)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Revise 760.179 first paragraph.

60.179 Listing and Marking of PLFA Cables and Insulated Continuous Line-Type Fire Detectors.

Type FPL cables installed as wiring within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 760.179(A) through (H) <u>and (K) through (P)</u> and shall be marked in accordance with 760.179(I). Insulated continuous line-type fire detectors shall be listed in accordance with 760.179(J). ~~Cable used in a wet location shall be listed for use in wet locations or have a moisture-impervious metal sheath.~~

Substantiation: The revision to 760.179 accommodates new cable listing requirements in 760.179(K) through (P). Requirements for cables installed in wet locations are in the companion proposal to establish new 760.179(L).

Panel Meeting Action: Reject

Panel Statement: Based on the lack of any applications provided in proposals for 760.154, other than marking requirements, acceptance of listing requirements for these cables cannot be accepted in 760.179.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

EGESDAL, S.: This proposal was primarily editorial to correlated with the new cable suffix markings in companion proposals to 760.179.

3-323 Log #1659 NEC-P03 **Final Action: Reject**
(760.179(D), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 760.179(D) FPN as follows:

FPN: One method of ~~defining~~ determining fire resistance and low smoke-producing characteristics is testing ~~low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested~~ in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~

Substantiation: 3.1.3 of the NEC Style Manual states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."
Panel Meeting Action: Reject
Panel Statement: Use of the phrase "determining resistance" rather than "defining resistance" and "testing in accordance with" provides text that could be interpreted as mandatory more than the existing text. Definitions cannot contain mandatory text; however, the FPN for the definition can provide dimensions and amounts of materials or current. For example, GFCI protection in Article 100 has defined values of trip current provided for a Class A GFCI device.

These fine print notes are not written in mandatory language and are simply expressing some of the maximum flame spread provided in the referenced NFPA 262 document. This FPN is providing information on various methods of defining smoke-producing cables or fire-resistant cables.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-324 Log #4560 NEC-P03 **Final Action: Accept in Principle**
(760.179(D), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
760.179 Listing and Marking of PLFA Cables and Insulated Continuous Line-Type Fire Detectors.

Type FPL cables installed as wiring within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 760.179(A) through 760.179(H) and shall be marked in accordance with 760.179(I). Insulated continuous line-type fire detectors shall be listed in accordance with 760.179(J).

(A) Conductor Materials. Conductors shall be solid or stranded copper.

(B) Conductor Size. The size of conductors in a multiconductor cable shall not be smaller than 26 AWG. Single conductors shall not be smaller than 18 AWG.

(C) Ratings. The cable shall have a voltage rating of not less than 300 volts.

(D) Type FPLP. Type FPLP power-limited fire alarm plenum cable shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~

No change for 760.179 (E) through 760.179 (J)

Substantiation: This comment recommends a slight change in wording for the existing Fine Print Note, by recognizing that listing of plenum cable by NFPA 262 represents listing to both low smoke and low flame spread, and that cables cannot be listed separately to either property. This is basically an editorial change, as a clarification, to the existing Fine Print Note.

The same change is being proposed to the other corresponding Fine Print Note in article 760 and to that in article 725. The new language is consistent with the language in the corresponding fine print notes in articles 770, 800, 820 and 830, all of which deal with the same type of cables.

This has been proposed before but was caught in the NEC moratorium associated with plenum cables.
Panel Meeting Action: Accept in Principle
Revise the proposed fine print note to read as follows:

"FPN: One method of defining low smoke-producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces."
Panel Statement: The revised language clarifies the intent of the panel and meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

EGESDAL, S.: The submitter's text is consistent with the text in 770, 800, 820, and 830. If the CMP 3 "tweaking" of the submitter's text is better grammar, hopefully, the NEC TCC will direct CMP 16 to revise the corresponding 770, 800, 820, and 830 FPN's.

KAHN, S.: The submitted text is identical to the corresponding FPNs in 770, 800, 820, and 830. If the revised text is better, it should be incorporated into the other Articles.

SEPULVEDA, M.: The submitter's text is consistent with the text in 770, 800, 820, and 830. If the CMP 3 "tweaking" of the submitter's text is better grammar, hopefully, the NEC TCC will direct CMP 16 to revise the corresponding 770, 800, 820, and 830 FPN's.

3-325 Log #4850 NEC-P03 **Final Action: Reject**
(760.179(D), FPN)

Submitter: T. David Mills, T. David Mills Associates
Recommendation: Modify the fine print note as follows:

FPN: ~~One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~ See {3}, Annex I.

Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.

I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.

(760.179(I))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 760.179(I).
(I) Cable Marking.
(1) The cable shall be marked in accordance with Table 760.179(I).
(2) The voltage rating shall not be marked on the cable.
~~Cables that are listed for circuit integrity shall be identified with the suffix CI as defined in 760.179(G).~~
FPN: Voltage ratings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.
Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.
(3) Temperature ratings greater than 60ºC shall be marked on the cable.
(4) Cables suitable for installation at temperatures lower than 60ºC shall have the lowest permitted temperature marked on the cable.
(5) Cables listed as meeting the requirements of 760.179(C), (D), and (E) shall be permitted to have additional suffixes identified in other subsections of 760.179.
Substantiation: There is no marking on cables rated at 60ºC (140ºF). There is no indication in this article as to the temperature rating for cables. Article 310 does an excellent job of identifying temperature ratings for conductors. The goal of this proposal is to provide equivalent requirements.
See companion proposal to add new 760.179(N).
The circuit integrity marking requirement is covered in 760.179(G). Cables with additional suffixes are permitted by proposal 760.179(I)(5).
Panel Meeting Action: Reject
Panel Statement: Marking requirements for cable temperatures in excess of 60 degrees C is already covered by the UL product standard UL 1424, covering power-limited fire alarm cables. These cables are available based on the standard requirements for temperatures up to 250 degrees C or 482 degrees F. Where an application occurs with a temperature in excess of 140 degrees F, a corresponding cable requirement would be to install a cable with a high enough temperature rating for the ambient temperature. Power-limited fire alarm cables would have very limited exposure to higher than normal ambient temperature and would certainly be installed in a very limited length in a metal wiring method within a fabricated duct based on 300.22(B)
Power-limited fire alarm cables are intended for use and tested for an operating temperature of 60 degrees C, unless a higher temperature rating is marked on the cable. Section 1.1 of UL 1424 reads as follows: "These requirements cover 60 - 250°C (140 - 482°F) single- and multiple-conductor cables for use as fixed wiring within buildings (some are also marked for direct burial) principally for power-limited fire-alarm circuits as described in Article 760 and other applicable parts of the National Electrical Code (NEC)."
Where a high ambient temperature is encountered in the installation of power-limited fire alarm cables and conductors, higher temperature cables can be required, obtained, and installed. There was no technical substantiation provided to justify adding this requirement to the NEC.
Where a low ambient temperature is encountered, power-limited fire alarm cables can be purchased that have been subjected to a cold bend test to ensure bending capability for cold temperatures down to minus 70 degrees C; however, this is not an installation temperature, it is an application temperature. Once the cable has been installed and connected, there would not normally be any bending of the conductor insulation. Again, the standard provides testing for this but there has been no substantiation provided to insert this into the NEC.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: The purpose of this proposal is to establish requirements in Article 760 for cable; requirements that provide equivalency to Chapter 3 conductor marking requirements. The requirements in this proposal match what is in the UL standard. Cables listed to the requirements in the UL standard have provided the industry with a reliable product. The specific marking would not have a financial impact on manufacturers.
Article 760 circuits are sometimes installed in harsh environments (e.g., wet locations, exposed to sunlight, walk-in freezers, rooftops). It is important that the NEC establish requirements that are needed for application and installation of Article 760 cables, and not rely on whatever a testing organization somewhere in the world decides is appropriate for the application. Specific marking requirements would be useful to designers, buyers, installers, and AHJ's.
SEPULVEDA, M.: The purpose of this proposal is to establish requirements in Article 760 for cable; requirements that provide equivalency to Chapter 3 conductor marking requirements. The requirements in this proposal match what is in the UL standard. Cables listed to the requirements in the UL standard have provided the industry with a reliable product. The specific marking would not have a financial impact on manufacturers.
Article 760 circuits are sometimes installed in harsh environments (e.g., wet locations, exposed to sunlight, walk-in freezers, rooftops). Specific marking requirements would be useful to designers, buyers, installers, and AHJ's.

3-334 Log #4050 NEC-P03 **Final Action: Reject**
(760.179(K) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.179(K)
(K) Power-Limited Fire Alarm Cables Installed in Corrosive Locations. Power-limited fire alarm cables installed in corrosive locations shall be listed as suitable for corrosive locations. Cables specified in 760.154(A), (B), and (C) and used for installation in corrosive locations shall have the additional classification using the following suffixes "-PR" for oil resistant, and "-GR" for gasoline and oil resistant.
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies power-limited fire alarm cables as being suitable for installation in corrosive locations. Corrosive locations have the potential to degrade cable and conductor insulation and cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: Based on the lack of any applications provided in proposals for 760.154, other than marking requirements, acceptance of listing requirements for these cables cannot be accepted in 760.179.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: See My Explanation of Negative on 3-333.
SEPULVEDA, M.: See my explanation of negative vote on Proposal 3-333.

3-335 Log #4053 NEC-P03 **Final Action: Reject**
(760.179(L) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.179(L).
(L) Conductors and Cables in Dry, Damp, or Wet Locations. Cables specified in 760.(179)(D), (E), and (F) shall be listed for installation in dry, damp, or wet locations or shall have a moisture-impervious metal sheath and shall be marked with a suffix as required in 760.179(a), (b), or (c).
(a) Conductors and cables installed in dry location shall not be required to have an additional suffix marking.
(b) Conductors and cables suitable for installation in damp locations shall be identified with the suffix "-DAMP". Conductors and cables listed for damp locations shall be suitable for installation in dry locations.
FPN: One method of defining suitability for installation in damp locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
(c) Conductors and cables suitable for installation in wet locations shall be identified with the suffix "-WET". Conductors and cables listed for damp locations shall be suitable for installation in dry or damp locations.
FPN: One method of defining suitability for installation in wet locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies which power-limited cables are suitable for dry, damp, or wet locations. Cables suitable for installation in dry locations that are installed in damp or wet locations have the potential to cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-334.
Number Eligible to Vote: 15

3-336 Log #4058 NEC-P03 **Final Action: Reject**
(760.179(M) and FPN (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.179(M).
(M) Conductors and Cables Exposed to Direct Sunlight. Cables specified in 760.179(D), (E), and (F) installed exposed to direct sunlight shall be listed and shall be marked with the suffix "-SUNLIGHT".
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies fire alarm cables as being suitable for installation exposed to direct sunlight. Cables that are not listed for exposure to direct sunlight and are installed exposed to direct sunlight have the potential to cause system malfunction. There are knows job failures where cables supported by an aerial messenger wire failed due to sunlight exposure.
Panel Meeting Action: Reject

SEPULVEDA, M.: See my explanation of negative vote on Proposal 3-333.

3-337 Log #4061 NEC-P03 **Final Action: Reject**
(760.179(N) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new text to read as follows:
(N) Power-Limited Fire Alarm Cable Temperature Ratings. Power-limited fire alarm cables shall be listed for a temperature rating of not less than 60ºC (140ºF). Power-limited fire alarm cables shall be permitted to have an additional temperature rating for the lowest permitted temperature.
Substantiation: Fire alarm cables are often installed in areas where the temperature exceeds the 60ºC (140ºF) rating, which is not marked on the cable. For example, cable installed in conduit on a rooftop could have an temperature internal to the conduit in excess of 160 ºF. NFPA 90A permits the temperature in a HVAC system to be as high as 250ºF. Additionally, fire alarm cables are sometimes installed in cold areas (e.g., walk-in freezer), so an indication of the minimum permitted temperature is important.
There is a companion proposal to revise 760.179 to add temperature marking requirements.
Panel Meeting Action: Reject
Panel Statement: Marking requirements for cable temperatures in excess of 60 degrees C is already covered by the UL product standard UL 1424, covering power-limited fire alarm cables. These cables are available based on the standard requirements for temperatures up to 250 degrees C or 482 degrees F. Where an application occurs with a temperature in excess of 140 degrees F, a corresponding cable requirement would be to install a cable with a high enough temperature rating for the ambient temperature. Power-limited fire alarm cables would have very limited exposure to higher than normal ambient temperature and would certainly be installed in a very limited length in a metal wiring method within a fabricated duct based on 300.22(B)
Power-limited fire alarm cables are intended for use and tested for an operating temperature of 60 degrees C, unless a higher temperature rating is marked on the cable. Section 1.1 of UL 1424 reads as follows: “These requirements cover 60 - 250°C (140 - 482°F) single- and multiple-conductor cables for use as fixed wiring within buildings (some are also marked for direct burial) principally for power-limited fire-alarm circuits as described in Article 760 and other applicable parts of the National Electrical Code (NEC).” Where a high ambient temperature is encountered in the installation of power-limited fire alarm cables and conductors, higher temperature cables can be required, obtained, and installed. There was no technical substantiation provided to justify adding this requirement to the NEC.
Where a low ambient temperature is encountered, power-limited fire alarm cables can be purchased that have been subjected to a cold bend test to ensure bending capability for cold temperatures down to minus 70 degrees C; however, this is not an installation temperature, it is an application temperature. Once the cable has been installed and connected, there would not normally be any bending of the conductor insulation. Again, the standard provides testing for this but there has been no substantiation provided to insert this into the NEC.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: See My Explanation of Negative on 3-333.
SEPULVEDA, M.: See my explanation of negative vote on Proposal 3-333.

3-338 Log #4063 NEC-P03 **Final Action: Reject**
(760.179(O) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.179(O).
(O) Very-Low-Smoke Producing Cables. Power-limited cables used to provide very-low-smoke producing characteristics shall be listed as very-low-smoke producing (50) and shall be listed as having low flame spread characteristics and very-low-smoke producing characteristics. Cables specified in 760.154(A), (B), and (C) shall have the additional classification using the suffix “-50”..
FPN No. 1: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core.
Substantiation: This proposal establishes a listing and marking for cable for installation where minimal smoke generations is required. This cable meets the requirement for installation in concealed spaces that permit a maximum flame spread index of 25 and a maximum smoke developed index of 50. The proposed cable has low flame spread characteristics and very-low-smoke-producing characteristics. Presently, a number of manufacturers have cables listed as meeting the proposed requirements, but do not have a unique marking permitted by the NEC.
The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.
Establishing a listing and marking for cables listed for a “-50” suffix provides cables with physical parameters (flame spread index, smoke developed index) that is consistent with requirements in other codes.
Panel Meeting Action: Reject
Panel Statement: Based on the lack of any applications provided in proposals for 760.53(B), other than marking requirements, acceptance of listing requirements for these cables cannot be accepted in 760.179.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials.
SEPULVEDA, M.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials.

3-339 Log #4055 NEC-P03 **Final Action: Reject**
(760.179(P) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 760.179(P).
(P) Fire Hazard Cables. Power-limited cables used to provide low combustible loading shall be listed as fire hazard cable (FHC) and shall be listed as having low flame spread characteristics, very-low-smoke producing characteristics, and a low potential heat release value. Cables specified in 760.154(A), (B), and (C) shall have the additional classification using the suffix “-FHC”..
FPN No. 1: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*
Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has low flame spread characteristics, very-low-smoke-producing characteristics, and a low potential heat release value. Presently, a number of manufacturers have cables listed to the proposed requirements.
A number of cable manufacturers have product listed that meets the testing criteria, but have no marking permitted by the NEC.
The testing criteria are based on the requirements found in NFPA 13 and the International Mechanical Code, as revised.
NFPA 13, Section 8.14.1.2.1 follows: “Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.” The proposed cable has a very low heat of combustion. While the term “combustible loading” is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.
The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.
Establishing a listing and marking for cables listed for a “FHC” suffix provides cables with physical parameters (flame spread index, smoke developed index, potential heat release) that is consistent with requirements in other codes.
NFPA 13-2007
8.15 Special Situations.
8.15.1 Concealed Spaces.
8.15.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.15.1.2.1 through 8.15.1.2.16 and 8.15.6.
8.15.1.2* Concealed Spaces Not Requiring Sprinkler Protection.
8.15.1.2.1* Concealed spaces of noncombustible and limited-combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading, see A.8.15.1.2.1.)

8.15.1.2.2 Concealed spaces of noncombustible and limited-combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.15.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)

8.15.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.

8.15.1.2.5 Concealed spaces formed by ceilings attached directly to or within 6 in. (152 mm) of wood joist construction shall not require sprinkler protection.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 3-338.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials; and a low potential heat release not greater than 8141 kJ/kg (3500 BTU/lb), as tested in accordance with UL 2424, Standard Test Method of Potential Heat of Building Materials. A number of manufacturers have products that meet this criteria. The NEC does not provide a marking requirement for this robust cable.

SEPULVEDA, M.: This listing provides a cable that matches the base requirement for installation in HVAC systems: flame spread index no greater than 25 and a smoke-developed index no greater than 50, as tested in accordance with UL 723, Test for Surface Burning Characteristics of Building Materials; and a low potential heat release not greater than 8141 kJ/kg (3500 BTU/lb), as tested in accordance with UL 2424, Standard Test Method of Potential Heat of Building Materials. A number of manufacturers have products that meet this criteria. The NEC does not provide a marking requirement for this robust cable.

ARTICLE 770 — OPTICAL FIBER CABLES AND RACEWAYS

16-3 Log #2282 NEC-P16 **Final Action: Reject**
(770)

Submitter: David H. Kendall, Thomas & Betts Corp.

Recommendation: Revise the indicated Sections in Article 770 to read as follows:

770.2 Definitions.

Optical Fiber Raceway **(OFCR).** ~~A raceway for enclosing and routing optical fiber cables.~~ A nonmetallic, pliable, corrugated raceway of circular cross section with integral or associated couplings, connectors, and fittings for the installation of optical-fiber cables.

FPN: See Article 100 for a definition of Raceway.

770.3 Other Articles. Circuits and equipment shall comply with 770.3(A) and (B). Only those sections of Chapter 2, ~~and~~ Articles 300 and 862 referenced in this article shall apply to optical fiber cables and raceways.

(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable.

(B) Ducts, Plenums, and Other Air-Handling Spaces. The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.

Exception: As permitted in ~~770.154(A).~~ 862.10(D) and (E).

(C) Optical Fiber Raceways (OFCR). Article 862 applies to the selection and installation of Optical Fiber Raceways (OFCR).

~~**770.12 Innerduct for Optical Fiber Cables.** Listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway selected in accordance with the provisions of 770.154 shall be permitted to be installed as innerduct in any type of listed raceway permitted in Chapter 3.~~

770.110 Raceways for Optical Fiber Cables. Where optical fiber cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or Optical Fiber/Communication Raceway (OFCR) selected and installed per Article 862. The number of Optical Fiber Cables shall comply with 862.22. ~~listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway selected in accordance with the provisions of 770.154, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. Where optical fiber cables are installed in raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply.~~ Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.

770.154 Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through (D) and 770.154(F), or where cable substitutions are made as shown in 770.154(E).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in ~~300.22(B)~~ 862.10(D) and in other spaces used for environmental air as described in ~~300.22(C)~~ 862.10(E). Only Type OFNP and OFCP cables shall be permitted to be installed in these raceways.

(B) Riser. Cables installed in risers shall be as described in any of (B)(1), (B)(2), or (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use. Listed riser optical fiber raceways and listed plenum optical fiber raceways shall also be permitted to be installed in vertical riser runs in a shaft from floor to floor as described in 862.10(F). Only Type OFNP, OFCP, OFNR, and OFCR cables shall be permitted to be installed in these raceways.

(2) Metal Raceways or Fireproof Shafts. Type OFNG, OFN, OFCG, and OFC cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

(3) One- and Two-Family Dwellings. Type OFNG, OFN, OFCG, and OFC cables shall be permitted in one- and two-family dwellings. Listed general-purpose optical fiber raceways, listed riser optical fiber raceways, and listed plenum optical fiber raceways shall be permitted for use as described in 862.10(G) with Type OFNG, OFN, OFCG, and OFC cables.

FPN: See 300.21 for firestop requirements for floor penetrations.

(C) Other Cabling Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and (B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways, listed riser optical fiber raceways, and listed plenum optical fiber raceways as described in 862.10(G).

(D) Cable Trays. Optical fiber cables of the types listed in Table 770.179 shall be permitted to be installed in cable trays.

FPN: It is not the intent to require that these optical fiber cables be listed specifically for use in cable trays.

(E) Cable Substitutions. The substitutions for optical fiber cables listed in Table 770.154(E) and illustrated in Figure 770.154(E) shall be permitted.

Table 770.154(E) Cable Substitutions (existing, not shown)

770.182 ~~**Optical Fiber Raceways.** Optical fiber raceways shall be listed in accordance with 770.182(A) through (C).~~ **Nonmetallic Optical-Fiber Raceways (OFCR).** Nonmetallic Optical-Fiber Raceways (OFCR) shall be listed in accordance to Article 862.6.

~~**(A) Plenum Optical Fiber Raceway.** Plenum optical fiber raceways shall be listed as having adequate fire-resistant and low smoke-producing characteristics.~~

~~FPN: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.~~

~~**(B) Riser Optical Fiber Raceway.** Riser optical fiber raceways shall be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.~~

~~FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, Standard for Optical Fiber Cable Raceway.~~

~~**(C) General-Purpose Optical Fiber Cable Raceway.** General-purpose optical fiber cable raceway shall be listed as being resistant to the spread of fire.~~

~~FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, Standard for Optical Fiber Cable Raceway.~~

Substantiation: This is a companion proposal to correlate with the proposal for a new optical fiber/communication raceway article. The new optical fiber/communication raceway article was proposed to Panel 16 as Article 862.

Optical fiber/communication raceways (Type OFCR) are currently listed raceways for use in plenums, risers or general purpose applications for the management of signaling, optical fiber, communication and CATV cables. This new Article and the companion proposals will clarify the selection, and installation optical fiber/communication raceways including the construction specifications. It is not the intent of the submitter to revise or change any of the currently permitted uses by this proposal, but only to enhance the usability of the Code.

Panel Meeting Action: Reject

Panel Statement: This proposal was submitted in companion with Proposal 16-350, which was rejected. The submitter of this proposal assumes the acceptance of Proposal 16-350, which was rejected.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-4 Log #2270 NEC-P16 **Final Action: Accept in Principle**
(770.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise text to read as follows:
770.1 Scope.
The provisions of this article apply to the installation of optical fiber cables, ~~and~~ raceways and optical fiber /communications cable routing assemblies. This article does not cover the construction of optical fiber cables and raceways.
Substantiation: Article 770 currently covers optical fiber raceways and provides applications and listing requirements for these raceways.. UL lists these raceways to UL 2024, *Optical Fiber and Communication Cable Raceway.* UL lists optical fiber /communications cable routing assemblies to UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies.* Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.)
For further information see the attached application guide from one of the manufacturers or got to http://www.storage-expo.com/ExhibitorLibrary/302/FiberRunner_6.pdf on the web.
The significant difference between optical fiber /communications cable routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.
We have submitted companion proposals to provide for the listing and applications of optical fiber /communications cable routing assemblies.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
770.1 Scope.
The provisions of this article apply to the installation of optical fiber cables, raceways, and cable routing assemblies. This article does not cover the construction of optical fiber cables and raceways.
Panel Statement: The panel recognizes that the TCC is responsible for the scope. The panel recommends that the TCC accept this proposal. The panel changed the name from "optical fiber/communications cable routing assemblies" to "cable routing assemblies". See panel action on Proposal 16-12.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-5 Log #1443 NEC-P16 **Final Action: Reject**
(770.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "may result" to "is likely".
Substantiation: Edit. "May" is subjective and a term to be avoided per the Style Manual. Likely is defined as such a nature or circumstance as to make something probabe, and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The submitters recommendation is not editorial. The term "may" connotes "a possibility"; the term "likely" connotes "is probable". The panel does not agree that these are probable events.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-6 Log #813 NEC-P16 **Final Action: Reject**
(770.2.Abandoned Optical Fiber Cable)

Submitter: J. L. Richardson, Engineering Services Group, Inc.
Recommendation: Delete the following text:
~~Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment other than a connector and not identified for future use with a tag.~~
Substantiation: To be replaced by general definition Article 100, Definitions.
Panel Meeting Action: Reject
Panel Statement: For the 2008 NEC, a TCC-directed task group, including representation from CMP-3, CMP-12 and CMP-16, determined there were enough differences in the installation of abandoned cables to justify them being addressed in individual articles. The current code wording is aligned with what was proposed by the task group.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-7 Log #2087 NEC-P16 **Final Action: Reject**
(770.2.Air Duct)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Add a definition of air duct:
Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [**90A:**3.3.5]
Substantiation: The term "air duct" is used in the task group's proposal for 770.154. It should be defined. It is defined in Articles 800 and 820. The task group is also proposing to define it in Article 830. A proposal has been submitted to define air duct in Article 100. If the proposal for Article 100 is accepted, the panel or the TCC can act to remove the definitions from panel sixteen's articles.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Reject
Panel Statement: The term "air duct" is not used in Article 770 and should not be defined in the article, in accordance with the NEC Style Manual.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-8 Log #2088 NEC-P16 **Final Action: Accept**
(770.2.Composite Optical Fiber Cable)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
Composite Optical Fiber Cable. ~~These~~ A cables containing optical fibers and current-carrying electrical conductors.
Substantiation: This is an editorial proposal to change the style of the definition to the format typically used for definitions.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Revise text to read as follows:
Composite Optical Fiber Cable. A cable containing optical fibers and current-carrying electrical conductors.
Panel Statement: The panel notes that the original submittal had the plural "cables" changed to "cable".
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
BRUNSSEN, J.: The Panel modified the submitter's text. Hence, the proper Panel Action should be 'Accept in Principle'.

16-9 Log #2089 NEC-P16 **Final Action: Accept**
(770.2.Conductive Optical Fiber Cable)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with the NEC Style Manual so that the definition does not contain the term being defined.
This action will be considered by the panel as a public comment.
Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
Conductive Optical Fiber Cable. ~~These~~ An optical fiber cable~~s~~ containing non–current-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.
Substantiation: This is an editorial proposal to change the style of the definition to the format typically used for definitions.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-10 Log #213 NEC-P16 **Final Action: Accept**
(770.2.General-Purpose Optical Fiber Raceway)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 2.2.2 of the NEC Style Manual to not contain mandatory text, such as "listed" and not contain the defined term.

This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise text to read as follows:

Optical Fiber Raceway. A raceway ~~for enclosing and routing optical fiber cables.~~ listed as a Plenum Optical Fiber Raceway, or a Riser Optical Fiber Raceway, or a General-Purpose Optical Fiber Raceway.
FPN: See Article 100 for a definition of Raceway.
Substantiation: The current definition "Optical Fiber Raceway" is wrong. It could be misinterpreted to be any raceway used for routing optical fiber cables; that is not the way the term "optical fiber raceway" is used in Article 770. The proposed definition is precise. Companion proposals have been submitted for Articles 800 and 820.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the print line should be "Definitions" not "General-Purpose Optical Fiber".
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
GUBISCH, R.: The proposed definition contains a requirement which conflicts with 2.2.2 of the NEC Style Manual.

16-11 Log #2090 NEC-P16 **Final Action: Accept**
(770.2.Nonconductive Optical Fiber Cable)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with the NEC Style Manual with respect to the use of mandatory language.

This action will be considered by the panel as a public comment.
Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:

Nonconductive Optical Fiber Cable. ~~These~~ An optical fiber cable~~s~~ containing no metallic members and no other electrically conductive materials.
Substantiation: This is an editorial proposal to change the style of the definition to the format typically used for definitions.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-12 Log #3594 NEC-P16 **Final Action: Accept in Principle**
(770.2.Optical fiber /communications cable routing assembly)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with the NEC Style Manual with respect to the use of mandatory language.

The Technical Correlating Committee further directs that the Chairs of Code-Making Panels 3 and 16 form a Task Group to correlate the actions taken on this proposal and Proposal 3-196.

This action will be considered by the panel as a public comment.
Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Add new text to read as follows:
Optical fiber /communications cable routing assembly. A flame retardant, nonmetallic assembly of pliable lengths, rigid straight sections, elbows, bends and fittings such as expansion joints, female and male adapters, and couplings used to support and protect optical fiber, communications and data cables in applications with a high density of cabling such a information technology (computer) rooms, broadcast stations and telecommunications offices. Parts of the assembly may have hinged or removable covers. The assembly is designed for cables be laid or set in place after the enclosures have been installed as a complete system.
Substantiation: Article 770 currently covers optical fiber raceways and provides applications and listing requirements for these raceways. UL lists these raceways to UL 2024, Optical Fiber and Communication Cable Raceway. UL lists optical fiber /communications cable routing assemblies to UL2024a, Outline of Investigation for Optical Fiber Cable Routing Assemblies. Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.)

For further information see the attached application guide from one of the manufacturers or got to http://www.storage-expo.com/ExhibitorLibrary/302/FiberRunner_6.pdf on the web.

The significant difference between optical fiber /communications cable routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.

Since users of the code may not be familiar with optical fiber / communications cable routing assemblies we are submitting this proposal to define them. We have submitted companion proposals to provide for a change of the scope of Article 770 to include optical fiber /communications cable routing assemblies and to provide listing and application for requirements for them. Since these routing assemblies are used for optical fiber, data and communications cables, proposals are being submitted for Articles 725, 770, 800 and 820.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Cable Routing Assembly. A unit or assembly of units or sections and associated fittings that are listed and form a structural system used to support listed cables.
Panel Statement: The panel action meets the submitters intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
GUBISCH, R.: The proposed definition contains a requirement which conflicts with 2.2.2 of the NEC Style Manual.
Comment on Affirmative:
BRUNSSEN, J.: The definition as stated in the Panel Meeting Action is incomplete as it fails to identify the types of cable to be supported and protected. Revise the Panel Meeting Action as follows: "**Cable Routing Assembly.** A unit or assembly of units or sections and associated fittings that are listed and form a structural system used to support and protect optical fiber, communications and data listed cables."
DORNA, G.: The panel action over-simplified the proposed definition. The submitter recommended:
Optical fiber /communications cable routing assembly. A flame retardant, nonmetallic assembly of pliable lengths, rigid straight sections, elbows, bends and fittings such as expansion joints, female and male adapters, and couplings used to support and protect optical fiber, communications and data cables in applications with a high density of cabling such a information technology (computer) rooms, broadcast stations and telecommunications offices. Parts of the assembly may have hinged or removable covers. The assembly is designed for cables be laid or set in place after the enclosures have been installed as a complete system.
The panel action simplified the text to:
Routing Assembly. A unit or assembly of units or sections and associated fittings that are listed and form a structural system used to support listed cables.
Routing assemblies are listed for use with optical fiber and data/com cables, not any listed cable. The panel action should be changed to:
Routing Assembly. A unit or assembly of units or sections and associated fittings that are listed and form a structural system used to support listed optical fiber, communications and data cables.

16-13 Log #2091 NEC-P16 **Final Action: Accept in Principle**
(770.2.Optical Fiber Cable)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise 770.2 Optical Fiber Cable as follows:
770.2 **Optical Fiber Cable.** A factory-assembly of one or more optical fibers having an overall covering. Optical fiber cables transmit light for control, signaling, and communications through an optical fiber.
Substantiation: This additional text, editorially relocated from 770.6, appropriately belongs in a definition and more fully defines an optical fiber cable. (See companion proposal to delete 770.6.) The proposed revision is editorial.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept in Principle
Revise 770.2 Optical Fiber Cable as follows:
770.2 Optical Fiber Cable. A factory-assembly of one or more optical fibers, having an overall covering, which transmit light for control, signaling, and communications.
Panel Statement: The panel revised the definition to meet the NEC Style Manual. The revised recommendation wording meets the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-14 Log #2092 NEC-P16 **Final Action: Accept in Principle**
(770.2.Optical Fiber Raceway)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise 770.2, Optical Fiber Raceway, as follows:
Optical Fiber Raceway: A raceway for enclosing and routing optical fiber cables. <u>, and identified as a Plenum Optical Fiber Raceway, a Riser Optical Fiber Raceway, or a General-Purpose Optical Fiber Raceway.</u>
Substantiation: The current definition is too broad and could possibly be interpreted as including all types of metallic and nonmetallic conduit and ducts. The proposed editorial clarification associates the raceway with specific application to optical fiber cables.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-10.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-15 Log #118 NEC-P16 **Final Action: Reject**
(770.3)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
Optical Fiber Raceway. ~~A raceway for enclosing and routing listed optical fiber cables.~~ <u>A raceway listed as a Plenum Optical Fiber Raceway, or a Riser Optical Fiber Raceway, or a General-Purpose Optical Fiber Raceway.</u>
Substantiation: The current definition Optical Fiber Raceway is confusing. The definition of Optical Fiber Raceway in the 2005 NEC is:
Optical Fiber Raceway. A raceway designed for enclosing and routing listed optical fiber cables.
The 2008 NEC changed the definition to:
Optical Fiber Raceway. A raceway ~~designed for~~ enclosing and routing listed optical fiber cables.
The 2008 NEC definition is confusing because any raceway used for routing optical fiber cables could be considered an "optical fiber raceway" and that is not the way the term "optical fiber raceway" is used throughout Article 770. The proposed definition is precise. Companion proposals have been submitted for Articles 800 and 820.
Panel Meeting Action: Reject
Panel Statement: This text does not appear in 770.3.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-16 Log #2093 NEC-P16 **Final Action: Accept in Principle**
(770.3)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 14 for comment.
Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Make the following changes:
770.3 Other Articles.
<u>Installations of optical fiber cables and raceways</u> ~~Circuits and equipment~~ shall comply with 770.3(A) and 770.3(B). Only those sections of Chapter 2 and Article 300 referenced in this article shall apply to optical fiber cables and raceways.
<u>**(A) Hazardous (Classified) Locations.** Listed optical fiber cables shall be permitted to be installed in hazardous (classified) locations. The cables shall be sealed in accordance with the requirements of 501.15, 502.15, 505.16, or 506.16, as applicable.</u>
(<u>B</u>~~A~~) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable.
~~(B) Ducts, Plenums, and Other Air-Handling Spaces. The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.~~
~~Exception: As permitted in 770.154(A).~~
Substantiation: This proposal is a clarification.
There are no circuits and equipment in Article 770 which only covers optical fiber cables and raceways. The proposed wording is more accurate. The current section 770.3(B) provides no additional guidance or requirements that are not already in 770.154(A). It's redundant and perhaps confusing. Section 800.3 does not have a similar requirement.
The task group has also submitted proposals to delete 820.3(B) and 830.3(B) in order to remove conflicts within Articles 820 and 830. If these proposals are accepted there will be no "Ducts, Plenums and Other Air Handling Spaces" in the "Other Articles" sections of Articles 770, 800, 820 and 830.
The hazardous locations requirements from 770.154(F) have been moved to this section to improve the parallelism with Articles 800 and 820.
This proposal to delete "circuits and equipment" and the provisions for "Ducts, Plenums, and Other Air Handling Spaces" was submitted by the CMP 16 Special Editorial Task Group during the development of the 2008 NEC. The proposal was rejected in order to comply with the NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005. The Standards Council Decision does not apply to the current NEC code cycle.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson, Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept in Principle
Revise proposed recommendation text to read as follows.
770.3 Other Articles.
Installations of optical fiber cables and raceways shall comply with 770.3(A) and 770.3(B). Only those sections of Chapter 2 and Article 300 referenced in this article shall apply to optical fiber cables and raceways.
(A) Hazardous (Classified) Locations.
Listed optical fiber cables and raceways shall be permitted to be installed in hazardous (classified) locations. The optical fiber cables and raceways shall be sealed in accordance with the requirements of 501.15, 502.15, 505.16, or 506.16, as applicable.
(B) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable.
Panel Statement: The panel modified the recommendation to include "optical fiber cables and raceways" in 770.3(A). This action accomplishes the "accept in principle" action of Proposal 16-63.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-17 Log #2094 NEC-P16 **Final Action: Accept in Principle**
(770.3 and 770.3(B))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Delete the following:
~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.~~
~~*Exception: As permitted in 770.154(A).*~~
Revise 770.3 Other Articles as follows:
770.3 Other Articles. Circuits and equipment shall comply with 770.3(A) ~~and (B)~~. Only those sections of Chapter 2 and Article 300 referenced in this article shall apply to optical fiber cables and raceways.
Substantiation: This proposal is editorial.
Section 770.3(B) provides no additional guidance or requirements that are not already in 770.154(A). It's redundant and perhaps confusing. Section 800.3 does not have a similar requirement.
Acceptance of this proposal, as well as companion proposals for 820.3 and 830.3, will make Articles 770, 800, 820 and 830 consistent and in compliance with section 3.3.5 of the NEC Style Manual, shown below:
3.3.5 Parallel Construction. Parallel construction means stating similar requirements in similar ways for greater consistency. This helps makes the *NEC* clear for users. Lack of consistency often creates confusion, causing users to ask: *Does this difference in wording represent a different requirement? Or is it simply two different ways of trying to say the same thing?* There are several kinds of parallel construction:
Organization and Numbering. If practicable, the subsections of similar articles should be numbered in the same order (see 2.4.1).
Sections. Different sections, within the same article, that reflect similar or closely related subjects, should have similar structures.
Lists. All items in a list should be parallel (that is, singular or plural, written in the same verb tense, using phrases or sentences but not a mix).

This proposal was submitted by the CMP 16 Special Editorial Task Group during the development of the 2008 NEC. This proposal was rejected in order to comply with the NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005. The Standards Council Decision does not apply to the current NEC code cycle.

This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-16. The panel action meets the intent of the submitter by deleting the existing 770.3(B).

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-18 Log #116 NEC-P16 **Final Action: Accept**

(770.3(B))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Deleted text:

~~**(B) Ducts, Plenums, and Other Air-Handling Spaces**. The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.~~

~~*Exception: As permitted in 770.154(A).*~~

Substantiation: Section 770.3(B) provides no additional guidance or requirements that are not already in 770.154(A). It's redundant and perhaps confusing to send an optical fiber cable installer to section 300.22 to look for requirements that are already in Article 770. Section 800.3 does not have a similar requirement. Elimination of 770.3(B) will improve the parallelism between the articles.

Panel Meeting Action: Accept

Panel Statement: See panel action on Proposal 16-16.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-20 Log #30 NEC-P16 **Final Action: Accept in Principle**

(770.12 and 770.110 (New))

NOTE: This proposal appeared as Comment 16-26 on Proposal 16-38 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-38 was:

Make the following changes:

770.12 ~~Raceways~~ Innerduct for Optical Fiber Cables.

~~**Installations of raceways shall comply with 770.12(A) through 770.12(D).**~~

~~**770.12(A) Listed Chapter 3 Raceways. Listed optical fiber cable shall be permitted to be installed in any type of listed raceway permitted in Chapter 3 where that listed raceway is installed in accordance with Chapter 3. Where optical fiber cables are installed within raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply**~~**.**

~~**770.12(B) Optical Fiber Raceways. Listed optical fiber cable shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 and 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing shall apply.**~~

~~**(C) Innerduct.**~~ **Listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 shall be permitted to be installed as innerduct in any type of listed raceway permitted in Chapter 3.**

~~**(D) Entering Buildings. Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance**~~

770.110 Raceways for Communications Wires and Cables. Where optical fiber cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154, and with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.ÊWhere optical fiber cables are installed in raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: The panel action on the Proposal should continue to be Accept in Principle, however, the following additional changes should be made to the panel action:

Revise 770.12 as shown:

770.12 ~~Innerduct for~~ Optical Fiber Cables Installed in Raceways. Listed ~~plenum~~ optical fiber raceways~~, listed riser optical fiber raceway, or listed general purpose optical fiber raceway~~ selected in accordance with the provisions of 770.154 shall be permitted to be installed ~~as innerduct~~ in any type of listed raceway permitted in Chapter 3.

Revise the new 770.110 as follows:

770.110 Raceways for Optical Fiber Cables. Where optical fiber cables are installed in a raceway, the raceway shall be either of a type ~~either~~ permitted in Chapter 3 and installed in accordance with Chapter 3 or a listed ~~plenum~~ optical fiber raceway~~, listed riser optical fiber raceway, or listed general purpose optical fiber raceway~~ selected in accordance with the provisions of 770.154, and installed in accordance with ~~362.24~~ 362.22 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. ~~Where optical fiber cables are installed in raceway without current carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.~~

Substantiation: "Innerduct" is not defined in the Code and is only used in 770.12. Changing the text as proposed will still permit the installation of listed optical fiber raceways (plenum, riser, or general-purpose) in any type of listed raceway permitted in Chapter 3 without adding an undefined term to the Code. Addition of the term "innerduct" is not necessary to permit the installations proposed, may be confusing to the user since it is not used anywhere else in the Code, and does not add clarity nor enhance usability of the Code.

Relocation of the word "either" provides the consistency between Articles 770, 800, and 820 that the proposer indicated as one of the objectives in the substantiation.

Using the term "listed optical fiber raceways" will also permit the installation of other types of listed optical fiber raceways that may be included in future Codes without having to revise 770.12.

The first sentence in the submitter's substantiation states that "This is an editorial proposal." Deletion of the maximum percentage fill requirements for Chapter 3 raceways is not editorial.

No substantiation was submitted to support the deletion of the maximum percentage fill requirements of Chapters 3 and 9. The fill requirements are based on the physical limitations of being able to pull conductors or cables into raceways without damaging the conductors or cables, particularly when there are bends in the run, and avoiding conductor/cable jamming. The maximum percentage fill requirements are independent of whether they are electrical conductors or not.

The maximum percentage fill requirements in Chapters 3 and 9 are an integral part of the permitted uses of the raceways contained in Chapter 3 and if conductors or cables are to be installed in a Chapter 3 raceway, then the maximum percentage fill requirements must also apply.

The first sentence in proposed 770.10 already states that "installed in accordance with Chapter 3" which would include all of Chapter 3 requirements pertaining to raceways including the maximum percentage fill limitations in Chapter 9. The proposal introduces conflicting requirements between the first and second sentences.

Chapter 9, Table 1 permits 53 percent fill when one conductor or cable is installed in a raceway; 31 percent for two; and 40 percent for three or more.

When electrical conductors are installed in raceways, with or without nonmetallic optical fiber cable or nonmetallic optical fiber raceways, then 310.15 applies and the ampacity adjustment factors in Table 310.15(B)(2)(a) for more than three current-carrying conductors in a raceway or cable would also apply, if applicable.

Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts in principle the revision of 770.110. See panel action on Proposal 16-47, which addresses 770.110. The panel rejects the revision to 770.12 because the term "innerduct" is well known and understood by installers of optical fiber cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-21 Log #946 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Cables shall be securely supported and fastened in place except where installed in raceways, cable trays or fished between access points in existing buildings and structures and intermediate support is not practical. Such cables shall be secured to supports by straps, staples, cable ties, hangers or other fittings identified for the purpose. The installation shall also comply with applicable provisions of 400.4 and 300.1.
Substantiation: "Neat" and "workmanlike" are subjective and terms to be avoided per the Style Manual, and "will" is a term that is not to be used, per the Style Manual. The manner of support does not necessarily prevent damage. See 110.13(A).
Panel Meeting Action: Reject
Panel Statement: The proposed text provides no improvement or clarification over the existing text. The proposal refers to 400.4 and 300.1 which are not applicable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-22 Log #3090 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
770.24 Mechanical Execution of Work.
Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4~~(D)~~ and 300.11.
FPN: Text to remain unchanged.
Substantiation: This is one of a series of proposals intended to provide correlation with sections 640.6(B), 725.24, 760.24, 770.24, 800.24, 820.24 and 830.24. Due to the power limitations of these circuits, there is no reason that the requirements should be different.
Panel Meeting Action: Reject
Panel Statement: Optical fiber cables contain no power and do not present a potential electrical safety hazard. There is insufficient substantiation to justify a major increase in physical protection requirements for optical fiber cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-23 Log #3721 NEC-P16 **Final Action: Accept in Principle**
(770.24, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add the following Fine Print Note:
<u>FPN: See NFPA 90A, Standard for Installation of Air-Conditioning and Ventilation Systems, for discrete combustible components installed in air-handling plenums in accordance with 300.22.</u>
Substantiation: This proposal addresses new requirements in NFPA 90A having an influence on installations in NEC Section 770.24, as well as held comments from the 2008 NEC Cycle, ROC 16-29 and 16-30.
Imposing the requirement that such products be "listed" in this section of the NEC would result in additional requirements not included in NFPA 90A. The implication of requiring listing in this section of the NEC would impose the full scope of requirements in UL 1565 for cable ties and UL 2239 for other support hardware. This effort to correlate with NFPA 90A would create big correlation issues within NFPA 70 for the same products used for supporting all other cables and conduits outside of the jurisdiction of code-making panel 16, for no good reason. It is not necessary to repeat requirements from NFPA 90A in NFPA 70 especially when doing so imposes unsubstantiated additional requirements.
The NFPA 90A requirements are focused on smoke and heat generated from a fire in an air-handling plenum. The NFPA 90A-2009 requirement is as follows for discrete combustible components installed in air-handling spaces in accordance with NEC 300.22 (C) and (D): (The actual clause numbers in NFPA 90A-2009 may vary editorially)
NFPA clause 4.3.10.2.6.5 Loudspeakers, recessed lighting fixtures and other electrical equipment with combustible enclosures, including their assemblies and accessories, cable ties and other discrete products shall be permitted in the ceiling cavity plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a peak heat release rate of 100 kW or less when tested in accordance with UL2043, *Standard for Safety Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.*
And very similar requirements in 4.3.10.6.5.6 apply in NFPA 90A for discrete <u>combustible</u> products installed in a "raised floor plenum".
Importantly, none of these requirements pertain to noncombustible products. There are many metallic products, including metallic cable ties, used to support power, data and communications conduits and cables and there has been no substantiation offered that these be required to be "listed".
Panel Meeting Action: Accept in Principle
Revise Fine Print Note text to read as follows:
FPN No. 2: See NFPA 90A, Standard for Installation of Air-Conditioning and Ventilation Systems, for discrete combustible components installed in accordance with 300.22(B) and (C).
Panel Statement: The panel removed the vague term "air-handling plenums" and added the references to 300.22(B) and (C). This meets the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-24 Log #4551 NEC-P16 **Final Action: Reject**
(770.25)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
770.25 Abandoned Cables.
The accessible portion of abandoned optical fiber cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved. <u>Removal of abandoned cables shall be performed in a neat and workmanlike manner.</u>
Substantiation: This proposal recommends added wording to ensure that abandoned cables are removed appropriately. Section 110.12 addresses installation and so does section 770.24. It is important to point out that similar care must be taken when removing cables.
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
Consistent wording is being proposed for other sections in the code.
For information, see relevant definitions in the NEC.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Panel Meeting Action: Reject
Panel Statement: This is an unenforceable requirement. Removing abandoned cable involves pulling unused cable and wiring from conduit, raceways, ducts, shafts and drop ceilings. The objective of the original text is directed at the final installation, that it be "neat and workmanlike", not necessarily the installation (in this case, removal) process. The submitter has provided no substantiation for additional requirements during the removal process.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-25 Log #1596 NEC-P16 **Final Action: Reject**
(770.26)

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Add a third sentence to 770.26: <u>Conduits or raceways entering enclosures of the ventilated type, shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway into other areas of the building or structure.</u>
Substantiation: A fire in the area where the enclosure is located will produce smoke, poison gases, and other products of combustion which can easily be carried through the enclosure's vents and these unsealed raceways to other areas in the building. Essentially defeating any firewalls. I have not seen this particular problem addressed in building codes or fire resistance directories since these raceways are not "sleeves" which ARE required to be fire stopped, but rather they are complete raceway systems which generally require only sealing up around the OUTSIDE of the pipe where it penetrates a firewall. In this particular installation smoke could easily pass right through the INSIDE of the raceway because of the ventilation openings in the enclosure.

I have witnessed the results of this "chimney-effect" problem when the smoke from a fire in a basement electric room spread throughout the upper floors of a high rise building because the raceways leaving the switch gear acted like chimneys and transported heavy smoke from the basement directly to panelboards and switchboards on the upper floors of the building thus bypassing and defeating any fire walls that the raceways penetrated and completely filling the UPPER floors with smoke. Luckily nobody was injured. If the ends of the raceways were simply filled with some fire-stopping type caulk or similar material this situation would probably never have happened.

Once a fire starts to produce toxic fumes we almost have to think of that area as a Hazardous (classified) location similar to those in Article 500. We must try to prevent those hazardous gases passing from one area in a building to another.

Just as other sealing requirements throughout the code prevent moisture, condensation, dusts, gases or vapors from traveling through raceways, this requirement for some simple fire proof putty could prevent toxic fumes from spreading throughout the building. The seals required by this proposal are equally as important as any other seals required by the NEC such as 230.8, 300.5(G), 300.7(A), 300.50(E), 312.5(C) exception to (D), 324.40(A), 332.40(A), 368, 238, 372.7, 501.15, 502.15, 504.70, 505.16, 506.16, 680.24(B) and any other seals that may be required.

I am submitting companion proposals to sections 300.21, 770.26, 800.26, 820.26 and 830.26.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposed recommendation is impractical. The submitter has not supplied sufficient data for substantiation of a problem.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
IVANS, R.: The submitter is correct that vented enclosures connected via unsealed raceways and conduit can bypass fire breaks between floors. It would not be impractical to seal such raceways or conduit.

16-26 Log #2095 NEC-P16 **Final Action: Accept in Principle**
(770.48(A))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
(A) Conductive and Nonconductive Cables. Unlisted conductive and nonconductive outside plant optical fiber cables shall be permitted to be installed in <u>building spaces other than risers, air ducts, plenums and other spaces used for environmental air</u>, ~~locations as described in 770.154(C)~~, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.
Substantiation: This proposal is editorial clarification. It is clearer to specify the actual locations in 770.154(C) than to refer to section 770.154(C). The locations described in 770.154(C) are risers, air ducts, plenums and other spaces used for environmental air.

This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
770.48 Unlisted Cables and Raceways Entering Buildings.
(A) Conductive and Nonconductive Cables. Unlisted conductive and nonconductive outside plant optical fiber cables shall be permitted to be installed in building spaces other than risers, ducts used for environmental air, plenums used for environmental air, and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.
Panel Statement: The revised text adds clarity and meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-27 Log #2096 NEC-P16 **Final Action: Accept**
(770.48(B))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
(B) Nonconductive Cables <u>In Raceway.</u> Unlisted nonconductive ~~optical fiber~~ outside plant optical fiber cables shall be permitted to enter the building from the outside and run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Polyvinyl Chloride Conduit: Type PVC; and Article 358, Electrical Metallic Tubing: Type EMT.
Substantiation: This is an editorial proposal.
770.48(B) deals with nonconductive cables in raceway. The revision of the title is an editorial clarification. Striking "optical fiber" removes a redundancy.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

Ballot Results: Affirmative: 16

16-28 Log #4492 NEC-P16 **Final Action: Reject**
(770.100)

Submitter: Steve Zugay, Alcatel-Lucent
Recommendation: Add new text as follows:
<u>(E) **Indoor Fiber.** Where a non-metallic fiber optic cable enters a structure through an outside wall and connects to a listed appliance acting as an indoor distribution network for communications cables, grounding of the appliance can be achieved by utilizing a flexible cord and 3-prong plug.</u>
Substantiation: Fiber optic network equipment designed to act as an indoor cable distribution network does not specifically require a connection to ground. However, this equipment may be connected to the building ground as required by the listing. If by definition it is not exposed to the outside plant, grounding with a flexible cord and 3-prong plug is sufficient to bring all devices it serves to the same potential. Since some devices in a home that would connect to a cable distribution network do not contain ground and the product standards used for such products may assume that a coax cable shield is grounded, this should not change that assumption.
Panel Meeting Action: Reject
Panel Statement: Equipment requirements are beyond the scope of Article 770 which addresses fiber optic cables and raceways only.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-29 Log #3091 NEC-P16 **Final Action: Accept in Principle**
(770.100(A)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(A) Grounding Conductor.
(1) <u>Listing</u> ~~Insulation~~. The grounding conductor ~~shall be insulated and~~ shall be listed.
Substantiation: There is no electrical reason that this conductor should be required to be insulated. This proposal provides consistency with nearly every other grounding/bonding related section of the code.
Panel Meeting Action: Accept in Principle
Revise 770.100(A)(1) to read as follows:
(1) Insulation. The grounding conductor shall be listed and shall be permitted to be insulated, covered or bare.

Panel Statement: The grounding conductor does not need to be insulated but for esthetic reasons, such as exposed grounding conductors routed within a premises, insulation or covering may be appropriate. Adding ‘covered’ accommodates proposal 16-30. Permitting all three, ‘insulated, covered or bare” will clarify that all three are now permitted since for many years only an insulated conductor was permitted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
GUBISCH, R.: There is no need to list a grounding conductor consisting of bare wire.

16-30 Log #4393 NEC-P16 **Final Action: Accept in Principle in Part**
(770.100(A)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal.
This action will be considered by the panel as a public comment.
Submitter: Jake Killinger, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
770.100 Entrance Cable Grounding.
When grounded, the non-current-carrying metallic members of optical fiber cables entering buildings shall be grounded as specified in 770.100(A) through (D).
(A) Grounding Conductor.
(1) ~~Insulation~~Insulated or Covered Conductors. The grounding conductor shall be permitted to be insulated, or covered and shall be listed as Protector Grounding Conductors.
(remaining text remains unchanged)
Substantiation: This is a sister proposal to 800.100.
The existing text would require fully insulated and Listed conductors for cable and primary protector grounding whereas in most other cases, bare conductors are usually adequate for most grounding purposes. Prior to the 1990 NEC, protective grounding conductors were required to have 30 mil rubber insulation and be covered by a fibrous covering. It also permitted conductors Listed for this use having less than 30 mil rubber insulation or having other kinds of insulation. In 1990 the NEC removed the thickness statements so that it read the grounding conductor shall be insulated and shall be listed as suitable for the purpose. In 2008, the suitable for the purpose clause was removed.
Discussions with past members of this CMP revealed that the reason for specifying insulated conductors was only to combat theft of uncovered copper wire. That being the case, thinner insulated conductor was permitted so long as it gave the same illusion of a conductor carrying power.
Listed Protector Grounding Conductors having less than the full insulation of Listed and insulated conductors exist today. These are based on the past allowances for thinner insulations. The 2008NEC text would literally not permit the use of these thinner walled insulated conductors and would make their certification obsolete.
If the reason for using the term ‘insulated’ was merely to provide a theft deterrent, then fully insulated wire is unnecessary. By definition in Article 100, only a “covered” conductor would be more than adequate. Therefore propose changing the text to permit both “insulated as well as “covered” conductors.
Also propose adding “Protector Grounding Conductor” to help identify the type of Listed products suitable in this application. These “Protector Grounding Conductors” are surface marked with this terminology to make it clear that they are listed only for this purpose and are not intended for general use with other Articles in the Code. They are presently certified under UL’s KDER category, but may be relocated to the KDSH (Grounding and Bonding Equipment – Communication) category to make their restricted use more obvious.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: Accept in principle the part to add “covered”. See panel action and statement on Proposal 16-29 which now permits the use of listed insulated, covered or bare conductors. The title is left as “insulation” since the paragraph now deals with levels of insulation.
Reject the parts adding the phrases “permitted to be” and “as a protector grounding conductor”. The panel does not want to restrict the listed wire to only listed “protector grounding conductors”.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-30a Log #CP1603 NEC-P16 **Final Action: Accept**
(770.100(A)(3))

Submitter: Code-Making Panel 16,
Recommendation: Revise text to read as follows:
(3) Size. The grounding conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity ~~approximately equal to or greater~~ not less than that of the grounded metallic member(s). The grounding conductor shall not be required to exceed 6 AWG.
Substantiation: This change correlates 770.100(A)(3) with similar changes in 820.100(A)(3) and 830.100(A)(3). 770.93(A) and (B) permit metallic member(s) to be either grounded or interrupted. The phrase “approximately equal to” is vague and subjective. The word “grounded” is added as only those metallic members that are grounded need be considered when determining the size of the grounding conductor. See Panel Action on Proposals 16-255 and 16-322.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-31 Log #945 NEC-P16 **Final Action: Reject**
(770.100(A)(5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Where ~~necessary~~ likely to be subject to physical damage the grounding conductor shall be protected by approved means. ~~Guarded from physical damage~~. (remainder unchanged)
Substantiation: Edit.
Panel Meeting Action: Reject
Panel Statement: The present wording is clear and the proposed revisions provide no improvement in clarity. The term “guarded” is a defined term while “protected” is undefined. The definition of “guarded” includes examples of appropriate guarding methods while the term “approved means” is ambiguous.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-32 Log #194 NEC-P16 **Final Action: Accept**
(770.100(B))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal as the existing numbering complies with the NEC Style Manual, and is consistent with other lists in the code.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Renumber 770.100(B) as shown.
(B) Electrode. The grounding conductor shall be connected in accordance with 770.100(B)(1), (B)(2), or (B)(3).
(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination, the grounding conductor shall be connected to the intersystem bonding termination.
(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:
(~~1~~a) The building or structure grounding electrode system as covered in 250.50
(~~2~~b) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52
(~~3~~c) The power service accessible means external to enclosures as covered in 250.94
(~~4~~d) The metallic power service raceway
(~~5~~e) The service equipment enclosure
(~~6~~f) The grounding electrode conductor or the grounding electrode conductor metal enclosure
(~~7~~g) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 770.100(B)(2), the grounding conductor shall be connected to either of the following:
(~~1~~a) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4).
(~~2~~b) If the building or structure served has no grounding means, as described in770.100(B)(2) or (B)(3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in800.53and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.
Substantiation: The current numbering is not in compliance with the style manual. See section 2.1.5.3 of the NEC Style Manual.

(770.100(B)(2)(4) and (D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise. (B)(2)(4): The nonflexible ~~power~~ service raceway. In (D) substitute "electric service" in lieu of "power".
Substantiation: Edit. Type MC cable and FMC permitted by 230.43 do not appear to be suitable for grounding conductor terminations. "Power" service may be inferred to exclude a "lighting" service.
Panel Meeting Action: Accept in Principle in Part
Revise existing 770.100(B)(2)(4) as follows:
(4) The nonflexible metallic power service raceway.
Reject the remainder of the proposal.
Panel Statement: The panel accepts in principle the part adding "nonflexible". The panel rejects the part replacing "power" with "electric".
While the term "service" may be correct based upon the definition in Article 100, use of the word "power" provides clarity and helps the reader to distinguish between "power" service and communications service, and between the communications grounding electrode and the "power" grounding electrode system. Adding the term "nonflexible" is consistent with 250.94 Exception (1). [Note: The Panel understands that the submitter intended to add "nonflexible".]
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-36 Log #3725 NEC-P16 **Final Action: Reject**
(770.100(B)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 770.100(B)(3) as follows:
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 770.100(B)(2), one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and comply with the requirements of 250.56 being applicable to rod, pipe, and plate electrode installations. ~~the grounding conductor shall be connected to either of the following:~~
~~(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4).~~
~~(2) If the building or structure served has no grounding means, as described in770.100(B)(2) or (B)(3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.~~
Substantiation: The requirement in existing 770.100(B)(3)(1) to connect the grounding electrode conductor to either a metal underground water pipe, the metal frame of a building or structure, a concrete-encased electrode, or a ground ring seems to require these electrodes to be installed as the subject of this section is **"Buildings or Structures Without …. Grounding Means."** This is not consistent with 250.50 that only requires the use of such electrodes where they are "present at each building or structure served." In addition, the first sentence of 770.100(B)(3)(2) is not a complete sentence, is simply a list of references, and thus has no meaning. In addition, it allows either a rod or pipe electrode to be used that is only 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter and driven where practicable into permanently damp earth. Into permanent damp earth is a good requirement but is doubtfully attained with a ½ in. rod or ½ in. pipe 5 ft in length.
The requirements of this section should state that where a building or structure is without grounding means, it is to have such reasonable grounding means installed such as a ground ring, rod, pipe, plate, or other underground metal structure that is recognized by Article 250 and more specifically 250.52(A)(4), (A)(5), (A)(6), (A)(7), and (A)(8). Also, 250.56 already requires that rod, pipe, and plate electrodes that do not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 250.52(A)(4) through (A)(8), and that where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart. This revision would bring the grounding of optical fiber cable into line with the requirements of Article 250 for both consistency and for technical application.
In addition 250.60 already states, "Air terminal conductors and driven pipes, rods, or plate electrodes used for grounding air terminals shall not be used in lieu of the grounding electrodes required by 250.50 for grounding wiring systems and equipment." With the revisions being sought, these revisions would also prohibit other possible electrodes not recognized by 250.52.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation for eliminating the 5-ft telecom ground rod, currently permitted by 770.100(B)(3)(2), that has been used successfully and safely by the telecom industry for decades. The tutorial, The ABCs of Grounding and Bonding, states: "Very little resistance change will result from using larger sizes of electrodes." The most important safety aspect is the bonding together of the power and telecom systems. When bonded together as specified in 770.100(D), intersystem voltages are equalized and the telecom grounding electrode, if separate, becomes part of the grounding electrode system at the premises.
The electrodes identified in 250.52(A)(4) through (A)(8), as proposed by the submitter, are intended for power system applications. Where power contact to conductive optical fiber cables is of concern (i.e., power fault) currents are limited by the equivalent small gauge of the metallic members, precluding the need for expansive and expensive grounding electrodes.
Finally, the title of 770.100(B)(3), "In Buildings or Structures Without …… Grounding Means" must be considered in context with the preceding Section 770.100(B)(2) where specific grounding means at the building or structure are identified.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-37 Log #1121 NEC-P16 **Final Action: Accept**
(770.100(B)(3)(2))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise the text of 770.100(B)(3)(2) as follows:
"….. or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in) in diameter, driven …".
Substantiation: The non-metric equivalent units were inadvertently omitted in the 2008 NEC text.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-38 Log #1122 NEC-P16 **Final Action: Accept**
(770.100(B)(3)(2))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise the last sentence of 770.100 (B)(3)(2) as follows:
Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for ~~protectors~~ non-current-carrying metallic members.
Substantiation: The word "protectors" should be deleted as protectors are not used with optical fiber cable. The proposed revision provides correlation with 830.100(B)(3)(2).
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-39 Log #3093 NEC-P16 **Final Action: Reject**
(770.100(B)(3)(2))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal since the phrase "effectively grounded" is no longer defined in the NEC.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(3) Text to remain unchanged
(1) Text to remain unchanged
(2) If the building or structure served has no grounding means, as described in 770.100(B)(2) or (B)(3)(1), to ~~an effectively grounded metal structure or to~~ a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.
Substantiation: The term "effectively grounded" is vague and unenforceable, as indicated by actions taken by the technical committees for the 2008 NEC. Furthermore, if this section is intending to address a metal building frame or underground metal structure, these items are already covered in 770.100(B)(2).
Panel Meeting Action: Reject
Panel Statement: The term "effectively grounded" is defined in the National Electrical Safety Code (NESC) as "Intentionally connected to earth through a ground connection ….", It is used extensively in that document and should remain. A metal building might itself be effectively grounded even though it does not have one of the identified grounding means in it. 770.100(B)(3)(2) permits connecting the grounding conductor to such a structure.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-40 Log #3940 NEC-P16 **Final Action: Accept in Principle**
(770.100(B)(3)(2))

Submitter: James Kelley, Sargent & Lundy
Recommendation: Revise text to read as follows:
(2) If the building or structure served has no grounding means, as described in 770.100(B)(2) or (B)(3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (<u>0.5</u> in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.
Substantiation: Insert the value of the inch units for the standard conversion of the 12.7 mm size rod or pipe missing from within the parenthesis provided that this is not intended to be a trade size of rod or pipe in which case, according to the 2003 National Electrical Code Style Manual, amended January 15, 2003,3.2.7.3.1, the trade size designator shall be used instead of the metric and converted units of measurement.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-37.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-41 Log #1123 NEC-P16 **Final Action: Accept**
(770.101)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Relocate 770.101 to 770.114 (New).
Revise text as follows:
Non-current-carrying conductive members of optical fiber cables shall be <u>bonded to a grounded equipment rack or enclosure, or</u> grounded according to the grounding methods specified by ~~770.100~~ <u>770.100(B)(2)</u>.
Substantiation: 770.101 is intended to apply to cables within the building [see 770.133(C) in the 2005 NEC] and hence is improperly located in the 2008 NEC. The grounding rules of 770.100 generally apply to cables entering or terminating on buildings. A more succinct and limited reference is appropriate for cables within buildings as contained in 770.100 (B)(2).
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-42 Log #1124 NEC-P16 **Final Action: Accept**
(770.106)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise text as follows:
Where grounded as required by 770.100 at a mobile home, the non-current-carrying metallic members of optical fiber cables entering ~~buildings~~ <u>the mobile home</u> shall be grounded as specified in 770.106(A) and (B).
Substantiation: Section 770.106 is specific to mobile homes, not buildings. Hence, the term 'building' is inappropriate.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-43 Log #1125 NEC-P16 **Final Action: Accept**
(770.106(A))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise text as follows:
"… the ground for non-current-carrying metallic members of optical fiber cables entering ~~buildings~~ <u>the mobile home</u> shall be in accordance with 770.100(B)(3)."
Substantiation: Section 770.106 is specific to mobile homes, not buildings. Hence, the term 'building' is inappropriate.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-44 Log #1126 NEC-P16 **Final Action: Accept**
(770.106(A))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise text as follows:
<u>**(A) Grounding.** Grounding shall comply with 770.106(A)(1) and (A)(2).</u>
<u>(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ground for non-current-carrying metallic members of optical fiber cables entering the mobile home shall be in accordance with 770.100(B)(3).</u>
<u>(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ground for non-current-carrying metallic members of optical fiber cables entering the mobile home shall be in accordance with 770.100(B)(3).</u>
Substantiation: This proposed revision is intended to editorially correlate 770.106(A) with similar requirements in 800.106(A), 820.106(A) and 830.106(A). As part of this proposed change, the text "buildings" has been changed to "the mobile home" as 770.106 deals solely with mobile homes, not buildings. See companion change proposals for 770.106 and 770.106(A). Note also that the text "from" has been changed to "of" and a comma added after the word "serves".
Panel Meeting Action: Accept

(770.106(B))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise text as follows:
"(B) Bonding. The ~~primary protector grounding terminal or~~ grounding electrode shall be bonded to the metal frame or available grounding terminal of the mobile home …".
Substantiation: Protectors are not used with optical fiber cable and hence should be deleted. It is necessary to bond the electrode to the mobile home metal frame to minimize any potential difference between the mobile home and the non-current-carrying conductive members of the optical fiber cable (if present).
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-46 Log #1442 NEC-P16 **Final Action: Reject**
(770.110)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Where optical fiber cables are installed in a raceway, cable tray, or other enclosure the wiring method shall be identified for the purpose. Listed plenum optical fiber cable raceway, listed optical fiber cable riser raceway, or listed general purpose optical fiber cable raceway, selected in accordance with the provisions of 770.154, and installed in accordance with 362.24 through 362.56, where the provisions applicable to electrical nonmetallic tubing shall apply. Where only conductive fiber optic cables are installed in a raceway, box, or other enclosure, conductor fill limitations shall not apply. Where optical fiber cables are installed in a raceway or other enclosure with electric circuit conductors, applicable raceway and enclosure fill requirements shall also apply to the optical fiber cables.

Substantiation: All wiring methods, including boxes, cabinets, cable trays should be identified for the use. Auxiliary gutters are not noted in the definition of raceway. "Nonconductive" optical fiber cables are not defined. There are no raceway fill tables in Chapter 3. Maximum fill requirements should apply to all types of optical fiber cables to prevent damage to electrical circuit conductors and the optical fiber cables.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-47, which clarifies that raceway fill tables do not apply to installations without electrical conductors. Damaged optical fiber cables are not an electrical shock or fire safety issue.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-47 Log #2083 NEC-P16 **Final Action: Accept in Principle**
(770.110)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise 770.110 as follows:
770.110 Raceways for Optical Fiber Cables.
(A) Types of Raceways.
Optical fiber cables shall be permitted to be installed in any raceway that complies with either (A)(1) or (A)(2).
(1) Chapter 3 Raceways. ~~Where~~ Optical fiber cables shall be permitted to be ~~are~~ installed in ~~a~~ any raceway, ~~the raceway shall be either of a type~~ included ~~permitted~~ in Chapter 3. The raceways shall be ~~and~~ installed in accordance with the requirements of Chapter 3.
(2) Other Permitted Raceways. ~~or~~ Optical fiber cables shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway selected in accordance with the provisions of ~~770.154~~ 770.113, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
(B) Raceway Fill for Optical Fiber Cables.
Raceway fill for optical fibers cables shall comply with either (B)(1) or (B)(2)
(1) Without Electric Light or Power Conductors. Where optical fiber cables are installed in raceway without electric light or power ~~current-carrying~~ conductors, the raceway fill ~~tables~~ requirements of Chapter 3 and Chapter 9 shall not apply.
(2) Nonconductive Optical Fiber Cables With Electric Light or Power Conductors. Where nonconductive optical fiber cables are installed with electric light or power conductors in a raceway, the raceway fill ~~tables~~ requirements of Chapter 3 and Chapter 9 shall apply.
Substantiation: This revision is both editorial and technical. The addition of the two first level subdivisions (A) Types of Raceways and (B) Raceway Fill for Optical Fiber Cables and their second level subdivisions provides more clarity and make the section as self-sufficient as possible. The deletion of word "tables" and replacing it with the word "requirements" is more appropriate as Chapter 3 has no raceway tables. However, Chapter 3 provides the raceway fill requirements which will direct the code user to Chapter 9 for the conduit fill tables. This proposal coordinates with the task group's proposal to move the cable and raceway installation requirements from 770.154 to 770.113.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.
Panel Meeting Action: Accept in Principle
Revise recommended 770.110 text as follows:
770.110 Raceways for Optical Fiber Cables.
(A) Types of Raceways.
Optical fiber cables shall be permitted to be installed in any raceway that complies with either (A)(1) or (A)(2).
(1) Chapter 3 Raceways. ~~Where~~ Optical fiber cables shall be permitted to be ~~are~~ installed in ~~a~~ any raceway, ~~the raceway shall be either of a type~~ included ~~permitted~~ in Chapter 3. The raceways shall be ~~and~~ installed in accordance with the requirements of Chapter 3.
(2) Other Permitted Raceways. ~~or~~ Optical fiber cables shall be permitted to be installed in listed plenum optical fiber raceway, listed plenum communications raceway, listed riser optical fiber raceway, listed riser communications raceway, listed general-purpose optical fiber raceway, or listed general purpose communications raceway selected in accordance with the provisions of ~~770.154~~ 770.113, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
(B) Raceway Fill for Optical Fiber Cables.
Raceway fill for optical fibers cables shall comply with either (B)(1) or (B)(2)
(1) Without Electric Light or Power Conductors. Where optical fiber cables are installed in raceway without electric light or power ~~current-carrying~~ conductors, the raceway fill ~~tables~~ requirements of Chapter 3 and Chapter 9 shall not apply.
(2) Nonconductive Optical Fiber Cables With Electric Light or Power Conductors. Where nonconductive optical fiber cables are installed with electric light or power conductors in a raceway, the raceway fill ~~tables~~ requirements of Chapter 3 and Chapter 9 shall apply.
Panel Statement: The panel added additional raceways for installation flexibility.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-48 Log #2084 NEC-P16 **Final Action: Accept in Principle**
(770.113)

TCC Action: The Technical Correlating Committee directs that this proposal be forwarded to Code-Making Panel 3 for comment.
Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Add new text to read as follows:
770.113 Installation of Optical Fiber Cables and Optical Fiber Raceways.
Installation of optical fiber cables and optical fiber raceways shall comply with 770.113 (A) through (H).
(A) Listing. Optical fiber cables installed in buildings shall be listed.
Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed.
(B) Air Ducts and Plenums. The following cables and raceways shall be permitted in air ducts and plenums, as described in 300.22(B):
(1) Types OFNP and OFCP
(2) Plenum optical fiber raceway installed in compliance with 770.110
(3) Types OFNP and OFCP installed in plenum optical fiber raceway
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(B).
(C) Other Spaces Used For Environmental Air. The following cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):
(1) Types OFNP and OFCP
(2) Plenum optical fiber raceway installed in compliance with 770.110
(3) Types OFNP and OFCP installed in plenum optical fiber raceway
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(C).
(D) Risers-Cables and Raceways in Vertical Runs. The following cables and raceways shall be permitted in vertical runs penetrating more than one floor and in vertical runs in a shaft:
(1) Types OFNP,OFCP, OFNR and OFCR
(2) Plenum and riser optical fiber raceways installed in compliance with 770.110
(3) Types OFNP, OFCP, OFNR and OFCR installed in plenum or riser optical fiber raceway.
FPN: See770.26 for firestop requirements for floor penetrations.
(E) Risers-Cables and Raceways in Metal Raceways, Fireproof Shafts and One- and Two-Family Dwellings. The following cables and raceways shall be permitted in metal raceway, in a fireproof shaft with firestops at each floor and in one- and two-family dwellings:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways installed in compliance with 770.110
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in plenum, riser or general-purpose optical fiber raceway
(4) Plenum, riser and general-purpose optical fiber raceways installed as innerduct in the metal raceway.
FPN: See770.26 for firestop requirements for floor penetrations.
(F) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways installed in compliance with 770.110
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in plenum, riser or general-purpose optical fiber raceway.
(G) Distributing Frames and Cross-Connect Arrays. The following wires and cables shall be permitted to be installed in distributing frames and cross-connect arrays:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC.
(H) Other Building Locations. The following cables and raceways shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (G):
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways installed in compliance with 770.110
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in plenum, riser or general-purpose optical fiber raceway
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in a raceway of a type included in Chapter 3.

