The additional levels of ground-fault protection shall not be ~~installed~~ required as follows:

(1) On the load side of an essential electrical system transfer switch where the alternate power source overcurrent protective device is rated 1000 amperes or more.

(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es) where the alternate power source overcurrent protective device is rated 1000 amperes or more.

(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase. Essential electrical systems where the alternate power source overcurrent protective device is rated 1000 amperes or more and the system is designed under engineering supervision, shall be permitted to have ground-fault protection.

Substantiation: There is a trend toward larger regional hospitals with generators that exceed 2 megawatts of output where there is the potential for a system meltdown in the event of a large ground fault. This proposal provides the provision for an engineer to utilize ground-fault protection at the engineer's discretion. Multiple levels of GFP on both the normal and alternate source sides of large systems may be needed to isolate such faults as close to their point of occurrence as possible, thus providing a level of selective coordination and yielding the minimum disruption to the essential electrical system.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 15-33.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-38 Log #21 NEC-P15 **Final Action: Reject**
(517.17(B)(2))

NOTE: This proposal appeared as Comment 15-23 on Proposal 15-29 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-29 was:
Delete the following text from 517.17(B):
~~**The additional levels of ground-fault protection shall not be installed as follows:**~~
~~**(1) On the load side of an essential electrical system transfer switch**~~
~~**(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es)**~~
~~**(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase**~~
Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC
Recommendation: Continue to reject 15-29 which applies to 517.17 Ground-Fault Protection. Add the following sentence to 517.17(B)(2):
For solidly grounded wye-emergency systems of more than 150 volts to ground and circuit-protective devices rated 1000 or more, refer to 700.7(D).
(Note: The intent is to refer to the language in the 2005 edition. If this wording is deleted, the entire text of 517.17(B)(2) shall be added here.)
Substantiation: Regardless of the size of the alternate source, ground-fault interruption on the alternate source overcurrent device can cause interruption of the alternate source feed to health care facility essential system loads. Automatic disconnecting should not be provided under any circumstances. 517.17(B) states, "The additional levels of ground-fault protection shall not be installed as follows: (1) On the load side of the essential electrical system transfer switch, (2) Between the onsite generating unit as described in 517.35(B) and the essential electrical system transfer switch(es). For many years, 517.17 warned against placing GFP interruption between the alternate source and the transfer switch(es). This warning has now become a prohibition. There are documented instances where GFP interrupted the normal source and the alternate source, leaving critical care areas without normal or alternate power.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-33.

Ballot Not Returned: 1 Lau, L.

15-39 Log #685 NEC-P15 **Final Action: Reject**
(517.17(B)(6))

Submitter: Marcelo Valdes, GE
Recommendation: Revise text to read as follows:
(B) Feeders. Where ground-fault protection is provided for operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load. Such protection shall consist of overcurrent devices and current transformers or other equivalent protective equipment that shall cause the feeder disconnecting means to open.
The additional levels of ground-fault protection shall not be installed as follows:
(3) On the load side of an essential electrical system transfer switch
(4) Between the onsite generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es)
(5) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase
(6) On feeders where the ground fault selectivity requirements defined in 517.17(C) are met by the feeder's phase protection without the need for the additional level of dedicated ground fault protection.
Substantiation: The addition of this fourth exception recognizes the fact that phase and ground fault protection work together. If the feeder disconnect device is small enough, it may offer perfectly selective ground fault protection without the need for a dedicated GF relay function at that level. Forced inclusion of the GF relay in a small feeder makes it very difficult or impossible to achieve a third layer of ground fault or phase selectivity causing unnecessary nuisance trips of the feeder device in systems that would otherwise be selective and meet the protection and selectivity requirement intent of the code.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Two levels of GFP using GFPE are easily verifiable in the field and should not be prohibited. The submitter's proposal prohibits this arrangement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-40 Log #686 NEC-P15 **Final Action: Accept in Principle**
(517.17(C))

Submitter: Marcelo Valdes, GE
Recommendation: Revise text to read as follows:
(C) Selectivity. Ground-fault protection for operation of the service and feeder disconnecting means shall be fully selective such that the feeder device, but not the service device, shall open on ground faults on the load side of the feeder device. ~~A six cycle minimum separation between the service and feeder ground fault tripping bands shall be provided.~~ Separation of time bands shall conform to manufacturer's recommendations and shall consider all required tolerances and disconnect device operating time~~. Operating time of the disconnecting devices shall be considered in selecting the time spread between these two bands~~ to achieve 100 percent selectivity.
Substantiation: The 6-cycle separation requirement is not universally required and is a carryover from the days of electromechanical relays operating on separate switching mechanisms. In most cases today, ground fault protection is integral to the disconnect devices upon which the GF relay operates. Manufacturer's curves include all applicable tolerances and mechanical operating time. It is not required to add artificial clearance between curves. Adding artificial delays where they are not required complicates the process of designing selective systems and slows down protection unnecessarily, potentially increasing exposure to arc flash hazard. System design and system analysis engineers should understand how coordination between devices is achieved and routinely consider manufacturer's recommendations in the selection and setting of protective devices.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Selectivity. Ground-fault protection for operation of the service and feeder disconnecting means shall be fully selective such that the feeder device, but not the service device, shall open on ground faults on the load side of the feeder device. Separation of ground-fault protection time current characteristics shall conform to manufacturer's recommendations and shall consider all required tolerances and disconnect operating time to achieve 100 percent selectivity."
Panel Statement: The panel contends that the revised wording clarifies and simplifies the language and meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-41 Log #4164 NEC-P15 **Final Action: Reject**
(517.17(C))

Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Revise text to read as follows:
(C) Selectivity. Ground-fault protection for operations of the service and feeder disconnecting means shall be fully selective such that the downstream device, not the upstream device, ~~feeder device, but not the service device~~, shall open on ground faults on the load side of the downstream ~~feeder~~ device. A six-cycle minimum separation between the service and feeder ground-fault tripping bands shall be provided. Operating time of the disconnecting devices shall be considered in selecting the time spread between these two bands to achieve 100 percent selectivity.
Substantiation: The manner in which the present text is written would only apply selectivity for the service overcurrent protective device and the feeder device but, where an over 600 volt service occurs, the first GFP device may be the feeder device at the secondary of a high voltage primary with a 480/277 volt secondary. The next level down would also be a GFP so the selectivity text must be written to also cover this application.
Panel Meeting Action: Reject
Panel Statement: The panel contends that the original language is more appropriate. The submitter failed to identify what problem he is attempting to resolve.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-42 Log #644 NEC-P15 **Final Action: Reject**
(517.17(C), FPN No. 2)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text to read as follows:
FPN No. 2: Where two-step ground-fault relaying is provided, it is important to consider the operating characteristics of the overcurrent protection provided for the service, feeder and branch circuits in order to achieve the 100 percent selectivity required by this section.
Substantiation: 100 percent selectivity is not always achieved by having a six or more cycle separation between the service and feeder ground-fault protection tripping bands, due to the fact that the service, feeder and downstream branch-circuit overcurrent devices may not be selectively coordinated.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-40, which satisfies the submitters concerns.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-43 Log #3930 NEC-P15 **Final Action: Reject**
(517.17(E))

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association (NEFA)
Recommendation: Add a new (E) to Section 517.17
(E) Restraint. Ground fault relays on the normal source side (line side of the transfer switch) that supply essential electrical systems are permitted to be restrained from operating for ground faults on the loadside of the transfer switch if the system complies with both of the following:
(1) Ground fault protection relays on the normal source side (line side of the transfer switch) are not restrained from operation for ground faults on the normal source side (line side of the transfer switch)
(2) Audible and visual signal devices indicate whenever a ground fault relay has been restrained. Instructions on the course of action to be taken in the event of an indicated ground fault shall be located at or near the sensor location.
Substantiation: For life-safety purposes and system reliability for the prevention of blackouts, it is desirable that a ground-fault on the load side of a transfer switch in an essential electrical system not take out the ground fault protection on the normal source. This proposal allows the ground fault protection on the normal source to be restrained from operating and taking down all or large portions of the entire normal system because of a ground fault on the load side of the transfer switch. For these critical life-safety-related applications, it requires both audible and visual signaling that a ground fault has occurred and that it is being restrained.
Restraining the normal system ground fault protection relays for faults on the load side of the transfer switch is consistent with the concept of continuity of service for emergency systems (700.26 & 700.7(D)), legally required standby systems (701.17), and healthcare essential electrical systems (517.17(B))
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: It is unclear how the proposed restrained GFP improves performance and reliability.
Number Eligible to Vote: 12

(517.18(A))

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
(A) Patient Bed ~~Location~~ Room. Each patient bed ~~location~~ room shall be supplied by at least two branch circuits,one from the ~~emergency system~~ critical branch and one from the normal system. All branch circuits from the normal system shall originate in the same panelboard.
Exception No. 3: A general care patient bed ~~location~~ room served from two separate transfer switches on the ~~emergency system~~ critical branch shall not be required to have circuits from the normal system.
Substantiation: To coordinate with the 2010 edition of NFPA 99. See previous proposals on definitions by the same submitter for further rationale.
Panel Meeting Action: Accept in Part
Retain "location" (3 places).
(A) Patient Bed Location. Each patient bed location shall be supplied by at least two branch circuits, one from the ~~emergency system~~ critical branch and one from the normal system. All branch circuits from the normal system shall originate in the same panelboard.
Exception No. 3: A general care patient bed location served from two separate transfer switches on the ~~emergency system~~ critical branch shall not be required to have circuits from the normal system.
Panel Statement: "Patient bed location" is needed when defining requirements for number of circuits or number of receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-45 Log #1504 NEC-P15 **Final Action: Accept**
(517.18(A) and 517.19(A))

Submitter: Patrick J. Clancy, Clancy Electric
Recommendation: Add new second paragraph to read as follows:
517.18(A) & 517.19(A): The branch circuit serving patient bed locations shall not be part of a multi-wire branch circuit.
Substantiation: The reason is because of the new requirements in 210.4 that required handle ties or 2 or 3 pole breakers to be used. This will cause more than one patient room to lose power. A problem that one room can shut off other patient room equipment, which will cause patients to not get the treatment needed. There are some pieces of equipment that operate from batteries, but the batteries have failed at times. The time it takes for a nurse to get to three could cause the patient to be injured or die.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-46 Log #2796 NEC-P15 **Final Action: Accept**
(517.18(B))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
(B) Patient Bed Location Receptacles. Each patient bed location shall be provided with a minimum of four receptacles. They shall be permitted to be of the single, duplex, quad plex, or any combination of the three, ~~or duplex types or a combination of both~~. All receptacles, whether four or more, shall be listed "hospital grade" and so identified. The grounding terminal of each receptacle shall be connected to an insulated copper equipment grounding conductor sized in accordance with Table 250.122.
Substantiation: Delete the phrase "or duplex or a combination of both" and replace it with, "duplex, quad-plex, or any combination of the three". "Hospital grade" quad receptacles are available on the market and should be permitted in these locations. Installing a quad receptacle as a replacement for a single or a duplex, especially where a single gang plaster ring has been installed, would provide the hospital maintenance with an option of not tearing out the plaster ring to replace it with a two gang plaster ring. It would permit double the number of receptacles at a single outlet without compromising safety. With the present wording in the Code, this installation would not be legal.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-47 Log #2948 NEC-P15 **Final Action: Reject**
(517.18(B))

Submitter: James Harvey, University of Michigan Hospitals / Rep. Manager of Electrical Engineering
Recommendation: Revise text to read as follows:
Each patient bed location shall be provided with a minimum of four receptacles. Fifty percent (50%) of these receptacles shall be on the emergency branch circuit, and the remaining 50% shall be connected to the normal power circuit.
Substantiation: If the patient bed location has a need for a given number of receptacles, that number needs to be available at all times. By requiring that 50% are on one circuit, and 50% are on another circuit, the probability of having the needed power at the bed location is increased. Under current wording engineers will often put a disproportionate number on one of the circuits (usually the normal power circuit), and an insufficient number on the other branch circuit (typically the emergency power circuit). If the normal power circuit is lost for whatever reason, insufficient receptacles are available to maintain the patient. This often results in the use of extension cords, or other means, inconsistent with the requirements of the life safety codes and other codes.
Panel Meeting Action: Reject
Panel Statement: The decision of splitting up of receptacles between the emergency branch and the normal branch should be made between the owner and designer. The code should not specify performance or design criteria. The code does not prohibit a 50/50 split of normal and emergency.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-52 Log #2956 NEC-P15 **Final Action: Reject**
(517.18(C))

Submitter: Fred W. Brown, HI Electron
Recommendation: Change 517.18(C) to read:
(C) Pediatric Locations. Receptacles located within the rooms, bathrooms, playrooms, activity rooms, and patient care areas of pediatric wards shall be listed tamper resistant, ~~or~~ shall employ a listed tamper resistant cover, or Electrical-Fault Circuit-Interrupter (EFCI) type.
Substantiation: U.S. Consumer Product Safety Commission (CPSC) conducted a 10 year study (1991 – 2001) of National Electronic Injury Surveillance Systems (NEISS). The data shows 24,000+ children less than 10 years old were treated in Emergency Rooms for incidents related to electrical receptacles. A similar study done by Canadian Hospitals Injury Reporting and Prevention Program (CHIRPP) 8 Year Study (1996-2003) from 14 CHIRPP Hospitals 465 children less than 9 years old were treated in Emergency Rooms for incidents related to electrical receptacles. The National Electrical Code, NFPA 70 2005 & 2008, has added requirements for tamper resistant receptacles in dwellings and Health Care pediatric areas. Electrical-Fault Circuit-Interrupter (EFCI) type receptacles give an additional type of protection to children and persons.

GFCI outlets and breakers are designed and tested to prevent death for most adults from line to ground leakage, but do not protect against death from line to neutral contact. Young adults, older adults, and children have a lower resistance to electrical current affects and are more vulnerable to injury. Tamper Resistance Receptacles are not tamperproof. These receptacles provide a reasonable means of protection against shock but are not child or foolproof.

Protection from line-to-neutral shocks is needed around children, since they do not all recognize the shock hazards and risks. Tamper Resistance outlets use a mechanical insulating shutter system to shield children from accessing live voltages on electrical receptacle sockets. Electrical-Fault Circuit-Interrupter (EFCI) uses a relay to normally disconnect electricity at the receptacle sockets. EFCI only turns electricity on at the socket when it detects the insertion of an electrical plug. The detection mechanism is an RFID tag embedded in a device plug or attached to the face of a device plug that complies with the Right Plug standard. Both Tamper Resistance and EFCI outlets provide a reasonable means of preventing line-to-neutral shocks. If proper receptacle installation is not accomplished then it may lead to more children injuries.

In the 2008 National Electrical Code Arc-Fault Circuit-Interrupter (AFCI) has been expanded to protect most 120 volt, single phase, 15 and 20 ampere branch circuits in dwelling units. AFCI technology senses parallel arcing faults in the range of 70 amperes, series arcing faults in the range of 5 amperes, and de-energize the branch circuit. Electrical-Fault Circuit-Interrupter (EFCI) would greatly improve the protection of persons and property from the use of electricity. This type of protection would help to minimize the risk of fires in dwelling units. Their sensitivity to some electrical fault conditions would be to isolate the dangerous causes of electrical fires.

During the 1999 National Electrical Code cycle there were extensive documentation presented that pointed out that most of the electrical fires that occurred in dwelling units were in wiring and equipment beyond the branch circuit overcurrent protection device. Overcurrent protection devices are to protect conductors and equipment if currents reach a value that will cause an excessive or dangerous temperature in conductors or conductor insulation. This protection is for large currents caused by short circuit, ground faults, or overloads. Article 210.19(A)(4) in the National Electrical Code (NEC) recognizes the use of ‘tap conductors’ connected to branch circuits. Tap conductors have overcurrent protection ahead of its point of supply that exceeds the value permitted for branch circuit conductors that are protected according their calculated load and allowable ampacity. Article 210.19(A)(4) Exception No. 2 allows small than 14 AWG cords where approved for and used with a specific listed appliance or luminaire. Article 310.5 in the NEC requires the minimum size conductor to be 14 AWG copper except as permitted elsewhere in the Code. The article “How Electricity Ignites Fires by John S. Robison” points out that currents far less than the design limits of branch circuit overcurrent protection devices and AFCIs are some of the causes for fires in electrical equipment, wiring, appliance cords, and other cords.

Electrical-Fault Circuit-Interrupter (EFCI) senses a lower level of fault and overload current conditions than branch circuit protection devices and AFCIs. The article "Stop Fires Before They Start by Steve Montgomery" points out that EFCI provide protection against over and under voltage, open neutral conductors, high resistance connections, damage wiring, overloading of small appliance cords, etc. that branch circuit overcurrent protection devices and AFCIs might not protect against. Even with the increased sensitive the EFCI they will not be a cause of nuisance tripping. EFCI detect a potential cause of electrical fires and safely segregate it.

A proposal similar to this was submitted to the State of Wisconsin Electrical Committee during the adoption of the 2008 National Electrical Code and to National Fire Protection Health Care (NFPA 99-82 Log #197 HEA-ELS, 4.3.2.2.6.2(D) **Receptacles for Special Area**) 2010. Both of these committees were supportive of this new technology but felt that this requirements belonged elsewhere. The State of Wisconsin Department of Commerce felt that the EFCI requirement should best be adopted at the National Fire Protection was more appropriate for NFPA 70.

Panel Meeting Action: Reject

Panel Statement: There are no product requirements for Electrical-Fault Circuit-Interrupter Protection. The Fact-Finding Investigations submitted by the two testing laboratories (CSA and Intertek) appear to be only test programs designed by the product manufacturer. They conclude that Safe Plug performs as specified by the manufacturer. A thorough study of wiring device failure mechanisms, and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the Code. Installation of these devices is not currently prohibited by the NEC.

In addition, the features proposed for receptacle power denial and overload protection of the cords are issues that would be under the jurisdiction of CMP-18 and CMP-10 respectively.

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-53 Log #4126 NEC-P15 **Final Action: Accept in Part**

(517.18(C))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal to correlate with its actions on Proposals 15-50 and 15-51.

In addition, the Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.

This action will be considered by the panel as a public comment.

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.

Recommendation: Revise text to read as follows:

(C) Pediatric Locations. Receptacles located within the rooms, bathrooms, playrooms, <u>and</u> activity rooms~~, and patient care areas~~ of pediatric ~~wards~~ <u>units, other than nurseries,</u> shall be listed tamper resistant or shall employ a listed tamper resistant cover.

Substantiation: This proposal came out of the public comments for the NFPA 99 Technical Systems Technical Committee, and in recognition of real-world performance issues in health care facilities. It is based on the fact that hospitals are no longer built with wards. It also recognizes that in nurseries, the hazard of children playing with outlets is much less than in room occupied by older children. This requirement was carefully word-smithed by our committee of many engineers who design and operate hospitals around the country, with the great assistance of the physician who sits on our committee. This proposal is a performance requirement that will appear as proposed here in the next edition of NFPA 99, and it is crucial that NFPA 70 coordinate with this language to avoid confusion.

Panel Meeting Action: Accept in Part

The action is to accept the insertion of the terms "other than nurseries" and to reject all other changes. In order to correlate with action on proposal 15-50 part (C) the remaining will be edited as follows:

Retain the text:

(C) Pediatric Locations. Receptacles located within the rooms, bathrooms, playrooms, activity rooms, and patient care areas of <u>designated</u> pediatric ~~wards~~ <u>locations, other than nurseries,</u> shall be listed tamper- resistant or shall employ a listed tamper resistant cover.

Panel Statement: The panel agrees with the submitter's substantiation to exempt nurseries. The panel action also coordinates this proposal with the action taken on Proposal 15-50.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-54 Log #2949 NEC-P15 **Final Action: Reject**

(517.19(B))

Submitter: James Harvey, University of Michigan Hospitals / Rep. Manager of Electrical Engineering

Recommendation: Revise text to read as follows:

Each patient bed location shall be provided with a minimum of six receptacles,~~ at least one~~ fifty percent (50%) of which shall be connected to ~~either~~ each of the following:

(1) The normal system branch required in 517.19(A)

(2) An emergency system branch supplied circuit supplied by a different transfer switch than the other receptacles at the same location.

Substantiation: If the critical care patient bed location has a need for a given number of receptacles, that number needs to be available at all times. By requiring that 50% are on one circuit, and 50% are on another circuit, the probability of having the needed power at the bed location is increased. Under current wording engineers will often put a disproportionate number on one of the circuits (usually the normal power circuit) and an insufficient number on the other branch circuit (typically the emergency power circuit). If the normal power circuit is lost for whatever reason, insufficient receptacles are available to maintain the patient. This often results in the use of extension cords, or other means, inconsistent with the requirements of the life safety codes and other codes.

Panel Meeting Action: Reject

Panel Statement: The decision of splitting up of receptacles between the emergency branch and the normal branch should be made between the owner and designer. The code should not specify performance or design criteria. The code does not prohibit a 50/50 split of normal and emergency.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-55 Log #4125 NEC-P15 **Final Action: Accept in Part**

(517.19(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal to correlate with its actions on Proposals 15-57 and 15-58.

In addition, the Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.

This action will be considered by the panel as a public comment.

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.

Recommendation: Revise text to read as follows:

(B) Patient Bed ~~Location~~ <u>Room</u> Receptacles.

(1) Minimum Number and Supply. Each patient bed location shall be provided with a minimum of ~~six~~ <u>fourteen</u> receptacles, at least ~~one~~ <u>four</u> of which shall be connected to either of the following:

(1) The normal system branch circuit required in 517.19(A)

(2) A~~n emergency system~~ <u>critical branch</u> circuit supplied by a different transfer switch than the other receptacles at the same location

(2) Receptacle requirements. The receptacles required in 517.19(B)(1) shall be permitted to be of the single or duplex types or a combination of both. All such receptacles shall be listed "hospital grade" and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

Substantiation: This proposal came out of the public comments for the NFPA 99 Technical Systems Technical Committee, and in recognition of real-world performance issues in health care facilities. This requirement reflects the growing need for cord-and-plug equipped electro-medical equipment in operating rooms today. This requirement was carefully word-smithed by our committee of many engineers who design and operate hospitals around the country, with the great assistance of the physician who sits on our committee. This proposal is a performance requirement that will appear as proposed here in the next edition of NFPA 99, and it is crucial that NFPA 70 coordinate with this language to avoid confusion.