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal moves those installation rules to section 770.113. The hazardous locations section was moved to 770.3.

Optical fiber cables are used in optical cross connect applications, but Section 770.154 currently does not have a distributing frame and cross connect section. A new section for distributing frames and cross connects was added. Adding this section also improves parallelism with Article 800. No new requirements were added since all listed optical fiber cables are permitted in these applications. Section 800.154(C)(2) explicitly permits communications cables to be installed in chapter 3 raceway. A similar explicit permission to use raceway for optical fiber cable in included in this proposal.

A companion proposal for section 770.154 greatly simplifies the statement of the applications of optical fiber cables and raceways by using a table.

This proposal and its companion proposal for section 770.154 need to be considered together as a package.

Panel Meeting Action: Accept in Principle

Revise 770.113 text to read as follows:

770.113 Installation of Optical Fiber Cables, Optical Fiber Raceways, and Cable Routing Assemblies. Installation of optical fiber cables, optical fiber raceways, and cable routing assemblies shall comply with 770.113 (A) through (I).

(A) Listing. Optical fiber cables, optical fiber raceways, and cable routing assemblies installed in buildings shall be listed.

Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted in ducts and plenums, as described in 300.22(B), if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Types OFNP and OFCP

(2) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in raceways that are installed in compliance with 300.22(B)

FPN: See 4.3.4 and 4.3.11.3.3 of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems*, for information on wire and cables in air ducts and apparatus casings plenums. See 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Types OFNP and OFCP

(2) Plenum optical fiber raceway installed in compliance with 770.110

(3) Types OFNP and OFCP installed in plenum optical fiber raceway or plenum communications raceway

(4) Types OFNP and OFCP supported by metallic cable trays or cable tray systems

(5) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in raceways that are installed in compliance with 300.22(C).

FPN: See 4.3.11.2, 4.3.11.4, and 4.3.11.5 of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems*, for information on wire, cables, and raceways in ceiling cavity, raised floor, and air-handling unit room plenums. See 3.3.22 for plenum definitions.

(D) Risers - Cables and Raceways in Vertical Runs. The following cables and raceways shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types OFNP, OFCP, OFNR, and OFCR

(2) Plenum and riser optical fiber raceways installed in compliance with 770.110 and listed riser cable routing assemblies

(3) Types OFNP, OFCP, OFNR, and OFCR installed in plenum optical fiber raceway, plenum communications raceway, riser optical fiber raceway, riser communications raceway or listed riser cable routing assemblies.

FPN: See 770.26 for firestop requirements for floor penetrations.

(E) Risers - Cables in Metal Raceways or Fireproof Shafts. Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted in metal raceways or in a fireproof shaft with firestops at each floor.

FPN: See 770.26 for firestop requirements for floor penetrations.

(F) Risers - One- and Two-Family Dwellings. The following cables and raceways shall be permitted in one- and two-family dwellings:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC

(2) Plenum, riser and general-purpose optical fiber raceways installed in compliance with 770.110

(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in plenum, riser, or general-purpose optical fiber raceway or plenum, riser or general-purpose communications raceway

(G) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC

(2) Plenum, riser, and general-purpose optical fiber raceways installed in compliance with 770.110

(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in plenum, riser, or general-purpose optical fiber raceway or plenum, riser, or general-purpose communications raceway

(H) Distributing Frames and Cross-Connect Arrays. Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC cables shall be permitted to be installed in distributing frames and cross-connect arrays.

(I) Other Building Locations. The following cables and raceways shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (H):

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC

(2) Plenum, riser, and general-purpose optical fiber raceways installed in compliance with 770.110

(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in plenum, riser, or general-purpose optical fiber raceway or plenum, riser, or general-purpose communications raceway or listed riser or general-purpose cable routing assembly

(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in a raceway of a type included in Chapter 3.

Panel Statement: See panel statement on Proposal 16-160.

The text is a combination of the text from Proposal 16-48, which has been modified to improve clarity, with text to incorporate panel actions to accept in principle Proposals 16-57 (cable routing assemblies), 16-59 (metallic cable tray), and 16-62 (requiring riser cable for penetration of one floor) and by modifications to correlate with NFPA 90A-2009.

The revised text relocates the wire, cable, and raceway installation rules from 770.154 and also includes installation rules from 770.110.

The panel recognizes that this proposal is a companion proposal to Proposal 16-56 and has considered them together.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

DORNA, G.:

This proposal is the first of a series of proposals prepared by the CMP 16 Special Editorial Task Group that were directed towards relocating installation requirements from the applications sections (770.154, 800.154, 820.154 and 830.154) to the installation sections (770.113, 800.113, 820.113 & 830.113) and simplifying the applications sections by utilizing a table of permitted and non-permitted applications. The panel also acted on other proposals (not from the task group) for changes to the applications sections, xxx.154, by taking accepting some in principle and integrating the actions into the installation sections xxx.113 and the new table in xxx.154. The maze of interlocking proposals is sufficiently complicated that a guide to the proposals should be useful. See the table on the next page.

Proposal	Sections	Purpose	Action
16-48 & 56	770.154 & 770.113	Remove installation rules from the applications section 770.154 and relocate them in the installations section 770.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications, permitting communications raceways to substitute for optical fiber raceways, and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-59 which permits metallic cable trays in plenums, 4) proposal 16-62 which simplifies the installation rules for risers and, 5) proposals 16-51, 52 & 57 which provide for the applications of cable routing assemblies.
16-160 & 172	800.154 & 800.113	Remove installation rules from the applications section 800.154 and relocate them in the installations section 800.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-175 which permits metallic cable trays in plenums, 4) proposal 16-179 which simplifies the installation rules for risers and, 5) proposals 16-165, 166 & 173 which provide for the applications of cable routing assemblies.
16-267 & 278	820.154 & 820.113	Remove installation rules from the applications section 820.154 and relocate them in the installations section 820.113. Simplify cable applications by using a table.	AIP by clarifying the permitted wire and cable applications, permitting communications raceways to be used in place of CATV raceways, and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts and only provides for optical fiber raceways and communications raceways, 2) proposal 16-289a which deleted the listing section for CATV raceways, 3) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 4) proposal 16-280 which permits metallic cable trays in plenums, 5) proposal 16-282 which simplifies the installation rules for risers, and 6) proposals 16-272 & 273 which provide for the application of cable routing assemblies.
16-331, 339	830.151, 830.154 & 830.113	Remove installation rules from the applications sections 830.151 & 830.154 and relocate them in the installations section 830.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-340 which permits metallic cable trays in plenums and, 4) proposals 16-338 & 341 which simplify the installation rules for risers.

The panel action on the revision of 770.113 changed the title and included several applications of cable routing assemblies, but a few applications were missed. Also the current text of 770.154(B)(2) permits all optical fiber cable types in fireproof shafts and metal raceways in shafts but it does not explicitly permit optical fiber raceways. If bare cables are permitted, then cables in optical fiber raceways should be also be permitted. Cable routing assemblies should be permitted in fireproof shafts, but are clearly not suitable for installation inside metal raceway. In order to accommodate both optical fiber raceways and cable routing assemblies, the riser section on metal raceways or fireproof shafts needs to be bifurcated. Repeated references to 770.110 can be replaced with a general requirement to install raceways in accordance with 770.110 and also 770.12.

The panel action text should be revised to read as follows:

770.113 Installation of Optical Fiber Cables, Raceways and Cable Routing Assemblies. Installation of optical fiber cables, raceways and cable routing assemblies shall comply with 770.113 (A) through (J). Installation of raceways shall also comply with 770.12 and 770.110.

(A) Listing. Optical fiber cables, raceways and cable routing assemblies installed in buildings shall be listed.

Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted in ducts and plenums, as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22m (4 ft) of Types OFNP and OFCP

(2) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(B).

FPN: See sections 4.3.4 & 4.3.11.3.3 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire and cables in air ducts and apparatus casings plenums. See section 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Types OFNP and OFCP

(2) Plenum optical fiber raceway

(3) Types OFNP and OFCP installed in plenum optical fiber raceway or plenum communications raceway

(4) Types OFNP and OFCP supported by metallic cable trays or cable tray systems

(5) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(C).

FPN: See sections 4.3.11.2, 4.3.11.4 & 4.3.11.5 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire, cables and raceways in ceiling cavity, raised floor and air-handling unit room plenums. See section 3.3.22 for plenum definitions.

(D) Risers-Cables, Raceways and Cable Routing Assemblies in Vertical Runs. The following cables, raceways and cable routing assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types OFNP, OFCP, OFNR and OFCR

(2) Plenum and riser optical fiber raceways

(3) Riser cable routing assemblies

(4) Types OFNP, OFCP, OFNR and OFCR installed in:

a) plenum optical fiber raceway

b) plenum communications raceway

c) riser optical fiber raceway

d) riser communications raceway

e) riser cable routing assembly

FPN: See770.26 for firestop requirements for floor penetrations.

(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway

FPN: See 770.26 for firestop requirements for floor penetrations.

(F) Risers-Cables, Raceways and Cable Routing Assemblies in Fireproof Shafts. . The following cables, raceways and cable routing assemblies shall be permitted to be installed in fireproof riser shafts having firestops at each floor:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

FPN: See 770.26 for firestop requirements for floor penetrations.

(G) Risers-One- and Two-Family Dwellings. The following cables, raceways and cable routing assemblies shall be permitted in one- and two-family dwellings:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

(H) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following cables, raceways and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser or general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

(J) Other Building Locations. The following cables, raceways and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (I):

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

IVANS, R.: We agree with the revision prepared by the CMP 16 Special Task Group.

This proposal is the first of a series of proposals prepared by the CMP 16 Special Editorial Task Group that were directed towards relocating installation requirements from the applications sections (770.154, 800.154, 820.154 and 830.154) to the installation sections (770.113, 800.113, 820.113 & 830.113) and simplifying the applications sections by utilizing a table of permitted and non-permitted applications. The panel also acted on other proposals (not from the task group) for changes to the applications sections, xxx.154, by taking accepting some in principle and integrating the actions into the installation sections xxx.113 and the new table in xxx.154. The maze of interlocking proposals is sufficiently complicated that a guide to the proposals should be useful. See table on the next page.

Proposal	Sections	Purpose	Action
16-48 & 56	770.154 & 770.113	Remove installation rules from the applications section 770.154 and relocate them in the installations section 770.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications, permitting communications raceways to substitute for optical fiber raceways, and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-59 which permits metallic cable trays in plenums, 4) proposal 16-62 which simplifies the installation rules for risers and, 5) proposals 16-51, 52 & 57 which provide for the applications of cable routing assemblies.
16-160 & 172	800.154 & 800.113	Remove installation rules from the applications section 800.154 and relocate them in the installations section 800.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-175 which permits metallic cable trays in plenums, 4) proposal 16-179 which simplifies the installation rules for risers and, 5) proposals 16-165, 166 & 173 which provide for the applications of cable routing assemblies.
16-267 & 278	820.154 & 820.113	Remove installation rules from the applications section 820.154 and relocate them in the installations section 820.113. Simplify cable applications by using a table.	AIP by clarifying the permitted wire and cable applications, permitting communications raceways to be used in place of CATV raceways, and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts and only provides for optical fiber raceways and communications raceways, 2) proposal 16-289a which deleted the listing section for CATV raceways, 3) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 4) proposal 16-280 which permits metallic cable trays in plenums, 5) proposal 16-282 which simplifies the installation rules for risers, and 6) proposals 16-272 & 273 which provide for the application of cable routing assemblies.
16-331, 339	830.151, 830.154 & 830.113	Remove installation rules from the applications sections 830.151 & 830.154 and relocate them in the installations section 830.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-340 which permits metallic cable trays in plenums and, 4) proposals 16-338 & 341 which simplify the installation rules for risers.

The panel action on the revision of 770.113 changed the title and included several applications of cable routing assemblies, but a few applications were missed. Also the current text of 770.154(B)(2) permits all optical fiber cable types in fireproof shafts and metal raceways in shafts but it does not explicitly permit optical fiber raceways. If bare cables are permitted, then cables in optical fiber raceways should be also be permitted. Cable routing assemblies should be permitted in fireproof shafts, but are clearly not suitable for installation inside metal raceway. In order to accommodate both optical fiber raceways and cable routing assemblies, the riser section on metal raceways or fireproof shafts needs to be bifurcated. Repeated references to 770.110 can be replaced with a general requirement to install raceways in accordance with 770.110 and also 770.12.

The panel action text should be revised to read as follows:

770.113 Installation of Optical Fiber Cables, Raceways and Cable Routing Assemblies. Installation of optical fiber cables, raceways and cable routing assemblies shall comply with 770.113 (A) through (J). Installation of raceways shall also comply with 770.12 and 770.110.

(A) Listing. Optical fiber cables, raceways and cable routing assemblies installed in buildings shall be listed.

Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted in ducts and plenums, as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22m (4 ft) of Types OFNP and OFCP

(2) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(B).

FPN: See sections 4.3.4 & 4.3.11.3.3 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire and cables in air ducts and apparatus casings plenums. See section 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Types OFNP and OFCP

(2) Plenum optical fiber raceway

(3) Types OFNP and OFCP installed in plenum optical fiber raceway or plenum communications raceway

(4) Types OFNP and OFCP supported by metallic cable trays or cable tray systems

(5) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(C).

FPN: See sections 4.3.11.2, 4.3.11.4 & 4.3.11.5 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire, cables and raceways in ceiling cavity, raised floor and air-handling unit room plenums. See section 3.3.22 for plenum definitions.

(D) Risers-Cables, Raceways and Cable Routing Assemblies in Vertical Runs. The following cables, raceways and cable routing assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types OFNP, OFCP, OFNR and OFCR

(2) Plenum and riser optical fiber raceways

(3) Riser cable routing assemblies

(4) Types OFNP, OFCP, OFNR and OFCR installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) riser cable routing assembly

FPN: See770.26 for firestop requirements for floor penetrations.

(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC

(2) Plenum, riser and general-purpose optical fiber raceways

(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway

FPN: See 770.26 for firestop requirements for floor penetrations.

(F) Risers-Cables, Raceways and Cable Routing Assemblies in Fireproof Shafts. . The following cables, raceways and cable routing assemblies shall be permitted to be installed in fireproof riser shafts having firestops at each floor:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC

(2) Plenum, riser and general-purpose optical fiber raceways

(3) Riser and general-purpose cable routing assemblies

(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

FPN: See 770.26 for firestop requirements for floor penetrations.

(G) Risers-One- and Two-Family Dwellings. The following cables, raceways and cable routing assemblies shall be permitted in one- and two-family dwellings:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
 a) plenum optical fiber raceway
 b) plenum communications raceway
 c) riser optical fiber raceway
 d) riser communications raceway
 e) general-purpose optical fiber raceway
 f) general-purpose communications raceway
 g) riser cable routing assembly
 h) general-purpose cable routing assembly

(H) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
 a) plenum optical fiber raceway
 b) plenum communications raceway
 c) riser optical fiber raceway
 d) riser communications raceway
 e) general-purpose optical fiber raceway
 f) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following cables, raceways and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser or general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
 a) plenum optical fiber raceway
 b) plenum communications raceway
 c) riser optical fiber raceway
 d) riser communications raceway
 e) general-purpose optical fiber raceway
 f) general-purpose communications raceway
 g) riser cable routing assembly
 h) general-purpose cable routing assembly

(J) Other Building Locations. The following cables, raceways and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (I):

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
 a) plenum optical fiber raceway
 b) plenum communications raceway
 c) riser optical fiber raceway
 d) riser communications raceway
 e) general-purpose optical fiber raceway
 f) general-purpose communications raceway
 g) riser cable routing assembly
 h) general-purpose cable routing assembly

16-49 Log #3094 NEC-P16 **Final Action: Reject**
(770.113)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
770.113 Listing Required. ~~Installation of Optical Fiber Cables.~~
Optical fiber cables installed in buildings shall be listed.
Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed.
Substantiation: The proposed title change more aptly describes the requirement, and it also gives a title that is not so similar to 770.133.
Panel Meeting Action: Reject
Panel Statement: Panel action on Proposal 16-48 revised this section so that the editorial change recommended by this proposal is no longer appropriate.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-50 Log #2462 NEC-P16 **Final Action: Reject**
(770.133(6))

Submitter: Joseph P. Savage, FIFTH Council North America
Recommendation: Add the following line to 770.133
(6) Premise-powered broadband communications circuits in compliance with Article 8XX.
Substantiation: A submission has been made for a new Article to Chapter 8. If this Article is accepted, then Article 770.133 should include the above added reference.
Panel Meeting Action: Reject
Panel Statement: The recommendation is redundant and not needed.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-51 Log #2085 NEC-P16 **Final Action: Accept in Principle in Part**
(770.133(B))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
(B) With Other Conductors. Optical fibers shall be permitted in the same cable, and conductive and nonconductive optical fiber cables shall be permitted in the same cable tray, enclosure, or raceway with conductors of any of the following:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725
(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760
(3) Communications circuits in compliance with Parts I and IV of Article 800
(4) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820
(5) Low-power network-powered broadband communications circuits in compliance with Parts I and IV of Article 830
Exception: Only Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables shall be permitted to be installed in plenum, riser and general-purpose optical fiber raceways.
Substantiation: This proposal is editorial and technical.
Section 770.154 restricts the applications of plenum, riser and general-purpose optical fiber raceways by permitting only listed optical fiber cables is thee raceways. Section 770.133(B) conflicts with the restrictions of 770.154.
The purpose of this proposal is to remove the conflict. It is also a companion proposal to a proposal to simplify the applications requirements in 770.154 by replacing the text with a table.
The word "other" was struck from the title because there are no conductors in optical fiber cables.
The NEC Style Manual states:
4.1.1 References to a Part Within an Article. References shall not be made to an entire article, such as "grounded in accordance with Article 250" unless additional conditions are specified. References to parts within articles shall be permitted.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept in Principle in Part
Revise recommended text as follows:
(B) With Other Conductors. Optical fibers shall be permitted in the same cable, and conductive and nonconductive optical fiber cables shall be permitted in the same cable tray, enclosure, ~~or~~ raceway or cable routing assembly with conductors of any of the following:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725
(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760
(3) Communications circuits in compliance with Parts I and IV of Article 800
(4) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820
(5) Low-power network-powered broadband communications circuits in compliance with Parts I and IV of Article 830.
Panel Statement: The addition of cable routing assemblies meets the intent of the submitter of Proposal 16-52. The new exception has been deleted because of panel action on other proposals to consolidate the types of raceways. See panel proposal 16-289a.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

Comment on Affirmative:

OHDE, H.: We believe that the second sentence of the panel statement should read as follows: The new exception has been deleted because of the panel action on other proposals to consolidate the type of raceways and support systems.

Cable Tray and routing assemblies are not raceways and it should not be insinuated that they are to avoid misinterpretation where the word raceway is used in other places in Chapter 8.

16-52 Log #2263 NEC-P16 **Final Action: Accept in Principle**
(770.133(B))

Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise text to read as follows:

(B) With Other Conductors. Optical fibers shall be permitted in the same cable, and conductive and nonconductive optical fiber cables shall be permitted in the same cable tray, enclosure, ~~or~~ raceway or optical fiber/communications cable routing assembly, with conductors of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725

(2) Power-limited fire alarm systems in compliance with Article 760

(3) Communications circuits in compliance with Article 800

(4) Community antenna television and radio distribution systems in compliance with Article 820

(5) Low-power network-powered broadband communications circuits in compliance with Article 830

Substantiation: Article 770 currently covers optical fiber raceways and provides listing requirements for plenum, riser and general-purpose versions. UL lists these raceways to UL 2024, *Optical Fiber and Communication Cable Raceway.* UL lists optical fiber routing assemblies to UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies.* Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.) UL 2024a provides for the listing of plenum, riser and general-purpose routing assemblies with the same fire testing requirements as UL 2024.

The significant difference between optical fiber routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.

We have submitted companion proposals to provide for a change of the scope of this article to include routing assemblies and to provide listing requirements for optical fiber routing assemblies.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-51.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-53 Log #1466 NEC-P16 **Final Action: Reject**
(770.133(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

~~Raceways shall be used for their intended purpose~~. Optical fiber cables shall not be strapped, taped, or attached by any means to the exterior of any ~~conduit,~~ raceway, cable, or conductor as a means of support, except a raceway mast shall be permitted to support aerial cables.

Substantiation: Edit. The first sentence is superfluous; covered by the second sentence. Cables and individual conductors should be included.
Panel Meeting Action: Reject
Panel Statement: The panel does not see this as an editorial improvement. The current code text has sufficient clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-54 Log #2283 NEC-P16 **Final Action: Reject**
(770.135 (New))

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Add a new Section to read as follows:

770.135 Optical Fiber Device and Equipment Mounting. Optical Fiber devices or equipment shall be mounted in listed boxes, brackets or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place. Boxes or brackets can be completely enclosed or backless.

(A) Optical Fiber Devices and Equipment Mounted to Boxes or Brackets. Optical Fiber devices or equipment shall be mounted to a listed boxes or bracket and installed per 314.20.

(B) Optical Fiber Devices and Equipment Mounted on Covers. Optical Fiber device and equipment mounted to and supported by a cover shall be held rigidly against the cover which is mounted to the box or bracket.

Substantiation: This proposal adds a new section to Article 770 addressing the mounting of devices or equipment to listed boxes and brackets. Currently, depending on the quality of workmanship, Optical Fiber devices or equipment have not been mounted to boxes or brackets that can support them. After several years device and/or covers that are mounted directly to the dry wall will become hazard because they have become loose and exposed. Conductive Optical Fiber cable can become energized by coming in incidental contact with electrical conductors.

770.135 was only a suggestion for the location of this new section. (A) addresses devices mounted directly to boxes or devices where as (B) address devices mounted to covers.

Panel Meeting Action: Reject
Panel Statement: The proposed recommendation is outside the scope of Article 770.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

IVANS, R.: The scope of 770 states: “The provisions of this article apply to the installation of optical fiber cables and raceways.”
Boxes are clearly part of the installation of such cables. Loose and exposed optical fiber cable or connectors can pose a laser radiation hazard. There are boxes and brackets listed for this purpose using UL Subject 2269, “Outline of Investigation for Optical Fiber/Communications/Signaling/Coaxial Cable Outlet Boxes.”

16-55 Log #1467 NEC-P16 **Final Action: Reject**
(770.153(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In the second paragraph, add: “enclosures” after “cable tray”.
Substantiation: Edit. Enclosures such as cabinets should be included as in the third and fourth paragraphs.
Panel Meeting Action: Reject
Panel Statement: The submitter has not indicated the location of the proposed text. 770.153 is not a correct code reference. The panel notes the second paragraph of 770.133(A) contains two possible locations for insertion of the text. The submitter has not supplied technical substantiation to support this proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-56 Log #2086 NEC-P16 **Final Action: Accept in Principle**
(770.154)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:

~~**770.154 Applications of Listed Optical Fiber Cables and Raceways.**~~
~~Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through (D) and 770.154(F), or where cable substitutions are made as shown in 770.154(E).~~

~~**(A) Plenums.** Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type OFNP and OFCP cables shall be permitted to be installed in these raceways.~~

~~**(B) Riser.** Cables installed in risers shall be as described in any of (B)(1), (B)(2), or (B)(3).~~

~~**(1)** Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use. Listed riser optical fiber raceways and listed plenum optical fiber raceways shall also be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type OFNP, OFCP, OFNR, and OFCR cables shall be permitted to be installed in these raceways.~~

~~**(2)** Metal Raceways or Fireproof Shafts. Type OFNG, OFN, OFCG, and OFC cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.~~

~~**(3)** One- and Two-Family Dwellings. Type OFNG, OFN, OFCG, and OFC cables shall be permitted in one- and two-family dwellings.~~

~~FPN: See 300.21 for firestop requirements for floor penetrations.~~

~~**(C) Other Cabling Within Buildings.** Cables installed in building locations other than the locations covered in 770.154(A) and (B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways, listed riser optical fiber raceways, and listed plenum optical fiber raceways.~~

~~(D) **Cable Trays.** Optical fiber cables of the types listed in Table 770.179 shall be permitted to be installed in cable trays.~~

~~FPN: It is not the intent to require that these optical fiber cables be listed specifically for use in cable trays.~~

~~**(E) Cable Substitutions.** The substitutions for optical fiber cables listed in Table 770.154(E) and illustrated in Figure 770.154(E) shall be permitted.~~

~~**(F) Hazardous (Classified) Locations.** Cables installed in hazardous (classified) locations shall be any type indicated in Table 770.154(E). Cables shall be sealed in accordance with the requirements of 501.15, 502.15, 505.16, or 506.~~

770.154 Applications of Listed Optical Fiber Cables and Raceways.
Permitted and non-permitted applications of listed optical fiber cables and raceways shall be as indicated in Table 770.154(A). The substitutions for optical fiber cables listed in Table 770.154(B) and illustrated in Figure 770.154(B) shall be permitted

Table 770.154(A), Applications of Optical Fiber Cables and Raceways

Cable or Raceway Type	Applications									
	In air ducts and plenums as described in 300.22(B)	In other spaces used for environmental air as described in 300.22(C)	In risers	In building locations other than air ducts, plenums, other spaces used for environmental air and risers	In cable trays	In hazardous locations	In any raceway in Chapter 3	In plenum optical fiber raceways	In riser optical fiber raceways	In general-purpose optical fiber raceways
OFNP, OFCP	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
OFNR, OFCR	N	N	Y	Y	Y	Y	Y	Y	Y	Y
OFNG, OFCG, OFN, OFC	N	N	Y	Y	Y	Y	Y	Y	Y	Y
Plenum Optical Fiber Raceways	Y	Y	Y	Y	Y		Y	-	-	-
Riser Optical Fiber Raceways	N	N	Y	Y	Y		Y	-	-	-
General-Purpose Optical Fiber Raceways	N	N	N	Y	Y		Y	-	-	-

Note. Applications indicated by "Y" shall be permitted. Applications indicated by an "N" shall not be permitted. Applications with a "–"are not addressed.

(Renumber Table 770.154(E) and Figure 770.154(E) to Table 770.154(B) and Figure 770.154(B) and insert them here.)

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 770, 800,820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal for section 770.154 greatly simplifies the statement of the applications of optical fiber cables and raceways by using a table where the permitted applications are indicated by a "Y" and the applications that are not permitted are indicted by an "N". A companion proposal moves the installation rules to section 770.113 Installation Of Optical Fiber Cables. The hazardous locations section was moved to 770.3.

This proposal makes no changes to the existing permitted and not permitted applications of optical fiber cables and raceways.

This proposal and its companion proposal for section 770.113 need to be considered together as a package.

This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept in Principle

Revise 770.154 text and replace in entirety as follows:

770.154 Applications of Listed Optical Fiber Cables and Raceways. Permitted and non-permitted applications of listed optical fiber cables and raceways shall be as indicated in Table 770.154(A). The permitted applications are subject to the installation rules of 770.113. The substitutions for optical fiber cables listed in Table 770.154(B) and illustrated in Figure 770.154 shall be permitted.

Table 770.154(A), Applications of Optical Fiber Cables and Raceways

Cable or Raceway Type	Applications: In fabricated ducts and plenums as described in 300.22(B)	In other spaces used for environmental air (plenums) as described in 300.22(C)	In risers in vertical runs	In risers in metal raceways or fire-proof shafts	In risers in one- and two-family dwellings	In building locations other than fabricated ducts and plenums, other spaces used for environmental air (plenums), risers distributing frames and cross connect arrays	In cable trays	In distributing frames and cross connect arrays	In hazardous locations in accordance with Chapter 5	In any raceway in Chapter 3	In plenum optical fiber and communications raceways	In riser optical fiber and communications raceways	In general-purpose optical fiber and communications raceways
OFNP, OFCP	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
OFNR, OFCR	N	N	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
OFNG, OFCG, OFN, OFC	N	N	Y	N	Y	Y	Y	Y	Y	Y	Y	Y	Y
Plenum Optical Fiber Raceways	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y			
Riser Optical Fiber Raceways	N	N	Y	Y	Y	Y	Y	Y	Y	Y

General-Purpose Cable Routing Assemblies	N	N	N	N	N	Y	N	Y	Y	N	N	N	N

Note: An 'N' in the table indicates that the cable type shall not be permitted to be installed in the application. A 'Y' indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 770.113.

(Renumber Table 770.154(E) and Figure 770.154(E) to Table 770.154(B) and Figure 770.154 and insert them here.)

16-56 Meeting Action

Panel Statement: See panel statement in Proposals 16-160 and 16-172.
The table is a combination of the table from proposal 16-48, which has been modified to improve clarity, with entries to incorporate panel actions to accept in principle Proposals 16-57 (cable routing assemblies), 16-59 (metallic cable tray), and 16-62 (requiring riser cable for penetration of one floor) and by modifications to correlate with NFPA 90A-2009.

The panel recognizes that this proposal is a companion proposal to Proposal 16-48 and has considered them together.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

DORNA, G.: The title of new Table 770.154 should contain the word "listed" to correlate with the title of the section.

The revised 770.154 should appear as shown below:

770.154 Applications of Listed Optical Fiber Cables, Raceways and Cable Routing Assemblies. Permitted and non-permitted applications of listed optical fiber cables, raceways and cable routing assembly type shall be as indicated in Table 770.154(A). The permitted applications are subject to the installation rules of 770.110 and 770.113. The substitutions for optical fiber cables listed in Table 770.154(B) and illustrated in Figure 770.154 shall be permitted.

See Table 770.154(A) on page 1062

(Renumber Table 770.154(E) and Figure 770.154(E) to Table 770.154(B) and Figure 770.154 and insert them here.)

Table 770.154(A), Applications of Listed Optical Fiber Cables, Raceways and Cable Routing Assemblies

Cable, Raceway and Cable Routing Assembly Types	Applications: In Air-Handling Spaces		In Risers				Within Buildings In Other Than Air-Handling Spaces and Risers						
	In fabricated ducts and plenums as described in 300.22(B)	In other spaces used for environmental air (plenums) as described in 300.22(C)	In vertical runs	In metal raceways	In fireproof shafts	In one- and two-family dwellings	General	In cable trays	In distributing frames and cross connect arrays	In any raceway in Chapter 3	In plenum optical fiber and communications raceways	In riser optical fiber and communications raceways and riser cable routing assemblies	In general-purpose optical fiber and communications raceways and general-purpose cable routing assemblies
OFNP, OFCP	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
OFNR, OFCR	N	N	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
OFNG, OFCG, OFN, OFC	N	N	N	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
Plenum Optical Fiber Raceways	N	Y	Y	Y	Y	Y	Y	Y	Y	Y			
Riser Optical Fiber Raceways	N	N	Y	Y	Y	Y	Y	Y	Y	Y			
General-Purpose Optical Fiber Raceways	N	N	N	Y	Y	Y	Y	Y	Y	Y			
Riser Cable Routing Assemblies	N	N	Y	N	Y	Y	Y	N	Y	N	N	N	N
General-Purpose Cable Routing Assemblies	N	N	N	N	Y	Y	Y	N	Y	N	N	N	N

Note: An 'N' in the table indicates that the cable, raceway or cable routing assembly type shall not be permitted to be installed in the application. A 'Y' indicates that the cable, raceway or cable routing assembly type shall be permitted to be installed in the application, subject to the limitations described in 770.110 and 770.113.

Dorna BE (16-56 Log #2086)

IVANS, R.: See my comment on proposal 16-48.

There are multiple changes that could be made to improve the clarity of the new Table 770.154(A).

The applications could be grouped in 1) in air-handling spaces, 2) in risers and 3) in all other spaces.

The column for hazardous locations should be deleted to correlate with the panel action of proposal 16-16 which moved the hazardous locations requirements to 770.3. This move makes Article 770 parallel to articles 800 and 820.

NFPA 90A does not permit nonmetallic raceway in air ducts so the permitted use of plenum optical fiber raceway in 300.22(B) space must be changed to a "N".

The column "In risers in metal raceways or fireproof shafts" should be split into two columns because the permitted wiring methods in a raceway differ from the permitted wiring methods in a fireproof shaft. Obviously cable routing assemblies can be used in a fireproof shaft but not inside a raceway.

The titles of the table, the first column and the last two columns need to be modified to add cable routing assemblies to correlate with the panel actions on proposal 16-48.

The panel action permitted general-purpose cable in a riser in a vertical run. This should be changed to an "N" to correlate with the panel action of proposals 16-48 & 16-62.

The column "In building locations other than fabricated ducts and plenums, other spaces used for environmental air (plenums), risers distributing frames and cross connect arrays" can simply be replaced with "General" to correlate with the titles of 800.154(C)(1) and, 820.154(C)(1).

The title of new Table 770.154 should contain the word "listed" to correlate with the title of the section.

The revised 770.154 should appear as shown below:

See Table 770.154(A) on page 1064

770.154 Applications of Listed Optical Fiber Cables, Raceways and Cable Routing Assemblies. Permitted and non-permitted applications of listed optical fiber cables, raceways and cable routing assembly type shall be as indicated in Table 770.154(A). The permitted applications are subject to the installation rules of 770.110 and 770.113. The substitutions for optical fiber cables listed in <u>Table 770.154(B)</u> and illustrated in <u>Figure 770.154</u> shall be permitted.

We have an additional recommendation for a reformatted table structure for table 770.154(A) (technical content unchanged)

See Table 770.154(A) on page 1065

(Renumber Table 770.154(E) and Figure 770.154(E) to Table 770.154(B) and Figure 770.154 and insert them here.)

16-57 Log #2264 NEC-P16 **Final Action: Accept in Principle**
(770.154)

Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise text to read as follows:

770.154 Applications of Listed Optical Fiber Cables<u>,</u> ~~and~~ Raceways <u>and Optical Fiber/Communications Cable Routing Assemblies</u>.
Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through (D) and 770.154(F), or where cable substitutions are made as shown in 770.154(E).
(A) Plenums. (No change in text.)
(B) Riser. Cables installed in risers shall be as described in any of (B)(1), (B)(2), or (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use. Listed riser optical fiber raceways and listed plenum optical fiber raceways shall also be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type OFNP, OFCP, OFNR, and OFCR cables shall be permitted to be installed in these raceways. <u>Listed riser optical fiber/communications cable routing assemblies shall be permitted to be installed in risers.</u>

(2) Metal Raceways or Fireproof Shafts. (No change in text.)

(3) One- and Two-Family Dwellings. (No change in text.)

(C) Other Cabling Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and (B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways, listed riser optical fiber raceways, and listed plenum optical fiber raceways. <u>Listed riser and general-purpose optical fiber/communications cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 770.154(A) and (B).</u>
(No change in text to (D) and (E).)

Substantiation: Article 770 currently covers optical fiber raceways and provides applications and listing requirements for these raceways. UL lists these raceways to UL 2024, *Optical Fiber and Communication Cable Raceway.* UL lists optical fiber /communications cable routing assemblies to UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies.* Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.)

The significant difference between optical fiber /communications cable routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.

We have submitted companion proposals to provide for a change of the scope of this article to include optical fiber /communications cable routing assemblies and to provide listing requirements for these assemblies.

This proposal provides applications for the routing assemblies that are identical to those for riser and general-purpose optical fiber raceway. A plenum grade routing assembly is not being proposed because it is not currently recognized in NFPA 90A which has primary responsibility for combustibles in plenums.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-48.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-58 Log #117 NEC-P16 **Final Action: Accept**
(770.154(A))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Delete the second sentence.
~~Abandoned cables shall not be permitted to remain.~~
Substantiation: Section 770.25 requires that "The accessible portion of abandoned optical fiber cables shall be removed." The requirement in to remove all abandoned cables in 770.154(A) is an error from the 1999 NEC that the panel tried to correct in the last code cycle.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-59 Log #128 NEC-P16 **Final Action: Accept in Principle**
(770.154(A))

Submitter: Gerald Lee Dorna, Belden
Recommendation: Add the following text at the end of 770.154(A):
<u>Metallic cable trays and metallic cable tray systems shall be permitted to be installed in other spaces used for environmental air. Types OFNP and OFCP cables, and plenum optical fiber raceways shall be permitted to be installed in these cable trays and cable tray systems. Types OFNR, OFCR, OFNG, OFCG, OFN and OFC cables, riser and general-purpose optical fiber raceways shall not be permitted to be installed in these cable trays and cable tray systems.</u>
Substantiation: Article 392, Cable Trays, has requirements for cable trays in air handling spaces in section 392.4.
392.4 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

Section 300.22 has provisions for cable trays in 300.22(C), Other Space Used For Environmental Air.
(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.
Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.
(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.

Section 300.22(C)(1) permits only solid bottom metal cable tray with solid metal covers. Optical fiber, communications, CATV, signaling and fire-alarm plenum cables, and plenum raceways are often installed in metal cable trays and metal cable tray systems in plenums (other spaces used for environmental air). These installations are "neat and workmanlike" and safe. They should be permitted.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-48.

Ivans BE (16-56 Log #2086)

16-60 Log #4544 NEC-P16 **Final Action: Accept**
(770.154(A))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
770.154 Applications of Listed Optical Fiber Cables and Raceways.
Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through (D) and 770.154(F), or where cable substitutions are made as shown in 770.154(E).
(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. ~~Abandoned cables shall not be permitted to remain.~~ Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type OFNP and OFCP cables shall be permitted to be installed in these raceways.
Substantiation: The text proposed for deletion is duplicative of the text in section 770.25 and potentially in conflict with it.
For information, see section 770.25:
770.25 Abandoned Cables.
The accessible portion of abandoned optical fiber cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-61 Log #1465 NEC-P16 **Final Action: Reject**
(770.154(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text to read as follows:
Cables shall be supported by approved methods at the top and at intervals necessary to prevent strain on the cables.
Substantiation: Provisions should be required to prevent strain on the cables and possible damage.
Panel Meeting Action: Reject
Panel Statement: The recommendation is vague and unenforceable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-62 Log #2210 NEC-P16 **Final Action: Accept in Principle**
(770.154(B)(1))

Submitter: Robert W. Jensen, dbi / Rep. BICSI
Recommendation: Revise text as follows:
Cables installed in vertical runs and penetrating <u>one or more floors</u> ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use. Listed riser optical fiber raceways and listed plenum optical fiber raceways shall also be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type OFNP, OFCP, OFNR, and OFCR cables shall be permitted to be installed in these raceways.
Substantiation: Is it really our intention that cables passing between floors through a floor penetration be less than riser rated?
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-48.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DORNA, G.: The current riser requirements are so complicated that they could be considered to be a “vague and unenforceable”.
Section 770.154(B)(1) requires that “Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use”. Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.
The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.

16-63 Log #2227 NEC-P16 **Final Action: Accept in Principle**
(770.154(F))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 14 for comment.
Submitter: Paul Guidry, Fluor Enterprises, Inc
Recommendation: Add new text:
<u>Blown fiber systems shall be considered a conduit system for the purposes of sealing in classified areas and must be sealed with a listed fitting.</u>
Substantiation: The issue of blown fiber systems being used in hazardous areas continues to be a problem with manufacturer’s trying to get customers to use the blown fiber system in hazardous locations without proper sealing. Many petrochemical plants have been using this system already without proper sealing methods being used which I believe to be a hazard since gases and vapors can pass freely through the tubes. The blown fiber manufacturers like to say that their system is neither a conduit or a cable, but a cable tube system and, therefore, doesn’t have to be sealed. There isn’t a listed seal on the market for these systems and until the manufacturers are convinced that the sealing method needs to be listed, they won’t spend the effort to acquire the listing. I believe the tube is more of a conduit system than a cable and adding the text will clarify that the sealing method must be listed the same as required in 501.15(C)(1) for conduits.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-16. The panel notes that cable tube systems are listed as raceways.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-64 Log #4000 NEC-P16 **Final Action: Reject**
(770.154(H) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 770.154(H).
<u>(H) Cables With Suffix Markings. Nonconductive and conductive optical fiber cables with single or multiple suffix markings shall be permitted where required to meet special applications.</u>
<u>(1) Cables for Dry, Damp, or Wet Locations. Nonconductive and conductive optical fiber cables installed in dry, damp, or wet locations shall be marked in accordance with 770.179.(E).</u>
<u>(2) Cables Exposed to Direct Sunlight. Nonconductive and conductive optical fiber cables installed exposed to direct sunlight shall be marked in accordance with 770.179(F).</u>
<u>(3) Cables in Corrosive Locations. Nonconductive and conductive optical fiber cables installed in corrosive locations shall be marked in accordance with 770.179(H).</u>
<u>(4) Very-Low-Smoke Producing Cables. Nonconductive and conductive optical fiber very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be marked in accordance with 770.179(I).</u>
<u>(5) Fire Hazard Cables. Nonconductive and conductive optical fiber fire hazard cables installed to provide low flame spread, very-low-smoke, and known potential heat release shall be marked in accordance with 770.179(J).</u>
Substantiation: This proposal permits cables identified in 770.154(A), (B), and (C) to have suffix markings.
This proposal establishes 770.154(G) for cables with suffixes for installation in locations requiring special cable characteristics.
Panel Meeting Action: Reject
Panel Statement: 770.154, Applications of Listed Optical Fiber Cables and Raceways, provides information as to where a particular cable can be installed. This proposal does not provide any applications or installation requirements for any of the proposed cables.
All of the suggested changes are dealing with suffix markings, which would be more appropriately addressed in 770.179, Listing Requirements Optical Fiber Cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-65 Log #4001 NEC-P16 **Final Action: Reject**
(770.179)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add text to the first paragraph of 770.179.

770.179(A) through 770.179(D) do not change.

770.179 Optical Fiber Cables.

Optical fiber cables shall be listed in accordance with 770.179(A) through (D) and shall be marked in accordance with Table 770.179 and shall be permitted to have suffix markings in accordance with 770.179(E) through (J).
Substantiation: This change is editorial to permit the new suffixes proposed for 770.179(E) through (J).

Optical fiber cables are sometimes used in systems covered by Articles 725 and 760, replacing copper conductors. It is important that optical fiber cables have the same listing requirements and suffixes as permitted for cables in Articles 725 and 760.
Panel Meeting Action: Reject
Panel Statement: Articles 725 and 760 do not have any applications or installation requirements or allowances for suffix markings, that are not also currently addressed for Article 770 cables.
770.154, Applications of Listed Optical Fiber Cables and Raceways, does not contain any application for the newly proposed cable listing suffixes. This proposal does not provide any applications or installation requirements for the newly proposed cable listing suffixes. Adding listing requirements without application or installation requirements is not in keeping with the 2003 NEC Style Manual Section 1.3, Regulatory Adoption, which states "Because the National Electrical Code is intended to be suitable for adoption as a regulatory document, it is important that it contain clearly stated mandatory requirements in the Code text."
Number Eligible to Vote: 16

(770.179(E))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 770.179(E)
(E) Cables in Dry, Damp, or Wet Locations. Nonconductive and conductive optical fiber cables specified in 770.154(A), (B), and (C) shall be listed for installation in dry, damp, or wet locations, or shall have a moisture-impervious metal sheath, and shall be marked with a suffix as required in 770.179(E)(a), (b), or (c).
(a) Cables installed in dry location shall not be required to have an additional suffix marking.
(b) Cables suitable for installation in damp locations shall be identified with the suffix "-DAMP". Conductors and cables listed for damp locations shall be suitable for installation in dry locations.
FPN: One method of defining suitability for installation in damp locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
(c) Cables suitable for installation in wet locations shall be identified with the suffix "-WET". Conductors and cables listed for damp locations shall be suitable for installation in dry or damp locations.
FPN: One method of defining suitability for installation in wet locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies which cables are suitable for dry, damp, or wet locations. Cables suitable for installation in dry locations that are installed in damp or wet locations have the potential to cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: 770.154, Applications of Listed Optical Fiber Cables and Raceways, does not contain any application for the newly proposed cable listing suffixes. This proposal does not provide any applications or installation

requirements for the newly proposed cable listing suffixes. Adding listing requirements without application or installation requirements is not in keeping with the 2003 NEC Style Manual Section 1.3, Regulatory Adoption, which states "Because the National Electrical Code is intended to be suitable for adoption as a regulatory document, it is important that it contain clearly stated mandatory requirements in the Code text."

(770.179(E) (New))

Submitter: Edward Walton, Draka Cableteq, USA
Recommendation: Add new text as follows:
770.179(E) Fiber Optic Circuit Integrity (CI) Cables. Cables suitable for use in systems to ensure survivability of critical circuits and pathways during a specified time under fire conditions shall be additionally listed as circuit integrity (CI) cable. Cables identified in 770.179(A) through (D) that meet the requirements for circuit integrity shall have the additional classification using the suffix "CI."
FPN: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-2001, Standard for Tests of Fire Resistive Cables.
Substantiation: To comply with the latest changes in NFPA 72, Chapter 12 "Emergency Communications Systems" and Chapter 13 "Pathway Survivability".
Panel Meeting Action: Reject
Panel Statement: 770.154, Applications of Listed Optical Fiber Cables and Raceways, does not contain any application for the newly proposed cable listing suffixes. This proposal does not provide any applications or installation requirements for the newly proposed cable listing suffixes. Adding listing requirements without application or installation requirements is not in keeping with the 2003 NEC Style Manual Section 1.3, Regulatory Adoption, which states "Because the National Electrical Code is intended to be suitable for adoption as a regulatory document, it is important that it contain clearly stated mandatory requirements in the Code text."
The submitter's substantiation is referring to sections of NFPA 72 that have not been adopted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-78 Log #3997 NEC-P16 **Final Action: Reject**
(770.179(F))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 770.179(F)
(F) Cables Exposed to Direct Sunlight. Nonconductive and conductive optical fiber cables installed exposed to direct sunlight shall be listed as sunlight resistant cable. Cables specified in 770.154(A), (B), and (C), and used for installations exposed to direct sunlight shall have the additional classification using the suffix "-SR".
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies cables as being suitable for installation exposed to direct sunlight. Cables that are not listed for exposure to direct sunlight and are installed exposed to direct sunlight have the potential to cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-76. The submitter's substantiation that cables are not marked for exposure to direct sunlight is incorrect. There are cables marked as suitable for installation in direct sunlight.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-79 Log #3998 NEC-P16 **Final Action: Reject**
(770.179(G))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 800.179(G)
(G) Cable Temperature Ratings. Nonconductive and conductive optical fiber cables shall be listed for a temperature rating of not less than 60ºC (140ºF). Communications cables shall be permitted to have an additional temperature rating for the lowest permitted temperature.
Substantiation: Cables may be installed in areas where the temperature exceeds the 60ºC (140ºF) rating, which is not marked on the cable. For example, cable installed in conduit on a rooftop could have a temperature internal to the conduit in excess of 160 ºF.
Additionally, cables may be installed in cold areas (e.g., walk-in freezer), so an indication of the minimum permitted temperature is important.
There is a companion proposal to add temperature marking requirements.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-76.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

Comment on Affirmative:
BRUNSSEN, J.: There is no correlation between this proposal and the Panel Meeting Action on Proposal 16-76. The Panel Statement should read: "The proposal references communications cables which is inappropriate for Article 770."

16-80 Log #3994 NEC-P16 **Final Action: Reject**
(770.179(H))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 770.179(H)
(H) Cables Installed in Corrosive Locations. Nonconductive and conductive optical fiber cables installed in corrosive locations shall be listed as suitable for corrosive locations. Cables specified in 770.154(A), (B), and (C), and used for installation in corrosive locations shall have the additional classification using the following suffixes: "-PR" for oil resistant, and "-GR" for gasoline and oil resistant.
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies which cables as being suitable for installation in corrosive locations. Corrosive locations have the potential to degrade cable insulation and cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-76.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-81 Log #3999 NEC-P16 **Final Action: Reject**
(770.179(I))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add the following new text:
(I) Very-Low-Smoke Producing Cables. Nonconductive and conductive optical fiber cables used to provide very-low-smoke producing characteristics shall be listed as very-low-smoke producing (50) and shall be listed as having low flame spread characteristics and very-low-smoke producing characteristics. Cables specified in 770.154(A), (B), and (C) shall have the additional classification using the suffix "-50".
FPN: One method of defining a very-low-smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with UL 723, *"Test for Surface Burning Characteristics of Building Materials"* with the cable unslit (intact) and cut through to expose the cable core.
Substantiation: This proposal establishes a listing and marking for cable for installation where minimal smoke generations is required. This cable meets the requirement for installation in concealed spaces that permit a maximum flame spread index of 25 and a maximum smoke developed index of 50. The proposed cable has low flame spread characteristics and very-low-smoke-producing characteristics. Presently, a number of manufacturers have cables listed as meeting the proposed requirements, but do not have a unique marking permitted by the NEC.
The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-76.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-82 Log #2265 NEC-P16 **Final Action: Accept in Principle**
(770.182)

Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise text to read as follows:
770.182 Optical Fiber Raceways and Optical Fiber/Communications Cable Routing Assemblies.
Optical fiber raceways and optical fiber/communications cable routing assemblies shall be listed in accordance with 770.182(B) through (C).
(A) Plenum Optical Fiber Raceway. (Text unchanged).
(B) Riser Optical Fiber Raceways and Optical Fiber/Communications Cable Routing Assemblies. Riser optical fiber raceways and riser optical fiber/communications cable routing assemblies shall be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.
FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, *Standard for Optical Fiber Cable Raceway*, or UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies as applicable.*
(C) General-Purpose Optical Fiber Cable Raceways and Optical Fiber/Communications Cable Routing Assemblies. General-purpose optical fiber cable raceways and optical fiber/communications cable routing assemblies shall be listed as being resistant to the spread of fire.

FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, *Standard for Optical Fiber Cable Raceway*, or UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies as applicable.*

Substantiation: Article 770 currently covers optical fiber raceways and provides applications and listing requirements for these raceways. UL lists these raceways to UL 2024, *Optical Fiber and Communication Cable Raceway.* UL lists optical fiber /communications cable routing assemblies to UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies.* Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.)

The significant difference between optical fiber /communications cable routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.

We have submitted companion proposals to provide for a change of the scope of this article to include optical fiber /communications cable routing assemblies and to provide appropriate applications of optical fiber routing assemblies.

A plenum grade routing assembly is not being proposed because it is not currently recognized in NFPA 90A which has primary responsibility for combustibles in plenums.

Panel Meeting Action: Accept in Principle

Revise recommended text to read as follows:

770.182 Optical Fiber Raceways and Cable Routing Assemblies. Optical fiber raceways and cable routing assemblies shall be listed in accordance with 770.182(A) through (C).

(A) Plenum Optical Fiber Raceway. (Text unchanged).

(B) Riser Optical Fiber Raceways and Cable Routing Assemblies. Riser optical fiber raceways and riser cable routing assemblies shall be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for flame propagation (riser) in UL 2024, *Standard for Optical Fiber Cable Raceway*, or UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies as applicable.*

(C) General-Purpose Optical Fiber Cable Raceways and Cable Routing Assemblies. General-purpose optical fiber cable raceways and cable routing assemblies shall be listed as being resistant to the spread of fire.

FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the vertical-tray flame test (general use) in UL 2024, *Standard for Optical Fiber Cable Raceway*, or UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies as applicable.*

Panel Statement: The panel struck "optical fiber/communications" because it was removed from the definitions. See panel action on Proposals 16-12, 16-108, and 16-232.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-83 Log #4872 NEC-P16 **Final Action: Reject**

(770.182)

Submitter: Paul Guidry, Fluor Enterprises, Inc

Recommendation: Add new text:

770.182(D) Optical fiber cable shall be listed for cable tray use where installed in cable tray.

FPN: One method of defining the listing requirements is that the cable passes UL 1277, *Electrical Power and Control Tray Cables with Optional Optical-Fiber Members.*

Substantiation: There are new optical fiber cable products on the market that are listed specifically for cable tray use. They meet UL 1277 criteria for TC cable. I believe this should be a requirement since there are products now being made that meet the proper UL standards. Up until now, there were no products that were listed specifically for cable tray use, so a variety of cables were installed that may or may not have met requirements for tests such as described in "UL Flame Exposure" or "FT4/IEEE 1202 Type of Flame Exposure" in the Standard Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables, UL 1685.

Panel Meeting Action: Reject

Panel Statement: The panel realizes that this is proposing that only listed optical fiber cable tray cable be permitted to be used in cable trays. 770.154(D) right now permits any of the cables in Table 770.179 to be used. The lowest rating in the table is "general-purpose". All of the other articles have a statement in the cable tray clause that permits every type of cable except limited use cable to be used in a cable tray. This includes general-purpose to plenum. There is no reason to restrict optical fiber cable in cable trays to only cable tray cable.

There is no optical fiber cable designated as optical fiber cable tray cable. There are hybrid cables that include power and light conductors as well as optical fiber members that are listed for tray cable use. The use and limitations for this type of cable is governed by the power and light articles.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-84 Log #1667 NEC-P16 **Final Action: Reject**

(770.182(A), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise 770.182(A) FPN as follows:

FPN: One method of ~~defining~~ determining the fire resistance and low smoke producing characteristics of ~~that~~ an optical fiber raceway is testing ~~a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested~~ in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.

Substantiation: 3.1.3 of the NEC Style Manual states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The arrangement of text provides consistency with other similar FPNs.

Panel Meeting Action: Reject

Panel Statement: The fine print note(s) does contain explanatory information. It does not contain requirements and is not written in mandatory language.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-85 Log #4875 NEC-P16 **Final Action: Reject**

(770.182(A), FPN)

Submitter: T. David Mills, T. David Mills Associates

Recommendation: Modify the fine print note as follows:

FPN: ~~One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.~~ See {9}, Annex I.

Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.

See my proposal for new Annex I.

I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.

Panel Meeting Action: Reject

Panel Statement: The FPNs are more user-friendly in current locations.

ARTICLE 790

12-183 Log #2891 NEC-P12 **Final Action: Reject**
(790 (New))

Submitter: Jerry Grant, Plainfield, IL
Recommendation: Add new text to read as follows:
<u>Proposed Article 790 Research and Development Laboratories</u>
<u>**790.1 Scope.** The requirements of this article shall apply to the electrical installations in those areas, with custom or special electrical equipment, designated by the facility management for research and development (R&D) or as laboratories.</u>
<u>**790.2 Definitions.** For the purposes of this article, the following definitions shall apply.</u>
<u>**Competent Person.** A person meeting all of the requirements of a qualified person, as defined in Article 100 and, in addition, is responsible for all work activities or safety procedures related to custom or special equipment, and has detailed knowledge regarding the electrical hazard exposure, the appropriate controls for mitigating those hazards, and implementation of those controls.</u>
<u>**Field Evaluated.** A thorough evaluation of nonlisted or modified equipment in the field that is performed by persons or parties acceptable to the authority having jurisdiction. The evaluation approval ensures that the equipment meets appropriate codes and standards, or is similarly found suitable for a specified purpose.</u>
<u>**Laboratory.** A building, space, room, or group of rooms intended to serve activities involving procedures for investigation, diagnostics, product testing, or use of custom or special electrical components, systems, or equipment.</u>
<u>**Research and Development (R&D).** An activity in an installation specifically designated for research or development conducted with custom or special electrical equipment.</u>
<u>**790.3 Applications of Other Articles.** Each electrical system for R&D and laboratory applications shall meet the requirements of the remainder of this document, except as amended by Article 790.</u>
<u>FPN: Examples of these applications include low voltage-high current power systems; high voltage-low current power systems; dc power systems; capacitors; cable trays for signal cables and other systems, such as steam, water, air, gas, or drainage; and custom-made electronic equipment.</u>
<u>**790.4 Specific Measures and Controls for R&D Installations.** Due to the unique nature of R&D and laboratory installations that are outside typical configurations of nominal voltage, current and frequency, the authority having jurisdiction and the competent person shall have the option of adopting special requirements developed from engineering and scientific standards for specific R&D installations based on the field evaluation and/or plan review.</u>
<u>**790.6 Listing Requirements.** The equipment or systems used in the R&D area or in the laboratory shall be listed or field evaluated prior to use.</u>
<u>FPN: Laboratory and R&D equipment or systems can pose unique electrical hazards that might require mitigation. Such hazards include ac and dc, low voltage and high amperage, high voltage and low current, large electromagnetic fields, induced voltages, pulsed power, multiple frequencies, and similar exposures.</u>
Substantiation: NFPA 70E now has a R&D section and this proposal will make NFPA 70 and NFPA 70E consistent on this issue. NFPA 70 is primarily written for typical nominal configurations of nominal voltage, current and 60 HZ. R&D labs often do work outside of these nominal values and need alternative methods to achieve safe installation with the oversight of the competent person and authority having jurisdiction along with NFPA 70.
Panel Meeting Action: Reject
Panel Statement: Article 350 of NFPA 70E was written primarily to address safety issues for energized installations, not for electrical installation requirements, such as found in the NEC. Therefore, this set of requirements more appropriately belongs in NFPA 70E, where it already resides.
The proposed new article does not contain any technical requirement, only a scope, definitions, and requirement for the AHJs to develop “special engineering requirements” to address what is considered unique. This is too broad and will be difficult for AHJs to properly enforce.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 800 — COMMUNICATIONS CIRCUITS

16-90 Log #2284 NEC-P16 **Final Action: Reject**
(800)

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Revise the indicated Sections in Article 800 to read as follows:
800.2 Definitions. See Article 100. For the purposes of this article, the following additional definitions apply.
<u>**Communication Raceway (OFCR).** A nonmetallic, pliable, corrugated raceway of circular cross section with integral or associated couplings, connectors, and fittings for the installation of communication cables.</u>
800.3 Other Articles.
(A) Hazardous (Classified) Locations. Communications circuits and equipment installed in a location that is classified in accordance with 500.5 and 505.5 shall comply with the applicable requirements of Chapter 5.
(B) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.
(C) Network-Powered Broadband Communications Systems. Article 830 shall apply to network-powered broadband communications systems.
<u>**(D) Optical Fiber Raceways (OFCR).** Article 862 applies to the selection and installation of Optical Fiber Raceways (OFCR).</u>
800.110 Raceways for Communications Wires and Cables. Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or <u>Optical Fiber/Communication Raceway (Type: OFCR) selected and installed per Article 862. The number of Communication Cables shall comply with 862.22.</u> ~~listed plenum communications raceway, listed riser communications raceway, or listed general-purpose communications raceway installed in accordance with 800.154 and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.~~ ~~The raceway fill tables of Chapter 3 and Chapter 9 shall not apply.~~

800.154 Applications of Listed Communications Wires and Cables and Communications Raceways. Communications wires and cables shall comply with the requirements of 800.154(A) through (D), 800.154(F), and 800.154(G), or where cable substitutions are made in accordance with 800.154(E).

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in ~~300.22(B)~~ 862.10(D) and in other spaces used for environmental air as described in ~~300.22(C)~~ 862.10(E). Only Type CMP cable shall be permitted to be installed in raceways.

(B) Riser. Cables installed in risers shall comply with 800.154(B)(1), (B)(2), or (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. Listed riser communications raceways and listed plenum communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor as described in 862.10(F). Only Type CMR and CMP cables shall be permitted to be installed in these raceways.

(2) Metal Raceways or Fireproof Shafts. Listed communications cables shall be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

(3) One- and Two-Family Dwellings. Type CM and CMX cable shall be permitted in one- and two-family dwellings. Listed general-purpose communication raceways, listed riser communication raceways, and listed plenum communication raceways shall be permitted for use as described in 862.10(G) with Type CM and CMX cables.

FPN: See 800.26 for firestop requirements for floor penetrations.

(C) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 800.154(A), (B), (D), and (G) shall be in accordance with 800.154(C)(1) through (C)(6).

(1) General. Cables shall be Type CMG or Type CM. Listed communications general-purpose raceways, listed riser communications raceways, and listed plenum communications raceways shall be permitted. Only Types CMG, CM, CMR, or CMP cables shall be permitted to be installed in these communications raceways as described in 862.10(G).

(2) In Raceways. Listed communications wires that are enclosed in a raceway of a type included in Chapter 3 shall be permitted.

(3) Nonconcealed Spaces. Type CMX communications cable shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).

(4) One- and Two-Family Dwellings. Type CMX communications cable less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.

(5) Multifamily Dwellings. Type CMX communications cable less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in nonconcealed spaces in multifamily dwellings.

(6) Under Carpets. Type CMUC undercarpet communications wires and cables shall be permitted to be installed under carpet.

(D) Cable Trays. Types CMP, CMR, CMG, and CM communications cables shall be permitted to be installed in cable trays. Communications raceways, as described in ~~800.182~~ 862.2, shall be permitted to be installed in cable trays.

(E) Cable Substitutions. The uses and substitutions for communications cables listed in Table 800.154(E) and illustrated in Figure 800.154(E) shall be permitted.

FPN: For information on Types CMP, CMR, CMG, CM, and CMX cables, see 800.179.

Table 800.154(E) Cable Substitutions (existing)

(F) Hybrid Power and Communications Cable. Hybrid power and communications cable listed in accordance with 800.179(H) shall be permitted to be installed in one- and two-family dwellings.

(G) Distributing Frames and Cross-Connect Arrays. Listed communications wire and Types CMP, CMR, CMG, and CM communications cables shall be used in distributing frames and cross-connect arrays.

800.182 ~~**Communications Raceways.** Communications raceways shall be listed in accordance with 800.182(A) through (C).~~ **Nonmetallic Communication Raceways (OFCR).** Nonmetallic Communication Raceways (OFCR) shall be listed in accordance to Article 862.6.

~~**(A) Plenum Communications Raceways.** Plenum communications raceways listed as plenum optical fiber raceways shall be permitted for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.~~

~~FPN: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.~~

~~**(B) Riser Communications Raceways.** Riser communications raceways shall be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.~~

~~FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, Standard for Optical Fiber Cable Raceway.~~

~~**(C) General-Purpose Communications Raceways.** General-purpose communications raceways shall be listed as being resistant to the spread of fire.~~

~~FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, Standard for Optical Fiber Cable Raceway.~~

Substantiation: This is a companion proposal to correlate with the proposal for a new optical fiber/communication raceway article. The new optical fiber/communication raceway article was proposed to Panel 16 as Article 862.

Optical fiber/communication raceways (Type OFCR) are currently listed raceways for use in plenums, risers or general purpose applications for the management of signaling, optical fiber, communication and CATV cables. This new Article and the companion proposals will clarify the selection, and installation optical fiber/communication raceways including the construction specifications. It is not the intent of the submitter to revise or change any of the currently permitted uses by this proposal, but only to enhance the usability of the Code.

Panel Meeting Action: Reject

Panel Statement: This proposal was submitted in companion with Proposal 16-350, which was rejected. The submitter of this proposal assumes the acceptance of Proposal 16-350, which was rejected.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-91 Log #4190 NEC-P16 **Final Action: Reject**
(800)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase "grounding conductor" and revising it to "grounding electrode conductor."

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Revise text to read as follows:

Replace the term "grounding conductor" with "grounding electrode conductor" throughout this Article.

Substantiation: The term "Grounding Conductor" is being proposed to be deleted because it is almost identical to the term "grounding electrode conductor". The defined term "grounding electrode conductor" includes the ability of connecting to a point on the grounding electrode system. This has been submitted as a single proposal to the Article instead of numerous proposals to allow the panel to ensure the resulting language still meets their intent in each specific section.

Panel Meeting Action: Reject

Panel Statement: The term "grounding electrode conductor" (GEC) has historically and traditionally both distinguished and identified the specific conductor that connects the grounded conductor (neutral) and equipment grounding conductor from within the power service equipment to the grounding electrode/grounding electrode system at the premises. This distinction must remain in place to identify the unique purpose of the GEC and to avoid confusion and misapplication of the numerous grounding/bonding requirements throughout the NEC.

There are very specific requirements for the material (250.62), installation, sizing and accessibility (250.64) of the GEC that are not specific to other 'grounding conductors'. It is often the access and connection point for other systems/equipment required to be grounded to the premises grounding electrode/grounding electrode system, and has the physical and electrical attributes for this function. Connection of other systems/equipment to a conductor designated as a GEC but not meeting the criteria of 250.62 and 250.64 may result in an unsafe installation.

No technical or electrical safety reasons have been cited to substantiate the proposed change.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

JANIKOWSKI, R.: I agree with the submitter that the term "grounding conductor" and "grounding electrode conductor" are all but identical. The term "grounding electrode conductor" will not be mistaken in the field for the grounded conductor and refers to any point on the grounding electrode system.

Comment on Affirmative:

BRUNSSEN, J.: This is a correlation issue with Panel 5. Although the deletion of the term "grounding conductor" is appropriate for articles covered by Panel 5, the term is used over 120 times in Chapter 8 articles covering low power communications circuits and elsewhere in the code. The term "Grounding Conductor" has proven a useful and well understood term within the communications articles and a definition should be retained in Article 100. Substitution of "Grounding Conductor" with "Grounding Electrode Conductor" is not appropriate for all uses in Chapter 8 articles. The definition of "Grounding Conductor" could be modified to make it more specific to communications circuits as follows: "G**rounding Conductor.** A conductor used to connect communications equipment and cable shield, as required, to a grounding electrode system or grounding electrode(s)." This definition would meet the needs of Chapter 8.

16-92 Log #1128 NEC-P16 **Final Action: Accept**
(800.1 FPN No. 1 (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Insert the following as FPN No 1:
<u>FPN No. 1: See 90.2(B)(4) for installations of communications circuits and equipment that are not covered.</u>
Renumber existing FPNs 1 through 5 as FPNs 2 through 6.
Substantiation: Adding the FPN reminds NEC users to check 90.2(B)(4) thereby avoiding misapplication of 800, and provides correlation between 800.1 and 830.1 that contains a similar FPN.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-93 Log #2099 NEC-P16 **Final Action: Accept**
(800.1, FPN to No. 5)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Delete 800.1 FPN No 5 as follows:
~~FPN No. 5: For installation requirements for network-powered broadband communications circuits, see Article 830.~~
Substantiation: This is an editorial proposal.
Section 800.1, FPN No. 5 is superfluous as the information is currently and properly contained in 800.3(C).
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-94 Log #178 NEC-P16 **Final Action: Accept in Principle**
(800.1, FPN 1 (New))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Renumber existing FPN No. 1 to 2, 2 to 3, etc.
Insert a new FPN No. 1.
<u>FPN No. 1: See 90.2(B)(4) for installations of communications equipment that are not covered.</u>
Substantiation: The proposed FPN will provide important scope information. It will also establish parallelism with the scope Article 830 which has a similar fine print note. "FPN No. 2: See 90.2(B)(4) for installations of broadband communications systems that are not covered."
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-92.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-95 Log #2078 NEC-P16 **Final Action: Accept in Principle**
(800.1, FPN 1)

Submitter: Steve C. Dryden, Poole Fire Protection, Inc. / Rep. NFPA TC on Telecommunications
Recommendation: Renumber existing FPN No. 1 to 2, 2 to 3, etc.
Insert a new FPN No. 1.
<u>FPN No. 1: See 90.2(B)(4) for installations of communications equipment that are not covered.</u>
Substantiation: The proposed FPN will provide important scope information. It will also establish parallelism with the scope Article 830 which has a similar fine print note. "FPN No. 2: See 90.2(B)(4) for installations of broadband communications systems that are not covered."
The NFPA Technical Committee on Telecommunications is responsible for NFPA 76. This proposal was developed by the Technical Committee at a pre-ROP meeting and is being submitted by the chairman on behalf of the Technical Committee.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-92.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-96 Log #2100 NEC-P16 **Final Action: Accept**
(800.1, FPN 1)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: After deleting the fine print note renumber the remaining fine print notes to n-1.
~~FPN No. 1: For installation requirements for information technology equipment and systems in an information technology equipment room, see Article 645.~~
Substantiation: This is an editorial proposal.
The fine print note reference to Article 645 is not necessary. It is being misinterpreted as applying to communications equipment in a computer room. Deleting it will remove any possible misinterpretation.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Ballot Results: Affirmative: 16

16-97 Log #119 NEC-P16 **Final Action: Accept**
(800.1, FPN 5)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Delete FPN No. 5.
Substantiation: FPN No. 5 is redundant. The text in 800.3(C) is sufficient to refer users to Article 830.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-98 Log #2077 NEC-P16 **Final Action: Reject**
(800.1, FPN 6 (New))

Submitter: Steve C. Dryden, Poole Fire Protection, Inc. / Rep. NFPA TC on Telecommunications
Recommendation: Add a new FPN.
<u>FPN. No. 6. For information on cable and equipment requirements in telecommunications facilities where telecommunication services such as telephone, data, cellular, internet, voice over internet protocol (VoIP), and video are rendered to the public, see NFPA 76, Standard for the Fire Protection of Telecommunications Facilities.</u>
Substantiation: Fire protection requirements, including cabling and equipment, for telecommunications facilities such as a central office, are covered by NFPA 76, Standard for the Fire Protection of Telecommunications Facilities. Although many telecommunications facilities are not covered by the NEC (see 90.2(B)(4)), the central offices of non-utility telecommunications companies are covered by NFPA 76 <u>and</u> NEC Article 800. The NFPA Technical Committee on Telecommunications is responsible for NFPA 76. This proposal was developed by the Technical Committee at a pre-ROP meeting and is being submitted by the chairman on behalf of the Technical Committee.
Panel Meeting Action: Reject
Panel Statement: The proposed FPN directs the reader to a document that applies to facilities identified in 90.2(B)(4) as not covered by the NEC. It is misleading as written and cannot be broadly applied to all communications facilities. For example, it does not apply to a communications closet of less than 500 square feet on a customer premises (e.g., office building or shopping center). It also does not apply to service to a PBX located on a customer premises.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-99 Log #2459 NEC-P16 **Final Action: Accept in Principle**
(800.1, FPN 6 (New))

Submitter: Joseph P. Savage, FIFTH Council North America
Recommendation: Add the following line to 800.1
FPN No. 6: For installation requirements for premises-powered broadband communications circuits, see Article 8XX.
Substantiation: A submission has been made for a new Article to Chapter 8. If this Article is accepted, then Article 800.1 should include the above added reference.
Panel Meeting Action: Accept in Principle
Add the following FPN and number as the last FPN to 800.1 to read as follows: "FPN No. 5: For installation requirements for premises-powered broadband communications circuits, see Article 840."
Panel Statement: See panel action on Proposal 16-349. The panel renumbered the FPN and reference article number. See panel action on Proposal 16-93, 16-96, 16-97, and 16-92, which added and deleted FPNs.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
PREZIOSO, L.: There is no need to add reference to the new article if the new article is not Accepted.