Panel Meeting Action: Accept in Part

Retain "location" in title of (B).

(B) Patient Bed <u>Location</u> Receptacles.

(1) Minimum Number and Supply. Each patient bed location shall be provided with a minimum of ~~six~~ <u>fourteen</u> receptacles, at least ~~one~~ <u>four</u> of which shall be connected to either of the following:

(1) The normal system branch circuit required in 517.19(A)

(2) A~~n emergency system~~ <u>critical branch</u> circuit supplied by a different transfer switch than the other receptacles at the same location

(2) Receptacle Requirements. The receptacles required in 517.19(B)(1) shall be permitted to be of the single or duplex types or a combination of both. All such receptacles shall be listed "hospital grade" and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

Panel Statement: "Patient bed location" is needed when defining requirements for number of circuits or number of receptacles.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-56 Log #1738 NEC-P15 **Final Action: Reject**
(517.19(B)(2))

Submitter: Mark Christian, Hixson, TN
Recommendation: Add new text to read as follows:
Receptacles shall have an integral light indicating the receptacle is powered or be part of a listed headwall assembly that provides indication of power to each receptacle.
Substantiation: Acceptance of this proposal would provide visual indication to medical staff that normal or emergency power is available from a receptacle for critical medical equipment. This would assist personnel in knowing whether or not an equipment issue is related to the equipment or the power source, thereby facilitating faster responses to loss of equipment function. If power is lost to a receptacle, medical staff could quickly identify receptacles that continue to be active or supplied by emergency sources.
Although critical equipment may be provided with indicator lights that depict the unit is connected to the electrical supply, these indicators would not readily demonstrate which receptacle can be used to ensure further operation. Critical equipment is often accompanied by a battery backup. While the battery backup will sustain equipment operation for a certain time, the element of time is important. Assuming that a power interruption may affect several rooms at one time, the lighted receptacle will facilitate personnel in locating active receptacles in less time, and provide medical staff with time to tend to multiple patients or other situations that occur.
Lighted receptacles on the market today use LEDs for power indication. LEDs are known to have very long lives, which is a key selling point for the many new LED lighting products. In the very rare event that an indicator light fails, medical personnel could use indicators on the equipment to verify that it is still operating from the electrical supply source.
The receptacle indicator lights, while readily visible, are sufficiently subdued that they should not disturb patients. General lighting in critical care areas are much more of a distraction than tiny LEDs with minimal output. The LED, while intended as a safety feature, may also limit the number of times medical staff has to use general lighting to plug a cord into a receptacle to verify power access, therefore, not having to disturb the patient when connecting or moving equipment.
Panel Meeting Action: Reject
Panel Statement: There has been no new compelling substantiation of the need submitted for this requirement since this same proposal was rejected in the 2008 cycle. See Comment 15-26 (on Proposal 15-34) in the 2008 cycle. This proposal is performance criteria and therefore the submitter should make a proposal to NFPA 99.
Number Eligible to Vote: 12

This action will be considered by the panel as a public comment.
Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
(B) Patient Bed Location Receptacles.
(1) Minimum Number and Supply. Each patient bed location shall be provided with a minimum of six receptacles, at least one of which shall be connected to either of the following:
(1) The normal system branch circuit required in 517.19(A)
(2) An emergency system branch circuit supplied by a different transfer switch than the other receptacles at the same location.
(2) Receptacle Requirements. The receptacles required in 517.19(B)(1) shall be permitted to be of the single, duplex, quad-plex, or any combination of the three. ~~or duplex types or a combination of both.~~ All receptacles, whether six or more, shall be listed "hospital grade" and so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.
Substantiation: Delete the phrase "or duplex types or a combination of both", and replace it with "duplex, quad-plex, or any combination of the three. "Hospital grade" quad receptacles are available on the market, and should be permitted in these locations: Installing a quad receptacle as a replacement for a single or duplex, especially where a single gang plaster ring has been installed, would provide the hospital maintenance with an option of not tearing out the plaster ting to replace it with a two gang plaster ring. It would permit double the number of receptacles at a single outlet without compromising safety. With the present wording in the Code, this installation would not be legal.

(517.19(C))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal to correlate with its action on Proposals 15-57 and 15-58.
The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Add new text to read as follows:
(C) Operating Room Receptacles.
(1) Minimum Number and Supply. Each operating rooms shall be provided with a minimum of thirty six receptacles, at least twelve of which shall be connected to either of the following:
(1) The normal system branch circuit required in 517.19(A)
(2) A critical branch circuit supplied by a different transfer switch than the other receptacles at the same location
(2) Receptacle Requirements. The receptacles required in 517.19(C)(1) shall be permitted to be of the single or duplex types or a combination of both. All receptacles, whether thirty six or more, shall be listed "hospital grade" and so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.
Renumber other paragraphs accordingly.
Substantiation: This proposal came out of the public comments for the NFPA 99 Technical Systems Technical Committee, and in recognition of real-world performance issues in health care facilities. This requirement reflects the growing need for cord-and-plug equipped electro-medical equipment in operating rooms today. This requirement was carefully word-smithed by our committee of many engineers who design and operate hospitals around the country, with the great assistance of the physician who sits on our committee. This proposal is a performance requirement that will appear as proposed here in the next edition of NFPA 99, and it is crucial that NFPA 70 coordinate with this language to avoid confusion.
Panel Meeting Action: Accept in Principle
Revise the text to read as follows:
(C) Operating Room Receptacles.
(1) Minimum Number and Supply. Each operating rooms shall be provided with a minimum of 36 receptacles, at least 12 of which shall be connected to either of the following:
(1) The normal system branch circuit required in 517.19(A)
(2) A critical branch circuit supplied by a different transfer switch than the other receptacles at the same location
(2) Receptacle Requirements. The receptacles required in 517.19(C)(1) shall be permitted to be of the single or duplex types or a combination of both.

All receptacles, whether 36 or more, shall be listed "hospital grade" and so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

Renumber other paragraphs accordingly.

Panel Statement: The panel accepts the proposal and made an editorial change by changing rooms to room in the first sentence.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-60 Log #2220 NEC-P15 **Final Action: Accept in Principle**

(517.19(D))

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Revise text to read as follows:

(D) Panelboard Grounding and Bonding. Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable that qualifies as an equipment grounding conductor in accordance with 250.118 is installed, grounding of a ~~panelboard or switchboard~~ switchboard or panelboard enclosure shall be ensured by one of the following bonding means at each termination or junction point of the metal raceway or Type MC or MI cable:

Substantiation: The definition for "panelboard" in Article 100 makes it clear that **it is actually the cabinet or cutout box (enclosure) that is grounded and bonded** by the feeder wiring method specified in 517.19(D). The "panelboard" is grounded and bonded by adherence to the manufacturer's listing or labeling installation instructions as addressed in 110.3 (B) when the assembly is completed beyond the "rough" installation phase. This proposed addition of one word, and minor rearrangement of words, clarifies what is intended by this section.

Panel Meeting Action: Accept in Principle

Change Title to "Equipment Grounding and Bonding".

Replace "grounding of a panelboard or switchboard" with "grounding of enclosures and equipment such as panelboards and switchboards".

Panel Statement: The new title is more accurate, and will also help avoid confusion with 517.14, which is entitled "Panelboard Bonding".

The panel also contends that the revised wording clarifies and simplifies the language and meets the intent of the submitter.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-61 Log #4123 NEC-P15 **Final Action: Accept**

(517.19(E))

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.

This action will be considered by the panel as a public comment.

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.

Recommendation: Revise text to read as follows:

(E) Additional Protective Techniques in Critical Care Areas (Optional). Isolated power systems shall be permitted to be used for critical care ~~areas~~ rooms, and, if used, the isolated power system equipment shall be listed as isolated power equipment. The isolated power system shall be designed and installed in accordance with 517.160.

Substantiation: To coordinate with the 2010 edition of NFPA 99. See previous proposals by the same author with respect to the needs for definition changes which drove this proposal.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 2

Ballot Not Returned: 1 Lau, L.

Explanation of Negative:

SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word "emergency" from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.

WHITE, A.: The code making cycle for NFPA 99 is not yet complete. Any action taken before this standard is issued by Standards Council is premature.

15-62 Log #1435 NEC-P15 **Final Action: Accept in Part**

(517.19(F))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: Isolated Power System Equipment Grounding Conductor. Where an isolated ~~ungrounded~~ power system source ~~is used and~~ limits the ~~first~~ fault current to a ~~low magnitude~~ value less than the maximum available fault current acceptable to the authority having jurisdiction, the equipment grounding conductor... (remainder unchanged).

Substantiation: Present wording implies the system is grounded. "Low magnitude" is not defined: if not feasible to specify a value perhaps the AHJ should make the determination. "Ungrounded" and "source" are superfluous.

Panel Meeting Action: Accept in Part

Accept the term "equipment" in two places. Everything else is rejected.

(F) Isolated Power System Equipment Grounding. Where an isolated ungrounded power source is used and limits the first fault current to a low magnitude, the equipment grounding conductor...". (remainder unchanged).

Panel Statement: The panel accepts the addition of the word "equipment" in both places. The system is not grounded intentionally so the word "ungrounded" should remain. The remainder of the proposed changes make this unenforceable as fault current thresholds are established by the healthcare industry and the equipment, not by the AHJ.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-63 Log #2435 NEC-P15 **Final Action: Reject**

(517.20(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.

Recommendation: Revise text to read as follows:

(A) Receptacles and Fixed Equipment. All receptacles and fixed equipment within the area of the wet procedure location shall have ~~ground fault circuit-interrupter~~ power safe protector protection for personnel if interruption of power under fault conditions can be tolerated, or be served by an isolated power system if such interruption cannot be tolerated.

Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.

The Power Safe Protector (PSP) device overcomes these limitations in three ways:

1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.

2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.

3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: There are no product standard requirements for the PSP receptacle and as such it is inappropriate to consider adding such requirements to the code. A study of wiring device failure mechanisms along with evidence that the technology can mitigate the hazards claimed is necessary before further consideration can be given.

The Panel notes that there is nothing in the NEC prohibiting installation of these devices.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Lau, L.

15-64 Log #2926 NEC-P15 **Final Action: Accept in Principle**
(517.20(A))

TCC Action: The Technical Correlating Committee directs that the panel reconsider the action taken on this proposal as to whether both list items are required together or individually.
This action will be considered by the panel as a public comment.
Submitter: Burton R. Klein, Burton Klein Associates
Recommendation: Revise wording to read:
"Wet (procedure) location patient care areas shall be provided with special protection against electric shock, either:
(1) A power distribution system that inherently limits the possible ground-fault current due to a first fault to a low value, without interrupting the power supply, or
(2) A power distribution system in which the power supply is interrupted if the ground-fault current does, in fact, exceed a value of 6 mA.
Substantiation: Text currently extracted, paragraphs 4.3.2.2.8.4 and 4.3.2.2.8.5 from NFPA 99, is only partially extracted and incomplete text. It is also a cause of misinterpretation with respect to the phrase "can be tolerated" and "cannot be tolerated." Main issue is what type of system is to be installed in a wet procedure location: one that interrupts power when a certain current flow is reached, or a system that limits possible ground due to first fault but without interrupting power supply. The proposal is wording from paragraph 4.3.2.2.8.1.
Extracted text is not to change the intent of requirements, in this instance the performance criteria intended, per NFPA Extract Policy.
Panel Meeting Action: Accept in Principle
Revise wording to read:
(A) **Receptacles and Fixed Equipment.** Wet procedure location patient care areas shall be provided with special protection against electric shock, either:
(1) A power distribution system that inherently limits the possible ground-fault current due to a first fault to a low value, without interrupting the power supply, or
(2) A power distribution system in which the power supply is interrupted if the ground-fault current does, in fact, exceed a value of 6 mA.
Panel Statement: The panel accepts the proposed changes, however notes that the Title of 517.20(A) has not changed and the exceptions to (A) will remain.

15-67 Log #4108 NEC-P15 **Final Action: Reject**
(517.26)

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Delete text to read as follows:
~~**517.26 Application of Other Articles.** The essential electrical system shall meet the requirements of Article 700, except as amended by Article 517.~~
Substantiation: The electrical distribution systems in health care facilities are different from those in other kinds of buildings, and they are called on to perform differently than those in other kinds of buildings. Accordingly, the general requirements for emergency systems in 700, good as they are, not not, in many cases, work when applied to health care facilities. Indeed, as noted in other proposals, they can often compromise the performance of the very systems they seek to protect. Accordingly, it is vital to ensure the proper definition of performance of these systems clearly and distinctly so as to meet the many complicated demands on the systems. Exactly these issues are the subject of much debate on the electrical Systems Technical Committee of NFPA 99, which I chair. That committee, composed of many electrical engineers with hundreds of years of experience designing and operating health care facilities between them, together with the medical expertise in the form of physicians on the committee allow that committee to focus on,and best define the peculiar needs of these buildings. This proposal will bring NFPA 70 into conformance with NFPA 99, and, thus, reduce confusion.
Panel Meeting Action: Reject
Panel Statement: The life safety branch, or at least parts thereof, will be decreed by many (building code, municipalities, etc.) as "emergency", bringing in the requirements of Article 700. Without a modifying statement within Article 517, no deviations from Article 700 will be acceptable, causing issues with number of transfer switches, generator sizing, and perhaps other areas."
See action on Proposal 15-68.
Number Eligible to Vote: 12

(517.26)

TCC Action: The Technical Correlating Committee directs that the panel reconsider the panel action on this proposal and correlate it with the action taken on Proposal 15-13.
This action will be considered by the panel as a public comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows: "The life safety branch of the emergency system shall meet the requirements of Article 700, except as modified by Article 517."
Substantiation: Essential electrical systems have three components, only one of which is pure Art. 700 (the life safety branch). The other half of the "emergency system" is the critical branch, which does not refer to Art. 700 within its definition, and is probably closer to Article 701 (legally required standby) than Article 700. Although it does have the same reconnection time of 10 seconds, it is not allowed to enter a common raceway with circuits on the life safety branch, by 517.30(C)(1). This proposal clarifies that Article 700 is not the appropriate article to include as applicable in its entirety (except as specifically modified here) for the critical branch and certainly not the equipment system. The "equipment system" is plainly not Art. 700 or even Article 701, with numerous permissions for delayed automatic or even manual reconnection to power. This proposal also mitigates the supposed mandatory application of 700.27 in hospital settings.
Panel Meeting Action: Accept in Principle
Revise as follows:
The life safety branch of the <u>essential electrical</u> system shall meet the requirements of Article 700, except as modified by Article 517.
Panel Statement: The panel revised the wording "emergency" to "essential electrical", for consistency with Proposal 15-72.

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
(E) Receptacle Identification. The cover plates for the electrical receptacles or the electrical receptacles themselves supplied from the ~~emergency~~ essential electrical system shall have a distinctive color or making so as to be readily identifiable. [**99:**4.4.2.2.4.2(B)]
Substantiation: To coordinate with the 2010 edition of NFPA 99. See previous proposals by this author regarding the need for changing the definitions for words used in this proposal.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2
Ballot Not Returned: 1 Lau, L.
Explanation of Negative:
SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word "emergency" from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.
WHITE, A.: The code making cycle for NFPA 99 is not yet complete. Any action taken before this standard is issued by Standards Council is premature.

15-72 Log #4122 NEC-P15 **Final Action: Accept**
(517.30(B)(1), (2), and (3))

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
(1) Separate Branches ~~Systems~~. Essential electrical systems for hospitals shall be comprised of three separate branches ~~two separate systems~~ capable of supplying a limited amount of lighting and power service that is considered essential for life safety and effective hospital operation during the time the normal electrical service is interrupted for any reason. The branches are: life safety, critical, and equipment. ~~These two systems shall be the emergency system and the equipment system.~~
~~**(2) Emergency Systems.** The emergency system shall be limited to circuits essential to life safety and critical patient care. These are designated the life safety branch and the critical branch. [99:4.4.2.2.1.1]~~

~~**(3) Equipment System.** The equipment system shall supply major electrical equipment necessary for patient care and basic hospital operation.~~

Modify the diagrams in FPN 517.30 Number 1 to correspond with this change.

Substantiation: The electrical distribution systems in health care facilities are different from those in other kinds of buildings, and they are called on to perform differently than those in other kinds of buildings. Accordingly, the general requirements for emergency systems in 700, good as they are, do not, in many cases, work when applied to health care facilities. Indeed, as noted in other proposals, they can often compromise the performance of the very systems they seek to protect. Accordingly, it is vital to ensure the proper definition of performance of these systems clearly and distinctively so as to meet the many complicated demands on the systems. Exactly these issues are the subject of much debate on the Electrical Systems Technical Committee of NFPA 99, which I chair. That committee, composed of many electrical engineers with hundreds of years of experience designing and operating health care facilities between them, together with the medical expertise in the form of physicians on the committee allow that committee to focus on, and best define the peculiar needs of these buildings. This proposal will bring NFPA 70 into conformance with NFPA 99, and thus, reduce confusion. As noted in other proposals by this commenter, on behalf of that committee, that committee has redefined the essential electrical system of a health care facility to be comprised of three branches, and not of any "systems." This proposal reflects that change.

See also proposal related to 517.34.

15-74 Log #2798 NEC-P15 **Final Action: Accept in Principle**
(517.30(C)(1))

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Add new text as follows:

(C) Wiring Requirements.

(1) Separation from Other Circuits. The life safety branch and critical branch of the emergency system shall be kept entirely independent of all other wiring and equipment and shall not enter the same raceways, boxes, or cabinets with each other or other wiring.

Where general care locations are served from two separate transfer switches on the emergency system in accordance with Section 517.18(A), Exception No. 3, the general care circuits from the two separate systems shall be kept independent of each other.

Where critical care locations are served from two separate transfer switches on the emergency system in accordance with Section 517.19(A), Exception No. 2, the critical care circuits from the two separate systems shall be kept independent of each other.

(the remainder to say the same)

Substantiation: Where the normal electrical system is not used in lieu of using the emergency power system, two transfer switches are required to provide for separation of the emergency system or redundancy, but the circuits are then permitted to be mixed together in raceways, enclosures, and other wiring methods and we lose the separation. A short in one conductor associated with one transfer switch can cause failure in the insulation of a circuit conductor in the other transfer switch power circuit causing them both to go down. The separation for these different essential circuits should remain as the way to the headboard, power module, power boom, or similar equipment and can certainly take the place in the already divided headboard where the normal circuit would be terminated.

Panel Meeting Action: Accept in Principle

Revise text as follows:

NOTE: This proposal appeared as Comment 15-39 on Proposal 15-54 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-54 was:

Revise text to read as follows:

(3) Mechanical Protection of the Emergency System. The wiring of the emergency system in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and 517.13(B). The following wiring methods shall be permitted:

(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 rigid nonmetallic conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

<u>(2) Listed MC cable identified as providing crush, impact and penetration circuit protection performance equivalent to Electrical Metallic Tubing.</u>

(~~2~~ <u>3</u>) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 rigid nonmetallic conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(~~3~~ <u>4</u>) Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:

a. Where used in listed prefabricated medical headwalls

b. In listed office furnishings

c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage

d. Where necessary for flexible connection to equipment

(~~4~~ <u>5</u>) Flexible power cords of appliances or other utilization equipment connected to the emergency system.

(~~5~~ <u>6</u>) Secondary circuits of Class 2 or Class 3 communication or signaling systems

Submitter: Phil Simmons, Rep. National Armored Cable Manufacturers
Recommendation: Revise 517.30(C)(3) as follows:

(3) Mechanical Protection of the Emergency System. The wiring of the emergency system in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and 517.13(B). The following wiring methods shall be permitted:

(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 rigid PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 rigid PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(3) Listed flexible metal raceways and listed metal-sheathed cable<u>s.</u> ~~assemblies in any of the following:~~

~~a. Where used in listed prefabricated medical headwalls~~

~~b. In listed office furnishings~~

~~c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage~~

~~d. Where necessary for flexible connection to equipment.~~

(4) Flexible power cords of appliances or other utilization equipment connected to the emergency system.

(5) Secondary circuits of Class 2 or Class 3 communication or signaling systems with or without raceways.

FPN: See 517.13 for additional grounding requirements in patient care areas.

Substantiation: Listed Type AC and Type MC cables are more than adequate to provide mechanical protection of the emergency systems in hospitals and should be accepted for that purpose. In fact, Code Panel 15 made that appropriate conclusion in its Panel Statement on Proposal 15-42 for the 2005 NEC. CMP 15 stated in part, "Types AC and MC cables that are listed provide adequate physical and mechanical protection for the emergency system of health care facilities." We agree with the Panel's conclusion. However, we feel the Panel inappropriately, and without technical justification for such action, limited the use of Type MC and AC cables as shown in the 2005 NEC.

Adequate documentation on the rigorous testing Type AC and MC cables must pass to be listed was submitted with Proposal 15-42. This documentation, plus the satisfactory field experience of CMP-15 members, no doubt led to the conclusion reached by the Panel in processing the 2005 NEC.

Type AC and MC cables are required to satisfactorily pass brutal treatment during the listing process. The testing includes crushing, bending and elongating. The tests the cables must satisfactorily pass are no doubt harsher than would be expected during installation of the cables.

The UL Fact-Finding Report on Nail Penetration of Types AC and MC Cable Installed Parallel to Framing Members (provided) show the cable is more resistant to damage from nails and screws than is Electrical Metallic Tubing. Type MC and AC cables need to be accepted for mechanical protection of the emergency system in hospitals to be treated equally.

It should be noted that items (3)(1) and (3)(2) in the list of accepted uses of listed flexible metal raceways and listed metal-sheathed cables seem to be incorrect as the wiring methods used in the construction of listed equipment by the manufacturer is controlled by the UL Safety Standard that regulates the construction of such equipment. See also 90.7 for an explanation of field examination or evaluation of listed equipment.

The information in this comment should not be considered a new concept as the issue has been before the Panel during the processing of both the 2005 and 2008 NECs.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: At this time the panel is not aware of any MC cable that has the crush, impact, and penetration circuit protection performance equivalent to EMT. The submitter has not referenced any type MC cable that performs equivalent to EMT in this regard. The panel is not receptive to writing code around products that do not exist yet.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-79 Log #959 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
~~MECHANICAL PHYSICAL PROTECTION OF THE~~ EMERGENCY SYSTEM WIRING METHODS. The fixed wiring of the emergency system in hospitals shall ~~be~~ comply with this section. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and (B). Feeder circuit wiring shall comply with 700.9(D)(1). The following wiring methods shall be employed ~~used~~
Delete (1) and (2).
Add: Exception: to first paragraph; Where encased in not less than 50 mm (2 in.) of concrete Schedule 40 or 80 PVC conduit, flexible nonmetallic raceways, nonmetallic jacketed metal raceways, or nonmetallic jacketed metallic cable assemblies listed for installation shall be permitted.
Substantiation: Edit. “Mechanical” implies machinery or tools. “Permitted” doesn’t require any of the wiring methods specified per 90.5(B). Section 230.43 for example is specific. Reference should be made to 700.9(D)(1) for feeders. If the proposed exception for branch circuits is accepted a corresponding provision should be made for 517.13(A) to avoid a conflict.
Panel Meeting Action: Reject
Panel Statement: The title of the section defines the purpose of the requirements: protecting the electrical distribution of the emergency system. Encasing a non-metallic wiring method in concrete is means of providing protection of the emergency system, but in itself is not a wiring method. By listing the permitted methods, but not restricting the language to these methods only, installers and inspectors are able to use alternative methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-80 Log #1438 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: ~~Mechanical~~ Physical Protection of the Emergency Systems. The wiring of the emergency system in hospitals shall be ~~mechanically~~ protected by identified means where likely to be subject to physical damage.
Substantiation: Edit. “mechanical” implies machinery or tools and is not the standard terminology used in similar sections. Different wording pertaining to the same thing may cause confusion per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The requirement for protection of these systems is to maintain a supply of power. The change would introduce a level of confusion not present in the existing language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-81 Log #2209 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Nancy Heckrotte, Silverman and Light, Inc., Consulting Electrical Engineers
Recommendation: Revise 517.30(C)(3) as follows:
(3) Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:
~~a. Where used in listed prefabricated medical headwalls~~
~~b. In listed office furnishings~~
~~c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage~~
~~d. Where necessary for flexible connection to equipment~~
Substantiation: The wiring of the emergency system in hospitals is required to be mechanically protected. However, by prohibiting the use of flexible metal raceways and metallic sheathed cables in new construction of emergency systems the current code unnecessarily equates mechanical protection exclusively with the non-flexible characteristic of the currently approved metal raceways. The Panel already accepts flexible metal raceway and metallic sheathed cables in essential electrical systems for hospitals where it is fished into existing walls and ceilings. Insofar as these fished flexible metal raceways have been providing acceptable service and performance since the advent of the 2005 NEC, the remaining question is whether flexible metal raceways can adequately withstand the rigors of installation in new construction. Flexible metal raceway and metal sheathed cables are mature wiring methods that are installed nation wide every day and have been in use for over 70 years. The concern over damage to these wiring methods in new construction due to nail and screw penetration where they are supported and secured was addressed in a fact finding report that was previously supplied to the panel and which is being provided with this proposal. The report shows that the flexible wiring method is no more prone to damage than is EMT or Rigid Nonmetallic Conduit.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-84.
Number Eligible to Vote: 12

This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
(3) Mechanical protection of the ~~Emergency~~ Essential Electrical System.
The wiring of the ~~emergency~~ life safety and critical branches ~~system in hospitals~~ shall be mechanically protected. Where installed as branch circuits in patient care rooms ~~areas~~, the installation shall comply with the requirements of 517.13(A) and (B). The following wiring methods shall be permitted:
Substantiation: To coordinate with the 2010 edition of NFPA 99. See other proposals by this author for further justification for the change of definition used in this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2
Ballot Not Returned: 1 Lau, L.
Explanation of Negative:
SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word “emergency” from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.
WHITE, A.: The code making cycle for NFPA 99 is not yet complete. Any action taken before this standard is issued by Standards Council is premature.

15-83 Log #4471 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise text to read as follows:
[517.30(C)] **(3) Mechanical Protection of the Emergency System. “**The wiring of the emergency system in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and (b). Only ~~T~~the following wiring methods shall be permitted: …”.
Substantiation: The current text of the sentence that introduces the five permitted wiring methods in this section does not convey the concept of exclusivity, and the wiring methods shown can be construed as merely examples of wiring methods that are in addition to any of those covered in chapter three. By adding the word “only” at the beginning of this sentence it is made clear that these are exclusively required wiring methods, and thereby promotes greater code language clarity for code users.
Panel Meeting Action: Reject
Panel Statement: By listing the permitted methods, but not restricting the language to these methods only, installers and inspectors are able to use alternative methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.
Number Eligible to Vote: 12

15-84 Log #4542 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revised text as follows:
(3) ~~Mechanical~~ Protection of the Emergency System. The wiring of the emergency system in hospitals shall be ~~mechanically~~ protected against physical damage by installation in one or more of the following wiring methods. ~~Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and (B). The following wiring methods shall be permitted~~:
(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
(2)Type AC and Type MC cables are permitted if not likely to be damaged at the location installed or, if subject to physical damage, are protected in accordance with 300.4(A), (C), and (D) if installed through or parallel to framing members.
(3) ~~(2)~~ If ~~Where~~ encased in not less than 50 mm (2 in.) of concrete, Schedule 40 PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete.

Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
(4) ~~(3)~~ Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:
a. ~~Where used~~ In listed prefabricated medical headwalls
b. In listed office furnishings
c. ~~Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage~~
~~d.~~ If ~~Where~~ necessary for flexible connection to equipment
(5) ~~(4)~~ Flexible power cords of appliances or other utilization equipment connected to the emergency system.
(6) ~~(5)~~ Secondary circuits of Class 2 or Class 3 communication or signaling systems with or without raceways.
FPN: See 517.13 for additional grounding requirements in patient care areas.
Substantiation: It can be safely said that all wiring methods are "subject to physical damage." This phrase is far too general and subjective. At times, opponents of cable wiring methods use the simple statement in the present Code rule as license to unreasonably restrict the use of Type AC and MC cables. All wiring methods should be installed in a manner and location so the wiring method is not expected to be damaged in ordinary use, or is protected in accordance with 300.4. For example, wiring installed in walls, ceilings and floors in compliance with 300.4 can be reasonably expected to be isolated from physical damage in ordinary building operations. Can the cables be damaged in an unexpected event such as cutting a hole in the wall with a reciprocating saw to make a opening for a window or door? Certainly. However that is not likely to happen in normal building operation.
Listed Type MC cables are subject to extensive testing as prescribed in UL 1569, the applicable product safety standard. This testing ensures Type MC cables are suitable to be installed in most all ordinary locations and in those hazardous locations as prescribed in other locations in the Code. Section 330.17 requires Type MC cables to be protected against physical damage in accordance with the appropriate sections of 300.4.
Listed Type AC cables are subject to extensive testing as prescribed in UL 4, the applicable product safety standard. This testing ensures Type AC cables are suitable to be installed in most all ordinary locations. Section 320.17 requires Type AC cables to be protected against physical damage in accordance with the appropriate sections of 300.4.
Section 3.2.5.5 of the NEC Style Manual states that the phrase "protection against physical damage" is preferred over "mechanical protection." This proposal intends to bring this section into compliance with this section of the Style Manual.
The sentence "Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and (B)" is unnecessary repetition as the requirements of those sections apply on their own.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
The term "likely" is used in the proposal to require protection of metallic cable wiring methods if damage is reasonably expected or probable at the location installed. The term "likely" is used in many NEC sections to predict or describe a probability the event or condition will occur such as: "… *likely* to become energized …", "… maximum fault current *likely* to be imposed …", "… not *likely* to be damaged …", "…equipment *likely* to be disconnected for repairs or replacement …", "… not *likely* to stretch during or after installation …" and "… conduct safely any fault current *likely* to be imposed".
Panel Meeting Action: Reject
Panel Statement: The requirement for protection of these systems is to maintain an uninterrupted supply of power in the event of an outage that is not limited to protection from nail or screw penetration during or after construction. The overall survivability of the emergency system must be assured.
At this time the panel is of the opinion that the physical protection of these circuits are best served by non-flexible metallic raceways. The proposal includes all types of MC and AC cable, even those not found to fair well during the previously conducted fact- finding investigation. The panel's concern is the mechanical integrity of the wiring method both during and after installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-85 Log #3927c NEC-P15 **Final Action: Reject**
(517.30(C)(3)(1))

Submitter: Goran Haag, Champion Fiberglass, Inc.
Recommendation: Add new text to read as follows:
Everywhere Schedule 80 PVC is mentioned, "Type RTRC marked with the suffix -XW" should also be included.
Substantiation: For the NEC 2008, Type RTRC marked with the suffix –XW and Schedule 80 PVC were added as sufficient for Class I Division 2 installations. The Type RTRC marked with the suffix –XW were "forgotten" at some places in the NEC, needs to be corrected.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient technical data to support the use of RTRC in similar applications as Schedule 80 PVC. The code permits the use of RTRC conduit in Class I Division 2 locations under very restrictive conditions. [See 501.10(B)(1)(7)]. The permitted conditions do not necessarily exist in health care facilities.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-86 Log #154 NEC-P15 **Final Action: Accept**
(517.30(C)(3)(5))

TCC Action: The Technical Correlating Committee understands that the acceptance of this proposal is superseded by the action taken on Proposal 15-87.
Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Change "communication" to "communications".
Substantiation: Section 3.3.3 of the NEC Style Manual States: "**3.3.3 Plural.** Unless referring to a single item of equipment, references to electrical components and parts shall be plural rather than singular. This results in greater consistency and makes it clear that the *NEC* provision refers to *all* components or parts of a given type or class." Changing "communication" to "communications" will correlate with the title of Chapter 8, "Communications Systems"**.**
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 12

Ballot Not Returned: 1 Lau, L.

15-87 Log #4086 NEC-P15 **Final Action: Accept in Principle**
(517.30(C)(3)(5))

Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
517.30(C)(3)(5) Secondary circuits of Class 2 or Class 3 communication or signaling systems, <u>data system circuits, fire alarm systems, and systems less than 120 volts, nominal</u> with or without raceways.
Substantiation: The addition of the phrase "with or without raceways" and the second paragraph to 517.80 in 2008 clarified that secondary circuits of transformer-powered communications or signaling systems in patient care areas are not required to be enclosed in raceways unless otherwise required by Chapter 7 or 8. Since the title of 517 Section VI also includes data systems, fire alarm systems, and systems less than 120 volts, nominal, it would be logical to conclude that the panel intends that these systems would be required to be enclosed in raceways. This proposal is submitted to clarify the intent of this paragraph. If the intent is to allow all of these systems to be installed in patient care areas without requiring them to be enclosed in raceways, this proposal should be accepted. Otherwise, since data systems, fire alarm systems, and systems less than 120 volts, nominal were excluded from this sentence, it will be concluded that these systems shall be required to be enclosed in raceways.
A similar proposal has been submitted for 517.80
Panel Meeting Action: Accept in Principle
Revise (5) of this section to read:
(5) Cables for Class 2 or Class 3 systems permitted by Part VI of this Article with or without raceways.
Panel Statement: The panel agrees with the intent of the submitter. The panel action better reflects the intent of the submitter and correlates this requirement with Part VI. The present wording of (5) is not in the proper format as it does not describe a wiring method.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-88 Log #4820 NEC-P15 **Final Action: Reject**
(517.30(C)(3)(6) (New))

Submitter: Robert Konnik, South Windsor, CT
Recommendation: Add new (6) to 517.30(C)(3) as shown below:
517.30(C)(3) Mechanical Protection of the Emergency System.
The wiring of the emergency system in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and (B). The following wiring methods shall be permitted:
(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
(2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
(3) Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:
a. Where used in listed prefabricated medical headwalls
b. In listed office furnishings
c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage

d. Where necessary for flexible connection to equipment

(4) Flexible power cords of appliances or other utilization equipment connected to the emergency system.

(5) Secondary circuits of Class 2 or Class 3 communication or signaling systems with or without raceways.

<u>(6) Type MC cable that employs a continuous, gas/vaportight metal sheath and is listed as an electrical circuit protective system.</u>

Substantiation: In just about all areas of the code, MC cable is allowed to be used where MI cable is used. The exception is in hospitals some areas of hospitals. 517.61(B)(1) allows MC cable with that employs a continuous, gas/vapor-tight metal sheath to be used. Where local jurisdictions require fire rated cable, fire rated MC cable is used in hospitals where allowed by the AHJ. This proposal only allows a small subset of MC cable that has additional positive benefits, that is ability to survive in a fire. MC cable meets crush and impact requirements greater than that required for flexible cords and class 2 and 3 communication cables.

Panel Meeting Action: Reject

Panel Statement: Type MC cable is not always allowed to be used where Type MI cable is permitted, and the provision for a gas/vaportight metal sheath may not provide adequate protection from damage. According to a UL fact-finding report on nail penetration of Type MC and AC cables, this type had the worst results. See panel action and statement on Proposal 15-84.

Ballot Not Returned: 1 Lau, L.

15-89 Log #3855 NEC-P15 **Final Action: Accept**

(517.30(C)(4))

Submitter: Bill McGovern, City of Plano

Recommendation: Revise text as follows:

517.30(C)(4) Is for two or more emergency circuits supplied from the same branch <u>and same transfer switch.</u>

Substantiation: Article 517 is based on redundancy and strengthening of the electrical system to insure the life safety provisions are in place for both the staff and patients alike. Separation of the emergency system wiring from all other wiring insures that short circuits and ground faults that occur in either the normal system or the equipment system will not compromise the integrity of the emergency system. Separation is already in place requiring both branches of the emergency system (critical & life safety) to remain independent of each other. Separation of both feeders and branch circuits originating from separate transfer switches of the same system should also remain independent of each other. Requiring separation of feeders and branch circuits of the same system but supplied by different transfer switches provides an increased level of safety should a ground fault or short circuit occur downsteam of one of the transfer switches.

Panel Meeting Action: Accept

Panel Statement: The panel notes that the proper reference is 517.30 (C)(1)(4).

Number Eligible to Vote: 12

15-90 Log #4129 NEC-P15 **Final Action: Reject**

(517.30(F))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.

Recommendation: Add new text to read as follows:

<u>**(F) Selective Coordination.** Overcurrent protective devices serving the essential electrical system shall be selectively coordinated for times longer than 0.1 seconds.</u>

<u>*Exception No. 1: Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exists on the transformer secondary.*</u>

<u>*Exception No. 2: Isolated power systems inherently comply with this selective coordination requirement.*</u>

Substantiation: The rationale for this proposal has two elements.

First, NFPA 99 is responsible for the performance of the electrical systems in health care facilities. That committee takes very seriously the charge of making health care facilities as safe as humanly possible for the patients we serve, including protecting them from electrical outages that might be caused by un-coordinated electrical systems. However, as designers and operators of these systems, we recognize that coordination is not a pure good in itself, and that there are competing hazards that can, in some cases, trump the ideal of perfect coordination. As chair of the electrical Systems Technical Committee for NFPA 99, I presided over two meetings to review comments from the public, including extensive presentations on this topic from all sides. We debated this issue extensively, testing out the various theories and data reported. In the end, by a clear majority, the committee adopted the performance criteria that, in our judgment, best balances the clear and compelling need for a well-coordinated electrical system with the other considerations involved. The NFPA 99 2010 Edition will include the language proposed here, and the NEC should be changed to prevent confusion in the field.

Second, we will repeat some of the technical arguments against an unfettered pursuit of perfect coordination on health care facilities, assembled by a group of electrical engineers including, by the way, the State of California Office of Statewide Health Planning and Development, who have a state amendment to NFPA 70 specifically excluding health care facilities from all coordination requirements due to the problems it creates.

Selective coordination is only one of several competing factors that must be considered in the selection of appropriate overcurrent protective devices (OCPDs) in health care facilities. Other factors that must be considered in the selection of overcurrent protective devices include: arc flash risk hazard, equipment damage, and reduced risk of extended outages; all of which have direct effects on both staff and patient safety. Mandating selective coordination as the sole determining factor in OCPD selection will result in diminished reliability of the essential electrical system.

The electrical distribution systems in health care facilities are different from those in other buildings. they generally have more levels of distribution between the service and the load thus greatly complicating the coordination task, and creating other potential hazards for the unwary who zealously work to maximize a single element of the overall safety equation. Unfortunately, the code requirement in Article 700, when strictly applied to health care facilities, has not accomplished its primary goal of making electrical systems more reliable. Instead, in many instances, it creates less reliable electrical distribution systems in most instances. Some reasons for this are:

● Achieving selective coordination throughout the entire electrical distribution system requires a delay in the upstream overcurrent devices (to wait for the downstream devices to clear). Delaying the operation of these overcurrent devices can lead to the arc flash levels being driven to dangerously high levels without interruption. Numerous engineers have reported this phenomenon in their designs since the 700 provisions for strict selective coordination began to be applied to health care facilities. G,iven the critical nature of our health care occupancies design engineers are forced to make tough decisions for our clients; de-energize equipment to maintain and repair it and expose the patient/building occupant to a potentially harmful electrical outage or keep the electrical equipment energized and expose the electrical worker to dangerously high arc flash levels. Lower arc flash levels, resulting from the acceptance of the current proposals, will help achieve the goal of making our healthcare electrical systems safer for both patients and electrical workers.

● Many of the members of the 99 committee have been asked to provide forensic engineering analysis for electrical distribution system disruptions. The vast majority of these disruptions resulted in what were initially perceived to be a mis-coordinated system issue. In reviewing the evidence associated with these disruptions we found that most, if not all, of these disruptions were due to low level arc faults to ground. These low level ground faults resulted in the activation of the nearest upstream ground fault device and not the overcurrent device (without ground fault) directly upstream of the fault. By virtue of other sections in NFPA 70 specifically 517.17(B), (1) & (2)) we are not allowed to install further downstream ground fault devices, therefore, not being able to enhance ground fault system coordination. Unfortunately, the current selective coordination verbiage in NFPA 70 paragraph 700.27, 701.18 & 708.54 does not address (nor can it address) the ground fault coordination issue that currently exist and is the most prevalent type of system fault. The addition of the "longer than 0.1 seconds" language as currently proposed does not diminish the goal of a selectively coordinated system since the vast majority of faults do not exist the 0.1 second or less tripping range.

● The selective coordination requirement as currently written in NFPA 70 requires the design engineer to limit the number of electrical equipment levels in order to attempt full selective coordination. This sometimes requires the elimination of electrical devices that would normally have been installed for isolation and maintenance reasons. These types of omissions will require the owner to take larger portions of this electrical system out of service simultaneously when performing off-line maintenance. Many individuals/entities try to make this a fuse versus circuit breaker issue. This argument only clouds the issue and does not get to the real fact that the current selective coordination requirement in NFPA 70 does not enhance our electrical distribution system. This proposal interjects logic and real world practical experience into the selective coordination topic.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 7 Negative: 4

Ballot Not Returned: 1 Lau, L.

Explanation of Negative:

SAMPSON, M.: Requiring selective coordination only for times longer than 0.1 second provides coordination for overloads only and does not provide assurance that typical ground faults and arcing faults will not cascade multiple levels of overcurrent protective devices.

SHELLY, B.: The reduction in safety of the electrical system should not be compromised due to cost considerations; therefore, Proposal 15-90 should be rejected and the present requirement left in place.

WHITE, A.: It is with great concern for the safety of patients that we must vote negative on Panel Action on Proposal 15-90. Unfortunately, Panel 15 has fallen victim to the materialistic desires of a few constituents that refuse to spend the time and energy necessary to modify their cookie cutter designs in order to accommodate selective coordination. For decades, financial centers and the military have had no issues designing and installing selectively coordinated systems. Isn't it odd that some in our society are willing to spend the time and money, even if it takes extra floor space, to keep financial centers up and running under all overcurrent conditions, but it they are not willing to take that same precautions for our sick and infirm.

Eliminating selective coordination for times less than 0.1 seconds is the same as eliminating the requirement altogether. If that is the desire of the submitter, have the fortitude to propose just that. They should not hide behind the false sense of security that 0.1 seconds portrays. The move to 0.1 seconds will not cover most ground faults and arcing faults. It will allow major blackouts of entire wings or even entire health care facilities, all because these engineers will now be able to design more quickly, but avoiding their fiduciary responsibility to owners, patients, and workers.

Opponents of selective coordination often cite increased arc-flash hazards as the major reason for avoiding their responsibilities. However, with a little extra work, knowledge, and skill, they could be utilizing several techniques that are aimed specifically at the very issues' they cite. Differential relaying and zone selective interlocking have been around for decades. Arc reducing maintenance switches are also readily available. These methods allow overcurrent devices to open as quickly as possible, with absolutely no increase in arc-flash energy or equipment damage, for overcurrents in their zone of protection. For overcurrents outside their zone of protection, the overcurrent devices are delayed long enough for downstream devices to operate, providing total selective coordination. These techniques are often utilized in industrial facilities, banking centers, and military facilities.

In summary, selective coordination can be achieved, and at the same time, arc-flash energies and equipment damage need not increase, if the designers are willing to spend the extra time and effort to modify their cookie cuter designs and utilize proven techniques that have been successfully employed for decades in financial centers and military facilities. The unnecessary elimination of selective coordination requirements for times less than 0.1 seconds reduces safety for both patients and workers.