16-100 Log #1463 NEC-P16 **Final Action: Reject**
(800.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
A circuit that is in such a position location that, in case of failure of supports or insulation contact with another circuit ~~may~~ is likely to result.
Substantiation: Edit. "May" is subjective and a term to be avoided. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The submitters recommendation is not editorial. The term "may" connotes "a possibility"; the term "likely" connotes "is probable". The panel does not agree that these are probable events.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-101 Log #1464 NEC-P16 **Final Action: Reject**
(800.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add "or premises" after "buildings".
Substantiation: Edit. The provision should include structures not deemed as buildings.
Panel Meeting Action: Reject
Panel Statement: The submitter has not specified to which definition of 800.2 the proposed revision is intended to apply.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-102 Log #744 NEC-P16 **Final Action: Reject**
(800.2.Abandoned Communications Cable)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Delete text and the associated Fine Print Note to read as follows:
800.2 Definitions.
See Article 100. For the purposes of this article, the following additional definitions apply.
~~**Abandoned Communications Cable.** Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag.~~
~~FPN: See Article 100 for a definition of Equipment.~~
[remainder of 800.2 unchanged by this Proposal]
Substantiation: Companion proposals have been made to add a single generalized definition in Article 100 and to delete the corresponding definitions for the various abandoned cables, supply circuits, etc., in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2.
NEC® Manual of Style 2.2.2.1. Consolidation into a new, single generalized definition in Article 100 of nearly identical definitions appear in multiple Articles, specifically in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2. Although these individual definitions served a valid transitional purpose to support the independent additions of individual requirements in 640.6(C), 645.5(F), 645.5(G), 725.25, 800.25, 820.25, and 830.25, these discreet definitions can be broadly consolidated into a single definition in Article 100.
The specific method by which identification for future use is achieved ("… with a tag") is conveyed in the definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 violates *NEC® Manual of Style* 2.2.2 ("Definitions shall not contain requirements …") and is omitted in the generalized definition for "Abandoned" being added in Article 100. This identification-with-a-tag requirement in these definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 is redundant to the actual requirement statements in 640.6(C), 645.5(G), 725.25, 800.25, 820.25, and 830.25, respectively. Also, words regarding the possibility of ceasing connection to an electric supply have been added in the generalized definition for "Abandoned" to correlate to 90.2(A)(3), since abandonment entails disconnection from either the terminating equipment or the electric supply (or both).
Panel Meeting Action: Reject
Panel Statement: For the 2008 NEC, a TCC-directed task group, including representation from CMP-3, CMP-12 and CMP-16, determined there were enough differences in the installation of abandoned cables to justify them being addressed in individual articles. The current code wording is aligned with what was proposed by the task group.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-103 Log #814 NEC-P16 **Final Action: Reject**
(800.2.Abandoned Communications Cable)

Submitter: J. L. Richardson, Engineering Services Group, Inc.
Recommendation: Delete the following text:
~~Abandoned Communications Cable. Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag.~~
Substantiation: To be replaced by general definition Article 100, Definitions.
Panel Meeting Action: Reject
Panel Statement: For the 2008 NEC, a TCC-directed task group, including representation from CMP-3, CMP-12 and CMP-16, determined there were enough differences in the installation of abandoned cables to justify them being addressed in individual articles. The current code wording is aligned with what was proposed by the task group.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-104 Log #4555 NEC-P16 **Final Action: Accept**
(800.2.Air Duct)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Delete the following text:
~~**800.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum.~~
Substantiation: The term "air duct" is not used in article 800 and should not be defined in the article, as per the manual of style of the National Electrical Code.
This has been proposed before but was caught in the NEC moratorium associated with plenum cables.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-105 Log #122 NEC-P16 **Final Action: Accept**
(800.2.Communications Raceway)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 2.2.2 of the NEC Style Manual to not contain mandatory text, such as "listed" and not contain the defined term.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Add definition to read as follows:
Communications Raceway. A raceway listed as a Plenum Communications Raceway, or a Riser Communications Raceway, or a General-Purpose Communications Raceway.
Substantiation: The term "Communications Raceway" is used throughout Article 800 and therefore needs to be defined. The proposed definition is precise. Companion proposals have been submitted for Articles 770 and 820.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
GUBISCH, R.: The proposed definition contains a requirement which conflicts with 2.2.2 of the NEC Style Manual.

16-106 Log #211 NEC-P16 **Final Action: Accept in Principle**
(800.2.Communications Raceway (New))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Add new definition to read as follows:
"Communications Raceway. A raceway listed as a Plenum Communications Raceway, or a Riser Communications Raceway, or a General-Purpose Communications Raceway."
Substantiation: The term "Communications Raceway" is used throughout Article 800 and therefore needs to be defined. The proposed definition is precise. Companion proposals have been submitted for Articles 770 and 820.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-105.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
GUBISCH, R.: The proposed definition contains a requirement which conflicts with 2.2.2 of the NEC Style Manual.

16-107 Log #204 NEC-P16 **Final Action: Reject**
(800.2.Concealed Space)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]
Nonconcealed space. That portion of a building that is not a concealed space.
Substantiation: Section 800.154(C)(3) has application requirements for communications cables in nonconcealed spaces. A definition of a concealed space is needed in order to define and understand what a nonconcealed space is. I have also submitted a proposal to clarify that the definition of "concealed" in Article 100 applies only to wiring methods.
Panel Meeting Action: Reject
Panel Statement: The terms "concealed spaces" and "nonconcealed spaces" are generally understood and do not require definitions.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-108 Log #3595 NEC-P16 **Final Action: Accept in Principle**
(800.2.Optical fiber /communications cable routing assembly)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 2.2.2 of the NEC Style Manual to not contain mandatory text, such as "listed" and not contain the defined term.
This action will be considered by the panel as a public comment.
Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Add new text to read as follows:
Optical fiber /communications cable routing assembly. A flame retardant, nonmetallic assembly of pliable lengths, rigid straight sections, elbows, bends and fittings such as expansion joints, female and male adapters, and couplings used to support and protect optical fiber, communications and data cables in applications with a high density of cabling such a information technology (computer) rooms, broadcast stations and telecommunications offices. Parts of the assembly may have hinged or removable covers. The assembly is designed for cables be laid or set in place after the enclosures have been installed as a complete system.
Substantiation: Article 770 currently covers optical fiber raceways and provides applications and listing requirements for these raceways. UL lists these raceways to UL 2024, Optical Fiber and Communication Cable Raceway. UL lists optical fiber /communications cable routing assemblies to UL2024a, Outline of Investigation for Optical Fiber Cable Routing Assemblies. Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.)
For further information see the attached application guide from one of the manufacturers or got to http://www.storage-expo.com/ExhibitorLibrary/302/FiberRunner_6.pdf on the web.
The significant difference between optical fiber /communications cable routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.
Since users of the code may not be familiar with optical fiber /communications cable routing assemblies we are submitting this proposal to define them. We have submitted companion proposals to provide for a change of the scope of Article 770 to include optical fiber /communications cable routing assemblies and to provide listing and application for requirements for them. Since these routing assemblies are used for optical fiber, data and communications cables, proposals are being submitted for Articles 725, 770, 800 and 820.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Cable Routing Assembly. A unit or assembly of units or sections and associated fittings that are listed and form a structural system used to support listed cables.
Panel Statement: The panel action meets the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
BRUNSSEN, J.: The definition as stated in the Panel Meeting Action is incomplete as it fails to identify the types of cable to be supported and protected. Revise the Panel Meeting Action as follows: "**Cable Routing Assembly.** A unit or assembly of units or sections and associated fittings that are listed and form a structural system used to support and protect optical fiber, communications and data listed cables."
DORNA, G.: See my comment on proposal 16-12.

16-109 Log #1279 NEC-P16 **Final Action: Reject**
(800.2.Cable, Cable Sheath)

Submitter: Steven L. Millard, Catering ELectric
Recommendation: Revise text to read as follows:
Remove the definitions "cable" and "cable sheath" from 800.2 and put them in Article 100.
Substantiation: The definitions "cable" and "cable sheath" are more appropriate for the Scope of Article 100 because the terms are used in other articles throughout the Code.
Panel Meeting Action: Reject
Panel Statement: The terms "cable" and "cable sheath" have specific connotation when associated with communications systems. CMP-16 does not, and should not, have purview over power cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-110 Log #158 NEC-P16 **Final Action: Accept in Principle**
(800.3(A) (New))

TCC Action: The Technical Correlating Committee directs that the panel reconsider its action on this proposal since there is no need to duplicate 90.3 in accordance with 4.1 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Re-letter the existing (A) to (B), (B) to (C), etc. and establish a new (A).
(A) Chapters 1 through 7. See 90.3. The requirements of Chapters 1 through 7 shall not apply to Article 800 except where the requirements are specifically referenced in Article 800.
Substantiation: Section 90.3 is extremely important to the application of Article 800. Adoption of this proposal will add clarity.
Panel Meeting Action: Accept in Principle
Re-letter the existing (A) to (B), (B) to (C), etc. and establish a new (A).
(A) Chapters 1 through 7. The requirements of Chapters 1 through 7 shall not apply to Article 800 except where the requirements are specifically referenced in Article 800. See 90.3.
Panel Statement: Field experience shows that 90.3 is often overlooked. The panel moved the reference to 90.3 to the end for clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-111 Log #120 NEC-P16 **Final Action: Accept in Principle**
(800.3(D) (New))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Add new text to read:
(D) Optical Fiber Cable. Where optical fiber cable is part of a communications circuit, Article 770 shall apply.
Substantiation: Communications circuits utilize optical fibers as well as copper wires and cables for transmission of communications signals.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-113.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-112 Log #2408 NEC-P16 **Final Action: Reject**
(800.3(D))

Submitter: Jerry Feagans, City of St. Louis
Recommendation: Add text to read as follows:
(D) Underground Installation. Minimum cover requirements shall comply with Table 300.5.
Substantiation: Article 800 does not indicate any burial depths for conductors. Table 300.5 is for all installations ranging from 0 to 600 volts communication conductors do fall into that category. I understand the electrical shock hazard is not there, but the possible loss of the transmission of communications should be a concern.
Panel Meeting Action: Reject
Panel Statement: The communications cables of Article 800 contain very low power levels. If cut, it may be an annoyance, but does not constitute an electrical safety hazard. Communications cables containing higher levels of network power are covered in Article 830 and are required to meet the minimum cover requirements of Table 830.47.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should have been an AIP. There should be established burial depths for communications conductors in the NEC whether or not voltage is an issue. Often times cables are placed just below the sod (2" to 3" in depth); at these depths ordinary grounds maintenance can destroy the cable. The submitter should revise this proposal in the ROC stage with specific burial depth requirements.

16-113 Log #2107 NEC-P16 **Final Action: Accept in Principle**
(800.3(D) (New) and 800.1, FPN No. 4)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
(D) Optical Fiber Cable. Where optical fiber cable is used to provide a communications circuit, either in whole or in part, Article 770 shall apply to the optical fiber cable portion of the communications circuit.
~~FPN No. 4: For installation requirements of optical fiber cables and raceways, see Article 770.~~
Substantiation: This proposal is editorial and technical.
Communications circuits utilize optical fibers as well as copper wires and cables for transmission of communications signals.
The task group is aware of section 4.1.1 of the NEC Style Manual which prohibits reference to an entire article. However, since it the intent of this proposal to have the entire article apply, it is necessary to reference the entire Article 770.
The fine print note referring to Article 770 in section 800.1 will be redundant with the acceptance of the text for 800.3(D). Therefore it should be deleted.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(D) Optical Fiber Cable. Where optical fiber cable is used, either in whole or in part, to provide a communications circuit within a building, Article 770 shall apply to the installation of the optical fiber portion of the communications circuit.
Delete FPN No. 4 in 800.1.
Panel Statement: The panel added the words "within a building" to distinguish between cable within a building and outside plant cable. The panel also moved "either in whole or in part" to modify "optical fiber cable". The panel added "installation" and deleted "cable" to broaden the applicability of Article 770.
The panel understands that the submitter's intent is to delete the existing 800.1 FPN No. 4 not add a new FPN No. 4. The panel understands that 800.3(D) is a new section.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
IVANS, R.: The panel revised the text to read as follows: Where optical fiber cable is used, either in whole or in part, to provide a communications circuit within a building, Article 770 shall apply to the installation of the optical fiber portion of the communications circuit.
"Within a building" should not be added as this changes the requirement and was not part of the submitter's proposal or rationale. There is no reason this requirement should be limited to "within a building".

16-114 Log #1588 NEC-P16 **Final Action: Reject**
(800.10(C))

Submitter: William Q. Cellini, Jr., Ardmore, PA
Recommendation: Add new text to read as follows:
(C) On walls (service conductors and cables): Residential, Commercial, institutional, industrial. Service conductors and cables on exterior walls shall be installed in metallic conduit.
Substantiation: This requirement is needed for protection from burglars and arson, especially telephone, security and fire-alarm notification services, including residential, etc.
Panel Meeting Action: Reject
Panel Statement: The panel is unable to identify submitter's intended placement of the proposed text. The reference location of 800.10 does not exist in the NEC. A broad-based requirement, as proposed by the submitter, is inappropriate as only a small portion of communications installations are used for such purposes. Responsibility for physical protection to deter burglary/arson should accrue to the alarm service provider and/or customer, not the communications utility.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-115 Log #167 NEC-P16 **Final Action: Accept**
(800.18)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Change "telecommunications" to "communications".
Substantiation: Throughout Article 800 the term "communications" is used rather than "telecommunications". Also, Article 100 defines "Communications Equipment" not "Telecommunications Equipment". Use of terminology should be consistent throughout the article.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-116 Log #2150 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Revise text as follows:
The installation shall also conform to 300.4(D), ~~and~~ 300.11~~.~~, and 334.15(C).
Substantiation: Cables ran across joists need running boards or bored holes to protect them from occupants hanging and damaging the conductors and cables.
Panel Meeting Action: Reject
Panel Statement: 334.15(C) does not apply to communications cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-117 Log #3095 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
800.24 Mechanical Execution of Work.
Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware, including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4~~(D)~~ and 300.11.
FPN: Text to remain unchanged.
Substantiation: This is one of a series of proposals intended to provide correlation with sections 640.6(B), 725.24, 760.24, 770.24, 800.24, 820.24 and 830.24. Due to the power limitations of these circuits, there is no reason that the requirements should be different.
Panel Meeting Action: Reject
Panel Statement: Communications cables operate at very low voltage and power levels and do not present a potential electrical safety hazard. There is insufficient substantiation to justify a major increase in physical protection requirements for communications cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-118 Log #3811 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Add language to the end of 800.24 as follows: "...to damage the cable. The installation shall also conform to 300.4(D), 300.5 and 300.11. All cables in wet locations shall be listed for that use."
Substantiation: Communication cables that are only listed for dry locations are being installed either in conduits underground or as direct burial cables without regard to depth, to provide phone, TV, and data service to accessory structures (pool houses, workshops, etc.) at dwelling units. There have even been instances where these dry location cables have been routed through a planting bed under less than one in. of mulch. While there is usually no hazard from shock or burn from these cables, there is the issue of a cable deteriorating, or getting cut by a lawn mower, wrapping into the blade, and being pulled from the structure so as to injure the operator. By mandating rules for underground installations, these hazards will be mitigated.
Panel Meeting Action: Reject
Panel Statement: Acceptance of this proposal will result in conflict with 800.48.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-119 Log #4189 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Add new text as follows:
Cables shall be permitted to be secured to and supported by cable trays.
Substantiation: It is common practice to secure cables to vertical runs of cable trays but this section does not specifically address that.
Panel Meeting Action: Reject
Panel Statement: The submitter has not indicated where the text of his proposal would appear in 800.24. This proposal would allow cables to be secured and supported underneath horizontal cable trays because the word "vertical" was not included in the actual text.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-120 Log #4387 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: Michal Hofkin, Middle Atlantic Inspections
Recommendation: Add language to the end of 800.24 as follows:
(language to this point unchanged) …to damage the cable. The installation shall also conform to 300.4(D), 300.5, and 300.11. All cables in wet locations shall be listed for that use.
Substantiation: Communication cables that are only listed for dry locations are being installed either in conduits underground or as direct burial cables without regard to depth, to provide phone, TV, and data service to accessory structures (pool houses, workshops, etc.) at dwelling units. There have even been instances where these dry location cables have been routed through a planting bed under less than one inch of mulch. While there is usually no hazard from shock or burn from these cables, there is the issue of a cable deteriorating, or getting cut by a lawn mower, wrapping into the blade, and being pulled from the structure so as to injure the operator. By mandating rules for underground installations, these hazards will be mitigated.
Panel Meeting Action: Reject

16-121 Log #3722 NEC-P16 **Final Action: Accept in Principle**
(800.24, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add the following Fine Print Note:
FPN: See NFPA 90A, Standard for Installation of Air-Conditioning and Ventilation Systems, for discrete combustible components installed in air-handling plenums in accordance with 300.22.
Substantiation: This proposal addresses new requirements in NFPA 90A having an influence on installations in NEC Section 800.24, as well as held comments from the 2008 NEC Cycle, ROC 16-29 and 16-30.
Imposing the requirement that such products be "listed" in this section of the NEC would result in additional requirements not included in NFPA 90A. The implication of requiring listing in this section of the NEC would impose the full scope of requirements in UL 1565 for cable ties and UL 2239 for other support hardware. This effort to correlate with NFPA 90A would create big correlation issues within NFPA 70 for the same products used for supporting all other cables and conduits outside of the jurisdiction of code-making panel 16, for no good reason. It is not necessary to repeat requirements from NFPA 90A in NFPA 70 especially when doing so imposes unsubstantiated additional requirements.
The NFPA 90A requirements are focused on smoke and heat generated from a fire in an air-handling plenum. The NFPA 90A-2009 requirement is as follows for discrete combustible components installed in air-handling spaces in accordance with NEC 300.22 (C) and (D): (The actual clause numbers in NFPA 90A-2009 may vary editorially)
NFPA clause 4.3.10.2.6.5 Loudspeakers, recessed lighting fixtures and other electrical equipment with combustible enclosures, including their assemblies and accessories, cable ties and other discrete products shall be permitted in the ceiling cavity plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a peak heat release rate of 100 kW or less when tested in accordance with UL2043, *Standard for Safety Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.*
And very similar requirements in 4.3.10.6.5.6 apply in NFPA 90A for discrete combustible products installed in a "raised floor plenum".
Importantly, none of these requirements pertain to noncombustible products. There are many metallic products, including metallic cable ties, used to support power, data and communications conduits and cables and there has been no substantiation offered that these be required to be "listed".
Panel Meeting Action: Accept in Principle
Revise fine print note text to read as follows:
FPN No. 2: See NFPA 90A, Standard for Installation of Air-Conditioning and Ventilation Systems, for discrete combustible components installed in accordance with 300.22(B) and (C).
Panel Statement: The panel removed the vague term "air-handling plenums" and added the references to 300.22(B) and (C). This meets the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-122 Log #4552 NEC-P16 **Final Action: Reject**
(800.25)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
800.25 Abandoned Cables.
The accessible portion of abandoned communications cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved. Removal of abandoned cables shall be performed in a neat and workmanlike manner.
Substantiation: This proposal recommends added wording to ensure that abandoned cables are removed appropriately. Section 110.12 addresses installation and so does section 800.24. Moreover, section 110.12 would only apply if specifically referenced. It is important to point out that similar care must be taken when removing cables.
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
Consistent wording is being proposed for other sections in the code.
For information, see relevant definitions in the NEC.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-24.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-123 Log #1597 NEC-P16 **Final Action: Reject**
(800.26)

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Add a third sentence to 800.26: Conduits or raceways entering enclosures of the ventilated type, shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway into other areas of the building or structure.
Substantiation: A fire in the area where the enclosure is located will produce smoke, poison gases, and other products of combustion which can easily be carried through the enclosure's vents and these unsealed raceways to other areas in the building. Essentially defeating any firewalls. I have not seen this particular problem addressed in building codes or fire resistance directories since these raceways are not "sleeves" which ARE required to be fire stopped, but rather they are complete raceway systems which generally require only sealing up around the OUTSIDE of the pipe where it penetrates a firewall. In this particular installation smoke could easily pass right through the INSIDE of the raceway because of the ventilation openings in the enclosure.

I have witnessed the results of this "chimney-effect" problem when the smoke from a fire in a basement electric room spread throughout the upper floors of a high rise building because the raceways leaving the switch gear acted like chimneys and transported heavy smoke from the basement directly to panelboards and switchboards on the upper floors of the building thus bypassing and defeating any fire walls that the raceways penetrated and completely filling the UPPER floors with smoke. Luckily nobody was injured. If the ends of the raceways were simply filled with some fire-stopping type caulk or similar material this situation would probably never have happened.

Once a fire starts to produce toxic fumes we almost have to think of that area as a Hazardous (classified) location similar to those in Article 500. We must try to prevent those hazardous gases passing from one area in a building to another.

Just as other sealing requirements throughout the code prevent moisture, condensation, dusts, gases or vapors from traveling through raceways, this requirement for some simple fire proof putty could prevent toxic fumes from spreading throughout the building. The seals required by this proposal are equally as important as any other seals required by the NEC such as 230.8, 300.5(G), 300.7(A), 300.50(E), 312.5(C) exception to (D), 324.40(A), 332.40(A), 368, 238, 372.7, 501.15, 502.15, 504.70, 505.16, 506.16, 680.24(B) and any other seals that may be required.

I am submitting companion proposals to sections 300.21, 770.26, 800.26, 820.26 and 830.26.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The proposed recommendation is impractical. The submitter has not supplied sufficient data for substantiation of a problem.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

IVANS, R.: The submitter is correct that vented enclosures connected via unsealed raceways and conduit can bypass fire breaks between floors. It would not be impractical to seal such raceways or conduit.

16-124 Log #4517 NEC-P16 **Final Action: Reject**
(800.26)

Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)

Recommendation: Revise text to read as follows:

800.26 Spread of Fire or Products of Combustion.

~~Installations of communications cables and communications raceways in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased.~~ <u>When required by the building, fire or mechanical code, communications cables and communications raceways within shaftways, plenums and air-handling ducts shall maintain a flame spread and smoke development index.</u> Openings around penetrations of communications cables and communications raceways <u>into or</u> through ~~fire-resistant-rated~~ <u>fire-resistive</u> walls, partitions, floors, or ceilings <u>and smoke partitions</u> shall be firestopped using approved methods ~~to maintain the fire resistance rating~~.

Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.

This section covers two issues: 1) appurtenances in certain locations must comply with flamespread and smoke development requirements established in the building, fire and mechanical codes; and 2) penetrations made in fire-resistive construction shall be provided with firestopping to maintain their fire-resistance rating.

Currently, the first sentence is vague. It is unclear what quantitatively will prevent the possible spread of fire or products of combustion from being substantially increased. What is "substantially". Additionally, we could not identify what constitutes a hollow space, and we could not identify any requirement that the combustible loading is regulated in general in hollow spaces. We do agree that building, fire and mechanical codes regulate flame spread and smoke development for spaces that are used for air distribution, see 300.22.

The second issue is addressed in the second sentence, which has been clarified. The end of the second sentence is revised to eliminate redundancy. Adding the term "into or" makes it clear that not only through penetrations, but also membrane penetrations into fire-resistive construction must be provided with firestopping to maintain the fire-resistance rating. This should also apply to smoke partitions, which are not required to be fire resistive construction. Note that a "smoke barrier" is also required to be fire-resistive, hence the change to "fire-resistive" in the second sentence.

See similar proposal to 300.21.

Panel Meeting Action: Reject

Panel Statement: Section 4.2 of the NEC Style Manual prohibits references to other standards in mandatory code text.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-125 Log #2351 NEC-P16 **Final Action: Reject**
(800.30 (New))

Submitter: Kevin M. Weigman, Northeast Wisconsin Technical College

Recommendation: Add new text as follows:

To 800.30???

Securing and Supporting.

<u>Communication cables shall be secured at intervals not to exceed 1.4 meters (4.5 ft).</u>

<u>The cable is permitted to be unsupported where the cable is fished between access points through concealed spaces in finished buildings or structures and support is impracticable.</u>

Substantiation: Currently, there are no requirements specifying the maximum distance to support such cables. As the code reads now, it states that the cables must be supported by the building structure but does not state the distance between such supports.

Panel Meeting Action: Reject

Panel Statement: The present text of 800.24, the reference to 300.11, Securing and Supporting, and the ANSI standards cited in the fine print note provide adequate guidelines for the installation and support of communications cables.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 14 Negative: 2

Explanation of Negative:

JANIKOWSKI, R.: I agree with inserting a maximum distance for supports. It would not have to be 4.5' I would be happy with the 5' in the reference document in the fpn. Inspectors like to have a value for supports like every other wiring method so there is no question at the time of inspection.

OHDE, H.: This proposal should have been an AIP. There are no specific maximum distances for supporting of communications cables in the NEC. 800.24 as referenced in the panel statement deals with mechanical execution of work and the requirements of 300.4 (D) and 300.11. 300.11 doesn't provide any supporting distances of cables. The FPN only provides guidance and is not enforceable. The submitter should revise this proposal in the ROC stage with more clear defined supporting requirements depending on the type and size of the cable.

16-126 Log #2098 NEC-P16 **Final Action: Accept**
(800.44, 820.44, and 830.44)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group

Recommendation: See Tables starting on the next page.

Revise sections 800.44, 820.44 & 830.44 as shown in the table below:

800.44 Overhead (Aerial) Communications Wires and Cables. Overhead (aerial) communications wires and cables entering buildings shall comply with 800.44(A) and (B).	820.44 Overhead (Aerial) Coaxial Cables. Overhead (aerial) coaxial ~~Coaxial~~ cables, prior to the point of grounding, as defined in 820.93, shall comply with 820.44(A) through (E ~~F~~).	830.44 Overhead (Aerial) Cables. Overhead (aerial) ~~Aerial~~ network-powered broadband communications cables shall comply with 830.44(A) through (G ~~I~~). FPN: For additional information regarding overhead (aerial) wires and cables, see ANSI C2-2007, National Electric Safety Code, Part 2, Safety Rules For Overhead Lines.
(A) On Poles and In-Span. Where communications wires and cables and electric light or power conductors are supported by the same pole or are run parallel to each other in-span, the conditions described in 800.44(A)(1) through (A)(4) shall be met. (1) Relative Location. Where practicable, the communications wires and cables shall be located below the electric light or power conductors. (2) Attachment to Cross-Arms. Communications wires and cables shall not be attached to a cross-arm that carries electric light or power conductors. (3) Climbing Space. The climbing space through communications wires and cables shall comply with the requirements of 225.14(D). (4) Clearance. Supply service drops of 0–750 volts running above and parallel to communications service drops shall have a minimum separation of 300 mm (12 in.) at any point in the span,	~~(A) On Poles. Where practicable, conductors on poles shall be located below the electric light, power, Class 1, or non power-limited fire alarm circuit conductors and shall not be attached to a cross-arm that carries electric light or power conductors.~~ (A) On Poles and In-Span. Where coaxial cables and electric light or power conductors are supported by the same pole or are run parallel to each other in-span, the conditions described in 820.44(A)(1) through (A)(4) shall be met. (1) Relative Location. Where practicable, the coaxial cables shall be located below the electric light or power conductors. (2) Attachment to Cross-Arms. Coaxial cables shall not be attached to a cross-arm that carries electric light or power conductors. (3) Climbing Space. have a vertical clearance of not less than 2.5 m (8 ft) from all points of roofs above which they pass. Exception No. 1: Auxiliary buildings such as garages and the like. Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (1) not more than 1.2 m (4 ft) of communications service drop conductors pass above the roof overhang, and (2) they are terminated at a raceway mast or other approved support. Exception No. 3: Where the roof has a slope of not less than 100 mm in 300 mm (4 in. in 12 in.), a reduction in clearance to not less than 900 mm (3 ft) shall be permitted.	(aerial) spans of network-powered broadband communication cables shall conform to not less than the following: (1) 2.9 m (9.5 ft) — above finished grade, sidewalks, or from any platform or projection from which they might be reached and accessible to pedestrians only (2) 3.5 m (11.5 ft) — over residential property and driveways, and those commercial areas not subject to truck traffic (3) 4.7 m (15.5 ft) — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land traversed by vehicles such as cultivated, grazing, forest, and orchard FPN: These clearances have been specifically chosen to correlate with ANSI C2-2007, National Electrical Safety Code, Table 232-1, which provides for clearances of wires, conductors, and cables above ground and roadways, rather than using the clearances referenced in 225.18. Because Article 800 and Article 820 have had no required clearances, the communications industry has used the clearances from the NESC for their installed cable plant.
(D ~~E~~) Between Buildings. Coaxial cables extending between buildings and also the supports or attachment fixtures shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.	(D ~~E~~) Over Pools. Clearance of network-powered broadband communications cable in any direction from the water level, edge of pool, base of diving platform, or anchored raft shall comply with those clearances in 680.8.

Exception: Where a coaxial cable does not have sufficient strength to be self-supporting, it shall be attached to a supporting messenger cable that, together with the attachment fixtures or supports, shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.	
(E ~~F~~) On Buildings. Where attached to buildings, coaxial cables shall be securely fastened in such a manner that they will be separated from other conductors in accordance with 820.44(F)(1), (F)(2), and (F)(3). (1) Electric Light or Power. The coaxial cable shall have a separation of at least 100 mm (4 in.) from electric light, power, Class 1, or non–power-limited fire alarm circuit conductors not in raceway or cable, or shall be permanently separated from conductors of the other system by a continuous and firmly fixed nonconductor in addition to the insulation on the wires. (2) Other Communications Systems. Coaxial cable shall be installed so that there will be no unnecessary interference in the maintenance of the separate systems. In no case shall the conductors, cables, messenger strand, or equipment of one system cause abrasion to the conductors, cable, messenger strand, or equipment of any other system.	(B ~~F~~) Above Roofs. Network-powered broadband communications cables shall have a vertical clearance of not less than 2.5 m (8 ft) from all points of roofs above which they pass. Exception No. 1: Auxiliary buildings such as garages and the like. Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (1) not more than 1.2 m (4 ft) of the broadband communications drop cables pass above the roof overhang, and (2) they are terminated at a through-the-roof raceway or support. Exception No. 3: Where the roof has a slope of not less than 100 mm in 300 mm (4 in. in 12 in.), a reduction in clearance to not less than 900 mm (3 ft) shall be permitted.

(3) Lightning Conductors. Where practicable, a separation of at least 1.8 m (6 ft) shall be maintained between any coaxial cable and lightning conductors. FPN: For additional information regarding overhead (aerial) wires and cables, see ANSI C2-2007, National Electric Safety Code, Part 2, Safety Rules for Overhead Lines.	
	(E G) Final Spans. Final spans of network-powered broadband communications cables without an outer jacket shall be permitted to be attached to the building, but they shall be kept not less than 900 mm (3 ft) from windows that are designed to be opened, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations. Exception: Conductors run above the top level of a window shall be permitted to be less than the 900-mm (3-ft) requirement above. Overhead (aerial) network-powered broadband communications cables shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they will obstruct entrance to these building openings.
	(F ~~H~~) Between Buildings. Network-powered broadband communications cables extending between buildings and also the supports or attachment fixtures shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which

they may be subjected.
Exception: Where a network-powered broadband communications cable does not have sufficient strength to be self-supporting, it shall be attached to a supporting messenger cable that, together with the attachment fixtures or supports, shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.

(G ~~I~~) On Buildings. Where attached to buildings, network-powered broadband communications cables shall be securely fastened in such a manner that they are separated from other conductors in accordance with 830.44(I)(1) through (I)(4).

(1) Electric Light or Power. The network-powered broadband communications cable shall have a separation of at least 100 mm (4 in.) from electric light, power, Class 1, or non–power-limited fire alarm circuit conductors not in raceway or cable, or be permanently separated from conductors of the other system by a continuous and firmly fixed nonconductor in addition to the insulation on the wires.

(2) Other Communications Systems. Network-powered broadband communications cables shall be installed so that there will be no unnecessary interference in the maintenance of the separate systems. In no case shall the conductors, cables, messenger strand, or equipment of one system cause abrasion to the conductors, cables, messenger strand, or equipment of any other system.

(3) Lightning Conductors. Where practicable, a separation of at least 1.8 m (6 ft) shall be maintained between any network-powered broadband communications cable and lightning conductors.

(4) Protection from Damage. Network-powered broadband communications cables attached to buildings and located within 2.5 m (8 ft) of finished grade shall be protected by enclosures, raceways, or other approved means.

Exception: A low-power network-powered broadband communications circuit that is equipped with a listed fault protection device, appropriate to the network-powered broadband communications cable used, and located on the network side of the network-powered broadband communications cable being protected.

Substantiation: The objective of this proposal is to improve the parallelism of sections 800.44, 820.44 and 830.44.

Sections 800.44 and 820.44 use the term "aerial" in the title and 830.44 uses "overhead". The exception to 800.133(B) uses "overhead (aerial)", which seems like a reasonable clarification, so this proposal uses "overhead (aerial)" in place of "overhead" and "aerial".

In order to improve parallelism, this proposal rearranges the parts of these sections and adds a new section "climbing space" to 820.44. The proposal is part editorial (rearrangement) and part technical (adding "climbing space").

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.

Ballot Results: Affirmative: 16

16-127 Log #4516 NEC-P16 **Final Action: Reject**
(800.44(B))

Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)

Recommendation: Revise text to read as follows:

Communications wires and cables shall have a vertical clearance of not less than 2.5 m (8 ft)~~. from all points of roofs above which they pass~~ <u>above the roof surface</u>.

Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.

This revision offers consistency with section 230.24(A). Note that the second sentence from 230.24(A) is not included here because it does not apply to low voltage wiring.

Panel Meeting Action: Reject

Panel Statement: The present text provides for clearance above all points of a roof over which they pass. The suggested revision, "above the roof surface", may be interpreted as meaning only the flat or sloped portion of the roof, excluding higher points such as the ridge, dormers and cupolas.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-128 Log #2108 NEC-P16 **Final Action: Accept**
(800.47)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group

Recommendation: Revise text to read as follows:

800.47 Underground ~~Circuits~~ <u>Communications Wires and Cables</u> Entering Buildings.

Underground communications wires and cables entering buildings shall comply with 800.47(A) and (B).

Substantiation: This is an editorial proposal. It will improve clarity.

Communications wires and cables enter the buildings to feed the circuits. The circuits themselves are not entering the building.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-129 Log #2470 NEC-P16 **Final Action: Accept in Principle**
(800.47)

Submitter: Gerald Lee Dorna, Belden Wire & Cable

Recommendation: Revise text to read as follows:

After the first sentence of "800.47 Underground Circuits Entering Buildings" add the following sentence. <u>The requirements of 310.8(B) and 310.8(C) shall not apply.</u>

Rather than enter another Proposal, if CMP-16 would rather put the above new sentence after 800.110, it would meet the proposal's intent.

Substantiation: We get calls all the time from our customers who are telling us that the local inspector is reading "800.110 Raceways for Communications Wires and Cables" and telling our customers that the Communications Wires and Cables have to meet "300.5(B) Wet Locations" since it is an underground installation which refers the reader to "310.8(C)" because in 800.110 it says the raceway shall be installed in accordance with Chapter 3. We have tried to explain that it is only the raceway that is to be per Chapter 3 and that Chapter 8 is a stand alone chapter. There is no such thing as a wet rated Communications Wire or Cable in the Standard UL-444 document.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

800.47 Underground Circuits Entering Buildings.

Underground communications wires and cables entering buildings shall comply with 800.47(A) and (B). <u>The requirements of 310.8(C) shall not apply to communications wires and cables.</u>

Panel Statement: The panel action meets the submitter's intent.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-130 Log #2109 NEC-P16 **Final Action: Accept in Principle**
(800.48)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group

Recommendation: Revise text to read as follows:

800.48 Unlisted Cables Entering Buildings.

Unlisted outside plant communications cables shall be permitted to be installed in <u>building spaces other than risers, air ducts, plenums and other spaces used for environmental air,</u> ~~locations as described in 800.154(C)~~ where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.

Substantiation: This proposal is editorial clarification. The locations described in 800.154(C) are risers, air ducts, plenums and other spaces used for environmental air.

This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept in Principle

Revise recommendation text to read as follows:

800.48 Unlisted Cables Entering Buildings. Unlisted outside plant communications cables shall be permitted to be installed in building spaces other than risers, ducts used for environmental air, plenums used for environmental air, and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.

Panel Statement: The revised text adds clarity and meets the intent of the submitter.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-131 Log #4515 NEC-P16 **Final Action: Reject**
(800.48)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
800.48 Unlisted Cables Entering Buildings
Unlisted outside plant communications cables shall be permitted to be installed in locations as described in 800.154(C) where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) ~~and the cable enters the building from the outside~~ and is terminated in an enclosure or on a listed primary protector.
FPN No. 1: Splice cases or terminal boxes, both metallic and plastic types, are typically used as enclosures for splicing or terminating telephone cables.
FPN No. 2: This section limits the length of unlisted outside plant cable to 15 m (50 ft), while 800.90(B) requires that the primary protector be located as close as practicable to the point at which the cable enters the building. ~~Therefore, i~~In installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.
The phrase has been eliminated from the text of the code because the provision already states that it is "measured from its point of entrance". This proposal eliminates the redundancy. In FPN No. 2, the term "therefore" is not needed.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 9 Negative: 7
Explanation of Negative:
BOYER, J.: Acceptance of proposal 16-131 would conflict with the panel action on proposal 16-130.
This negative vote will also favorably create parallelism with 770.48 and 820.48.
BRUNSSEN, J.: This requirement is intended to apply only to unlisted outside plant cables that enter from the outside. The requirement was originally introduced to provide relief from requiring multiple splices, one immediately upon entering the building to convert from unlisted to listed cable, and another only a short distance further (50 feet or less) at the 'telephone closet'. The definition of "Point of Entrance" in 800.2 is not restricted to cables entering from the outside. The '50-foot rule' is not intended to permit general use of unlisted outside plant cable within the building. The text that is proposed to be deleted ("and the cable enters the building from the outside") reinforces that the 50-foot allowance applies **only** to cables entering from the outside and should remain.
DORNA, G.: I agree with Mr. Brunssen. Furthermore, acceptance of this proposal would conflict with the panel action on Proposal 16-130. Acceptance of this proposal would also result in lack of parallelism with 770.48 and 820.48 because the submitter did not submit correlating proposals for 770.48 and 820.48.
ESEMPLARE, R.: I agree with Mr. Brunssen's comment on vote. Furthermore, acceptance of this proposal would conflict with the panel action on proposal 16-130. Acceptance on this proposal would also result in lack of parallelism with 770.48 and 820.48 because the submitter did not submit correlating proposals for 770.48 and 820.48.
IVANS, R.: I agree with Mr. Brunssen's comments concerning his negative vote. Furthermore, acceptance of this proposal would conflict with the panel action on proposal 16-130. Acceptance on this
proposal would also result in lack of parallelism with 770.48 and 820.48 because the submitter did not submit correlating proposals for 770.48 and 820.48.
OHDE, H.: We agree with Mr. Brunssen as this requirement was not intended to permit general use of unlisted outside plant cable within the building.
PIRKLE, W.: I agree with Mr. Brunssen's comment on vote. Acceptance of this proposal would conflict with the panel action taken on Proposal 16-130 resulting in a lack of parallelism with 770.48 and 820.48. The submitter did not submit correlating proposals for 770.48 and 820.48.

16-132 Log #4512 NEC-P16 **Final Action: Accept**
(800.50(B))

Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
800.50(B) On Buildings
Communications wires and cables in accordance with 800.50(A) shall be separated at least 100 mm (4 in.) from electric light or power conductors not in a raceway or cable or be permanently separated from conductors of the other systems by a continuous and firmly fixed nonconductor in addition to the insulation on the wires, such as porcelain tubes or flexible tubing...
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.
The term "system" should be plural. This appears to be editorial.

(800.90(1)(a))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "current-carrying capacity" to "ampacity".
Substantiation: Editorial. The Style Manual specifies ampacity is the term to be used for current-carrying capacity of conductors.
Panel Meeting Action: Reject
Panel Statement: Communications protectors and communications grounding conductors are subject to transient conditions resulting from power fault and lightning events. "Ampacity" applies to a continuous (i.e. steady-state) condition and is an inappropriate term in this context (see Article 100).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-135 Log #400 NEC-P16 **Final Action: Accept**
(800.90(A), FPN 2(3))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change "per" to "each".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-136 Log #3096 NEC-P16 **Final Action: Reject**
(800.90(A)(1))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal since the phrase "effectively grounded" is no longer defined in the NEC.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(a) Text to remain unchanged
(b) Where insulated conductors in accordance with 800.50(A) are used to extend circuits to a building from a cable with a~~n effectively~~ grounded metallic sheath member(s) and where the conductors in the cable or cable stub, or the connections between the insulated conductors and the plant exposed to accidental contact with electric light or power conductors operating at greater than 300 volts to ground, safely fuse on all currents greater than the current-carrying capacity of the primary protector, or the associated insulated conductors and of the primary protector grounding conductor.
(c) Text to remain unchanged.
(d) Text to remain unchanged.
(e) Where insulated conductors in accordance with 800.50(A) are used to extend circuits to a building from cable with a~~n effectively~~ grounded metallic sheath member(s), and where (1) the combination of the primary protector and insulated conductors is listed as being suitable for this purpose for application with circuits extending from a cable with a~~n effectively~~ grounded metallic sheath member(s), and (2) the insulated conductors safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor.
Substantiation: The term "effectively grounded" is no longer used in the Code. This proposal simply finishes the work that was begun in the 2008 NEC.
Panel Meeting Action: Reject
Panel Statement: The term "effectively grounded" is defined in the National Electrical Safety Code (NESC) as "Intentionally connected to earth through a ground connection...". It is used extensively in that document and should remain.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-137 Log #168 NEC-P16 **Final Action: Accept**
(800.90(A)(1), FPN)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Change "telecommunications" to "communications".
Substantiation: Throughout Article 800 the term "communications" is used rather than "telecommunications". Also, Article 100 defines "Communications Equipment" not "Telecommunications Equipment". Use of terminology should be consistent throughout the article.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-138 Log #2110 NEC-P16 **Final Action: Accept**
(800.90(C))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise the following:
(C) Hazardous (Classified) Locations. The primary protector shall not be located in any hazardous (classified) locations as defined in 500.5 and 505.5 or in the vicinity of easily ignitable material.
Exception: As permitted in 501.50, 502.150 and 503.150.
Substantiation: This is a clarification proposal. It is editorial and technical.
CMP 16 was instructed by the Technical Correlating Committee during the 2008 NEC ROP process to consider not only the different hazardous location division applications (500.5) but also the different hazardous location zone applications (505.5). This directive was issued for 2008 Proposal 16-121 which dealt with 800.3(A). This reference of 505.5 should be added here as well to correlate with all related sections that references these defined hazardous locations and hazardous location zones.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-139 Log #4561 NEC-P16 **Final Action: Reject**
(800.100 (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Add the following new text:
800.100 Grounding. Article 250 covers the general requirements for grounding and bonding of communications circuits and their associated electrical installations, and the specific requirements in (1) through (5), unless otherwise indicated in 800.100(A) through (D).
(1) Systems, circuits, and equipment required, permitted, or not permitted to be grounded
(2) Circuit conductor to be grounded on grounded systems
(3) Location of grounding connections
(4) Types and sizes of grounding and bonding conductors and electrodes
(5) Methods of grounding and bonding
800.101 ~~800.100~~ Cable and Primary Protector Grounding.
The primary protector and the metallic member(s) of the cable sheath shall be grounded as specified in 800.101(A) through (D) ~~800.100(A) through (D)~~.
(A) Grounding Conductor. *(no change to text except for renumbering section 800.100 to section 800.101)*
(B) Electrode. *(no change to text except for renumbering section 800.100 to section 800.101)*
(C) Electrode Connection. *(no change to text)*
(D) Bonding of Electrodes. *(no change to text)*
Substantiation: This proposal recommends wording to ensure that communications circuits appropriately comply with the grounding and bonding requirements of article 250, while recommending that Article 800 include specific requirements associated with communications circuits. This change is needed because Chapter 8 is independent of Chapters 1 through 4 and thus Article 250 on grounding. Please note that "medium power wiring" is included in Article 800 and not just low power wiring and that brings some additional needs.
Panel Meeting Action: Reject
Panel Statement: The NEC Style Manual, Section 4.1.1, prohibits reference to complete articles. A blanket statement referencing Article 250 is redundant as communications grounding requirements are fully covered in Article 800, IV. Grounding Methods, with specific reference to the applicable sections of Article 250 contained throughout Sections 800.100(B) and (C).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-140 Log #3097 NEC-P16 **Final Action: Accept in Principle**
(800.100(A)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(1) Listing ~~Insulation~~. The grounding conductor ~~shall be insulated and~~ shall be listed.
Substantiation: There is no electrical reason that this conductor should be required to be insulated. This proposal provides consistency with nearly every other grounding/bonding related section of the code.
Panel Meeting Action: Accept in Principle
Revise 800.100(A)(1) to read as follows:
(1) Insulation. The grounding conductor shall be listed and shall be permitted to be insulated, covered, or bare.
Panel Statement: The grounding conductor does not need to be insulated but for esthetic reasons, such as exposed grounding conductors routed within a premises, insulation or covering may be appropriate. Adding 'covered' accommodates Proposal 16-141. Permitting all three, "insulated, covered, or bare" will clarify that all three are now permitted since for many years only an insulated conductor was permitted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-141 Log #4394 NEC-P16 **Final Action: Accept in Principle in Part**
(800.100(A)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal.
This action will be considered by the panel as a public comment.
Submitter: Jake Killinger, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
800.100 Cable and Primary Protector Grounding.
The primary protector and the metallic member(s) of the cable sheath shall be grounded as specified in 800.100(A) through (D).
(A) Grounding Conductor.
(1) ~~Insulation~~Insulated or Covered Conductors. The grounding conductor shall be permitted to be insulated, or covered and ~~shall be~~ listed as Protector Grounding Conductors.
(remaining text remains unchanged)
Substantiation: The existing text would require fully insulated and Listed conductors for cable and primary protector grounding whereas in most other cases, bare conductors are usually adequate for most grounding purposes. Prior to the 1990 NEC, protective grounding conductors were required to have 30 mil rubber insulation and be covered by a fibrous covering. It also permitted conductors Listed for this use having less than 30 mil rubber insulation or having other kinds of insulation. In 1990 the NEC removed the thickness statements so that it read the grounding conductor shall be insulated and shall be listed as suitable for the purpose. In 2008, the suitable for the purpose clause was removed.
Discussions with past members of this CMP revealed that the reason for specifying insulated conductors was only to combat theft of uncovered copper wire. That being the case, thinner insulated conductor was permitted so long as it gave the same illusion of a conductor carrying power.
Listed Protector Grounding Conductors having less than the full insulation of Listed and insulated conductors exist today. These are based on the past allowances for thinner insulations. The 2008NEC text would literally not permit the use of these thinner walled insulated conductors and would make their certification obsolete.
If the reason for using the term ‘insulated’ was merely to provide a theft deterrent, then fully insulated wire is unnecessary. By definition in Article 100, only a “covered” conductor would be more than adequate. Therefore propose changing the text to permit both “insulated as well as “covered” conductors.
Also propose adding “Protector Grounding Conductor” to help identify the type of Listed products suitable in this application. These “Protector Grounding Conductors” are surface marked with this terminology to make it clear that they are listed only for this purpose and are not intended for general use with other Articles in the Code. They are presently certified under UL’s KDER category, but may be relocated to the KDSH (Grounding and Bonding Equipment – Communication) category to make their restricted use more obvious.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: Accept in principle the part to add “covered”. See panel action and statement on Proposal 16-140, which now permits the use of listed insulated, covered, or bare conductors. The title is left as “insulation” since the paragraph now deals with levels of insulation.
Reject the parts adding the phrases “permitted to be” and “as a protector grounding conductor”. The panel does not want to restrict the listed wire to only listed “protector grounding conductors”.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-141a Log #CP1604 NEC-P16 **Final Action: Accept**
(800.100(A)(3))

Submitter: Code-Making Panel 16,
Recommendation: Add the following additional text:
(3) Size. The grounding conductor shall not be smaller than 14 AWG. <u>It shall have a current-carrying capacity not less than the grounded metallic sheath member(s) and protected conductor(s) of the communications cable. The grounding conductor shall not be required to exceed 6 AWG.</u>
Substantiation: This change correlates 800.100(A)(3) with similar changes in 770.100(A)(3), 820.100(A)(3) and 830.100(A)(3). See Panel Action on Proposals 16-255 and 16-322. See panel Proposal 16-30a.

16-142 Log #4514 NEC-P16 **Final Action: Reject**
(800.100(A)(4))

Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
800.100 (A)(4) Length. The primary protector grounding conductor shall be as short as practicable. In one- and two-family dwellings, the primary protector grounding conductor shall ~~be as short as practicable,~~ not ~~to~~ exceed 6.0 m (20 ft) in length.
FPN: Similar grounding conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building’s power and communications systems during lightning events.
Exception: In one- and two-family dwellings where it is not practicable to <u>limit</u> ~~achieve~~ an overall maximum primary protector grounding conductor length <u>to</u> ~~of~~ 6.0 m (20 ft)…
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee’s endorsement.
Deleting the repeated phrase “be as short as practicable” in item (4) will eliminate redundancy, as this has already been addressed by the first sentence. Deleting this phrase will also clarify that the code limits the conductor to 20 ft or less in one- and two-family dwellings.
As written in the code, the exception appears to conflicts with item (4) above. The objective of item (4) is to limit the length of the primary protector grounding conductor to 20 ft to reduce the fire and shock hazard as described in the NEC Handbook. As written, the exception implies that the objective of item (4) is to reach a maximum length of 20 ft. This revision to the exception clarifies that the objective is to limit the length to 20 ft.
Panel Meeting Action: Reject
Panel Statement: The objective of 800.100(A)(4) is to encourage minimizing the length of the communications grounding conductor, but not be overly restrictive. In many instances it is impossible to limit the conductor to a maximum of 20 ft. This might occur when power enters on one side of the building and communications on the other. In such cases the installer must be given a workable solution, which is provided in the exception.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-143 Log #3727 NEC-P16 **Final Action: Accept in Principle in Part**
(800.100(A)(4) Exception)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 800.100(A)(4), Exception as follows:
Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector grounding conductor length of 6.0 m (20 ft), <u>one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and used as a separate communications electrode.</u> ~~a separate communications ground rod meeting the minimum dimensional criteria of 800.100(B)(2)(2) shall be driven, t~~ The primary protector shall be connected to the communications ~~ground rod~~ <u>electrode(s)</u> in accordance with 800.100(C), and the communications ~~ground rod~~ <u>electrode(s)</u> shall be connected to the power grounding electrode system in accordance with 800.100(D).
Substantiation: The current reference in this exception to 800.100(B)(2)(2) addressing a ground rod is incorrect as 800.100(B)(2)(2) addresses the attachment location of a grounding electrode conductor to an interior metal water pipe. In addition, it must be assumed that in the case of this exception a grounding electrode is not available within 20 feet of the communications system installation and that an electrode is required to be installed and utilized. A ground rod is only one such electrode that can be installed therefore this exception should reference all electrodes that are practicable in such necessary installations.
In addition, the requirements of this section should state that where a grounding electrode is required to be installed, the electrode installed should be a ground ring, rod, pipe, plate, or other underground metal structure that is recognized by Article 250 and more specifically 250.52(A)(4), (A)(5), (A)(6), (A)(7), and (A)(8). This revision would bring the electrode requirements included in this exception into line with the requirements of Article 250 for both consistency and for technical application.
Panel Meeting Action: Accept in Principle in Part
Revise existing exception as follows:
“*Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector grounding conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 800.100(B)~~(2)~~<u>(3)</u>(2) shall be driven, the primary protector shall be connected to the communications ground rod in accordance with 800.100(C), and the communications ground rod shall be connected to the power grounding electrode system in accordance with 800.100(D).*”
Reject the remainder of the proposal.
Panel Statement: Referencing the grounding electrodes in 250.52(A)(4) through (A)(8) is unnecessary as:
1. 800.100(B)(1) through (3) presents a logical sequence for selecting the appropriate telecom grounding electrode, in order of preference. The first choice is the Intersystem Bonding Termination (introduced in the 2008 NEC), where available. The second choice is one of the electrodes of 800.100(B)(2). If none of the above are available, then an electrode as specified in 800.100(B)(3) is selected, some of which are contained in 250.52(A).
2. The electrodes identified in 250.52(A)(4) through (A)(8) are intended for power system applications. Telecom system currents are small, typically less than 100 mA. Where telecom circuits are subjected to power contact, currents are limited by the equivalent small gauge of the communications conductors, precluding the need for expansive and expensive grounding electrodes.

3. The submitter has provided no technical substantiation for revising the telecom grounding criteria and eliminating the 5-ft telecom ground rod that has been used successfully and safely by the telecom industry for decades.

4. Increasing the diameter and length of the telecom ground rod has minimal impact on grounding resistance (see panel substantiation for Proposal 16-151).

5. The most important safety aspect is the bonding together of the power and telecom systems. When bonded together as specified in 800.100(D), intersystem voltages are equalized and the telecom grounding electrode, if separate, becomes part of the grounding electrode system at the premises.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-144 Log #944 NEC-P16 **Final Action: Reject**
(800.100(A)(6))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: The grounding conductor shall be protected by identified means where likely to be subject to physical damage. Where the grounding conductor is run in a metal raceway or cable armor, or the metal enclosure, the grounding conductor shall be bonded to the raceway, armor, or enclosure at the point where it emerges from the raceway, armor, or enclosure, and to the same electrode and terminal to which it is connected. Bonding jumpers shall have an ampacity not less than the grounding conductor.
Substantiation: Editorial.
Panel Meeting Action: Reject
Panel Statement: The proposal is not editorial, as the submitter states, and provides no improvement in clarity over the existing text. Bonding of the grounding conductor to a ferrous metal raceway at both ends is performed to reduce inductance (reactance) effects. Such effects do not apply to metal enclosures, such as a junction box. The subject of the section is protection from physical damage; addressing bonding jumper ampacity in this section is inappropriate.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-145 Log #3311 NEC-P16 **Final Action: Reject**
(800.100(A)(6))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: The grounding conductor shall be protected by ~~approved~~ identified means where likely to be subject to physical damage. Where the grounding conductor is run in a metal raceway the raceway shall be nonflexible type with ~~both~~ each end of the raceway bonded to the same terminal or electrode to which the grounding conductor is connected. Where a bonding jumper is used it shall not be smaller than the grounding conductor. These bonding requirements shall also apply where an armored grounding conductor is used.
Substantiation: There may be no exposure to physical damage when the grounding conductor is first installed, but a likelihood of damage. Raceways should be specified as nonflexible to correlate with 250.64(B). Bonding jumper size should be specified to correlate with 250.64(E).
Panel Meeting Action: Reject
Panel Statement: The submitter is proposing to revise text that is not present in the 2008 NEC. See panel action on Proposal 16-144.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-146 Log #195 NEC-P16 **Final Action: Accept**
(800.100(B))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal as the existing numbering complies with the NEC Style Manual and, is consistent with other lists in the code.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Renumber 800.100(B) as shown.

(B) Electrode. The grounding conductor shall be connected in accordance with 800.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination, the grounding conductor shall be connected to the intersystem bonding termination.

(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:

(~~1~~a) The building or structure grounding electrode system as covered in 250.50

(~~2~~b) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(~~3~~c) The power service accessible means external to enclosures as covered in 250.94

(~~4~~d) The metallic power service raceway

(~~5~~e) The service equipment enclosure

(~~6~~f) The grounding electrode conductor or the grounding electrode conductor metal enclosure

(~~7~~g) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is nonremovable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 800.90(B), shall be considered accessible.

(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 800.100(B)(2), the grounding conductor shall be connected to either of the following:

(~~1~~a) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(~~2~~b) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 800.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(7), and (A)(8) or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.

Substantiation: The current numbering is not in compliance with the style manual. See section 2.1.5.3 of the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-147 Log #1497 NEC-P16 **Final Action: Accept**
(800.100(B)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify that the panel action text on this proposal does not change “intersystem bonding termination” to “intersystem grounding termination” in the title and in the text of the requirement.
This action will be considered by the panel as a public comment.
Submitter: L. Keith Lofland, IAEI
Recommendation: Revise text as follows:

800.100(B)(1) In Buildings or Structures with an Intersystem Grounding Termination. If the building or structure served has an intersystem grounding termination as required by 250.94, the grounding conductor shall be connected to the intersystem grounding termination.

Substantiation: A link needs to be provided between 800.100(B)(1) and 250.94. Section 250.94 requires an external intersystem bonding termination. As 90.3 states, Chapter 8 is not subject to the requirements of Chapters 1-7 except where the requirements are specifically referenced in Chapter 8.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-148 Log #1129 NEC-P16 **Final Action: Accept**
(800.100(B)(1), FPN (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Add the FPN following 800.100(B) (1):
FPN: See Article 100 for the definition of *Intersystem Bonding Termination.*
Substantiation: *Intersystem Bonding Termination* is a new and unfamiliar term introduced in the 2008 NEC. The FPN reference to Article 100 will help ensure that NEC users not only become familiar with the new terminology, but encourage application of this preferred intersystem bonding arrangement as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-149 Log #3310 NEC-P16 **Final Action: Accept in Principle in Part**
(800.100(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (3) The ~~power~~ electric service accessible means external to enclosures as covered in 250.94.
(4) The nonflexible ~~power~~ electric service raceway.
(6) The grounding electrode conductor or the grounding electrode conductor nonflexible metal enclosure.
Substantiation: "Power" may infer this provision doesn't apply where the electric service is only for lighting. Flexible metal service raceways and flexible metal armor of grounding conductors do not seem suitable for connection of ground clamps.
Panel Meeting Action: Accept in Principle in Part
Revise 800.100(B)(2)(4) as follows:
(4) The nonflexible metallic power service raceway.
Reject the remainder of the recommendation.
Panel Statement: The panel accepts in principle the part adding "nonflexible" in (4). The panel rejects the part replacing "power" with "electric" in (4). The panel rejects adding "nonflexible" to modify metal enclosures in (6) as it does not improve clarity.
See panel action and statement on Proposal 16-35.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-150 Log #3098 NEC-P16 **Final Action: Reject**
(800.100(B)(2)(3))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(2) Text to remain unchanged.
(1) Text to remain unchanged.
(2) Text to remain unchanged.
~~(3) The power service accessible means external to enclosures as covered in 250.94~~
~~(4)~~ (3) Text to remain unchanged.
~~(5)~~ (4) Text to remain unchanged.
~~(6)~~ (5) Text to remain unchanged.
~~(7)~~ (6) Text to remain unchanged.
A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is nonremovable.
For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 800.90(B), shall be considered accessible.
Substantiation: The item being discussed in (3) is the item covered in 800.100(B)(1), so there is no reason for it to be in 800.100(B)(2).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-34.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-151 Log #3726 NEC-P16 **Final Action: Reject**
(800.100(B)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 800.100(B)(3)(1) as follows:
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 800.100(B)(2), one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and used with the requirements of 250.56 being applicable to rod, pipe, and plate electrode installations. ~~the grounding conductor shall be connected to either of the following:~~
~~(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4).~~
~~(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 800.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(7), and (A)(8) or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.~~
Substantiation: The requirement in existing 800.100(B)(3)(1) to connect the grounding electrode conductor to either a metal underground water pipe, the metal frame of a building or structure, a concrete-encased electrode, or a ground ring seems to require these electrodes to be installed as the subject of this section is **"Buildings or Structures Without …. Grounding Means."** This is not consistent with 250.50 that only requires the use of such electrodes where they are "present at each building or structure served." In addition, the first sentence of 800.100(B)(3)(2) is not a complete sentence, is simply a list of references, and thus has no meaning. In addition, it allows either a rod or pipe electrode to be used that is only 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter and driven where practicable into permanently damp earth. Into permanent damp earth is a good requirement but is doubtfully attained with a ½ in. rod or ½ in. pipe 5 ft in length.
The requirements of this section should state that where a building or structure is without grounding means, it is to have such reasonable grounding means installed such as a ground ring, rod, pipe, plate, or other underground metal structure that is recognized by Article 250 and more specifically 250.52(A)(4), (A)(5), (A)(6), (A)(7), and (A)(8). Also, 250.56 already requires that rod, pipe, and plate electrodes that do not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 250.52(A)(4) through (A)(8), and that where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart. This revision would bring the grounding of communications circuits into line with the requirements of Article 250 for both consistency and for technical application.
In addition 250.60 already states, "Air terminal conductors and driven pipes, rods, or plate electrodes used for grounding air terminals shall not be used in lieu of the grounding electrodes required by 250.50 for grounding wiring systems and equipment." With the revisions being sought, these revisions would also prohibit other possible electrodes not recognized by 250.52.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation for eliminating the 5-ft telecom ground rod, currently permitted by 800.100(B)(3)(2), that has been used successfully and safely by the telecom industry for decades. The tutorial, The ABCs of Grounding and Bonding, states: "Very little resistance change will result from using larger sizes of electrodes." The most important safety aspect is the bonding together of the power and telecom systems. When bonded together as specified in 800.100(D), intersystem voltages are equalized and the telecom grounding electrode, if separate, becomes part of the grounding electrode system at the premises.
The electrodes identified in 250.52(A)(4) through (A)(8), as proposed by the submitter, are intended for power system applications. Telecom system currents are small, typically less than 100 mA. Where power contact to telecom circuits is of concern (i.e., power fault) currents are limited by the equivalent small gauge of the telecom conductors, precluding the need for expansive and expensive grounding electrodes.
Finally, the title of 800.100(B)(3), "In Buildings or Structures Without …… Grounding Means" must be considered in context with the preceding Section 800.100(B)(2) where specific grounding means at the building or structure are identified.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-152 Log #1130 NEC-P16 **Final Action: Accept**
(800.100(B)(3)(2))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise the last sentence of 800.100 (B)(3)(2) as follows:
Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors and grounded metallic members.
Substantiation: Steam and hot water pipes may be rendered electrically discontinuous by installation of non-conductive equipment such as valves and hot water heaters, making them ineffective as a grounding means. Air terminal conductors (lightning-rod conductors) are subject to large voltages and currents during lightning events, may introduce such voltages and currents into the systems being connected to them, and are dangerous and inappropriate as a grounding means. See 250.60. The proposed revision provides correlation with 830.100(B)(3)(2).
Panel Meeting Action: Accept

Ballot Results: Affirmative: 16

16-153 Log #948 NEC-P16 **Final Action: Reject**
(800.100(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
A copyright bonding jumper not smaller than 6 AWG ~~copper or equivalent~~ or a corrosion resistant conductor with equal or greater ampacity. Shall be connected between...". (remainder unchanged)
Substantiation: Edit. "Equivalent" is a term to be avoided by the Style Manual and is subjective. Section 800.100(A)(2) specified a grounding conductor to be corrosion-resistant, which should also apply to bonding jumpers.
Panel Meeting Action: Reject
Panel Statement: The NEC Style Manual does not prohibit the use of the term "equivalent", but states in Section 3.2.1 that it's use "… shall be reviewed in context and if the resulting requirement is unenforceable or vague, the term shall not be used." In the context of 800.100(D), it is perfectly clear that the term "equivalent" means a conductor of comparable electrical (i.e., current-carrying capacity) and physical (i.e., corrosion resistance) properties. The proposed editorial changes do not improve clarity.

(800.110)

NOTE: This proposal appeared as Comment 16-135 on Proposal 16-171 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-171 was:
Revise as follows:
800.110 Raceways for Communications Wires and Cables.
Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum communications raceway, listed riser communications raceway, or listed general-purpose communications raceway installed in accordance with 800.154, and ~~a listed nonmetallic raceway complying with 800.182, and installed in accordance~~ with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Exception: Conduit fill restrictions shall not apply.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: The panel action on the Proposal should continue to be Accept in Principle, however, the following additional changes should be made to the panel action:
Revise 800.110 as shown:
800.110 Raceways for Communications Wires and Cables. Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a ~~listed plenum~~ communications raceway listed in accordance with 800.182 and~~, listed riser communications raceway, or listed general purpose communications raceway~~ installed in accordance with 800.154~~, and a listed nonmetallic raceway complying with 800.182,~~ and ~~installed in accordance with 362.24~~ 362.22 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. ~~The raceway fill tables of Chapter 3 and Chapters shall not apply.~~
Substantiation: The revisions in the first sentence clarify that the listing requirements are specified in 800.182 and the installation requirements in 800.154. 362.22 should also apply if the requirements for ENT are to be utilized.
Revising the text as proposed will still permit the installation of communications wires and cables in communications raceways (plenum riser, or general-purpose) or in any type of listed raceway permitted in Chapter 3 without adding additional text to the Code.
Using the term "listed communications raceways" will also permit the installation of other types of listed communications raceways that may be included in future Codes without having to revise 800.110.
The Exception should have been deleted rather than including it as positive text in the last sentence.
No substantiation was submitted to support the deletion of the conduit fill restrictions or raceway fill tables of Chapters 3 and 9. The fill restrictions are based on the physical limitations of being able to pull conductors or cables into raceways without damaging the conductors or cables, particularly when there are bends in the run, and to avoid conductor/cable jamming. The maximum percentage fill requirements are independent of whether they are electrical conductors or not.
The maximum percentage fill requirements in Chapters 3 and 9 are an integral part of the permitted uses of the raceways contained in Chapter 3 and if conductors or cables are to be installed in a Chapter 3 raceway, then the maximum percentage fill requirements must also apply.
The first sentence in 800.110, as modified by the panel action, already states "installed in accordance with Chapter 3" which would include all of Chapter 3 requirements pertaining to raceways including the maximum percentage fill limitations in Chapter 9. The proposal introduces conflicting requirements between the two sentences in 800.110.
Chapter 9, Table 1 permits 53 percent fill when one conductor or cable is installed in a raceway; 31 percent for two; and 40 percent for three or more.
The panel action to change "conduit" to "raceway" was appropriate since raceway is defined in Article 100 and includes, but is not limited to, conduit and tubing. Also, 800.110 references the applicable Sections of Article 362 which addresses Electrical Nonmetallic Tubing (ENT).
Panel Meeting Action: Accept in Principle
Panel Statement: See Proposal 16-159, which reorganizes this section for greater clarity and meets the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-157 Log #34 NEC-P16 **Final Action: Accept in Principle**
(800.110)

NOTE: This proposal appeared as Comment 16-136 on Proposal 16-173 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-173 was:
Add the specific paragraph references as shown:
800.110 Raceways for Communications Wires and Cables.
Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a listed nonmetallic raceway complying with 800.182(A), (B) or (C), as applicable, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Exception: Conduit fill restrictions shall not apply.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: The Proposal should have been Accepted in Principle and the panel action revised as stated in my Comment on Proposal 16-171.
Substantiation: See substantiation on my Comment on Proposal 16-171.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-159, which revises this section for greater clarity and addresses the submitter's concern.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-158 Log #1749 NEC-P16 **Final Action: Reject**
(800.110)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Where communication wires and or cables are installed in a raceway, auxiliary gutter, or cable tray, the applicable provisions of the wiring method used shall apply. ~~the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3~~ or a listed general purpose...". (remainder unchanged).

The ~~raceway~~ conductor fill ~~tables of Chapter 3 and Chapter 9~~ requirements for raceways, auxiliary gutters, boxes, and other enclosures shall not apply.
Substantiation: Auxiliary gutters (not listed as a raceway in Article 100 definition of raceway) and cable trays should be included. If conductor fill requirements for raceways are excluded, it should also apply to boxes and other enclosures such as conduit bodies. There are no raceway fill tables in Chapter 3.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation to justify the change.

(800.110)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise 800.110 as follows:
800.110 Raceways for Communications Wires and Cables.
(A) Types of Raceways.
Communication wires and cables shall be permitted to be installed in any raceway that complies with either (A)(1) or (A)(2).
(1) Chapter 3 Raceways. ~~Where~~ Communications wires and cables shall be permitted to be ~~are~~ installed in ~~a~~ any raceway, ~~the raceway shall be either of a type~~ included ~~permitted~~ in Chapter 3. The raceways shall be ~~and~~ installed in accordance with the requirements of Chapter 3.
(2) Other Permitted Raceways. ~~or~~ Communications wires and cables shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway selected in accordance with the provisions of 800.113 ~~800.154~~, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
(B) Raceway Fill for Communications Wires and Cables. Raceway fill ~~tables~~ requirements of Chapter 3 and Chapter 9 shall not apply to communications wires and cables.
Substantiation: This revision is both editorial and technical. The addition of the two first level subdivisions (A) Types of Raceways and (B) Raceway Fill for Communications Wires and Cables and their second level subdivisions provides more clarity and make the section as self-sufficient as possible. Replacing the word "tables" by the word " requirements" is more appropriate as Chapter 3 has no raceway tables. However, Chapter 3 provides the raceway fill requirements which direct the code user to Chapter 9 for the conduit fill tables.

This proposal coordinates with the task group's proposal to move the cable and raceway installation requirements from 800.154 to 800.113.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

DORNA, G.: This proposal contains a cut-and-paste error. It is a companion proposal to 16-47. "Optical fiber raceway" should have been replaced with "communications raceway".

16-160 Log #2102 NEC-P16 **Final Action: Accept in Principle**
(800.113)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Add new text to read as follows:
800.113 Installation of Communications Wires, and Cables and Communications Raceways. Installation of communications wires and cables, and communications raceways shall comply with 800.113 (A) through (L).
(A) Listing. Communications wires and cables installed in buildings shall be listed.

Exception: Communications cables that comply with 800.48 shall not be required to be listed.
(B) Air Ducts and Plenums. The following wires, cables and raceways shall be permitted in air ducts and plenums as described in 300.22(B).

(1) Type CMP

(2) Plenum communications raceway installed in compliance with 800.110

(3) Type CMP installed in plenum communications raceway

(4) Types CMP, CMR, CMG, CM, CMX and listed communications wires installed in raceways that are installed in compliance with 300.22(B)
(C) Other Spaces Used For Environmental Air. The following wires, cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C).

(1) Type CMP

(2) Plenum communications raceway installed in compliance with 800.110

(3) Type CMP installed in plenum communications raceway

(4) Types CMP, CMR, CMG, CM, CMX and listed communications wires installed in raceways that are installed in compliance with 300.22(C)
(D) Risers-Wires and Cables in Vertical Runs. The following wires, cables and raceways shall be permitted in vertical runs penetrating more than one floor and in vertical runs in a shaft:

(1) Types CMP and CMR

(2) Plenum and riser communications raceways installed in compliance with 800.110

(3) Types CMP and CMR installed in plenum or riser communications raceway

FPN: See 800.26 for firestop requirements for floor penetrations.
(E) Risers-Cables in Metal Raceways, Fireproof Shafts and One- and Two-Family Dwellings. The following cables and raceways shall be permitted in metal raceway, in a fireproof shaft with firestops at each floor and in one- and two-family dwellings:

(1) Types CMP, CMR, CMG, CM and CMX

(2) Plenum, riser and general-purpose communications raceways installed in compliance with 800.110

(3) Types CMP, CMR, CMG and CM installed in plenum, riser or general-purpose optical fiber raceway

FPN: See 800.26 for firestop requirements for floor penetrations.
(F) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays.

(1) Types CMP, CMR, CMG and CM

(2) Plenum, riser and general-purpose communications raceways installed in compliance with 800.110

(3) Types CMP, CMR, CMG and CM installed in plenum, riser or general-purpose communications raceway.
(G) Distributing Frames and Cross-Connect Arrays. The following wires and cables shall be permitted to be installed in distributing frames and cross-connect arrays.

(1) Types CMP, CMR, CMG and CM

(2) Listed communications wire
(H) Other Building Locations. The following wires, cables and raceways shall be permitted to be installed in building locations other than the locations covered in 800.113(B) through (G).

(1) Types CMP, CMR, CMG and CM

(2) Plenum, riser and general-purpose communications raceways installed in compliance with 800.110

(3) Types CMP, CMR, CMG and CM installed in plenum, riser or general-purpose communications raceway

(4) Listed communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3

(5) A maximum of 3m (10 ft) of exposed Type CMX in nonconcealed spaces
(I) One- and Two-Family Dwellings. The following cables and raceways shall be permitted to be installed in one- and two-family dwellings in locations other than the locations covered in 800.113(B) through (F).

(1) Types CMP, CMR, CMG, CM and Type CMX less than 6 mm (0.25 in.) in diameter

(2) Plenum riser and general-purpose communications raceways installed in compliance with 800.110

(3) Types CMP, CMR, CMG and CM installed in plenum, riser or general-purpose communications raceway
(J) Multifamily Dwellings. The following cables and raceways shall be permitted to be installed in one- and two-family dwellings in locations other than the locations covered in 800.113(B) through (F).

(1) Types CMP, CMR, CMG, CM

(2) Type CMX less than 6 mm (0.25 in.) in diameter in nonconcealed spaces

(3) Plenum, riser and general-purpose communications raceways installed in compliance with 800.110

(4) Types CMP, CMR, CMG and CM installed in plenum riser or general-purpose communications raceway

(5) Listed communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(K) Under Carpets. Type CMUC undercarpet communications wires and cables shall be permitted to be installed under carpet in locations other than the locations covered in 800.113(B) through (G)

(L) Hybrid Power and Communications Cable. Hybrid power and communications cable listed in accordance with 800.179(I) shall be permitted to be installed in one- and two-family dwellings.

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal moves those installation rules to section 800.113.

A companion proposal for section 800.154 greatly simplifies the statement of the applications of communications cables and raceways by using a table. This proposal and its companion proposal for section 800.154 need to be considered together as a package.

Panel Meeting Action: Accept in Principle

Revise 800.113 text to read as follows:

800.113 Installation of Communications Wires and Cables, Communications Raceways, and Cable Routing Assemblies. Installation of communications wires and cables, communications raceways, and cable routing assemblies shall comply with 800.113 (A) through (K).

(A) Listing. Communications wires and cables, communications raceways, and cable routing assemblies installed in buildings shall be listed.