WISEMAN, J.: The 0.1 second limit in this proposal could reduce the level of safety by limiting the types of overcurrents that would need to be isolated to the nearest upstream device. Requiring selective coordination down to only 0.1 seconds will cover only overloads and a few minor phase-to-phase fault and minor ground faults.

15-91 Log #4117 NEC-P15 **Final Action: Accept**
(517.30(G) (New))

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.

This action will be considered by the panel as a public comment.

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.

Recommendation: Add new text to read as follows:

<u>(G) Feeders from Alternate Power Source. A single feeder supplied by a local or remote alternate power source shall be permitted to supply the essential electrical system to the point at which the life safety, critical, and equipment branches are separated. Installation of the transfer equipment shall be permitted at other than the location of the alternate power source.</u>

Renumber following paragraph.

Substantiation: The present requirements of NFPA 70, Article 445 and Article 700 as applied to healthcare facilities essentially eliminates central plant alternate power source applications by requiring additional multiple feeders (and in the case of generating systems greater than 600v, additional transformer(s) emanating from the source to the system distribution equipment.

This new requirement in the NEC provides no proven increase in reliability. In fact, by in effect mandating the use of distributed generation over central plant architecture it can be argued that reliability will be decreased. This proposal permits a single feeder from a health care facility central generating plant to serve the essential electrical system of a remote healthcare building or buildings within the same campus.

The electrical distribution systems in health care facilities are different from those in other kinds of buildings, and they are called on to perform differently than those in other kinds of buildings. Accordingly, the general requirements for emergency systems in 700, good as they are, do not, in many cases, work when applied to health care facilities. Indeed, as noted in other proposals, they can often compromise the performance of the very systems they seek to protect. Accordingly, it is vital to ensure the proper definition of performance of these systems clearly and distinctively so as to meet the many complicated demands on the systems. Exactly these issues are the subject of much debate on the Electrical Systems Technical Committee of NFPA 99, which I chair. That committee, composed of many electrical engineers with hundreds of years of experience designing and operating health care facilities between them, together with the medical expertise in the form of physicians on the committee allow that committee to focus on, and best define the peculiar needs of these buildings. This proposal will bring NFPA 70 into conformance with NFPA 99, and thus, reduce confusion.

Panel Meeting Action: Accept

Panel Statement:

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 2

Ballot Not Returned: 1 Lau, L.

Explanation of Negative:

SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word "emergency" from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.

WHITE, A.: Allowing a single feeder to service the entire essential electrical system, before the transfer equipment, presents obvious reliability issues should the single feeder become deenergized due to fault conditions. The scenario becomes even more horrific should the single feeder become physically damaged, in this case the facilities entire redundant essential electrical system is out of service until emergency repairs can be made; placing patients and staff at grave risk.

Patient safety should be foremost, this proposal plainly puts economics before patient safety and should be rejected.

15-92 Log #4115 NEC-P15 **Final Action: Accept**
(517.31)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.

This action will be considered by the panel as a public comment.

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.

Recommendation: Revise text to read as follows:

517.31 ~~Emergency System~~ <u>Branches for Automatic Connection</u>. ~~Those functions of patient car depending on lighting of appliances that are automatically connected to the emergency essential electrical system shall be divided into two mandatory branches: the life safety branch and the critical branch, described in 517.32 and 517.33.~~

The <u>life safety and critical</u> branches ~~of the emergency system~~ shall be installed and connected to the alternate power source so that all functions <u>supplied by these branches</u> ~~specified here for the emergency essential electrical system~~ shall be automatically restored to operation within 10 seconds after interruption of the normal source. [**99:**4.4.2.2.2.1, 4.4.3.1]

Substantiation: The electrical distribution systems in health care facilities are different from those in other kinds of buildings, and they are called on to perform differently than those in other kinds of buildings. Accordingly, the general requirements for emergency systems in 700, good as they are, do not, in many cases, work when applied to health care facilities. Indeed, as noted in other proposals, they can often compromise the performance of the very systems they seek to protect. Accordingly, it is vital to ensure the proper definition of performance of these systems clearly and distinctively so as to meet the many complicated demands on the systems. Exactly these issues are the subject of much debate on the Electrical Systems Technical Committee of NFPA 99, which I chair. 15-97 Log #4112 NEC-P15 **Final Action: Accept in Part**
(517.32(F))

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
(F) Generator Set Accessories. ~~Generator Set accessories as required for generator performance.~~ Fuel transfer pump(s), task illumination, and selected receptacles at the generator set location and essential electrical system transfer switch locations. Ventilation fans, electrically operated louvers, controls, cooling system, and other generator accessories essential for generator operation shall be supplied directly from the output terminals of the generator with overcurrent protective devices or from the life safety branch.
Substantiation: Without operation of generator accessories, the generators will not function. The loads for the equipment spaces are very small, and must be the first loads onto the generator to ensure the ability to operate these spaces effectively. This requirement was extensively debated by the NFPA 99 Electrical Systems Technical Committee to ensure proper performance of the systems. This requirement will be in the next edition of NFPA 99 and should be extracted here to ensure coordination between the two documents and to ensure that this issue is covered by 70.
To coordinate with the 2010 edition of NFPA 99.
Panel Meeting Action: Accept in Part
Accept the proposal rejecting the language “directly from the output terminals of the generator with overcurrent protective devices or” the remainder of the language is accepted.
The revised wording will be: **(F) Generator Set Accessories.** ~~Generator Set accessories as required for generator performance.~~ Fuel transfer pump(s), task illumination, and selected receptacles at the generator set location and essential electrical system transfer switch locations, ventilation fans, electrically operated louvers, controls, cooling system, and other generator accessories essential for generator operation shall be supplied from the life safety branch.
Panel Statement: Allowing certain generator accessories to be tapped directly from the generator terminals realistically means the accessories can only be energized when the generator is online; this presents certain issues when commissioning and testing activities occur.
Allowing this connection also provides enormous incident energy at these branch circuits, in turn creating worker safety issues concerning NFPA 70E.
Number Eligible to Vote: 12

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
517.33 Critical Branch.
(A) Task Illumination and Selected Receptacles. The critical branch of the ~~emergency~~ essential electrical system shall supply power for task illumination, fixed equipment, selected receptacles, and special power circuits serving the following areas and functions related to patient care:
Substantiation: To coordinate with the 2010 Edition of NFPA 99. See previous proposals by same author regarding need for changing the terms used in this proposal. This proposal simply makes this section consistent with others in the same article.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-100 Log #384 NEC-P15 **Final Action: Accept**
(517.33(A)(8)(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as shown:
"General care beds (at least one duplex receptacle in each ~~per~~ patient bedroom)".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-101 Log #4110 NEC-P15 **Final Action: Accept**
(517.34)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
517.34 Equipment ~~System~~ Branch ~~Connection to Alternate Power Source~~. The equipment branch shall supply major electrical equipment necessary for patient care and basic building operation. The equipment ~~system~~ branch shall be installed and connected to the alternate power source such that the equipment described in 517.34(A) is automatically restored to operation at appropriate time-lag intervals following the energizing of the ~~emergency~~ essential electrical system. Its arrangement shall also provide for the subsequent connection of equipment described in 517.34(B). [**99:**4.4.2.2.3.2]
Substantiation: To coordinate with the 2010 Edition of NFPA 99. See previous proposals by same author regarding need for changing the terms used in this proposal. This proposal simply makes this section consistent with others in the same article.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-102 Log #950 NEC-P15 **Final Action: Reject**
(517.34(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "throw over" to "transfer".
Substantiation: Edit.
Panel Meeting Action: Reject
Panel Statement: The term is used to reference a selector switch, not a transfer switch. See ASME A17.1-2004 Section 2.27.2.4.1. The term "throw over" provides more flexibility for the type of equipment used to service the elevator.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-103 Log #949 NEC-P15 **Final Action: Reject**
(517.35(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
~~An external~~ A utility service when the normal source consists of a generating unit(s) located on the premises.
Substantiation: "External" implies the service equipment is necessarily outdoors.
Panel Meeting Action: Reject
Panel Statement: The term external does not necessarily mean outdoors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-104 Log #1395 NEC-P15 **Final Action: Accept**
(517.41)

Submitter: Jon Reuter, Minneapolis, MN
Recommendation: Qualify FPN Figure 517.41, No. 1 as follows:
FPN Figure 517.41, No. 1 Nursing Home and Limited Health Care Facilities – Minimum Requirement (greater than 150 kVA) for Transfer Switch Arrangement.
Substantiation: FPN Figure 517.41, No. 1 is only the minimum requirement if greater than 150 kVA. Otherwise, FPN Figure 517.41, No. 2 is the minimum requirement.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-105 Log #964 NEC-P15 **Final Action: Reject**
(517.42(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
~~Sufficient~~ Lighting as is necessary to provide illumination to exit ways.
Substantiation: Edit. "Sufficient" is a term to be avoided per the Style Manual. Proposal tracks similar wording in 517.42(A). Where "necessary" is usually established by building or fire codes.
Panel Meeting Action: Reject
Panel Statement: There isn't a difference between "lighting as is necessary" and "sufficient illumination."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-106 Log #963 NEC-P15 **Final Action: Reject**
(517.61(B)(2) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: The exception doesn't cover ceiling mounted receptacles; doesn't specify any height above the the 5 ft hazardous area. Sparks or hot metal could be produced by the attachment plug if disconnected under load. It doesn't correlate well with 410.12 which requires lampholders to be unswitched types and 430.14(B).
Panel Meeting Action: Reject
Panel Statement: This exception first appears in the 1984 NEC. This is a stand alone allowance and does not need to correlate to any of the code sections listed. No substantiation has been presented to support the deletion.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-107 Log #2386 NEC-P15 **Final Action: Reject**
(517.61(B)(5))

Submitter: Jamie McNamara, Hastings, MN
Recommendation: Revise text to read as follows:
517.61 Wiring and Equipment.
(B) Above Hazardous (Classified) Anesthetizing Locations.
(5) Receptacles and Attachment Plugs. Receptacles and attachment plugs located above hazardous (classified) anesthetizing locations shall be listed "hospital grade" and ~~for hospital use~~ for services of prescribed voltage, frequency, rating, and number of conductors with provision for the connection of the grounding conductor. This requirement shall apply to attachment plugs and receptacles of the 2-pole, 3-wire grounding type for single-phase, 120-volt, nominal, ac service.
Substantiation: This requirement should be made clear as to what type or receptacle is required. This would harmonize the text with current 517.61(C)(2).
Panel Meeting Action: Reject
Panel Statement: Receptacles listed for use in hospitals (or hospital use) are a specific configuration and are for use in hospitals only. Acceptance of this proposal would relax the requirement without proper substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-108 Log #962 NEC-P15 **Final Action: Accept in Principle in Part**
(517.61(C)(1) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Pendant receptacle ~~construction~~ installations that employ ~~Type SJO or equivalent~~ hard usage or extra-hard usage flexible cords identified for the purpose. (remainder unchanged)
Substantiation: Equivalent is a term to be avoided per the Style Manual. Cords should be identified for the purpose as all hard usage or extra hard usage types may not be suitable for the use or conditions.
Panel Meeting Action: Accept in Principle in Part
Accept all of the recommendation with the exception of the phrase ~~identified for the purpose~~ and the strikeout of "Type SJO or equivalent " as follows:
Pendant receptacle ~~construction~~ installations that employ listed Type SJO, or equivalent hard usage or extra-hard usage, flexible cords ~~identified for the purpose.~~ (remainder unchanged)
Panel Statement: Type SJO designates a specific cord product having rubber insulation and an oil -resistant jacket. Hard or extra -hard service need not be rubber or oil resistant. However, the panel agrees that equivalent is not defined. Therefore, the panel agrees to include "hard usage" or extra "hard usage" cord after equivalent and the word listed before SJO to satisfy part of proposal requesting identified. There are no cords identified for use with pendent receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-109 Log #215 NEC-P15 **Final Action: Accept in Principle**
(517.63(A) Exception (New))

TCC Action: The Technical Correlating Committee directs that the panel correlate the action taken in this proposal with the action taken on Proposal 15-3a.
This action will be considered by the panel as a public comment.
Submitter: Chris Pogorzelski, Graef Anhalt Schloemer & Associates
Recommendation: Add an exception to read as follows:
Exception: For operating rooms, procedure rooms and c-section rooms. The battery-powered emergency lighting units shall be permitted to be wired to the critical lighting circuit in the area and connected ahead of any local switches.
Substantiation: In my years of experience and working in the Healthcare industry as a consultant in various states, the hospital representatives will request putting the emergency battery units serving the surgical suites to the "Critical Circuit" ahead of any local switches. Currently, how the code section is enforced does not allow the owner of the electrical consultant to wire the emergency battery unit on the essential branch (critical power) because NEC 517.63(S) refers to NEC 700.12(F) which refers to the Battery-Powered Emergency Lighting Units to be wired normal lighting circuit.
In NFPA 99, Section 13.4.1.2.6.1(E) "Battery-Powered Emergency Lighting Units" states "such lights shall be wired to circuits serving the general area lighting". In a surgical suite where you have both normal and critical power serving the general area lighting, it could be wired to either branch of power.
In NFPA 99 Section A.4.4.2.2.2.3 (explanatory material) "It is recommended that facility authorities give consideration to providing and properly maintaining automatic battery-powered lighting units or systems to provide minimal task illumination in operating rooms, delivery rooms, and certain special-procedure radiology rooms where the loss of lighting due to failure of the essential electrical system could case severe and immediate danger to a patient undergoing surgery on an invasive radiographic procedure." In my opinion, the above explanation would steer an owner of a healthcare facility to install the Battery-Powered Emergency Lighting units to the (critical) Essential Electrical System branch of power.
We can look at two different scenarios of what would happen in an Operating Suite if there was a loss of normal power and the generator would transfer the power to the Essential branch (critical power).
Scenario One - Battery-Powered Emergency Lighting Units wired to normal power: The Battery-Powered Emergency Lighting Units would energize at the loss of normal power and remain burning for the required 10 seconds as required by NFPA 110 for the generators to start up and automatically switch the load from normal power to the Essential Electrical System (Critical Power), however the Battery-Powered Emergency Lighting Units would remain lit and eventually would discharge all its lumens and power after 90 minutes. In a catastrophic event, after 90 minutes you would lose the Essential Electrical System (Critical Power) and the entire Surgical Suite would be in total darkness.
Scenario Two - Battery-Powered Emergency Lighting Units wired to the Essential Electrical System (Critical Power): The Battery-Powered Emergency Lighting Units would energize at the loss of normal power and remain burning for the required 10 seconds as required by NFPA 110 for the generators to start up and to automatically switch the load from normal power to the Essential Electrical System (Critical Power), however the Battery-Powered Emergency Lighting Units would turn themselves "off" at the first sign of critical power and reenergize the Battery-Powered Emergency Lighting Units back to full strength. In a catastrophic event, after 90 minutes, you would lose the Essential Electrical System (Critical Power) and the staff would still have the full 90 minutes of the full Battery-Powered Emergency Lighting Units to complete any necessary procedures still being performed after the loss of the Essential Electrical System (Critical Power).
In conclusion, I strongly believe if we make this code change we can better utilize the use of the Battery-Powered Emergency Lighting Units and provide the Surgical Staff an additional 90 minutes of lighting if the facility loses the Essential Electrical System (Critical Power).
Panel Meeting Action: Accept in Principle
Revise Section 517.63(A) as follows:
(A) **Battery- Powered Lighting Units.** One or more battery-powered lighting units shall be provided and shall be permitted to be wired to the critical lighting circuit in the area and connected ahead of any local switches.
Panel Statement: The panel is of the opinion that this action better addresses the submitter's intent and eliminates a list of locations and the reference to Article 700 as this is not an emergency egress lighting requirement. Additionally, the revised text is positive language omitting the exception.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-110 Log #1437 NEC-P15 **Final Action: Accept**
(517.63(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence: Isolated power system equipment and its supply circuit ~~grounded primary feeder~~ shall be permitted...(remainder unchanged).
Substantiation: Edit. While "grounded primary feeder" correlates with "grounded power systems" in the heading of 517.63 it infers this subsection may not apply to an ungrounded primary feeder to an isolation transformer, which is not specifically prohibited.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-111 Log #961 NEC-P15 **Final Action: Reject**
(517.64(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Low voltage equipment that is ~~frequently in~~ intended for contact with the bodies of persons or...". (remainder unchanged)
Substantiation: "Frequently" is not defined, is subjective, and a term to be avoided per the Style Manual, and has no bearing on the requirement.
Panel Meeting Action: Reject
Panel Statement: The proposal as presented would essentially change the requirement of 517.64(A) without any substantiation. The term intended would not be readily understood by anyone other than the clinical staff.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-112 Log #960 NEC-P15 **Final Action: Reject**
(517.64(B), (C), and (E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "isolating" to "isolation" in (B)(1) and (2) and (C) and (E).
Substantiation: Isolation transformer is defined; isolating transformer is not; are these the same or different?
Panel Meeting Action: Reject
Panel Statement: The existing definition is consistent with NFPA 99. See panel action and statement on Proposal 15-11.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-113 Log #843 NEC-P15 **Final Action: Reject**
(517.71(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text (A):
Fixed and stationary X-ray equipment shall be connected to the power supply by means of ~~a~~ an identified wiring method complying with applicable ~~requirements~~ provisions of Chapters 1 through 4 of this Code ~~as~~ unless modified by this article.
Exception: Equipment properly supplied by a branch circuit rated at not over 30 amperes shall be permitted to be supplied through a suitable by an identified attachment plug and hard service or extra-hard service flexible cord or cable identified for the use.
(B) Individual branch circuits shall not be required for portable, mobile, or transportable medical X-ray equipment requiring a capacity with a long short-time rating of not over 60 amperes.
Substantiation: The wiring method and attachment plug should be identified as suitable for the use. There are provisions in Chapters 1 through 4 such as exceptions and alternatives which are permissive and not requirements, which should be included. There is no apparent reason not to permit extra-hard service cords or cables. "Capacity" appears intended to be amperes. For reliability, it seems that long-time ratings should require an individual circuit.
Panel Meeting Action: Reject
Panel Statement: Identified wiring for X-ray equipment should be part of the specification for that equipment. The wiring need not be identified for the purpose.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-114 Log #849 NEC-P15 **Final Action: Reject**
(517.72(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(A) ~~CAPACITY~~ RATING ~~A~~ An identified disconnecting means ~~of adequate ampacity for at least~~ with a current rating not less than 50 percent of the input required for the momentary rating or 100 percent of the rating required for the long-time rating of the X-ray equipment, whichever is greater, shall be provided in the supply branch circuit.
Substantiation: Edit. "Capacity" appears intended to be amperes. Disconnecting means should be identified for the use. "Adequate" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: This language is identical to the disconnecting means requirements in Article 660. Disconnecting means are not required to be "identified."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-115 Log #1436 NEC-P15 **Final Action: Accept in Principle**
(517.78)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part:...shall be grounded in a manner specified in Part VII of Article 250 as modified by 517.13(A) and 517.13(B).
Substantiation: Edit. Reference should not be made to an entire article.
Panel Meeting Action: Accept in Principle
Change the existing text of 517.78(C) to read:
(C) Non–Current-Carrying Metal Parts. Non–current-carrying metal parts of X-ray and associated equipment (controls, tables, X-ray tube supports, transformer tanks, shielded cables, X-ray tube heads, etc.) shall be connected to an equipment grounding conductor in the manner specified in Part VII of Article 250, as modified by 517.13(A) and (B).
Panel Statement: Submitter has not recognized that in the 2008 cycle the word "grounded" was changed to "connected to an equipment grounding conductor."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-116 Log #2241 NEC-P15 **Final Action: Reject**
(517.80)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action in relation to the report of "Reject"on this proposal.
This action will be considered by the panel as a public comment.
Submitter: Richard E. Loyd, Sun Lakes, AZ
Recommendation: Delete 2nd paragraph in its entirety.
Substantiation: I recognize this text is extracted from NFPA 99, however, the NFPA 99 Committee does not have electrical expertise, this resides with this committee. Healthcare facilities are unique and deal with persons with low resistance to shock hazards. We historically require more stringent rules to safe guard patients from trauma. Panels 3 and 16 responsible for communications and signaling also do not consider typically persons with low resistance to shock and they are often barefooted and unclothed. The responsibility for determining the degree of physical protection required of these circuits must reside with the designers since 517.2 defines "patient care areas" to cover a variety of conditions and locations.
Please accept this proposal to delete the 2nd paragraph, safety is paramount. There is no record that 517.80 has not worked well over the past many cycles.
Panel Meeting Action: Reject
Change the existing sentence in 517.80 as follows:
Listed cables for Class 2 or Class 3 signaling systems, power-limited fire alarm, data, antenna, fiber optics, and communication circuits installed in patient care areas are deemed to have equivalent insulation and isolation to that required for the electrical distribution systems in those spaces.
Panel Statement: See panel action and statement on Proposal 15-120. The panel contends that the action taken on Proposal 15-120 is more appropriate for these systems in patient care areas.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-117 Log #4098 NEC-P15 **Final Action: Accept in Principle**
(517.80)

Submitter: Rod Mutch, Selah, WA
Recommendation: Revise text to read as follows:
517.80 Patient Care Areas. Equivalent insulation and isolation to that required for the electrical distribution systems in patient care areas shall be provided for communications, signaling systems, data system circuits, fire alarm systems, and systems less than 120 volts, nominal.
Secondary circuits of transformer-powered communications or signaling systems, data system circuits, fire alarm systems, and systems less than 120 volts, nominal shall not be required to be enclosed in raceways unless otherwise specified by Chapter 7 or 8. [99:4.4.2.2.4.6]
Substantiation: The additional of the second paragraph to 517.80 in 2008 clarified that secondary circuits of transformer-powered communications or signaling systems in patient care areas are not required to be enclosed in raceways unless otherwise required by Chapter 7 or 8. Since the title of 517 Section VI also includes data systems, fire alarm systems, and systems less than 120 volts, nominal, it would be logical to conclude that the panel intends that these systems would be required to be enclosed in raceways. This proposal is submitted to clarify the intent of this paragraph. If the intent is to allow all of these systems to be installed in patient care areas without requiring them to be enclosed in raceways, this proposal should be accepted. Otherwise, since data systems, fire alarm systems, and systems less than 120 volts, nominal were excluded from the second paragraph, it will be concluded that these systems shall be required to be enclosed in raceways.
A similar proposal has been submitted for 517.30(C)(3)(5).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on proposal 15-120.
Number Eligible to Vote: 12

Ballot Not Returned: 1 Lau, L.