Exception: Communications cables that comply with 800.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ducts and plenums used for environmental air as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Type CMP cable

(2) Types CMP, CMR, CMG, CM, CMX, and listed communications wires installed in raceways that are installed in compliance with 300.22(B)

FPN: See 4.3.4 and 4.3.11.3.3 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems,* for information on wire and cables in air ducts and apparatus casings plenums. See 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following wires, cables, and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Type CMP

(2) Plenum communications raceway installed in compliance with 800.110

(3) Type CMP installed in plenum communications raceway

(4) Type CMP supported by metallic cable trays or cable tray systems

(5) Types CMP, CMR, CMG, CM, CMX, and listed communications wires installed in raceways that are installed in compliance with 300.22(C)

FPN: See 4.3.11.2, 4.3.11.4 and 4.3.11.5 of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire, cables, and raceways in ceiling cavity, raised floor, and air-handling unit room plenums. See 3.3.22 for plenum definitions.

(D) Risers-Wires and Cables in Vertical Runs. The following wires, cables, and raceways shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types CMP and CMR

(2) Plenum and riser communications raceways installed in compliance with 800.110 and listed riser cable routing assemblies

(3) Types CMP and CMR installed in plenum communications raceway, riser communications raceway, or a listed riser cable routing assembly

FPN: See 800.26 for firestop requirements for floor penetrations.

(E) Risers-Cables in Metal Raceways or Fireproof Shafts. Types CMP, CMR, CMG, CM, and CMX shall be permitted in metal raceway or in a fireproof shaft with firestops at each floor

FPN: See 800.26 for firestop requirements for floor penetrations.

(F) Risers- One- and Two-Family Dwellings. The following cables and raceways shall be permitted in one- and two-family dwellings:

(1) Types CMP, CMR, CMG, and CM

(2) Type CMX less than 6 mm (0.25 in.) in diameter

(3) Plenum, riser, and general-purpose communications raceways installed in compliance with 800.110

(4) Types CMP, CMR, CMG, and CM installed in plenum, riser, or general-purpose communications raceway

(G) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays:

(1) Types CMP, CMR, CMG, and CM

(2) Plenum, riser, and general-purpose communications raceways installed in compliance with 800.110

(3) Types CMP, CMR, CMG, and CM installed in plenum, riser, or general-purpose communications raceway

(H) Distributing Frames and Cross-Connect Arrays. The following wires and cables shall be permitted to be installed in distributing frames and cross-connect arrays:

(1) Types CMP, CMR, CMG, and CM

(2) Listed communications wires

(I) Other Building Locations. The following wires, cables, and raceways shall be permitted to be installed in building locations other than the locations covered in 800.113(B) through (H).

(1) Types CMP, CMR, CMG, and CM

(2) A maximum of 3 m (10 ft) of exposed Type CMX in nonconcealed spaces

(3) Plenum, riser, and general-purpose communications raceways installed in compliance with 800.110

(4) Types CMP, CMR, CMG, and CM installed in plenum, riser or general-purpose communications raceway, or listed riser or general-purpose cable routing assembly

(5) Listed communication wires and Types CMP, CMR, CMG, CM, and CMX and installed in a raceway of a type included in Chapter 3

(6) Type CMUC undercarpet communications wires and cables installed under carpet

(J) Multifamily Dwellings. The following cables and raceways shall be permitted to be installed in multifamily dwellings in locations other than the locations covered in 800.113(B) through (F).

(1) Types CMP, CMR, CMG, CM

(2) Type CMX less than 6 mm (0.25 in.) in diameter in nonconcealed spaces

(3) Plenum, riser, and general-purpose communications raceways installed in compliance with 800.110

(4) Types CMP, CMR, CMG, and CM installed in plenum riser or general-purpose communications raceway

(5) Listed communication wires and Types CMP, CMR, CMG, CM, and CMX and installed in a raceway of a type included in Chapter 3

(6) Type CMUC undercarpet communications wires and cables installed under carpet

(K) One- and Two-Family Dwellings. The following cables and raceways shall be permitted to be installed in one- and two-family dwellings in locations other than the locations covered in 800.113(B) through (F):

(1) Types CMP, CMR, CMG, and CM

(2) Type CMX less than 6 mm (0.25 in.) in diameter

(3) Plenum, riser, and general-purpose communications raceways installed in compliance with 800.110

(4) Types CMP, CMR, CMG and CM installed in plenum, riser or general-purpose communications raceway

(5) Listed communication wires and Types CMP, CMR, CMG, CM, and CMX and installed in a raceway of a type included in Chapter 3

(6) Type CMUC undercarpet communications wires and cables installed under carpet

(7) Hybrid power and communications cable listed in accordance with 800.179(I).

Panel Statement: The text is a combination of the text from Proposal 16-160, which has been modified to improve clarity, with text to incorporate panel actions to accept in principle Proposals 16-173 (cable routing assemblies), 16-175 (metallic cable tray), and 16-179 (requiring riser cable for penetration of one floor) and by modifications to correlate with NFPA 90A-2009.

The NFPA 90A-2009 requirements for wires, cables, and raceways in air ducts and apparatus casing plenums (Sections 4.3.11.4 and 4.3.11.5) permit only 4 ft of plenum cable that is associated with the air distribution system. There is no provision for plenum communications raceways in air ducts and apparatus casing plenums. The air handling spaces that NFPA 90A defines as air ducts and apparatus casing plenums match the air handling spaces in NEC Section 300.2(B). The requirements for wires, cables, and raceways in ceiling cavity plenums, raised floor plenums, and air-handling unit room plenums (Sections 4.3.11.2, 4.3.11.4 and 4.3.11.5) are the same as in sections 800.154(A), 800.179(A), and 800.182(A) the 2008 NEC. The air handling spaces that NFPA 90A describes as ceiling cavity plenums, raised floor plenums, and air-handling unit room plenums match the air handling spaces in NEC Section 300.22(C).

The panel recognizes that references to 300.22(B) and (C) may need to be changed to correlate with Panel 3 action on Proposal 3-94. In anticipation the words “Fabricated” and “(Plenums)” were added to the titles.

Correlation with NFPA 90A is required by numerous Standards Council decisions—Standards Council decision 80-60, which established that the Technical Committee on Air-Conditioning has primary responsibility for combustibles in plenums and Standards Council decision 03-10-25, which directed the NEC project to hold off on making any changes to plenum requirements in the NEC until NFPA 90A-2009, Standard for the Installation of Air-Conditioning and Ventilating Systems has completed its revision process. NFPA 90A has completed its process and has been published.

The revised text relocates the wire, cable, and raceway installation rules from 800.154 and also includes installation rules from 800.110.

The requirements for CMX cable in one- and two-family risers were corrected. The current text of 800.154(B)(3) permits Type CMX in a riser in one- or two-family dwellings whereas 800.154(C)(4) only permits Type CMX under ¼ in. in diameter. Obviously if the only skinny CMX is permitted in the general space in a house that’s all that would be running up to another floor.

The panel recognizes that this proposal is a companion proposal to Proposal 16-172 and has considered them together.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Abstain: 1

Explanation of Abstention:

BOYER, J.: The proposal does not appear to add any clarity to the NEC.

Comment on Affirmative:

DORNA, G.:

See my comment on proposals 16-48 and 16-56.

Section 800.110 permits communications wires to be installed in communications raceways but 800.154 has no specific application for communications wires in communications raceways. Communications wires are used primarily in cross-connect arrays. They should be permitted to be installed in communications raceways and routing assemblies that are part of a cross-connect array.

The panel action on the revision of 800.113 changed the title and included several applications of cable routing assemblies, but a few applications were missed.

The panel action should be revised to read as follows:

800.113 Installation of Communications Wires, Cables, Raceways and Cable Routing Assemblies. Installation of communications wires, cables, raceways and cable routing assemblies shall comply with 800.113 (A) through (L). Installation of raceways shall also comply with 800.110.

(A) Listing. Communications wires, cables, raceways and cable routing assemblies installed in buildings shall be listed.

Exception: Communications cables that comply with 800.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ducts and plenums used for environmental air as described in 300.22(B) if they are directly associated with the air distribution system.

(1) Up to 1.22 m (4 ft) of Type CMP cable
(2) Types CMP, CMR, CMG, CM, CMX and communications wires installed in raceways that are installed in compliance with 300.22(B)

FPN: See sections 4.3.4 & 4.3.11.3.3 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire and cables in air ducts and apparatus casings plenums. See section 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following wires, cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C).

(1) Type CMP
(2) Plenum communications raceway
(3) Type CMP installed in plenum communications raceway
(4) Type CMP supported by metallic cable trays or cable tray systems
(5) Types CMP, CMR, CMG, CM, CMX and communications wires installed in raceways that are installed in compliance with 300.22(C)

FPN: See sections 4.3.11.2, 4.3.11.4 & 4.3.11.5 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire, cables and raceways in ceiling cavity, raised floor and air-handling unit room plenums. See section 3.3.22 for plenum definitions.

(D) Risers- Cables, Raceways and Cable Routing Assemblies in Vertical Runs. The following cables, raceways and cable routing assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types CMP and CMR
(2) Plenum and riser communications raceways
(3) Riser cable routing assemblies
(4) Types CMP and CMR installed in:
a) plenum communications raceway
b) riser communications raceway
c) riser cable routing assembly

FPN: See 800.26 for firestop requirements for floor penetrations.

(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor.

(1) Types CMP, CMR, CMG, CM and CMX
(2) Plenum and riser communications raceways
(3) Types CMP, CMR, CMG, CM and CMX installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway

FPN: See 800.26 for firestop requirements for floor penetrations.

(F) Risers-Cables, Raceways and Cable Routing Assemblies in Fireproof Shafts. . The following cables, raceways and cable routing assemblies shall be permitted to be installed in fireproof riser shafts having firestops at each floor.

(1) Types CMP, CMR, CMG, CM and CMX
(2) Plenum, riser and general-purpose communications raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

FPN: See 800.26 for firestop requirements for floor penetrations.

(G) Risers- One- and Two-Family Dwellings. The following cables, raceways and cable routing assemblies shall be permitted in one- and two-family dwellings:

(1) Types CMP, CMR, CMG and CM
(2) Type CMX less than 6 mm (0.25 in.) in diameter,
(3) Plenum, riser and general-purpose communications raceways
(4) Riser and general-purpose cable routing assemblies
(5) Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(H) Cable Trays. The following wires, cables and raceways shall be permitted to be installed in cable trays.

(1) Types CMP, CMR, CMG and CM
(2) Plenum, riser and general-purpose communications raceways
(3) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following wires, cables, raceways and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays.

(1) Types CMP, CMR, CMG, CM and communications wires
(2) Plenum, riser and general-purpose communications raceways
(3) Riser and general-purpose cable routing assemblies
(4) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(J) Other Building Locations. The following wires, cables, raceways and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 800.113(B) through (I).

(1) Types CMP, CMR, CMG and CM
(2) A maximum of 3 m (10 ft) of exposed Type CMX in nonconcealed spaces
(3) Plenum, riser and general-purpose communications raceways
(4) Riser and general-purpose cable routing assemblies
(5) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(6) Types CMP, CMR, CMG and CM installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(7) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(8) Type CMUC undercarpet communications wires and cables installed under carpet

(K) Multifamily Dwellings. The following cables, raceways and wring assemblies shall be permitted to be installed in multifamily dwellings in locations other than the locations covered in 800.113(B) through (G).

(1) Types CMP, CMR, CMG, CM
(2) Type CMX less than 6 mm (0.25 in.) in diameter in nonconcealed spaces
(3) Plenum, riser and general-purpose communications raceways
(4) Riser and general-purpose cable routing assemblies
(5) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(6) Types CMP, CMR, CMG and CM installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(7) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(8) Type CMUC undercarpet communications wires and cables installed under carpet

(L) One- and Two-Family Dwellings. The following cables and raceways shall be permitted to be installed in one- and two-family dwellings in locations other than the locations covered in 800.113(B) through (F).

(1) Types CMP, CMR, CMG, CM
(2) Type CMX less than 6 mm (0.25 in.) in diameter
(3) Plenum, riser and general-purpose communications raceways
(4) Riser and general-purpose cable routing assemblies
(5) Communications wires and Types CMP, CMR, CMG and CM installed in;
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(6) Types CMP, CMR, CMG and CM installed in:

a) riser cable routing assembly
b) general-purpose cable routing assembly
(7) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(8) Type CMUC undercarpet communications wires and cables installed under carpet
(9) Hybrid power and communications cable listed in accordance with 800.179(I)

IVANS, R.:

We agree with the revision proposal prepared by the CMP 16 Special Editorial Task Group.

See my comment on proposals 16-48 and 16-56.

Section 800.110 permits communications wires to be installed in communications raceways but 800.154 has no specific application for communications wires in communications raceways. Communications wires are used primarily in cross-connect arrays. They should be permitted to be installed in communications raceways and routing assemblies that are part of a cross-connect array.

The panel action on the revision of 800.113 changed the title and included several applications of cable routing assemblies, but a few applications were missed.

The panel action should be revised to read as follows:

800.113 Installation of Communications Wires, Cables, Raceways and Cable Routing Assemblies. Installation of communications wires, cables, raceways and cable routing assemblies shall comply with 800.113 (A) through (L). Installation of raceways shall also comply with 800.110.

(A) Listing. Communications wires, cables, raceways and cable routing assemblies installed in buildings shall be listed.

Exception: Communications cables that comply with 800.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ducts and plenums used for environmental air as described in 300.22(B) if they are directly associated with the air distribution system.

(1) Up to 1.22 m (4 ft) of Type CMP cable
(2) Types CMP, CMR, CMG, CM, CMX and communications wires installed in raceways that are installed in compliance with 300.22(B)

FPN: See sections 4.3.4 & 4.3.11.3.3 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire and cables in air ducts and apparatus casings plenums. See section 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following wires, cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C).

(1) Type CMP
(2) Plenum communications raceway
(3) Type CMP installed in plenum communications raceway
(4) Type CMP supported by metallic cable trays or cable tray systems
(5) Types CMP, CMR, CMG, CM, CMX and communications wires installed in raceways that are installed in compliance with 300.22(C)

FPN: See sections 4.3.11.2, 4.3.11.4 & 4.3.11.5 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wire, cables and raceways in ceiling cavity, raised floor and air-handling unit room plenums. See section 3.3.22 for plenum definitions.

(D) Risers- Cables, Raceways and Cable Routing Assemblies in Vertical Runs. The following cables, raceways and cable routing assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types CMP and CMR
(2) Plenum and riser communications raceways
(3) Riser cable routing assemblies
(4) Types CMP and CMR installed in:
a) plenum communications raceway
b) riser communications raceway
c) riser cable routing assembly

FPN: See 800.26 for firestop requirements for floor penetrations.

(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor.

(1) Types CMP, CMR, CMG, CM and CMX
(2) Plenum and riser communications raceways
(3) Types CMP, CMR, CMG, CM and CMX installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway

FPN: See 800.26 for firestop requirements for floor penetrations.

(F) Risers-Cables, Raceways and Cable Routing Assemblies in Fireproof Shafts. . The following cables, raceways and cable routing assemblies shall be permitted to be installed in fireproof riser shafts having firestops at each floor.

(1) Types CMP, CMR, CMG, CM and CMX
(2) Plenum, riser and general-purpose communications raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

FPN: See 800.26 for firestop requirements for floor penetrations.

(G) Risers- One- and Two-Family Dwellings. The following cables, raceways and cable routing assemblies shall be permitted in one- and two-family dwellings:

(1) Types CMP, CMR, CMG and CM
(2) Type CMX less than 6 mm (0.25 in.) in diameter,
(3) Plenum, riser and general-purpose communications raceways
(4) Riser and general-purpose cable routing assemblies
(5) Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(H) Cable Trays. The following wires, cables and raceways shall be permitted to be installed in cable trays.

(1) Types CMP, CMR, CMG and CM
(2) Plenum, riser and general-purpose communications raceways
(3) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway\
b) riser communications raceway
c) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following wires, cables, raceways and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays.

(1) Types CMP, CMR, CMG, CM and communications wires
(2) Plenum, riser and general-purpose communications raceways
(3) Riser and general-purpose cable routing assemblies
(4) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(J) Other Building Locations. The following wires, cables, raceways and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 800.113(B) through (I).

(1) Types CMP, CMR, CMG and CM
(2) A maximum of 3 m (10 ft) of exposed Type CMX in nonconcealed spaces
(3) Plenum, riser and general-purpose communications raceways
(4) Riser and general-purpose cable routing assemblies
(5) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(6) Types CMP, CMR, CMG and CM installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(7) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(8) Type CMUC undercarpet communications wires and cables installed under carpet

(K) Multifamily Dwellings. The following cables, raceways and wring assemblies shall be permitted to be installed in multifamily dwellings in locations other than the locations covered in 800.113(B) through (G).

(1) Types CMP, CMR, CMG, CM
(2) Type CMX less than 6 mm (0.25 in.) in diameter in nonconcealed spaces
(3) Plenum, riser and general-purpose communications raceways
(4) Riser and general-purpose cable routing assemblies
(5) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(6) Types CMP, CMR, CMG and CM installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(7) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(8) Type CMUC undercarpet communications wires and cables installed under carpet

(L) One- and Two-Family Dwellings. The following cables and raceways shall be permitted to be installed in one- and two-family dwellings in locations other than the locations covered in 800.113(B) through (F).

(1) Types CMP, CMR, CMG, CM
(2) Type CMX less than 6 mm (0.25 in.) in diameter

(3) Plenum, riser and general-purpose communications raceways
(4) Riser and general-purpose cable routing assemblies
(5) Communications wires and Types CMP, CMR, CMG and CM installed in;
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(6) Types CMP, CMR, CMG and CM installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(7) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(8) Type CMUC undercarpet communications wires and cables installed under carpet
(9) Hybrid power and communications cable listed in accordance with 800.179(I)

OHDE, H.: We vote affirmative but note there are a number of corrections that need to be made which we will addresses during the 2011 ROC period. For example in 800.113(B)(2) and in 800.113 (C)(5) the word "metal" should be inserted if front of the word " raceways" to clarify that the cable types permitted must be installed in metal raceways and this clarification is included for cable trays.

16-161 Log #2576 NEC-P16 **Final Action: Accept in Principle**
(800.113)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Communication wires and cables installed in building or structures shall be listed.
Substantiation: Edit. Cables and structures other than "buildings" should be included.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-160.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-162 Log #3099 NEC-P16 **Final Action: Reject**
(800.113)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
800.113 ~~Installation of Communications Wires and Cables.~~ Listing Required.
Communications cables installed in buildings shall be listed.
Exception: Communications cables that comply with 800.48 shall not be required to be listed.
Substantiation: The proposed title change more aptly describes the requirement, and it also gives a title that is not so similar to 800.133.
Panel Meeting Action: Reject
Panel Statement: Panel action on Proposal 16-160 revised this section so that the editorial change recommended by this proposal is no longer appropriate.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-163 Log #1743 NEC-P16 **Final Action: Reject**
(800.133)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add "...or structures" after "buildings" in the first paragraph.
Revise (A)(1)(a): Communication wires and cables shall be permitted in the same raceway, auxiliary gutter, cable tray or enclosure with ~~cables~~ conductors of any of the following: (remainder unchanged).
(b) Class I circuits shall not be run in the same cable, raceway, or enclosure with communication circuits. Class 2 and Class 3 circuit conductors shall be permitted in the same cable, raceway, or enclosure with communication circuits. Where installed in cable trays communication circuits shall comply with 830.154(D).
Substantiation: "Cables" implies two or more conductors per the definition in 800.2 and doesn't include wire as defined in 800.2, which seems appropriate for inclusion in this provision. Raceways and enclosures should be included in (b).
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation to justify the change.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-164 Log #1747 NEC-P16 **Final Action: Reject**
(800.133)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add "or structure" after "building" in the first paragraph.
Revise (A)(1)(a): Other power-limited circuits. Communication wires and cables shall be permitted in the same raceway, auxiliary gutter, cable tray, or enclosure with ~~cables~~ conductors of any of the following: (remainder unchanged).
(b) Class I circuits shall not be run in the same cable, raceway, or enclosure with communication circuits. Class 2 and Class 3 circuit conductors shall be permitted in the same cable, raceway, or enclosure with communication circuits in which case the Class 2 and Class 3 circuits shall be classified as communication circuits and shall meet the requirements of this article. The ~~cables~~ Class 2 and Class 3 conductor shall be ~~listed~~ classified as communication circuits. ~~cables.~~ Where installed in cable trays communication circuits shall comply with 830.154(D).
Substantiation: Edit. "Cables" implies two or more conductors per the definition in 800.2 and doesn't include wire as defined in 800.2, which seems appropriate for inclusion. Raceways and enclosures should be included in (b).
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation to justify the change.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-164a Log #CP1612 NEC-P16 **Final Action: Accept**
(800.133(A)(1))

Submitter: Code-Making Panel 16,
Recommendation: Revise 800.133(A)(1) Title to read as follows:
(1) In Raceways, Cable Trays, Boxes, Cables, and Enclosures.
Substantiation: The panel revised the title to include "Enclosures" in order to provide consistency.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-165 Log #2266 NEC-P16 **Final Action: Accept in Principle**
(800.133(A)(1))

Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise text to read as follows:
(1) In Raceways, Routing Assemblies, Cable Trays, Boxes, and Cables.
(a)*Other Power-Limited Circuits.* Communications cables shall be permitted in the same raceway, optical fiber/communications cable routing assembly, cable tray, or enclosure with cables of any of the following:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
(2) Power-limited fire alarm systems in compliance with Article 760
(3) Nonconductive and conductive optical fiber cables in compliance with Article 770
(4) Community antenna television and radio distribution systems in compliance with Article 820
(5) Low-power network-powered broadband communications circuits in compliance with Article 830
Substantiation: Article 770 currently covers optical fiber raceways and provides listing requirements for plenum, riser and general-purpose versions. UL lists these raceways to UL 2024, *Optical Fiber and Communication Cable Raceway.* UL lists optical fiber routing assemblies to UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies.* Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.) UL 2024a provides for the listing of plenum, riser and general-purpose routing assemblies with the same fire testing requirements as UL 2024.
The significant difference between optical fiber routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.
We have submitted companion proposals to provide for a change of the scope of Article 770 to include routing assemblies and to provide listing and application for requirements for optical fiber routing assemblies. Since these routing assemblies are used for optical fiber, data and communications cables, proposals are being submitted for Articles 725, 770, 800 and 820.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-166.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-166 Log #2103 NEC-P16 **Final Action: Accept in Principle in Part**
(800.133(A)(1)(a))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with the NEC Style Manual with respect to the use of mandatory language.

The Technical Correlating Committee directs that the Chairs of Code-Making Panels 3 and 16 form a Task Group to correlate the actions taken on this proposal and Proposal 3-196.

This action will be considered by the panel as a public comment.

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group

Recommendation: Revise text to read as follows:

(a)*Other ~~Power-Limited~~ Circuits.* Communications cables shall be permitted in the same raceway, cable tray, or enclosure with cables of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with <u>Parts I and III of </u>Article 725

(2) Power-limited fire alarm systems in compliance with <u>Parts I and III of </u>Article 760

(3) Nonconductive and conductive optical fiber cables in compliance with <u>Parts I and IV of </u>Article 770

(4) Community antenna television and radio distribution systems in compliance with <u>Parts I and IV of </u>Article 820

(5) Low-power network-powered broadband communications circuits in compliance with <u>Parts I and IV of </u>Article 830

<u>Exception: Only Types CMP, CMR, CMG and CM cables shall be permitted to be installed in plenum communications raceways, riser communications raceways and general-purpose communications raceways.</u>

Substantiation: This proposal is editorial and technical.

Section 800.154 restricts the applications of plenum, riser and general-purpose communications raceways by permitting only Types CMP, CMR, CMG and CM cables in these raceways.

Section 800.133(A)(1)(a) conflicts with the restrictions of 800.154.

The purpose of this proposal is to remove the conflict. It is also a companion proposal to a proposal to simplify the applications requirements in 800.154 by replacing the text with a table.

Power-limited is struck from the title to improve parallelism with Article 820. Also, optical fiber cables are not electrical and therefore are not power-limited circuits.

The NEC Style Manual states:

4.1.1 References to a Part Within an Article. References shall not be made to an entire article, such as "grounded in accordance with Article 250" unless additional conditions are specified. References to parts within articles shall be permitted.

This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

(a) *Other ~~Power-Limited~~ Circuits.*

Communications cables shall be permitted in the same raceway, cable tray, <u>or</u> enclosure <u>or cable routing assembly </u>with cables of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with <u>Parts I and III of</u> Article <u>725</u>

(2) Power-limited fire alarm systems in compliance with <u>Parts I and III of</u> Article <u>760</u>

(3) Nonconductive and conductive optical fiber cables in compliance with <u>Parts I and IV of</u> Article <u>770</u>

(4) Community antenna television and radio distribution systems in compliance with <u>Parts I and IV of</u> Article <u>820</u>

(5) Low-power network-powered broadband communications circuits in compliance with <u>Parts I and IV of</u> Article <u>830.</u>

Panel Statement: The recommendation from Proposal 16-165 has been incorporated into this proposal, and the new exception has been deleted because of panel action on other proposals to consolidate the types of raceways. See the panel actions on Proposals 16-278 and 16-267.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-167 Log #4691 NEC-P16 **Final Action: Reject**
(800.133(A)(2) Exception No. 3 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Add a third exception as follows:

Exception No. 3: Where all of the electric light, power, Class 1, non-power limited fire alarm, and medium-power network-powered broadband communications circuit conductors are permanently separated from all of the communications wires and cables through the use of sheathing that provides for system separation that does not rely on conductor or cable insulation alone, the combination of conductors comprising different systems shall be permitted to be combined into a listed hybrid cable assembly.

Substantiation: There is not and has never been any express permission to include communications circuit conductors within a common cable assembly with power conductors. Para (2) here comes the closest, because it recognizes a "continuous and firmly fixed nonconductor." This is crucial to the production of hybrid cables, where additional separation beyond the conductor insulation is applied to the power-limited conductors in accordance with the spirit of these principles. For example, 334.116(C) expressly recognizes this type of construction for Type NMS cable, and UL has been listing such constructions for many years. This topic must be addressed in the limited-power wiring articles, and this proposal is designed to raise the issue.

Panel Meeting Action: Reject

Panel Statement: The submitter has neither identified a specific application nor cited any technical rationale for an additional exception that appears to be covered in the present Exception No. 2.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-168 Log #1748 NEC-P16 **Final Action: Reject**
(800.133(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: Raceways <u>enclosing conductors or fiber optic cables</u> shall be used for ~~their intended~~ the purposes <u>required or permitted by this Code.</u> Communication wires and cables <u>and fiber optic cables</u> shall not be ~~strapped, taped or~~ attached to the exterior of any conduit or raceway, <u>cable, or conductor</u> as a means of support <u>except where supported by a raceway mast.</u>

Substantiation: Edit. "Intended purpose" could be many things to the installer. Intended purpose could be strictly mechanical such as protection posts, mounting posts for equipment, support brackets, etc. Cables and single conductors such as grounding electrode conductor should be included. A provision for support by a raceway mast should be provided.

Panel Meeting Action: Reject

Panel Statement: Article 800 deals with communications circuits, not optical fiber cables.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-169 Log #2104 NEC-P16 **Final Action: Accept**
(800.133(B))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group

Recommendation: Revise the title of 800.133 (B) as follows:

(B) Support of ~~Conductors~~ <u>Communications Wires and Cables</u>. Raceways shall be used for their intended purpose. Communications ~~cables or~~ wires <u>and cables </u>shall not be strapped, taped, or attached by any means to the exterior of any ~~conduit or~~ raceway as a means of support.

Exception: Overhead (aerial) spans of communications ~~cables or~~ wires <u>and cables </u>shall be permitted to be attached to the exterior of a raceway-type mast intended for the attachment and support of such ~~conductors~~ <u>wires and cables.</u>

Substantiation: This proposal is editorial. The addition of the wording "Communications Cables" is more appropriate than conductors as this section deals with communications cables and not conductors. "Cables or Wires" was changed to 'wires and cables" to be consistent with the rest of the article. Conduit was struck because conduits are a form of raceway.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-170 Log #2105 NEC-P16 **Final Action: Accept**
(800.133(C))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Delete 800.133(C)
~~(C) Wiring in Ducts for Dust, Loose Stock, or Vapor Removal. Section 300.22(A) shall apply.~~
Relocate the same to 800.3(D).
800.3 (E) Wiring in Ducts for Dust, Loose Stock, or Vapor Removal. 300.22(A) shall apply.
Substantiation: This change is both editorial and technical. This proposal relocates the requirements in 800.133(C) to a more appropriate section 800.3 (E) – Other Articles. (Another task group proposal used (D)). The requirements of 300.22 (A) really apply to the entire Article 800 therefore the requirements of 300.4 should be inserted in 800.3.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.
Panel Meeting Action: Accept
Panel Statement: The panel understands that the last sentence of the first paragraph of the submitters substantiation was intended to read as follows: The requirements of 300.22 (A) really apply to the entire Article 800 therefore the requirements of 800.133(C) should be moved to 800.3.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-171 Log #2285 NEC-P16 **Final Action: Reject**
(800.135 (New))

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Add a new Section to read as follows:
800.135 Communication Device and Equipment Mounting. Communication devices or equipment shall be mounted in listed boxes, brackets or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place. Boxes or brackets can be completly enclosed or backless.
(A) Communication Devices and Equipment Mounted to Boxes or Brackets. Communication devices or equipment shall be mounted to a listed boxes or bracket and installed per 314.20.
(B) Communication Devices and Equipment Mounted on Covers. Communication device and equipment mounted to and supported by a cover shall be held rigidly against the cover which is mounted to the box or bracket.
Substantiation: This proposal adds a new section to Article 800 addressing the mounting of devices or equipment to listed boxes and brackets. Currently, depending on the quality of workmanship, Communication devices or equipment have not been mounted to boxes or brackets that can support them. After several years device and/or covers that are mounted directly to the dry wall will become hazard because they have become loose and exposed. Communication cable can become energized by coming in incidental contact with electrical conductors.
800.135 was only a suggestion for the location of this new section. (A) addresses devices mounted directly to boxes or devices where as (B) address devices mounted to covers.
Panel Meeting Action: Reject
Panel Statement: Not all communications equipment and devices need to be mounted in boxes, brackets or assemblies.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
IVANS, R.: Loose and exposed cable or connectors can pose a risk of electric shock. Ringing voltages can exceed 100V and should not become easily accessible. Loose cabling and connectors can come into contact with electric light and power conductors. There are boxes and brackets listed for this purpose using UL Subject 2269, “Outline of Investigation for Optical Fiber/Communications/Signaling/Coaxial Cable Outlet Boxes.”
OHDE, H.: We agree with Mr. Ivans negative statement as loose cabling and connectors could indeed come into contact with electric light and power conductors therefore is a risk of electrical shock and hazard. UL lists boxes and brackets for this purpose.

16-172 Log #2106 NEC-P16 **Final Action: Accept in Principle**
(800.154)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
~~**800.154 Applications of Listed Communications Wires and Cables and Communications Raceways.**~~
~~Communications wires and cables shall comply with the requirements of 800.154(A) through (D), 800.154(F), and 800.154(G), or where cable substitutions are made in accordance with 800.154(E).~~
~~**(A) Plenum.** Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.~~
~~**(B) Riser.** Cables installed in risers shall comply with 800.154(B)(1), (B)(2), or (B)(3).~~
~~**(1) Cables in Vertical Runs.** Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. Listed riser communications raceways and listed plenum communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.~~
~~**(2) Metal Raceways or Fireproof Shafts.** Listed communications cables shall be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.~~
~~**(3) One- and Two-Family Dwellings.** Type CM and CMX cable shall be permitted in one- and two-family dwellings.~~
~~FPN: See 800.26 for firestop requirements for floor penetrations.~~
~~**(C) Other Wiring Within Buildings.** Cables installed in building locations other than the locations covered in 800.154(A), (B), (D), and (G) shall be in accordance with 800.154(C)(1) through (C)(6).~~
~~**(1) General.** Cables shall be Type CMG or Type CM. Listed communications general-purpose raceways, listed riser communications raceways, and listed plenum communications raceways shall be permitted. Only Types CMG, CM, CMR, or CMP cables shall be permitted to be installed in these communications raceways.~~
~~**(2) In Raceways.** Listed communications wires that are enclosed in a raceway of a type included in Chapter 3 shall be permitted.~~
~~**(3) Nonconcealed Spaces.** Type CMX communications cable shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).~~
~~**(4) One- and Two-Family Dwellings.** Type CMX communications cable less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.~~
~~**(5) Multifamily Dwellings.** Type CMX communications cable less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in nonconcealed spaces in multifamily dwellings.~~
~~**(6) Under Carpets.** Type CMUC undercarpet communications wires and cables shall be permitted to be installed under carpet.~~
~~**(D) Cable Trays.** Types CMP, CMR, CMG, and CM communications cables shall be permitted to be installed in cable trays. Communications raceways, as described in 800.182, shall be permitted to be installed in cable trays.~~
~~**(E) Cable Substitutions.** The uses and substitutions for communications cables listed in Table 800.154(E) and illustrated in Figure 800.154(E) shall be permitted.~~
~~FPN: For information on Types CMP, CMR, CMG, CM, and CMX cables, see 800.179.~~
~~**(F) Hybrid Power and Communications Cable.** Hybrid power and communications cable listed in accordance with 800.179(H) shall be permitted to be installed in one- and two-family dwellings.~~
~~**(G) Distributing Frames and Cross-Connect Arrays.** Listed communications wire and Types CMP, CMR, CMG, and CM communications cables shall be used in distributing frames and cross-connect arrays.~~
800.154 Applications of Listed Communications Wires and Cables and Communications Raceways. Permitted and non-permitted applications of listed communications wires, cables and raceways shall be as indicated in Table 800.154(A). The substitutions for communications cables listed in Table 800.154(B) and illustrated in Figure 800.154(B) shall be permitted.

Table 800.154(A), Applications of Communications Wires, Cables and Raceways

Wire, Cable or Raceway Type	Applications													
	In air ducts and plenums as described in 300.22(B)	In other spaces used for environmental air as described in 300.22(C)	In risers	In building locations other than air ducts, plenums, other spaces used for environmental air, risers, cable trays, distributing frames and cross-connect arrays	In one- and two-family dwellings	In multifamily dwellings	In nonconcealed spaces	In cable trays	Under carpets	In distributing frames and cross-connect arrays	In any raceway in Chapter 3	In plenum communications raceways	In riser communications raceways	In general-purpose communications raceways

Note. Applications indicated by "Y" shall be permitted. Applications indicated by an "N" shall not be permitted. Applications with a "–" are not addressed.

(Renumber Table 800.154(E) and Figure 800.154(E) to Table 800.154(B) and Figure 800.154(B) and insert them here.)

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 770, 800,820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal for section 800.154 greatly simplifies the statement of the applications of optical fiber cables and raceways by using a table where the permitted applications are indicated by a "Y" and the applications that are not permitted are indicted by an "N". A companion proposal moves the installation rules to section 800.113 Installation Of Communications Cables.

This proposal makes no changes to the existing permitted and not permitted applications of communications wires, cables and raceways.

This proposal and its companion proposal for section 800.113 need to be considered together as a package.

This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept in Principle

See revised Table on page 1102

Panel Statement: See the panel action and statement on Proposal 16-160.

Some of the non-permitted applications were determined by considering the listing requirements for the cable—for example, Type CMUC fire testing is the same as Type CMX. Other non-permitted applications were determined from existing code requirements as determined by the panel.

The panel recognizes that this proposal is a companion proposal to Proposal 16-160 and has considered them together.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

DORNA, G.: See my comments on proposals 16-48, 16-56 and 16-160.

The word "In" was omitted from head of the second column of Table 800.154(A). It should read "<u>In</u> fabricated ducts and plenums as described in 300.22(B)"

The references to "routing assemblies" in the last two columns need to be corrected to "cable routing assemblies".

Section 800.110 permits communications wires to be installed in communications raceway.

The revised 800.154 should appear as shown below:

See Table 800.154(A) on page 1103

800.154 Applications of Listed Communications Wires, Cables, Raceways and Cable Wiring Assemblies. Permitted and non-permitted applications of listed communications wires, cables, raceways and cable routing assemblies shall be as indicated in Table 800.154(A). The permitted applications are subject to the installation rules of 800.110 and 800.113. The substitutions for communications cables listed in Table 800.154(B) and illustrated in Figure 800.154 shall be permitted.

See Table 800.154(B) on page 1102

(Renumber Figure 800.154(E) to Figure 800.154 and insert it here.)

IVANS, R.: See my comments on proposals 16-48, 16-56 and 16-160.

The word "In" was omitted from head of the second column of Table 800.154(A). It should read "<u>In</u> fabricated ducts and plenums as described in 300.22(B)"

The references to "routing assemblies" in the last two columns need to be corrected to "cable routing assemblies".

Section 800.110 permits communications wires to be installed in communications raceway.

The revised 800.154 should appear as shown below:

See Table 800.154(A) on page 1104

800.154 Applications of Listed Communications Wires, Cables, Raceways and Cable Wiring Assemblies. Permitted and non-permitted applications of listed communications wires, cables, raceways and cable routing assemblies shall be as indicated in Table 800.154(A). The permitted applications are subject to the installation rules of 800.110 and 800.113. The substitutions for communications cables listed in <u>Table 800.154(B)</u> and illustrated in <u>Figure 800.154</u> shall be permitted.

Table 800.154(A) Applications of Listed Communications Wires, Cables, Raceways and Cable Routing Assemblies

We have an additional recommendation for a reformatted table structure for Table 800.154(A) (technical content unchanged).

See Table 820.154(A) on page 1105

Table 800.154(B) Cable Substitutions

(Renumber Figure 800.154(E) to Figure 800.154 and insert it here.)

16-173 Log #2267 NEC-P16 **Final Action: Accept in Principle**
(800.154)

Submitter: Terry Peters, The Society of the Plastics Industry

Recommendation: Revise text to read as follows:

800.154 Applications of Listed Communications Wires and Cables~~, and~~ Communications Raceways <u>and Optical Fiber/Communications Cable Routing Assemblies</u>. Communications wires and cables shall comply with the requirements of 800.154(A) through (D), 800.154(F), and 800.154(G), or where cable substitutions are made in accordance with 800.154(E).

(A) Plenum. (No change in text.)

(B) Riser. Cables installed in risers shall comply with 800.154(B)(1), (B)(2), or (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. Listed riser communications raceways and listed plenum communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways. <u>Listed riser optical fiber/communications cable routing assemblies shall be permitted to be installed in risers.</u>

(2) Metal Raceways or Fireproof Shafts. (No change in text.)

(3) One- and Two-Family Dwellings. (No change in text.)

(C) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 800.154(A), (B), (D), and (G) shall be in accordance with 800.154(C)(1) through (C)(6).

(1) General. Cables shall be Type CMG or Type CM. Listed communications general-purpose raceways, listed riser communications raceways, and listed plenum communications raceways shall be permitted. Only Types CMG, CM, CMR, or CMP cables shall be permitted to be installed in these communications raceways. <u>Listed riser and general-purpose optical fiber/communications cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 800.154(A) and (B).</u>

(2) In Raceways. (No change in text.)

(3) Nonconcealed Spaces. (No change in text.)

(4) One- and Two-Family Dwellings. (No change in text.)

(5) Multifamily Dwellings. (No change in text.)

(6) Under Carpets. (No change in text.)

Substantiation: This is a companion proposal to provide for the use of optical fiber /communications cable routing assemblies. Please refer to the substantiation for the companion proposals for 770.154 and 770.182.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 16-160.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-174 Log #121 NEC-P16 **Final Action: Accept**
(800.154(A))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Delete the second sentence.

~~Abandoned cables shall not be permitted to remain.~~

Substantiation: Section 800.25 requires that "The accessible portion of abandoned communications cables shall be removed." The requirement in to remove all abandoned cables in 800.154(A) is an error from the 1999 NEC that the panel tried to correct in the last code cycle.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Revise 800.154 and replace in entirety to read as follows:

"800.154 Applications of Listed Communications Wires and Cables and Communications Raceways. Permitted and non-permitted applications of listed communications wires, cables and raceways shall be as indicated in Table 800.154(A). The permitted applications are subject to the installation rules of 800.113. The substitutions for communications cables listed in Table 800.154(B) and illustrated in Figure 800.154 shall be permitted.

Table 800.154(A) Applications of Communications Cables, Wires and Raceways

Wire, cable, or raceway type	Applications

Table 800.154(B) Cable Substitutions

Cable type	Permitted Substitutions
CMR	CMP
CMG, CM	CMP, CMR
CMX	CMP, CMR, CMG, CM

16-172 Ivans BE

16-175 Log #129 NEC-P16 **Final Action: Accept in Principle**
(800.154(A))

Submitter: Gerald Lee Dorna, Belden
Recommendation: Add the following text at the end of 800.154(A):
Metallic cable trays and metallic cable tray systems shall be permitted to be installed in other spaces used for environmental air. Type CMP cables and communications plenum raceways shall be permitted to be installed in these cable trays and cable tray systems. Type CMR, CMG, CM and CMX cables, and communications riser and general-purpose raceways shall not be permitted to be installed in these cable trays and cable tray systems.
Substantiation: Article 392, Cable Trays, has requirements for cable trays in air handling spaces in section 392.4.
392.4 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.
Section 300.22 has provisions for cable trays in 300.22(C), Other Space Used For Environmental Air.
(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.
FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.
Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.
(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.
Section 300.22(C)(1) permits only solid bottom metal cable tray with solid metal covers. Optical fiber, communications, CATV, signaling and fire-alarm plenum cables, and plenum raceways are often installed in metal cable trays and metal cable tray systems in plenums (other spaces used for environmental air). These installations are "neat and workmanlike" and safe. They should be permitted.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-160.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-176 Log #4180 NEC-P16 **Final Action: Reject**
(800.154(A))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Change the last sentence as follows:
Only Type CMP cable shall be permitted to be installed in these raceways.
Substantiation: The current text can be interpreted to mean that only CMP cables are permitted in any type of raceway used in plenums, which is incorrect. The intent is that only CMP cable is to be used in the plenum communications raceways. This proposal simply matches the text used in 800.154(B)(1) and (C)(1): e.g. "*Only type CMR and CMP cables shall be permitted to be installed in **these** raceways.*"
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 16-160, which clarifies the issue. See panel action on Proposal 16-48, which permits optical fiber plenum cable to be run in communications plenum raceway.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-177 Log #4509 NEC-P16 **Final Action: Reject**
(800.154(A))

Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
800.154 (A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP, CMR, CMG, CM or CMX, or be communications wire installed in compliance with 300.22. Abandoned cables shall not be permitted to remain. ~~Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted.~~ Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.
The first sentence establishes the one Type of cable that is allowed – Type CMP. The third sentence then allows several other types of cable, seemingly negating the first sentence. This revision clarifies which types of cables are allowed.
Panel Meeting Action: Reject
Panel Statement: Cable types CMR, CMG, and CM are not listed for use in ducts, plenums, and other spaces used for environmental air.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-178 Log #4545 NEC-P16 **Final Action: Accept**
(800.154(A))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
800.154 Applications of Listed Communications Wires and Cables and Communications Raceways.
Communications wires and cables shall comply with the requirements of 800.154(A) through (D), 800.154(F), and 800.154(G), or where cable substitutions are made in accordance with 800.154(E).
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. ~~Abandoned cables shall not be permitted to remain.~~ Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
Substantiation: The text proposed for deletion is duplicative of the text in section 800.25 and potentially in conflict with it.
For information, see section 800.25:
800.25 Abandoned Cables.
The accessible portion of abandoned communications cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-179 Log #2211 NEC-P16 **Final Action: Accept in Principle**
(800.154(B)(1))

Submitter: Robert W. Jensen, dbi / Rep. BICSI
Recommendation: Revise text as follows:
Cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. Listed riser communications raceways and listed plenum communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.
Substantiation: Is it really our intention that cables passing between floors through a floor penetration be less than riser rated?
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-160.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DORNA, G.: The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".
Section 800.154(B)(1) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.
The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.

16-180 Log #4510 NEC-P16 **Final Action: Accept in Principle**
(800.154(B)(1))

Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
800.154(B)(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Cables installed in vertical runs and penetrating more than one fFloor ~~penetrations requiring Type CMR~~ shall contain only cables suitable for riser or plenum use. Listed riser communications raceways and listed plenum communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.
The second sentence is not clear and has been proposed for revision. The first sentence already requires the use of Type CMR cables in this situation so CMR cables do not need to be repeated. We believe that the revision clarifies what the second sentence is trying to require.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action of Proposal 16-160, which moved the installation rules to 800.113 and revised the requirements to make this recommendation unnecessary.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-181 Log #4511 NEC-P16 **Final Action: Reject**
(800.154(B)(2))

Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)
Recommendation: Revise text to read as follows:
800.154(B)(2) Metal Raceways or ~~Fireproof~~ Fire-resistive Shafts. Except as allowed in 800.154(B)(1), lListed communications cables shall be encased in a metal raceway or located in a ~~fireproof~~ fire-resistive shaft. Metal raceways shall be provided with ~~having~~ firestops at each floor.
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee's endorsement.
This subsection requires rated cable to be in "fireproof shafts" or raceways for rises. However, 800-154(B)(1) says that Type CMR cable is allowed in vertical runs penetrating more than one floor without a shaft or raceway. This revision clarifies this provision, particularly for Type CMR cable.

Additionally, the term "fireproof shafts" is not defined. This also implies that building floors run through shafts at each level. The building code generally considers building floors to end at shaft walls, such that there are no intermittent floors within a shaft. Further, the term "fireproof" for building construction is considered archaic. This revision revises the term "fireproof shaft" to "fire-resistive shaft".

Consideration should be given to changing the term "fireproof shaft" to "fire-resistive shaft" throughout the NEC.

Panel Meeting Action: Reject

Panel Statement: Both terms "fireproof" and "fire-resistive" are presently not defined in the NEC. The panel suggests the submitter consider submitting a definition of the term "fire-resistive" to Article 100. For correlation it is also suggested that proposals be submitted to change the term throughout the NEC.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-182 Log #199 NEC-P16 **Final Action: Accept in Principle**
(800.154(E))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

800.154(E) Cable Substitutions. The uses and substitutions for communications cables listed in Table 800.154(E) and illustrated in Figure 800.154(E) shall be permitted. Communications cables shall be permitted to substitute for class 2 and class 3 cables in accordance with 725.154(G), and to substitute for power-limited fire alarm cables in accordance with 760.154(D). Coaxial communications cables shall be permitted to substitute for community antenna television coaxial cables in accordance with 820.154(E).

~~FPN: For information on Types CMP, CMR, CMG, CM, and CMX cables, see 800.179.~~

Substantiation: Article 725 permits communications cables to substitute for class 2 and 3 cables, and article 760 permits communications cables to substitute for power-limited fire alarm cables. However, a correlating reference in Article 800 to the cable substitution provisions of Articles 725 and 760 is necessary because 90.3 Code Arrangement states, "Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8. The reference to Article 820 is included for completeness.

Deletion of the FPN is proposed because the note is superfluous.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-172, which accomplished the submitter's recommendation.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-183 Log #4008 NEC-P16 **Final Action: Reject**
(800.154(H) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Add new 800.154(H).

<u>(H) Communications Cables With Suffix Markings. Communications cables with single or multiple suffix markings shall be permitted where required to meet special applications.</u>

<u>(1) Communications Circuit Integrity (CI) Cables or Electrical Circuit Protective System. Circuit integrity (CI) cables or a listed electrical circuit protective system shall be permitted for use in communications systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions. Circuit integrity cable shall be marked in accordance with 800.179(G).</u>

<u>(2) Communications Cables for Dry, Damp, or Wet Locations. Communications cables installed in dry, damp, or wet locations shall be marked in accordance with 800.179.(K).</u>

<u>(3) Communications Cables Exposed to Direct Sunlight. Communications cables installed exposed to direct sunlight shall be marked in accordance with 800.179(L).</u>

<u>(4) Communications Cables in Corrosive Locations. Communications cables installed in corrosive locations shall be marked in accordance with 800.179(N).</u>

<u>(5) Communications Very-Low-Smoke Producing Cables. Communications very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be marked in accordance with 800.179(O).</u>

<u>(6) Communications Fire Hazard Cables. Communications fire hazard cables installed to provide low flame spread, very-low-smoke, and known potential heat release shall be marked in accordance with 800.179(P).</u>

Substantiation: This proposal permits cables identified in 800.154(A), (B), and (C) to have suffix markings.

This proposal establishes 800.154(H) for cables with suffixes for installation in locations requiring special cable characteristics.

Panel Meeting Action: Reject

Panel Statement: 800.154, Applications of Listed Communications Wires and Cables and Communications Raceways, provides information as to where a particular cable can be installed. This proposal does not provide any applications or installation requirements for any of the proposed cables.

All of the suggested changes are dealing with suffix markings, which would be more appropriately addressed in 800.179, Listing Requirements Communications Wires and Cables.

16-185 Log #169 NEC-P16 **Final Action: Accept**
(800.170)

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Change "telecommunications" to "communications".

Substantiation: Throughout Article 800 the term "communications" is used rather than "telecommunications". Also, Article 100 defines "Communications Equipment" not "Telecommunications Equipment". Use of terminology should be consistent throughout the article.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-186 Log #4870 NEC-P16 **Final Action: Reject**
(800.170, FPN)

Submitter: T. David Mills, T. David Mills Associates

Recommendation: Modify the fine print note as follows:

FPN: One way to determine applicable requirements is to refer to ~~UL 60950-1-2003, Standard for Safety of Information Technology Equipment; UL 1459-1995, Standard for Safety, Telephone Equipment; or~~ UL 1863-2004, Standard for Safety, Communications Circuit Accessories. ~~For information on listing requirements for communications raceways, see UL 2024-2004, Standard for Optical Fiber and~~
~~Communication Cable Raceways.~~ <u>See {2} and {9}, Annex I.</u>

Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.

See my proposal for new Annex I. (An additional item could be added for UL 1863-2004, Standard for Safety, Communications Circuit Accessories as {12})

I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.

Panel Meeting Action: Reject

Panel Statement: The FPNs are more user-friendly in current locations.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-187 Log #3991 NEC-P16 **Final Action: Reject**
(800.179 and 800.179(J) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Revise 800.179

Add new 800.179(J)

Table 800.179 does not change.

800.179 Communications Wires and Cables.

Communications wires and cables shall be listed in accordance with 800.179(A) through (I) and (K) through (P), and marked in accordance with Table 800.179. Conductors in communications cables, other than in a coaxial cable, shall be copper.

Communications wires and cables shall have a voltage rating of not less than 300 volts. The insulation for the individual conductors, other than the outer conductor of a coaxial cable, shall be rated for 300 volts minimum. ~~The cable voltage rating shall not be marked on the cable or on the undercarpet communications wire. Communications wires and cables shall have a temperature rating of not less than 60°C.~~

~~Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.~~

~~FPN No. 1: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.~~

FPN No. 2: See 800.170 for listing requirement for equipment.

(J) Marking. Cables shall be marked in accordance with Table 800.179 and 800.179(J)(1) through (4).

(1) Voltage ratings shall not be marked on the cables.

FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 electric light and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.

(2) Temperature ratings greater than 60ºC shall be marked on the cable.

(3) Cables listed as suitable for installation at temperatures lower than 60ºC shall have the lowest permitted temperature marked on the cable.

(4) Cables listed as meeting the requirements of 800.179.(A) through (E) shall be permitted to have additional suffixes that comply with other 800.179 subsections.

Substantiation: The revision to the first paragraph of 800.179 is editorial and accommodates new cable listing requirements.

The proposed new 800.179(J) provides a separate subsection for cable marking, which parallels the requirements in Articles 725 and 760. Communications cables are permitted to substitute for Class 2, Class 3, and fire alarm power-limited cables, so it is important to have equivalent requirements.

There is no marking on cables rated at 60ºC (140ºF). Article 310 does an excellent job of identifying temperature rating of conductors. This proposal provides equivalent requirements.

The subsections in 800.179(J) correlate with markings identified in other subsections of 800.179 [e.g., 800.179(G) provides for a "-CI" suffix that can be added to any of the cables identified in 800.179(A) through (E)].

Communications cables are permitted to substitute for cables covered by Articles 725 and 760. It is important that communications cables have the same listing requirements and suffixes as permitted for cables in Articles 725 and 760.

Panel Meeting Action: Reject
Panel Statement: Articles 725 and 760 do not have any applications or installation requirements or allowances for suffix markings that are not also currently addressed for Article 800 cables.

800.154, Applications of Listed Communications Wires and Cables and Communications Raceways, does not contain any application for the newly proposed cable listing suffixes. This proposal does not provide any applications or installation requirements for the newly proposed cable listing suffixes. Adding listing requirements without application or installation requirements is not in keeping with the 2003 NEC Style Manual Section, 1.3 Regulatory Adoption, which states "Because the National Electrical Code is intended to be suitable for adoption as a regulatory document, it is important that it contain clearly stated mandatory requirements in the Code text."

NOTE: This proposal appeared as Comment 16-172 on Proposal 16-219 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-219 was:
Change cable to cables as shown:
(F) Type CMUC Undercarpet Wire and Cable. Type CMUC undercarpet communications wires and cables shall be listed as being suitable for undercarpet use and shall also be listed as being resistant to flame spread.
FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords*
Submitter: James Daly, Upper Saddle River, NJ
Recommendation: The Panel Action should have been to Accept in Principle and reword the FPN to read:
FPN: One method of determining that the cable is resistant to flame spread is the VW-1 (vertical-wire) flame test in ANSI/UL 1581-2001, *Reference Standard for Electrical Wires, Cables and Flexible Cords.*
Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."
The FPN as submitted in the Proposal includes mandatory language by requiring that the cable be tested to UL 1581. The revised wording provides explanatory information without any requirements.
The date of the latest edition of the UL standard was corrected from 1991 to 2001.
Panel Meeting Action: Reject
Panel Statement: The fine print note(s) does contain explanatory information. It does not contain requirements and is not written in mandatory language.

(800.179(G))

NOTE: This proposal appeared as Comment 16-175 on Proposal 16-221 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-221 was
Delete the following:
~~(G) Multipurpose (MP) Cables. Until July 1, 2003, cables that meet the requirements for Types CMP, CMR, CMG, and CM and also satisfy the requirements of 760.82(B) for multiconductor cables and 760.82(H) for coaxial cables shall be permitted to be listed and marked as multipurpose cable Types MPP, MPR, MPG, and MP, respectively.~~
Re-letter the remaining subsections as shown:
(G~~H~~) Communications Circuit Integrity (CI) Cable. Cables suitable for use in communications systems to ensure survivability of critical circuits during a specified time under fire conditions shall be listed as circuit integrity (CI) cable. Cables identified in 800.90(A), (B), (C), (D), and (E) that meet the requirements for circuit integrity shall have the additional classification using the suffix "CI."
FPN: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-1995, *Standard for Tests of Fire Resistive Cables*.
(H~~I~~) Communications Wires. Communications wires, such as distributing frame wire and jumper wire, shall be listed as being resistant to the spread of fire.
FPN: One method of defining *resistant to the spread of fire* is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords*. Another method of defining *resistant to the spread of fire* is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, *Test Methods for Electrical Wires and Cables*.
(I~~J~~) Hybrid Power and Communications Cable. Listed hybrid power and communications cable shall be permitted where the power cable is a listed Type NM or NM-B conforming to the provisions of Article 334, and the communications cable is a listed Type CM, the jackets on the listed NM or NM-B and listed CM cables are rated for 600 volts minimum, and the hybrid cable is listed as being resistant to the spread of fire.
FPN: One method of defining *resistant to the spread of fire* is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords*. Another method of defining *resistant to the spread of fire* is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, *Test Methods for Electrical Wires and Cables*.
Submitter: James Daly, Upper Saddle River, NJ
Recommendation: The Panel Action should have been to Accept in Principle in Part by accepting and rewording the FPNs in the sections indicated to read as shown below. The balance of the Proposal should be Rejected in accordance with the Panel Statement.
(G) – FPN: One method of determining circuit integrity is ANSI/UL 2196-2001, *Standard for Safety for Tests for Fire Resistive Cables.*
(H) – FPN: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*
Another method of determining that the cable is resistant to the spread of fire is the "Vertical Flame Test - Cables in Cable Trays," in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables.*
(I) – same text as (H) above.
Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."
The Proposal as submitted defines the damage and specifies performance requirements.

The number, title, and the date of the latest edition of the UL standard were corrected to reflect the current applicable standard. The reference in the CSA standard and the date of the CSA standard were also corrected.

The Proposal as submitted defines the damage and specifies performance requirements.
The number, title, and the date of the latest edition of the UL standard were corrected to reflect the current applicable standard. The reference in the CSA standard and the date of the CSA standard were also corrected.
Panel Meeting Action: Reject
Panel Statement: The fine print note(s) does contain explanatory information. It does not contain requirements and is not written in mandatory language.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-204 Log #3996 NEC-P16 **Final Action: Reject**
(800.179(J))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 800.179(P)
(P) Fire Hazard Cables. Communications cables used to provide low combustible loading shall be listed as fire hazard cable (FHC) and shall be listed as having low flame spread characteristics, very-low-smoke producing characteristics, and a low potential heat release value. Cables specified in 800.154(A), (B), and (C) shall have the additional classification using the suffix "-FHC".
FPN: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with UL 723, *"Test for Surface Burning Characteristics of Building Materials"* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*
Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has low flame spread characteristics, very-low-smoke-producing characteristics, and a low potential heat release value.
The testing criteria are based on the requirements found in NFPA 13 and the International Mechanical Code, as revised.
NFPA 13, Section 8.14.1.2.1 follows: "Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum." The proposed cable has a very low heat of combustion. While the term "combustible loading" is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.
The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.

Establishing a listing and marking for cables listed for a "FHC" suffix provides cables with physical parameters (flame spread index, smoke developed index, potential heat release) that is consistent with requirements in other codes.

NFPA 13-2007

8.15 Special Situations.

8.15.1 Concealed Spaces.

8.15.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.15.1.2.1 through 8.15.1.2.16 and 8.15.6.

8.15.1.2* Concealed Spaces Not Requiring Sprinkler Protection.

8.15.1.2.1* Concealed spaces of noncombustible and limited-combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading, see A.8.15.1.2.1.)

8.15.1.2.2 Concealed spaces of noncombustible and limited-combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.15.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)

8.15.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.

8.15.1.2.5 Concealed spaces formed by ceilings attached directly to or within 6 in. (152 mm) of wood joist construction shall not require sprinkler protection.

Panel Meeting Action: Reject

Panel Statement: 800.154, Applications of Listed Communications Wires and Cables and Communications Raceways, does not contain any application for the newly proposed cable listing suffix. This proposal does not provide any applications or installation requirements for the newly proposed cable listing suffixes. Adding listing requirements without application or installation requirements is not in keeping with the 2003 NEC Style Manual Section 1.3, Regulatory Adoption, which states "Because the National Electrical Code is intended to be suitable for adoption as a regulatory document, it is important that it contain clearly stated mandatory requirements in the Code text."

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-205 Log #4003 NEC-P16 **Final Action: Reject**

(800.179(K) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Add new 800.179(K)

<u>(K) Cables in Dry, Damp, or Wet Locations. Cables specified in 800.154(A), (B), and (C) shall be listed for installation in dry, damp, or wet locations, or shall have a moisture-impervious metal sheath, and shall be marked with a suffix as required in 800.179(K)(a), (b), or (c).</u>

<u>(a) Cables installed in dry location shall not be required to have an additional suffix marking.</u>

<u>(b) Conductors and cables suitable for installation in damp locations shall be identified with the suffix "-DAMP". Conductors and cables listed for damp locations shall be suitable for installation in dry locations.</u>

<u>FPN: One method of defining suitability for installation in damp locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*</u>

<u>(c) Cables suitable for installation in wet locations shall be identified with the suffix "-WET". Conductors and cables listed for damp locations shall be suitable for installation in dry or damp locations.</u>

<u>FPN: One method of defining suitability for installation in wet locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*</u>

Substantiation: Presently, there is no marking that identifies which Communications cables are suitable for dry, damp, or wet locations. Cables suitable for installation in dry locations that are installed in damp or wet locations have the potential to cause system malfunction.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 16-204.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-206 Log #4005 NEC-P16 **Final Action: Reject**

(800.179(L) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Add new 800.179(L)

<u>(L) Communications Cables Exposed to Direct Sunlight. Communications cables installed exposed to direct sunlight shall be listed as sunlight resistant cable. Cables specified in 800.154(A), (B), and (C), and used for installations exposed to direct sunlight shall have the additional classification using the suffix "-SR".</u>

<u>FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*</u>

Substantiation: Presently, there is no marking that identifies communications cables as being suitable for installation exposed to direct sunlight. Cables that are not listed for exposure to direct sunlight and are installed exposed to direct sunlight have the potential to cause system malfunction. There have been job failures where cables supported by an aerial messenger wire failed due to sunlight exposure.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 16-204. The submitter's substantiation that cables are not marked for exposure to direct sunlight is incorrect. There are cables marked as suitable for installation in direct sunlight.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-207 Log #4006 NEC-P16 **Final Action: Reject**

(800.179(M) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Add new 800.179(M)

<u>(M) Communications Cable Temperature Ratings. Communications cables shall be listed for a temperature rating of not less than 60ºC (140ºF). Communications cables shall be permitted to have an additional temperature rating for the lowest permitted temperature.</u>

Substantiation: Communications are often installed in areas where the temperature exceeds the 60ºC (140ºF) rating, which is not marked on the cable. For example, cable installed in conduit on a rooftop could have a temperature internal to the conduit in excess of 160 ºF.

Additionally, Communications cables are sometimes installed in cold areas (e.g., walk-in freezer or home fire alarm/security system pre-wire installation), so an indication of the minimum permitted temperature is important.

There is a companion proposal to add temperature marking requirements.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 16-204.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-208 Log #4002 NEC-P16 **Final Action: Reject**

(800.179(N) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Recommendation: Add new 800.179(N)

<u>(N) Communications Cables Installed in Corrosive Locations. Communications cables installed in corrosive locations shall be listed as suitable for corrosive locations. Cables specified in 800.154(A), (B), and (C), and used for installation in corrosive locations shall have the additional classification using the following suffixes: "-PR" for oil resistant, and "-GR" for gasoline and oil resistant.</u>

<u>FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*</u>

Substantiation: Presently, there is no marking that identifies which communications cables as being suitable for installation in corrosive locations. Corrosive locations have the potential to degrade cable and conductor insulation and cause system malfunction.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 16-204.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-209 Log #4007 NEC-P16 **Final Action: Reject**
(800.179(O) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 800.179(O)
<u>(O) Very-Low-Smoke Producing Cables. Communications cables used to provide very-low-smoke producing characteristics shall be listed as very-low-smoke producing (50) and shall be listed as having low flame spread characteristics and very-low-smoke producing characteristics. Cables specified in 800.154(A), (B), and (C) shall have the additional classification using the suffix "-50".</u>
<u>FPN: One method of defining a very-low-smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with UL 723, *"Test for Surface Burning Characteristics of Building Materials"* with the cable unslit (intact) and cut through to expose the cable core.</u>
Substantiation: This proposal establishes a listing and marking for cable for installation where minimal smoke generations is required. This cable meets the requirement for installation in concealed spaces that permit a maximum flame spread index of 25 and a maximum smoke developed index of 50. The proposed cable has low flame spread characteristics and very-low-smoke-producing characteristics. Presently, a number of manufacturers have cables listed as meeting the proposed requirements, but do not have a unique marking permitted by the NEC.

The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.

Establishing a listing and marking for cables listed for a "-50" suffix provides cables with physical parameters (flame spread index, smoke developed index) that is consistent with requirements in other codes.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-204.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-210 Log #4004 NEC-P16 **Final Action: Reject**
(800.179(P))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Recommendation: Add new 800.179(P)
<u>(P) Fire Hazard Cables. Communications cables used to provide low combustible loading shall be listed as fire hazard cable (FHC) and shall be listed as having low flame spread characteristics, very-low-smoke producing characteristics, and a low potential heat release value. Cables specified in 800.154(A), (B), and (C) shall have the additional classification using the suffix "-FHC".</u>
<u>FPN: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with UL 723, *"Test for Surface Burning Characteristics of Building Materials"* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>
Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has low flame spread characteristics, very-low-smoke-producing characteristics, and a low potential heat release value. Presently, a number of manufacturers have cables listed to the proposed requirements.

The testing criteria are based on the requirements found in NFPA 13 and the International Mechanical Code, as revised.

NFPA 13, Section 8.14.1.2.1 follows: "Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum." The proposed cable has a very low heat of combustion. While the term "combustible loading" is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.

The International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50.

Establishing a listing and marking for cables listed for a "FHC" suffix provides cables with physical parameters (flame spread index, smoke developed index, potential heat release) that is consistent with requirements in other codes.

NFPA 13-2007

8.15 Special Situations.

8.15.1 Concealed Spaces.

8.15.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.15.1.2.1 through 8.15.1.2.16 and 8.15.6.

8.15.1.2* Concealed Spaces Not Requiring Sprinkler Protection.

8.15.1.2.1* Concealed spaces of noncombustible and limited-combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading, see A.8.15.1.2.1.)

8.15.1.2.2 Concealed spaces of noncombustible and limited-combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.15.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)

8.15.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.

16-211 Log #2268 NEC-P16 **Final Action: Accept in Principle**
(800.182)

Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise text to read as follows:
800.182 Communications Raceways <u>and Optical Fiber/Communications Cable Routing Assemblies</u>.
Communications raceways shall be listed in accordance with <u>800.182(A)</u> through (C).
(A) (A) Plenum Communications Raceways. (Text unchanged).
(B) Riser Communications Raceways <u>and Optical Fiber/Communications Cable Routing Assemblies</u>. Riser communications raceways <u>and riser optical fiber/communications cable routing assemblies shall</u> be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, *Standard for Optical Fiber Cable Raceway*<u>, or UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies as applicable.*</u>
(C) General-Purpose Communications Raceways <u>and Optical Fiber/Communications Cable Routing Assemblies</u>. General-purpose communications raceways <u>and optical fiber/communications cable routing assemblies</u> shall be listed as being resistant to the spread of fire.

FPN: One method of defining *resistance to the spread of fire* is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, *Standard for Optical Fiber Cable Raceway*<u>, or UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies as applicable.*</u>
Substantiation: This is a companion proposal to provide for the use of optical fiber /communications cable routing assemblies. Please refer to the substantiation for the companion proposals for 770.154 and 770.182.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
800.182 Communications Raceways <u>and Cable Routing Assemblies</u>.
Communications raceways shall be listed in accordance with <u>800.182(A)</u> through (C).
(A) Plenum Communications Raceways. (Text unchanged).
(B) Riser Communications Raceways <u>and Cable Routing Assemblies</u>. Riser communications raceways <u>and riser cable routing assemblies shall</u> be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, *Standard for Optical Fiber Cable Raceway*<u>, or UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies as applicable.*</u>
(C) General-Purpose Communications Raceways <u>and Cable Routing Assemblies</u>. General-purpose communications raceways <u>and cable routing assemblies</u> shall be listed as being resistant to the spread of fire.

FPN: One method of defining *resistance to the spread of fire* is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, *Standard for Optical Fiber Cable Raceway*<u>, or UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies as applicable.*</u>
Panel Statement: The panel struck "optical fiber/communications" because it was removed from the definitions. See panel action on Proposals 16-12, 16-108, and 16-232.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

ARTICLE 810 — RADIO AND TELEVISION EQUIPMENT

16-212 Log #4186 NEC-P16 **Final Action: Accept**
(810)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase "grounding conductor" and revising it to "grounding electrode conductor."

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Replace the term "grounding conductor" with "grounding electrode conductor" throughout this Article.
Substantiation: The term "Grounding Conductor" is being proposed to be deleted because it is almost identical to the term "grounding electrode conductor". The defined term "grounding electrode conductor" includes the ability of connecting to a point on the grounding electrode system. This has been submitted as a single proposal to the Article instead of numerous proposals to allow the panel to ensure the resulting language still meets their intent in each specific section.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-91.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
JANIKOWSKI, R.: I agree with the submitter that the term "grounding conductor" and "grounding electrode conductor" are all but identical. The term "grounding electrode conductor" will not be mistaken in the field for the grounded conductor and refers to any point on the grounding electrode system.
Comment on Affirmative:
BRUNSSEN, J.: This is a correlation issue with Panel 5. Although the deletion of the term "grounding conductor" is appropriate for articles covered by Panel 5, the term is used over 120 times in Chapter 8 articles covering low power communications circuits and elsewhere in the code. The term "Grounding Conductor" has proven a useful and well understood term within the communications articles and a definition should be retained in Article 100. Substitution of "Grounding Conductor" with "Grounding Electrode Conductor" is not appropriate for all uses in Chapter 8 articles. The definition of "Grounding Conductor" could be modified to make it more specific to communications circuits as follows: "G**rounding Conductor.** A conductor used to connect communications equipment and cable shield, as required, to a grounding electrode system or grounding electrode(s)." This definition would meet the needs of Chapter 8.

16-213 Log #3241 NEC-P16 **Final Action: Accept**
(810.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence as follows:
This article covers antennas such as <u>wire-strung type</u>, multi-element, vertical rod and dish... (remainder unchanged).
Substantiation: Edit. Antenna types covered in 810.16 should be noted.
Panel Meeting Action: Accept
Panel Statement: The panel recognizes that the TCC is responsible for the scope. The panel recommends that the TCC accept this proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-214 Log #3423 NEC-P16 **Final Action: Accept**
(810.13)

TCC Action: The Technical Correlating Committee directs that the panel clarify that the panel action intends to delete "of less than 250 volts between conductors".
In addition, the Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
This shall be considered as a public comment.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
810.13 Avoidance of Contacts with Conductors of Other Systems. Outdoor antennas and lead-in conductors from an antenna to a building shall not cross over open conductors of electric light or power circuits and shall be kept well away from all such circuits so as to avoid the possibility of accidental contact. Where proximity to open electric light or power service<u>-entrance</u> conductors cannot be avoided, the installation shall be such as to provide a clearance of at least 600 mm (2 ft). (The remainder of the text to be unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.
Service<u>-Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service<u>-entrance</u> conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
IVANS, R.: The proposed change does not add any clarity to the interpretation or readability of the NEC regarding the use of the term "Service." The submitter has not substantiated what value has been added by inserting the word "entrance".

16-215 Log #4914 NEC-P16 **Final Action: Reject**
(810.15)

Submitter: Nisar Chaudhry, TII Network Technologies, Inc.
Recommendation: Add new text as follows:
810.15 Grounding.
Masts and metal structures supporting antennas shall be grounded in accordance with <u>810.21</u>.
Add a new Exception.
<u>**Exception:** Dish Antennas mounted where no part of the antenna is higher than the highest point of the structure.</u>
Substantiation: The coax cable from Satellite Dish is electrically isolated from the metallic dish reflector and mounting hardware (See document provided). When the Dish Antenna is installed below the roof level of the premises, the dish antenna does not attract any lightning discharges. The induced voltages on the antenna are similar to the ones that can be present on the inside premises wiring. This is based on the analysis done using a Rolling Sphere (See document provided). In addition, grounding of the totally isolated and confined within the premises, satellite dish antenna systems will not involve any power cross or lightning induced currents. A rolling sphere of 150 feet radius was chosen as the worst case situation as generally used in designing Lightning Protection Systems for the premises. These Dish Antennas mounted in this configuration should not be required to be grounded, as they do not fall under requirements set in Article 250 as "Likely to become energized".
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 16-251.