15-118 Log #2799 NEC-P15 **Final Action: Accept**
(517.80, FPN)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete FPN as follows:
517.80 Patient Care Areas. Equivalent insulation and isolation to that required for the electrical distribution systems in patient care areas shall be provided for communications, signaling systems, data system circuits, fire alarm systems, and systems for less than 120 volts, nominal.
~~FPN: An acceptable alternate means of providing isolation for patient/nurse call systems is by the use of nonelectrified signaling, communications, or control devices held by the patient or within reach of the patient.~~
Substantiation: Non-electric apparatus may be a safer alternative to electrical apparatus in a patient care area but this Fine Print Note does not seem to have any logical place in the National Electrical Code. Since it is not giving any electrical alternative, reference, or any usable explanation for 517.80 as is the normal function of a Fine Print Note, it should be removed from this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-119 Log #4168 NEC-P15 **Final Action: Accept**
(517.80, FPN)

Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Revise text as follows:
517.80 Patient Care Areas. Equivalent insulation and isolation to that required for electrical distribution systems in patient care areas shall be provided for communications, signaling systems, data system circuits, fire alarm systems, and systems for less than 120 volts, nominal.
~~FPN: An acceptable alternate means of providing isolation for patient/nurse call systems is by the use of nonelectrified signaling, communications, or control devices held by the patient or within reach of the patient.~~
Substantiation: Non-electric apparatus may be a safer alternative to electrical apparatus in a patient care area, but this Fine Print Note does not seem to have any logical place in the National Electrical Code. Since it is not giving any electrical alternative, reference, or any usable explanation for 517.80 as is the normal function of a Fine Print Note, it should be removed from this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-120 Log #67 NEC-P15 **Final Action: Accept in Principle**
(517.80 Exception No. 3 (New))

Note: This Proposal appeared as Comment 15-56 on Proposal 15-103 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-103 was:
Add an exception to 517.80:
517.80 Patient Care Areas Equivalent insulation and isolation...nominal.
Exception: Secondary circuits of Class 2 or Class 3 communications or signaling systems.
Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC
Recommendation: Delete 517.80 Patient Care Areas, including the FPN. Add an additional exception under 517.13(B).
Exception No. 3 shall read: <u>Secondary circuits of Class 2 and Class 3 communications or signaling systems.</u>
Substantiation: 517.80 has been a source of confusion for many years. Nurse call and other Class 2 and Class 3 communications systems at the patient bedside are intrinsically safe. This section has been misinterpreted by many AHJs. Some have interpreted this section to mean that nurse call wiring must be installed in metallic conduit for mechanical protection. This has never been the intent of 517.80, since nurse call systems are not a part of the emergency system. Some AHJs have required insulated green ground conductors and metallic conduit. 517.30(C)(3)(5) permits secondary circuits of Class 2 or Class 3 communication or signaling systems to be installed without mechanical protection. The proposed exception under 517.13(B) will make it clear that metal conduit and an insulated green ground conductor are not required for electrical safety.
Panel Meeting Action: Accept in Principle
Revise text of 517.80 as follows:
517.80 Patient Care Areas. Equivalent insulation and isolation to that required for the electrical distribution systems in patient care areas shall be provided for communications, signaling systems, data system circuits, fire alarm systems, and systems less than 120 volts, nominal. Circuits of these Class 2 and Class 3 signaling and communications systems shall not be required to comply with the grounding requirements of 517.13, comply with the mechanical protection requirements of 517.30(C)(3)(5), or to be enclosed in raceways unless otherwise specified by Chapter 7 or 8.
Panel Statement: The panel agrees with the intent of the submitter's proposal. The panel is of the opinion that the action satisfies the submitter's intent and reduces confusion in three areas; 1. Grounding, 2. Mechanical protection, 3. Insulation and isolation, associated with communication and signaling systems.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Lau, L.
Explanation of Negative:
WHITE, A.: The assertion that Class 2 and Class 3 circuits are somehow not a danger to patients is mystifying. Table 11 (A) and (B) in Chapter 9 detail the power source requirements for Class 2 and Class 3 circuits. In both cases, each table is preceded by a technical note explaining voltage ranges are defined in:... indoor locations or where wet contact is unlikely to occur. Wet contact is certainly a real possibility in patient care areas. Patient safety, not economics,should be foremost, these circuits should be effectively grounded and mechanically protected to provide protection to patients and staff.

15-121 Log #4169 NEC-P15 **Final Action: Accept in Principle**
(517.81)

Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Revise text to read as follows:
517.81 Other than Patient Care Areas. In other than patient care areas, installations shall be in accordance with the appropriate provisions of Articles 640, 725, 760, 800, <u>770, 810, 820, and 830.</u>
Substantiation: As written, this section addresses only sound systems, Class 1, Class 2, Class 3 circuits, as well as fire alarm circuits. Many health care facilities now employ the various additional systems covered in Articles 770, for fiber optical cables and raceways, radio and television antenna systems, CATV, and network powered broadband, and these system requirements should be added into this section. Even though the NEC Style Manual recommends not referencing one section to an entire Article, various parts or all of the Articles may apply to areas within a health care area not part of a patient care area so the reference to entire Articles is appropriate in this case.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
517.81 **Other than Patient Care Areas**. In other than patient care areas, installations shall be in accordance with the applicable provisions of <u>other parts of the code</u>.
Panel Statement: Adding those article numbers to the current list is correct, but the NEC Style Manual states that references shall not be made to an entire article. A general statement referring users to the applicable parts of the code is more appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-122 Log #842 NEC-P15 **Final Action: Reject**
(517.160)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first sentence of (A)(1) and substitute:
Each isolated power circuit shall be controlled by a switch or circuit breaker that simultaneously disconnects all conductors of the circuit.
Delete text of (A)(2) and substitute:
Circuits supplying primaries of isolating transformers shall operate at no more than 600 volts, nominal between conductors. Overcurrent protection for transformers and conductors supplying transformers or supplied by generators or batteries shall be in accordance with applicable provisions of Articles 240 and 450. The voltage of each isolated power circuit shall not exceed 600 volts, nominal, between conductors. Secondaries, if isolation transformers and systems derived directly from generator sets, batteries, or other sources shall be ungrounded. If a transformer has an electrostatic shield it shall be grounded.
Revise text of (3):
The ~~isolating~~ <u>isolation</u> transformers, ~~motor~~ generator sets, batteries, battery chargers, <u>and other isolated power system sources and their supply conductors,</u> associated primary and secondary overcurrent devices <u>and disconnecting means</u> shall not be installed in a hazardous (classified) location. The isolated <u>power system branch circuits</u> extending into a hazardous <u>(classified)</u> ~~anesthetizing~~ location shall be installed in accordance with ~~501.10~~ <u>the applicable requirements for the location</u>.
Revise first paragraph of (4):
An isolation transformer, <u>generator, batteries, or other isolated power system supply source</u> shall not serve more than one operating room except as covered in (A)(4)(a) and (A)(4)(b).
Delete text of (A)(4)(b) and substitute:
Where isolated power system circuits operating at over 150 volts, nominal, supply power to receptacles for equipment such as X-ray units or other equipment, the receptacles and mating plugs shall be uniquely configurated and not compatible with receptacles and plugs of other systems on the premises and receptacles shall be of the single type.

Substantiation: Types/ratings of overcurrent devices are covered elsewhere in the Code. "Proper" is a term to be avoided per the Style Manual. Systems supplied by other than transformers, generators, and batteries should be included. Present wording of (A)(4)(b) implies voltages higher than 150 volts are limited to (b)(1) and (2) whereas (A)(1) permits voltage up to 600. Any receptacle or plug is interchangeable, i.e., can be removed and replaced. Present (A)(4)(b) implies that single receptacles can only be used under condition (1) and (2) whereas there is no prohibition against their general use.
Panel Meeting Action: Reject
Panel Statement: The panel recognizes that 517.160(A)(2) is extracted material and the panel intends to maintain continuity with NFPA 99. The panel contends that the other changes suggested by the submitter would significantly alter the intent of this section. The submitter has not presented data to support his substantiation that replacement receptacles may be installed incorrectly.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-123 Log #2031 NEC-P15 **Final Action: Accept**
(517.160(A)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "or circuit breaker" after "switch" in the first sentence.
Substantiation: While a circuit breaker may be used as a switch, it is still a circuit breaker. Both terms are used in 404.2(B), 404.3(A), 404.4, 404.7, and 404.8 which indicates they are not one and the same.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-124 Log #3256 NEC-P15 **Final Action: Reject**
(517.160(A)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:
Each isolated power circuit shall be controlled by a switch or circuit breaker that simultaneously disconnects all conductors of the circuit it controls. Conductors of isolated power circuits shall not be installed in cables, raceways, or enclosures containing conductors of another system.
Substantiation: Circuit breakers are suitable disconnecting means. Isolated power circuits should be separate from conductors of other systems.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 15-123 made by the same submitter addresses the concern with regard to circuit breakers used as disconnects. The panel contends that the remainder of the submitters proposal would significantly alter the intent of this section by omitting the entire second sentence. The submitter has not provided any technical data to substantiate this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-125 Log #566 NEC-P15 **Final Action: Accept**
(517.160(A)(5))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text to read as follows:
(5) Conductor Identification. The isolated circuit conductors shall be identified as follows:
(1) Isolated Conductor No. 1 - Orange with <u>at least one distinctive</u> colored stripe other than white, green, or gray <u>along the entire length of the conductor.</u>
(2) Isolated Conductor No. 2 - Brown with at least one distinctive colored stripe other than white, green, or gray <u>along the entire length of the conductor.</u>
For 3-phase systems, the third conductor shall be identified as yellow with <u>at least one</u> distinctive colored stripe other than white, green, or gray <u>along the entire length of the conductor.</u>
Substantiation: The revision in the 2008 edition of the NEC provided a new requirement to distinguish branch circuit conductors of isolated power systems from other branch circuits in the same building. The problem is that the requirement for a distinctive stripe is unclear as to the physical characteristics of the stripe. As written, a distinctive stripe can be applied to the conductor using vinyl marking tape or other means. It appears that the intentions of the submitter and Code-Making Panel 15 are to require this distinctive marking along the entire length of the conductor as is already the requirement in 200.7.

ARTICLE 518 — PLACES OF ASSEMBLY

15-126 Log #2967 NEC-P15 **Final Action: Accept in Principle**
(518.3(B))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise as follows:
518.3 Other Articles.
[518.3(A) unchanged by this Proposal]
(B) Temporary Wiring. In exhibition halls used for display booths, as in trade shows, the temporary wiring shall be permitted to be installed in accordance with Article 590. Flexible cables and cords approved for hard or extra-hard usage shall be permitted to be laid on floors where protected from contact by the general public. <u>Except where ground-fault circuit-interrupter protection for personnel is required elsewhere in this *Code* other than Article 590, t</u>he ground-fault circuit-interrupter requirements of 590.6 shall not apply.
[remainder of 518.3(B) and 518.3(C) unchanged by this Proposal]
Substantiation: NOTE: This proposal is separate from another proposal I submitted for 518.3(B) involving portable GFCI protection in plug-and-cord-connected applications.
Throughout the *Code*, where ground-fault circuit-interrupter protection for personnel is mandated, ground faults arise from two causes:
· internally, insulation systems or materials of the installation have ***gradually degraded*** due to aging, exposure, and wear-and-tear
· externally, insulation systems or materials of connected equipment have been ***suddenly compromised*** by accidental events (immersion, penetration, mishandling, etc.)
The 590.6 requirements for temporary wiring, where similar requirements do not exist for corresponding permanent wiring installations, are based more predominantly on the greater likelihood of that gradual degradation. Where the *Code* elsewhere does mandate ground-fault circuit-interrupter protection for personnel that also encompasses permanent wiring (near sinks and kitchen countertops in 210.8(A) and 210.8(B), adjacent to swimming pools in 680.22 and 680.32, in conjunction with vending machines in 422.51, etc.), sudden accidental events are the more prevalent reasons for those other GFCI requirements in the *Code*.
590.6 on temporary wiring installations imposes requirements for ground-fault circuit-interrupter protection for personnel that would not be mandated generally for the same installations connected to permanent wiring. The unmodified last sentence of 518.3(B) was predicated on the duration of temporary wiring being far shorter and on the rewiring frequency and the re-inspection incidence of temporary wiring being far greater for tradeshows than for most temporary wiring installations (construction sites, seasonal retailing, outdoor holiday displays, etc.).
Although the last sentence of 518.3(B) is ***intended*** to focus at those 590.6 temporary wiring installations where GCFI protection would NOT be required for similar installations to permanent wiring, the mere ***use of temporary wiring connections at tradeshows*** and ***citation of the last sentence of 518.3(B)*** have been used to rationalize completely ignoring of the other essential GFCI protection requirements elsewhere throughout the *Code* that apply, regardless of permanent or temporary wiring.
Given the hasty set up of tradeshow exhibits and booths, the absence of Qualified Persons* ***within*** the exhibitions and booths once temporary power has been established ***to*** the exhibitions and booths, and the general confusion and absence of supervision that occurs once a tradeshow is opened to attendees, the risk of sudden accidents resulting in ground faults is at least equal and arguably even greater than for permanent wiring installations where GFCI protection is mandated.
* (Article 100 "Qualified Persons: One who has skills and knowledge related to the construction and operation of the electrical equipment and installations and has received safety training to recognize and avoid the hazards involved.")
How can the **ambiguous** and **equivocal** last sentence of 518.3(B), as is, be allowed to serve as a pusillanimous rationale for NOT providing essential GFCI protection at a swimming pool tradeshow or as a rationale for NOT providing essential GFCI protection at the kitchen countertop sink of a food kiosk at a tradeshow, all by pulling the "tradeshow temporary wiring" card?
The Proposal is intentionally written to correlate the GFCI requirements elsewhere in the *Code* (other than Article 590), when applied to tradeshows, to the GFCI requirements of 590.6 because many tradeshow exhibits and booths ***demonstrate*** permanent installations (which might include GFCI receptacles or circuit breakers intended for permanent wiring as a component of the equipment being demonstrated) but are ***actually connected*** to temporary power by means of ***cordsets*** that must have fault circuit-interrupter protection for personnel identified for portable use to prevent loss of GFCI protection due to open- or intermittent-neutral.
Panel Meeting Action: Accept in Principle
Reword proposed added language to state: "... The ground-fault circuit-interrupter requirements of 590.6 shall not apply. <u>All other ground-fault circuit-interrupter requirements of this Code apply."</u>
Panel Statement: Revised wording meets the proposer's intent and provides additional clarification.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Lau, L.

15-127 Log #3600 NEC-P15 **Final Action: Accept**
(518.3(B))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text to read as follows:
518.3 Other Articles.
[518.3(A) unchanged by this Proposal]
(B) Temporary Wiring. In exhibition halls used for display booths, as in trade shows, the temporary wiring shall be permitted to be installed in accordance with Article 590. Flexible cables and cords approved for hard or extra-hard usage shall be permitted to be laid on floors where protected from contact by the general public. The ground-fault circuit-interrupter requirements of 590.6 shall not apply. Where ground-fault circuit interrupter protection for personnel is supplied by plug-and-cord-connection to the branch circuit or to the feeder, the GFCI protection shall be listed as portable GFCI protection or provide a level of protection equivalent to a portable GFCI, whether assembled in the field or at the factory.
[remainder of 518.3(B) and 518.3(C) unchanged by this Proposal]
Substantiation: NOTE: This proposal is separate from another proposal I submitted for 518.3(B) involving GFCI protection required elsewhere in the *Code*.

"Portable GFCIs" are required by the trinational *Standard for Ground-Fault Circuit-Interrupters, NMX-J-520-ANCE-2006* 1, *CSA C22.2 No. 144.1-06* 2, *ANSI/UL943-2005* 3, Clause 6.7.2.1, and construction-site portable power-distribution equipment is similarly required by standard *Portable Power-Distribution Equipment, UL1640* 3, Clauses 53.3 - 53.5 and 63.3 - 63.4, additionally to de-energize the "load" output contacts and terminals when one or more of the following defects occurs:

the grounded conductor to the power supply is opened

the grounded conductor is transposed with an ungrounded conductor to the power supply

one of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened

When Underwriters Laboratories (in UL product category KCXS) and CSA International (in CSA product class 1451-81) list such products, both certifiers specifically identify these as "portable GFCIs" to differentiate them from other GFCIs. Listed portable GFCIs can be embodied not only as GFCI plugs and in-line GFCI cord sets but even some GFCIs for permanent wiring such as SOME faceless GFCI receptacles can be additionally Listed and identified as portable GFCIs.

[1] Asociación de Normalización y Certificación (Association of Standardization and Certification),
[2] Canadian Standards Association
[3] Underwriters Laboratories Inc.

When conventional GFCIs intended for permanent, inspected hard-wiring are used in what should be portable GFCI applications, where the any of the indicated defect conditions occur, the ground-fault-detection circuitry is NOT powered and the GFCI protection cannot operate but power is nonetheless delivered UNinterrrupted EVEN IN THE PRESENCE OF A GROUND-FAULT. Any GFCI protection the user assumes is present is in fact UNAVAILABLE.

Amongst those NOT directly involved in GFCI manufacture who are nonetheless involved with this *Code*, there is a significant misperception that GFCI protection of personnel will provide a panacea against ALL causes of lethal electric shock. Due to their misunderstanding of the differences between GFCIs for permanent installation and portable GFCIs, a significant number of cord reel manufacturers unwittingly extrapolated their Listings for portable (cord-and-plug-connected) cord reels [having ordinary receptacles as outlet components] and their Listings for HARD-WIRED cord reels acceptably having GFCI receptacles as outlet components, without the overt knowledge of at least two major certifiers, to incorrectly encompass portable (cord-and-plug-connected) cord reels having GFCI receptacles (no open neutral protection) as outlet components where portable GFCI protection (with open neutral protection) was warranted.

It is also common to find cord-and-plug-connected field assemblies employing GFCI receptacles (no open neutral protection) as outlet components rather than portable GFCI protection (with open neutral protection) of the outlets. Some times, these are field repairs misperceived as safety upgrades where conventional receptacles in plug-and-cord-connected equipment are replaced with conventional GFCI receptacles. Furthermore, field repairs of plug-and-cord-connected equipment are occasionally encountered where portable GFCIs (faceless-receptacle-type) have been field-replaced with more-readily available, conventional GFCI receptacles under the mistaken belief that they are equivalent. In either situation, where the indicated defects occur, the user has a false sense of security because power is still delivered.
Companion proposals have been made to 100 "Ground-Fault Circuit Interrupter (GFCI), *Portable (as applied to ground-fault circuit interrupters)*" [NEW], to 210.8, to 215.9, and to 590.6.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the added wording follows the changes made in the panel action and statement in Proposal 15-126.
Number Eligible to Vote: 16

Ballot Not Returned: 1 Lau, L.

15-128 Log #837 NEC-P15 **Final Action: Reject**
(518.4(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
The wiring method itself shall qualify as an equipment grounding conductor ~~according to 250.118~~ or shall contain an insulated equipment grounding conductor ~~sized in accordance with Table 250.122~~ or shall be provided with an equipment bonding conductor.
Substantiation: Reference to 250.118 and Table 250.122 is superfluous, they already apply. Equipment bonding jumpers should also be permitted which maintain the ground-fault current path between equipment grounding conductors.
Panel Meeting Action: Reject
Panel Statement: The current edition of the code recognizes the term "equipment grounding conductor" in both definitions and Article 250. The intent of this requirements is that the wiring method be or contain a properly sized equipment grounding conductor, not an equipment bonding jumper.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Lau, L.

15-129 Log #844 NEC-P15 **Final Action: Reject**
(518.4(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
The wiring method itself shall qualify as an equipment grounding conductor ~~according to 250.118~~ or shall contain an insulated equipment grounding conductor ~~sized in accordance with Table 250.122~~ or shall be provided with an equipment bonding conductor.
Substantiation: Reference to 250.118 and 250.122 is superfluous as they already apply. Equipment bonding conductors should be included which maintain the ground-fault current path.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-128.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Lau, L.

15-130 Log #966 NEC-P15 **Final Action: Reject**
(518.4(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: The wiring method shall qualify as an equipment grounding conductor ~~according to 250.118~~ or shall contain an insulated equipment grounding conductor or be provided with an equipment bonding conductor ~~sized in accordance with Table 250.122.~~
Substantiation: Reference to 250.118 and Table 250.122 is superfluous; they apply unless amended. A bonding jumper is suitable for maintaining the ground path between equipment or wiring methods that qualify as a grounding means.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-128.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Lau, L.

15-131 Log #2274 NEC-P15 **Final Action: Reject**
(518.4(B))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise section 518.4(B) as follows: **Nonrated Construction.** ~~In addition to the wiring methods of 518.4(A), nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit~~ Any wiring method approved by this code shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire-rated construction by the applicable building code.
Substantiation: The current text of section 518.4(B) omits types LFMC and LFNC as acceptable wiring methods. In non-fire-rated construction, which is the construction type addressed in this section, wiring-method "fuel load" is not a concern and should therefore permit any of the wiring methods covered in chapter 3 of the NEC, especially since the current text expressly permits, for example, nonmetallic-sheathed cable. This proposed change simplifies and clarifies the code and makes it more user friendly.
Panel Meeting Action: Reject
Panel Statement: Not all wiring methods are the same. Wholesale substitution is an inappropriate method to add LFMC and LFNC without including some substantiation for their inclusion. This will allow the panel to make an informed decision on including it in the code.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Lau, L.