Ballot Results: Affirmative: 16

16-217 Log #3101 NEC-P16 **Final Action: Reject**
(810.21(F)(2)(3))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(2) Text to remain unchanged.
(1) Text to remain unchanged.
(2) Text to remain unchanged.
~~(3) The power service accessible means external to the building, as covered in 250.94~~
~~(4)~~ (3) Text to remain unchanged.
~~(5)~~ (4) Text to remain unchanged.
~~(6)~~ (5) Text to remain unchanged.
A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.
Substantiation: The item being discussed in (3) is the item covered in 810.21(F)(1), so there is no reason for it to be in 810.21(F)(2).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-34.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-218 Log #1142 NEC-P16 **Final Action: Accept**
(810.21(F)(3))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise text as follows:
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means~~,~~ as described in ~~810.21(F)(1)~~ 810.21(F)(2).
Substantiation: The title states "without intersystem bonding termination", hence it is the grounding means of 810.21(F)(2) that should be referenced. See similar requirements in 770.100(B)(3), 800.100(B)(3), 820.100(B)(3) and 830.100(B)(3). The comma is superfluous.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-219 Log #3100 NEC-P16 **Final Action: Reject**
(810.21(F)(3))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 810.21(F)(1), the grounding conductor shall be connected to an electrode as described in 250.52.
~~(1) To any one of the individual electrodes described in 250.52; or~~
~~(2) If the building or structure served has no grounding means, as described in 810.21(F)(1) or (F)(2), to an effectively grounded metal structure.~~
Substantiation: The term "effectively grounded" is vague and unenforceable, as indicated by actions taken by the technical committees for the 2008 NEC. Furthermore, if this section is intending to address a metal building frame or underground metal structure, these items are already covered in 810.21(F)(2).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-220 Log #3728 NEC-P16 **Final Action: Reject**
(810.21(F)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 810.21(F)(3) as follows:
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 810.21(F)(1), one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and comply with the requirements of 250.56 being applicable to rod, pipe, and plate electrode installations.
~~(1) To any one of the individual electrodes described in 250.52; or~~
~~(2) If the building or structure served has no grounding means, as described in 810.21(F)(1) or (F)(2), to an effectively grounded metal structure.~~
Substantiation: The requirement in existing 810.21(F)(3)(1) to connect the grounding electrode conductor to "any of the individual electrodes described in 250.52" seems to suggest one or more of these electrodes are readily available but forgets that this section is titled **"Buildings or Structures Without …. Grounding Means."** This is not consistent with 250.50 that only requires the use of such electrodes where they are "present at each building or structure served." Subsection 810.21(F)(3)(2) also has similar issues as if a grounded metal structure exists there exists a "grounding means."
The requirements of this section should state that where a building or structure is without grounding means, it is to have such reasonable grounding means installed such as a ground ring, rod, pipe, plate, or other underground metal structure that is recognized by Article 250 and more specifically 250.52(A)(4), (A)(5), (A)(6), (A)(7), and (A)(8). This revision would bring the grounding of radio and television equipment circuits into line with the requirements of Articles 250 for both consistency and for technical application.
Panel Meeting Action: Reject
Panel Statement: Specific reference to 250.52(A)(4) through (A)(8) is unnecessary as all appropriate grounding connections are presently listed in 810.21(F)(1) and (2). The title of 810.21(F)(3), "In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means" must be considered in context with the preceding Section 810.21(F)(2) where specific grounding means at the building or structure are identified.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-221 Log #1134 NEC-P16 **Final Action: Accept**
(810.21(F)(3)(2))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Revise text as follows:
(2) if the building or structure served has no intersystem bonding termination or has no grounding means, as described in ~~810.21(F)(1) or (F)(2)~~ 810.21(F)(2) or (F)(3)(1), to and effectively grounded metal structure.
Substantiation: The proposed revision correlates 810.21(F)(3)(2) with similar requirements in 770.100(B)(3), 800.100(B)(3), 820.100(B)(3) and 830.100(B)(3). It also emphasizes that the option provided by 810.21(F)(3)(1) should be pursued before resorting to 810.21(F)(3)(2).
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-222 Log #1482 NEC-P16 **Final Action: Accept in Principle**
(810.51 through 810.58)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: David Bredhold, Eaton Corporation
Recommendation: Revise text as follows:
III. Amateur and Citizen Band Transmitting and Receiving Stations—Antenna
Substantiation: Citizen Band antennae are of like construction and require similar lead-in cable as amateur antennae. While Citizen Band antennae use shielded cable (typically enclosed in metallic sheath) for lead-in, other conditions are similar to those of amateur equipment. Citizen Band antennae are exposed to the same environmental and atmospheric conditions as are amateur antennae: lightning, wind-loading, and clearance requirements from overhead conductors are examples. Therefore, Citizen Band transmitting and receiving installations should be required to adhere to stipulations delineated in the NEC as are installations for amateur transmitting and receiving stations.
Panel Meeting Action: Accept in Principle
Revise 810.1 text as follows:
810.1 Scope.
This article covers antenna systems for radio and television receiving equipment, amateur, and citizens band radio transmitting and receiving equipment, and certain features of transmitter safety. This article covers antennas such as multi-element, vertical rod, and dish, and also covers the wiring and cabling that connects them to equipment. This article does not cover equipment and antennas used for coupling carrier current to power line conductors."
Revise III title text as follows:
III. Amateur and Citizen Band Transmitting and Receiving Stations—Antenna
Revise 810.51 text as follows:
810.51 Other Sections.
In addition to complying with Part III, antenna systems for amateur and citizen band transmitting and receiving stations shall also comply with 810.11 through 810.15.
Revise table 810.52 title as follows:
Table 810.52 Size of ~~Amateur Station~~ Outdoor Antenna Conductors
Revise 810.58 title as follows:
810.58 Grounding Conductors — Amateur and Citizens Band Transmitting and Receiving Stations.
Grounding conductors shall comply with 810.58(A) through (C).
Revise 810.58(A) as follows:
(A) Other Sections. All grounding conductors for amateur and citizens band transmitting and receiving stations shall comply with 810.21(A) through (K).
Panel Statement: The addition of the words "citizens band" throughout Article 810 meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-223 Log #4692 NEC-P16 **Final Action: Accept**
(810.70 Exception No. 1)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal and the existing section 640.3(K).
This action will be considered by the panel as a public comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this exception.
Substantiation: This exception is not in the form of a complete sentence and therefore of uncertain meaning, in violation of 3.1.4.1 of the Style Manual. This exception is almost certainly obsolete. It was in the NEC over 50 years ago when Article 640 was firmly rooted in the vacuum tube era, and it is unlikely to have any meaning with today's technology.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

ARTICLE 820 — COMMUNITY ANTENNA TELEVISION AND RADIO DISTRIBUTION SYSTEMS

16-224 Log #2286 NEC-P16 **Final Action: Reject**
(820)

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Revise the indicated Sections in Article 820 to read as follows:
820.2 Definitions. See Article 100. For the purposes of this article, the following additional definitions apply.
Coaxial Raceway (OFCR). A nonmetallic, pliable, corrugated raceway of circular cross section with integral or associated couplings, connectors, and fittings for the installation of coaxial cables.
820.3 Other Articles. Circuits and equipment shall comply with 820.3(A) through (G).
(A) Hazardous (Classified) Locations. CATV equipment installed in a location that is classified in accordance with 500.5 shall comply with the applicable requirements of Chapter 5.
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.
Exception: As permitted in 820.154(A).
(C) Installation and Use. Section 110.3 shall apply.
(D) Installations of Conductive and Nonconductive Optical Fiber Cables. Article 770 shall apply.
(E) Communications Circuits. Article 800 shall apply.
(F) Network-Powered Broadband Communications Systems. Article 830 shall apply.
(G) Alternate Wiring Methods. The wiring methods of Article 830 shall be permitted to substitute for the wiring methods of Article 820.
FPN: Use of Article 830 wiring methods will facilitate the upgrading of Article 820 installations to network-powered broadband applications.
(H) Coaxial Raceways (OFCR). Article 862 applies to the selection and installation of Coaxial Raceways (OFCR).
820.110 Raceways for Coaxial Cables. Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or Optical Fiber/Communication Raceway (OFCR) selected and installed per Article 862. The number of Communication Cables shall comply with 862.22~~listed plenum CATV raceway, listed riser CATV raceway, or listed general-purpose CATV raceway installed in accordance with 820.154, and with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.~~
~~*Exception: Conduit fill restrictions shall not apply.*~~
820.154 Applications of Listed CATV Cables and CATV Raceways. CATV cables shall comply with the requirements of 820.154(A) through (E) or where cable substitutions are made as shown in Table 820.154(E).
(A) Plenums. Coaxial cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in ~~300.22(B)~~ 862.10(D) and in other spaces used for environmental air as described in ~~300.22(C)~~ 862.(E). Only Type CATVP cable shall be permitted to be installed in these raceways.
(B) Riser. Coaxial cables installed in risers shall comply with any of the requirements of 820.154(B)(1) through (B)(3).
(1) Coaxial Cables in Vertical Runs. Coaxial cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. Listed riser CATV raceways and listed plenum CATV raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor as described in 862.10(F). Only Type CATVR and CATVP cables shall be permitted to be installed in these raceways.
(2) Metal Raceways or Fireproof Shafts. Types CATV and CATVX cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having fire- stops at each floor.
(3) One- and Two-Family Dwellings. Types CATV and CATVX cables shall be permitted in one- and two-family dwellings. Listed general-purpose coaxial raceways, listed riser coaxial raceways, and listed plenum coaxial raceways shall be permitted for use as described in 862.10(G) with Type CM and CMX cables.
FPN: See 820.3(A) for the firestop requirements for floor penetrations.
(C) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 820.154(A) and (B) shall be in accordance with any of the requirements in 820.154(C)(1) through (C)(5).
(1) General. Type CATV shall be permitted. Listed CATV general-purpose raceways, listed riser CATV raceways, and listed plenum CATV raceways shall be permitted. Only Types CATV, CATVX, CATVR, or CATVP cables shall be permitted to be installed in these CATV raceways as described in 862.10(G).
(2) In Raceways. Type CATVX shall be permitted to be installed in a raceway.
(3) Nonconcealed Spaces. Type CATVX shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).
(4) One- and Two-Family Dwellings. Type CATVX cables less than 10 mm (0.375 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.
(5) Multifamily Dwellings. Type CATVX cables less than 10 mm (0.375 in.) in diameter shall be permitted to be installed in multifamily dwellings.
(D) Cable Trays. Cables installed in cable trays shall be Types CATVP, CATVR, and CATV.
(E) Cable Substitutions. The uses and substitutions for CATV coaxial cables listed in

Table 820.154(E) Coaxial Cable Uses and Permitted Substitutions (not submitted)

820.182 ~~**CATV Raceways.** CATV raceways shall be listed in accordance with 820.182(A) through (C).).~~ **Nonmetallic Coaxial Raceways (OFCR).** Nonmetallic Coaxial Raceways (OFCR) shall be listed in accordance with Article 862.6.

~~**(A) Plenum CATV Raceways.** Plenum CATV raceways shall be listed for use in other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.~~

~~FPN: One method of defining that an optical fiber raceway is a low smoke-producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical-Fiber Cable Raceway.~~

~~**(B) Riser CATV Raceways.** Riser CATV raceways shall be listed for use in risers and shall also be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.~~

~~FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the Test for Flame Propagation (Riser) in UL 2024, Standard for Optical-Fiber Cable Raceway.~~

~~**(C) General-Purpose CATV Raceways.** General-purpose CATV raceways shall be listed suitable for general-purpose use and shall also be listed as being resistant to the spread of fire.~~

~~FPN: One method of defining resistance to the spread of fire is that the raceway passes the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, Standard for Optical-Fiber Cable Raceway.~~

Substantiation: This is a companion proposal to correlate with the proposal for a new optical fiber/communication raceway article. The new optical fiber/ communication raceway article was proposed to Panel 16 as Article 862.

Optical fiber/communication raceways (Type OFCR) are currently listed raceways for use in plenums, risers or general purpose applications for the management of signaling, optical fiber, communication and CATV cables. This new Article and the companion proposals will clarify the selection, and installation optical fiber/communication raceways including the construction specifications. It is not the intent of the submitter to revise or change any of the currently permitted uses by this proposal, but only to enhance the usability of the Code.

Panel Meeting Action: Reject

Panel Statement: This proposal was submitted in companion with Proposal 16-350, which was rejected. The submitter of this proposal assumes the acceptance of Proposal 16-350, which was rejected.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-225 Log #4187 NEC-P16 **Final Action: Reject**
(820)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase "grounding conductor" and revising it to "grounding electrode conductor."

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Replace the term "grounding conductor" with "grounding electrode conductor" throughout this Article.

Substantiation: The term "Grounding Conductor" is being proposed to be deleted because it is almost identical to the term "grounding electrode conductor". The defined term "grounding electrode conductor" includes the ability of connecting to a point on the grounding electrode system. This has been submitted as a single proposal to the Article instead of numerous proposals to allow the panel to ensure the resulting language still meets their intent in each specific section.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 16-91.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

JANIKOWSKI, R.: I agree with the submitter that the term "grounding conductor" and "grounding electrode conductor" are all but identical. The term "grounding electrode conductor" will not be mistaken in the field for the grounded conductor and refers to any point on the grounding electrode system.

Comment on Affirmative:

BRUNSSEN, J.: This is a correlation issue with Panel 5. Although the deletion of the term "grounding conductor" is appropriate for articles covered by Panel 5, the term is used over 120 times in Chapter 8 articles covering low power communications circuits and elsewhere in the code. The term "Grounding Conductor" has proven a useful and well understood term within the communications articles and a definition should be retained in Article 100. Substitution of "Grounding Conductor" with "Grounding Electrode Conductor" is not appropriate for all uses in Chapter 8 articles. The definition of "Grounding Conductor" could be modified to make it more specific to communications circuits as follows: "G**rounding Conductor.** A conductor used to connect communications equipment and cable shield, as required, to a grounding electrode system or grounding electrode(s)." This definition would meet the needs of Chapter 8.

16-226 Log #201 NEC-P16 **Final Action: Reject**
(820.1)

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

<u>**Concealed Space.** That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1]</u>

<u>Nonconcealed space. That portion of a building that is not a concealed space.</u>

Substantiation: Section 820.154(C)(3) has application requirements for CATV cables in nonconcealed spaces. A definition of a concealed space is needed in order to define and understand what a nonconcealed space is. I have also submitted a proposal to clarify that the definition of "concealed" in Article 100 applies only to wiring methods.

Panel Meeting Action: Reject

Panel Statement: The terms "concealed spaces" and "nonconcealed spaces" are generally understood and do not require definitions.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-227 Log #1135 NEC-P16 **Final Action: Accept**
(820.1, FPN (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)

Recommendation: Add the FPN following 820.1:

<u>FPN: See 90.2(B)(4) for installations of CATV and Radio Distribution Systems that are not covered.</u>

Substantiation: Adding the FPN reminds NEC users to check 90.2(B)(4), thereby avoiding misapplication of 820, and provides correlation between 820.1 and 830.1 that contains a similar FPN.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-228 Log #745 NEC-P16 **Final Action: Reject**
(820.2.Abandoned Coaxial Cable)

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Delete text and the associated Fine Print Note to read as follows:

820.2 Definitions.

See Article 100. For the purposes of this article, the following additional definitions apply.

~~**Abandoned Coaxial Cable.** Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.~~

~~FPN: See Article 100 for a definition of Equipment.~~

[remainder of 820.2 unchanged by this Proposal]

Substantiation: Companion proposals have been made to add a single generalized definition in Article 100 and to delete the corresponding definitions for the various abandoned cables, supply circuits, etc., in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2.

NEC® Manual of Style 2.2.2.1. Consolidation into a new, single generalized definition in Article 100 of nearly identical definitions appear in multiple Articles, specifically in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2. Although these individual definitions served a valid transitional purpose to support the independent additions of individual requirements in 640.6(C), 645.5(F), 645.5(G), 725.25, 800.25, 820.25, and 830.25, these discreet definitions can be broadly consolidated into a single definition in Article 100.

The specific method by which identification for future use is achieved ("… with a tag") is conveyed in the definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 violates *NEC® Manual of Style* 2.2.2 ("Definitions shall not contain requirements …") and is omitted in the generalized definition for "Abandoned" being added in Article 100. This identification-with-a-tag requirement in these definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 is redundant to the actual requirement statements in 640.6(C), 645.5(G), 725.25, 800.25, 820.25, and 830.25, respectively. Also, words regarding the possibility of ceasing connection to an electric supply have been added in the generalized definition for "Abandoned" to correlate to 90.2(A)(3), since abandonment entails disconnection from either the terminating equipment or the electric supply (or both).

Panel Meeting Action: Reject

Panel Statement: For the 2008 NEC, a TCC-directed task group, including representation from CMP-3, CMP-12 and CMP-16, determined there were enough differences in the installation of abandoned cables to justify them being addressed in individual articles. The current code wording is aligned with what was proposed by the task group.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-229 Log #815 NEC-P16 **Final Action: Reject**
(820.2.Abandoned Coaxial Cable)

Submitter: J. L. Richardson, Engineering Services Group, Inc.
Recommendation: Delete the following text:
~~Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.~~
Substantiation: To be replaced by general definition Article 100, Definitions.
Panel Meeting Action: Reject
Panel Statement: For the 2008 NEC, a TCC-directed task group, including representation from CMP-3, CMP-12 and CMP-16, determined there were enough differences in the installation of abandoned cables to justify them being addressed in individual articles. The current code wording is aligned with what was proposed by the task group.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-230 Log #4556 NEC-P16 **Final Action: Accept**
(820.2.Air Duct)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Delete the following text:
~~**820.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum.~~
Substantiation: The term "air duct" is not used in article 820 and should not be defined in the article, as per the manual of style of the National Electrical Code.
This has been proposed before but was caught in the NEC moratorium associated with plenum cables.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Proposal 16-248. The term "air duct" has been included in Article 820 in Proposal 16-248.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-231 Log #212 NEC-P16 **Final Action: Reject**
(820.2.CATV Raceway (New))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Add new definition to read as follows:
"CATV Raceway. A raceway listed as a Plenum CATV Raceway, or a Riser CATV Raceway, or a General-Purpose CATV Raceway."
Substantiation: The term "CATV Raceway" is used throughout Article 800 and therefore needs to be defined. The proposed definition is precise. Companion proposals have been submitted for Articles 770 and 800.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-289a where the listing of "CATV raceway" is deleted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-232 Log #3596 NEC-P16 **Final Action: Accept in Principle**
(820.2.Optical Fiber/Communications Cable Routing Assembly)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 2.2.2 of the NEC Style Manual to not contain mandatory text, such as "listed."
This action will be considered by the panel as a public comment.
Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Add new text to read as follows:
<u>**Optical fiber /communications cable routing assembly**. A flame retardant, nonmetallic assembly of pliable lengths, rigid straight sections, elbows, bends and fittings such as expansion joints, female and male adapters, and couplings used to support and protect optical fiber, communications and data cables in applications with a high density of cabling such a information technology (computer) rooms, broadcast stations and telecommunications offices. Parts of the assembly may have hinged or removable covers. The assembly is designed for cables be laid or set in place after the enclosures have been installed as a complete system.</u>
Substantiation: Article 770 currently covers optical fiber raceways and provides applications and listing requirements for these raceways. UL lists these raceways to UL 2024, Optical Fiber and Communication Cable Raceway. UL lists optical fiber /communications cable routing assemblies to UL2024a, Outline of Investigation for Optical Fiber Cable Routing Assemblies. Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.)
For further information see the attached application guide from one of the manufacturers or got to http://www.storage-expo.com/ExhibitorLibrary/302/FiberRunner_6.pdf on the web.
The significant difference between optical fiber /communications cable routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.
Since users of the code may not be familiar with optical fiber / communications cable routing assemblies we are submitting this proposal to define them. We have submitted companion proposals to provide for a change of the scope of Article 770 to include optical fiber /communications cable routing assemblies and to provide listing and application for requirements for them. Since these routing assemblies are used for optical fiber, data and communications cables, proposals are being submitted for Articles 725, 770, 800 and 820.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Cable Routing Assembly. A unit or assembly of units or sections and associated fittings that are listed and form a structural system used to support listed cables.
Panel Statement: The panel action meets the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
GUBISCH, R.: The proposed definition contains a requirement which conflicts with 2.2.2 of the NEC Style Manual.
Comment on Affirmative:
BRUNSSEN, J.: The definition as stated in the Panel Meeting Action is incomplete as it fails to identify the types of cable to be supported and protected. Revise the Panel Meeting Action as follows: "**Cable Routing Assembly.** A unit or assembly of units or sections and associated fittings that are listed and form a structural system used to support <u>and protect optical fiber, communications and data</u> listed cables."
DORNA, G.: See my comment on proposal 16-12.

16-233 Log #125 NEC-P16 **Final Action: Reject**
(820.3)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Add new text to read:
<u>CATV Raceway. A raceway listed as a Plenum CATV Raceway, or a Riser CATV Raceway, or a General-Purpose CATV Raceway.</u>
Substantiation: The term "CATV Raceway" is used throughout Article 800 and therefore needs to be defined. The proposed definition is precise. Companion proposals have been submitted for Articles 770 and 800.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-289a where the listing of "CATV Raceway" is deleted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-234 Log #2460 NEC-P16 **Final Action: Accept in Principle**
(820.3)

Submitter: Joseph P. Savage, FIFTH Council North America
Recommendation: Add the following line to 820.3
<u>**(G) Premise-Powered Broadband Communications Systems.** Article 8XX shall apply.</u>
(~~G~~ H) Alternate Wiring Methods. The wiring methods of Article <u>830</u> shall be permitted to substitute for the wiring methods of Article <u>820</u>.
Substantiation: A submission has been made for a new Article to Chapter 8. If this Article is accepted, then Article 820.3 should include the above added reference.
Panel Meeting Action: Accept in Principle
Revise text and insert the following new subparagraphs to 820.3 to read as follows:
(F) Premises-Powered Broadband Communications Systems. Article 840 shall apply.
(G) Alternate Wiring Methods. The wiring methods of Article 830 shall be permitted to substitute for the wiring methods of Article 820.
Panel Statement: See panel action on Proposal 16-349. See panel action on Proposal 16-235 that deleted one of the existing subparagraphs.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
PREZIOSO, L.: There is no need to substitute the new article's wiring methods if the new article is not Accepted.

16-235 Log #2117 NEC-P16 **Final Action: Accept**
(820.3 and 820.3(B))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Make the following changes:
~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** Section 300.22, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.~~
~~*Exception: As permitted in 820.154(A).*~~
Revise 820.3 introductory sentence as follows:
820.3 Other Articles. Circuits and equipment shall comply with 820.3 (A) through ~~(G)~~ (F).
Reletter existing items (C) through (G) as (B) through (F).
Substantiation: This is an editorial and clarification proposal.
Section 820.3(B) provides no additional guidance or requirements that are not already in 820.154(A). Section 300.22 conflicts with Article 820 because Article 820 requires listed coaxial cables whereas 300.22 permits various electrical power and control cables that are not permitted to be used for CATV circuits in Article 820. Section 800.3 does not have a similar requirement.
Acceptance of this proposal, as well as companion proposals for 770.3 and 830.3, will make Articles 770, 800, 820 and 830 consistent and in compliance with section 3.3.5 of the NEC Style Manual, shown below:
3.3.5 Parallel Construction. Parallel construction means stating similar requirements in similar ways for greater consistency. This helps makes the *NEC* clear for users. Lack of consistency often creates confusion, causing users to ask: *Does this difference in wording represent a different requirement? Or is it simply two different ways of trying to say the same thing?* There are several kinds of parallel construction:
Organization and Numbering. If practicable, the subsections of similar articles should be numbered in the same order (see 2.4.1).
Sections. Different sections, within the same article, that reflect similar or closely related subjects, should have similar structures.
Lists. All items in a list should be parallel (that is, singular or plural, written in the same verb tense, using phrases or sentences but not a mix).
This proposal was submitted by the CMP 16 Special Editorial Task Group during the development of the 2008 NEC. This proposal was rejected in order to comply with the NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005. The Standards Council Decision does not apply to the current NEC code cycle.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-236 Log #159 NEC-P16 **Final Action: Accept in Principle**
(820.3(A) (New))

TCC Action: The Technical Correlating Committee directs that the panel delete the subsection since 90.3 already provides the information and compliance with 4.1 of the NEC Style Manual is necessary.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: In section 820.3, re-letter the existing (A) to (B), (B) to (C), etc. and establish a new (A).
(A) **Chapters 1 through 7.** See 90.3. The requirements of Chapters 1 through 7 shall not apply to Article 820 except where the requirements are specifically referenced in Article 820.
Substantiation: Section 90.3 is extremely important to the application of Article 820. Adoption of this proposal will add clarity.
Panel Meeting Action: Accept in Principle
Re-letter the existing (A) to (B), (B) to (C), etc., and establish a new (A).
(A) Chapters 1 through 7. The requirements of Chapters 1 through 7 shall not apply to Article 800 except where the requirements are specifically referenced in Article 800. See 90.3.
Panel Statement: Field experience shows that 90.3 is often overlooked. The panel moved the reference to 90.3 to the end for clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DORNA, G.: There is an error in the panel action. "Article 800" needs to be changed to "Article 820" twice.
IVANS, R.: There is an error in the panel action. "Article 800" needs to be changed to "Article 820" twice.

16-237 Log #2116 NEC-P16 **Final Action: Accept**
(820.3(A))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise the following:
820.3(A) Hazardous (Classified) Locations. CATV equipment installed in a location that is classified in accordance with 500.5 and 505.5 shall comply with the applicable requirements of Chapter 5.
Substantiation: This is a clarification proposal. This proposal is editorial and technical.
CMP 16 was instructed by the Technical Correlating Committee during the 2008 NEC ROP process to consider not only the different hazardous location division applications (500.5) but also the different hazardous location zone applications (505.5). This directive was issued for 2008 Proposal 16-121 which dealt with 800.3(A). This reference of 505.5 should be added here as well to correlate with Articles 800 and 830.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-238 Log #123 NEC-P16 **Final Action: Accept**
(820.3(B))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Deleted text:
~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** Section 300.22, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.~~
~~*Exception: As permitted in 820.154(A).*~~
Substantiation: Section 820.3(B) provides no additional guidance or requirements that are not already in 820.154(A). It's redundant and perhaps confusing to send a CATV installer to section 300.22 to look for requirements that are already in Article 820. Section 800.3 does not have a similar requirement. Elimination of 820.3(B) will improve the parallelism between the articles.
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 16-235.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-239 Log #3102 NEC-P16 **Final Action: Reject**
(820.24)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
820.24 Mechanical Execution of Work.
Community television and radio distribution systems shall be installed in a neat and workmanlike manner. Coaxial cables installed exposed on the surface of ceiling and sidewalls shall be supported by the building structure in such a manner that the cables will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4~~(D)~~ and 300.11.
FPN: Text to remain unchanged.
Substantiation: This is one of a series of proposals intended to provide correlation with sections 640.6(B), 725.24, 760.24, 770.24, 800.24, 820.24 and 830.24. Due to the power limitations of these circuits, there is no reason that the requirements should be different.
Panel Meeting Action: Reject
Panel Statement: CATV coaxial cables contain no or limited power (60 V max) and do not present a potential electrical safety hazard. There is insufficient substantiation to justify a major increase in physical protection requirements for CATV coaxial cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-240 Log #3723 NEC-P16 **Final Action: Accept in Principle**
(820.24, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add the following Fine Print Note:
FPN: See NFPA 90A, Standard for Installation of Air-Conditioning and Ventilation Systems, for discrete combustible components installed in air-handling plenums in accordance with 300.22.
Substantiation: This proposal addresses new requirements in NFPA 90A having an influence on installations in NEC Section 820.24, as well as held comments from the 2008 NEC Cycle, ROC 16-29 and 16-30.
Imposing the requirement that such products be "listed" in this section of the NEC would result in additional requirements not included in NFPA 90A. The implication of requiring listing in this section of the NEC would impose the full scope of requirements in UL 1565 for cable ties and UL 2239 for other support hardware. This effort to correlate with NFPA 90A would create big correlation issues within NFPA 70 for the same products used for supporting all other cables and conduits outside of the jurisdiction of code-making panel 16, for no good reason. It is not necessary to repeat requirements from NFPA 90A in NFPA 70 especially when doing so imposes unsubstantiated additional requirements.
The NFPA 90A requirements are focused on smoke and heat generated from a fire in an air-handling plenum. The NFPA 90A-2009 requirement is as follows for discrete combustible components installed in air-handling spaces in accordance with NEC 300.22 (C) and (D): (The actual clause numbers in NFPA 90A-2009 may vary editorially)
NFPA clause 4.3.10.2.6.5 Loudspeakers, recessed lighting fixtures and other electrical equipment with combustible enclosures, including their assemblies and accessories, cable ties and other discrete products shall be permitted in the ceiling cavity plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a peak heat release rate of 100 kW or less when tested in accordance with UL2043, *Standard for Safety Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.*
And very similar requirements in 4.3.10.6.5.6 apply in NFPA 90A for discrete combustible products installed in a "raised floor plenum".
Importantly, none of these requirements pertain to noncombustible products. There are many metallic products, including metallic cable ties, used to support power, data and communications conduits and cables and there has been no substantiation offered that these be required to be "listed".
Panel Meeting Action: Accept in Principle
Revise recommended fine print note text to read as follows:
FPN No. 2: See NFPA 90A, Standard for Installation of Air-Conditioning and Ventilation Systems, for discrete combustible components installed in accordance with 300.22(B) and (C).
Panel Statement: The panel removed the vague term "air-handling plenums" and added the references to 300.22(B) and (C). This meets the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-241 Log #4553 NEC-P16 **Final Action: Reject**
(820.25)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
820.25 Abandoned Cables.
The accessible portion of abandoned coaxial cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved. Removal of abandoned cables shall be performed in a neat and workmanlike manner.
Substantiation: This proposal recommends added wording to ensure that abandoned cables are removed appropriately. Section 110.12 addresses installation and so does section 820.24. Moreover, section 110.12 would only apply if specifically referenced. It is important to point out that similar care must be taken when removing cables.
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
Consistent wording is being proposed for other sections in the code.
For information, see relevant definitions in the NEC.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-24.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-242 Log #1598 NEC-P16 **Final Action: Reject**
(820.26)

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Add a third sentence to 820.26: Conduits or raceways entering enclosures of the ventilated type, shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway into other areas of the building or structure.
Substantiation: A fire in the area where the enclosure is located will produce smoke, poison gases, and other products of combustion which can easily be carried through the enclosure's vents and these unsealed raceways to other areas in the building. Essentially defeating any firewalls. I have not seen this particular problem addressed in building codes or fire resistance directories since these raceways are not "sleeves" which ARE required to be fire stopped, but rather they are complete raceway systems which generally require only sealing up around the OUTSIDE of the pipe where it penetrates a firewall. In this particular installation smoke could easily pass right through the INSIDE of the raceway because of the ventilation openings in the enclosure.
I have witnessed the results of this "chimney-effect" problem when the smoke from a fire in a basement electric room spread throughout the upper floors of a high rise building because the raceways leaving the switch gear acted like chimneys and transported heavy smoke from the basement directly to panelboards and switchboards on the upper floors of the building thus bypassing and defeating any fire walls that the raceways penetrated and completely filling the UPPER floors with smoke. Luckily nobody was injured. If the ends of the raceways were simply filled with some fire-stopping type caulk or similar material this situation would probably never have happened.
Once a fire starts to produce toxic fumes we almost have to think of that area as a Hazardous (classified) location similar to those in Article 500. We must try to prevent those hazardous gases passing from one area in a building to another.
Just as other sealing requirements throughout the code prevent moisture, condensation, dusts, gases or vapors from traveling through raceways, this requirement for some simple fire proof putty could prevent toxic fumes from spreading throughout the building. The seals required by this proposal are equally as important as any other seals required by the NEC such as 230.8, 300.5(G), 300.7(A), 300.50(E), 312.5(C) exception to (D), 324.40(A), 332.40(A), 368, 238, 372.7, 501.15, 502.15, 504.70, 505.16, 506.16, 680.24(B) and any other seals that may be required.
I am submitting companion proposals to sections 300.21, 770.26, 800.26, 820.26 and 830.26.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposed recommendation is impractical. The submitter has not supplied sufficient data for substantiation of a problem.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
IVANS, R.: The submitter is correct that vented enclosures connected via unsealed raceways and conduit can bypass fire breaks between floors. It would not be impractical to seal such raceways or conduit.

16-242a Log #CP1600 NEC-P16 **Final Action: Accept**
(820.44(B) Exception)

Submitter: Code-Making Panel 16,
Recommendation: Revise existing 820.44(B) Exception text:
Exception: Where proximity to electric light, power, Class 1, or non–power-limited fire alarm circuit ~~service~~ conductors cannot be avoided, the installation shall ~~be such as to~~ provide clearances of not less than 300 mm (12 in.) from electric light, power, Class 1, or non–power-limited fire alarm circuit conductors ~~service drops~~.
The remainder of the text remains unchanged.
Substantiation: The panel identified the need for clarification in the exception. The panel recognizes that the term "fire alarm circuit service conductors" is not a defined term.
The panel notes that Proposal 16-126 relocated the existing 820.44(B) Exception to new 820.44(A)(4) Exception.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-243 Log #3418 NEC-P16 **Final Action: Reject**
(820.44(B) Exception)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
820.44(B)
Exception: Where proximity to electric light, power, Class 1, or non-power-limited fire alarm circuit service-entrance conductors cannot be avoided, the installation shall be such as to provide clearance not less than 300 mm (12 in.) from light, power, Class 1, or non-power-limited fire alarm circuit service-entrance conductors. (The remainder of the text to be unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.

The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.

It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: There is no such thing as a fire alarm circuit service-entrance conductor, but the panel does recognize the exception needs revision. The panel has submitted a panel proposal to revise the existing text.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-244 Log #4508 NEC-P16 **Final Action: Reject**
(820.44(D))

Submitter: Rick Breezee, Airport Development Metropolitan Airports Commission / Rep. Building Code Development Committee (BCDC)
Recommendation: Delete text as follows:
~~(D) Above Roofs~~
~~Coaxial cables shall have a vertical clearance of not less than 2.5 (8 ft) from all points of roofs above which they pass.~~
~~Exception No. 1: Auxiliary buildings such as garages and the like.~~
~~Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (1) not more than 1.2 m (4 ft) of communications service drop conductors pass above the roof overhang, and (2) they are terminated at a raceway mast or other approved support.~~
~~Exception No. 3: Where the roof has a slope of not less than 100 mm in 300 mm (4 in. in 12 in.), a reduction in clearance to not less than 900 mm (3 ft) shall be permitted.~~
Substantiation: Note: This proposal was developed by the proponent as a member of the NFPA Building Code Development Committee (BCDC) with the committee’s endorsement.

This is low voltage coaxial cable, which is allowed to run without restriction on the interior of a building. There is no reason that this type of low voltage cable should not be allowed to run on the surface of a roof as long as it is installed in a secure manner.
Panel Meeting Action: Reject
Panel Statement: CATV coaxial cable clearance requirements should be consistent with other Chapter 8 communications systems.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-244a Log #CP1602 NEC-P16 **Final Action: Accept**
(820.44(E))

Submitter: Code-Making Panel 16,
Recommendation: Revise existing 820.44(E) as follows:
“(E) Between Buildings. Coaxial cables extending between buildings or structures and also the supports or attachment fixtures shall be ~~acceptable~~ identified for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.
Substantiation: This panel proposal correlates this section with the panel action on Proposal 16-312. Note Proposal 16-126 moved section 820.44(E) to 820.44(D).
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-245 Log #2118 NEC-P16 **Final Action: Accept**
(820.47)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
820.47 Underground ~~Circuits~~ Coaxial Cables Entering Buildings.
Underground coaxial cables entering buildings shall comply with 820.47(A) and (B).
Substantiation: This is an editorial proposal. It will improve clarity. Coaxial cables enter the buildings to feed the circuits. The circuits themselves are not entering the building.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-246 Log #3522 NEC-P16 **Final Action: Reject**
(820.47(B))

Submitter: Tim Henry, Code Electrical Classes Inc.
Recommendation: Revise as follows:
820.47(B) Direct-Buried Cables and Raceways. Direct-buried coaxial cable shall be separated at least 300 mm (12 in.) from conductors of any light or power or Class 1 circuit and shall comply with the requirements of Table 300.5.
Substantiation: 820.47(B) Addresses direct-buried cables and raceways and there separation from conductors of any light or power or Class 1 circuit of at least 12 inches but doesn’t address the minimum cover requirements. To many times coax cable is cut in half when a homeowner is planting bushes, etc., because it is placed just under the sod. Then the homeowner, repairman etc., goes to repair the coax cable and cuts into a 120 volt energized cable or raceway which I feel is a real safety hazard. Thus indicating the need for a minimum burial depth for coax cables.
Panel Meeting Action: Reject
Panel Statement: Table 300.5 applies to power cables. CATV cabling, although it is allowed to contain low-energy powering, does not have the power levels associated with power circuits. The submitter did not provide sufficient substantiation to justify applying the stringent requirements associated with power circuits to these low power cable television installations. Cables containing higher levels of network power are covered in Article 830 and are required to meet minimum cover requirements.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

(820.47(B) Exception No. 1)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
820.47(B)
Exception No.1: Where electric service-entrance conductors or co-axial cables are installed in raceways or have metal cable armor.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
IVANS, R.: The proposed change does not add any clarity to the interpretation or readability of the NEC regarding the use of the term "Service." The submitter has not substantiated what value has been added by inserting the word "entrance".

16-248 Log #2119 NEC-P16 **Final Action: Accept in Principle**
(820.48)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
820.48 Unlisted Cables Entering Buildings.
Unlisted outside plant coaxial cables shall be permitted to be installed in building spaces other than risers, air ducts, plenums and other spaces used for environmental air, ~~locations as described in 820.154(D)~~, where the length of the cable within the building, measured from its point of entrance does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.
Substantiation: This proposal is editorial clarification. The locations described in 820.154(D) are risers, air ducts, plenums and other spaces used for environmental air.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
820.48 Unlisted Cables Entering Buildings. Unlisted outside plant coaxial cables shall be permitted to be installed in building spaces other than risers, ducts used for environmental air, plenums used for environmental air, and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.
Panel Statement: The revised text adds clarity and meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-249 Log #2120 NEC-P16 **Final Action: Accept**
(820.93(D))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise the following:
(D) Hazardous (Classified) Locations. Where a primary protector or equipment providing the primary protection function is used, it shall not be located in any hazardous (classified) location as defined in 500.5 and 505.5 or in the vicinity of easily ignitible material.
Exception: As permitted in 501.50, 502.150 and 503.150.
Substantiation: This is a clarification proposal. It is editorial and technical.
CMP 16 was instructed by the Technical Correlating Committee during the 2008 NEC ROP process to consider not only the different hazardous location division applications (500.5) but also the different hazardous location zone applications (505.5). This directive was issued for 2008 Proposal 16-121 which dealt with 800.3(A). This reference of 505.5 should be added here as well to correlate with all related sections that references these defined hazardous locations and hazardous location zones.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-250 Log #4562 NEC-P16 **Final Action: Reject**
(820.100 (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Add the following new text:
820.100 Grounding. Article 250 covers the general requirements for grounding and bonding of community antenna television and radio distribution systems and their associated electrical installations, and the specific requirements in (1) through (5), unless otherwise indicated in 820.101(A) through (D).
(1) Systems, circuits, and equipment required, permitted, or not permitted to be grounded
(2) Circuit conductor to be grounded on grounded systems
(3) Location of grounding connections
(4) Types and sizes of grounding and bonding conductors and electrodes
(5) Methods of grounding and bonding
820.101 ~~820.100~~ Cable Grounding. The shield of the coaxial cable shall be grounded as specified in 820.101(A) through (D) ~~820.100(A) through (D)~~.
(A) Grounding Conductor. *(no change to text except for renumbering section 820.100 to section 820.101)*
(B) Electrode. *(no change to text except for renumbering section 820.100 to section 820.101)*
(C) Electrode Connection. *(no change to text)*
(D) Bonding of Electrodes. *(no change to text)*
(E) Shield Protection Devices. *(no change to text)*
Substantiation: This proposal recommends wording to ensure that community antenna television and radio distribution systems appropriately comply with the grounding and bonding requirements of article 250, while recommending that Article 820 include specific requirements associated with community antenna television and radio distribution systems. This change is needed because Chapter 8 is independent of Chapters 1 through 4 and thus Article 250 on grounding. Please note that "medium power wiring" can be included with Article 820 wiring in raceways, cable trays and boxes in Article 820 and not just low power wiring and that brings some additional needs.
Panel Meeting Action: Reject

Panel Statement: The NEC Style Manual, Section 4.1.1, prohibits reference to complete articles. A blanket statement referencing Article 250 is redundant as communications grounding requirements are fully covered in Article 820, IV. Grounding Methods, with specific reference to the applicable sections of Article 250 contained throughout Sections 820.100(B) and (C).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-251 Log #4915 NEC-P16 **Final Action: Reject**
(820.100 (New))

Submitter: Nisar Chaudhry, TII Network Technologies, Inc.
Recommendation: Add new text as follows:

820.100 Cable Grounding. The shield of the coaxial cable shall be grounded as specified in 820.100(A) through (D).

Add new wording.

820.100 Cable Grounding.

(B) Electrode. The grounding conductor shall be connected in accordance with 820.100(B)(1) and (B)(2).

(1) **In Buildings or Structures with Grounding Means.** If the building or structure served has no intersystem bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following: The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94

(4) The metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor of the grounding electrode conductor metal enclosure, or

(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

*8) The grounding conductor of coax cable from non-exposed satellite dish is permitted to be grounded through a suitably grounded receptacle using a permanently connected device listed for the purpose.

Fine Print Note: Dish Antennas mounted where no part of the antenna is higher than the highest point of the structure are considered non-exposed.

Substantiation: Shield of the coaxial cable from Dish Antenna even though it is electrically connected to the set top box chassis and grounded through the power cord must also be grounded to the AC receptacle using a permanently attached grounding device. These connections should be sufficient to equalize any hazardous ground potential differences on the coaxial cable.
Panel Meeting Action: Reject
Panel Statement: Mounting a dish antenna below the highest point of the structure does not necessarily render the antenna “non-exposed” to lightning. While it is generally accepted that tall structures provide a “cone of protection” to surrounding lower structures against lightning strikes, it does not absolutely preclude a lightning strike. While lightning will typically strike at the top of a tall structure, it has been known to strike along the side of tall structures as well. Arcing and corona along the building surface are also of concern.

There is no substantiation of why a dish antenna not higher than a roofline should not be considered exposed. The standard model used for a zone of protection is the rolling sphere zone of protection and it would not include all space up to the roof line. In addition, this and other models assume that the building is already protected by a lightning protection system complying with NFPA 780. This is not often the case. The roof line is not the only criteria in using the rolling sphere model for exposure to lightning. Therefore, the proposal is incomplete.

Lightning hitting an unprotected building will travel down the building in an unpredictable path seeking ground. An antenna mounted outside that is not properly grounded by one of the methods currently described in the NEC, but provided with some other ground, such as an equipment grounding conductor, could “attract” the lightning and direct it into the premises with catastrophic results.

It is not acceptable to use an equipment grounding conductor to mitigate lightning since things like bends and splices are not controlled and these introduce very large impedances at lightning frequencies.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-252 Log #4916 NEC-P16 **Final Action: Accept in Principle**
(820.100 Exception (New))

Submitter: Nisar Chaudhry, TII Network Technologies, Inc.
Recommendation: Add new text as follows:

820.100 Cable Grounding. The shield of the coaxial cable shall be grounded as specified in 820.100(A) through (D).

Add a new Exception as follows:

Exception: For communication systems using coaxial cable confined within the premises and isolated from outside cable plant the shield is permitted to be grounded by a connection to an equipment grounding conductor as described in 250.118. Connecting to an equipment grounding conductor through a suitably grounded receptacle using a dedicated grounding conductor and permanently connected device listed for the purpose is permitted. Use of a cord and plug for the connection to an equipment grounding conductor is not permitted.

Substantiation: In the newer cable systems, as an example Fiber to the home, signals for the TV and data can be derived within the customer premises without ever needing any connections to the conventional CATV coaxial cables. The grounding of these totally isolated and confined within the premises cable systems will not involve any power cross or lightning induced currents. Therefore, connecting the coax cable shield of such isolated and confined systems to the AC receptacle ground will eliminate any stray ground potentials that could be present on the ungrounded coax cable shield. This will enhance the safety of the user and reliability of the system.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:

Exception: For communication systems using coaxial cable confined within the premises and isolated from outside cable plant, the shield ~~is~~ shall be permitted to be grounded by a connection to an equipment grounding conductor as described in 250.118. Connecting to an equipment grounding conductor through a ~~suitably~~ grounded receptacle using a dedicated grounding conductor and permanently connected listed device ~~listed for the purpose is~~ shall be permitted. Use of a cord and plug for the connection to an equipment grounding conductor ~~is not~~ shall not be permitted.

Panel Statement: The comma is added to the first sentence for clarity. Use of the phrase “listed for the purpose” is discouraged as it is vague. Calling for a “listed” device is clear and consistent with the definition of “listed” in Article 100. The NEC Style Manual directs that the phrase “shall be permitted” and “shall not be permitted” be used to indicate allowed optional or alternate methods.

Intrabuilding coaxial cable shields that are not exposed to outside plant facilities do not need to be protected against lightning and power cross the way that coax entering a building from the outside network does.

There is still a concern about cumulative leakage currents from connected equipment on the network. Even though each individual set-top box, TV or computer limits leakage to extremely low levels, the cumulative affect can easily exceed perception levels and depending on the installed equipment, even let-go thresholds.

It should be the responsibility of the originating equipment (i.e. the NID creating the CATV network) to provide suitable grounding to mitigate this cumulative leakage.

It is common practice to deal with leakage currents using an equipment grounding conductor as described in 250.118.

It is not suitable to use the NID plug for the ground since unplugging the device eliminates the ground connection but does not eliminate the source(s) of the leakage current.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

DORNA, G.: Some “communications systems” are outside the scope of Article 820. Article 820 only covers Community Antenna Television and Radio Distribution Systems; hence “communications systems” should be changed to “community antenna television and radio distribution systems”.

16-253 Log #3103 NEC-P16 **Final Action: Accept in Principle**
(820.100(A)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal.

This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(1) Listing ~~Insulation~~. The grounding conductor ~~shall be insulated and~~ shall be listed.
Substantiation: There is no electrical reason that this conductor should be required to be insulated. This proposal provides consistency with nearly every other grounding/bonding related section of the code.
Panel Meeting Action: Accept in Principle

Revise 820.100(A)(1) to read as follows:

(1) Insulation. The grounding conductor shall be listed and shall be permitted to be insulated, covered, or bare.

Panel Statement: The grounding conductor does not need to be insulated but for esthetic reasons, such as exposed grounding conductors routed within a premises, insulation or covering may be appropriate. Adding “covered” accommodates Proposal 16-254. Permitting all three, “insulated, covered, or bare” will clarify that all three are now permitted since for many years only an insulated conductor was permitted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-254 Log #4395 NEC-P16 **Final Action: Accept in Principle in Part**
(820.100(A)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this Proposal.
This action will be considered by the panel as a public comment.
Submitter: Jake Killinger, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
820.100 Cable Grounding.
The shield of the coaxial cable shall be grounded as specified in 820.100(A) through (D).
(A) Grounding Conductor.
(1) ~~Insulation~~Insulated or Covered Conductors. The grounding conductor shall be permitted to be insulated, or covered and shall be listed as Protector Grounding Conductors.
(remaining text remains unchanged)
Substantiation: This is a sister proposal to 800.100.
The existing text would require fully insulated and Listed conductors for cable and primary protector grounding whereas in most other cases, bare conductors are usually adequate for most grounding purposes. Prior to the 1990 NEC, protective grounding conductors were required to have 30 mil rubber insulation and be covered by a fibrous covering. It also permitted conductors Listed for this use having less than 30 mil rubber insulation or having other kinds of insulation. In 1990 the NEC removed the thickness statements so that it read the grounding conductor shall be insulated and shall be listed as suitable for the purpose. In 2008, the suitable for the purpose clause was removed.
Discussions with past members of this CMP revealed that the reason for specifying insulated conductors was only to combat theft of uncovered copper wire. That being the case, thinner insulated conductor was permitted so long as it gave the same illusion of a conductor carrying power.
Listed Protector Grounding Conductors having less than the full insulation of Listed and insulated conductors exist today. These are based on the past allowances for thinner insulations. The 2008NEC text would literally not permit the use of these thinner walled insulated conductors and would make their certification obsolete.
If the reason for using the term 'insulated' was merely to provide a theft deterrent, then fully insulated wire is unnecessary. By definition in Article 100, only a "covered" conductor would be more than adequate. Therefore propose changing the text to permit both "insulated as well as "covered" conductors.
Also propose adding "Protector Grounding Conductor" to help identify the type of Listed products suitable in this application. These "Protector Grounding Conductors" are surface marked with this terminology to make it clear that they are listed only for this purpose and are not intended for general use with other Articles in the Code. They are presently certified under UL's KDER category, but may be relocated to the KDSH (Grounding and Bonding Equipment – Communication) category to make their restricted use more obvious.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: Accept in principle the part to add "covered". See panel action and statement on Proposal 16-253, which now permits the use of listed insulated, covered, or bare conductors. The title is left as "insulation" since the paragraph now deals with levels of insulation.
Reject the parts adding the phrases "permitted to be" and "as a protector grounding conductor". The panel does not want to restrict the listed wire to only listed "protector grounding conductors".
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-255 Log #1741 NEC-P16 **Final Action: Accept**
(820.100(A)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence: It shall have a current-carrying capacity ~~approximately equal to that~~ <u>not less than</u> that of the outer conductor of the coaxial cable.
Substantiation: Edit. "Ampacity" is a defined term generally used in the Code and required by 3.2.5.1 of the Style Manual. Conductors can have a capacity to carry current greater than their ampacity. There is no apparent safety reason the grounding conductor cannot have an ampacity greater than the outer conductor of the coaxial cable.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the submitter's substantiation does not fully correlate with this proposal, but with his similar Proposal 16-322.
See panel statement on Proposal 16-322.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-256 Log #196 NEC-P16 **Final Action: Accept**
(820.100(B))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal as the existing numbering complies with the NEC Style Manual and is consistent with other lists in the code.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Renumber 820.100(B) as shown.
(B) Electrode. The grounding conductor shall be connected in accordance with 820.100(B)(1), (B)(2), or (B)(3).
(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination, the grounding conductor shall be connected to the intersystem bonding termination.
(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:
(~~1~~a) The building or structure grounding electrode system as covered in 250.50
(~~2~~b) The grounded interior metal water piping system, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52
(~~3~~c) The power service accessible means external to enclosures as covered in 250.94
(~~4~~d) The metallic power service raceway
(~~5~~e) The service equipment enclosure
(~~6~~f) The grounding electrode conductor or the grounding electrode conductor metal enclosure, or
(~~7~~g) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is connected to an electrode as covered in 250.32
A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.
For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 820.93, shall be considered accessible.
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2), the grounding conductor shall be connected to either of the following:
(~~1~~a) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), (A)(4); or,
(~~2~~b) If the building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(5), (A)(7), and (A)(8).
Substantiation: The current numbering is not in compliance with the style manual. See section 2.1.5.3 of the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-257 Log #3313 NEC-P16 **Final Action: Reject**
(820.100(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (B)(2)(3): The electric power service accessible means external to enclosures as covered in 250.84 (B)(2)(4): The metallic nonflexible power service raceway.
Substantiation: Edit. "Power" may infer that a service only for lighting is not acceptable. Flexible service raceways do not seem suitable for connection of ground clamps.
Panel Meeting Action: Reject
Panel Statement: The panel does not understand the intent of the submitter. See panel action on Proposal 16-258 to see if it meets the intent of Proposal 16-257.

(820.100(B)(1))

Submitter: Code-Making Panel 16,
Recommendation: Revise 820.100(B)(1) as follows:
"If the building or structure served has an intersystem bonding termination <u>as required by 250.94,</u> the grounding conductor shall...".
Substantiation: This change provides correlation with the revision to 800.100(B)(1) accepted by the Panel. See Panel action on Proposal 16-147.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-258 Log #1843 NEC-P16 **Final Action: Accept in Principle in Part**
(820.100(B)(1)(4) and (6))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (B)(1)(4): The ~~metallic~~ electric ~~power~~ service nonflexible metal service raceway
(B)(1)(6): The grounding electrode conductor or the nonflexible metal grounding electrode enclosure.
Substantiation: Flexible metal service raceways and flexible metal armor of grounding electrode conductors are not appropriate. "Power" may be deemed not to include services solely for lighting. "Power" and "Lighting" are common terms to distinguish systems or use.
Panel Meeting Action: Accept in Principle in Part
Revise existing 820.100(B)(2)(4) as follows:
(4) The nonflexible metallic power service raceway.
Reject the remainder of the recommendation.
Panel Statement: The panel understands that the submitter intended the revision to apply to 820.100(B)(2)(4) and (6).
The panel accepts in principle the part adding "nonflexible". The panel rejects the part replacing "power" with "electric". The panel rejects adding "nonflexible" to modify metal enclosures in (6) as it does not improve clarity.
See panel action and statement on Proposal 16-35.
Number Eligible to Vote: 16

16-259 Log #1136 NEC-P16 **Final Action: Accept**
(820.100(B)(1), FPN (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Add the FPN following 820.100(B) (1):
FPN: See Article 100 for the definition of *Intersystem Bonding Termination*.
Substantiation: *Intersystem Bonding Termination* is a new and unfamiliar term introduced in the 2008 NEC. The FPN reference to Article 100 will help ensure that NEC users not only become familiar with the new terminology, but encourage application of this preferred intersystem bonding arrangement as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-260 Log #3104 NEC-P16 **Final Action: Reject**
(820.100(B)(2)(3))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(2) Text to remain unchanged.
(1) Text to remain unchanged.
(2) Text to remain unchanged.
~~(3) The power service accessible means external to enclosures as covered in 250.94~~
~~(4)~~ (3) Text to remain unchanged.
~~(5)~~ (4) Text to remain unchanged.
~~(6)~~ (5) Text to remain unchanged.
~~(7)~~ (6) Text to remain unchanged.
A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.
For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 820.93, shall be considered accessible.
Substantiation: The item being discussed in (3) is the item covered in 820.100(B)(1), so there is no reason for it to be in 820.100(B)(2).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-34.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-261 Log #3729 NEC-P16 **Final Action: Reject**
(820.100(B)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 820.100(B)(3) as follows:
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2), one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and comply with the requirements of 250.56 being applicable to rod, pipe, and plate electrode installations. ~~the grounding conductor shall be connected to either of the following:~~
~~(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), (A)(4); or,~~
~~(2) If the building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(5), (A)(7), and (A)(8).~~
Substantiation: The requirement in existing 820.100(B)(3)(1) to connect the grounding electrode conductor "to any of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), (A)(4)" seems to suggest one or more of these electrodes are readily available but forgets that this section is titled **"Buildings or Structures Without …. Grounding Means."** This is not consistent with 250.50 that only requires the use of such electrodes where they are "present at each building or structure served." Subsection 820.100(B)(3)(2) is more in line with the subject of this section and contains requirements for electrodes that could be installed and used but it is felt the continuing sentence structure as proposed is cleaner and is completely consistent with 250.50 and 250.52 where grounding electrodes have to be installed as opposed to being a natural part of a building or a structure such as a metal water line, concrete encased electrode or a grounding steel building frame.
This revision would bring the grounding of CATV and radio distribution systems circuits into line with the requirements of Articles 250 for both consistency and for technical application.
Panel Meeting Action: Reject
Panel Statement: Specific reference to 250.52(A)(4) through (A)(8) is unnecessary as all appropriate grounding connections are presently listed in 820.100(B)(1) and (2). The title of 820.100(B)(3), "In Buildings or Structures Without …… Grounding Means" must be considered in context with the preceding Section 820.100(B)(2) where specific grounding means at the building or structure are identified.

Substantiation: The reference is incorrect. In the 2005 NEC 820.106(A)(1) referred to 820.100(B)(2). That information is now contained in 820.100(B)(3) in the 2008 NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-264 Log #43 NEC-P16 **Final Action: Accept in Principle**
(820.110)

NOTE: This proposal appeared as Comment 16-242 on Proposal 16-306 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-306 was:
Revise as follows:
820.110 Raceways for Coaxial Cables.
Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum CATV raceway, listed riser CATV raceway, or listed general-purpose CATV raceway installed in accordance with 820.154, and ~~a listed nonmetallic raceway complying with 820.182(A), (B), or (C), as applicable, and installed in accordance~~ with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Exception: Conduit fill restrictions shall not apply.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: The panel action on the Proposal should have been Accept in Principle with the following changes:
820.110 Raceways for Coaxial Cables. Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a ~~listed plenum~~ CATV raceway~~, listed riser CATV raceway, or listed general purpose CATV raceway~~ listed in accordance with 820.182 and installed in accordance with 820.154~~, and with 362.24~~ and 362.22 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Delete the Exception.
Substantiation: The revisions in the first sentence clarify that the listing requirements are specified in 820.182 and the installation requirements in 820.154. These revisions will also provide consistency with 770.110 and 800.110.
362.22 should also apply if the requirements for ENT are to be utilized.
Using the term “listed CATV raceways” will still permit the installation of CATV coaxial cables in CATV raceways (plenum, riser, or general-purpose) or in any type of listed raceway permitted in Chapter 3 without adding additional text to the Code. This revision will also permit the installation of other types of listed CATV coaxial cables and CATV raceways that may be included in future Codes without having to revise 820.110.
The Exception should have been deleted rather than including it as positive text in the last sentence. The first sentence in 820.110 already states “installed in accordance with Chapter 3” which would include all of Chapter 3 requirements pertaining to raceways including the maximum percentage fill limitations in Chapter 9. The Proposal and the panel action perpetuates conflicting requirements between that sentence and the Exception.
No substantiation was submitted to support the deletion of the conduit fill restrictions of Chapters 3 and 9. The fill restrictions are based on the physical limitations of being able to pull conductors or cables into raceways without damaging the conductors or cables, particularly when there are bends in the run, and to avoid conductor/cable jamming. The maximum percentage fill requirements are independent of whether they are electrical conductors or not; they could be empty tubes.
The maximum percentage fill requirements in Chapters 3 and 9 are an integral part of the permitted uses of the raceways contained in Chapter 3 and if CATV cables are to be installed in a Chapter 3 raceway, then the maximum percentage fill requirements must also apply.
Chapter 9, Table 1 permits 53 percent fill when one conductor or cable is installed in a raceway; 31 percent for two; and 40 percent for three or more.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-265, which revises this section for greater clarity and addresses the submitter’s concern.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-265 Log #2111 NEC-P16 **Final Action: Accept in Principle**
(820.110)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise 820.110 as follows:
820.110 Raceways for Coaxial Cables.
(A) Types of Raceways.
Coaxial cables shall be permitted to be installed in any raceway that complies with either (A)(1) or (A)(2).
(1) Chapter 3 Raceways. ~~Where~~ Coaxial cables shall be permitted to be ~~are~~ installed in ~~a~~ any raceway~~, the raceway shall be either of a type~~ included ~~permitted~~ in Chapter 3. The raceways shall be ~~and~~ installed in accordance with the requirements of Chapter 3.
(2) Other Permitted Raceways. ~~or~~ Coaxial cables shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway selected in accordance with the provisions of ~~820.154~~ 820.113, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
(B) Raceway Fill for Coaxial Cables. Raceway ~~Conduit~~ fill requirements of Chapter 3 and Chapter 9 shall not apply to coaxial cables.
~~*Exception: Conduit fill restrictions shall not apply.*~~
Substantiation: This revision is both editorial and technical. The addition of the two first level subdivisions (A) Types of Raceways and (B) Raceway Fill for Coaxial Cables and their second level subdivisions provides more clarity and makes the section as self-sufficient as possible. To comply with the NEC Style Manual this revision deletes the Exception and changes it into positive text language.
Replacing of the word “conduit” with the word “raceway” will improve the parallelism of this section to 770.110 and 800.110. Conduit is a form of a raceway and all raceways can be used to install coaxial cables.
The word “requirements” is appropriate as Chapter 3 has no raceway tables. However, Chapter 3 provides the raceway fill requirements which direct the code user to Chapter 9 for the conduit fill tables. This proposal coordinates with the task group’s proposal to move the cable and raceway installation requirements from 820.154 to 820.113.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.
Panel Meeting Action: Accept in Principle
Revise 820.110 as follows:
820.110 Raceways for Coaxial Cables.
(A) Types of Raceways.
Coaxial cables shall be permitted to be installed in any raceway that complies with either (A)(1) or (A)(2).
(1) Chapter 3 Raceways. ~~Where~~ Coaxial cables shall be permitted to be ~~are~~ installed in ~~a~~ any raceway~~, the raceway shall be either of a type~~ included ~~permitted~~ in Chapter 3. The raceways shall be ~~and~~ installed in accordance with the requirements of Chapter 3.
(2) Other Permitted Raceways. ~~or~~ Coaxial cables shall be permitted to be installed in listed plenum communications raceway, listed riser communications raceway, or listed general-purpose communications raceway selected in accordance with the provisions of ~~820.154~~ 820.113, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
(B) Raceway Fill for Coaxial Cables. Raceway ~~Conduit~~ fill requirements of Chapter 3 and Chapter 9 shall not apply to coaxial cables.
~~*Exception: Conduit fill restrictions shall not apply.*~~
Panel Statement: See panel action on Proposal 16-47. The mention of “optical fiber raceway” was in error for this proposal in Article 820. The panel has replaced “optical fiber” with “communications” because CATV raceways have been eliminated. See panel proposal 16-289a.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-266 Log #1745 NEC-P16 **Final Action: Reject**
(820.110 Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change “conduit” to “conductor”.
Substantiation: Edit. If fill restrictions do not apply to conduit they should also not apply to EMT, wireways, auxiliary gutters, boxes, conduit bodies, and other enclosures.
Panel Meeting Action: Reject
Panel Statement: The exception deals with “conduit fill” not “conductor fill”.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-267 Log #2112 NEC-P16 **Final Action: Accept in Principle**
(820.113)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Add new text to read as follows:
820.113 Installation of Coaxial Cables and CATV Raceways. Installation of coaxial cables and CATV raceways shall comply with 820.113 (A) through (I).
(A) Listing. Coaxial cables installed in buildings shall be listed.
Exception: Coaxial cables that comply with 820.48 shall not be required to be listed.
(B) Air Ducts and Plenums. The following cables and raceways shall be permitted in air ducts and plenums as described in 300.22(B).
(1) Type CATVP
(2) Plenum CATV raceway installed in compliance with 820.110
(3) Type CATVP installed in plenum CATV raceway
(4) Types CATVP, CATVR, CATV and CATVX installed in raceways that are installed in compliance with 300.22(B)
(C) Other Spaces Used For Environmental Air. The following cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C).
(1) Type CATVP
(2) Plenum CATV raceway installed in compliance with 820.110
(3) Type CATVP installed in plenum CATV raceway
(4) Types CATVP, CATVR, CATV and CATVX installed in raceways that are installed in compliance with 300.22(C)
(D) Risers- Cables in Vertical Runs. The following cables and raceways shall be permitted in vertical runs penetrating more than one floor and in vertical runs in a shaft:
(1) Types CATVP and CATVR
(2) Plenum and riser CATV raceways installed in compliance with 800.110
(3) Types CATVP and CATVR installed in plenum or riser CATV raceway
FPN: See 820.26 for firestop requirements for floor penetrations.
(E) Risers-Cables in Metal Raceways, Fireproof Shafts and One- and Two-Family Dwellings. The following cables and raceways shall be permitted in metal raceway, in a fireproof shaft with firestops at each floor and in one- and two-family dwellings:
(1) Types CATVP, CATVR, CATV and CATVX
(2) Plenum, riser and general-purpose CATV raceways installed in compliance with 800.110
(3) Types CATVP, CATVR and CATV installed in plenum, riser or general-purpose optical fiber raceway
FPN: See 820.26 for firestop requirements for floor penetrations.
(F) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays.
(1) Types CATVP, CATVR, and CATV
(2) Plenum, riser and general-purpose CATV raceways installed in compliance with 820.110
(3) Types CATVP, CATVR and CATV installed in plenum riser or general-purpose CATV raceway
(G) Distributing Frames and Cross-Connect Arrays. The following cables shall be permitted to be installed in distributing frames and cross-connect arrays.
(1) Types CATVP, CATVR and CATV
(H) Other Building Locations. The following wires, cables and raceways shall be permitted to be installed in building locations other than the locations covered in 820.113(B) through (F).
(1) Types CATVP, CATVR and CATV
(2) Plenum, riser and general-purpose CATV raceways installed in compliance with 820.110
(3) Types CATVP, CATVR, CATV and Type CATVX installed in plenum, riser or general-purpose CATV raceway
(4) Types CATVP, CATVR, CATV and Type CATVX installed in a raceway of a type included in Chapter 3
(5) A maximum of 3m (10 ft) of exposed Type CATVX in nonconcealed spaces
(I) One- and Two-Family and Multifamily Dwellings. The following cables and raceways shall be permitted to be installed in one- and two-family and multifamily dwellings in locations other than the locations covered in 820.113(B) through (G).
(1) Types CATVP, CATVR, CATV and Type CATVX less than 10 mm (0.375 in.) in diameter
(2) Plenum, riser and general-purpose CATV raceways installed in compliance with 820.110
(3) Types CATVP, CATVR and CATV installed in plenum riser or general-purpose CATV raceway
Substantiation: This proposal is editorial and technical.
The cable and raceway applications sections of articles 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal moves those installation rules to section 820.113.
Coaxial cables are used in cross connect applications, but Section 820.154 currently does not have a distributing frame and cross connect section. A new section for distributing frames and cross connects was added. Adding this section also improves parallelism with Article 800. No new requirements were added.
A companion proposal for section 820.154 greatly simplifies the statement of the applications of coaxial cables and raceways by using a table.
This proposal and its companion proposal for section 820.154 need to be considered together as a package.
Panel Meeting Action: Accept in Principle
Revise 820.113 text and replace in entirety as follows:
820.113 Installation of Coaxial Cables and Cable Routing Assemblies. Installation of coaxial cables and cable routing assemblies shall comply with 820.113 (A) through (J).
(A) Listing. Coaxial cables and cable routing assemblies installed in buildings shall be listed.
Exception: Coaxial cables that comply with 820.48 shall not be required to be listed.
(B) Fabricated Ducts and Plenums. The following cables shall be permitted in ducts and plenums as described in 300.22(B) if they are directly associated with the air distribution system:
(1) Up to 1.22 m (4 ft) of Type CATVP
(2) Types CATVP, CATVR, CATV, and CATVX installed in raceways that are installed in compliance with 300.22(B)
FPN: See 4.3.4 and 4.3.11.3.3 of NFPA 90A-2009, Standard for the Installation of Air-Conditioning and Ventilation Systems, for information on wire and cables in air ducts and apparatus casings plenums. See 3.3.22 for the definition of an apparatus casing plenum.
(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C):
(1) Type CATVP
(2) Type CATVP installed in plenum communications raceway
(3) Type CATVP supported by metallic cable trays or cable tray systems
(4) Types CATVP, CATVR, CATV, and CATVX installed in raceways that are installed in compliance with 300.22(C)
FPN: See sections 4.3.11.2, 4.3.11.4, and 4.3.11.5 of NFPA 90A-2009, Standard for the Installation of Air-Conditioning and Ventilation Systems, for information on wire, cables, and raceways in ceiling cavity, raised floor, and air-handling unit room plenums. See 3.3.22 for plenum definitions.
(D) Risers - Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:
(1) Types CATVP and CATVR
(2) Types CATVP and CATVR installed in plenum or riser communications raceway
FPN: See 820.26 for firestop requirements for floor penetrations.
(E) Risers - Cables in Metal Raceways or Fireproof Shafts. The following cables shall be permitted in metal raceway or in a fireproof shaft with firestops at each floor:
(1) Types CATVP, CATVR, CATV, and CATVX
(2) Types CATVP, CATVR, and CATV installed in plenum, riser, or general-purpose communications raceway
FPN: See 820.26 for firestop requirements for floor penetrations.
(F) Risers - One- and Two-Family Dwellings. The following cables shall be permitted one- and two-family dwellings:
(1) Types CATVP, CATVR, CATV, and CATVX
(2) Types CATVP, CATVR, and CATV installed in plenum, riser, or general-purpose communications raceway
FPN: See 820.26 for firestop requirements for floor penetrations
(G) Cable Trays. The following cables shall be permitted to be installed in cable trays:
(1) Types CATVP, CATVR, and CATV
(2) Types CATVP, CATVR, and CATV installed in plenum riser or general-purpose communications raceway
(H) Distributing Frames and Cross-Connect Arrays. Types CATVP, CATVR, and CATV shall be permitted to be installed in distributing frames and cross-connect arrays.
(I) Other Building Locations. The following cables shall be permitted to be installed in building locations other than the locations covered in 820.113(B) through (H):
(1) Types CATVP, CATVR, and CATV
(2) A maximum of 3 m (10 ft) of exposed Type CATVX in nonconcealed spaces
(3) Types CATVP, CATVR, and CATV installed in plenum, riser, or general-purpose communications raceway
(4) Types CATVP, CATVR, CATV, and Type CATVX installed in a raceway of a type included in Chapter 3
(J) One- and Two-Family and Multifamily Dwellings. The following cables shall be permitted to be installed in one- and two-family and multifamily dwellings in locations other than the locations covered in 820.113(B) through (H):
(1) Types CATVP, CATVR, CATV
(2) Type CATVX less than 10 mm (0.375 in.) in diameter
(3) Types CATVP, CATVR, and CATV installed in plenum riser or general-purpose communications raceway.

Panel Statement: See panel statement on Proposal 16-160. The text is a combination of the text from Proposal 16-267, which has been modified to improve clarity, with text to incorporate panel actions to accept in principle Proposals 16-280 (metallic cable tray) and 16-282 (requiring riser cable for penetration of one floor) and by modifications to correlate with NFPA 90A-2009.

Section 4.3.11.2.6.4 and 4.3.11.5.5.4 of NFPA 90A provide for the listing and use of plenum optical fiber raceways and plenum communications raceways; plenum CATV raceways are not mentioned. Proposal 16-350 introduced the concept of consolidating the type of raceways. The panel has eliminated the use CATV raceways in the text of this proposal and substituted communications raceways. See also panel Proposal 16-289a which deletes section 820.182.

The revised text relocates the wire, cable, and raceway installation rules from 820.154 and also includes installation rules from 820.110.

The panel recognizes that this proposal is a companion proposal to Proposal 16-278 and has considered them together.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

DORNA, G.: See my comments on proposals 16-48, 16-56, 16-160 and 16-172.

The panel action on the revision of 820.113 changed the title to include cable routing assemblies but didn't add any specific applications. In order to correct this oversight the panel action should be revised as follows:

820.113 Installation of Coaxial Cables and Cable Routing Assemblies. Installation of coaxial cables and cable routing assemblies shall comply with 820.113 (A) through (K). Installation of raceways shall comply with 820.110.

(A) Listing. Coaxial cables and cable routing assemblies installed in buildings shall be listed.

Exception: Coaxial cables that comply with 820.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums. The following cables shall be permitted in ducts and plenums as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Type CATVP
(2) Types CATVP, CATVR, CATV and CATVX installed in raceways that are installed in compliance with 300.22(B)

FPN: See sections 4.3.4 & 4.3.11.3.3 of NFPA 90A-2009 Standard for the Installation of Air-Conditioning and Ventilation Systems for information on wire and cables in air ducts and apparatus casings plenums. See section 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C).

(1) Type CATV
(2) Type CATVP installed in plenum communications raceway
(3) Type CATVP supported by metallic cable trays or cable tray systems
(4) Types CATVP, CATVR, CATV and CATVX installed in raceways that are installed in compliance with 300.22(C)

FPN: See sections 4.3.11.2, 4.3.11.4 & 4.3.11.5 of NFPA 90A-2009 Standard for the Installation of Air-Conditioning and Ventilation Systems for information on wire, cables and raceways in ceiling cavity, raised floor and air-handling unit room plenums. See section 3.3.22 for plenum definitions.

(D) Risers- Cables and Routing Assemblies in Vertical Runs. The following cables and cable assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types CATVP and CATVR
(2) Riser cable routing assemblies
(3) Types CATVP and CATVR installed in plenum or riser communications raceway
(4) Types CATVP and CATVR installed in a riser cable routing assembly

FPN: See 820.26 for firestop requirements for floor penetrations.

(E) Risers-Cables in and Raceways in Metal Raceways. The following cables shall be permitted in metal raceway or in a riser having with firestops at each floor:

(1) Types CATVP, CATVR, CATV and CATVX
(2) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway

FPN: See 820.26 for firestop requirements for floor penetrations.

(F) Risers-Cables and Cable Routing Assemblies in Fireproof Shafts. The following cables and cable routing assemblies shall be permitted to be installed in fireproof riser shafts with firestops at each floor:

(1) Types CATVP, CATVR, CATV and CATVX
(2) Riser and general-purpose cable routing assemblies
(3) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

FPN: See 8206 for firestop requirements for floor penetrations

(G) Risers- One- and Two-Family Dwellings. The following cables and cable routing assemblies shall be permitted one- and two-family dwellings:

(1) Types CATVP, CATVR, CATV and CATVX
(2) Type CATVX less than 10 mm (0.375 in.) in diameter
(3) Riser and general-purpose cable routing assemblies
(4) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

FPN: See 820.26 for firestop requirements for floor penetrations

(H) Cable Trays. The following cables shall be permitted to be installed in cable trays.

(1) Types CATVP, CATVR, and CATV
(2) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following cables, and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays.

(1) Types CATVP, CATVR and CATV
(2) Riser and general-purpose cable routing assemblies
(3) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(J) Other Building Locations. The following cables and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 820.113(B) through (I).

1) Types CATVP, CATVR and CATV
2) A maximum of 3m (10 ft) of exposed Type CATVX in nonconcealed spaces
3) Riser and general-purpose cable routing assemblies
4) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
5) Types CATVP, CATVR, CATV and Type CATVX installed in a raceway of a type included in Chapter 3

(J) One- and Two-Family and Multifamily Dwellings. The following cables and cable routing assemblies shall be permitted to be installed in one- and two-family and multifamily dwellings in locations other than the locations covered in 820.113(B) through (I).

(1) Types CATVP, CATVR and CATV
(2) Type CATVX less than 10 mm (0.375 in.) in diameter
(3) Riser and general-purpose cable routing assemblies
(4) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
(5)Types CATVP, CATVR, CATV and Type CATVX installed in a raceway of a type included in Chapter 3

IVANS, R.:

We agree with the revision proposal prepared by the CMP 16 Special Editorial Task Group.

See my comments on proposals 16-48, 16-56, 16-160 and 16-172.

The panel action on the revision of 820.113 changed the title to include cable routing assemblies but didn't add any specific applications. In order to correct this oversight the panel action should be revised as follows:

820.113 Installation of Coaxial Cables and Cable Routing Assemblies. Installation of coaxial cables and cable routing assemblies shall comply with 820.113 (A) through (K). Installation of raceways shall comply with 820.110.

(A) Listing. Coaxial cables and cable routing assemblies installed in buildings shall be listed.

Exception: Coaxial cables that comply with 820.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums. The following cables shall be permitted in ducts and plenums as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Type CATVP
(2) Types CATVP, CATVR, CATV and CATVX installed in raceways that are installed in compliance with 300.22(B)

FPN: See sections 4.3.4 & 4.3.11.3.3 of NFPA 90A-2009 Standard for the Installation of Air-Conditioning and Ventilation Systems for information on wire and cables in air ducts and apparatus casings plenums. See section 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as

described in 300.22(C).
(1) Type CATV
(2) Type CATVP installed in plenum communications raceway
(3) Type CATVP supported by metallic cable trays or cable tray systems
(4) Types CATVP, CATVR, CATV and CATVX installed in raceways that are installed in compliance with 300.22(C)
FPN: See sections 4.3.11.2, 4.3.11.4 & 4.3.11.5 of NFPA 90A-2009 Standard for the Installation of Air-Conditioning and Ventilation Systems for information on wire, cables and raceways in ceiling cavity, raised floor and air-handling unit room plenums. See section 3.3.22 for plenum definitions.
(D) Risers- Cables and Routing Assemblies in Vertical Runs. The following cables and cable assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:
(1) Types CATVP and CATVR
(2) Riser cable routing assemblies
(3) Types CATVP and CATVR installed in plenum or riser communications raceway
(4) Types CATVP and CATVR installed in a riser cable routing assembly
FPN: See 820.26 for firestop requirements for floor penetrations.
(E) Risers-Cables in and Raceways in Metal Raceways. The following cables shall be permitted in metal raceway or in a riser having with firestops at each floor:
(1) Types CATVP, CATVR, CATV and CATVX
(2) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
FPN: See 820.26 for firestop requirements for floor penetrations.
(F) Risers-Cables and Cable Routing Assemblies in Fireproof Shafts. The following cables and cable routing assemblies shall be permitted to be installed in fireproof riser shafts with firestops at each floor:
(1) Types CATVP, CATVR, CATV and CATVX
(2) Riser and general-purpose cable routing assemblies
(3) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
FPN: See 8206 for firestop requirements for floor penetrations
(G) Risers- One- and Two-Family Dwellings. The following cables and cable routing assemblies shall be permitted one- and two-family dwellings:
(1) Types CATVP, CATVR, CATV and CATVX
(2) Type CATVX less than 10 mm (0.375 in.) in diameter
(3) Riser and general-purpose cable routing assemblies
(4) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
FPN: See 820.26 for firestop requirements for floor penetrations
(H) Cable Trays. The following cables shall be permitted to be installed in cable trays.
(1) Types CATVP, CATVR, and CATV
(2)Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(I) Distributing Frames and Cross-Connect Arrays. The following cables, and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays.
(1) Types CATVP, CATVR and CATV
(2) Riser and general-purpose cable routing assemblies
(3) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
(J) Other Building Locations. The following cables and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 820.113(B) through (I).
1) Types CATVP, CATVR and CATV
2) A maximum of 3m (10 ft) of exposed Type CATVX in nonconcealed spaces
3) Riser and general-purpose cable routing assemblies
4) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
5) Types CATVP, CATVR, CATV and Type CATVX installed in a raceway of a type included in Chapter 3
(J) One- and Two-Family and Multifamily Dwellings. The following cables and cable routing assemblies shall be permitted to be installed in one- and two-family and multifamily dwellings in locations other than the locations covered in 820.113(B) through (I).
(1) Types CATVP, CATVR and CATV
(2) Type CATVX less than 10 mm (0.375 in.) in diameter
(3) Riser and general-purpose cable routing assemblies
(4) Types CATVP, CATVR and CATV installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
(5) Types CATVP, CATVR, CATV and Type CATVX installed in a raceway of a type included in Chapter 3

16-268 Log #3105 NEC-P16 **Final Action: Reject**
(820.113)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
820.113 <u>Listing Required.</u> ~~Installation of Coaxial Cables.~~
Coaxial cables installed in buildings shall be listed.
Exception: Coaxial cables that comply with 800.48 shall not be required to be listed.
Substantiation: The proposed title change more aptly describes the requirement, and it also gives a title that is not so similar to 820.133.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 16-273, which organized this section for clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-269 Log #44 NEC-P16 **Final Action: Reject**
(820.113 and 820.179)

NOTE: This proposal appeared as Comment 16-244 on Proposal 16-309 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-309 was:
Revise 820.179 and 820.113 as shown and transfer Table 820.113 and Table FPN's to 820.179.
820.179 Coaxial Cables.
Cables shall be listed in accordance with 820.179(A) through 820.179(D) <u>and marked in accordance with Table 820.179. The cable voltage rating shall not be marked on the cable.</u>
<u>FPN: Voltage markings on cables could be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.</u>
<u>Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.</u>
820.113 Installation and Marking of Coaxial Cables.
Listed coaxial cables shall be installed as wiring within buildings. ~~Coaxial cables shall be marked in accordance with Table 820.113. The cable voltage rating shall not be marked on the cable.~~
~~FPN: Voltage markings on cables could be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.~~
~~Exception No. 1: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.~~
Exception No. 2: Listing and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.
Submitter: James Daly, Upper Saddle River, NJ
Recommendation: The Panel action should have been to Accept in Part by not accepting the FPN to 820.179.
Substantiation: The FPN is not necessary since the reason for not marking the voltage rating on the cable is obvious. There are numerous other instances in the Code where similar requirements to the last sentence in 820.179 are included and there are no explanatory FPNs included with them.
Panel Meeting Action: Reject
Panel Statement: The existing 800.179 has the same requirement and includes the FPN. Since these cables are in fact rated for a voltage, questions do come up regarding why they cannot be and aren't marked. The FPN is useful information.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-270 Log #1744 NEC-P16 **Final Action: Accept in Principle**
(820.133)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "Boxes" in the heading to "Enclosures".
Substantiation: Edit. (A)(1)(a) addresses enclosures other than boxes.
Panel Meeting Action: Accept in Principle
Revise 820.133(A)(1) title to read as follows:
(1) In Raceways, Cable Trays, Boxes, and Enclosures.
Panel Statement: The panel revised the title to include "Enclosures" in order to provide consistency throughout the section.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-271 Log #1044 NEC-P16 **Final Action: Reject**
(820.133(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (A) and substitute:
(A) SEPARATION FROM OTHER CONDUCTORS. Coaxial cables shall not be installed in any raceway, cable tray, compartment, box, cabinet, or other enclosure with conductors of other systems except as follows:
(1) Where the coaxial cables are separated from other systems conductors (except Class 2) by an approved permanent barrier or identified divider.
(2) Where all the conductors of other systems are solely for connection to the coaxial cable distribution equipment and the installation complies with 820.133(A)(1) and exception.
Revise text of (B):
~~Raceways shall be used for their intended purpose.~~ Coaxial cables shall not be attached to the exterior of any ~~conduit or~~ raceway <u>containing conductors, cable or electrical conductor</u> as a means of support.
Exception: Overhead (aerial) spans of coaxial cables shall be permitted to be attached to exterior of an <u>identified</u> raceway mast <u>where the mast supports the coaxial cables, and does not support or contain conductors or cables other than for Class 2 or Class 3 systems, power-limited fire alarm systems, and optical fiber cables</u>.
Substantiation: Edit. Proposal is essentially a change of format incorporating present provisions with less verbiage.
Panel Meeting Action: Reject
Panel Statement: No additional clarity is provided by submitter's proposed editorial revision.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-272 Log #2262 NEC-P16 **Final Action: Accept in Principle**
(820.133(A)(1))

Submitter: Terry Peters, The Society of the Plastics Industry
Recommendation: Revise text to read as follows:
(1) In Raceways, <u>Routing Assemblies,</u> Cable Trays, and Boxes.
(a) *Other Circuits.* Coaxial cables shall be permitted in the same raceway, <u>or optical fiber/communications cable routing assembly,</u> cable tray, or enclosure with jacketed cables of any of the following:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
(2) Power-limited fire alarm systems in compliance with Article 760
(3) Nonconductive and conductive optical fiber cables in compliance with Article 770
(4) Communications circuits in compliance with Article 800
(5) Low-power network-powered broadband communications circuits in compliance with Article 830
Substantiation: Article 770 currently covers optical fiber raceways and provides listing requirements for plenum, riser and general-purpose versions. UL lists these raceways to UL 2024, *Optical Fiber and Communication Cable Raceway.* UL lists optical fiber routing assemblies to UL2024a, *Outline of Investigation for Optical Fiber Cable Routing Assemblies.* Routing assemblies are u-shaped wiring troughs that may or may not have covers. (If they always had covers, they would be raceways and this proposal would not be necessary.) UL 2024a provides for the listing of plenum, riser and general-purpose routing assemblies with the same fire testing requirements as UL 2024.
The significant difference between optical fiber routing assemblies and optical fiber raceways is that the routing assemblies are larger and open, therefore present a greater fire load.
We have submitted companion proposals to provide for a change of the scope of Article 770 to include routing assemblies and to provide listing and application for requirements for optical fiber routing assemblies. Since these routing assemblies are used for optical fiber, data and communications cables, proposals are being submitted for Articles 725, 770, 800 and 820.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-273.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-273 Log #2114 NEC-P16 **Final Action: Accept in Principle in Part**
(820.133(A)(1)(a))

TCC Action: The Technical Correlating Committee directs that the Chairs of Code-Making Panels 3 and 16 form a Task Group to correlate the actions taken on this proposal and Proposal 3-196.
Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
(a) *Other Circuits.* Coaxial cables shall be permitted in the same raceway, cable tray, or enclosure with jacketed cables of any of the following:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with <u>Parts I and III of</u> Article 725
(2) Power-limited fire alarm systems in compliance with <u>Parts I and III of</u> Article 760
(3) Nonconductive and conductive optical fiber cables in compliance with <u>Parts I and IV of</u> Article 770
(4) Communications circuits in compliance with <u>Parts I and IV of</u> Article 800
(5) Low-power network-powered broadband communications circuits in compliance with <u>Parts I and IV of</u> Article 830
<u>Exception: Only Types CATVP, CATVR, CATV and CATVX cables shall be permitted to be installed in plenum CATV raceways, riser CATV raceways and general-purpose CATV raceways.</u>
Substantiation: This is an editorial and technical proposal.
Section 820.154 restricts the applications of plenum, riser and general-purpose CATV raceways by permitting only Types CATVP, CATVR, CATV and CATVX cables in these raceways.
Section 820.133(A)(1)(a) conflicts with the restrictions of 820.154.
The purpose of this proposal is to remove the conflict. It is also a companion proposal to a proposal to simplify the applications requirements in 820.154 by replacing the text with a table.
The NEC Style Manual states:
4.1.1 References to a Part Within an Article. References shall not be made to an entire article, such as "grounded in accordance with Article 250" unless additional conditions are specified. References to parts within articles shall be permitted.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
(1) In Raceways, <u>Routing Assemblies,</u> Cable Trays, and Boxes.
(a) *Other Circuits.* Coaxial cables shall be permitted in the same raceway, cable tray, <u>or</u> enclosure, <u>or cable routing assembly</u> with jacketed cables of any of the following:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with <u>Parts I and III of</u> Article <u>725</u>
(2) Power-limited fire alarm systems in compliance with <u>Parts I and III of</u> Article <u>760</u>
(3) Nonconductive and conductive optical fiber cables in compliance with <u>Parts I and IV of</u> Article <u>770</u>
(4) Communications circuits in compliance with <u>Parts I and IV of</u> Article <u>800</u>
(5) Low-power network-powered broadband communications circuits in compliance with <u>Parts I and IV of</u> Article <u>830</u>.
Panel Statement: The recommendation from Proposal 16-272 has been incorporated into this proposal, and the new exception has been deleted because of panel action on other proposals to consolidate the types of raceways. See the panel actions on Proposals 16-278 and 16-267. See panel proposal 16-289a that eliminated the listing of CATV raceways.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-274 Log #4693 NEC-P16 **Final Action: Reject**
(820.133(A)(2) Exception No. 3 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add a third exception as follows:
Exception No. 3: Where all of the electric light, power, Class 1, non-power limited fire alarm, and medium-power network-powered broadband communications circuit conductors are permanently separated from all of the coaxial cables through the use of sheathing that provides for system separation that does not rely on conductor or cable insulation alone, the combination of conductors comprising different systems shall be permitted to be combined into a listed hybrid cable assembly.
Substantiation: There is not and has never been any express permission to include CATV conductors within a common cable assembly with power conductors. Para (2) here comes the closest, because it recognizes a "continuous and firmly fixed nonconductor." This is crucial to the production of hybrid cables, where additional separation beyond the conductor insulation is applied to the power-limited conductors in accordance with the spirit of these principles. For example, 334.116(C) expressly recognizes this type of construction for Type NMS cable, and UL has been listing such constructions for many years. This topic must be addressed in the limited-power wiring articles, and this proposal is designed to raise the issue.
Panel Meeting Action: Reject
Panel Statement: The submitter has neither identified a specific application nor cited any technical rationale for an additional exception that appears to be covered in the present Exception No. 2.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-275 Log #1746 NEC-P16 **Final Action: Reject**
(820.133(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Raceways shall be used ~~for their intended purpose~~ <u>in accordance with their required or permitted use.</u> Coaxial cables shall not be ~~strapped, taped, or~~ attached by any means to the exterior of any ~~conduit or~~ raceway, <u>electrical cable or conductor</u> as a means of support.
Exception: Overhead (aerial) spans of coaxial cable shall be permitted to be attached to the exterior of a raceway mast ~~intended for the attachment and support of such cables.~~ <u>The mast shall be permitted to support or enclose other conductors where in compliance with 820.133(A).</u>
Substantiation: The intended purpose for raceways is as required or permitted by the raceway articles. The "intended" use could be for fence posts which I have seen done which is not a Code violation. Raceways other than conduit, and cables and individual conductors such as grounding electrode conductors should be included. "Cable" should be designated as "electrical" since a messenger cable is appropriate for support of overhead spans of coaxial cable.
Panel Meeting Action: Reject
Panel Statement: Editorial changes proposed by the submitter provide no additional clarity. Permitting attachment to a mast containing power conductors is in conflict with 820.44(C).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-276 Log #2113 NEC-P16 **Final Action: Accept**
(820.133(B))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise the title of 820.133 (B) as follows:
(B) Support of <u>Coaxial</u> Cables. Raceways shall be used for their intended purpose. Coaxial cables shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.
Exception: Overhead (aerial) spans of coaxial cables shall be permitted to be attached to the exterior of a raceway-type mast intended for the attachment and support of such cables.
Substantiation: This is an editorial change. The addition of the wording "coaxial" will add clarity to the title of 820.133(B) as this section deals with coaxial cables.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-277 Log #2287 NEC-P16 **Final Action: Reject**
(820.135 (New))

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Add a new Section to read as follows:
<u>**820.135 Communication Device and Equipment Mounting.** Communication devices or equipment shall be mounted in listed boxes, brackets or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place. Boxes or brackets can be completly enclosed or backless.</u>
<u>**(A) Communication Devices and Equipment Mounted to Boxes or Brackets.** Communication devices or equipment shall be mounted to a listed boxes or bracket and installed per 314.20.</u>
<u>**(B) Communication Devices and Equipment Mounted on Covers.** Communication device and equipment mounted to and supported by a cover shall be held rigidly against the cover which is mounted to the box or bracket.</u>
Substantiation: This proposal adds a new section to Article 820 addressing the mounting of devices or equipment to listed boxes and brackets. Currently, depending on the quality of workmanship, coaxial devices or equipment have not been mounted to boxes or brackets that can support them. After several years device and/or covers that are mounted directly to the dry wall will become hazard because they have become loose and exposed. Coaxial cable can become energized by coming in incidental contact with electrical conductors.
820.135 was only a suggestion for the location of this new section. (A) addresses devices mounted directly to boxes or devices where as (B) address devices mounted to covers.
Panel Meeting Action: Reject
Panel Statement: Not all CATV equipment and devices need to be mounted in boxes, brackets, or assemblies.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
IVANS, R.: Loose and exposed cable or connectors can pose a risk of electric shock if improperly grounded. Loose cabling and connectors can come into contact with electric light and power conductors. There are boxes and brackets listed for this purpose using UL Subject 2269, "Outline of Investigation for Optical Fiber/Communications/Signaling/Coaxial Cable Outlet Boxes."
OHDE, H.: See our Negative Comment on Proposal 16-171.

16-278 Log #2115 NEC-P16 **Final Action: Accept in Principle**
(820.154)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
~~**820.154 Applications of Listed CATV Cables and CATV Raceways.**~~
~~CATV cables shall comply with the requirements of 820.154(A) through (E) or where cable substitutions are made as shown in Table 820.154(E).~~
~~**(A) Plenums.** Coaxial cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.~~
~~**(B) Riser.** Coaxial cables installed in risers shall comply with any of the requirements of 820.154(B)(1) through (B)(3).~~
~~**(1)** Coaxial **Cables in Vertical Runs.** Coaxial cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. Listed riser CATV raceways and listed plenum CATV raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CATVR and CATVP cables shall be permitted to be installed in these raceways.~~
~~**(2) Metal Raceways or Fireproof Shafts.** Types CATV and CATVX cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having fire- stops at each floor.~~
~~**(3) One- and Two-Family Dwellings.** Types CATV and CATVX cables shall be permitted in one- and two-family dwellings.~~
~~FPN: See 820.3(A) for the firestop requirements for floor penetrations.~~
~~**(C) Other Wiring Within Buildings.** Cables installed in building locations other than the locations covered in 820.154(A) and (B) shall be in accordance with any of the requirements in 820.154(C)(1) through (C)(5).~~
~~**(1) General.** Type CATV shall be permitted. Listed CATV general-purpose raceways, listed riser CATV raceways, and listed plenum CATV raceways shall be permitted. Only Types CATV, CATVX, CATVR, or CATVP cables shall be permitted to be installed in these CATV raceways.~~
~~**(2) In Raceways.** Type CATVX shall be permitted to be installed in a raceway.~~
~~**(3) Nonconcealed Spaces.** Type CATVX shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).~~

~~**(4) One- and Two-Family Dwellings.** Type CATVX cables less than 10 mm (0.375 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.~~

~~**(5) Multifamily Dwellings.** Type CATVX cables less than 10 mm (0.375 in.) in diameter shall be permitted to be installed in multifamily dwellings.~~

~~(D) Cable Trays. Cables installed in cable trays shall be Types CATVP, CATVR, and CATV.~~

~~(E) Cable Substitutions. The uses and substitutions for CATV coaxial cables listed in~~ Table 820.154(E) ~~and illustrated in~~ Figure 820.154(E) ~~shall be permitted.~~

<u>**820.154 Applications of Listed CATV Cables and CATV Raceways.** Permitted and non-permitted applications of listed coaxial cables and CATV raceways shall be as indicated in Table 820.154(A). The substitutions for coaxial cables listed in Table 820.154(B) and illustrated in Figure 820.154(B) shall be permitted.</u>

See Table 820.154(A) on page 1133

(Renumber Table 820.154(E) and Figure 820.154(E) to Table 820.154(B) and Figure 820.154(B) and insert them here.)

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 770, 800,820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal for section 820.154 greatly simplifies the statement of the applications of optical fiber cables and raceways by using a table where the permitted applications are indicated by a "Y" and the applications that are not permitted are indicted by an "x". A companion proposal moves the installation rules to section 820.113 Installation of CATV Cables.

This proposal makes no changes to the existing permitted and not permitted applications of CATV cables and raceways.

This proposal and its companion proposal for section 820.113 need to be considered together as a package.

This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept in Principle

See Table 820.154 on page 1134

Panel Statement: See panel statement on Proposals 16-160 and 16-172.

The table is a combination of the table from Proposal 16-278, which has been modified to improve clarity, with entries to incorporate panel actions to accept in principle Proposals 16-173 (cable routing assemblies), 16-175 (metallic cable tray), and 16-179 (requiring riser cable for penetration of one floor) and by modifications to correlate with NFPA 90A-2009.

The non-permitted applications were determined by considering the listing requirements for the cable. Other non-permitted applications were determined from existing code requirements as determined by the panel.

The panel recognizes that this proposal is a companion proposal to Proposal 16-267 and has considered them together.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

DORNA, G.: See my comments on proposals 16-48, 16-56, 16-160, 16-172 and 16-267

The heading of the last two columns should be revised to include cable routing assemblies to correlate with the panel action on proposals 16-232 and 16-273. See proposal 16-172 which includes cable routing assemblies.

The headings of the last two columns should be revised to read:

"In riser communications raceways and riser routing assemblies"

"In general-purpose communications raceways and general-purpose cable routing assemblies"

"Cable Type" needs to be revised to include cable routing assemblies and two rows for applications of cable routing assemblies need to be added to correlate with panel action on 16-267.

The revised 820.154 should appear as shown below:

820.154 Applications of Listed CATV Cables. Permitted and non-permitted applications of listed coaxial cables shall be as indicated in Table 820.154(A). The permitted applications are subject to the installation rules of 820.113. The substitutions for coaxial cables listed in Table 820.154(B) and illustrated in Figure 820.154 shall be permitted.

See Table 820.154 on page 1135

(E) Cable Substitutions. The uses and substitutions for CATV coaxial cables listed in <u>Table 820.154(B)</u> and illustrated in <u>Figure 820.154</u> shall be permitted.

Insert Table 820.154(E) and renumber as 820.154(B)

FPN: The substitute cables in <u>Table 820.154(B)</u> and <u>Figure 820.154</u> are only coaxial-type cables.

(Renumber figure 820.154(E) to 820.154 and insert it here.)

IVANS, R.: See my comments on proposals 16-48, 16-56, 16-160, 16-172 and 16-267.

The heading of the last two columns should be revised to include cable routing assemblies to correlate with the panel action on proposals 16-232 and 16-273. See proposal 16-172 which includes cable routing assemblies.

The headings of the last two columns should be revised to read:

"In riser communications raceways and riser routing assemblies"

"In general-purpose communications raceways and general-purpose cable routing assemblies"

"Cable Type" needs to be revised to include cable routing assemblies and two rows for applications of cable routing assemblies need to be added to correlate with panel action on 16-267.

The revised 820.154 should appear as shown below:

820.154 Applications of Listed CATV Cables. Permitted and non-permitted applications of listed coaxial cables shall be as indicated in Table 820.154(A). The permitted applications are subject to the installation rules of 820.113. The substitutions for coaxial cables listed in <u>Table 820.154(B)</u> and illustrated in <u>Figure 820.154</u> shall be permitted.

See Table 820.154(A) on page 1136

16-279 Log #124 NEC-P16 **Final Action: Accept**
(820.154(A))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Delete the second sentence.

~~Abandoned cables shall not be permitted to remain.~~

Substantiation: Section 820.25 requires that "The accessible portion of abandoned communications cables shall be removed." The requirement in to remove all abandoned cables in 820.154(A) is an error from the 1999 NEC that the panel tried to correct in the last code cycle.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Table 820.154(A), Applications of Coaxial Cables and CATV Raceways

Cable or Raceway Type	Applications											
	In air ducts and plenums as described in 300.22(B)	In other spaces used for environmental air as described in 300.22(C)	In risers	In building locations other than air ducts, plenums, other spaces used for environmental air and, risers	In one- and two-family dwellings	In multifamily dwellings	In nonconcealed spaces	In cable trays	In any raceway in Chapter 3	In plenum CATV raceways	In riser CATV raceways	In general-purpose CATV raceways

16-278 Ivans BE

16-280 Log #130 NEC-P16 **Final Action: Accept in Principle**
(820.154(A))

Submitter: Gerald Lee Dorna, Belden
Recommendation: Add the following text at the end of 820.154(A):
Metallic cable trays and metallic cable tray systems shall be permitted to be installed in other spaces used for environmental air. Type CATVP cables and CATV plenum raceways shall be permitted to be installed in these cable trays and cable tray systems. Types CATVR, CATV and CATVX cables, and CATV riser and general-purpose raceways shall not be permitted to be installed in these cable trays and cable tray systems.
Substantiation: Article 392, Cable Trays, has requirements for cable trays in air handling spaces in section 392.4.
392.4 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.
Section 300.22 has provisions for cable trays in 300.22(C), Other Space Used For Environmental Air.
(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.
FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.
Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.
(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.
Section 300.22(C)(1) permits only solid bottom metal cable tray with solid metal covers. Optical fiber, communications, CATV, signaling and fire-alarm plenum cables, and plenum raceways are often installed in metal cable trays and metal cable tray systems in plenums (other spaces used for environmental air). These installations are "neat and workmanlike" and safe. They should be permitted.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-267.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-281 Log #4546 NEC-P16 **Final Action: Accept**
(820.154(A))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
820.154 Applications of Listed CATV Cables and CATV Raceways.
CATV cables shall comply with the requirements of 820.154(A) through (E) or where cable substitutions are made as shown in Table 820.154(E).
(A) Plenums. Coaxial cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. ~~Abandoned cables shall not be permitted to remain.~~ Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
Substantiation: The text proposed for deletion is duplicative of the text in section 820.25 and potentially in conflict with it.
For information, see section 820.25:
820.25 Abandoned Cables.
The accessible portion of abandoned coaxial cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-282 Log #2212 NEC-P16 **Final Action: Accept in Principle**
(820.154(B)(1))

Submitter: Robert W. Jensen, dbi / Rep. BICSI
Recommendation: Revise text as follows:
Coaxial cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. Listed riser CATV raceways and listed plenum CATV raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CATVR and CATVP cables shall be permitted to be installed in these raceways.
Substantiation: Is it really our intention that cables passing between floors through a floor penetration be less than riser rated?
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-267.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DORNA, G.: The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".
Section 820.154(B)(1) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.
The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.

16-283 Log #1677 NEC-P16 **Final Action: Reject**
(820.179(A), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 820.179(A) FPN as follows:
FPN: One method of ~~defining~~ determining fire resistance and low smoke-producing characteristics of a cable is testing ~~that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested~~ in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.
Substantiation: 3.1.3 of the NEC Style Manual states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."
Panel Meeting Action: Reject
Panel Statement: The panel recognizes the intent of the submitter but notes that NFPA-262 is a test method that has no inherent pass/fail criteria. The FPN does provide explanatory information. It provides one set of criteria. It does not set requirements.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-284 Log #45 NEC-P16 **Final Action: Reject**
(820.179(B))

NOTE: This proposal appeared as Comment 16-271 on Proposal 16-340 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-340 was:
Make the changes as shown:
(B) Type CATVR. Type CATVR community antenna television riser coaxial cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.
FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*
Submitter: James Daly, Upper Saddle River, NJ
Recommendation: The Panel Action should have been to Accept in Principle and reword the FPN as shown:
FPN: One method of determining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is ~~that the raceways pass the requirements of the test for Flame Propagation (riser) in~~ ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*

Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The FPN defines the damage and specifies performance requirements.

Panel Meeting Action: Reject

NOTE: This proposal appeared as Comment 16-272 on Proposal 16-341 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-341 was:

Make the changes as shown:

(C) Type CATV. Type CATV community antenna television coaxial cables shall be listed as being suitable for general-purpose CATV use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining *resistant to the spread of fire* is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords*.

Another method of defining *resistant to the spread of fire* is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, *Test Methods for Electrical Wires and Cables.*

Submitter: James Daly, Upper Saddle River, NJ

Recommendation: The Panel Action should have been to Accept in Principle and reword the FPN to read:

FPN: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*

Another method of determining that the cable is resistant to the spread of fire is the "Vertical Flame Test - Cables in Cable Trays," in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables.*

Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The Proposal as submitted defines the damage and specifies performance requirements.

The number, title, and the date of the latest edition of the UL standard were corrected to reflect the current applicable standard. The reference in the CSA standard and the date of the CSA standard were also corrected.

Panel Meeting Action: Reject

(820.179(D))

NOTE: This proposal appeared as Comment 16-274 on Proposal 16-343 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-343 was:
Make the changes as shown:
(D) Type CATVX. Type CATVX limited-use community antenna television coaxial cables shall be listed as being suitable for use in dwellings and for use in raceway and shall also be listed as being resistant to flame spread.
FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords*.
Submitter: James Daly, Upper Saddle River, NJ
Recommendation: The Panel Action should have been to Accept in Principle and reword the FPN to read:
FPN: One method of determining that the cable is resistant to flame spread is the VW-1 (vertical-wire) flame test in ANSI/UL 1581-2001, *Reference Standard for Electrical Wires, Cables and Flexible Cords.*
Substantiation: 3.1.3 of the NEC Style Manual stipulates that “Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language.”
The FPN as submitted in the Proposal includes mandatory language by requiring that the cable be tested to UL 1581. The revised wording provides explanatory information without any requirements.
The date of the latest edition of the UL standard was updated from 1991 to 2001.
Panel Meeting Action: Reject
Panel Statement: The fine print note(s) does contain explanatory information. It does not contain requirements and is not written in mandatory language.

ARTICLE 830 — NETWORK-POWERED BROADBAND COMMUNICATIONS SYSTEMS

16-293 Log #4183 NEC-P16 **Final Action: Accept**
(830)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase “grounding conductor” and revising it to “grounding electrode conductor.”
Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Replace the term “grounding conductor” with “grounding electrode conductor” throughout this Article.
Substantiation: The term “Grounding Conductor” is being proposed to be deleted because it is almost identical to the term “grounding electrode conductor”. The defined term “grounding electrode conductor” includes the ability of connecting to a point on the grounding electrode system. This has been submitted as a single proposal to the Article instead of numerous proposals to allow the panel to ensure the resulting language still meets their intent in each specific section.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-91.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
JANIKOWSKI, R.: I agree with the submitter that the term “grounding conductor” and “grounding electrode conductor” are all but identical. The term “grounding electrode conductor” will not be mistaken in the field for the grounded conductor and refers to any point on the grounding electrode system.
Comment on Affirmative:
BRUNSSEN, J.: This is a correlation issue with Panel 5. Although the deletion of the term “grounding conductor” is appropriate for articles covered by Panel 5, the term is used over 120 times in Chapter 8 articles covering low power communications circuits and elsewhere in the code. The term “Grounding Conductor” has proven a useful and well understood term within the communications articles and a definition should be retained in Article 100. Substitution of “Grounding Conductor” with “Grounding Electrode Conductor” is not appropriate for all uses in Chapter 8 articles. The definition of “Grounding Conductor” could be modified to make it more specific to communications circuits as follows: “G**rounding Conductor.** A conductor used to connect communications equipment and cable shield, as required, to a grounding electrode system or grounding electrode(s).” This definition would meet the needs of Chapter 8.

16-294 Log #1200 NEC-P16 **Final Action: Reject**
(830.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Insert “is likely to” in place of “may”.
Substantiation: Edit. “May” is a term to be avoided per the Style Manual. “Likely” is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The submitters recommendation is not editorial. The term “may” connotes “a possibility”; the term “likely” connotes “is probable”. The panel does not agree that these are probable events.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-295 Log #746 NEC-P16 **Final Action: Reject**
(830.2.Abandoned Network Powered Broadband Powered Communications Cable)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Delete text and the associated Fine Print Note to read as follows:
830.2 Definitions.
See Article 100. For the purposes of this article, the following additional definitions apply.
~~**Abandoned Network-Powered Broadband Communications Cable.** Installed network-powered broadband communications cable that is not terminated at equipment other than a connector and not identified for future use with a tag.~~
~~FPN: See Article 100 for a definition of Equipment.~~
[remainder of 830.2 unchanged by this Proposal]
Substantiation: Companion proposals have been made to add a single generalized definition in Article 100 and to delete the corresponding definitions for the various abandoned cables, supply circuits, etc., in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2.
NEC® Manual of Style 2.2.2.1. Consolidation into a new, single generalized definition in Article 100 of nearly identical definitions appear in multiple Articles, specifically in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2. Although these individual definitions served a valid transitional purpose to support the independent additions of individual requirements in 640.6(C), 645.5(F), 645.5(G), 725.25, 800.25, 820.25, and 830.25, these discreet definitions can be broadly consolidated into a single definition in Article 100.
The specific method by which identification for future use is achieved ("… with a tag") is conveyed in the definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 violates *NEC® Manual of Style* 2.2.2 ("Definitions shall not contain requirements …") and is omitted in the generalized definition for "Abandoned" being added in Article 100. This identification-with-a-tag requirement in these definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 is redundant to the actual requirement statements in 640.6(C), 645.5(G), 725.25, 800.25, 820.25, and 830.25, respectively. Also, words regarding the possibility of ceasing connection to an electric supply have been added in the generalized definition for "Abandoned" to correlate to 90.2(A)(3), since abandonment entails disconnection from either the terminating equipment or the electric supply (or both).
Panel Meeting Action: Reject
Panel Statement: For the 2008 NEC, a TCC-directed task group, including representation from CMP-3, CMP-12 and CMP-16, determined there were enough differences in the installation of abandoned cables to justify them being addressed in individual articles. The current code wording is aligned with what was proposed by the task group.
Number Eligible to Vote: 16

16-297 Log #2129 NEC-P16 **Final Action: Reject**
(830.2.Air Duct)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Add a definition of air duct:
<u>**Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [**90A:**3.3.5].</u>
Substantiation: The term "air duct" is used in the task group's proposal for 830.154. It should be defined. It is defined in Articles 800 and 820. The task group is also proposing to define it in Article 770. A proposal has been submitted to define air duct in Article 100. If the proposal for Article 100 is accepted, the panel or the TCC can act to remove the definitions from panel sixteen's articles.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Reject
Panel Statement: The term "air duct" is not used in Article 830 and should not be defined in the article, in accordance with the NEC Style Manual.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-298 Log #2131 NEC-P16 **Final Action: Accept**
(830.3 and 830.3(B))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Delete the following:
~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.~~
~~*Exception: As permitted in 830.154(B)*~~
Revise 830.3 Other Articles as follows:
830.3 Other Articles. Circuits and equipment shall comply with 830.3(A) through ~~(D)~~ <u>(C)</u>.
Reletter existing items (C) and (D) as (B) and (C).
Substantiation: This proposal is editorial and technical.
Section 830.3(B) provides no additional guidance or requirements that are not already in 830.154(A). Section 300.22 conflicts with Article 830 because Article 830 requires listed network-powered broadband cables whereas 300.22 permits various electrical power and control cables that are not permitted to be used for network-powered broadband circuits in Article 830. Section 800.3 does not have a similar requirement.
Acceptance of this proposal, as well as companion proposals for 770.3 and 820.3, will make Articles 770, 800, 820 and 830 consistent and in compliance with section 3.3.5 of the NEC Style Manual, shown below:
3.3.5 Parallel Construction. Parallel construction means stating similar requirements in similar ways for greater consistency. This helps makes the *NEC* clear for users. Lack of consistency often creates confusion, causing users to ask: *Does this difference in wording represent a different requirement? Or is it simply two different ways of trying to say the same thing?* There are several kinds of parallel construction:
Organization and Numbering. If practicable, the subsections of similar articles should be numbered in the same order (see 2.4.1).
Sections. Different sections, within the same article, that reflect similar or closely related subjects, should have similar structures.
Lists. All items in a list should be parallel (that is, singular or plural, written in the same verb tense, using phrases or sentences but not a mix).
This proposal was submitted by the CMP 16 Special Editorial Task Group during the development of the 2008 NEC. This proposal was rejected in order to comply with the NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005. The Standards Council Decision does not apply to the current NEC code cycle.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

16-299 Log #157 NEC-P16 **Final Action: Accept in Principle**
(830.3(A) (New))

TCC Action: The Technical Correlating Committee directs that the panel reconsider its action on this proposal since there is no need to duplicate 90.3 in accordance with 4.1 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: In section 830.3, re-letter the existing (A) to (B), (B) to (C), etc. and establish a new (A).
(A) **Chapters 1 through 7.** See 90.3. The requirements of Chapters 1 through 7 shall not apply to Article 830 except where the requirements are specifically referenced in Article 830.
Substantiation: Section 90.3 is extremely important to the application of Article 830. Adoption of this proposal will add clarity.
Panel Meeting Action: Accept in Principle
Re-letter the existing (A) to (B), (B) to (C), etc. and establish a new (A).
(A) Chapters 1 through 7. The requirements of Chapters 1 through 7 shall not apply to Article 800 except where the requirements are specifically referenced in Article 800. See 90.3.
Panel Statement: Field experience shows that 90.3 is often overlooked. The panel moved the reference to 90.3 to the end for clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DORNA, G.: There is an error in the panel action. "Article 800" needs to be changed to "Article 830" twice.
IVANS, R.: There is an error in the panel action. "Article 800" needs to be changed to "Article 820" twice.

16-300 Log #2130 NEC-P16 **Final Action: Accept**
(830.3(A))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise the following:
830.3(A) Hazardous (Classified) Locations. Network-powered broadband communications circuits and equipment installed in a location that is classified in accordance with 500.5 and 505.5 shall comply with the applicable requirements of Chapter 5.
Substantiation: This is a clarification proposal. This proposal is editorial and technical.
CMP 16 was instructed by the Technical Correlating Committee during the 2008 NEC ROP process to consider not only the different hazardous location division applications (500.5) but also the different hazardous location zone applications (505.5). This directive was issued for 2008 Proposal 16-121 which dealt with 800.3(A). This reference of 505.5 should be added here as well to correlate with Articles 800 and 820.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

(830.24)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
830.24 Mechanical Execution of Work.
Network-powered broadband communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4~~(D)~~ and 300.11.
FPN: Text to remain unchanged.
Substantiation: This is one of a series of proposals intended to provide correlation with sections 640.6(B), 725.24, 760.24, 770.24, 800.24, 820.24 and 830.24. Due to the power limitations of these circuits, there is no reason that the requirements should be different.
Panel Meeting Action: Reject
Panel Statement: Physical protection is already covered in 830.157.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-303 Log #1204 NEC-P16 **Final Action: Reject**
(830.24 and Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
~~Network powered broadband communication circuits and equipment shall be installed in a neat and workmanlike manner.~~ Cables ~~installed exposed on the surface of ceilings and sidewalls~~ shall be securely fastened and supported. Cables shall be located where not likely to be subject to physical damage or shall be protected by approved means. (remainder unchanged)
Add: Exception: Where fished between access points through concealed spaces in finished buildings or structures and fastening is not practicable.
Substantiation: "Workmanlike" is a term to be avoided per the Style Manual, is subjective and if the installation complies with the purpose of the Code (90.1 (A) there is no hazard. Whether exposed or concealed or on ceilings or sidewalls cables should be secured and supported. The means of support doesn't necessarily prevent physical damage. "Likely" is defined as such a nature or circumstance as to make something probable and is a term used in many sections. Proposed exception is similar to other such provisions in the Code.
Panel Meeting Action: Reject
Panel Statement: Physical protection is already covered under 830.157. "Neat and workmanlike manner" is recognized by other standards. The panel is aware of the guidance in the NEC Style Manual.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-304 Log #3724 NEC-P16 **Final Action: Accept in Principle**
(830.24, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add the following Fine Print Note:
FPN: See NFPA 90A, Standard for Installation of Air-Conditioning and Ventilation Systems, for discrete combustible components installed in air-handling plenums in accordance with 300.22.
Substantiation: This proposal addresses new requirements in NFPA 90A having an influence on installations in NEC Section 830.24, as well as held comments from the 2008 NEC Cycle, ROC 16-29 and 16-30.
Imposing the requirement that such products be "listed" in this section of the NEC would result in additional requirements not included in NFPA 90A. The implication of requiring listing in this section of the NEC would impose the full scope of requirements in UL 1565 for cable ties and UL 2239 for other support hardware. This effort to correlate with NFPA 90A would create big correlation issues within NFPA 70 for the same products used for supporting all other cables and conduits outside of the jurisdiction of code-making panel 16, for no good reason. It is not necessary to repeat requirements from NFPA 90A in NFPA 70 especially when doing so imposes unsubstantiated additional requirements.
The NFPA 90A requirements are focused on smoke and heat generated from a fire in an air-handling plenum. The NFPA 90A-2009 requirement is as follows for discrete combustible components installed in air-handling spaces in accordance with NEC 300.22 (C) and (D): (The actual clause numbers in NFPA 90A-2009 may vary editorially)

NFPA clause 4.3.10.2.6.5 Loudspeakers, recessed lighting fixtures and other electrical equipment with combustible enclosures, including their assemblies and accessories, cable ties and other discrete products shall be permitted in the ceiling cavity plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a peak heat release rate of 100 kW or less when tested in accordance with UL2043, *Standard for Safety Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.*

And very similar requirements in 4.3.10.6.5.6 apply in NFPA 90A for discrete <u>combustible</u> products installed in a "raised floor plenum".

Importantly, none of these requirements pertain to noncombustible products. There are many metallic products, including metallic cable ties, used to support power, data and communications conduits and cables and there has been no substantiation offered that these be required to be "listed".

Panel Meeting Action: Accept in Principle

Revise fine print note text to read as follows:

FPN No. 2: See NFPA 90A, Standard for Installation of Air-Conditioning and Ventilation Systems, for discrete combustible components installed in accordance with 300.22(B) and (C).

Panel Statement: The panel removed the vague term "air-handling plenums" and added the references to 300.22(B) and (C). This meets the submitter's intent.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-305 Log #4554 NEC-P16 **Final Action: Reject**
(830.25)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Recommendation: Revise text as follows:

830.25 Abandoned Cables.

The accessible portion of abandoned network-powered broadband cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved. <u>Removal of abandoned cables shall be performed in a neat and workmanlike manner.</u>

Substantiation: This proposal recommends added wording to ensure that abandoned cables are removed appropriately. Section 110.12 addresses installation and so does section 830.24. Moreover, section 110.12 would only apply if specifically referenced. It is important to point out that similar care must be taken when removing cables.

110.12 Mechanical Execution of Work.

Electrical equipment shall be installed in a neat and workmanlike manner.

FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.

Consistent wording is being proposed for other sections in the code.

For information, see relevant definitions in the NEC.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 16-24.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-306 Log #1599 NEC-P16 **Final Action: Reject**
(830.26)

Submitter: Russell LeBlanc, The Peterson School of Engineering

Recommendation: Add a third sentence to 830.26: <u>Conduits or raceways entering enclosures of the ventilated type, shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway into other areas of the building or structure.</u>

Substantiation: A fire in the area where the enclosure is located will produce smoke, poison gases, and other products of combustion which can easily be carried through the enclosure's vents and these unsealed raceways to other areas in the building. Essentially defeating any firewalls. I have not seen this particular problem addressed in building codes or fire resistance directories since these raceways are not "sleeves" which ARE required to be fire stopped, but rather they are complete raceway systems which generally require only sealing up around the OUTSIDE of the pipe where it penetrates a firewall. In this particular installation smoke could easily pass right through the INSIDE of the raceway because of the ventilation openings in the enclosure.

I have witnessed the results of this "chimney-effect" problem when the smoke from a fire in a basement electric room spread throughout the upper floors of a high rise building because the raceways leaving the switch gear acted like chimneys and transported heavy smoke from the basement directly to panelboards and switchboards on the upper floors of the building thus bypassing and defeating any fire walls that the raceways penetrated and completely filling the UPPER floors with smoke. Luckily nobody was injured. If the ends of the raceways were simply filled with some fire-stopping type caulk or similar material this situation would probably never have happened.

Once a fire starts to produce toxic fumes we almost have to think of that area as a Hazardous (classified) location similar to those in Article 500. We must try to prevent those hazardous gases passing from one area in a building to another.

Just as other sealing requirements throughout the code prevent moisture, condensation, dusts, gases or vapors from traveling through raceways, this requirement for some simple fire proof putty could prevent toxic fumes from spreading throughout the building. The seals required by this proposal are equally as important as any other seals required by the NEC such as 230.8, 300.5(G), 300.7(A), 300.50(E), 312.5(C) exception to (D), 324.40(A), 332.40(A), 368, 238, 372.7, 501.15, 502.15, 504.70, 505.16, 506.16, 680.24(B) and any other seals that may be required.

I am submitting companion proposals to sections 300.21, 770.26, 800.26, 820.26 and 830.26.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The proposed recommendation is impractical. The submitter has not supplied sufficient data for substantiation of a problem.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

IVANS, R.: The submitter is correct that vented enclosures connected via unsealed raceways and conduit can bypass fire breaks between floors. It would not be impractical to seal such raceways or conduit.

16-307 Log #1203 NEC-P16 **Final Action: Reject**
(830.44(C))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text as follows:

Lead-in ~~or~~ <u>and</u> aerial drop network-powered broadband communication cable from a pole or other support including the point(s) of attachment to a building or structure shall <u>comply with 830.44 (I)</u> (1) ~~be kept away from electric light, power, Class I, or nonpower-limited fire alarm circuit conductors so as to avoid the possibility of accidental contact.~~ <u>except that lead-in and aerial drop network broadband communication cables shall have a separation of not less than 300 mm (12 in) from light, power, Class I, and nonpower-limited fire alarm open circuit conductors. The separation shall apply to all points along the conductors and shall be not less than 1.02m (40 in) at poles and other attachment points</u>.

Delete exception.

Substantiation: Section 830.44 provides specifics rather than kept away from. "Proximity" is not specific and the 12 in. clearance is the actual determining clearance which should apply to open light, power, Class 1 and nonpower-limited conductors whether or not they are "service" conductors.

Panel Meeting Action: Reject

Panel Statement: 830.44(C) addresses lead-in (drop) clearance and states in general terms that the drop should be kept away from specific other circuits. Specific separation for drops (12 in.) is given in the Exception; it is clear that, unless unattainable, separation should be greater than 12 in. Once the cable attaches to the building, specific clearances are provided in 830.44(I), (1) through (3). Additional clarification is unnecessary.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-308 Log #1999 NEC-P16 **Final Action: Reject**
(830.44(C) and (D)(3))

Submitter: Dan Leaf, Seneca, SC

Recommendation: In (C) change "avoid" to "minimize".

In (D)(3) insert "recreational vehicle parks, mobile home parks" after "traffic".

Substantiation: (C) is a generalized requirement which does not absolutely ensure the avoidance of accidental contact. In (D) These locations should be included; 551.79 appears to apply only to power and lighting conductors.

Panel Meeting Action: Reject

Panel Statement: The word "avoid" must be taken in the context of the sentence: network-powered broadband communications cables shall be kept far enough away so that accidental contact is not possible. 830.44(D)(3), in stating alleys, roads, and parking areas subject to truck traffic is sufficient to cover recreational vehicle and mobile home parks.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-309 Log #2000 NEC-P16 **Final Action: Reject**
(830.44(C) and (D)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (C) change "avoid" to "minimize".
In (D)(3) insert "recreational vehicle parks, mobile home parks" after "traffic".
Substantiation: These locations should be included; 551.79 appears to apply only to power and lighting conductors.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-308.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-309a Log #CP1601 NEC-P16 **Final Action: Accept**
(830.44(C) Exception)

Submitter: Code-Making Panel 16,
Recommendation: Revise existing 830.44(C) Exception text:
Exception: Where proximity to electric light, power, Class 1, or non–power-limited fire alarm circuit ~~service~~ conductors cannot be avoided, the installation shall ~~be such as to~~ provide clearances of not less than 300 mm (12 in.) from electric light, power, Class 1, or non–power-limited fire alarm circuit conductors ~~service drops~~.
The remainder of the text remains unchanged.
Substantiation: The panel identified the need for clarification in the exception. The panel recognizes that the term "fire alarm circuit service conductors" is not a defined term.
The panel notes that Proposal 16-126 relocated the existing 830.44(B) Exception to new 830.44(A)(4) Exception.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-310 Log #3425 NEC-P16 **Final Action: Reject**
(830.44(C) Exception)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
830.44(C)
Exception: Where proximity to electric light, power, Class 1, or non-power-limited fire alarm circuit service-entrance conductors cannot be avoided, the installation shall be such as to provide clearance not less than 300 mm (12 in.) from light, power, Class 1, or non-power-limited fire alarm circuit service-entrance conductors. (The remainder of the text to be unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-311 Log #1750 NEC-P16 **Final Action: Accept in Principle**
(830.44(H))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "acceptable" to "identified".
Substantiation: Edit. "Identified" is defined in Article 100, is specific, and used through the Code. "Acceptable" is not necessarily the same.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-312.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-312 Log #1202 NEC-P16 **Final Action: Accept in Principle**
(830.44(H) and Exception)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal relating to "identified for the purpose" in compliance with the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Aerial network broadband communications ~~extending~~ installed between structures or buildings and also their supports and attachments shall be identified ~~acceptable~~ for the purpose. ~~And have sufficient strength to withstand the loads to which they may be subjected.~~
Delete exception.
Substantiation: Spans between structures whether or not buildings should be included. "Identified" covers all aspects including cable strength, supports, attachments, messenger cable, etc. "acceptable" and "sufficient" are terms to be avoided per the Style Manual. The rule requires "sufficient" strength; the exception refers to insufficient strength but does not permit insufficient strength. Proposed text makes the exception unnecessary.
Panel Meeting Action: Accept in Principle
Revise existing 830.44(H) as follows:
(H) Between Buildings. Network-powered broadband communications cables extending between buildings or structures and also the supports or attachment fixtures shall be ~~acceptable~~ identified for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.
The remainder of the recommendation is rejected. The exception remains unchanged.
Panel Statement: The panel accepts the addition of the words "structure" and "identified".
Adding the word "aerial" is redundant as the entire Section 830.44 deals with aerial cables. Replacing "extending" with "installed" and "the" with "their" provides no improvement in clarity. The exception alerts the reader to an alternative to self-supporting cable and is therefore pertinent. With respect to adding "or structures', see panel action on proposal 16-313.
The NEC Style Manual, Section 3.2.1, identifies "acceptable" as a vague and unenforceable term.
While the use of the phrase "identified for the purpose" seems redundant based on the Art. 100 definition, use of "identified" alone fails to convey the full meaning.
The panel notes that Proposal 16-126 moved 830.44(H) to 830.44(F).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-313 Log #1246 NEC-P16 **Final Action: Accept**
(830.44(I)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "or structures" after "buildings".
Substantiation: Edit. Structures other than "buildings" should be included, such as poles. Through 830.44 D) covers clearance above grade for overhead spans to poles, the cables may be run down the poles.
Panel Meeting Action: Accept
Panel Statement: Proposal 16-126 moved 830.44(I) to 830.44(G).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-314 Log #2132 NEC-P16 **Final Action: Accept**
(830.47)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
830.47 Underground ~~Circuits~~ Network-Powered Broadband Communications Cables Entering Buildings.
Underground network-powered broadband communications cables entering buildings shall comply with 830.47(A) through (D).
Substantiation: This is an editorial proposal. It will improve clarity. The cables enter the buildings to feed the circuits. The circuits themselves are not entering the building.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

(830.47(B) Exception No. 1)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
830.47(B)
Exception No.1: Where electric service-entrance conductors or co-axial cables are installed in raceways or have metal cable armor.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
IVANS, R.: The proposed change does not add any clarity to the interpretation or readability of the NEC regarding the use of the term “Service.” The submitter has not substantiated what value has been added by inserting the word “entrance”.

16-316 Log #1245 NEC-P16 **Final Action: Reject**
(830.47(B) Exceptions No. 1s and No. 2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete Exception No. 1.
Revise Exception No. 2: Where electric light or ~~power branch circuit or feeder~~ conductors non-power-limited fire alarm circuit conductors ~~or~~ and Class 1 circuit conductors are installed in a separate raceway(s) or separate approved metal ~~sheathed metal clad~~ covered cables or Type UF or Type USE cables, or the network-powered broadband communication cables have metal cable armor or are installed in a separate raceway(s).
Substantiation: Exception No. 2 should apply to light and power circuits whether or not branch circuit or feeder conductors, such as service conductors. The raceway should be specified as separate for the system involved. Present wording does not specifically prohibit communication cables installed in the same raceway with other systems. Metal sheathed and metal clad implies Type MI and MC cables and Type MV cable permitted to be direct-buried (328.10(4)) which should not be exempted from the 12 in. separation requirement.
Panel Meeting Action: Reject
Panel Statement: The Panel understands that the submitter intended the proposal to apply to 830.47(B), Exceptions Nos. 1 and 2. The submitter provided no substantiation for deleting Exception No. 1. Exception No. 2 does apply to both electric light and power circuits as indicated by the punctuation of Exception No. 2. The submitter’s proposed revision provides no clarification.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-317 Log #401 NEC-P16 **Final Action: Accept**
(830.90(A), FPN 2(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change “per” to “each”.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-318 Log #2133 NEC-P16 **Final Action: Accept**
(830.90(C))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise the following:
(C) Hazardous (Classified) Locations. The primary protector shall not be located in any hazardous (classified) locations as defined in 500.5 and 505.5 or in the vicinity of easily ignitable material.
Exception: As permitted in 501.50, 502.150 and 503.150.
Substantiation: This is a clarification proposal. It is editorial and technical.
CMP 16 was instructed by the Technical Correlating Committee during the 2008 NEC ROP process to consider not only the different hazardous location division applications (500.5) but also the different hazardous location zone applications (505.5). This directive was issued for 2008 Proposal 16-121 which dealt with 800.3(A). This reference of 505.5 should be added here as well to correlate with all related sections that references these defined hazardous locations and hazardous location zones.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Ohde.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-319 Log #4563 NEC-P16 **Final Action: Reject**
(830.100 (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Add the following new text:
830.100 Grounding. Article 250 covers the general requirements for grounding and bonding of network-powered broadband communications systems and their associated electrical installations, and the specific requirements in (1) through (5), unless otherwise indicated in 830.101(A) through (D).
(1) Systems, circuits, and equipment required, permitted, or not permitted to be grounded
(2) Circuit conductor to be grounded on grounded systems
(3) Location of grounding connections
(4) Types and sizes of grounding and bonding conductors and electrodes
(5) Methods of grounding and bonding
~~830.100~~ 830.101 Cable, Network Interface Unit, and Primary Protector Grounding.
Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be grounded shall be grounded as specified in 830.101(A) through (D) ~~830.100(A) through (D)~~.
(A) Grounding Conductor. *(no change to text except for renumbering section 830.100 to section 830.101)*
(B) Electrode. *(no change to text except for renumbering section 830.100 to section 830.101)*
(C) Electrode Connection. *(no change to text)*
(D) Bonding of Electrodes. *(no change to text)*
Substantiation: This proposal recommends wording to ensure that network-powered broadband communications systems appropriately comply with the grounding and bonding requirements of article 250, while recommending that Article 83 include specific requirements associated with network-powered broadband communications systems. This change is needed because Chapter 8 is independent of Chapters 1 through 4 and thus Article 250 on grounding. Please note that “medium power wiring” is included in Article 83 and not just low power wiring and that brings some additional needs.
Panel Meeting Action: Reject
Panel Statement: The NEC Style Manual, Section 4.1.1, prohibits reference to complete articles. A blanket statement referencing Article 250 is redundant as communications grounding requirements are fully covered in Article 830, IV. Grounding Methods, with specific reference to the applicable sections of Article 250 contained throughout Sections 830.100(B) and (C).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-320 Log #3107 NEC-P16 **Final Action: Accept in Principle**
(830.100(A)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(1) Listing ~~Insulation~~. The grounding conductor ~~shall be insulated and~~ shall be listed.
Substantiation: There is no electrical reason that this conductor should be required to be insulated. This proposal provides consistency with nearly every other grounding/bonding related section of the code.
Panel Meeting Action: Accept in Principle
Revise 830.100(A)(1) to read as follows:
(1) Insulation. The grounding conductor shall be listed and shall be permitted to be insulated, covered, or bare.
Panel Statement: The grounding conductor does not need to be insulated but for esthetic reasons, such as exposed grounding conductors routed within a premises, insulation or covering may be appropriate. Adding “covered” accommodates Proposal 16-321. Permitting all three, “insulated, covered, or bare” will clarify that all three are now permitted since for many years only an insulated conductor was permitted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-321 Log #4396 NEC-P16 **Final Action: Accept in Principle in Part**
(830.100(A)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal.
This action will be considered by the panel as a public comment.
Submitter: Jake Killinger, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
830.100 Cable, Network Interface Unit, and Primary Protector Grounding.
Network interface units (NIUs) containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be grounded shall be grounded as specified in 830.100(A) through (D).
(A) Grounding Conductor.
(1) ~~Insulation~~Insulated or Covered Conductors. The grounding conductor shall be permitted to be insulated, or covered and shall be listed as Protector Grounding Conductors.
(remaining text remains unchanged)
Substantiation: This is a sister proposal to 800.100.
The existing text would require fully insulated and Listed conductors for cable and primary protector grounding whereas in most other cases, bare conductors are usually adequate for most grounding purposes. Prior to the 1990 NEC, protective grounding conductors were required to have 30 mil rubber insulation and be covered by a fibrous covering. It also permitted conductors Listed for this use having less than 30 mil rubber insulation or having other kinds of insulation. In 1990 the NEC removed the thickness statements so that it read the grounding conductor shall be insulated and shall be listed as suitable for the purpose. In 2008, the suitable for the purpose clause was removed.
Discussions with past members of this CMP revealed that the reason for specifying insulated conductors was only to combat theft of uncovered copper wire. That being the case, thinner insulated conductor was permitted so long as it gave the same illusion of a conductor carrying power.
Listed Protector Grounding Conductors having less than the full insulation of Listed and insulated conductors exist today. These are based on the past allowances for thinner insulations. The 2008NEC text would literally not permit the use of these thinner walled insulated conductors and would make their certification obsolete.
If the reason for using the term ‘insulated’ was merely to provide a theft deterrent, then fully insulated wire is unnecessary. By definition in Article 100, only a “covered” conductor would be more than adequate. Therefore propose changing the text to permit both “insulated as well as “covered” conductors.
Also propose adding “Protector Grounding Conductor” to help identify the type of Listed products suitable in this application. These “Protector Grounding Conductors” are surface marked with this terminology to make it clear that they are listed only for this purpose and are not intended for general use with other Articles in the Code. They are presently certified under UL’s KDER category, but may be relocated to the KDSH (Grounding and Bonding Equipment – Communication) category to make their restricted use more obvious.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel accepts in principle the part to add “covered”. See panel action and statement on Proposal 16-320, which now permits the use of listed insulated, covered, or bare conductors. The title is left as “insulation” since the paragraph now deals with levels of insulation.
The panel rejects the parts adding the phrases “permitted to be” and “as a protector grounding conductor”. The panel does not want to restrict the listed wire to only listed “protector grounding conductors”.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-322 Log #2002 NEC-P16 **Final Action: Accept in Part**
(830.100(A)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: The grounding conductor shall not be smaller than 14 AWG and shall have ~~a current carrying capacity approximately equal to that of~~ an ampacity not less than the grounded metallic members (remainder unchanged).
Substantiation: Edit. “Approximately equal” is vague and subjective; see table 3.2.1 of the Style Manual.
Panel Meeting Action: Accept in Part
Revise existing 830.100(A)(3) text as follows:
The grounding conductor shall not be smaller than 14 AWG and shall have a current-carrying capacity ~~approximately equal to~~ not less than that of the grounded metallic member(s) and protected conductor(s) of the network-powered broadband communications cable. The grounding conductor shall not be required to exceed 6 AWG.
Panel Statement: Communications grounding conductors are subject to transient conditions resulting from power fault and lightning events. “Ampacity” applies to a continuous (i.e., steady-state) condition and is inappropriate for communications grounding conductors (see Article 100).
The panel accepts the part to revise “approximately equal to” to “not less than”. The panel rejects the part to revise “a current-carrying capacity” to “an ampacity”.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-323 Log #3731 NEC-P16 **Final Action: Accept in Principle in Part**
(830.100(A)(4) Exception)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 830.100(A)(4), Exception as follows:
Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector grounding conductor length of 6.0 m (20 ft), one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and used as a separate communications electrode. ~~a separate communications ground rod meeting the minimum dimensional criteria of 830.100(B)(2)(2) shall be driven, and t~~ The primary protector shall be connected to the communications ~~ground rod~~ electrode(s) in accordance with 830.100(C), and the communications ~~ground rod~~ electrode(s) shall be connected to the power grounding electrode system in accordance with 830.100(D).
Substantiation: The current reference in this exception to 830.100(B)(2)(2) addressing a ground rod is incorrect as 830.100(B)(2)(2) addresses the attachment location of a grounding electrode conductor to an interior metal water pipe. In addition, it must be assumed that in the case of this exception a grounding electrode is not available within 20 feet of the communications system installation and that an electrode(s) is required to be installed and utilized. A ground rod is only one such electrode that can be installed therefore this exception should reference all electrodes that are practicable in such necessary installations.
In addition, the requirements of this section should state that where a grounding electrode is required to be installed, the electrode installed should be a ground ring, rod, pipe, plate, or other underground metal structure that is recognized by Article 250 and more specifically 250.52(A)(4), (A)(5), (A)(6), (A)(7), and (A)(8). This revision would bring the electrode requirements included in this exception into line with the requirements of Article 250 for both consistency and for technical application.
Panel Meeting Action: Accept in Principle in Part
Revise existing exception as follows:
Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum grounding conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 830.100(B)~~(2)~~(3)(2) shall be driven, and the grounding conductor shall be connected to the communications ground rod in accordance with 830.100(C). The communications ground rod shall be bonded to the power grounding electrode system in accordance with 830.100(D).
Reject the remainder of the proposal.
Panel Statement: The panel accepts in principle the part that states the reference to 830.100(B)(2)(2) is incorrect; the correct reference is 830.100 (B)(3)(2).
The panel rejects the remainder of the proposal. Referencing the grounding electrodes in 250.52(A)(4) through (A)(8) is unnecessary as:
1. 830.100(B)(1) through (3) presents a logical sequence for selecting the appropriate telecom grounding electrode, in order of preference. The first choice is the Intersystem Bonding Termination (introduced in the 2008 NEC), where available. The second choice is one of the electrodes of 830.100(B)(2). If none of the above are available, then an electrode as specified in 830.100(B)(3) is selected, some of which are contained in 250.52(A).
2. The electrodes identified in 250.52(A)(4) through (A)(8) are intended for power system applications. Network-powered broadband communications system currents are small, typically less than 100 mA. Where Network-powered broadband communications system circuits are subjected to power contact, currents are limited by the equivalent small gauge of the communications conductors, precluding the need for expansive and expensive grounding electrodes.
3. The submitter has provided no technical substantiation for revising the telecom grounding criteria and eliminating the 5-ft telecom ground rod that has been used successfully and safely by the telecom industry for decades.
4. Increasing the diameter and length of the telecom ground rod has minimal impact on grounding resistance (see Panel substantiation for Proposal 16-151).
5. The most important safety aspect is the bonding together of the power and telecom systems. When bonded together as specified in 830.100(D), intersystem voltages are equalized and the telecom grounding electrode, if separate, becomes part of the grounding electrode system at the premises.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-324 Log #197 NEC-P16 **Final Action: Accept**
(830.100(B))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal as the existing numbering complies with the NEC Style Manual and is consistent with other lists in the code.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Renumber 830.100(B) as shown.
(B) Electrode. The grounding conductor shall be connected in accordance with 830.100(B)(1), (B)(2), or (B)(3).
(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination, the grounding conductor shall be connected to the intersystem bonding termination.
(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:
(~~1~~a) The building or structure grounding electrode system as covered in 250.50
(~~2~~b) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52
(~~3~~c) The power service accessible means external to enclosures as covered in 250.94
(~~4~~d) The metallic power service raceway
(~~5~~e) The service equipment enclosure
(~~6~~f) The grounding electrode conductor or the grounding electrode metal enclosure, or
(~~7~~g) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32
A bonding device intended to provide a termination point for the grounding conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.
For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 830.93, shall be considered accessible.
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 830.100(B)(2), the grounding conductor shall be connected to either of the following:
(~~1~~a) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4).
(~~2~~b) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 830.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(7) and (A)(8), or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.
Substantiation: The current numbering is not in compliance with the style manual. See section 2.1.5.3 of the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-325 Log #3312 NEC-P16 **Final Action: Reject**
(830.100(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (B)(2)(3): The electric power service accessible means external to enclosures as covered in 250.84(B)(2)(4): The metallic nonflexible power service raceway.
Substantiation: Edit. "Power" may infer that a service only for lighting is not acceptable. Flexible service raceways do not seem suitable for connection of ground clamps.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-257.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
BRUNSSEN, J.: The Panel Meeting Action should be 'Accept in Principle in Part', based upon the Panel Meeting Action on similar proposals to other articles by this submitter (see the Panel Meeting Action on Proposals 16-35, -149, -216a and -258). Add "nonflexible" to 830.100(B)(2)(4) as follows: "(4) The nonflexible metallic power service raceway." The remainder of the proposal should continue to be rejected.

16-325a Log #CP1609 NEC-P16 **Final Action: Accept**
(830.100(B)(1))

Ballot Results: Affirmative: 16

16-326 Log #1139 NEC-P16 **Final Action: Accept**
(830.100(B)(1), FPN (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Add the FPN following 830.100(B) (1):
FPN: See Article 100 for the definition of *Intersystem Bonding Termination.*
Substantiation: *Intersystem Bonding Termination* is a new and unfamiliar term introduced in the 2008 NEC. The FPN reference to Article 100 will help ensure that NEC users not only become familiar with the new terminology, but encourage application of this preferred intersystem bonding arrangement as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-327 Log #3730 NEC-P16 **Final Action: Reject**
(830.100(B)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 830.100(B)(3) as follows:
(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 830.100(B)(2), one or more of the grounding electrodes specified in 250.52(A)(4) through (A)(8) shall be installed and used with the requirements of 250.56 being applicable to rod, pipe, and plate electrode installations. ~~the grounding conductor shall be connected to either of the following:~~
~~(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4).~~
~~(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 830.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(7) and (A)(8), or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.~~
Substantiation: The requirement in existing 830.100(B)(3)(1) to connect the grounding electrode conductor to either a metal underground water pipe, the metal frame of a building or structure, a concrete-encased electrode, or a ground ring seems to require these electrodes to be installed as the subject of this section is **"Buildings or Structures Without …. Grounding Means."** This is not consistent with 250.50 that only requires the use of such electrodes where they are "present at each building or structure served." In addition, the first sentence of 830.100(B)(3)(2) is not a complete sentence, is simply a list of references, and thus has no meaning. In addition, it allows either a rod or pipe electrode to be used that is only 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter and driven where practicable into permanently damp earth. Into permanent damp earth is a good requirement but is doubtfully attained with a ½ in. rod or ½ in. pipe 5 ft in length.
The requirements of this section should state that where a building or structure is without grounding means, it is to have such reasonable grounding means installed such as a ground ring, rod, pipe, plate, or other underground metal structure that is recognized by Article 250 and more specifically 250.52(A)(4), (A)(5), (A)(6), (A)(7), and (A)(8). Also, 250.56 already requires that rod, pipe, and plate electrodes that do not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 250.52(A)(4) through (A)(8), and that where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1.8 m (6 ft) apart. This revision would bring the grounding of network-powered broadband communications systems circuits into line with the requirements of Article 250 for both consistency and for technical application.
In addition 250.60 already states, "Air terminal conductors and driven pipes, rods, or plate electrodes used for grounding air terminals shall not be used in lieu of the grounding electrodes required by 250.50 for grounding wiring systems and equipment." With the revisions being sought, these revisions would also prohibit other possible electrodes not recognized by 250.52.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation for eliminating the 5-ft telecom ground rod, currently permitted by 830.100(B)(3)(2), that has been used successfully and safely by the telecom industry for decades. The tutorial, The ABCs of Grounding and Bonding, states: "Very little resistance change will result from using larger sizes of electrodes." The most important safety aspect is the bonding together of the power and telecom systems. When bonded together as specified in 830.100(D), intersystem voltages are equalized and the network-powered broadband communications system grounding electrode, if separate, becomes part of the grounding electrode system at the premises.
The electrodes identified in 250.52(A)(4) through (A)(8), as proposed by the submitter, are intended for power system applications. Network-powered broadband communications system currents are small, typically less than 100 mA. Where power contact to network-powered broadband communications systems is of concern (i.e., power fault) currents are limited by the equivalent small gauge of the Network-Powered Broadband Communications System conductors, precluding the need for expansive and expensive grounding electrodes.
Finally, the title of 830.100(B)(3), "In Buildings or Structures Without …… Grounding Means" must be considered in context with the preceding Section 830.100(B)(2) where specific grounding means at the building or structure are identified.

16-330 Log #2121 NEC-P16 **Final Action: Accept**
(830.110)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal related to "Chapter 3 Raceways".
This action will be considered by the panel as a public comment.
Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise 830.110 as follows:
830.110 Raceways for Low- and Medium- Power Network- Powered Broadband Communications Cables.
(A) Chapter 3 Raceways. ~~Where~~ Low-and medium- power network-powered broadband communications cables shall be permitted to be ~~are~~ installed ~~in a~~ any raceway~~, the raceway shall be either of a type~~ included ~~permitted~~ in Chapter 3. The raceways shall be ~~and~~ installed in accordance with the requirements of Chapter 3.
(B) Raceway Fill for Network- Powered Broadband Communications Cables. Raceway fill for network-powered broadband communications cables shall comply with either (B)(1) or (B)(2)
(1) Low-Power Network-Powered Broadband Communications Cables. Raceway ~~Conduit~~ fill ~~restrictions~~ requirements of Chapter 3 and Chapter 9 shall not apply to low-power network-powered broadband communications cables.

(2) Medium-Power Network-Powered Broadband Communications Cables. Where medium-power network- powered broadband communications cables are installed in a raceway, the raceway fill requirements of Chapter 3 and Chapter 9 shall apply.

~~*Exception: Conduit fill restrictions shall not apply* low-power network-powered broadband communications cables.~~

Substantiation: This proposal is editorial and technical.

The cable and raceway applications sections of articles 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal moves those installation rules to section 830.113.

Besides moving the requirements a correction was made to 830.154(C)(5), which is 830.113(F)(4). Grounding block was changed to NIU because Article 830 installations terminate at an NIU (Network Interface Unit) rather than a grounding block.

A companion proposal for section 830.154 greatly simplifies the statement of the applications of communications cables and raceways by using a table.

This proposal and its companion proposal for section 830.154 need to be considered together as a package.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-331 Log #2122 NEC-P16 **Final Action: Accept in Principle**
(830.113 (New) and 830.151)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group

Recommendation: Delete section 830.151.

830.113 Installation of Network-Powered Broadband Communications Cables.. Installation of network-powered broadband communications cables shall comply with 830.113 (A) through (F).

(A) Listing. Network-powered broadband communications cables installed in buildings shall be listed.

(B) Air Ducts and Plenums. The following cables shall be permitted to be installed in air ducts and plenums as described in 300.22(B).

(1) Type BLP

(2) Types BLP, BMR, BLR, BM, BL and BLX installed in raceways that are installed in compliance with 300.22(B)

(C) Other Spaces Used For Environmental Air. The following cables shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C).

(1) Type BLP

(3) Types BLP, BMR, BLR, BM, BL and BLX installed in raceways that are installed in compliance with 300.22(C)

(D) Risers- Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating more than one floor and in vertical runs in a shaft:

(1) Types BLP, BMR and BLR

(2) Types BMR and BM encased in a metal raceway or in a fireproof shaft having firestops at each floor

FPN: See 830.26 for firestop requirements for floor penetrations.

(E) Risers-Cables in Metal Raceways, Fireproof Shafts and One- and Two-Family Dwellings. The following cables shall be permitted in metal raceway, in a fireproof shaft with firestops at each floor and in one- and two-family dwellings:

(1) Types BLP, BMR, BLR, BM, BL and BLX

FPN: See 830.26 for firestop requirements for floor penetrations.