Explanation of Negative:

SAMPSON, M.: I respectfully request that the panel accept this proposal. In buildings or portions of buildings permitted to be of non-rated construction, there are no restrictions on the wiring methods that can be used. It is unnecessary to create and maintain a list of permitted wiring methods.

15-132 Log #2185 NEC-P15 **Final Action: Accept**
(518.5)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise text as follows:

518.5 Supply.

Portable switchboards and portable power distribution equipment shall be supplied only from listed power outlets of sufficient voltage and ampere rating. Such power outlets shall be protected by overcurrent devices. Such overcurrent devices and power outlets shall not be accessible to the general public. Provisions for connection of an equipment grounding conductor shall be provided. The neutral conductor of feeders supplying solid-state phase control, 3-phase, 4-wire dimmer systems shall be considered a current-carrying conductor for purposes of <u>ampacity adjustment</u> ~~derating~~. The neutral conductor of feeders supplying solid-state sine wave, 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor for purposes of <u>ampacity adjustment</u> ~~derating~~.

Exception: The neutral conductor of feeders supplying systems that use or may use both phase-control and sine-wave dimmers shall be considered as current-carrying for purposes of <u>ampacity adjustment</u> ~~derating~~.

FPN: For definitions of solid-state dimmer types, see 520.2.

Substantiation: The term “ampacity adjustment factor” is the term used in 310.15(B)(2)(a).

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Lau, L.

15-133 Log #3005 NEC-P15 **Final Action: Accept**
(518.5)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise text to read as follows:

518.5 Supply.

Portable switchboards and portable power distribution equipment shall be supplied only from listed power outlets of sufficient voltage and ampere rating. Such power outlets shall be protected by overcurrent devices. Such overcurrent devices and power outlets shall not be accessible to the general public. Provisions for connection of an equipment grounding conductor shall be provided. The neutral conductor of feeders supplying solid-state phase control, 3-phase, 4-wire dimmer systems shall be considered a current-carrying conductor for purposes of <u>ampacity adjustment</u> ~~derating~~. The neutral conductor of feeders supplying solid-state sine wave, 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor for purposes of <u>ampacity adjustment</u> ~~derating~~.

Exception: The neutral conductor of feeders supplying systems that use or may use both phase-control and sine-wave dimmers shall be considered as current-carrying for purposes of <u>ampacity adjustment</u> ~~derating~~.

FPN: For definitions of solid-state dimmer types, see 520.2.

Substantiation: The term “adjustment factor” is the term used in 310.15(B)(2)(a).

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Lau, L.

15-134 Log #3006 NEC-P15 **Final Action: Reject**
(518.5, FPN)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise text to read as follows:

518.5 Supply.

Portable switchboards and portable power distribution equipment shall be supplied only from listed power outlets of sufficient voltage and ampere rating. Such power outlets shall be protected by overcurrent devices. Such overcurrent devices and power outlets shall not be accessible to the general public. Provisions for connection of an equipment grounding conductor shall be provided. The neutral conductor of feeders supplying solid-state phase control, 3-phase, 4-wire dimmer systems shall be considered a current-carrying conductor for purposes of derating. The neutral conductor of feeders supplying solid-state sine wave, 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor for purposes of derating.

Exception: The neutral conductor of feeders supplying systems that use or may use both phase-control and sine-wave dimmers shall be considered as current-carrying for purposes of derating.

~~FPN: For definitions of solid-state dimmer types, see 520.2.~~

Substantiation: A definition contained in the.2 section of an article applies only to the article containing the definition. If the definitions in 520.2 are important to article 518, the definition must be moved to article 100. Referring to a definition in another article makes no sense, because the definition does not apply.

Panel Meeting Action: Reject

Panel Statement: 518.2(C) indicates certain areas within assembly occupancies shall comply with Article 520. Therefore, references to definitions in Article 520 are appropriate. Also, this equipment is highly specialized and the panel believes the definitions should remain within these articles and not Article 100.

Fine print notes are for guidance only; they are not requirements. Removal of this FPN would make this portion of the code harder to use for people unfamiliar with this type of dimmer.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Lau, L.

ARTICLE 520 — THEATRES, AUDIENCE AREAS OF MOTION PICTURE AND TELEVISION STUDIOS, AND SIMILAR LOCATIONS

15-135 Log #3296 NEC-P15 **Final Action: Reject**
(520.2)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete and substitute: Electrical apparatus intended to be moved from one place to another and connected to a supply circuit with flexible cords or cables.

Substantiation: Edit. Present wording indicates the cords or cables are the items to be moved.

Panel Meeting Action: Reject

Panel Statement: The proposal does not meet the requirements of 4.3.3(b) the Regulations Governing Committee projects Additionally, the submitter did not identify which definition, but it appears to be for “portable equipment.” Proposed definition does not provide additional clarity.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-136 Log #965 NEC-P15 **Final Action: Reject**
(520.2.Stand Lamp (Work Light))

Submitter: Dan Leaf, Seneca, SC

Recommendation: STAND LAMP (WORK LIGHT). Revise: A portable stand that contains a general-purpose an identified luminaire or lampholder...”. (remainder unchanged)

Substantiation: “General purpose” is not defined; the luminaire should be identified for the use.

Panel Meeting Action: Reject

Panel Statement: “General-purpose” is easily understood and used throughout the code.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-137 Log #151 NEC-P15 **Final Action: Accept**
(520.5(A) Exception)

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Change “communication” to “communications”.

Substantiation: Section 3.3.3 of the NEC Style Manual States: “**3.3.3 Plural.** Unless referring to a single item of equipment, references to electrical components and parts shall be plural rather than singular. This results in greater consistency and makes it clear that the *NEC* provision refers to *all* components or parts of a given type or class.” Changing “communication” to “communications” will correlate with the title of Chapter 8, “Communications Systems”.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-138 Log #866 NEC-P15 **Final Action: Reject**
(520.5(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
The non-fixed supply wiring for portable switchboards, stage lighting, stage effects and other wiring equipment not fixed as to location, except listed portable lamps and equipment with integral cords shall be ~~permitted~~ with extra-hard usage or hard usage type flexible cords or cables identified for the use ~~as provided elsewhere in Article 520~~.
Substantiation: Edit. The provision should be limited to non-fixed wiring since "wiring for portable switchboards" literally includes other feeders and service conductors. Listed portable equipment with integral cords should be exempted. This provision is not a requirement; "permitted" per 90.5 identifies "permitted" as something allowed but not required. "Approved" is not the same as "identified". Cords should be identified for the use; not all cords are suitable; e.g., electric vehicle cables, for wet locations, sunlight resistance, oil, etc.
Panel Meeting Action: Reject
Panel Statement: 520.5(A) covers fixed wiring, (B) is for portable equipment. The addition of "non-fixed supply" provides no clarity. Portable wiring is required to be Listed extra-hard usage unless specifically excepted as noted in several sections of 520, so the general reference to other parts of 520 is appropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-139 Log #2275 NEC-P15 **Final Action: Reject**
(520.5(C))

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise section 520.5 (C) as follows: **Nonrated Construction.** ~~Nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit~~ Any wiring method approved by this code shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire-rated construction by the applicable building code.
Substantiation: The current text of section 520.5(C) omits types LFMC and LFNC as acceptable wiring methods. In non-fire-rated construction, which is the construction type addressed in this section, wiring-method "fuel load" is not a concern and should therefore permit any of the wiring methods covered in chapter 3 of the NEC, especially since the current text expressly permits, for example, nonmetallic-sheathed cable. This proposed change simplifies and clarifies the code and makes it more user friendly.
Panel Meeting Action: Reject
Panel Statement: Not all wiring methods are the same. Wholesale substitution is an inappropriate method to add LFMC and LFNC without including some substantiation for their inclusion. This will allow the panel to make an informed decision on including it in the code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
SAMPSON, M.: I respectfully request that the panel accept this proposal. In buildings or portions of buildings permitted to be of non-rated construction, there are no restrictions on the wiring methods that can be used. It is unnecessary to create and maintain a list of permitted wiring methods.

15-140 Log #1887 NEC-P15 **Final Action: Reject**
(520.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Conductor fill is already specified elsewhere in the Code and applies unless amended. Conductor fill of 366.22 and 376.22 are presumably for safety per 90.1(A) and apply whether current is continuous, intermittent, or short-time; why should it be different for certain premises?
Panel Meeting Action: Reject
Panel Statement: This variance from the conductor fill requirements from Chapter 3 is due to the high density of distinct circuits and the diversity in loading in this special location. For example, it is not unusual for a connector strip to have a density of one receptacle per foot, each receptacle on a different circuit. Not all these receptacles may have a connected load at one time. Not all general requirements of the Code apply to a 520 occupancy.
Additionally, the submitter did not supply any technical documentation that indicates this exception to the Chapter 3 conductor limitations should be removed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-141 Log #3936 NEC-P15 **Final Action: Accept**
(520.6)

Submitter: Mitchell K. Hefter, Entertainment Technology - a Philips group brand
Recommendation: Revise text to read as follows:
520.6 Number of Conductors in Raceway. The number of conductors permitted in any metal conduit, rigid nonmetallic conduit as permitted in this article, or electrical metallic tubing for ~~border or stage pocket~~ circuits or for remote-control conductors shall not exceed the percentage fill shown in Table 1 of Chapter 9. Where contained within an auxiliary gutter or a wireway, the sum of the crosssectional areas of all contained conductors at any cross section shall not exceed 20 percent of the interior crosssectional area of the auxiliary gutter or wireway. The 30-conductor limitation of 366.22 and 376.22 shall not apply.
Substantiation: Existing Section 520.6 refers to conductors for border or stage pocket circuits. This has been mistakenly interpreted as not addressing connector strips or drop boxes which are also stage circuits. Drop boxes are stage pockets fed by extra-hard usage multiconductor cables (see 520.46). Connector strips are similar to drop boxes, except they are generally larger and either "hard-wired" as stage pockets are or fed by extra-hard multiconductor cable (again see 520.46) and in fact are analogous to border lights with receptacles for connection of portable luminaires rather than integral lamps.
Section 520.44 addresses borders and proscenium sidelights and includes cords and cables for border lights. 520.46 is titled Connector Strips, Drop Boxes, Floor Pockets, and Other Outlet Enclosures. It states that the supply cables for connector strips and drop boxes shall be as specified in 520.44 (B).
Therefore, the reference to conductors in 520.6 also refers to Connector Strips and Drop Boxes in addition to the specific language of border or stage pocket circuits. By changing the text of 520.6, this circuitous route to application of the 30-conductor exception in stage venues is simplified.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-142 Log #3254 NEC-P15 **Final Action: Accept in Principle in Part**
(520.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Portable stage and studio lighting and power equipment and ~~portable power distribution equipment~~ not identified for outdoor use shall be permitted for temporary use outdoors, provided the equipment is supervised by qualified personnel while energized and ~~barriered from~~ not accessible to the general public and not subject to weather which has an adverse effect on the equipment.
Substantiation: This provision should apply to equipment not suitable for outdoor use, since if approved for outdoor use should not be restricted to temporary use. Methods other than barriers such as elevation or personnel can prevent access to the general public. Weather conditions are factors which should be considered.
Panel Meeting Action: Accept in Principle in Part
Change the title of 520.10 to read Portable Equipment Used Outdoors.
Accept the language "not identified for outdoor use," the rest of the language of the proposal is rejected.
Revise text to read as follows:
520.10 **Portable Equipment Used Outdoors**. Portable stage and studio lighting equipment and portable power distribution equipment not identified for outdoor use shall be permitted for temporary use outdoors, provided the equipment is supervised by qualified personnel while energized and barriered from the general public.
Panel Statement: The section only describes restrictions for portable equipment use outdoors.
Portable power distribution equipment is an appropriate term because UL Standard 1640, Portable Power Distribution Equipment is the standard this equipment is evaluated to. These products are not consumer grade and are supervised by qualified personnel. There is no reason that portable equipment not identified for outdoor use should not be able to be used under such supervision in non-adverse weather conditions.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
WHITE, A.: This proposal allows the use of certain electrical equipment in a manner in which they are not listed/identified. This condition is inherently unsafe. Furthermore, it is unclear how the supervision of qualified person somehow permits the use of equipment not identified for the purpose. The panel should analyze this proposal closely.
Comment on Affirmative:
KRAMER, E.: A common practice in backyards across the country is to put a stereo, radio, ect. outside during the day while using the backyard; if it rains, it gets brought inside or covered. This is the same thing that happens when equipment that is not marked suitable for wet or damp locations is permitted to be temporarily used outdoors.

This practice is summed up nicely in the Code handbook. "In accordance with 520.10, portable indoor stage or studio equipment that is not marked suitable for wet or damp locations is permitted to be used temporarily in outdoor locations. If rain occurs, this equipment is typically de-energized, and a protective cover is installed before it is re-energized. At the end of the day, this equipment is either de-energized and protected or dismantled and stored."

15-143 Log #851 NEC-P15 **Final Action: Reject**
(520.21)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "and listed".
Substantiation: Article 400 does not require listing.
Panel Meeting Action: Reject
Panel Statement: Proposal does not address the content in 520.21 and the panel cannot identify which section the proposer is addressing. The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee projects.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

Ballot Results: Affirmative: 15

15-150 Log #3255 NEC-P15 **Final Action: Reject**
(Table 520.44)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change right hand column heading to "Ampacity".
Substantiation: Edit. Table relates to ampacity not overcurrent devices.
Panel Meeting Action: Reject
Panel Statement: The headings of the columns are correct. The purpose of the right- hand column is to limit the maximum amount current for the wire size given in the table.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-151 Log #3937 NEC-P15 **Final Action: Accept**
(520.44)

TCC Action: The Technical Correlating Committee directs that the panel clarify 520.44(B)(2) as it applies to "listed for the purpose".
This action will be considered by the panel as a public comment.
Submitter: Mitchell K. Hefter, Entertainment Technology - a Philips group brand
Recommendation: Revise Section 520.44 as follows:
520.44 Borders ~~and~~<u>,</u> Proscenium Sidelights<u>, Drop Boxes, and Connector Strips</u>.
(A) General. Borders and proscenium sidelights shall be as follows:
(1) Constructed as specified in 520.43
(2) Suitably stayed and supported
(3) Designed so that the flanges of the reflectors or other adequate guards protect the lamps from mechanical damage and from accidental contact with scenery or other combustible material
<u>**(B) Connector Strips and Drop Boxes.** Connector Strips and Drop Boxes shall be as follows:</u>
<u>(1) Suitably stayed and supported</u>
<u>(2) Listed for the purpose</u>
~~(B)~~<u>(C)</u> Cords and Cables for Border Lights<u>, Drop Boxes, and Connector Strips</u>.
(1) General. Cords and cables for supply to border lights<u>, drop boxes, and connector strips</u> shall be listed for extra-hard usage. The cords and cables shall be suitably supported. Such cords and cables shall be employed only where flexible conductors are necessary. Ampacity of the conductors shall be as provided in 400.5.
(2) Cords and Cables Not in Contact with Heat-Producing Equipment. Listed multiconductor extra-hard usage-type cords and cables not in direct contact with equipment containing heat-producing elements shall be permitted to have their ampacity determined by Table 520.44. Maximum load current in any conductor with an ampacity determined by Table 520.44 shall not exceed the values in Table 520.44.
<u>**(3) Identification of conductors in multiconductor extra-hard usage cords and cables.** Grounded (neutral) conductors shall be white without stripe or shall be identified by a distinctive white marking at their terminations. Grounding conductors shall be green with or without yellow stripe or shall be identified by a distinctive green marking at their terminations.</u>
Substantiation: Section 520.46 refers back to 520.44 with respect to supply cables for drop boxes and connector strips, but these items are not mentioned in 520.44. Due to the special nature of the installations, it is necessary that the proper application of cords and cables for multiconductor extra-hard usage cords and cables is addressed clearly in this section.

Standard extra-hard usage multiconductor cord, including product from Carol (General), Royal (Omni), and Leviton AIW, uses ICEA/NEMA Method 1 color coding. This is for Type SO, Extra Hard Usage (hard service) required under Article 520. However, this color coding method only provides for one white conductor and one green conductor per 21 conductors (see attached excerpt from the AIW catalog - *mkh520-44proposalExhibit_AIW_SOOW_PortControlCab.pdf*), and this has led to confusion and misapplication - one recent case where the inspector required connector strips to be "hard-wired" and another where the engineer called for Tray Cable to be used in theatre.

In summary from Section 200.6 Paragraph (E) Grounded Conductors of Multiconductor Cables, and by extension, 200.7, any insulated conductor can be re-identified as a grounded (neutral) conductor except a solid green conductor.

"Exception No. 1: Where the conditions of maintenance and supervision ensure that only qualified persons service the installation, grounded conductors in multi-conductor cables shall be permitted to be permanently identified at their terminations at the time of installation by a distinctive white marking or other equally effective means."

Similar language in Section 250.119 Identification of Equipment Grounding Conductors, Paragraph (B) Multiconductor Cable states that is permissible to permanently re—identify conductors as equipment grounding conductors at time of installation.

Despite the existence of language in other parts of the Code, the unique nature of installation under Article 520 continues to lead to confusion among inspectors and engineers. The added language clarifies the application of extra-hard usage multiconductor cord and cable in venues subject to Article 520.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-152 Log #2302 NEC-P15 **Final Action: Accept in Principle**
(Table 520.44, Footnote)

Submitter: John Marshall, Underwriters Laboratories Inc.

Recommendation: Table 520.44 (last footnote) – Revise to

On a 4-wire, 3 phase, (cord connected) wye circuit where the major portion of the load consists of nonlinear loads, ~~such as electronic-discharge lighting, electronic computer/data processing or similar equipment~~, there are harmonic currents in the neutral conductor, ~~and~~ therefore the neutral conductor shall be considered to be a current-carrying conductor.

Substantiation: Revised to agree with revised footnote to the definition - Nonlinear Load covered in a companion proposal. Remove "such as" examples as they would best be contained in the footnote to the definition.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

On a 4-wire, 3 phase wye circuit where the major portion of the load consists of nonlinear loads, ~~such as electronic-discharge lighting, electronic computer/data processing or similar equipment~~, there are harmonic currents in the neutral conductor~~, and~~. Therefore, the neutral conductor shall be considered to be a current-carrying conductor.

Panel Statement: The panel maintains the intent, however, revised the language to improve readability.

Ballot Results: Affirmative: 15

15-153 Log #913 NEC-P15 **Final Action: Accept**
(520.45)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the existing text in 520.46 and 520.62(B).

This action will be considered by the panel as a public comment.

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: Edit. Ampere ratings are covered in 406.2(B) (which includes cord connectors). Articles 310 and 400 apply unless modified.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-154 Log #911 NEC-P15 **Final Action: Reject**
(520.47)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Lamps (bare bulbs) installed backstage and ancillary areas where they can or are likely to come in contact with scenery shall be located and/or guarded so as to be ~~free~~ not likely to be subject to physical damage and shall be provided an air space...". (remainder unchanged).

Substantiation: "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections. Location OR guarding, not both, should be acceptable if one or the other is effective.

Panel Meeting Action: Reject

Panel Statement: "Not likely" is not prescriptive enough in the harsh environment. "Likely" is to be avoided per the NEC Style Manual. Current wording clearly describes proven, industry-specific safe practice.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-155 Log #4639 NEC-P15 **Final Action: Accept**
(520.50(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Change "terminate in" to "originate from".

Substantiation: This rule requires the point where a circuit is connected to consist of an inlet that matches, by current and voltage, that of the receptacle supplied at the other end of the wiring. This proposal is editorial. The submitter believes the intent is more clearly conveyed through the use of "originate from" because that is the direction of power transfer. Otherwise the "inlet" would be powered when not in use, which would violate 406.6(D).

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-156 Log #848 NEC-P15 **Final Action: Accept**
(520.50(C))

This action will be considered by the panel as a public comment.

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise last sentence:

~~The individual~~ Each supplemental circuit within the road show connection point and theater shall be protected by branch circuit overcurrent protective devices ~~of suitable ampacity~~ installed within the road show connection panel.

Substantiation: "Individual" may imply a single load. Branch circuit overcurrent devices are not rated by ampacity which 3.2.5.1 of the Style Manual applies to conductors only. "Suitable" is a term to be avoided per the Style Manual. Ratings of overcurrent devices is covered elsewhere in the code.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-157 Log #4640 NEC-P15 **Final Action: Reject**
(520.51)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Delete the word "only" from the first sentence.

Substantiation: This limitation conflicts with 520.51(H)(1) and particularly 520.51(K). Further, 520.53(P) provides for qualified personnel to make the connections, and the power outlet option only appears in the exception. Power outlets are simply not the "only" source for connecting this equipment.

Panel Meeting Action: Reject

Panel Statement: A power outlet is defined as an assembly used to provide and control power. The reason for "only" is to ensure that power is derived from a proper power outlet.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-158 Log #1767 NEC-P15 **Final Action: Accept in Principle**
(520.52)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise last sentence: Circuits for lampholders rated over 300 watts shall be permitted where ~~overcurrent protection complies is~~ in accordance with ~~Article~~ 210.23.

Substantiation: Edit. Reference should not be made to an entire article. Section 210.23 is specific. 210.23(A), (B), and (C) is applicable; Table 210.24 does not preclude 15- and 20-ampere circuits from supplying heavy duty lampholders.

Panel Meeting Action: Accept in Principle

Delete entire section and replace with:

520.52 **Overcurrent Protection for Branch Circuits**. Portable switchboards shall contain overcurrent protection for branch circuits. Section 210.23 shall not apply.