(F) Other Building Locations. The following cables and raceways shall be permitted to be installed in building locations other than the locations covered in 830.113(B) through (E).

(1) Types BLP, BMR, BLR, BM and BL

(2) Types BLP, BMR, BLR, BM, BL and BLX installed in raceway

(3) Types BLX and BL less than 10 mm (0.375 in.) in diameter in one- and two-family dwellings

(4) Types BMU and BLU cables entering the building from outside and run in rigid metal conduit or intermediate metal conduit where the conduits is connected by a grounding conductor to an electrode in accordance with 830.100(B).

(3) Types BLX and BL cables less than 10 mm (0,375 in.) in diameter in one- and two-family dwellings

(4) A maximum length of 15 m (50 ft) within the building of Type BLX cable entering the building from outside and terminated at a NIU or a primary protection location

FPN to (4): This provision limits the length of Type BLX cable to 15 m (50 ft), while 830.90(B) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.

Substantiation:

This proposal is editorial and technical.

The cable and raceway applications sections of articles 770, 800, 820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal moves those installation rules to section 830.113.

Besides moving the requirements a correction was made to 830.154(C)(5), which is 830.113(F)(4). Grounding block was changed to NIU because Article 830 installations terminate at an NIU (Network Interface Unit) rather than a grounding block.

A companion proposal for section 830.154 greatly simplifies the statement of the applications of communications cables and raceways by using a table. This proposal and its companion proposal for section 830.154 need to be considered together as a package.

Panel Meeting Action: Accept in Principle

Revise 830.113 text and replace in entirety as follows:

830.113 Installation of Network-Powered Broadband Communications Cables. Installation of network-powered broadband communications cables shall comply with 830.113 (A) through (F).

(A) Listing. Network-powered broadband communications cables installed in buildings shall be listed.

(B) Fabricated Ducts and Plenums. The following cables shall be permitted to be installed in air ducts and plenums as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Type BLP

(2) Types BLP, BMR, BLR, BM, BL, and BLX installed in raceways that are installed in compliance with 300.22(B)

FPN: See 4.3.4 and 4.3.11.3.3 of NFPA 90A-2009, Standard for the Installation of Air-Conditioning and Ventilation Systems, for information on wire and cables in air ducts and apparatus casings plenums. See 3.3.22 for the definition of an apparatus casing plenum.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C):

(1) Type BLP

(2) Type BLP supported by metallic cable trays or cable tray systems

(3) Types BLP, BMR, BLR, BM, BL, and BLX installed in raceways that are installed in compliance with 300.22(C)

FPN: See 4.3.11.2, 4.3.11.4, and 4.3.11.5 of NFPA 90A-2009, Standard for the Installation of Air-Conditioning and Ventilation Systems, for information on wire, cables, and raceways in ceiling cavity, raised floor, and air-handling unit room plenums. See 3.3.22 for plenum definitions.

(D) Risers-Cables in Vertical Runs. Types BLP, BMR, and BLR cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft.

FPN: See 830.26 for firestop requirements for floor penetrations.

(E) Risers-Cables in Metal Raceways or Fireproof Shafts. Types BLP, BMR, BLR, BM, BL, and BLX cables shall be permitted in metal raceway or in a fireproof shaft with firestops at each floor.

FPN: See 830.26 for firestop requirements for floor penetrations.

(F) Risers-Cables in One- and Two-Family Dwellings. Types BLP, BMR, BLR, BM, BL, and BLX cables shall be permitted in one- and two-family dwellings.

FPN: See 830.26 for firestop requirements for floor penetrations.

(G) Other Building Locations. The following cables and raceways shall be permitted to be installed in building locations other than the locations covered in 830.113(B) through (F):

(1) Types BLP, BMR, BLR, BM, and BL

(2) Type BLX installed in a raceway

(3) Types BLP, BMR, BLR, BM, and BL

(4) Types BLX and BL less than 10 mm (0.375 in.) in diameter in one- and two-family dwellings

(5) Types BMU and BLU cables entering the building from outside and run in rigid metal conduit or intermediate metal conduit where the conduits is connected by a grounding conductor to an electrode in accordance with 830.100(B).

FPN: This provision limits the length of Type BLX cable to 15 m (50 ft), while 830.90(B) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.

(6) A maximum length of 15 m (50 ft) within the building of Type BLX cable entering the building from outside and terminated at a NIU or a primary protection location.

Panel Statement: See panel statement on Proposals 16-160 and 16-172. The text is a combination of the text from Proposal 16-331, which has been modified to improve clarity, with text to incorporate panel actions to accept in principle Proposals 16-340 (metallic cable tray) and 16-338 and 16-341 (requiring riser cable for penetration of one floor) and by modifications to correlate with NFPA 90A-2009.

The revised text relocates the wire, cable, and raceway installation rules from 830.154 and also includes installation rules from 830.110.

The panel recognizes that this proposal is a companion proposal to Proposal 16-339 and has considered them together.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

DORNA, G.: The proposal recommended for the deletion of section 830.151. The panel action needs to be clarified to show that the recommendation to delete section 830.151 was accepted.

Also, see my comment on proposal 16-48.

IVANS, R.: We agree with the revision proposal prepared by the CMP 16 Special Editorial Task Group. The proposal recommended for the deletion of section 830.151. The panel action needs to be clarified to show that the recommendation to delete section 830.151 was accepted.

Also, see my comment on proposal 16-48.

16-332 Log #2461 NEC-P16 **Final Action: Reject**
(830.133)

Submitter: Joseph P. Savage, FIFTH Council North America
Recommendation: Add the following line to 830.133

(6) Premises-powered broadband communications circuits, in compliance with Article 8XX.

Substantiation: A submission has been made for a new Article to Chapter 8. If this Article is accepted, then Article 830.133 should include the above added reference.
Panel Meeting Action: Reject
Panel Statement: The recommendation is not needed since it is already covered in Article 830.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-332a Log #CP1611 NEC-P16 **Final Action: Accept**
(830.133(A)(1))

Submitter: Code-Making Panel 16,
Recommendation: Revise 830.133(A)(1) Title to read as follows:

(1) In Raceways, Cable Trays, Boxes, and Enclosures.

Substantiation: The panel revised the title to include "Boxes" in order to provide consistency.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-333 Log #2123 NEC-P16 **Final Action: Accept**
(830.133(A)(1)(b) and (c))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:

(b) *Low-Power Network-Powered Broadband Communications Circuit Cables.* Low-power network-powered broadband communications cables shall be permitted in the same raceway, cable tray, or enclosure with jacketed cables of any of the following circuits:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760

(3) Communications circuits in compliance with Parts I and IV of Article 800

(4) Nonconductive and conductive optical fiber cables in compliance with Parts I and IV of Article 770

(5) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820

(c) *Medium-Power Network-Powered Broadband Communications Circuit Cables.* Medium-power network-powered broadband communications cables shall not be permitted in the same raceway, cable tray, or enclosure with conductors of any of the following circuits:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760

(3) Communications circuits in compliance with Parts I and IV of Article 800

(4) Conductive optical fiber cables in compliance with Parts I and IV of Article 770

(5) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820.

Substantiation: This proposal is editorial and technical. It refines the references to the articles in order to comply with the style manual.

The NEC Style Manual states:

4.1.1 References to a Part Within an Article. References shall not be made to an entire article, such as "grounded in accordance with Article 250" unless additional conditions are specified. References to parts within articles shall be permitted.

This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-334 Log #4694 NEC-P16 **Final Action: Reject**
(830.133(A)(2) Exception No. 3 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add a third exception as follows:

Exception No. 3: Where all of the electric light, power, Class 1, and non-power limited fire alarm circuit conductors are permanently separated from all of the network-powered broadband communications cables through the use of sheathing that provides for system separation that does not rely on conductor or cable insulation alone, the combination of conductors comprising different systems shall be permitted to be combined into a listed hybrid cable assembly.

Substantiation: There is not and has never been any express permission to include network-powered conductors within a common cable assembly with power conductors. Para (2) here comes the closest, because it recognizes a "continuous and firmly fixed nonconductor." This is crucial to the production of hybrid cables, where additional separation beyond the conductor insulation is applied to the power-limited conductors in accordance with the spirit of these principles. For example, 334.116(C) expressly recognizes this type of construction for Type NMS cable, and UL has been listing such constructions for many years. This topic must be addressed in the limited-power wiring articles, and this proposal is designed to raise the issue.
Panel Meeting Action: Reject
Panel Statement: The submitter has not cited an application for hybrid network-powered broadband/electric power cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-335 Log #2124 NEC-P16 **Final Action: Accept**
(830.133(B))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise the title of 830.133(B) as follows:
(B) Support of ~~Conductors~~ Network-Powered Broadband Communications Cables. Raceways shall be used for their intended purpose. Network-powered broadband communications cables shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.
Substantiation: This proposal is editorial. The addition of the wording "Network-Powered Broadband Communications Cables" is more appropriate than conductors as this section deals with network-powered broadband communications cables and not conductors.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-336 Log #2125 NEC-P16 **Final Action: Accept**
(830.133(C))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Delete 830.133(C)
~~**Installation and Use.** Section 110.3(b) shall apply~~

Relocate the same to 830.3(F).

830.3 (F) Installation and Use. 110.3 (B) shall apply.
Substantiation: This change is both editorial and technical. This proposal relocates the requirements in 830.133(C) to a more appropriate section 830.3 (F) – Other Articles. The requirements of 110.3 (B) really apply to the entire Article 830 therefore the requirements of 110.3(B) should be inserted in 830.3.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-337 Log #2288 NEC-P16 **Final Action: Reject**
(830.135)

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Add a new Section to read as follows:
830.135 Network-Powered Broadband Communication Device and Equipment Mounting. Network-Powered Broadband Communication devices or equipment shall be mounted in listed boxes, brackets or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place. Boxes or brackets can be completly enclosed or backless.
(A) Network-Powered Broadband Communication Devices and Equipment Mounted to Boxes or Brackets. Communication devices or equipment shall be mounted to a listed boxes or bracket and installed per 314.20.
(B) Network-Powered Broadband Communication Devices and Equipment Mounted on Covers. Communication device and equipment mounted to and supported by a cover shall be held rigidly against the cover which is mounted to the box or bracket.
Substantiation: This proposal adds a new section to Article 830 addressing the mounting of devices or equipment to listed boxes and brackets. Currently, depending on the quality of workmanship, Network-Powered Broadband Communication devices or equipment have not been mounted to boxes or brackets that can support them. After several years device and/or covers that are mounted directly to the dry wall will become hazard because they have become loose and exposed. Network-Powered Broadband Communication cable can become energized by coming in incidental contact with electrical conductors.
830.135 was only a suggestion for the location of this new section. (A) addresses devices mounted directly to boxes or devices where as (B) address devices mounted to covers.
Panel Meeting Action: Reject
Panel Statement: Not all network-powered broadband communications equipment and devices need to be mounted in boxes, brackets or assemblies.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
IVANS, R.: Loose and exposed cable or connectors can pose a risk of electric shock. Network Powered Broadband Circuits can pose a risk of electric shock and should not become accessible. Ringing voltages can exceed 100V and should not become easily accessible. Loose cabling and connectors can come into contact with electric light and power conductors. There are boxes and brackets listed for this purpose using UL Subject 2269, “Outline of Investigation for Optical Fiber/Communications/Signaling/Coaxial Cable Outlet Boxes.”
OHDE, H.: See our Negative Comment on Proposal 16-171.

16-338 Log #2213 NEC-P16 **Final Action: Accept in Principle**
(830.151(B))

Submitter: Robert W. Jensen, dbi / Rep. BICSI
Recommendation: Revise text as follows:
Cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type BMR. Floor penetrations requiring Type BMR shall contain only cables suitable for riser or plenum use.
Exception No. 1: Type BM cables encased in metal raceway or located in a fireproof shaft that has firestops at each floor.
Exception No. 2: Type BM cables in one- and two-family dwellings.
Substantiation: Is it really our intention that cables passing between floors through a floor penetration be less than riser rated?
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-331.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DORNA, G.: The current riser requirements are so complicated that they could be considered to be a “vague and unenforceable”.
Section 830.151(B) requires that “Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type BMR. Floor penetrations requiring Type BMR shall contain only cables suitable for riser or plenum use”. Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.
The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.

16-339 Log #2126 NEC-P16 **Final Action: Accept in Principle**
(830.154)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Revise text to read as follows:
~~**830.154 Applications of Low-Power Network-Powered Broadband Communications System Cables.**~~
~~Low-power network-powered broadband communications systems shall comply with any of the requirements of 830.154(A) through (C).~~
~~**(A) Plenums.** Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type BLP. Type BLX cable installed in compliance with 300.22 shall be permitted.~~
~~**(B) Riser.** Cables installed in risers shall comply with any of the requirements in 830.154(B)(1), (B)(2), or (B)(3).~~
~~**(1) Cables in Vertical Runs.** Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type BLP, BLR, or BMR. Floor penetrations requiring Type BMR or BLR shall contain only cables suitable for riser or plenum use.~~
~~**(2) Metal Raceways or Fireproof Shafts.** Type BLX cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.~~
~~**(3) One- and Two-Family Dwellings.** Type BLX or BL cables less than 10 mm (0.375 in.) in diameter shall be permitted in one- and two-family dwellings.~~
~~(C**) Other Wiring** Within Buildings. Cables installed in locations other than those covered in 830.154(A) and (B) shall comply with the requirements of 830.154(C)(1) through (C)(5).~~
~~**(1) General.** Type BLP, BL, or BM shall be permitted.~~
~~**(2) In Raceways.** Type BLX shall be permitted to be installed in a raceway.~~
~~**(3) Type BLU Cable.** Type BLU cable entering the building from outside shall be permitted to be run in rigid metal conduit or intermediate metal conduit. Such conduits shall be connected by a grounding conductor to an electrode in accordance with 830.100(B).~~
~~**(4) One- and Two-Family Dwellings.** Type BLX or BL cables less than 10 mm (0.375 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.~~
~~**(5) Type BLX Cable.** Type BLX cable entering the building from outside and terminated at a grounding block or a primary protection location shall be permitted to be installed, provided that the length of cable within the building does not exceed 15 m (50 ft).~~
~~FPN: This provision limits the length of Type BLX cable to 15 m (50 ft), while 830.90(B) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.~~
~~(D) Cable Substitutions. The substitutions for network-powered broadband cables listed in Table 830.154 shall be permitted. All cables in Table 830.154, other than network-powered broadband cables, shall be coaxial cables.~~
830.154 Applications of Network-Powered Broadband Communications System Cables. Permitted and non-permitted applications of listed network-powered broadband communications system cables shall be as indicated in Table 830.154(A). The substitutions for network-powered broadband system cables listed in Table 830.154(B) shall be permitted.

See Table 830.154(A) on page 1151

(Renumber Table 830.154 to Table 820.154(B) and insert it here.) (Not submitted).

Substantiation: This proposal is editorial and technical.
The cable and raceway applications sections of articles 770, 800,820 and 830 (xxx.154) contain more than applications; they also contain installation rules. These installation rules are in the wrong place; the right place is the installation sections. This proposal for section 820.154 greatly simplifies the statement of the applications of optical fiber cables and raceways by using a table where the permitted applications are indicated by a “Y” and the applications that are not permitted are indicted by an “N”. A companion proposal moves the installation rules to section 830.113 Installation of Network-Powered Broadband Cables.
This proposal makes no changes to the existing permitted and not permitted applications of network-powered broadband cables.
This proposal and its companion proposal for section 830.113 need to be considered together as a package.
This proposal is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group for the 2011 NEC. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

Table 830.154(A), Applications of Network Powered Broadband Cables

Cable Type	Applications								
	In air ducts and plenums as described in 300.22(B)	In other spaces used for environmental air as described in 300.22(C)	In risers	In building locations other than air ducts, plenums, other spaces used for environmental air and, risers	In one- and two-family dwellings	In nonconcealed spaces	In cable trays	In rigid metal conduit and intermediate metal conduit	In any raceway in Chapter 3
BLP	Y	Y	Y	Y	Y	Y	Y	Y	Y
BMR, BLR	N	N	Y	Y	Y	Y	Y	Y	Y
BM, BL	N	N	Y	Y	Y	Y	Y	Y	Y
BLX	N	N	Y	Y	Y	Y	N	Y	Y
BLU	N	N	N	N	N	N	N	Y	N

Note. Applications indicated by "Y" shall be permitted. Applications indicated by an "N" shall not be permitted.

(Renumber Table 830.154 to Table 820.154(B) and insert it here.)

16-339 Rec

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept in Principle

See Table 730.154(A) on page 1153

Panel Statement: See panel statement on Proposals 16-160, 16-172, and 16-331.
The non-permitted applications were determined by considering the listing requirements for the cable. Other non-permitted applications were determined from existing code requirements as determined by the panel.
The panel recognizes that this proposal is a companion proposal to Proposal 16-331 and has considered them together.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DORNA, G.: See my comments on proposals 16-48 and 16-56.
Since the new 830.154 includes medium-power and low-power applications, emphasizing compliance with 830.40 should be helpful.
In addition the panel action needs to be expanded to delete the current 830.151 because its contents have been incorporated into the panel actions on proposals 16-331 and 16-339.
The revised 830.154 should appear as shown below:
830.154 Applications of Network-Powered Broadband Communications System Cables. Permitted and non-permitted applications of listed network-powered broadband communications system cables shall be as indicated in Table 830.154(A). The permitted applications are subject to the installation rules of 830.40, 830.110 and 830.113. The substitutions for network-powered broadband system cables listed in Table 830.154(B) shall be permitted.

See Table 830.154(A) on page 1154

(Renumber Table 830.154 to Table 830.154(B) and insert it here.)
IVANS, R.: See my comments on proposals 16-48 and 16-56.
Since the new 830.154 includes medium-power and low-power applications, emphasizing compliance with 830.40 should be helpful.
In addition the panel action needs to be expanded to delete the current 830.151 because its contents have been incorporated into the panel actions on proposals 16-331 and 16-339.
The revised 830.154 should appear as shown below:
830.154 Applications of Network-Powered Broadband Communications System Cables. Permitted and non-permitted applications of listed network-powered broadband communications system cables shall be as indicated in Table 830.154(A). The permitted applications are subject to the installation rules of 830.40, 830.110 and 830.113. The substitutions for network-powered broadband system cables listed in <u>Table 830.154(B)</u> shall be permitted.

We have an additional recommendation for a reformatted table structure for Table 830.154(A) (technical content unchanged).

See Table 830.154(A) on page 1155

(Renumber Table 830.154 to Table 830.154(B) and insert it here.)

16-340 Log #131 NEC-P16 **Final Action: Accept in Principle**
(830.154(B))

Submitter: Gerald Lee Dorna, Belden
Recommendation: Add the following text at the end of 830.154(B):
<u>Metallic cable trays and metallic cable tray systems shall be permitted to be installed in other spaces used for environmental air. Type BLP cables shall be permitted to be installed in these cable trays and cable tray systems. Types BMR, BLR, BM, BL and BLX, cables shall not be permitted to be installed in these cable trays and cable tray systems.</u>
Substantiation: Article 392, Cable Trays, has requirements for cable trays in air handling spaces in section 392.4.
392.4 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.
Section 300.22 has provisions for cable trays in 300.22(C), Other Space Used For Environmental Air.
(C) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 300.22(A) and (B). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.
FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.
Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.
(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.
Section 300.22(C)(1) permits only solid bottom metal cable tray with solid metal covers. Optical fiber, communications, CATV, signaling and fire-alarm plenum cables, and plenum raceways are often installed in metal cable trays and metal cable tray systems in plenums (other spaces used for environmental air). These installations are "neat and workmanlike" and safe. They should be permitted.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-331.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

16-341 Log #2214 NEC-P16 **Final Action: Accept in Principle**
(830.154(B)(1))

Submitter: Robert W. Jensen, dbi / Rep. BICSI
Recommendation: Revise text as follows:
Cables installed in vertical runs and penetrating <u>one or more floors</u> ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type BLP, BLR, or BMR. Floor penetrations requiring Type BMR or BLR shall contain only cables suitable for riser or plenum use.
Substantiation: Is it really our intention that cables passing between floors through a floor penetration be less than riser rated?
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 16-331.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
DORNA, G.: The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".
Section 830.151(B) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type BLP, BLR or BMR. Floor penetrations requiring Type BMR or BMR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.
The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.

16-342 Log #2127 NEC-P16 **Final Action: Accept**
(830.157)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Delete 830.157
~~830.157 Protection Against Physical Damage.~~
~~Section 300.4 shall apply~~
Relocate the same to 830.3(E).
<u>**830.3 (E) Protection Against Physical Damage.** 300.4 shall apply.</u>
Substantiation: This change is both editorial and technical. This proposal relocates the requirements in 830.157 to a more appropriate section 830.3 (E) – Other Articles. The requirements of 300.4 really apply to the entire Article 830 therefore the requirements of 300.4 should be inserted in 830.3.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

Revise 830.154 text and replace in entirety as follows:

830.154 Applications of Network-Powered Broadband Communications System Cables. Permitted and non-permitted applications of listed network-powered broadband communications system cables shall be as indicated in Table 830.154(A). The permitted applications are subject to the installation rules of 830.113. The substitutions for network-powered broadband system cables listed in Table 830.154(B) shall be permitted.

Table 830.154(A), Applications of Network Powered Broadband Cables

Cable Types	Applications									
	In fabricated ducts and plenums as described in 300.22(B)	In other spaces used for environmental air (plenums) as described in 300.22(C)	In risers in vertical runs	In risers in metal raceways or fire-proof shafts	In risers in one- and two-family dwellings	In building locations other than fabricated ducts and plenums, other spaces used for environmental air (plenums) and risers	In one- and two-family dwellings	In cable trays	In rigid metal conduit and intermediate metal conduit	In any raceway in Chapter 3
BLP	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
BMR, BLR	N	N	Y	Y	Y	Y	Y	Y	Y	Y
BM, BL	N	N	N	Y	Y	Y	Y	Y	Y	Y
BLX	N	N	N	Y	Y	Y	Y	N	Y	Y
BLU	N	N	N	N	N	N	N	N	Y	N

Note: An 'N' in the table indicates that the cable type shall not be permitted to be installed in the application. A 'Y' indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 830.113.

(Renumber Table 830.154 to Table 830.154(B) and insert it here.)

16-343 Log #49 NEC-P16 **Final Action: Reject**
(830.179)

NOTE: This proposal appeared as Comment 16-317 on Proposal 16-415 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-415 was:
Change the titles as shown:
830.179 Network-Powered Broadband Communications Equipment and Cables.
Network-powered broadband communications equipment and cables shall be listed as suitable for the purpose.
Exception No. 1: This listing requirement shall not apply to community antenna television and radio distribution system coaxial cables that were installed prior to January 1, 2000, in accordance with Article 820 and are used for low-power network-powered broadband communications circuits.
Exception No. 2: Substitute cables for network-powered broadband communications cables shall be permitted as shown in Table 830.133.
(A) Listing and Marking. Listing and marking of network-powered broadband communications cables shall comply with 830.179(A)(1) or (A)(2).
(1) Types BMU, ~~Type~~ BM, and ~~Type~~ BMR Cables. Network-powered broadband communications medium power underground cable, Type BMU; network-powered broadband communications medium power cable, Type BM; and network-powered broadband communications medium power riser cable, Type BMR, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11. Type BMU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BM cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BMR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.
FPN No. 1: One method of defining *resistant to spread of fire* is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords*. Another method of defining *resistant to the spread of fire* is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, *Test Methods for Electrical Wires and Cables.*
FPN No. 2: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*
(2) Types BLU, ~~Type~~ BLX, ~~Type~~ BL, BLR and ~~Type~~ BLP Cables. Network-powered broadband communications low-power underground cable, Type BLU; limited use network-powered broadband communications low-power cable, Type BLX; network-powered broadband communications low-power cable, Type BL; network-powered broadband communications low-power riser cable, Type BLR; and network-powered broadband communications low-power plenum cable, Type BLP, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11. Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread. Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.
FPN No. 1: One method of determining that cable is resistant to flame spread is by testing the cable to VW-1 (vertical-wire) flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords*.
FPN No. 2: One method of defining *resistant to spread of fire* is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1584-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords*.
FPN No. 3: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-1997, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*
FPN No. 4: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-1999, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air Handling Spaces*.
Submitter: James Daly, Upper Saddle River, NJ
Recommendation: The Panel Action should have been to Accept in Principle and revise the Fine Print Notes to read as follows:
830.179(A)(1)
FPN No. 1: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*
Another method of determining that the cable is resistant to the spread of fire is the "Vertical Flame Test - Cables in Cable Trays," in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables.*
FPN No. 2: One method of determining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts*.
830.179(A)(2)
FPN No. 1: One method of determining that the cable is resistant to flame spread is the VW-1 (vertical-wire) flame test in ANSI/UL 1581-2001, *Reference Standard for Electrical Wires, Cables and Flexible Cords.*

FPN No. 2: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*

FPN No. 3: One method of determining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*

FPN No. 4: One method of determining that the cable has fire-resistant and low-smoke-producing characteristics is NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.

Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The FPNs in the Proposal define the damage, specify performance requirements, and include mandatory language by requiring that the cable be tested to a particular standard or pass the requirements of a particular test. The revised wording provides explanatory information without any requirements.

830.179(A)(1) FPN No. 1 – In accordance with the Panel action to Accept Proposal 16-416, the number, title, and the date of the latest edition of the UL 1685 standard were corrected to reflect the current applicable standard; the title of the reference within the CSA standard was corrected and the date of the CSA standard was updated. This Comment also incorporates my Comments on Proposals 16-416 and 16-417.

In 830.179(A)(2): FPN No. 1 – the date was updated. FPN No. 2 – the UL standard was corrected from UL1584 to UL 1581 and then updated to UL 1685 to incorporate the current effective standard as explained in Accepted Proposal 16-416.

Panel Meeting Action: Reject

Panel Statement: The fine print note(s) does contain explanatory information. It does not contain requirements and is not written in mandatory language.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

16-344 Log #2128 NEC-P16 **Final Action: Accept in Principle**
(830.179)

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group

Recommendation: Revise text to read as follows:

830.179 Network-Powered Broadband Communications Equipment and Cables.

Network-powered broadband communications equipment and cables shall be listed and marked ~~as suitable for the purpose~~ in accordance with 830.179(A) or (B

Exception No. 1: This listing requirement shall not apply to community antenna television and radio distribution system coaxial cables that were installed prior to January 1, 2000, in accordance with Article 820 and are used for low-power network-powered broadband communications circuits.

Exception No. 2: Substitute cables for network-powered broadband communications cables shall be permitted as shown in Table 830.154.

~~(A) Listing and Marking. Listing and marking of network-powered broadband communications cables shall comply with 830.179(A)(1) or (A)(2).~~

~~(1) Types BMU, BM, and BMR Cables. Network-powered broadband communications medium-power underground cable, Type BMU; network-powered broadband communications medium-power cable, Type BM; and network-powered broadband communications medium-power riser cable, Type BMR,~~

(A) **Network-Powered Broadband Communications Medium-Power Cables. Network-powered broadband communications medium-power cables** shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11.

~~Type BMU cables shall be jacketed and listed as being suitable for outdoor underground use.~~

~~Type BM cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.~~

~~Type BMR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.~~

(1) **Type BMR.** Type BMR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN ~~No. 2~~: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.

(2) **Type BM.** Type BM cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.

FPN ~~No. 1~~: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

~~FPN No. 2: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.~~

(3)Type BMU. Type BMU cables shall be jacketed and listed as being suitable for outdoor underground use.

~~(2) Types BLU, BLX, BL, BLR, and BLP Cables. Network-powered broadband communications low-power underground cable, Type BLU; limited-use network-powered broadband communications low-power cable, Type BLX; network-powered broadband communications low-power cable, Type BL; network-powered broadband communications low-power riser cable, Type BLR; and network-powered broadband communications low-power plenum cable, Type BLP,~~

(B) **Network-Powered Broadband Communication Low-Power Cables**. Network-powered broadband communications low-power cables shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multindividual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11.

~~Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread. Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.~~

(1) Type BLP. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN ~~No. 4~~: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

(2) Type BLR. Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN No. 3: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-1997, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.

(3) Type BL. Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire

FPN ~~No. 2~~: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

(4)Type BLX. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread.

FPN ~~No. 1~~: One method of determining that cable is resistant to flame spread is by testing the cable to VW-1 (vertical-wire) flame test in ANSI/UL 1581-2001, Reference Standard for Electrical Wires, Cables and Flexible Cords.

(5) Type BLU. Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use.

FPN No. 2: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

~~FPN No. 3: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-1997, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.~~

~~FPN No. 4: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.~~

Substantiation:

Change language to be compatible to 770.179, 800.179, and 820.179. Editorial only with no change to requirements. This proposal restructured existing requirements into a more readable format which is more closely parallel to the other.179 sections. Cable types were re-ordered to go from highest to lowest fire protection. FPNs were moved to the associated cable type. This change is consistent with placement of the FPNs in 770.179, 800.179, and 820.179.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Jim Brunssen, Sandy Egesdal, Ralph Esemplare, Steve Johnson Stan Kahn, Stan Kaufman and Harry Odhe.

Panel Meeting Action: Accept in Principle

Revise recommendation text as follows:

830.179 Network-Powered Broadband Communications Equipment and Cables.

Network-powered broadband communications equipment and cables shall be listed <u>and marked</u> ~~as suitable for the purpose~~ <u>in accordance with 830.179(A) or (B)</u>

Exception No. 1: This listing requirement shall not apply to community antenna television and radio distribution system coaxial cables that were installed prior to January 1, 2000, in accordance with Article 820 and are used for low-power network-powered broadband communications circuits.

Exception No. 2: Substitute cables for network-powered broadband communications cables shall be permitted as shown in Table 830.154.

~~(A) Listing and Marking. Listing and marking of network-powered broadband communications cables shall comply with 830.179(A)(1) or (A)(2).~~

~~(1) Types BMU, BM, and BMR Cables. Network-powered broadband communications medium-power underground cable, Type BMU; network-powered broadband communications medium-power cable, Type BM; and network-powered broadband communications medium-power riser cable, Type BMR,~~

(A) <u>Network-Powered Broadband Communications Medium-Power Cables.</u> <u>Network-powered broadband communications medium-power cables</u> shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11.

~~Type BMU cables shall be jacketed and listed as being suitable for outdoor underground use.~~

~~Type BM cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.~~

~~Type BMR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.~~

(1) <u>Type BMR.</u> <u>Type BMR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.</u>

<u>FPN</u> ~~No. 2~~: <u>One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2007, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.</u>

(2) <u>Type BM.</u> <u>Type BM cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.</u>

FPN ~~No. 1~~: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the "UL flame exposure, vertical tray flame test" in UL 1685-2007, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "vertical flame test — cables in cable trays," as described in CSA C22.2 No. 0.3-2001, Test Methods for Electrical Wires and Cables.

~~FPN No. 2: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.~~

<u>(3)Type BMU.</u> <u>Type BMU cables shall be jacketed and listed as being suitable for outdoor underground use.</u>

~~(2) Types BLU, BLX, BL, BLR, and BLP Cables.~~

~~Network-powered broadband communications low-power underground cable, Type BLU;~~

~~limited-use network-powered broadband communications low-power cable, Type BLX;~~

~~network-powered broadband communications low-power cable, Type BL;~~

~~network-powered broadband communications low-power riser cable, Type BLR;~~

~~and network-powered broadband communications low-power plenum cable, Type BLP,~~

(B) <u>Network-Powered Broadband Communication Low-Power Cables</u>. <u>Network-powered broadband communications low-power cables</u> shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multindividual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11.

~~Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread. Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.~~

(1) Type BLP. <u>Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.</u>

FPN ~~No. 4~~<u>: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.</u>

(2) Type BLR. <u>Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.</u>

<u>FPN No. 3: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2007, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.</u>

(3) Type BL. <u>Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire</u>

<u>FPN</u> ~~No. 2~~<u>: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the "UL flame exposure, vertical tray flame test" in UL 1685-2007, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable. Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "vertical flame test — cables in cable trays," as described in CSA C22.2 No. 0.3-2001, Test Methods for Electrical Wires and Cables.</u>

(4)Type BLX. <u>Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread.</u>

FPN ~~No. 1~~: One method of determining that cable is resistant to flame spread is by testing the cable to VW-1 (vertical-wire) flame test in ANSI/UL 1581-2001, Reference Standard for Electrical Wires, Cables and Flexible Cords.

(5) Type BLU. <u>Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use.</u>

~~FPN No. 2: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.~~

~~Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.~~

~~FPN No. 3: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-1997, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.~~
~~FPN No. 4: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.~~
Panel Statement: The panel changed the references to old issues of the UL standard to the latest versions.

The panel notes the text of FPN No. 2 information was moved up to the appropriate cable type. Therefore the panel deleted FPN No. 2 as it is no longer necessary.

NOTE: This proposal appeared as Comment 16-318 on Proposal 16-416 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-416 was:
Revise text to read as follows:

FPN No. 1: One method of defining *resistant to the spread of fire* is that the cables do not spread fire to the top of the tray in the "<u>UL Flame Exposure</u>, Vertical Tray Flame Test" in ~~ANSI/UL 1581-2001, Standard for Electrical Wires, Cables, and Flexible Cords.~~ <u>UL 1685-2000 Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.</u> Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test - Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-~~1985~~ <u>2001</u>, Test Methods for Electrical Wires and Cables.
Submitter: James Daly, Upper Saddle River, NJ
Recommendation: The Panel Action should have been to Accept in Principle and reword FPN No. 1 to read:

FPN: One method of determining that the cable is resistant to the spread of fire is the UL Flame Exposure, Vertical Tray Flame Test in UL1685-2000 *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.*

Another method of determining that the cable is resistant to the spread of fire is the "Vertical Flame Test - Cables in Cable Trays," in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables.*
Substantiation: 3.1.3 of the NEC Style Manual stipulates that "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The Proposal as submitted defines the damage and specifies performance requirements.

The sentence "The smoke measurements in the test method are not applicable." is mandatory language.
Panel Meeting Action: Reject
Panel Statement: The fine print note(s) does contain explanatory information. It does not contain requirements and is not written in mandatory language.

ARTICLE 840 —PREMISES-POWERED BROADBAND COMMUNICATIONS SYSTEMS

16-349 Log #2463 NEC-P16 **Final Action: Accept in Principle**
(840 (New))

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
The Technical Correlating Committee further directs that the panel review the proposed changes for compliance with the NEC Style Manual with respect to titles for first level subsections.
This action will be considered by the panel as a public comment.
Submitter: Joseph P. Savage, FIFTH Council North America
Recommendation: Add the following new Article 840 as follows:
Article 8XX - Non-Network Powered Fiber-based Broadband Communications Systems
I. General
8XX.1 Scope. This article covers non-network powered broadband communications systems that provide any combination of voice, video, data, and interactive services through a network interface unit.

FPN No. 1: A typical basic system configuration includes an optical fiber cable serving an Optical Network Terminal (ONT)which would provide traditional telephone service, video service, and high speed internet service. These systems derive their power from the ac available at the premise by the use of an ONT Power Supply UNIT (OPSU) and a battery backup unit (BBU) for some specified time should ac be lost.

FPN No. 2: See 90.2(B)(4) for installations of broadband communications systems that are not covered.

8XX.2 Definitions. See Article 100. For purpose of this article, the following additional definitions apply.
Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.

Abandoned Communications Cable. Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag.

Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

FPN: See Article 100 for a definition of Equipment

Block. A square or portion of a city, town, or village enclosed by streets, including the alleys so enclosed but not any street.

Coaxial Cable. A cylindrical assembly composed of a conductor centered inside a metallic tube or shield, separated by a dielectric material, and usually covered by an insulating jacket.

Communications Circuit. The circuit that extends voice, audio, video, data, interactive services, telegraph (except radio), outside wiring for fire alarm and burglar alarm from the communications utility to the customer's communications equipment up to and including terminal equipment such as a telephone, fax machine, or answering machine.

Conductive Optical Fiber Cable. These optical fiber cables contain non–current-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.
Exposed (to Accidental Contact). A circuit in such a position that, in case of failure of supports or insulation, contact with another circuit may result.

Fiber-to-the-Premises (FTTP). Optical fiber cable taken to the premises and terminated either aerial, buried, or in a raceway and may or may not contain a non-current carrying metallic member.

Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering.

Optical Fiber Raceway. A raceway for enclosing and routing optical fiber cables.

FPN: See Article 100 for a definition of Raceway.

Optical Network Terminal (ONT). A device that converts an optical signal into component voice, audio, video, data, wireless signals or interactive service signals.

Nonconductive Optical Fiber Cable. These optical fiber cables contain no metallic members and no other electrically conductive materials.

Point of Demarcation: The defined point of separation between the service provider facilities/equipment and a subscriber's facilities/equipment conforming to subpart F of Part 68 of the FCC rules.

Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) connected by a grounding conductor to an electrode in accordance with 8XX.100(B).

Premises. The property of a user located on the user side of the utility-use network point of demarcation.

Wire. A factory assembly of one or more insulated conductors without an overall covering.
8XX.3 Other Articles

(A) Hazardous (Classified) Locations. Non-network powered broadband communications circuits and equipment installed in a location that is classified in accordance with 500.5 shall comply with the applicable requirements of Chapter 5.

(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.

(C) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.

(D) Output Circuits. As appropriate for the services provided, the output circuits derived from the network interface unit shall comply with the requirements of the following:

(1) Installations of communications circuits — Article 800
(2) Installations of community antenna television and radio distribution circuit— Article 820
(3) Installations of optical fiber cables — Article 770
(4) Installations of Class 2 and Class 3 circuits — Article 725
(5) Installations of power-limited fire alarm circuits — Article 760

8XX.24 Mechanical Execution of Work. Non-network powered broadband communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4(D) and 300.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2006, *Standard for Installing Commercial Building Telecommunications Cabling*; ANSI/TIA/EIA-568-B.1 2004 – Part I General Requirements Commercial Building Telecommunications Cabling Standard; ANSI/TIA – 569-B-2004 – Commercial Building Standard for Telecommunications Pathways and Spaces; ANSI/TIA-570-B, Residential Telecommunications Infrastructure, and other ANSI-approved installation standards.

8XX.25 Abandoned Cables. The accessible portion of abandoned non-network powered broadband cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved. Also, the accessible portion of abandoned communications cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment. Finally, the accessible portion of abandoned coaxial cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.

8XX.26 Spread of Fire or Products of Combustion. Installation of non-network powered broadband cables in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of non-network powered broadband cables through fire-resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Buildings codes also contain restrictions on membrane penetrations on opposite sides of a fire resistance-rated wall assembly. An example is the 600 mm (24 in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 800.26 can be found in building codes, fire resistance directories, and product listings.

II. Cables Outside and Entering Building.

8XX.44 Overhead Optical Fiber Cables.

Overhead optical fiber cables containing a non-current carrying metallic member entering buildings shall comply with 8XX.44(A) and (B).

(A) On Poles and In-Span. Where outside plant optical fiber cables and electric light or power conductors are supported by the same pole or are run parallel to each other in-span, the conditions described in(1) through 8XX.44 (A)(4) shall be met.

(1) Relative Location. Where practicable, the outside plant optical fiber cables shall be located below the electric light or power conductors.

(2) Attachment to Cross-Arms. Attachment of outside plant optical fiber cables to a cross-arm that carries electric light or power conductors shall not be permitted.

(3) Climbing Space. The climbing space through outside plant optical fiber cables shall comply with the requirements of 225.14(D)

(4) Clearance. Supply service drops of 0–750 volts running above and parallel to communications service drops shall have a minimum separation of 300 mm (12 in.) at any point in the span, including the point of and at their attachment to the building, provided the nongrounded conductors are insulated and that a clearance of not less than 1.0 m (40 in.) is maintained between the two services at the pole.

(B) Above Roofs. Outside plant optical fiber cables shall have a vertical clearance of not less than 2.5 m (8 ft) from all points of roofs above which they pass.

Exception No. 1: Auxiliary buildings, such as garages and the like.

Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (a) not more than 1.2 m (4 ft) of communications service-drop conductors pass above the roof overhang and (b) they are terminated at a through- or above-the-roof raceway or approved support.

Exception No. 3: Where the roof has a slope of not less than 100 mm in 300 mm (4 in. in 12 in.), a reduction in clearance to not less than 900 mm (3 ft) shall be permitted.

FPN: For additional information regarding overhead wires and cables, see ANSI C2-2007, *National Electric Safety Code*, Part 2, Safety Rules for Overhead Lines.

8XX.47 Underground Circuits Entering Buildings.

Underground optical fiber cables with a non-current carrying metallic member entering buildings with electric light or power conductors in a raceway, handhole enclosure, or manhole containing electric light, power, Class 1, or non–power-limited fire alarm circuit conductors shall be in a section separated from such conductors by means of brick, concrete, or tile partitions or by means of a suitable barrier.

(B) Direct-Buried Cables and Raceways. Direct-buried non-network-powered broadband communications cables with a non-current carrying metallic member shall be separated by at least 300 mm (12 in.) from conductors of any light, power, non–power-limited fire alarm circuit conductors or Class 1 circuit.

Exception No. 1: Where electric service conductors installed in raceways or have metal cable armor.

Exception No. 2: Where electric light or power branch-circuit or feeder conductors, non–power-limited fire alarm circuit conductors, or Class 1 circuit conductors are installed in a raceway or in metal-sheathed, metal-clad, or Type UF or Type USE cables.

(C) Mechanical Protection. Direct-buried cable, conduit, or other raceways shall be installed to meet the minimum cover requirements of 6 inches.

8XX.48 Unlisted Cables and Raceways Entering Buildings.

(A) Conductive and Nonconductive Cables. Unlisted conductive and non-conductive outside plant optical fiber cables shall be permitted to be installed in locations as described in 8XX.154(C), where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.

FPN: Splice cases or terminal boxes, both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.

(B) Nonconductive Cables. Unlisted nonconductive optical fiber outside plant cable optical fiber cables shall be permitted to enter the building from the outside and run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Polyvinyl Chloride Conduit: Type PVC; and Article 358, Electrical Metallic Tubing: Type EMT.

III Protection

8XX.93 Grounding of the Outer Conductive Shield of Coaxial Cables. Where the ONT is installed outside of the building, the coaxial cables terminated on the ONT entering buildings or attached to buildings shall be grounded in accordance with 8XX.100 using the ground lugs provided by the ONT. The grounding shall be as close as practicable to the point of attachment or termination. Where the outer conductive shield of a coaxial cable is grounded, no other protective devices shall be required. For purposes of this section grounding located at mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, or at a mobile home disconnecting grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section. Abandon coaxial service drops shall be grounded per 820.100.

IV Grounding Methods

8XX.100 ONT and Optical Fiber Cable Grounding. The ONT and the non-current carrying member of the optical fiber cable shall be grounded as specified in 8XX.100(A) through (D).

A Grounding Conductor

(1) Insulation. The grounding conductor shall be insulated and shall be listed and in accordance with the ONTs listing.

(2) Material. The grounding conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The grounding conductor shall not be smaller than 14 AWG. The grounding conductor shall have a current-carrying capacity at least equal to that of the outer conductor of the coaxial cable and the non-current carrying member of the optical fiber cable. The grounding conductor shall not be required to exceed 6 AWG.

(4) Length. The grounding conductor shall be as short as practicable. In one- and two-family dwellings, the grounding conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

FPN: Similar grounding conductor length limitations applied at apartment buildings and commercial buildings will help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where achieving an overall maximum grounding conductor length of 6.0 m (20 ft) is not practicable, a separate grounding electrode as specified in250.52(A)(5), (A)(6), or (A)(7) shall be used, the grounding conductor shall be connected to the separate grounding electrode in accordance with 250.70, and the separate grounding electrode shall be connected to the power grounding electrode system in accordance with 8XX.100(D).

(5) Run in Straight Line. The grounding conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. The grounding conductor shall be protected where exposed to physical damage. Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.

(B) Electrode. The grounding conductor shall be connected in accordance with 8XX.100(B)(1), (B)(2), or (B)(3).

(1) In Building or Structure with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination, the grounding conductor shall be connected to the intersystem bonding termination.

(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem bonding termination, the grounding conductor shall be connected to the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping system, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to enclosures as covered in 250.94
(4) The metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure, or
(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means enclosure that is connected to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding conductor intersystem bonding shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 820.93, shall be considered accessible.

(3) In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the building or structure served has no intersystem bonding termination or grounding means, as described in 8XX.100(B)(2), the grounding conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), (A)(4); or,
(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 800.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(7), and (A)(8) or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.

(C) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.

(D) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the optical fiber cable non-current carrying metallic member, ONT grounding electrode, and the power grounding electrode system at the building or structure served where separate electrodes are used.

Exception: At mobile homes as covered in 8XX.106.

FPN No. 1: See 250.60 for use of air terminals (lightning rods).

FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.

8XX.101 ONT Mounted Completely Inside a Building

(A) Communications Circuits Leaving the Building. When the ONT is mounted completely inside the building and connected to the network via an outside plant optical fiber cable that does not contain a non-current carrying metallic member within the building, where any of the communications circuits or the coaxial cable terminated on the ONT do exit the facility at some point protection shall be provided per Article 800 and Article 820 to the communications circuits and/or the coaxial cable. If the outside plant optical fiber cable contains a non current carrying member it shall be grounded at the point of entrance as described in 770.93.

(B) Communications Circuits Not Leaving the Building. When the ONT is mounted completely inside the building and connected to the network via an outside plant optical fiber cable that does not contain a non-current carrying metallic member within the building, the ONT shall be grounded using the equipment grounding conductor (EGC) as specified in 645.15 where the communications circuits as well as the coaxial cable terminated on the ONT are totally within the building and do not exit the facility. This does not preclude the use of any of the grounding methods as outlined in Section 8XX.100 (B). If the outside plant optical fiber cable contains a non current carrying member it shall be grounded at the point of entrance as described in 770.93.

FPN No. 1: The ONT may be served by a flexible cord from the local ac outlet and the EGC would be sized per 250.122(E) and using Table 400.5(A) to ensure that the EGC has been sized correctly.

FPN No. 2. Another example is where the ONT is powered by a power supply which is not internal to the ONT. Therefore, the ONT Power Supply Unit (OPSU) is mounted on the wall near the ONT. The OPSU is served by a two, or three pronged plug and then the ONT is served by two wires which provide the dc power to the ONT. Following the previously described thought process for grounding the ONT, the EGC is derived for grounding the ONT by using a listed device used for extending the equipment ground from the AC outlet to the ONT grounding lug. Table 250.122 is applied to this scenario and sizing the EGC from the listing device to the ONT.

8XX.106 Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with 8XX.106(A)(1) and (A)(2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 8XX.100(B)(2). If a network interface device (NID) is required this NID shall be installed per 800.90 and 800.106.

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 8XX.100(B)(2) following the guidelines of 820.93.

(B) Bonding. The ONT grounding terminal or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper grounding conductor not smaller than 12 AWG under any of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 8XX.106(A).
(2) Where the mobile home is supplied by cord and plug.

V. Installation Methods Within Buildings

8XX.110 Raceways

(A) Optical Fiber Cables. Where optical fiber cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway selected in accordance with the provisions of 770.154, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. Where optical fiber cables are installed in a raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.

(B) Communications Wires and Cables. Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum communications raceway, listed riser communications raceway, or listed general-purpose communications raceway installed in accordance with 800.154 and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. The raceway fill tables of Chapter 3 and Chapter 9 shall not apply.

(C) Coaxial Cables. Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum CATV raceway, listed riser CATV raceway, or listed general-purpose CATV raceway installed in accordance with 820.154, and with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.

Exception: Conduit fill restrictions shall not apply.

8XX.113 Installation Past the ONT

Installation of communications wires and cables installed in a building from the ONT shall be listed for the purpose and the installation shall comply with 800.133 and 800.154.

Installation of coaxial cables installed in a building from the ONT shall be listed for the purpose and the installation shall comply with 820.133 and 820.154.

8XX.154 Applications of Listed Optical Fiber Cables and Raceways.

Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 8XX.154(A) through (D) and 770.154(F) or where cable substitutions are made as shown in 8XX.154(E).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type OFNP and OFCP cables shall be permitted to be installed in these raceways.

(B) Riser. Cables installed in risers shall be as described in any of (B)(1), (B)(2), or (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use. Listed riser optical fiber raceways and listed plenum optical fiber raceways shall also be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type OFNP, OFCP, OFNR, and OFCR cables shall be permitted to be installed in these raceways.

(2) Metal Raceways or Fireproof Shafts. Type OFNG, OFN, OFCG, and OFC cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

(3) One- and Two-Family Dwellings. Type OFNG, OFN, OFCG, and OFC cables shall be permitted in one- and two-family dwellings.

FPN: See 300.21 for firestop requirements for floor penetrations.

(C) Other Cabling Within Buildings. Cables installed in building locations other than the locations covered in 8XX.154(A) and (B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways, listed riser optical fiber raceways, and listed plenum optical fiber raceways.

(D) Cable Trays. Optical fiber cables of the types listed in Table 770.179 shall be permitted to be installed in cable trays.

FPN: The intent is not to require that these optical fiber cables be listed specifically for use in cable trays.

(E) Cable Substitutions. The substitutions for optical fiber cables listed in Table 8XX.154(E) and illustrated in Figure 8XX.154(E) shall be permitted.

Table 8XX.154(E) Cable Substitutions

Cable Type	Permitted Substitutions
OFNP	None
OFCP	OFNP
OFNR	OFNP
OFCR	OFNP, OFCP, OFNR
OFNG, OFN	OFNP, OFNR
OFNG, OFN	OFNP, OFNR
OFGC, OFC	OFNP, OFCP, OFNR, OFCR, OFNG, OFN

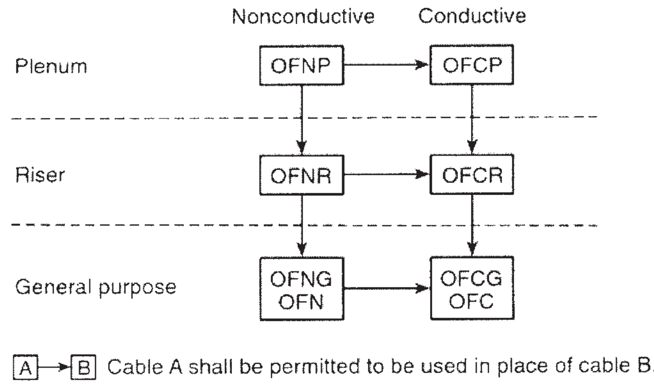

Figure 8XX.154(E) Cable Substitution Hierarchy

F) Hazardous (Classified) Locations. Cables installed in hazardous (classified) locations shall be any type indicated in Table 770.154(E). Cables shall be sealed in accordance with the requirements of 501.15, 502.15, 505.16, or 506.16, as applicable.

VI Listing Requirements

8XX.170 Equipment.

The ONT shall be listed as being suitable for the purpose.

FPN No. 1: One way to determine applicable requirements is to refer to UL60950-1-2003 *Standard for Safety of Information Technology Equipment*; or UL 498A *Current Taps and Adapters.*

FPN No. 2: there are no requirements on the ONT and its grounding methodologies except for those covered by the listing of the product.

Optical fiber cables shall be listed in accordance with 770.179(A) through (D) and shall be marked in accordance with Table 770.179.

The communications wires and cables being served from the ONT shall be listed in accordance with 800.179 and communications raceways associated with the non-network powered broadband communications systems shall be listed in accordance with 800.182

Coaxial cables being served from the ONT shall be listed in accordance with 820.179 and CATV raceways associated with the non-network powered broadband communications systems shall be listed in accordance with 820.182.

Substantiation: Broadband services are being offered that are non-network powered. At this point in time no specific Article of the National Electrical Code addresses all the applications involved in these types of services resulting in state regulatory agencies, authorities having jurisdiction, and even companies making judgments on installations with loose interpretation or in some limited cases no interpretations of the National Electric Code. Installations have been found that create fire hazards and the potential for shock. This proposed Article to Chapter 8 is an attempt to address these known issues. Refer to attached sketches for an explanation of how services are being provided in certain scenarios.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise text and create a new article as follows:

Article 840 Premises-Powered Broadband Communications Systems

I. General

840.1 Scope. This article covers premises-powered optical fiber-based broadband communications systems that provide any combination of voice, video, data, and interactive services through an optical network terminal (ONT).

FPN No. 1: A typical basic system configuration consists of an optical fiber cable to the premises (FTTP) supplying a broadband signal to an ONT that converts the broadband optical signal into component electrical signals such as traditional telephone, video, high-speed internet, and interactive services. Powering of the ONT is typically accomplished through an ONT power supply Unit (OPSU) and battery backup unit (BBU) that derives their power input from the available ac at the premises. The optical fiber cable is unpowered and may be nonconductive or conductive.

FPN No. 2: See 90.2(B)(4) for installations of broadband communications systems that are not covered.

840.2 Definitions. The definitions in Article 100 and 770.2, 800.2, and 820.2 shall apply. For purpose of this article, the following additional definitions apply.

Fiber-to-the-Premises (FTTP). Conductive or non-conductive optical cable provided either aerial, buried, or through a raceway and terminated at an optical network terminal (ONT) and establishing a communications network.

Optical Network Terminal (ONT). A device that converts an optical signal into component voice, audio, video, data, wireless signals, and/or interactive service electrical signals and is considered to be a network interface unit terminating equipment.

Premises Community Antenna Television (CATV) Circuit. The circuit that extends community antenna television (CATV) systems for audio, video, data, and interactive services from the service provider's ONT to the appropriate customer equipment.

Premises Communications Circuit. The circuit that extends voice, audio, video, data, interactive services, telegraph (except radio), outside wiring for fire alarm and burglar alarm from the service provider's ONT to the customer's communications equipment up to and including terminal equipment such as a telephone, fax machine, or answering machine.

840.3 Other Articles.

(A) Chapters 1 through 7. The requirements of Chapters 1 though 7 shall not apply to Article 840 except where the requirements are specifically referenced in Article 840. See 90.3

(B) Hazardous (Classified) Locations. Premises-powered broadband communications circuits and equipment installed in a location that is classified in accordance with 500.5 and 505.5 shall comply with the applicable requirements of Chapter 5.

(C) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.

(D) Output Circuits. As appropriate for the services provided, the output circuits derived from the network interface unit shall comply with the requirements of the following:

(1) Installations of premises communications circuits — Article 800

(2) Installations of premises community antenna television and radio distribution circuits — Article 820

(3) Installations of optical fiber cables — Article 770

(4) Installations of Class 2 and Class 3 circuits — Article 725

(5) Installations of power-limited fire alarm circuits — Article 760

840.21 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by an accumulation of premises-powered broadband cables that prevents removal of panels, including suspended ceiling panels.

840.24 Mechanical Execution of Work. Sections 770.24, 800.24, and 820.24 shall apply.

840.25 Abandoned Cables. Sections 770.25, 800.25, and 820.25 shall apply.

840.26 Spread of Fire or Products of Combustion. Sections 770.26, 800.26, and 820.26 shall apply.

II. Cables Outside and Entering Building.

840.44 Overhead Optical Fiber Cables.

Overhead optical fiber cables containing a non-current carrying metallic member entering buildings shall comply with 840.44(A) and (B).

(A) On Poles and In-Span. Where outside plant optical fiber cables and electric light or power conductors are supported by the same pole or are run parallel to each other in-span, the conditions described in 840.44(A)(1) through (A)(4) shall be met.

(1) Relative Location. Where practicable, the outside plant optical fiber cables shall be located below the electric light or power conductors.

(2) Attachment to Cross-Arms. Attachment of outside plant optical fiber cables to a cross-arm that carries electric light or power conductors shall not be permitted.

(3) Climbing Space. The climbing space through outside plant optical fiber cables shall comply with the requirements of 225.14(D).

(4) Clearance. Supply service drops of 0–750 volts running above and parallel to premises-powered broadband communications service drops shall have a minimum separation of 300 mm (12 in.) at any point in the span, including the point of and at their attachment to the building. Clearance of not less than 1.0 m (40 in.) shall be maintained between the two services at the pole.

(B) Above Roofs. Outside plant optical fiber cables shall have a vertical clearance of not less than 2.5 m (8 ft) from all points of roofs above which they pass.

Exception No. 1: Auxiliary buildings, such as garages and the like.

Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 450 mm (18 in.) shall be permitted if (a) not more than 1.2 m (4 ft) of premises-powered broadband communications service-drop cable passes above the roof overhang and (b) it is terminated at a through- or above-the-roof raceway or approved support.

Exception No. 3: Where the roof has a slope of not less than 100 mm in 300 mm (4 in. in 12 in.), a reduction in clearance to not less than 900 mm (3 ft) shall be permitted.

FPN: For additional information regarding overhead wires and cables, see ANSI C2-2007, National Electric Safety Code, Part 2, Safety Rules for Overhead Lines.

840.47 Underground Optical Fiber Cables Entering Buildings. Underground optical fiber cables entering buildings shall comply with 840.47(A) through (C).

(A) Class 1 or Non-Power Limited Fire Alarm Circuits. Underground optical fiber cables with a non-current carrying metallic member entering buildings with electric light, power, Class 1, or non–power-limited fire alarm circuit conductors in a raceway, handhole enclosure, or manhole shall be in a section separated from such conductors by means of brick, concrete, or tile partitions or by means of a suitable barrier.

(B) Direct-Buried Cables and Raceways. Direct-buried premises-powered broadband communications optical fiber cables with a non-current carrying metallic member shall be separated by at least 300 mm (12 in.) from conductors of any light, power, non–power-limited fire alarm circuit conductors or Class 1 circuit.

Exception No. 1: Where electric service conductors installed in raceways or have metal cable armor.

Exception No. 2: Where electric light or power branch-circuit or feeder conductors, non–power-limited fire alarm circuit conductors, or Class 1 circuit conductors are installed in a raceway or in metal-sheathed, metal-clad, or Type UF or Type USE cables.

(C) Mechanical Protection. Direct-buried cable, conduit, or other raceways shall be installed to have a minimum cover of 150 mm (6 in.).

840.48 Unlisted Cables and Raceways Entering Buildings. Section 770.48 shall apply.

III Protection

840.90 Protective Devices. Section 800.90 shall apply.

840.93 Grounding or Interruption.

(A) Non-Current Carrying Metallic Members of Optical Fiber Cables. Non-current carrying metallic members of optical fiber cables entering the building or terminating on the outside of the building shall comply with 770.93(A) or (B).

(B) Communications Cables. The grounding or interruption of the metallic sheath of communications cable shall comply with 800.93.

(C) Coaxial Cables. Where the ONT is installed inside or outside of the building with coaxial cables terminating at the ONT, either entering, exiting or attached to the outside of the building, 820.93 shall apply.

IV Grounding Methods

840.100 ONT and Optical Fiber Cable Grounding. Grounding required for protection shall comply with 770.100, 800.100, or 820.100 as applicable.

840.101 Premises Circuits Not Leaving the Building. Where the ONT is served by a nonconductive optical fiber cable, or where any non-current-carrying metallic member is interrupted by an insulating joint or equivalent device, and circuits that terminate at the ONT and are completely contained within the building (i.e., do not exit the building), 840.101 (A) or (B) or (C) shall apply as applicable.

(A) The shield of coaxial cable shall be grounded by one of the following:

(1) Any of the methods described in 820.100 or 820.106.

(2) A fixed connection when using an equipment grounding conductor as described in 250.118. Use of the equipment grounding conductor to ground the ONT shall not require additional grounding of the coaxial cable shield.

(B) Communications circuits shall not be required to be grounded.

(C) The ONT shall not be required to be grounded unless required by its listing. Where grounding is required, connecting to an equipment grounding conductor through a listed grounding device that will retain the ground connection if the ONT is unplugged shall be permitted. If the coaxial cable shield is grounded as permitted in 840.101(A), the use of a cord and plug for the connection to the ONT shall be permitted.

FPN No. 1. Where required to be grounded, a listed device that extends the equipment grounding conductor from the receptacle to the ONT equipment grounding terminal is permitted. Sizing of the extended equipment grounding conductor is covered in Table 250.122.

840.103 Equipment Grounding. The grounding of the ONT shall be as required by the equipment listing.

840.106 Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with (1) and (2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ONT, if required to be grounded, shall be connected to a grounding conductor in accordance with 840.100. Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded in accordance with 840.93.

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, ONT, if required to be grounded, shall be connected to a grounding conductor in accordance with 840.100(B)(3). Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded in accordance with 840.93.

(B) Bonding. The ONT grounding terminal or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper grounding conductor not smaller than 12 AWG under any of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 840.106(A).

(2) Where the mobile home is supplied by cord and plug.

V Installation Methods Within Buildings

840.110 Raceways for Premises-Powered Broadband Communications Optical Fiber Cables. Section 770.110 shall apply.

840.113 Installation Past the ONT. Installation of premises communications circuits and premises coaxial circuits shall comply with 840.113(A) and (B).

(A) Premises Communications Circuits. Premises communications wires and cables installed in a building from the ONT shall be listed in accordance with 800.179, and the installation shall comply with 800.113 and 800.133.

(B) Premises Community Antenna Television (CATV) Circuits. Premises community antenna television (CATV) coaxial cables installed in a building from the ONT shall be listed in accordance with 820.179, and the installation shall comply with 820.113 and 820.133.

840.133 Installation of Optical Fibers and Electrical Conductor Associated with Premises-Powered Communications Systems.

Section 770.133 shall apply.

840.154 Applications of Listed Optical Fiber Cables and Raceways.

Section 770.154 shall apply.

VI Listing Requirements

840.170 Equipment and Cables. Premises-powered broadband communications systems equipment and cables shall comply with 840.170(A) through (D).

(A) Optical Network Terminal. The ONT and applicable grounding means shall be listed for application with premises-powered broadband communications systems.

FPN No. 1: One way to determine applicable requirements is to refer to UL 60950-1-2003, Standard for Safety of Information Technology Equipment, UL 498A, Current Taps and Adapters, or UL 467, Grounding and Bonding Equipment.

FPN No. 2: There are no requirements on the ONT and its grounding methodologies except for those covered by the listing of the product.

(B) Optical Fiber Cables. Optical fiber cables shall be listed in accordance with 770.179(A) through (D) and shall be marked in accordance with Table 770.179.

(C) Premises Communications Circuits. Premises communications wires and cables connecting to the ONT shall be listed in accordance with 800.179. Communications raceways associated with the premises-powered broadband communications system shall be listed in accordance with 800.182.

(D) Premises Community Antenna Television (CATV) Circuits. Premises community antenna television (CATV) coaxial cables connecting to the ONT shall be listed in accordance with 820.179.

Panel Statement: The panel acknowledges new technologies being introduced into the market and made changes to the proposal to align with the style manual requirements and safety issues expressed by various panel members were addressed.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

PREZIOSO, L.: This Proposal seeks to add a new Article to deal with “Premise-Powered” systems. The Article is well written, in the format of the other Articles, and it contains repeated references to the other Articles. I see this as evidence that the subject matter is already covered, with some exceptions, by the current NEC Articles. Current sections should be amended to include any issues with the new technology.

Article 830 was added to the NEC to cover “Network-Powered Broadband Communications Systems”. The rationale for the Network-Powered Article was that previous systems were all premise powered. The justification was that new systems were not being powered on-site, and the existing NEC Articles were not written to address this situation. While there may be valid issues with this technology that need to be addressed in the NEC, the introduction of a new article is premature. When asked why this issue needed to be addressed with a new Article, the Panel discussion centered on the belief that there is confusion amongst AHJs regarding the installation of this new technology. It is standard practice to require a safety justification for proposals seeking to amend the Code. There was no information presented identifying and validating the safety concerns that would be resolved by enacting a new article. This panel used the lack of safety justification alone as a reason to reject other proposals submitted in this code cycle.

Once a safety justification has been presented and accepted, the proper course of action would be to amend the current code, not add a new article. Technology changes continuously, but the activities covered by the NEC (power, grounding, bonding, pathways, etc.) remain fairly constant regardless of the technology. The NEC would be unmanageable if the solution is to add a new Article to the NEC for each new technology.”

Comment on Affirmative:

BRUNSSEN, J.: Currently there appears to be a great deal of confusion in the field regarding the grounding of premises-powered broadband communications systems provided over non-conductive OF cable, and why grounding requirements for these systems should differ from those of the more conventional “metallic” telephone and CATV systems. A separate article, rather than inserting requirements within a number of existing articles, will enhance NEC usability by placing all requirements for premises-powered broadband communications systems in a single location. This arrangement will serve both to highlight and to inform installers and AHJs as to the differences in grounding requirements from those of Articles 800, 820 and 830 applicable to locally-powered optical fiber systems.

IVANS, R.: The panel wording of section 840.101 is not clear and does not convey the intent that the coaxial grounding connection should never be able to be disconnected by the disconnection of a plug. Section 840.101 should be reworded as follows:

840.101 Premises Circuits Not Leaving the Building.

Where the ONT is served by a nonconductive optical fiber cable, or where any non-current-carrying metallic member is interrupted by an insulating joint or equivalent device, and circuits that terminate at the ONT and are completely contained within the building (i.e., do not exit the building), 840.101 (A) or and (B) or and (C) shall apply as applicable.

(A) The shield of coaxial cable shall be grounded by one of the following:

(1) Any of the methods described in 820.100 or 820.106.

(2) A fixed connection when using to an equipment grounding conductor as described in 250.118. Use of the equipment grounding conductor to ground the ONT shall not require additional grounding of the coaxial cable shield.

(3) Connection to the ONT grounding terminal provided that the terminal is connected to an equipment grounding conductor through a listed grounding device that will retain the ground connection if the ONT is unplugged.

(B) Communications circuits shall not be required to be grounded.

(C) The ONT shall not be required to be grounded unless required by its listing. Where grounding is required, connecting to an equipment grounding conductor through a listed grounding device that will retain the ground connection if the ONT is unplugged shall be permitted. If the coaxial cable shield is separately grounded as permitted required in 840.101 (A)(1) or 840.101(A)(2), the use of a cord and plug for the connection to the ONT grounding connection shall be permitted.

FPN No. 1. Where required to be grounded, a listed device that extends the equipment grounding conductor from the receptacle to the ONT equipment grounding terminal is permitted. Sizing of the extended equipment grounding conductor is covered in Table 250.122.

MCCOY, W.: The 50 feet exemption to installed unlisted optical fiber cable past the point of entrance outlined in Article 770.48 has proven not to be a liability as a source of fire in communications installation when installed in vaults or rooms containing communications type equipment that meet NEBS requirements and/or has a fire suppression system. However, a number of installations for premises powered equipment involve unlisted conductive and/or non-conductive optical fiber cable being run from the outside and installed up to 50 feet in environments, such as garages, where flammable items are stored and in some cases come in contact with the unlisted cable. Therefore, Section 840.48 should be changed to read as follows:

<u>**Conductive and Nonconductive Cables.** Unlisted conductive and nonconductive outside plant optical fiber cables shall be installed up to 15 m (50 ft) from the point of entrance to its termination in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Polyvinyl Chloride Conduit: Type PVC; and Article 358, Electrical Metallic Tubing: Type EMT.</u>

OHDE, H.: We support the new Article as new technology has been introduced to the market. We believe that the Article need some more work done to it to make to provide better clarity. Hopefully the NEC TCC will accept the new Article so more work can be done to improve and enhance this article.

ARTICLE 862

16-350 Log #2289 NEC-P16 **Final Action: Reject**
(862 (New))

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Add a new Article to read as follows:
ARTICLE 862 Optical Fiber/Communication Raceways:
Type OFCR
I. General
862.1 Scope.
This article covers the use, installation, and construction specifications for optical fiber/communication raceways (OFCR) and associated fittings.
862.2 Definition.
Optical Fiber/Communication Raceways (OFCR). A nonmetallic, pliable, corrugated raceway of circular cross section with integral or associated couplings, connectors, and fittings for the installation of signaling, optical-fiber, communication and community antenna television and radio distribution system (CATV) cables. OFCR is composed of a material that is resistant to moisture and chemical atmospheres and is flame retardant and are identified as:
(A) Plenum Optical Fiber/Communications Raceways (OFCR). Plenum rated OFCR is utilized in ducts, plenums, and other spaces used for environmental air and has the adequate fire-resistant and low smoke-producing characteristics.
FPN: One method of defining a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.
(B) Riser Optical Fiber/Communications Raceways (OFCR). Riser rated OFCR has the adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.
FPN: One method of defining a riser raceway that is fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, Standard for Optical Fiber Cable Raceway.
(C) General-Purpose Optical Fiber/Communications Raceways (OFCR). General-purpose rated OFCR is resistant to the spread of fire.
FPN: One method of defining a general purpose raceway that is resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, Standard for Optical Fiber Cable Raceway.
A pliable raceway is a raceway that can be bent by hand with a reasonable force but without other assistance.
862.6 Listing Requirements. OFCR and associated fittings shall be listed.
II. Installation
862.10 Uses Permitted. The use of OFCR shall be permitted in accordance with 862.10 (A) through (G):
(A) Concealed. OFCR shall be permitted to be installed within the walls, floors, or ceilings of a building of any height. OFCR is permitted to be installed as innerduct in any other type of listed conduits or tubings permitted in Chapter 3.
(B) Exposed. OFCR shall be permitted in exposed locations, where not prohibited by 862.12.
(C) Dry and Damp Locations. OFCR shall be permitted in dry and damp location where not prohibited by 862.12.
(D) Ducts and Plenums. Plenum Rated OFCR shall be permitted to be installed in ducts and plenums as described in 300.22(B) when used with Plenum Rated cables defined in Articles 770, 800 or 820.
(E) Above Suspended Ceilings. Plenum Rated OFCR shall be permitted to be installed above suspended ceilings as defined by 300.22(C) when used with Plenum Rated cables defined in Articles 725, 770, 800 or 820. Riser Rated and General Purpose Rated OFCR shall be permitted to be installed above suspended ceilings when this space is not used for environmental air-handling purposes and when used with cables defined in Articles 725, 770, 800 and 820.
(F) Riser Application. Riser Rated and Plenum Rated OFCR shall be permitted to be installed in a riser application when used with cables defined in Articles 725, 770, 800 and 820.
(G) General Purpose. General Purpose Rated, Riser Rated and Plenum Rated OFCR shall be permitted to be installed in general purpose application when used with cables defined in Articles 725, 770, 800 and 820.
862.12 Uses Not Permitted. The use of OFCR shall not be permitted for use in accordance with 862.12 (A) through (E):
(A) Electrical Conductors. OFCR shall not be used with electrical conductors or cables. Only those cables defined in Articles 725, 770, 800 and 820 are permitted to be used with OFCR.
(B) Cables. With cables other then those defined in Articles 725, 770, 800 or 820.
(C) Physical Damage. OFCR shall not be used where subject to physical damage.
(D) Direct Rays of the Sun. OFCR shall not be used where exposed to the direct rays of the sun, unless identified as sunlight resistant.
(E) Wet Locations. OFCR shall not be used in areas defined as a Wet Location.
862.22 Number of Cables. Where optical fiber, communication and coaxial cables, per Articles 770, 800 and 820, are installed in OFCR without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.
FPN: See 725.3(A) for Signaling cables fill requirements.
862.24 Bends — How Made. Bends shall be so made that the OFCR will not be damaged and the internal diameter of the raceway will not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment, and the radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9 using the column "Other Bends."
862.26 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.
862.28 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.
862.30 Securing and Supporting. OFCR shall be installed as a complete system in accordance with 300.18 and shall be securely fastened in place and supported in accordance with 862.30(A) and (B).
(A) Securely Fastened. OFCR shall be securely fastened at intervals not exceeding 900 mm (3 ft). In addition, OFCR shall be securely fastened in place within 900 mm (3 ft) of each outlet box, device box, junction box, cabinet, or fitting where it terminates.
(B) Supports. Horizontal runs of OFCR supported by openings in framing members at intervals not exceeding 900 mm (3 ft) and securely fastened within 900 mm (3 ft) of termination points shall be permitted.
Exception No. 1: For concealed work in finished buildings or prefinished wall panels where such securing is impracticable, unbroken lengths (without coupling) of OFCR shall be permitted to be fished.
862.46 Bushings. Where the OFCR enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the cable from abrasion unless the box, fitting, or enclosure design provides equivalent protection.
862.48 Joints. All joints between lengths of OFCR and between raceways and couplings, fittings, and boxes shall be by an approved method.
III. Construction Specifications
862.100 Construction. OFCR, as a prewired manufactured assembly, shall be provided in continuous lengths capable of being shipped in a coil, reel, or carton without damage.
862.120 Marking. OFCR shall be clearly and durably marked at least every 3 m (10 ft) as required in the first sentence of 110.21. Plenum Rated OFCR shall be marked "PLENUM", Riser Rated OFCR shall be marked "RISER" and General Purpose Rated OFCR shall be marked "GENERAL PURPOSE".
Substantiation: This is a NEW Article for the 2011 National Electrical Code for Optical Fiber/Communication Raceways (Type OFCR). Companion proposals have been submitted for Articles 725, 770, 800 and 820 to reference this new article.
Optical fiber/communication raceways (Type OFCR) are currently listed raceways for use in plenums, risers or general purpose applications for the management of signaling, optical fiber, communication and CATV cables. This new Article and the companion proposals will clarify the selection, and installation optical fiber/communication raceways including the construction specifications. It is not the intent of the submitter to revise or change any of the currently permitted uses by this proposal, but only to enhance the usability of the Code.
Only the TCC can assign an Article number and define the scope. It seems appropriate that this Article is placed at the end of Chapter 8. The Article Number "862" is used in the proposals since it gives a correlation with Article 362 for Electrical Nonmetallic Tubing. Sections of Article 362 have been referenced in Articles 770, 800 and 820. Panel 16 should discuss whether the new Article 862 will continue to be the responsibility of Panel 16 who first introduced these raceways into the NEC or if the responsibility should fall under Panel 8 who has the raceway expertise for the NEC.
This proposal will require a correlation with Panels 3 and 16 since Article 725 references these raceways for use with signaling cables. In addition, Panel 16 will have to make a recommendation to the TCC for the new article number and whether the proposed scope should be used.
Since there was not an easy acronym to be used to define Optical Fiber/Communication/Signaling/CATV Cable Raceway the submitter used "OFCR". "OFCR" basically stands for "Optical Fiber/Communication Raceway".
This new optical fiber/communication raceways article utilizes the same format developed by Panel 8 for the raceways articles found in Chapter 3.
Panel Meeting Action: Reject
Panel Statement: Acceptance of the article in this proposal will eliminate a competitive product, Maxcell fiber innerduct. Use of the acronym "OFCR" will cause confusion because it is identical to riser fiber optical cables.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
IVANS, R.: The panel action should have been an AIP as the panel comments could have been easily handled with editorial changes. A separate article for optical fiber and communications raceways and cable routing assemblies is a good idea and would consolidate the requirements and avoid constant repetition. It would also eliminate the difficulty of always having to coordinate requirements for these identical assemblies and devices between the various existing articles.

Chapter 9 Tables

6-177 Log #3251a NEC-P06 **Final Action: Reject**
(Chapter 9, Table Notes)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
(3) Equipment grounding and bonding conductors where installed, shall be included when calculating ~~conduit or tubing~~ conductor fill.
(5) For conductors not included in Chapter 9 such as multiconductor cables, flexible cords and cables, and optical fiber cables, the actual dimensions shall be used.
A copy of this proposal has also been sent to CMP-8 for action related to Tables 1-4.
Substantiation: Note 3 should apply to conductor fill for raceways other than conduit and tubing. Note 5 should include flexible cords and cables.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation was provided for the proposed changes. There is no evidence that there is a problem or confusion with the current code text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

8-278 Log #3251 NEC-P08 **Final Action: Reject**
(Chapter 9, Table Notes)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
(3) Equipment grounding and bonding conductors where installed, shall be included when calculating ~~conduit or tubing~~ conductor fill.
(5) For conductors not included in Chapter 9 such as multiconductor cables, flexible cords and cables, and optical fiber cables, the actual dimensions shall be used.
A copy of this proposal has also been sent to CMP-6 for action related to Tables 5-9.
Substantiation: Note 3 should apply to conductor fill for raceways other than conduit and tubing. Note 5 should include flexible cords and cables.
Panel Meeting Action: Reject
Panel Statement: Requirements for flexible cord and cable are included in Chapter 9 Notes to Tables, Note 9. Optical fiber cables are the privy of CMP-16
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-279 Log #4792 NEC-P08 **Final Action: Reject**
(Chapter 9, Table 2)

Submitter: Omeshwar D. Mathur, SW Construction, PWD / Rep. Philadelphia Water Dept.
Recommendation: Proposed revised wording:
MINIMUM Radius of Conduit and Tubing Bends
Substantiation: Existing wording of this Table 2 heading states "Radius of Conduit and Tubing Bends" while MINIMUM RADIUS OF CONDUIT AND TUBING BENDS is better description of the contents of the table as larger radius of conduits and tubing bends is safer and acceptable.
Panel Meeting Action: Reject
Panel Statement: Conduit and tubing bends are described in each conduit or tubing section 3XX.24
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-280 Log #302 NEC-P08 **Final Action: Reject**
(Chapter 9 Table 4, & Annex C)

Submitter: Stephen Pirolli, Florida Electrical Apprenticeship & Training, Inc.
Recommendation: Add new text to Chapter 9, Table 4 to read as follows.
Also, add new text to Annex C to read as follows:
The Dimensions and Percent Area of Conduit and Tubing for Article 355 Reinforced Thermosetting Resin Conduit: Type RTRC.
Substantiation: 355.22 refers you to Table 1, Chapter 9. In Table 4, Chapter 9, there is no table to figure out conduit fill for Type RTRC Article 355. Conduit fill table is missing. RTRC is also missing from Annex C.
Panel Meeting Action: Reject
Panel Statement: Submitter did not provide any proposed tables.
The proposal does not recommend specific code text as is required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

6-178 Log #2554 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 5)

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481 IBEW
Recommendation: #10 THW must have its area increased in Table 5 or Annex C. #10 THW must have its conductor fills increased.
A companion proposal has been submitted to Code-Making Panel 8 for Annex C.
Substantiation: So that the Table and the Annex agree with one another.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter has only provided documentation of problems in previous editions of the Code (1999, 2002). In the current edition of the code, the dimensions in Chapter 9 Table 5 for 10 THW are correct.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-179 Log #3912 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 5)

Submitter: Edward Walton, Draka Cableteq, USA
Recommendation: Annex C tables for conduit fill for types RHH*, RHW*, RHW-2* without outer covering are incorrect and should be revised. The correct diameters for these cables are shown in the table below:
A copy of this proposal has also been sent to CMP-8 for action related to Annex C.

See Chapter 9 Table 5 on page 1167

Substantiation: See proposal for NFPA 70, Chapter 9, Table 5 "Dimensions of Insulated Conductors and Fixture Wires". In this table, conductor types RHH*, RHW*, RHW-2* (*without outer jacket) have been placed in the same type class as TW, THW, THHW, THW-2 and this is never the case. This error leads to an understatement of the diameters of "R" type conductors in sizes 6 AWG and larger which could lead to under sizing conduit for these conductors.
I assume that Annex C tables are generated by a computer program that could be revised with the correct diameters. Willing to help with corrective effort.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided reference material to justify the proposed changes to Chapter 9 Table 5. In addition, current tables show largest (with a jacket and designated without *), and smallest diameters without jacket (designated with *). The numbers in the proposal are for a composite construction and are legitimate but thicker than those that exist without a jacket.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-180 Log #3911 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 5)

Submitter: Edward Walton, Draka Cableteq, USA
Recommendation: See the following Table with revisions/errors for types RHH*, RHW*, RHW-2* without outer covering.

See Chapter 9, Table 5 on page 1168

Substantiation: NFPA 70, Chapter 9, Table 5 "Dimensions of Insulated Conductors and Fixture Wires". In this table, conductor types RHH*, RHW, RHW-2* (*without outer jacket) have been placed in the same class as TW, THW, THW-2 and this is never the case. This error leads to an understatement of the diameters of "R" type conductors in sizes 6 AWG and larger which could lead to under sizing conduit for these conductors.
The same error was carried over to Annex C for these types, see separate proposal.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided reference material to justify the proposed changes to Chapter 9 Table 5. In addition, current tables show largest (with a jacket and designated without *), and smallest diameters without jacket (designated with *). The numbers in the proposal are for a composite construction and are legitimate but thicker than those that exist without a jacket. Note that this is a duplicate proposal. See panel action on Proposal 1-179.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

900	25.37	0.999	31.50	1.240	779.3	1.2076
1000	26.92	1.060	32.64	1.285	836.6	1.2968

*Dimensions are from industry sources.
**Types RHH and RHW without outer coverings.

Substantiation: Types RHH, RHW, and USE are available with compact conductors.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided new recommended values for the table but has not provided any references to justify the proposed change. There may be variations in manufacturer's data. The panel requests uniform, third-party data.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
FRIEDMAN, S.: The panel vote on proposal 6-181 should be Accept in Part. The panel rejected this proposal because it did not know where the dimensions came from. However, the panel was advised (as indicated on the proposal) that these dimensions came from industry sources, as did the dimensions that are presently in table 5(A) of Chapter 9. NEMA agrees to remove USE from the title since that product does not exist in present table.

6-182 Log #1154 NEC-P06 **Final Action: Accept**
(Chapter 9, Table 8, FPN)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change "NEMA WC8-1992" to "NEMA WC 70".
Substantiation: NEMA WC8 is obsolete and was replaced with NEMA WC70.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

8-281 Log #416 NEC-P08 **Final Action: Reject**
(Chapter 9, Table 8, FPN)

TCC Action: The Technical Correlating Committee refers this proposal to Code-Making Panel 6 for action.
This action will be considered by Code-Making Panel 6 as a public comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change "per" to "in accordance with" in two places.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Panel Statement: Not part of Panel 8 but the panel accepts.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

6-183 Log #280 NEC-P06 **Final Action: Accept**
(Chapter 9,Table 8, Note 2)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "formula" to "equation".
Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematical expression which follows in the Note.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

1-274 Log #2385 NEC-P01 **Final Action: Reject**
(Chapter 9, Tables 13(A) and 13(B))

Submitter: Peter Pollak, The Aluminum Association, Inc.
Recommendation: Add text to read as follows:

Pressure Wire Connectors Whose Performance Depend Upon Prescribed Installation Torques Should Be Installed With the Recommended* Tightening Torques in Tables 13(A) and 13(B):

Table 13(A)
Recommended*Tightening Torques for Wire-Binding Screws, Connectors with Slotted Screws, and Connectors for External Drive Wrench
(See Table 13(B)

Type of connection	Wire size, AWG or kcmil	Tightening torques, Newton*metres
Wire-binding screws	14 to 10	1.4
Connectors with slotted screws	14, 12, and 10	2.3
	8	3.4
	6 and 4	4.0
	3 to 4/0 inclusive	4.5
Connectors for external drive wrench	1/0	19.8
	2/0	19.8
	3/0	28.3
	4/0	28.3
	250	39.5
	300	39.5
	350	39.5
	400	39.5
	500	45.2
	600	45.2
	700	45.2
	750	45.2
	800	50.8
	900	50.8
	1000	50.8
	1250	67.8
	1500	67.8
	1750	67.8
	2000	67.8

*For proper termination of conductors it is very important that field connections be properly tightened. In the absence of manufacturer's instructions on the equipment, the torque values given in Tables 13(A) and 13(B) are recommended.

Because it is normal for some relaxation to occur in service, checking torque values sometime after installation is not a reliable means of determining the values of torque applied at installation.

Table 13(B)
Recommended* Tightening Torques for Connectors with Hexagonal Socket Screws
(See Table 13(A)

Socket size (across flats), in	Tightening torque, Newton*metres
5/32	11.3
3/16	13.6
7/32	17.0
1/4	19.8
5/16	28.3
3/8	39.5
½	50.8
9/16	67.8

*For proper termination of conductors it is very important that field connections be properly tightened. In the absence of manufacturer's instructions on the equipment, the torque values given in Tables 13(A) and 13(B) are recommended.

Because it is normal for some relaxation to occur in service, checking torque values sometime after installation is not a reliable means of determining the values of torque applied at installation.

Substantiation: Electrical connections must be tight, but not too tight in order to provide reliable performance in service. This is why connector manufacturers provide torques values in their installation instructions. It is also why UL tests connector performance using prescribed installation torques. It is known that not every electrical installer uses torque wrenches. (Some do not even have torque wrenches.) The proposed addition of these torque tables to the Code would give tightening torques explicit recognition and provide needed values where manufacturers' recommended values are not available. Furthermore, the proposed addition harmonizes requirement already in the Canadian Electrical Code and UL 486 Standards. It adds no additional requirements, but helps electrical professionals to do a better job thus contributing to electrical safety.
Panel Meeting Action: Reject
Panel Statement: The addition of these tightening torque values to the NEC has not been technically substantiated. The panel notes the proposed tables are based on Tables D6 and D7 from Appendix D of the Canadian Electrical Code, Part 1. However, the proposed values do not correspond to the values of the Standard for Wire Connectors, ANSI/UL 486A-486B/CSA C22.2 No. 65-03 or the Standard for Equipment Wiring Terminals for Use with Aluminum and/or Copper Conductors, ANSI/UL 486E.

Most terminals for listed equipment specify tightening torque values as part of the listing, requiring the specified torque to be used for installation of this equipment in accordance with 110.3(B). However, the panel notes that for some terminals, for example some control circuit conductor terminals of industrial control equipment, values for tightening torque are not required to be marked. The proposed tightening torques may be significantly higher than the accepted values for some unmarked terminals, and their use may introduce hazards through over-tightening or damage to equipment.

The proposed placement of recommended values in Chapter 9 is not permitted based on 90.3, and 2.3 of the NEC Style Manual. Tables of recommended values may be suitable for inclusion in a new informational annex. Information on the intended application of the tables, including text that is in the proposed notes, should be included as text in the informational annex to clearly explain the intent of the tables and to promote proper use. The requirements of 3.2.7.2 of the NEC Style Manual, for dual system of units, would apply to the values in the tables.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:

ANTHONY, M.: APPA enters an abstention here in order to send a signal to the electrical industry that the educational facilities industry is positioned to encourage innovation in products and installation methods that reduce the cost of electrical infrastructure. A new burst of regulations seems likely given federal policy changes that will attempt to merge the objectives of educational facility infrastructure investment and energy conservation. The electrical industry will benefit from this information; at least placed in an informational annex. We hope to see consistent information presented to the panel in the ROC stage.

Annex A — Product Safety Standards

1-275 Log #2950 NEC-P01 **Final Action: Accept in Principle**
(Annex A)

TCC Action: The Technical Correlating Committee notes that this is a staff responsibility and will be addressed by NFPA editorial staff.
Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Add new text to read as follows:

<u>Annex: Informational Purposes Only.</u>
<u>Annex A Product Safety.</u>
<u>Annex B Application Information for Ampacity Calculation.</u>
<u>Annex C Conduit and Tubing Fill Tables for Conductors and Luminaire Wires of the Same Size.</u>
<u>Annex D Examples.</u>
<u>Annex E Type of Construction.</u>
<u>Annex F About Critical Operations Power System.</u>
<u>Annex G Supervisory Control and Data Acquisition.</u>
<u>Annex H Administration and Enforcement.</u>

Substantiation: A description of the Annexes would be very helpful in searching for the informational headings making the code easier to use.
Panel Meeting Action: Accept in Principle
Panel Statement: The addition of a separate table of contents for the annexes is unnecessary.

The panel acknowledges that including the correct titles of the annexes in the table of contents, as is now done for each article and table, would improve usability and refers this issue to the Technical Correlating Committee as it affects more than one panel.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-276 Log #3590 NEC-P01 **Final Action: Accept in Principle**
(Annex A)

Submitter: Sonya M. Bird, Underwriters Laboratories Inc.
Recommendation:

Wire Connectors	UL 486A-486B
Wireways, Auxiliary Gutters, and Associated Fittings	UL 870

Substantiation: Annex A, Product Safety Standards, is proposed to be updated in order for the annex to reflect the most recent product standard designations and names for those UL standards that are currently referenced. Additionally, changes to the Annex are needed in order to reflect the product listing requirements of the NEC, and to reflect those standards that are suitable for evaluating products and identifying them for a particular purpose within the NEC. Listing to these specific product safety standards is one mechanism for meeting the requirement that a product be identified for a particular purpose.

Specifically, this proposal is made to:

(1) Reinstate the reference to UL 183, Manufactured Wiring Systems. This standard was included in the 2005 NEC and was inadvertently removed from the 2008 NEC.

(2) Update the following standard titles and designations:

a. Audio, Video and Similar Electronic Apparatus, UL 60065 – Update title

b. Switchboards, UL 891 – Update title and reposition in table

c. Electrical Apparatus for Explosive Gas Atmospheres – Part 0, General Requirements, UL 60079-0 – Correct Title

d. Electrical Apparatus for Explosive Gas Atmospheres – Part 1, Flameproof Enclosures “d”, UL 60079-1 – Correct Title

e. Electrical Apparatus for Explosive Gas Atmospheres – Part 5, Powder Filling “q”, UL 60079-5 – Correct Title

f. Electrical Apparatus for Explosive Gas Atmospheres – Part 6, Oil-Immersion “o”, UL 60079-6 – Correct Title

g. Electrical Apparatus for Explosive Gas Atmospheres – Part 7, Increased Safety “e”, UL 60079-7 – Correct Title

h. Electrical Apparatus for Explosive Gas Atmospheres – Part 18, Construction, Test and Marking of Type of Protection Encapsulation “m”, UL 60079-18, Correct Title

i. Flexible Cords and Cables, UL 62 – Update Title

j. Sealed Wire Connector Systems, UL 486D – Update Title and reposition in the Annex based on the new title.

(3) Make the following editorial updates:

a. Remove the “HDPE” following the UL 651B reference

b. Correct the reference to UL 1640 such that the “UL” is capitalized

(4) Replace the reference to UL 1585, Class 2 and Class 3 Transformers, with references to the following unique standards, and position these references alphabetically:

a. UL 5085-1, Low Voltage Transformers – Part 1: General Requirements

b. UL 5085-3, Low Voltage Transformers – Part 3: Class 2 and Class 3 Transformers

(5) Replace the reference to UL 1004, Electric Motors, with references to the following unique standards and position these references alphabetically:

a. UL 1004-1, Rotating Electrical Machines – General Requirements

b. UL 1004-2, Impedance Protected Motors

c. UL 1004-3, Thermally Protected Motors

d. UL 1004-4, Electric Generators

e. UL 1004-5, Fire Pump Motors

(6) Replace the reference to UL 1598 with references to the following unique standards (currently, the reference includes the designation of (a) with the standard title of (b):

a. UL 1598, Luminaires

b. UL 1598B, Luminaire Reflector Kits for Installation on Previously Installed Fluorescent Luminaires, Supplemental Requirements

(7) Add reference to UL 60947-5-2, Proximity Switches, and UL 61131-2, Programmable Controllers – Part 2: Equipment Requirements and Tests, as options to the existing UL 508 reference. These IEC-based UL standards incorporate the international requirements with relevant national differences.

(8) Add reference to UL 60950-22, Information Technology Equipment Safety – Part 22: Equipment to be Installed Outdoors, and UL 60950-23, Information Technology Equipment – Part 23: Large Data Storage Equipment, for specific requirements associated with the general requirements already referenced in UL 60950-1. Also, remove "Safety of" from the titles for the UL 60950-1 and the UL 60950-21 standards and reposition these standards alphabetically in the list.

(9) Add reference to UL 60335-2-24, Household and Similar Electrical Appliances, Part 2: Particular Requirements for Refrigerating Appliances, Ice-Cream Appliances, and Ice-Makers as an option to the existing UL 250 reference. UL 60335-2-24 is an IEC-based UL standard incorporating the international requirements with relevant national differences.

(10) Add reference to the following new UL standards in order to reflect product listing requirements of the NEC, and to reflect those standards that are suitable for evaluating products and identifying these for a particular purpose within the NEC (listing for these product safety standards is one mechanism for meeting the requirement that a product be identified for a particular purpose):

a. UL 489A, Circuit Breakers for use in Communication Equipment

b. UL 810A, Electrochemical Capacitors

c. UL 2459, Insulated Multi-Pole Splicing Wire Connectors

d. UL 8750, Light Emitting Diode (LED) Light Sources for Use in Lighting Products

(11) Delete the following reference standards, as these are scheduled to be withdrawn on 1/1/2010:

a. Audio-Video Products and Accessories, UL 1492

b. Commercial Audio Equipment, UL 813

Panel Meeting Action: Accept in Principle

The panel accepts the proposal with the addition of the following:

IEEE Standard 515, Standard for the Testing, Design, Installation and Maintenance of Electrical Resistance Heat Tracing for Industrial Applications.

Panel Statement: The panel accepts the proposed text.

The added IEEE standard is referenced in 427.1 FPN.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

14-301 Log #4437 NEC-P14 **Final Action: Accept**

(Annex A)

TCC Action: The Technical Correlating Committee directs that this proposal be forwarded to Code-Making Panel 1 for action

This action will be considered by Code-Making panel 1 as a public comment.

Submitter: Eliana Beattie, ISA

Recommendation: Revise text to read as follows:

Change Combustible Gas Detectors, Performance Requirements ISA 12.13.01 to Combustible Gas Detectors, Performance Requirements for ANSI/ISA-60079-29-1

Change Electrical Apparatus for Explosive Gas Atmospheres – Part 11: Intrinsic Safety "i" ISA 60079-11/UL 60079-11 to Explosive Atmospheres – Part 11: Equipment protection by intrinsic safety "i" ANSI/ISA-60079-11 / ANSI/UL 60079-11

Change Electrical Apparatus for Explosive Gas Atmospheres – Part 15: Type of Protection "n" ISA 60079-15/UL 60079-15 to Electrical Apparatus for Explosive Gas Atmospheres – Part 15: Type of Protection "n" ANSI/ISA-60079-15 / ANSI/UL 60079-15

Change Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection – Encapsulation "m" ISA S12.23.01/UL 60079-18 to Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection – Encapsulation "m" ANSI/ISA-60079-18 / ANSI/UL 60079-18

Change Electrical Apparatus for Use in Class I, Zones 0 & 1 Hazardous (Classified) Locations: General Requirements ISA 12.0.01/UL 60079-0 to Explosive Gas Atmospheres – Part 0: Equipment- General requirements ANSI/ISA-60079-0 / ANSI/UL 60079-0

Change Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations: Type of Protection – Increased Safety "e" ISA S12.16.01/UL 60079-7 to Explosive Gas Atmospheres – Part 7: Increased safety "e" ANSI/ISA-60079-7 / ANSI/UL 60079-7

Change Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations: Type of Protection – Flameproof "d" ISA S12.22.01/UL 60079-1 to Explosive Gas Atmospheres – Part 1: Type of protection – Flameproof "d" ANSI/ISA-60079-1 / ANSI/UL 60079-1

Change Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations: Type of Protection – Powder Filling "q" ISA S12.25.01/UL 60079-5 to Explosive Gas Atmospheres – Part 5: Type of protection – Powder filling "q" ANSI/ISA-60079-5 / ANSI/UL 60079-5

Change Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations: Type of Protection – Oil Immersion "O" ISA S12.26.01/UL 60079-6 Explosive Gas Atmospheres – Part 6: Type of protection – Oil immersion "o" ANSI/ISA-60079-6 / ANSI/UL 60079-6

Change Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations – Protection by Encapsulation "mD" ISA 61241-18 (12.10.07) to Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations – Protection by Encapsulation "mD" ANSI/ISA-61241-18

Change Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations – Protection by Enclosure "td" ISA 61241-1 (12.10.03) to Electrical Apparatus for Use in Zone 20 and Zone 21 Hazardous (Classified) Locations – Protection by Enclosure "tD" ANSI/ISA-61241-1

Change Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations – General Requirements ISA 61241-0 (12.10.02) to Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations – General Requirements ANSI/ISA-61241-0

Change Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations – Protection by Intrinsic Safety "iD" ISA 61241-11 (12.10.06) to Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations – Protection by Intrinsic Safety "iD" ANSI/ISA-61241-11

Change Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations – Protection by Pressurization "pD" ISA 61241-2 (12.10.04) to Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations – Protection by Pressurization "pD" ANSI/ISA-61241-2

Change Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Divisions 1 and 2 Hazardous (Classified) Locations ISA-12.12.01 to Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Divisions 1 and 2 Hazardous (Classified) Locations ANSI/ISA-12.12.01

Change Performance Requirements, Combustible Gas Detectors ISA 12.13.01 to Performance Requirements of Detectors for Flammable Gases ANSI/ISA-60079-29-1

Change Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids ISA 12.27.01 to Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids ANSI/ISA-12.27.01

Substantiation: Change format to match actual ISA standards title.

Panel Meeting Action: Accept

Panel Statement: See panel action and substantiation on Proposal 14-6a.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Annex B — Application Information for Ampacity Calculation

6-184 Log #2950a NEC-P06 **Final Action: Reject**

(Annex B)

Submitter: Mark T. Rochon, Peabody, MA

Recommendation: Add new text to read as follows:

<u>Annex: Informational Purposes Only.</u>

<u>Annex A Product Safety.</u>

<u>Annex B Application Information for Ampacity Calculation.</u>

<u>Annex C Conduit and Tubing Fill Tables for Conductors and Luminaire Wires of the Same Size.</u>

<u>Annex D Examples.</u>

<u>Annex E Type of Construction.</u>

<u>Annex F About Critical Operations Power System.</u>

<u>Annex G Supervisory Control and Data Acquisition.</u>

<u>Annex H Administration and Enforcement.</u>

Substantiation: A description of the Annexes would be very helpful in searching for the informational headings making the code easier to use.

Panel Meeting Action: Reject

Panel Statement: The panel notes that this proposal would be helpful if included in the table of contents as well as the annex but cannot be acted on by this panel. The TCC could redirect this to the proper panel.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-185 Log #1152 NEC-P06 **Final Action: Accept**

(Table B.310.1 and Table B.310.3)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Change "See Table 310.13" to "See Table 310.13(A)."

Substantiation: Table 310.13 has been revised to 310.13(A).

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-186 Log #641 NEC-P06 **Final Action: Accept in Principle**
(Table B.310.1)

Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: Revise the Correction Factors Table at the bottom of Table B.310.1 as shown:

CORRECTION FACTORS

Ambient Temperature (ºC)	For ambient temperatures other than 30ºC (86ºF), multiply the allowable ampacities shown above by the appropriate factor shown below.						Ambient Temperature (ºF)
10 or less	1.29	1.20	1.15	1.29	1.20	1.15	50 or less
11-15	1.22	1.15	1.12	1.22	1.15	1.12	51-59

76-80	—	—	0.41	—	—	0.41	168-176
81-85	—	—	0.29	—	—	0.29	177-185

Substantiation: If the Proposal to add a new 310.15(B)(2) is accepted, this Proposal should be accepted in Principle and refer to the Panel Action on Proposal 310.15(B)(2) (New).

Acceptance of this revised table will harmonize the ampacity correction factors for various ambient temperatures between the NEC and the CEC.

The equation in 310.60(C)(4) was used to calculate the ampacity correction factors for various ambient air temperatures for the conductor temperature ratings in the table. The term Δ*TD* was deleted since it is not necessary to include it for cables rated below 46kV; the temperature rise due to dielectric heating is insignificant compared to the conductor losses. This equation appears in 3.4.1 of *IEEE STD 835, IEEE Standard Power Cable Ampacity Tables*.

Since the NEC is used internationally, the three lower ambient temperature ranges were added to provide the appropriate ampacity correction factors for colder regions and the 81-85C range was added to complete the table and address high ambient temperature applications. The temperature ranges for 61C-80C were changed from 10C to 5C since the differences in the correction factors are significant and it provides consistent temperature ranges throughout the Table. The correction factors for the ambient temperature ranges in the existing table remain the same.

The Ambient Temperature (ºF) column was revised to be continuous and consistent with Tables 310.16 through 310.19.

This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr
Mark Earley	Steve Douglas
Christel Hunter	Duncan Dunshire
Alan Manche	David Mascarenhas
David Mercier	Robert Nelson
Jeff Sargent	Shawn Paulsen
John Stacey	Tim Pope
John Thompson	Doug Reith
	Brian Savaria
	Ark Tsisserev

6-197 Log #446 NEC-P06 **Final Action: Accept**
(Table B310.10)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
In the Table title:
Change "Arrangement per Figure B.310.2" to "Electrical Duct Arrangement in Accordance with Figure B.310.2".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
The addition of the words "Electrical Duct" will provide consistency with the other Tables in Annex B.
Panel Meeting Action: Accept
Panel Statement: This revision is an editorial change. No technical changes have been made.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-198 Log #278 NEC-P06 **Final Action: Accept**
(Table B.310.11, FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "formula" to "equation" in the first sentence.
Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematical expression which follows the FPN.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-199 Log #643 NEC-P06 **Final Action: Accept in Part**
(Table B.310.11)

Submitter: James M. Daly, Rep. NEC/CEC Ampacity Harmonization Task Group
Recommendation: Revise first column heading in Table B.310.11 from "Number of Current-Carrying Conductors" to "Number of Conductors (See Note 1.)".
Add a Note below the Table before the FPN to read:
1 Number of Conductors is the total number of conductors in the raceway or cable adjusted in accordance with 310.15(B)(4) and (5).
Revise the FPN as follows:
"FPN: The ampacity limit for ~~the number of~~ <u>10 through 85</u> current-carrying conductors ~~in 10 through 85~~ is based on the following ~~formula~~ <u>equation</u>. For <u>more</u> ~~greater~~ than 85 conductors, special calculations are required that are beyond the scope of this table."
Revise the explanation of terms as follows:
A1 - replace the semi-colons after each Table number with commas in four places and revise the last phrase "~~and~~ <u>or</u> Table B.310.7 multiplied by the appropriate <u>adjustment</u> factor from Table B.310.11."
N = ~~total~~ number of conductors <u>that may be current-carrying</u> used to <u>select adjustment</u> ~~obtain multiplying~~ factor from Table B.310.11"
E = ~~desired~~ <u>maximum</u> number of ~~current-carrying~~ conductors <u>carrying current simultaneously</u> in the raceway or cable
In Example 1 and 2, revise the last phrase "that contains 24 conductors <u>that may, at different times, be current-carrying."</u>
Substantiation: A companion proposal is being submitted for Table 310.15(B)(2)(a).
During the 1993 NEC revision cycle, the column headings in Table 310.15(B)(2)(a) and Table B.310.11 were editorially changed to "Number of Current-Carrying Conductors". There was no Proposal, Comment, or Panel Action to make that change. See the substantiation and chronological history provided in the Proposal on Table 310.15(B)(2)(a).
The correction to the column heading also correlates with the column headings in Table 400.5 in the NEC and Table 5C in the 2006 Canadian Electrical Code, Part I.
When there is load diversity, the adjustment factor is calculated based on the percentage of the maximum number of conductors that are carrying current at any time to the total number of conductors that may carry current. The Note is proposed for clarity since there has been some confusion that the column referred to the total number of conductors in the raceway or cable.
The changes in the FPN correlate with the revised column heading. "Formula" refers more to a chemical composition whereas "equation" refers to a mathematical expression. The change from "greater" to "more" is grammatical.
The change in the explanation of the term *A1* is grammatical since a choice is offered between the five Tables.
The change in the explanation of the term *N* correlates with the change in the column heading, the addition of Note 1, and that the Table provides an adjustment factor rather than a multiplying factor.

The change in the explanation of the term *E* and the additional text in the two examples clarifies that this is the maximum number of conductors that would be current-carrying at any point in time.

This Proposal was generated by the NFPA/CSA NEC/CEC Ampacity Harmonization Task Group which consisted of the following members:

United States	Canada
Jim Daly, U.S. Co-Chair	Barry O'Connell, Canadian Co Chair
Thomas Blewitt	William Burr
Mark Earley	Steve Douglas
Christel Hunter	Duncan Dunshire
Alan Manche	David Mascarenhas
David Mercier	Robert Nelson
Jeff Sargent	Shawn Paulsen
John Stacey	Tim Pope
John Thompson	Doug Reith
	Brian Savaria
	Ark Tsisserev

Panel Meeting Action: Accept in Part

Accept all changes and revise text as follows:

N = ~~total~~ Number of conductors used to select adjustment ~~obtain multiplying~~ factor from Table B.310.11

E = ~~desired~~ Number of ~~current-carrying~~ conductors carrying current simultaneously in the raceway or cable.

Panel Statement: The panel does not accept the addition of the phrase "that may be current-carrying" because the added note 1, referencing Section 310.15(B)(4) and (5), will yield the proper number of conductors. The panel does not accept the addition of the word "maximum" because the equation deals with a count of conductors, not a maximum number.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-200 Log #1625 NEC-P06 **Final Action: Accept in Principle**
(Table B.310.11)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: In the definition of terms for *A*1, Change "Table 310.16, Table 310.18" to "Table 310.15(B)(1), Table 310.15(B)(3)".

Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

In the definition of terms for *A*1, Change "Table 310.16, Table 310.18" to "Table 310.15(B)(16), Table 310.15(B)(18)".

Panel Statement: This proposal was modified by the panel's acceptance of Proposal 6-52.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-201 Log #279 NEC-P06 **Final Action: Accept**
(B.310.15(B)(1))

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Change "formula" to "equation".

Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematical expression.

This is one of a series of proposals to have consistent terminology throughout the code.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-202 Log #1635 NEC-P06 **Final Action: Accept**
(B.310.15(B)(2), Table B.310.1 to Table B.310.10 and Figure B.310.1 to Figure B.310.5)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: In B.310.15(B)(2):

Change "Table B.310.1 through Table B.310.10" to "Table B.310.15(B)(2)(1) through Table B.310.15(B)(2)(10)" and insert a new second sentence "Table B.310.15(B)(2)(11) provides the Adjustment Factors for more than three current-carrying conductors in a raceway or cable with load diversity.

Change "Figure B.310.3, Figure B.310.4, and Figure B.310.5" to "Figure B.310.15(B)(2)(3), Figure B.310.15(B)(2)(4), and Figure B.310.15(B)(2)(5)".

Change "Figure B.310.2 through Figure B.310.5" to "Figure B.310.15(B)(2)(2) through Figure B.310.15(B)(2)(5)".

Change title designation of Table B.310.1 to Table B.310.15(B)(2)(1).

Change title designation of Table B.310.3 to Table B.310.15(B)(2)(3).

Change title designation of Table B.310.5 to Table B.310.15(B)(2)(5) and change Figure B.310.2 to Figure B.310.15(B)(2)(2) in the title and in the 6 column headings.

Change title designation of Table B.310.6 to Table B.310.15(B)(2)(6) and change Figure B.310.2 to Figure B.310.15(B)(2)(2) in the title and in the 6 column headings.

Change title designation of Table B.310.7 to Table B.310.15(B)(2)(7) and change Figure B.310.2 to Figure B.310.15(B)(2)(2) in the title and in the 6 column headings.

Change title designation of Table B.310.8 to Table B.310.15(B)(2)(8) and change Figure B.310.2 to Figure B.310.15(B)(2)(2) in the title and in the 4 column headings.

Change title designation of Table B.310.9 to Table B.310.15(B)(2)(9) and change Figure B.310.2 to Figure B.310.15(B)(2)(2) in the title and in the 4 column headings.

Change title designation of Table B.310.10 to Table B.310.15(B)(2)(10) and change Figure B.310.2 to Figure B.310.15(B)(2)(2) in the title and in the 4 column headings.

Change title designation of Table B.310.11 to Table B.310.15(B)(2)(11) and in the FPN definition of terms, change "Table B.310.1; Table B.310.6; and Table B.310.7" to "Table B.310.15(B)(2)(1); Table B.310.15(B)(2)(6); and Table B.310.15(B)(2)(7)" and change "Table B.310.11" to "Table B.310.15(B)(2)(11)" in two places.

Change title designation of Figure B.310.1 to Figure B.310.15(B)(2)(1).

Change title designation of Figure B.310.2 to Figure B.310.15(B)(2)(2) and change "Table B.310.5 Through Table B.310.10" to "Table B.310.15(B)(2)(5) Through Table B.310.15(B)(2)(10)".

Change title designation of FPN Figure B.310.3 to FPN Figure B.310.15(B)(2)(3).

Change title designation of FPN Figure B.310.4 to FPN Figure B.310.15(B)(2)(4).

Change title designation of FPN Figure B.310.5 to FPN Figure B.310.15(B)(2)(5).

Substantiation: This revision will bring the Code into compliance with 2.3.1 of the NEC Style Manual which states "Tables and figures shall be referenced in the text and shall be designated by the number of the *NEC* rule in which they are referenced.

The new second sentence in B.310.15(B)(2) provides the text reference for Table B.310.15(B)(2)(11) since there is no other reference to that table in the Annex B text.

Proposals are also being submitted to correlate all the references to these Tables throughout the Code.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-203 Log #275 NEC-P06 **Final Action: Accept**
(B.310.15(B)(3))

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Change "figured" to "calculated" in the second paragraph.

Substantiation: The term "calculated" more accurately describes the operation.

This is one of a series of proposals to provide consistent terminology throughout the code.

Panel Meeting Action: Accept

Panel Statement: This revision is an editorial change. No technical changes have been made.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Annex C — Conduit and Tubing Fill Tables for Conductors And Fixture Wires of the Same Size

8-282 Log #2554a NEC-P08 **Final Action: Reject**
(Annex C)

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481 IBEW
Recommendation: #10 THW must have its area increased in Table 5 or Annex C. #10 THW must have its conductor fills increased.

A companion proposal has been submitted to Code-Making Panel 6 for Table 5.

Substantiation: So that the Table and the Annex agree with one another.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as is required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-283 Log #2950b NEC-P08 **Final Action: Reject**
(Annex C)

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Add new text to read as follows:

<u>Annex: Informational Purposes Only.</u>
<u>Annex A Product Safety.</u>
<u>Annex B Application Information for Ampacity Calculation.</u>
<u>Annex C Conduit and Tubing Fill Tables for Conductors and Luminaire Wires of the Same Size.</u>
<u>Annex D Examples.</u>
<u>Annex E Type of Construction.</u>
<u>Annex F About Critical Operations Power System.</u>
<u>Annex G Supervisory Control and Data Acquisition.</u>
<u>Annex H Administration and Enforcement.</u>

Substantiation: A description of the Annexes would be very helpful in searching for the informational headings making the code easier to use.
Panel Meeting Action: Reject
Panel Statement: CMP-8 concludes the text does not belong in Annex C.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-284 Log #3912a NEC-P08 **Final Action: Reject**
(Annex C)

Submitter: Edward Walton, Draka Cableteq, USA
Recommendation: Annex C tables for conduit fill for types RHH*, RHW*, RHW-2* without outer covering are incorrect and should be revised. The correct diameters for these cables are shown in the table below:

A copy of this proposal has also been sent to CMP-6 for action related to Table 5.

See Chapter 9 Table 5 on page 1183

Substantiation: See proposal for NFPA 70, Chapter 9, Table 5 “Dimensions of Insulated Conductors and Fixture Wires”. In this table, conductor types RHH*, RHW*, RHW-2* (*without outer jacket) have been placed in the same type class as TW, THW, THHW, THW-2 and this is never the case. This error leads to an understatement of the diameters of “R” type conductors in sizes 6 AWG and larger which could lead to under sizing conduit for these conductors.

I assume that Annex C tables are generated by a computer program that could be revised with the correct diameters. Willing to help with corrective effort.

Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as is required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects. The submitter did not provide the appropriate tables for the number of conductors in raceways for Annex C.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-285 Log #258 NEC-P08 **Final Action: Reject**
(Tables C.1 through C.12)

Submitter: Stephen Pirolli, Florida Electrical Apprenticeship & Training, Inc.
Recommendation: Correction to Annex C: Tables C.1, C.2, C.3, C.4, C.5, C.6, C.7, C.8, C.9, C.10, C.11, C.12.
Substantiation: In Annex C, Tables C.1 through C.12, TW #14 to #8 AWG is grouped by itself. This is a mistake. With TW #14 AWG to #8 AWG, this group should include TW, THHW, THW and THW-2. I have provided a marked-up copy of the suggested changes.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as is required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects. The submitter’s proposal was incomplete. The submitter correctly submitted Table C1 and C2 revisions; however the remaining tables need to be submitted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 8-286 was not used)

Annex D — Examples

11-158 Log #2069a NEC-P11 **Final Action: Reject**
(Annex D)

Submitter: John Skalecki, Cavendish, VT
Recommendation: Square feet is denoted throughout the code as (ft^2). 20 ft^2 does not equal 20 square feet. It equals 400 sq ft as mathematical notation goes.
This proposal has also been submitted to Code-Making Panels 2, 12, and 19.
Substantiation: It is very confusing to read square feet as feet squared. I propose all (ft^2) notations be replaced with (sq. ft.). Example: 20 sq ft = 4 ft x 5 ft. 20 ft^2 = 20 ft x 20 ft. Another example: 210.52(E)(3) Ex. 3 1.86 m^2 = 20 ft^2, 1.86 m^2 = 20 sq ft.
Panel Meeting Action: Reject
Panel Statement: The term is correct as written.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-184 Log #2069b NEC-P12 **Final Action: Reject**
(Annex D)

Submitter: John Skalecki, Cavendish, VT
Recommendation: Square feet is denoted throughout the code as (ft^2). 20 ft^2 does not equal 20 square feet. It equals 400 sq ft as mathematical notation goes.
This proposal has also been submitted to Code-Making Panels 2, 11, and 19.
Substantiation: It is very confusing to read square feet as feet squared. I propose all (ft^2) notations be replaced with (sq. ft.). Example: 20 sq ft = 4 ft x 5 ft. 20 ft^2 = 20 ft x 20 ft. Another example: 210.52(E)(3) Ex. 3 1.86 m^2 = 20 ft^2, 1.86 m^2 = 20 sq ft.
Panel Meeting Action: Reject
Panel Statement: The proposed revision would be in conflict with the 2003 NEC Style Manual for units of measure.
The submitter is incorrectly attributing the superscript to the numbers when it applies only to the units. For example, 20 ft^2 does not mean 20^2 ft^2. Therefore, 20 ft^2 or 20 sq ft equals 20 square feet and 20 ft squared or 20 ft sq = 400 square feet.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

19-308 Log #2069c NEC-P19 **Final Action: Reject**
(Annex D)

Submitter: John Skalecki, Cavendish, VT
Recommendation: Square feet is denoted throughout the code as (ft^2). 20 ft^2 does not equal 20 square feet. It equals 400 sq ft as mathematical notation goes.
This proposal has also been submitted to Code-Making Panels 2, 11, and 12.
Substantiation: It is very confusing to read square feet as feet squared. I propose all (ft^2) notations be replaced with (sq. ft.). Example: 20 sq ft = 4 ft x 5 ft. 20 ft^2 = 20 ft x 20 ft. Another example: 210.52(E)(3) Ex. 3 1.86 m^2 = 20 ft^2, 1.86 m^2 = 20 sq ft.
Panel Meeting Action: Reject
Panel Statement: The existing language is consistent with other examples in Annex D. The proposed language does not improve clarity and usability of the code.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

2-371 Log #2069 NEC-P02 **Final Action: Reject**

(Example D.1(a))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
Annex D1a
Selected text to read "Sections 230.42(B) and 230.79 require service-entrance conductors and disconnecting means rated not less than 100 amperes." (The remaining text to be unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 2-298.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-374 Log #402 NEC-P02 **Final Action: Accept**
(Example D.1(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
In General Lighting Load, change "3 VA per ft^2" to "3 VA/ft^2".
Substantiation: This revision will comply with the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-375 Log #3800 NEC-P02 **Final Action: Reject**
(Example D.1(b))

Submitter: David Filipiak, Sky Electric, Inc.
Recommendation: Delete Example D1(b) in its entirety and replace with the following:
Example D1(b) One-Family Dwelling
Assume same conditions as Example No. D1(a), plus addition of one 6-A, 230-V, room air-conditioning unit and one 12-A, 115-V, room air-conditioning unit,* one 8-A, 115-V, rated waste disposer, and one 10-A 120-V, rated dishwasher. See Article 430 for general motors and Article 440, Part VII, for air-conditioning equipment. Motors have nameplate ratings of 115V and 230V for use on 120-V and 240-V nominal voltage systems.
*(For feeder neutral, use larger of the two appliances for unbalance.)

Let Calculated load from D1(a) 18,600VA
One 6-A, 230V room air conditioner 1,440VA* (see 440.62(A)
One 12-A, 115-V room air conditioner 1,440VA
One 8-A, 115-V rated waste disposer 960VA
One 10-A, 120-V rated dishwasher 1,200VA (see 430.22)
*25 percent of largest room air conditioner, 1440 ×.25 360VA
*25 percent of largest motor, 1200VA ×.25 300VA
Net Calculated load for 120/240-V, 3 wire
single phase service or feeder 24,300VA/240V=101.25 A

Service or feeder rating would be 110 A.

Calculation for Neutral for Feeder and Service

Net calculated load for neutral from D1(a) 14,550VA
One 12-A, 115-V room air conditioner 1,440VA* (see 440.62(A))
One 8-A, 115-V rated waste disposer 960VA* (see 430.22)
One 10-A, 120V dishwasher 1,200VA
*25 percent of largest motor, 960VA ×.25 240VA
*25 percent of largest room air conditioner 360VA
Net calculated load for Neutral 18,750VA / 240V = 78.1A

Neutral conductor rating would be 78 A.

Substantiation: In Parts I, II, and III of Article 220 all of the calculations are discussed in Volt-Amperes or KVA.
The new calculated load in Example D1(a) in Annex D is shown in VA.
For consistency and clarification, example D1(b) in Annex D, which is a continuation of example D1(a) should also be calculated in Volt-Amperes
Panel Meeting Action: Reject
Panel Statement: The purpose of the example is to show an unbalanced load, which is why line currents are used.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-376 Log #403 NEC-P02 **Final Action: Accept**
(Example D.1(b))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change "Total amperes per line" to "Total amperes".
Substantiation: "Per line" was deleted since only two of the three columns refer to a "Line".
This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-377 Log #1626 NEC-P02 **Final Action: Reject**
(Example D.3)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In the very last sentence, change "Table 310.16" to "Table 310.15(B)(1)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: If CMP-6 revises the table designations then the proposal can be accepted at the comment stage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-382 Log #1627 NEC-P02 **Final Action: Reject**
(Example D.3(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In Ungrounded Feeder Conductors, change "Table 310.16" to "Table 310.15(B)(1)" in six places.
In the last paragraph under Feeder Neutral Conductor, change "Table 310.16" to "Table 310.15(B)(1)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: If CMP-6 revises the table designations then the proposal can be accepted at the comment stage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-383 Log #4695 NEC-P02 **Final Action: Reject**
(Annex D, Example D.3(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change the final neutral size to 4 AWG or even 3 AWG as required; rewrite the explanatory text to show a further increase in sizing proportionally based on the increase in size of the ungrounded conductors provoked by the requirements to overcome derating due to mutual conductor heating and ambient temperature.
Substantiation: This proposal is a simple placeholder that will afford public review and thereby preserve the ability to write specific text in the comment period, should CMP 5 rule that an increase in conductor size above the very minimum size established by ampacity requirements is an increase in size within the meaning of 250.122(B). This submitter is doing everything in his power to resist that interpretation, and has submitted a clarifying proposal to that end. The submitter fervently hopes this proposal will be rejected and stay rejected. However, should CMP 5 go the wrong way, the text in this example will require correlation, and by this submittal, it will not be necessary to wait for the next code cycle to do so.
Panel Meeting Action: Reject
Panel Statement: Should CMP-5 change 250.122 to require a recalculation of the neutral size, this proposal can be revisited at the comment phase.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-384 Log #1628 NEC-P02 **Final Action: Reject**
(Example D.4(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In the very last line, change "Table 310.16 through 310.21" to "Table 310.15(B)(1) through Table 310.15(B)(6)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: If CMP-6 revises the table designations then the proposal can be accepted at the comment stage.
Number Eligible to Vote: 12

(Example D.5(b))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:

Under **Minimum Number of Branch Circuits Required for Each Dwelling Unit**, in Range Circuit, revise as follows "…and one 10 AWG conductor in accordance with ~~per~~ 210.19(A)(3)".

Under **Minimum Size Feeder Required for Each Dwelling Unit**, in the fourth line, change "120 V per leg" to "120 V/leg".

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

11-159a Log #1397 NEC-P11 **Final Action: Reject**
(Example D.8)

Submitter: Jon Reuter, Minneapolis, MN
Recommendation: Add feeder conductor calculations at the end of the "Conductor Ampacity" section as follows:

For the 25-hp motor,
34 A x 1.25 = 42.5 A
For the 30-horsepower motors,
40 A x 1.25 = 50 A
65 A x 1.25 = 81.25 A
For the feeder *[see 430.24]*,
(40 A x 1.25) + 40 A + 34 A = 124 A

Substantiation: Example D8 does not include the calculations for sizing feeder conductors. Although the appropriate article and section (430.24) is referenced at the top of the example, it is never applied in the example.
Panel Meeting Action: Reject
Panel Statement: It is unclear as to what the submitter is requesting based on his proposed calculations.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-185 Log #411 NEC-P12 **Final Action: Accept**
(Example D.9(a), (e), and (f))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:

Change "Per" to "In accordance with" in (a), (e), and (f).

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

11-160 Log #412 NEC-P11 **Final Action: Reject**
(Example D.10(b), (c), and (d))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 12 for Action.

The action will be considered by Code-Making Panel 12 as a public comment.

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:

Change "Per" to "In accordance with" in (b), (c), and (d).

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The panel does not have jurisdiction over this example. It resides with Panel 12.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

19-310 Log #413 NEC-P19 **Final Action: Reject**
(Example D.11)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: The following text should be revised as shown:
"Lighting (70 ft × 10 ft × 3 VA/ft[2] ~~VA per ft2~~)"
"4260 VA ÷ 240 V = 17.75 ~~A per leg~~ amperes"
"Amperes ~~per Leg~~"; "~~Leg~~ Line A" and "~~Leg~~ Line B"
"Total amperes ~~per leg~~"
"Based on the higher current calculated for either line ~~leg~~, a minimum 50 ampere ~~50-A~~ supply cord would be required."
Substantiation: These revisions will comply with the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard. Ampere is required to be spelled out when accompanied by a number value. The change from "leg" to "line" provides consistency with other Annex D Examples. "Phase" might be more appropriate.
Panel Meeting Action: Reject
Panel Statement: The existing language is consistent with other examples in Annex D. The proposed language does not improve clarity and usability of the code.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-311 Log #414 NEC-P19 **Final Action: Reject**
(Example D.12)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: The following text should be revised as shown:
"Lighting (40 ft × 10 ft × 3 VA/ft[2] ~~VA per ft2~~)"
"3945 VA ÷ 240 V = 16.44 ~~A per leg~~ amperes"
"Amperes ~~per Leg~~"; "~~Leg~~ Line A" and "~~Leg~~ Line B"
"~~Totals~~ Total amperes"
"Based on the higher current calculated for either line ~~leg~~, a minimum 50 ampere ~~50-A~~ supply cord would be required."
Substantiation: These revisions will comply with the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard. Ampere is required to be spelled out when accompanied by a number value. The change from "leg" to "line" provides consistency with other Annex D Examples. "Phase" might be more appropriate.
Panel Meeting Action: Reject
Panel Statement: The existing language is consistent with other examples in Annex D. The proposed language does not improve clarity and usability of the code.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

8-287 Log #4299 NEC-P08 **Final Action: Accept in Principle**
(Example D.13-(New))

Submitter: Robert Crain, Cablofil
Recommendation: Add sample calculations for cable tray fill to a new or existing Annex.

EXAMPLE CALCULATIONS FOR SIZING CABLE TRAY CONTAINING POWER CABLES

1. Multi-Conductor Cables 4/0 & Larger
USE: NEC 392.9(A)(1)
Cable tray must have an inside width equal to or greater than the sum of the diameters (Sd) of the cables, which must be installed in a single layer.

Example: Cable tray width is obtained as follows:

Cable size being used	**(OD)** Cable outside Diameters (inches)	**(N)** Number of Cables	**Sd = (OD) x (N)** (Sum of the Cable Diameters in Inches)
3-conductor Type MC Cable – 4/0 AWG	1.57	12	18.84

The sum of the diameters (Sd) of all cables = 18.84 inches, therefore a ***cable tray*** with an inside width of at least ***18.84 inches*** is required.

Note: Cable outside diameter is a nominal diameter from catalog data.

EXAMPLE CALCULATIONS FOR SIZING CABLE TRAY CONTAINING POWER CABLES

2. Multi-Conductor Cables smaller than 4/0
USE: *NEC 392.9(A)(2)*
The sum of the cross-sectional areas of all the cables to be installed in the cable tray must be equal to or less than the allowable cable area for the tray width, as indicated in ***Table 392.9 Column 1***

Table 392.9 Column 1

Inside width of cable Tray (inches)	Allowable cable area (square inches)
6	7.0
9	10.5
12	14.0
18	21.0
24	28.0
30	35.0
36	42.0

Example: Cable tray width is obtained as follows:

Cable size being used	**(A)** Cable cross-sectional area (square inches)	**(N)** Number of Cables	Multiply **(A)** x **(N)** (which is a total cable cross-sectional area in square inches
4-conductor Type TC Cable - #1 AWG	1.1350	9	12.15

The total cable cross-sectional area is 12.15 square inches. Using the Table above, the next higher allowable cable area must be used, which is 14.0 square inches. The table specifies that the cable tray inside width for an allowable cable area of 14.0 square inches is 12 inches.

Note: Cable cross-sectional area is a nominal area from catalog data.

EXAMPLE CALCULATIONS FOR SIZING CABLE TRAY CONTAINING POWER CABLES

3. Single Conductor Cables 1/0-4/0

USE: *NEC 392.10(A)(4)*

Cable tray must have an inside width equal to or greater than the sum of the diameters (Sd) of the cables. The cables must be evenly distributed across the cable tray.

Example: Cable tray width is obtained as follows:

Single conductor Cable size being used	**(OD)** Cable outside Diameters (inches)	**(N)** Number of Cables	**Sd = (OD) x (N)** (Sum of the Cable Diameters in Inches)
THHN – 4/0 AWG	0.642	18	11.556

The sum of diameters (Sd) of all cables = 11.56 inches, therefore a ***cable tray*** with an inside width of at least ***11.56 inches*** is required.

Note: Cable outside diameter from Chapter 9, Table 5.

EXAMPLE CALCULATIONS FOR SIZING CABLE TRAY CONTAINING POWER CABLES

4. Single Conductor Cables 250 – 900 kcmil

USE: NEC 392.10(A)(2)

The sum of the cross-sectional areas of all the cables to be installed in the cable tray must be equal to or less than the allowable cable area for the tray width, as indicated in Table 392.10(A) Column 1

Table 392.10 Column 1

Inside width of cable tray (inches)	Allowable cable area (square inches)
6	6.5
9	9.5
12	13.0
18	19.5
24	26.0
30	32.5
36	39.0

Example: Cable tray width is obtained as follows:

Cable size being used	**(A)** Cable cross-sectional area (square inches)	**(N)** Number of Cables	Multiply **(A)** x **(N)** (which is a total cable cross-sectional area in square inches
THHN- 500kcmil	0.707	9	6.36

The total cable cross-sectional area is 6.36 square inches. Using the Table above, the next higher allowable cable area must be used, which is 6.5 square inches. The table specifies that the cable tray inside width for an allowable cable area of 6.5 square inches is ***6 inches***.

Note: Single conductor cable cross-sectional area from Chapter 9, Table 5.

Substantiation: The rules and charts provided in Article 392 for determining the required cable tray size are complex. Cable tray manufacturers receive many technical support inquiries regarding how to figure cable tray size. Locating sample calculations in an Annex would assist users of the Code in sizing cable tray.

A table in an Annex of the Code would be a useful tool, and additionally these sample calculations will provide the detail necessary to understand the application of alternate cable types and sizes.

Panel Meeting Action: Accept in Principle

Add a new title to the proposal to state:

Example D.13 Cable Tray Calculations (see Article 392).

Panel Statement: The panel supports the proposal but requires a title per the NEC Style Manual.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

(**Note: Sequence 8-288 was not used)**

Annex E — Types of Construction

7-163 Log #2950f NEC-P07 **Final Action: Accept in Principle**
(Annex E)

Submitter: Mark T. Rochon, Peabody, MA

Recommendation: Add new text to read as follows:

<u>Annex: Informational Purposes Only.</u>
<u>Annex A Product Safety.</u>
<u>Annex B Application Information for Ampacity Calculation.</u>
<u>Annex C Conduit and Tubing Fill Tables for Conductors and Luminaire Wires of the Same Size.</u>
<u>Annex D Examples.</u>
<u>Annex E Type of Construction.</u>
<u>Annex F About Critical Operations Power System.</u>
<u>Annex G Supervisory Control and Data Acquisition.</u>
<u>Annex H Administration and Enforcement.</u>

Substantiation: A description of the Annexes would be very helpful in searching for the informational headings making the code easier to use.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel recommends that the text be added to the NEC Table of Contents.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Annex F — Availability and Reliability for Critical Operations Power Systems; and Development and Implementation of Functional Performance Tests (FPTs) for Critical Operations Power Systems

---

13-304 Log #3943 NEC-P13 **Final Action: Reject**
(Annex F)

Submitter: James Kelley, Sargent & Lundy

Recommendation: Revise text to read as follows:

Testing Implementation for FPTs. The final step in the successful commissioning plan is testing and proper execution of system-integrated tests.

(1) Systems Ready to Operate. The FPTs can be implemented as various systems become operative (i.e., test for the generator system) or when the entire system is installed. However, the final "pull the plug" test is performed only after all systems are completely installed. If the electrical contractor (or subcontractor) implements the FPTs, a witness must initial each step of the test. The electrical contractor cannot employ the witness directly or indirectly.

(2) Perform Tests ~~(FPTs)~~. If the system fails the test, the problem must be resolved and the equipment or system retested or the testing requirements re-analyzed until successful tests are witnessed. Once the system or equipment passes testing, it is verified by designated commissioning official.

Substantiation: "System-integrated tests" should be defined.

The acronym FPT is incorrect for "Perform Tests"; therefore, stricken provided the intent was to discuss the act of performing tests.

Panel Meeting Action: Reject

Panel Statement: The intent of the annex provisions are clear as written in the current text.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-305 Log #3945 NEC-P13 **Final Action: Accept in Part**
(Annex F)

Submitter: James Kelley, Sargent & Lundy

Recommendation: Revise text to read as follows:

(1) Submit Functional Performance Tests (FPTs). System/component tests or <u>functional performance tests</u> (FPTs) are developed from submitted drawings, <u>systems operating documents</u> (SODS) and <u>systems operation and maintenance manuals</u> (SOMMs), including large component testing (i.e., transformers, cable, generators, UPS), and how components operate as part of the total system. The commissioning authority develops the test and cannot be the installation contractor (or subcontractor).

As the equipment/components/systems are installed, quality assurance procedures are administered to verify that components are installed in accordance with minimum manufacturers' recommendations, safety codes, and acceptable installation practices. Quality assurance discrepancies are then identified and added to a "commissioning action list" that must be rectified as ~~past~~ <u>part</u> of the commissioning program. These items would usually be discussed during commissioning meetings. Discrepancies are usually identified initially by visual inspection.

Substantiation: According to the 2003 National Electrical Code Style Manual amended January 15, 2003, 3.2.3, all acronyms and any abbreviations that are not in common use shall be spelled out with the abbreviation [or acronym] following in parenthesis for the first use of the term in the body of each article.

Though the acronym FPT, familiar to the commissioning community, is spelled out ahead of its use in the title of the article, the comment is for the body of the article.

The acronym SOD is not in common use. A search for the meaning of this acronym yielded a term used in government or military language. One case where this was found spelled out was in the Army Corp of Engineers Technical Manual 5-694 meaning "systems operating document".

The acronym SOMM is not in common use. A search for the meaning of this acronym yielded a term used in government or military language. One case where this was found spelled out was in the Army Corp of Engineers document ER 25-345-1 meaning "Systems Operation and Maintenance (O&M) Manual".

Editorial correction of spelling that resulted in the word "past" instead of "part".

Panel Meeting Action: Accept in Part

The panel accepts the recommendation other than to use the term "functional performance tests" in the text of the provision.

Panel Statement: The use of only the acronym in the text is appropriate as it is explained in the title.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

13-306 Log #2950g NEC-P13 **Final Action: Accept in Principle**
(Annex F)

Submitter: Mark T. Rochon, Peabody, MA

Recommendation: Add new text to read as follows:

<u>Annex: Informational Purposes Only.</u>
<u>Annex A Product Safety.</u>
<u>Annex B Application Information for Ampacity Calculation.</u>
<u>Annex C Conduit and Tubing Fill Tables for Conductors and Luminaire Wires of the Same Size.</u>
<u>Annex D Examples.</u>
<u>Annex E Type of Construction.</u>
<u>Annex F About Critical Operations Power System.</u>
<u>Annex G Supervisory Control and Data Acquisition.</u>
<u>Annex H Administration and Enforcement.</u>

Substantiation: A description of the Annexes would be very helpful in searching for the informational headings making the code easier to use.

Panel Meeting Action: Accept in Principle

The panel recommends that the titles of Annexes A through H be added to the table of contents.

Panel Statement: The panel understands that the table of contents is a staff editorial function. The panel concurs with the recommendation that the annex titles are useful information that can be added to the list of annexes in the table of contents.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Annex H — Administration and Enforcement

1-276a Log #173 NEC-P01 **Final Action: Reject**
(Annex H)

Submitter: Felix Giannini, Lexco, Inc.
Recommendation: Changes to Article 90.4: FROM:
Insert into Annex H Administration 80.2 Definitions:
Governing Authority. A duly elected legislative body empowered to enact legislation in behalf of the Local, State, Federal or National government to which it has been elected.
Substantiation: I believe that a definition should be included in Annex G Administration 80.2, too, so as to make the term clear and perhaps legally effective, this should be addressed in any and all other codes that use that term as well as similar terms.
Panel Meeting Action: Reject
Panel Statement: The proposed definition would preclude those governing authorities who are appointed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-277 Log #3983 NEC-P01 **Final Action: Reject**
(H80.13)

Submitter: Michael A. Anthony, University of Michigan Business Operations
Recommendation: ADD TEXT AS SHOWN BELOW:
80.13 Authority.
Where used in this article, the term *authority having jurisdiction* shall include the chief electrical inspector, **fire marshal, public safety official,** or other individuals designated by the governing body. This Code shall be administered and enforced by the authority having jurisdiction designated by the governing authority as follows.
Substantiation: THIS CHANGE BROADENS THE AUTHORITY TO OTHER OFFICIALS, WITH OTHER TITLES AND/OR FUNCTIONS, WHO MAY HAVE A KEY ROLE IN ADMINISTRATION AND ENFORCEMENT. THIS CHANGE MAY ASSIST ADOPTING AGENCIES IN THE DETERMINATION OF AUTHORITY IN USING NEW ARTICLE 708 – CRITICAL OPERATIONS POWER SYSTEMS.
Panel Meeting Action: Reject
Panel Statement: The chief electrical inspector is defined in 80.2. Generally, the authority having jurisdiction for administering the NEC should be the chief electrical inspectors.
This section, however, currently allows for “other individuals designated by the governing body” Other individuals could be the fire marshal or public safety official. The additional text is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: This section of the code needs to reflect a changed workplace in which the widely understood title and responsibility of the Chief Electrical Inspector has been integrated into the work of a Public Safety Official or Fire Marshal. We should not assume that the individual charged with administering the NEC is an inspector or even an electrician; so much has risk management spread out responsibility.

1-278 Log #2328 NEC-P01 **Final Action: Reject**
(H80.15(B)(4)f.)

Submitter: Michael L. Last, Na’alehu, HI
Recommendation: Revise text as follows:
f. A member of an ~~the labor~~ organization that represents the primary electrical workforce.
Substantiation: The submitter is well aware that Annex H (as are all the other annexes: A thru G), is (are) included for informational purposes only; and not a part of NFPA 70. Unlike any of the other annexes (A thru G), the preface to Annex H has additional wording relative to adoption by the local jurisdiction. If the local jurisdiction adopts Annex H (without modification), the wording is such that an unfair benefit could be afforded to a labor organization- through its adoption. As a member of the Electrical Board, the individual identified in paragraph f. could assist in the formulation of rules and regulations that, while beneficial to members of labor organizations, has a negative impact on other equally (or more) qualified individuals who do not affiliate themselves with a labor organization. An example of such a regulation could be one which stipulates a required completion of a course of study administered by a labor union. The proposed revision will give equal representation to both those who align themselves with labor (union) organizations, and those who do not. there are organizations, while not considered labor entities, perform similar functions to unions. The members of said non- labor groups share the same work ethics as do their brothers in the unions. The wording currently in place could offer an unfair advantage to a select group of workers. Especially when the majority of the workforce is not represented by a labor organization.
Panel Meeting Action: Reject
Panel Statement: List item (f)of 80.15(B)(4) is one of eight additional membership choices necessary to ensure that the electrical board reflects the balanced representation required in 80.15(B)(1).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: We agree with the submitter’s substantiation that the more general term to describe the primary electrical workforce is more fair to the majority of the workforce that is not represented by a labor organization. As an example, here is how the composition of an electrical administrative board is described in one state
The Electrical Administrative board was established by Act XXX of 19XX and consists of:

- State Fire Marshal
- A representative of an insurance bureau
- A representative of an electrical energy supply agency
- An electrical contractor
- A master electrician serving as a supervisor
- An electrical Journeyman
- A chief electrical inspector of a municipality
- A representative of distributors of electrical apparatus and supplies
- A representative of manufacturers primarily and actively engaged in
- similar products used as a part of or in connection with, an electrical installation.
- A representative of the general public

This state gets a balance of interests in its work without use of a word that connotes membership in a labor organization.
HITTINGER, D.: This proposal should have been accepted. Deleting the term “labor” would allow a member of any organization representing the primary electrical workforce to be able to serve on an electrical board.

Annex I

8-289 Log #3708 NEC-P08 **Final Action: Reject**
(Annex I (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add table for cable tray fill to a new Annex.

See Tables 1-7 starting on page 1192

Substantiation: The tables for sizing cable tray based on the type and number of conductors is very confusing and difficult to understand. The rules are hard to apply correctly even for an experienced user. Tables showing the number of conductors in each size tray, similar to Annex C in NFPA 70 is much simpler and straightforward. The number one request of cable tray manufacturers’ technical support is for information concerning the correct sizing of cable tray based on a fixed number of cables. Many cable tray manufacturers have developed charts or spreadsheets to try and assist the contractor with sizing tray and some do not always give the correct answers. Inspectors also have difficulty determining the correct number of cables for an installed cable tray. The tables proposed to be added to new Annex are designed to reduce errors and provide the contractor the ease of use similar in design and style to those currently located in Annex C.
The information used to generate the tables is contained within the 2008 NFPA 70. The formulas used are based on the cable types, ampacities and sizes as required in NEC section 392.9 and 392.11. The tables are based on single conductor diameters currently located in NFPA 70, Chapter 9 Table 8. Multi-conductor cable diameters are based on worst case diameters reviewed from each all North American Copper/Aluminum multiconductor cable manufacturers. The inside width and fill depth of cable tray is restricted by NEMA VE1 as referenced in NEC 392.1. The proposed cable tray tables have the most common combination of cable types and conductors. It will serve as guideline for the typical cable tray installation and will allow the less common installation to continue to rely on the formulas in the existing code.
Panel Meeting Action: Reject
Panel Statement: The panel found errors in the table; technical information is not correct.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

16-351 Log #4830a NEC-P16 **Final Action: Reject**
(Annex I (New))

Submitter: T. David Mills, T. David Mills Associates
Recommendation: Add new Annex I as follows:
Annex I
Annex I is not a part of the requirements of this NFPA document. It is included for informational purposes only and does not form a mandatory part of the requirements of this Code.
This informational annex provides a list of referenced documents referred to by Fine Print Notes within other sections of this Code. It is recognized that this list is current at the time of publication but that new documents or modifications to existing documents can occur at any time while this edition of the Code is in effect.
(1) NFPA 251-2006, Standard Methods of Tests of Fire Resistance of Building Construction and Materials - one method of determining fire rating
(2) UL 60950-1-2003, Standard for Safety of Information Technology Equipment - for one way to determine applicable requirements for listing of information technology (computer) equipment
(3) NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces - for one method of defining low smoke-producing cable as a maximum peak optical density of 0.5 and a maximum average optical density of 0.15.
(4) ANSI/UL 1666- 2002, Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts - for one method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor
(5) UL
1685-2000, Standard for Safety for Vertical-Tray Fire- Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables - for one method of defining “resistant to the spread of fire” by using the “UL Flame Exposure, Vertical Tray Flame Test”
(6) CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables - for another method of defining “resistant to the spread of fire”
(7) ANSI/UL 1581-2001, Reference Standard for Electrical Wires, Cables and Flexible Cords - for one method of determining that cable is resistant to flame spread by use of the VW-1 (vertical wire) flame test.
(8) UL 2196-2002, Standard for Tests of Fire Resistive Cables - for one method of defining circuit integrity by establishing a minimum 2-hour fire resistance rating
(9) UL 2024, Standard for Optical Fiber Cable Raceway - for one method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor by using the Test for Flame Propagation (Riser)
(10) NFPA 72®-2007, National Fire Alarm Code® - for further information on the installation and monitoring for integrity requirements for fire alarm systems
(11) ANSI/UL 1666-2002, Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts - for one method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor
This proposal has also been sent to Code-Making Panel 3.
Substantiation: The number of fine print notes (FPNs) solely to reference other documents has grown significantly and many are repeated verbatim in several different sections of the Code. This situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without duplicating paragraphs of words. The Code would be easier to read and printing costs could be reduced as well.
I plan to recommend a revision to the NEC Manual of Style section 4.2 allowing the creation of just such an annex.
Panel Meeting Action: Reject
Panel Statement: The FPNs are more user-friendly in current locations.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

3-340 Log #4830 NEC-P03 **Final Action: Reject**
(Annex I (New))

Submitter: T. David Mills, T. David Mills Associates
Recommendation: Add new Annex I as follows:

Panel Statement: See the panel statement on Proposal 3-72.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
SANDERS, M.: See my Explanation of Negative for Proposal 3-72.

Annex K

1-276b Log #468 NEC-P01 **Final Action: Reject**
(Annex K (New))

Submitter: Joseph A. Tedesco, Tedesco Electrical Code Consultants, Inc.
Recommendation: Add new text from NFPA 70E Annex K to read as follows:
This annex is not a part of the requirements of this NFPA document but is included for informational purposes only.
XX.1 General Categories.
There are three general categories of electrical hazards: electrical shock, arc-flash, and arc-blast.
XX.2 Electric Shock.
Approximately 30,000 nonfatal electrical shock accidents occur each year. The National Safety Council estimates that about 1000 fatalities each year are due to electrocution, more than half of them while servicing energized systems of less than 600 volts. Electrocution is the fourth leading cause of industrial fatalities, after traffic, homicide, and construction accidents. The current required to light a 71/2 watt, 120 volt lamp, if passed across the chest, is enough to cause a fatality. The most damaging paths through the body are through the lungs, heart, and brain.
XX.3 Arc-Flash.
When an electric current passes through air between ungrounded conductors or between ungrounded conductors and grounded conductors, the temperatures can reach 35,000F. Exposure to these extreme temperatures both burns the skin directly and causes ignition of clothing, which adds to the burn injury. The majority of hospital admissions due to electrical accidents are from arc-flash burns, not from shocks. Each year more than 2,000 people are admitted to burn centers with severe arc-flash burns. Arc-flashes can and do kill at distances of 10 ft.
XX.4 Arc-Blast.
The tremendous temperatures of the arc cause the explosive expansion of both the surrounding air and the metal in the arc path. For example, copper expands by a factor of 67,000 times when it turns from a solid to a vapor. The danger associated with this expansion is one of high pressures, sound, and shrapnel. The high pressures can easily exceed hundreds or even thousands of pounds per square foot, knocking workers off ladders, rupturing eardrums, and collapsing lungs. The sounds associated with these pressures can exceed 160 dB. Finally, material and molten metal is expelled away from the arc at speeds exceeding 700 miles per hour, fast enough for shrapnel to completely penetrate the human body.
Substantiation: NFPA 70E is not adopted by many, and parts of it should be in an Annex in the NEC.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Annex L

8-291 Log #492 NEC-P08 **Final Action: Reject**
(Annex L-(New))

Submitter: Joe Tedesco, Tedesco Electrical Code Consultants, Inc.
Recommendation: Add new text as follows:
Annex L: Removal of abandoned wiring & equipment
Substantiation: Remove abandoned wiring to source of supply.
Remove exposed abandoned conduit, including abandoned conduit above accessible ceiling finishes. Cut conduit flush with walls and floors, and patch surfaces.
Disconnect abandoned outlets and remove devices. Remove abandoned outlets if conduit servicing them is abandoned and removed. Provide blank cover for abandoned outlets which are not removed.
Disconnect and remove abandoned panelboards and distribution equipment.
Disconnect and remove electrical devices and equipment serving utilization equipment that has been removed.
Disconnect and remove abandoned luminaires. Remove brackets, stems, hangers, and other accessories.
Panel Meeting Action: Reject
Panel Statement: The proposal does not recommend specific code text as is required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