Panel Statement: There are sections of Article 210, including portions of 210.23, that are not applicable to the overcurrent protection of branch circuits from portable switchboards on stage. Distinctions regarding 300 watts originated with obsolete equipment and are not applicable to current technology and industry practice.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

15-159 Log #839 NEC-P15 **Final Action: Reject**
(520.53)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (H)(3)(3) last sentence:
The ~~supply conductors~~ cords and cables shall be ~~adequately~~ protected by approved means where likely to be subject to physical damage.
Revise (H)(4)(4):
The supply ~~conductors~~ flexible cords and cables shall not penetrate ~~walls, floors, or ceilings,~~ structural members or finishes of buildings or structures or be run through door openings or regularly used traffic areas unless protected by approved means.
Substantiation: Supply conductors include all conductors from the source of power. This section relates to flexible cords and cables. Cords and cables should not be run through any structural members or finishes, not just walls, floors, and ceilings. Protective mats and coverings are available for cord and cable protection that are suitable for some foot traffic areas.
Panel Meeting Action: Reject
Panel Statement: The title of 520.53(H) is Supply Conductors. It is part of Part IV - Portable Switchboards on stage. It is obvious to users of the Code that it does not pertain to all conductors from the source of power. “Walls, floors, or ceilings” are intentionally more specific than “structural members or finishes of buildings of structures.” This section addresses all traffic areas, not just “regularly used.” The existing wording is clear as to intent or meaning.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-160 Log #847 NEC-P15 **Final Action: Reject**
(520.53(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter portion:
...Or otherwise ~~properly~~ coated with identified material to prevent corrosion or be made of a corrosion resistant material.
Substantiation: Edit. “Properly” is subjective and a term to be avoided per the Style Manual. “Identified” is “suitable for the use”.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 15-161.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-161 Log #1766 NEC-P15 **Final Action: Reject**
(520.53(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Enclosures of ~~wood~~ combustible material shall be completely lined with sheet metal of not less than 0.51 mm (0.020 in.) thickness and shall be ~~that is well~~ galvanized, enameled, or otherwise ~~properly~~ coated with noncombustible material to ~~prevent~~ minimize corrosion, or be of a corrosion resistant nonflammable material identified for the use.
Substantiation: Edit. Dimensions should be specified as thickness. Galvanizing and coating may minimize, but not prevent corrosion. Coating and corrosion resistant material should be nonflammable.
Panel Meeting Action: Reject
Panel Statement: The existing wording describing wood construction is correct but may not be representative of all combustible materials, the characteristics of lining material are based on wood construction.
Number Eligible to Vote: 15

(520.53(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete: “all control wiring shall comply with Article 725”.
Substantiation: Edit. Reference should not be made to an entire article. Article 725 already applies where applicable and applies to remote control wiring.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-163 Log #846 NEC-P15 **Final Action: Accept in Part**
(520.53(F) and (H))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence of (F):
Conductors shall be enclosed in approved raceways or shall be... (remainder unchanged).
In (H)(1), delete “listed” and revise last sentence:
The supply cords or cables (and connector assembly) shall have ~~sufficient ampacity~~ current ratings not less than the total load connected to the switchboard and shall be protected by overcurrent devices.
In (H)(2), revise fourth sentence:
Where single conductors are paralleled ~~for increased ampacity the paralleled conductors shall be of the same size and length~~. They shall comply with 310.4 in (H)(3) and (4) and (4)(4) delete “adequately” and “suitably”.
Substantiation: Approved raceways other than metal raceways should be permitted. “Sufficiently”, “adequately”, and “suitably” are subjective and terms to be avoided per the Style Manual. “Ampacity” is a term to be used with conductors only (not connector assemblies) per the Style Manual. Present wording can be construed as amending the provisions for parallel conductors in 310.4 re: conductor material, insulation type and terminations. Conductors may be paralleled for reasons other than increased ampacity, such as ease in handling, availability.
Panel Meeting Action: Accept in Part
Accept the part in 520.53(H)(1): The supply cords or cable (and connector assembly) shall have ~~sufficient ampacity to carry~~ current ratings not less than the total load connected to the switchboard and shall be protected by overcurrent devices.
Reject all other proposed changes.
Panel Statement: In 520.53(H)(1), listing is a valid requirement. In 520.53(H)(2) existing language is clear and correct. 520.53(F) contains the words “metal wireways” because they are the intended and appropriate method for interior construction of portable switchboards.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-164 Log #973 NEC-P15 **Final Action: Reject**
(520.53(H)(1) and (2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
(1) The non-fixed wiring to a portable switchboard shall be by means of extra-hard usage flexible cords or cables identified for the use. The supply cords and cables shall terminate at the switchboard enclosure in a manually externally operable fused main switch or circuit breaker, or in a connector assembly identified for the purpose. The supply cords and cables, connector assembly fused switch and circuit breaker shall have a rating not less than the calculated load and the supply cords and cables shall be provided with overcurrent protection.
(2) Single conductor supply cords and cables shall not be smaller than 2 AWG and be Type SC, SCE, SCT, PPE, or W. An equipment grounding conductor other than type SC, SCE, SCT, PPE flexible cord or cable, shall be a stranded type. Single conductor neutral supply conductors shall be sized in accordance with 520.53(O)(2). Cables shall be grouped together but not bundled.
Substantiation: Extra-hard usage cords and cables should be suitable for the use since all such types are not suitable for all the “use” considerations in Table 400.4. Single conductor equipment grounding conductors other than types indicated in the proposal (building wire) should be stranded for flexibility. Requirements for identification of conductors and systems is already covered elsewhere in the Code and apply unless modified.
Panel Meeting Action: Reject
Panel Statement: Proposed wording removes required headings from (H)(1) and (H)(2). Proposed language does not add clarity. Enumeration of single-conductor cable types excludes future additions to this category.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-165 Log #1888 NEC-P15 **Final Action: Reject**
(520.53(H) and (L))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise fourth sentence of (H)(2): Where single conductors are paralleled ~~for increased ampacity,~~ the paralleled conductors shall comply with 310.4.~~ shall be of the same size and length.~~
In (H)(1)(3) and (4) and in (L), insert: “from the power outlet” after “supply” in the first sentences.
Substantiation: Parallel conductors may be installed for reasons other than increased ampacity, such as ease in handling or availability. The provisions should only apply to certain portions of supply conductors, not feeders or service conductors. 520.51 requires power outlets. 310.4 has additional requirements which may be deemed modified by only requiring the same size and length.
Panel Meeting Action: Reject
Panel Statement: The existing language is appropriate for this application and clearly describes proven, industry-specific safe practice.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-166 Log #1764 NEC-P15 **Final Action: Reject**
(520.53(H)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: The supply cord or cable (and connector assembly) shall have ~~sufficient~~ an ampacity ~~to carry the total load connected to the switchboard~~ not less than the rating of the master switch or circuit breaker and shall be protected by overcurrent devices.
Substantiation: "Sufficient" is subjective and a term to be avoided per the Style Manual. Ampacity of the supply conductors should be determined by the master switch or circuit breaker as loads connected to a switchboard may vary.
Panel Meeting Action: Reject
Panel Statement: Proposed wording would not allow the "tap rules" of 520.53(H)(3) and (4).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-167 Log #3354 NEC-P15 **Final Action: Reject**
(520.53(H)(1)and (2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (1) and substitute:
The non-fixed wiring supply to a portable switchboard shall be extra-hard usage type flexible cords or cables identified for the use. The supply cords and cables shall terminate at the switchboard enclosure within an externally operable fused main (master) switch or circuit breaker, or in a connector assembly identified for the purpose. The master switch or circuit breaker, supply cords and cables (and connector assembly) shall have ratings not less than the rating of the switchboard and shall be provided with overcurrent devices.
Revise text of (2):
Single conductor portable supply cable sets shall be Type G, GC, or W and shall not be smaller than 2 AWG. The equipment grounding conductor shall not be smaller than 6 AWG. ~~conductor.~~ Single conductor grounded neutral conductors shall be sized in accordance with 520.23(O)(2). ~~Where single conductors are paralleled for increased ampacity the paralleled conductors shall be the same length and size.~~ Single-conductor supply cables shall be grouped together but not bundled. The equipment grounding conductor(s) shall be permitted to be of a different type, provided ~~it~~ they meet the other requirements of this section ~~and it shall be permitted to be reduced in size as permitted by 250.122~~. Grounded ~~(neutral)~~ circuit conductors and equipment grounding conductors shall be identified in accordance with applicable provisions of 200.6, 250.119, and 310.12.
~~Conductors shall be permitted to be identified by marking at least the first 150 mm (6 in.) from both ends of each length of conductor with white or gray. Equipment grounding conductors shall be permitted to be identified by marking at least the first 150 mm (6 in.) from both ends of each length of conductor with green or green with yellow strips. Where more than one nominal voltage exists within the same promises, each ungrounded conductor shall be identified by system.~~
Substantiation: In (B) (1), "supply" should be clearly specified as the non-fixed wiring; "supply" includes feeders and service conductors. The switch or circuit breaker where the supply terminates may not be within the switchboard. "Sufficient" is a term to be avoided per the Style Manual. "Permitted to be" does not impose a requirement per 90.5 and Article 499 does not specify listing. The supply cord or cable should have ratings not less than the switchboard since it is likely to accompany the portable switchboard and the load may vary from use to use.
In (B) (2), portable supply cable sets are not specifically defined; per Table 400.4 Types G, GC, and W appear to be the appropriate types. The provision for single parallel conductors is already covered in 310.4 and is not limited to single conductors and increased ampacity. Conductors may be paralleled for other reasons such as ease in handling or availability. Identification of equipment grounding conductors and grounded circuit conductors is covered elsewhere in the Code which includes being bare or stripped...which could be the "different" type...Where the grounded conductor is a circuit conductor it should be so noted; equipment grounding conductors are grounded conductors per the definition of Grounded in Article 100. The provision for identification of systems seems unwarranted since portable cables for this use are unlikely to be confused with other systems.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 15-164. Also, it is clear that this is non-fixed wiring because the text is part of 520 Part IV - Portable Switchboards On Stage. Marking for different systems is critical, since that is a typical use for Article 520 venues. Current wording clearly describes proven, industry-specific safe practice.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-168 Log #4641 NEC-P15 **Final Action: Accept**
(520.53(H)(3)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action relating to the use of the phrase "overcurrent protection device" vs. "overcurrent protective device".
This action will be considered by the panel as a public comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change "the ampacity of the supply overcurrent protection device" to "the current rating of the supply overcurrent protection device."
Substantiation: Overcurrent devices do not possess ampacity. This wording violates 3.2.5.1 of the NEC Style Manual. Only conductors have ampacities.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-169 Log #4642 NEC-P15 **Final Action: Accept**
(520.53(H)(4)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action relating to the use of the phrase "overcurrent protection device" vs. "overcurrent protective device".
This action will be considered by the panel as a public comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change "the ampacity of the supply overcurrent protection device" to "the current rating of the supply overcurrent protection device."
Substantiation: Overcurrent devices do not possess ampacity. This wording violates 3.2.5.1 of the NEC Style Manual. Only conductors have ampacities.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-170 Log #4643 NEC-P15 **Final Action: Accept**
(520.53(H)(4)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change "the supply neutral terminal," to "the current rating of the supply neutral terminal and the ampacity of".
Substantiation: Terminals do not possess ampacity. This wording violates 3.2.5.1 of the NEC Style Manual. Only conductors have ampacities.
Panel Meeting Action: Accept
Panel Statement: The panel point outs that the actual section to be revised is 520.53(O)(1).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-171 Log #2003 NEC-P15 **Final Action: Reject**
(520.53(L))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Superfluous; already covered by 110.27(B), 400.8(7), 520.53(H)(4)(3). "Approved" is inherent in the requirement per 110.2.
Panel Meeting Action: Reject
Panel Statement: Article 520 applications specifically require the protection described in 520.53(L). In addition, the clarification that such protection need not be a raceway is also required. Current wording clearly describes proven, industry-specific safe practice.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-172 Log #2187 NEC-P15 **Final Action: Accept**
(520.53(O)(2))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
(2) Supply Neutral Conductor. The power supply conductors for portable switchboards utilizing solid-state phase-control dimmers shall be sized considering the neutral conductor as a current-carrying conductor for ampacity adjustment ~~derating~~ purposes. The power supply conductors for portable switchboards utilizing only solid-state sine wave dimmers shall be sized considering the neutral conductor as a non–current-carrying conductor for ampacity adjustment ~~derating~~ purposes. Where single-conductor feeder cables, not installed in raceways, are used on multiphase circuits feeding portable switchboards containing solid-state phase-control dimmers, the neutral conductor shall have an ampacity of at least 130 percent of the ungrounded circuit conductors feeding the portable switchboard. Where such feeders are supplying only solid-state sine wave dimmers, the neutral conductor shall have an ampacity of at least 100 percent of the ungrounded circuit conductors feeding the portable switchboard.
Substantiation: The term "ampacity adjustment factor" is a term used in 310.15(B)(2)(a).
Panel Meeting Action: Accept

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-173 Log #3008 NEC-P15 **Final Action: Accept**
(520.53(O)(2))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
(2) Supply Neutral Conductor. The power supply conductors for portable switchboards utilizing solid-state phase-control dimmers shall be sized considering the neutral conductor as a current-carrying conductor for ampacity adjustment ~~derating~~ purposes. The power supply conductors for portable switchboards utilizing only solid-state sine wave dimmers shall be sized considering the neutral conductor as a non–current-carrying conductor for ampacity adjustment ~~derating~~ purposes. Where single-conductor feeder cables, not installed in raceways, are used on multiphase circuits feeding portable switchboards containing solid-state phase-control dimmers, the neutral conductor shall have an ampacity of at least 130 percent of the ungrounded circuit conductors feeding the portable switchboard. Where such feeders are supplying only solid-state sine wave dimmers, the neutral conductor shall have an ampacity of at least 100 percent of the ungrounded circuit conductors feeding the portable switchboard.
Substantiation: The term “adjustment factor” is the term used in 310.15(B)(2)(a).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-174 Log #853 NEC-P15 **Final Action: Accept in Part**
(520.53(P) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
In the *Exception*, change “ampacity” to “current rating”.
In (a), change “suitable” to “identified”.
In (c), change “suitable for the type of” to “not less than the load”.
Substantiation: Per the Style Manual, “ampacity” is to be applied only to conductors. “Suitable” is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Accept in Part
Accept the first and last recommendations:
In the *Exception*, change “rated ampacity” to “current rating”.
In (c), change “suitable for the type of” to “not less than the load”.
Reject the second recommendation:
In (a), change “suitable” to “identified”.
Panel Statement: The existing language of (a) to the exception is appropriate. While “suitable” is normally to be avoided, it is the best choice in this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-175 Log #850 NEC-P15 **Final Action: Reject**
(520.61(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(D) FLANGED SURFACE DEVICES. ~~INLETS~~ Flanged surface devices ~~inlets that are used to accept the power~~ shall be rated in amperes.
(E) CABLE ARRANGEMENT Flexible cords and cables shall be ~~adequately~~ protected by approved means where they pass through enclosures and be ~~arranged~~ installed or provided with identified strain relief fittings so that tension on the flexible cord or cable is not transmitted to the terminations.
Substantiation: Flanged surface outlets should be included, also flexible cables... Means to prevent tension on terminations should be identified for the use, not looping or tying the cord or cable.
Panel Meeting Action: Reject
Panel Statement: The proposal does not match the text of 520.61.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-176 Log #2045 NEC-P15 **Final Action: Reject**
(520.62(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change “current-carrying” to “live”.
Substantiation: Edit. Current-carrying may be deemed to mean capable of carrying current or actually energized. “Live” is explicit and defined.
Panel Meeting Action: Reject
Panel Statement: The meaning is clear. The nature of environment means some parts could be live sometimes and not others. “Current-carrying” is common usage and identified as suitable in the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-177 Log #852 NEC-P15 **Final Action: Accept in Part**
(520.62(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
Flexible cords or cables supplying pendant receptacle or cord connectors shall be ~~listed for~~ extra-hard usage types identified for the use.
Substantiation: Pendant cord connectors should be included. Flexible cords and cables should be identified as suitable for the conditions of use. Article 400 does not specify listing.
Panel Meeting Action: Accept in Part
Accept the introduction of the word “flexible” and the phrase “or cord connectors.”
The panel rejects all other proposed changes.
Flexible Cords or cables supplying pendant receptacles or cord connectors shall be listed for extra-hard usage.
Panel Statement: The panel contends that listed cord or cable is required for this article.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-178 Log #840 NEC-P15 **Final Action: Reject**
(520.62(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. This section covers portable power distribution units, defined as an enclosure containing receptacles and overcurrent devices, not specifically related to cords or cables. “Adequately” is subjective and a term to be avoided per the Style Manual. Flexible cord and cable protection is covered elsewhere in the Code. Section 406.6 covers ratings for flanged surface devices.
Panel Meeting Action: Reject
Panel Statement: Paragraphs (D) and (E) are clearly within the scope of portable power distribution units and contain valid requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-179 Log #2044 NEC-P15 **Final Action: Reject**
(520.65)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first sentence and substitute:
The connections of permanently attached leads of pendant lampholders to festoon conductors shall be staggered.
Substantiation: Edit. Clarification of apparent intent.
Panel Meeting Action: Reject
Panel Statement: All joints in a festoon assembly are subject to the staggering requirement, not just joints of pendant lampholders.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-180 Log #4644 NEC-P15 **Final Action: Accept**
(520.65)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following sentence after the first sentence: “Where such lampholders have terminals of a type that puncture the insulation and make contact with the conductors, they shall be attached only to conductors of the stranded type.”
Substantiation: This is an important rule that is necessary to properly apply this equipment. It appears in 225.24. This section correctly incorporated the portion of the rule regarding staggered joints, but fails to bring in the stranding rule. Since this wiring is usually indoors, 225.24 does not automatically apply.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-181 Log #835 NEC-P15 **Final Action: Reject**
(520.68(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
(1) Flexible conductors including cable extensions used to supply portable stage equipment shall be ~~listed~~ hard usage types identified for the use except as permitted in (A)(2).
Exception: Flexible cords that are an integral part of listed floor or table lamps or appliances shall be permitted.
(2) Listed hard usage type flexible cord shall be permitted to supply stand lamps where the cord is not likely to be subject to physical damage and is protected by an overcurrent device in accordance with 240.5(A) but not over 20 amperes.

Substantiation: Article 400 does not require listing. Cords should be identified as suitable for the use such as wet or oil conditions, direct sunlight, etc. electric vehicle cords may not be suitable. Section 240.5(A) is not specifically amended by this section.
Panel Meeting Action: Reject
Panel Statement: The proposed wording is not correct (material omitted and not shown as such in legislative format). Listed extra-hard usage cords and cables are the only type permitted for general use. "Not likely" is not prescriptive enough and is to be avoided per the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-182 Log #2043 NEC-P15 **Final Action: Reject**
(520.73)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete last sentence.
Substantiation: Superfluous: The first sentence specifies which outlets are to be switched, which then doesn't apply to other outlets.
Panel Meeting Action: Reject
Panel Statement: The current wording is correct. Only outlets adjacent to mirrors must be switched.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-183 Log #2042 NEC-P15 **Final Action: Reject**
(520.81)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change "metal sheathed" to "metal enclosed".
Substantiation: Edit. "Metal-sheathed" may be deemed not to include Type AC and MC cables which don't have "sheaths".
Panel Meeting Action: Reject
Panel Statement: The existing wording is adequate. Metal sheathed cable does not exclude type AC and MC cable.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 522 — CONTROL SYSTEMS FOR PERMANENT AMUSEMENT ATTRACTIONS

15-184 Log #2800 NEC-P15 **Final Action: Accept**
(522.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text
~~522.3 Other Articles~~
~~Wherever the requirements of other articles of this Code and Article 522 differ, the requirements of Article 522 shall apply.~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 522.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

15-185 Log #4289 NEC-P15 **Final Action: Accept**
(522.3)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Delete this section.
~~522.3 Other Articles.~~
~~Wherever the requirements of other articles of this Code and Article 522 differ, the requirements of Article 522 shall apply.~~
Substantiation: NEC 90.3 indicates Chapters 1-4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 522.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

15-186 Log #901 NEC-P15 **Final Action: Reject**
(522.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Only qualified persons shall install, service, and maintain electrical control systems.
Substantiation: Edit. "Permanent amusement attractions" includes non-electrical components while 522.1 indicates this article covers electrical wiring.
Panel Meeting Action: Reject
Panel Statement: Section 522.7 covers maintenance and does not cover the installation of control systems for permanent amusement attractions. The panel contends that the existing language is more appropriate.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

15-187 Log #2648 NEC-P15 **Final Action: Reject**
(522.22)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Conductors sized 16 AWG and smaller shall not exceed the continuous current values provided ampacity specified in Table 522.22.
Substantiation: Edit. Table 522.22 specifies but does not provide ampacity; that is determined by the conductor, material, insulation, and conditions of use. "Continuous" is superfluous; the definition of ampacity specifies continuous current.
Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects. The panel does not understand the submitters intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

15-188 Log #1624 NEC-P15 **Final Action: Reject**
(522.23)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "Table 310.16" to "Table 310.15(B)(1)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: The references made by the submitter will be automatically addressed if the lead proposal is accepted by Panel 6.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

15-189 Log #2649 NEC-P15 **Final Action: Reject**
(522.23)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows: Conductors larger than 16 AWG shall have overcurrent protection in accordance with applicable provisions of Article 725. ~~the appropriate conductor ampacity in Table 310.16.~~
Substantiation: Edit. Since this section relates to control circuits, Article 725 seems to be an appropriate reference since 725.43 doesn't apply derating factors and Table 310.16 does (allowable ampacities). Class 2 circuit conductors are not specified in Article 725 to be provided with overcurrent protection.
Panel Meeting Action: Reject
Panel Statement: The requirement is for the overcurrent protection of conductors, per the ampacity table, Table 310.16. This proposed change is not editorial and the submitter has not provided any substantiation for this change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

15-190 Log #865 NEC-P15 **Final Action: Reject**
(522.24(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (3) IN a MANHOLE or HANDHOLE Control circuits and power and lighting circuits shall only be permitted in the same manhole or handhole in accordance with at least one of the following:
(1) The power and lighting or control circuits or all system conductors are in a separate dedicated identified raceway, metal covered cable, or type UF multiconductor cable.
Make present (B)(3)(4) bold (4) and revise:
CABLE TRAYS. In cable trays where the control circuit conductors and power and lighting conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power and lighting or control circuit conductors are in a separate dedicated identified raceway or metal-covered cable.
Substantiation: Handholes should be included. “Permitted” without “only” is not a requirement per 90.5 but identifies actions not required. The present (B)(3)(3) should have a heading since it doesn’t relate to (B)(3) in a manhole.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation for the proposed changes.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

15-191 Log #857 NEC-P15 **Final Action: Reject**
(522.25)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
(1) Continuity of power is required for orderly shutdown and where a ground-fault is likely to result in a hazardous condition.
(2) Ground detectors are installed on the control system at an approved location.
Add: FPN: See *Exception No. 2* for 250.162(A) for rectifier-derived dc systems.
Substantiation: The provision should apply where interruption of power is likely to result in a hazard. *Exception No. 2* for 250.162(A) is not modified by this provision and also applies. Ground detectors should be installed at a location occupied by a person during hours of operation.
Panel Meeting Action: Reject
Panel Statement: The present wording is clear and the reference to a hazardous condition is unnecessary. A requirement for the location of the ground detectors to be installed at approved (unspecified) locations is unnecessary.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 525 — CARNIVALS, CIRCUSES, FAIRS, AND SIMILAR EVENTS

15-192 Log #834 NEC-P15 **Final Action: Reject**
(525.5(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Open individual conductors and multiconductor cables shall have a vertical clearance ~~to ground~~ in accordance with 225.18.
Substantiation: Edit. Section 225.18 includes vertical clearances from platforms or projections and limits the provision to open type conductor which may not be perceived as cords.
Panel Meeting Action: Reject
Panel Statement: “Conductors” is a more inclusive term. The recommendation does not enhance the usability of the Code.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-193 Log #3511 NEC-P15 **Final Action: Accept**
(525.5(B)(2))

TCC Action: The Technical Correlating Committee directs that the panel clarify the action taken on this proposal relating to the phrase “and extending vertically to grade” by placing it after the word “horizontally” in the text.
This action will be considered by the panel as a public comment.
Submitter: Mark R. Hilbert, Wolfeboro, NH
Recommendation: Revise 525.5(B)(2) as follows:
(B) Clearance to Portable Structures.
(2) Over 600 Volts. Portable structures shall not be located under or within a space that is 4.5 m (15 ft) horizontally of conductors operating in excess of 600 volts and extending vertically to grade.
Substantiation: Since the 2008 NEC, 525.5(B)(2) has applied to concessions and other portable structures and in many cases there is limited space at fairgrounds, etc. With the expansion of this section in 2008, the interpretation of this section has become significantly more important. Although I have always had some questions regarding the literal wording of this section, I have interpreted it to mean that a ride or attraction or now a portable structure cannot be located in the space under the 15 ft horizontal measurement. However, when this section only applied to rides and attractions (prior to 2008) there were not as many questions from the industry.
The current language in 525.5(B)(2) states: “portable structures cannot be located under or within 12 ft horizontally of conductors operating in excess of 600 volts.” If taken literally, as demonstrated in Figure 1, it could be reasonably interpreted that a portable structure could be located in a manner that meets the 12 ft horizontal measurement and not be located under the conductors, but still have a portion that is located within a space that is under the 15 ft horizontal measurement.
If 525.5(B)(2) intends that the portable structure not be located in the space under the 15 ft horizontal measurement, as shown in Figure 2, then the proposed revision will clarify how the section is to be interpreted.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-194 Log #855 NEC-P15 **Final Action: Reject**
(525.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part:...with ~~mechanical~~ approved protection where such equipment or wiring methods are likely to be subject to physical damage.
Substantiation: Edit. “Mechanical” implies machinery or tools. “Likely” is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: “Likely” is not prescriptive enough and is to be avoided per the NEC Style Manual. “Mechanical” is imperative as part of the application.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-195 Log #1923 NEC-P15 **Final Action: Reject**
(525.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Where likely to be subject to physical damage electrical equipment and wiring methods in or on portable structures shall be provided with ~~mechanical~~ identified means of protection. ~~where such equipment or wiring methods are subject to physical damage.~~
Substantiation: Edit. “Mechanical” implies tools or machinery. “Likely” is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: “Likely” is not prescriptive enough and is to be avoided per the NEC Style Manual. “Mechanical” is imperative as part of the application.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-196 Log #1782 NEC-P15 **Final Action: Reject**
(525.10(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Service equipment shall not be installed in a location ~~that is~~ where accessible to ~~unqualified~~ unauthorized persons unless the equipment enclosure is locked or under the continuous observation and control of an authorized person.
Substantiation: The equipment should be actually locked not just have the potential for being locked. If an enclosure is locked, it need not be inaccessible to unqualified persons. Many locked switches, transformer enclosures, etc., in public areas are accessible. A person can exercise control without be “qualified”.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 15-197.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-197 Log #2041 NEC-P15 **Final Action: Reject**
(525.10(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Service equipment shall not be installed in a location that is accessible to unqualified persons unless the equipment is ~~lockable~~ locked or under the continuous supervision of a qualified person.
Substantiation: Edit. The equipment should not only be lockable, but actually locked.
Panel Meeting Action: Reject
Panel Statement: The existing wording is adequate. The term locked is not enforceable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-198 Log #854 NEC-P15 **Final Action: Accept in Principle in Part**
(525.10(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of (A):
Service equipment shall not be installed in a location that is accessible to unqualified persons unless the equipment is ~~lockable~~ provided with identified integral permanent means for locking in the open (off) position and kept locked.
Revise text of (B):
Service equipment shall be ~~mounted on solid backing~~ securely fastened in place and if installed in a wet location be weatherproof or protected from the weather by approved means ~~and be installed so as to be protected from the weather unless of weatherproof construction~~.
Substantiation: "Lockable" is not specific and allows for makeshift methods; does not specifically require equipment to be locked. Free standing equipment secured to concrete slabs are not mounted on backing. Protection from weather should be "approved".
Panel Meeting Action: Accept in Principle in Part
Reject proposed change to paragraph (A). See action and statement on Proposal 15-197.
Accept in principle the wording in (B).
The revised wording to read:
(B) Mounting and Location. Service equipment shall be securely fastened to a ~~mounted on~~ solid backing and be installed so as to be protected from the weather, unless of weatherproof construction.
Revised wording meets the submitter's intent and provides clarity.
Panel Statement: See the panel action and statement for Proposal 15-197 for the part being rejected. The revised wording in (B) meets the submitters intent and provides additional clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-199 Log #2040 NEC-P15 **Final Action: Reject**
(525.10(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (B) and reference to 525.10(A) and (B) in the first paragraph.
Substantiation: Unnecessary redundant rule; already covered by 110.12 and 110.13(A). Additionally, some premises covered by this article are permanent and have switchboards mounted and secured to floors or concrete bases. Weatherproof requirements are also covered elsewhere in the Code.
Panel Meeting Action: Reject
Panel Statement: Requirements of 525.10(B) must be clearly called out in Article 525. 110.12 and 110.13(A) do not eliminate the need for 525.10(B).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-200 Log #1704 NEC-P15 **Final Action: Reject**
(525.11 Exception (New))

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Add an exception to 525.11 Multiple Sources of Supply, for portable structures that are non-metallic, like a tent.
Where multiple services or separately derived systems, or both, supply portable structures, the equipment grounding conductors of all the sources of supply that serve such structures separated by less than 3.7 m (12 ft) shall be bonded together at the portable structures. The bonding conductor shall be copper and sized in accordance with Table 250.122 based on the largest overcurrent device supplying the portable structures, but not smaller than 6 AWG.
Exception: This bonding requirement will not apply to nonmetallic portable structures such as tents.
Substantiation: It would be pointless to bond canvas or wood structures to each other.
Panel Meeting Action: Reject
Panel Statement: 525.11 requires equipment grounding conductors of separate supplies supplying different structures less than 12 ft apart to be bonded together. Equipment located within non-metallic structures should not be exempt from this requirement. The requirement is to bond the equipment grounding conductors of both electrical supply sources, preventing a difference in potential between equipment energized from two separate sources, even though the equipment supplied may be located under a canopy or tent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-201 Log #2680 NEC-P15 **Final Action: Reject**
(525.20(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Where flexible cords or cables are used they shall be ~~listed for~~ extra-hard usage types and identified for the use, such as wet locations and sunlight resistant. Where flexible cords are used and not subject to physical damage they shall be permitted to be ~~listed for~~ hard usage. Where used outdoors flexible cords and cables shall also be ~~listed~~ identified for wet locations and be sunlight resistant. Extra-hard usage flexible cords or cables shall be permitted for use as ~~permanent~~ fixed wiring on portable amusement rides and attractions where not likely to be subject to physical damage.
Substantiation: Article 400 does not require listing. Cords should be identified as suitable for the use. All extra-hard usage and hard usage types are not suitable, e.g., electric vehicle cable. "Permanent" is not defined.
Panel Meeting Action: Reject
Panel Statement: Listing is required for Article 525 venues. Cords listed for extra -hard usage are suitable for wet locations and sunlight are resistant. The phrase "subject to physical damage" is self-explanatory.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-202 Log #2647 NEC-P15 **Final Action: Reject**
(525.20(A), (D), and (G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete texts and substitute: (A) Flexible cords and cables shall be permitted for temporary wiring and permanent wiring on portable amusement rides and attractions and portable structures. Flexible cords and cables shall be extra-hard usage types identified for the purpose and sunlight resistant where exposed to direct sunlight. Where likely to be subject to physical damage they shall be protected by identified means. Where passing through doorways or other pinch points approved protection shall be provided. (D) Flexible cords and cables shall be continuous without splice or taps between terminations. (G) Flexible cords and cables accessible to the public shall be arranged to minimize the tripping hazard and shall be covered with an identified nonconductive matting where installed on the ground in areas of pedestrian travel. It shall be permitted to bury flexible cords or cables used for temporary wiring where not likely to be subject to physical damage and not installed under a building or structure. The requirements of 300.5(A) shall not apply.
Substantiation: Edit. Article 400 does not specify listing. Where use outdoors under cover such as tents or awnings and not exposed to direct sunlight cords and cables should not have to be sunlight resistant. Direct burial should only be where not under buildings or structures and not likely to be disturbed or damaged by foot or vehicle traffic or animal confinement areas. Covering for cords or cables laid on the ground in traffic areas should be a requirement.
Panel Meeting Action: Reject
Panel Statement: Listing is required. Current wording clearly describes proven, industry-specific safe practice. The proposed wording does not provide clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-203 Log #4756 NEC-P15 **Final Action: Accept in Principle**
(525.21)

Submitter: Kim Jones, Funtastic Shows / Rep. O.A.B.A. Outdoor Amusement Businessmans Assoc.
Recommendation: Add new text to read as follows:
(c) Portable structure disconnecting means.
Wiring and equipment in portable disconnecting means shall conform to the section applying to permanently fixed structures, but, due to the limited space available, the working spaces shall be permitted to be reduced, provided that the equipment shall be arranged so that the operator can work safely and so that other persons in the vicinity cannot accidently come into contact with current-carrying parts or bring conducting objects into contact with them while they are energized.
Substantiation: This proposal allows the NEC to recognize that Art. 525 Portable structures have the same limited space available as other portable industries do. The wording was plagiarized from Art. 530.62. The proposal would bring into compliance the vast majority of portable structures that cannot meet existing space requirements.
Panel Meeting Action: Accept in Principle
Revise beginning of proposal text - entire added text now reads:
(c) Working Space for Electrical Equipment in Portable Structures
In portable structures where electrical equipment is installed, and the working space of 110.26 applies, the working spaces shall be permitted to be reduced, provided that the equipment shall be arranged so that work can be performed safely and so that persons in the vicinity cannot accidentally come into contact with energized parts or bring conducting objects into contact with energized parts.
Panel Statement: The revised wording meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
SAMPSON, M.: I respectfully request that the panel reject this proposal. Section 110.26 establishes the minimum safe working clearances around electrical equipment. To compromise that minimum for the disconnecting means for a portable structure would expose carnival and festival workers to unnecessary electrical hazards. Note that the phrase “shall be permitted to be reduced” provides no limit whatsoever and would allow the complete elimination of the safe working clearances. Electrical work on and in portable structures is often done “hot” and almost always done by the owners, operators or their unlicensed employees who may not fully understand the hazards involved. For the safety of those who work on this equipment, the minimum working clearance should not be negotiable.
WHITE, A.: The proposal as written presents a dangerous precedent. The clearance requirements of 110.26 are critical to worker safety and should not be reduced due to space limitations. Workers installing and preforming maintenance on this equipment are deserving of the same safety considerations as those workers preforming the very same work on permanent structures. Safety is paramount and should not be superceded by convenience.

15-204 Log #1326 NEC-P15 **Final Action: Reject**
(525.21(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise third sentence:
Where accessible to ~~unqualified~~ unauthorized persons the ~~enclosure for~~ switch or circuit breaker shall be ~~of the lockable type~~ provided with an identified permanent integral means for locking in the open (off) position and kept locked when the operator is not present.
Substantiation: “Lockable type” is not specific. Locking the enclosure doesn’t prevent operation of the disconnecting means external handle. Operators are usually authorized but “unqualified”. Present wording does not require a lockable type when the operator is present; can it be installed when not present? The disconnecting means should be kept locked when the operator is not present.
Panel Meeting Action: Reject
Panel Statement: “Authorized” does not mean “qualified”, and qualified is required (therefore the term “unqualified” is appropriate). The intent of the remainder of proposal is met by the panel action on Proposal 15-205.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-205 Log #1569 NEC-P15 **Final Action: Accept**
(525.21(A))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal and correlate with the action taken on Proposal 1-63.
This action will be considered by the panel as a public comment.
Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
(A) Disconnecting Means. **A means to disconnect e**ach portable structure **from all ungrounded conductors** shall be provided**.** ~~with a~~ **The** disconnect**ing means shall be** ~~switch~~ located within sight of and within 1.8 m (6 ft) of the operator’s station. The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the **disconnecting means shall be lockable.** ~~enclosure for the switch or circuit breaker shall be of the lockable type~~. A shunt trip device that opens the fused disconnect or circuit breaker when a switch located in the ride operator’s console is closed shall be a permissible method of opening the circuit.
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for “Disconnecting Means, Lockable.”
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-206 Log #581 NEC-P15 **Final Action: Reject**
(525.21(B))

Submitter: Mitch Feininger, North Dakota State Electrical Board
Recommendation: Delete the following text:
~~All lamps for general illumination shall be protected from accidental breakage by a suitable luminaire or lampholder with a guard.~~
Substantiation: I think that the first part of the paragraph, which requires protection for lamps that are subject to physical damage is sufficient. If it is not subject to physical damage, breakage is unlikely.
Panel Meeting Action: Reject
Panel Statement: The first sentence covers wiring and does not automatically imply lamps. The second sentence addressing lamps is necessary.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-207 Log #1922 NEC-P15 **Final Action: Reject**
(525.21(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Electrical wiring ~~for lighting~~ where installed in or on tents and concessions shall comply with 525.20(G) and be securely supported ~~installed. and~~ Where likely to be subject to physical damage identified means of protection shall be provided. ~~With mechanical protection.~~ All lamps for general illumination shall be protected from accidental breakage by ~~a suitable~~ an identified luminaire or lampholder or guard.
Substantiation: The provision should also apply to the outside surfaces of tents and concessions and to wiring for other than lighting. “Suitable” is a term to be avoided per Style Manual; “likely” is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The proposed wording does not improve or clarify current wording. In addition, it would allow a lamp to be installed without a guard.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-208 Log #1891 NEC-P15 **Final Action: Accept**
(525.22(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: Boxes shall be designed so that no live parts are exposed ~~to accidental contact~~ except when necessary for examination, adjustment, servicing, or maintenance by qualified persons.
Substantiation: “Accidental” is superfluous. Exposed live parts may be necessary during examination, adjustment, or servicing.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-209 Log #2533 NEC-P15 **Final Action: Accept in Principle in Part**
(525.23)

Submitter: Marcus R. Sampson, Lysistrata Electric
Recommendation: Revise text to read as follows:
525.23 Ground-Fault Circuit-Interrupter (GFCI) Protection.
(A) Where GFCI Protection Is Required. ~~The ground-fault-circuit-interrupter shall be permitted to be an integral part of the attachment plug or located in the power supply cord, within 300 mm (12 in.) of the attachment plug. Listed cord sets incorporating ground-fault-circuit-interrupter for personnel shall be permitted.~~
~~(1) 125-volt, single-phase, 15- and 20-ampere non-looking type receptacles used for disassembly and reassembly or readily accessible to the general public.~~
~~(2) Equipment that is readily accessible to the general public and supplied from a 125 volt, single-phase, 15- or 20-ampere branch circuit~~
~~**(B) Where GFCI Protection Is Not Required.** Receptacles that only facilitate quick disconnecting and reconnecting of electrical equipment shall not be required to be provided with GFCI protection. These receptacles shall be of the looking type.~~
All 125-volt, single-phase, 15- and 20-ampere receptacles.
~~**(C)**~~ **(B) Where GFCI Protection Is Not Permitted.** Egress lighting shall not be protected by a GFCI.
Substantiation: GFCI is a time-tested technology and this protection was expanded in the 2008 Code cycle to apply to all 125-volt, single-phase, 15- and 20-ampere outdoor receptacles. This same level of personal safety must be extended to the workers and patrons of carnivals, festivals and events.
Panel Meeting Action: Accept in Principle in Part
The panel rejects the revisions to Part (A) of 525.23 and accepts in principle the intent of the changes to part (B) with the revised wording as follows:
(B) **Where GFCI Protection Is Not Required**. Receptacles that are not accessible from grade level and that only facilitate quick disconnecting and reconnecting of electrical equipment shall not be required to be provided with GFCI protection. These receptacles shall be of the locking type.
Panel Statement: For part (A) see panel action and statement on proposal 15-213. Panel action on (B) reinforces the intent to limit the receptacles not requiring GFCI protection for personnel to those used in very specific applications.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-210 Log #503 NEC-P15 **Final Action: Accept in Part**
(525.23(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "circuit" and "interrupter" in two places and add an "a" in the second sentence so it reads: "Listed cord sets incorporating a ground-fault circuit-interrupter for personnel shall be permitted."
Substantiation: The addition of the hyphen will correlate with the title of 525.23 and provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
The addition of the "a" is grammatical.
Panel Meeting Action: Accept in Part
Accept the part to add a hyphen in two locations. The remainder of the proposal is rejected.
Panel Statement: Addition of the 'a' is supplanted by revised language as accepted in panel action on Proposal 15-213.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-211 Log #1307 NEC-P15 **Final Action: Accept in Principle**
(525.23(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add to first paragraph:
Ground-fault circuit interrupter protection shall be provided for receptacles and equipment described in 525.23(A)(1) and (2).
Substantiation: Edit. The text has no specific requirement to provide GFCI protection.
Panel Meeting Action: Accept in Principle
See panel action on Proposal 15-213.
Panel Statement: The panel action and statement on Proposal 15-213 incorporates the intent of the submitter's proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-212 Log #1890 NEC-P15 **Final Action: Accept in Principle**
(525.23(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Ground-fault circuit interrupter protection shall be provided for the following:
(1) no change.
(2) no change.
The ground-fault circuit interrupter shall be permitted to be an integral part of the attachment plug or located in the power supply cord within 300 mm (12 in.) of the attachment plug. Listed cord sets incorporating a ground-fault circuit interrupter for personnel shall be permitted.
Substantiation: Edit. Since the heading refers to where protection is required, (1) and (2) should immediately follow, as the first paragraph relates to types.
Panel Meeting Action: Accept in Principle
See panel action on Proposal 15-213.
Panel Statement: The panel action and statement on 15-213 incorporates the intent of the submitters proposal.
Number Eligible to Vote: 16

15-215 Log #4799 NEC-P15 **Final Action: Reject**
(525.23(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
525.23 ~~Ground-Fault Circuit-Interrupter (GFCI)~~ Power Safe Protector Protection.
(A) Where ~~GFCI~~ power safe protector Protection Is Required. The ~~ground-fault circuit interrupter~~ power safe protector shall be permitted to be an integral part of the attachment plug or located in the power-supply cord, within 300 mm (12 in.) of the attachment plug. Listed cord sets incorporating ~~ground-fault circuit interrupter~~ power safe protector for personnel shall be permitted.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle is actively supplying power to an appliance, it provides traditional GFCI protection.
2. PSP receptacles monitor the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There are no product standard requirements for the PSP receptacle and as such it is inappropriate to consider adding such requirements to the code. A study of wiring device failure mechanisms along with evidence that the technology can mitigate the hazards claimed is necessary before further consideration can be given.
The Panel notes that there is nothing in the NEC prohibiting installation of these devices.

15-222 Log #978 NEC-P15 **Final Action: Reject**
(530.13)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Switches used for studio ~~stage~~ set lighting and effects (on the stages and lots and on location) shall be of the ~~externally~~ manually operable type. Where contactors are used for the disconnecting means for fuses ~~an individual externally~~ a manually operable ~~suitably rated~~ switch identified for the use and control of each contactor shall be readily accessible and located at a distance of not more than 1.8 m (6 ft) from the contactor, in addition to any remote control switches for the contactor. A single ~~externally~~ manually operable switch shall be permitted to simultaneously disconnect all the contactors on any one location board where readily accessible and located at a distance of not more than 1.8 m (6 ft) from the location board.
Substantiation: Edit. Externally operable includes external remote control circuits. "Suitable" is subjective and a term to be avoided per the Style Manual. Readily accessible should be a requirement.
Panel Meeting Action: Reject
Panel Statement: Current wording clearly describes proven, industry-specific safe practice.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-223 Log #1837 NEC-P15 **Final Action: Reject**
(530.19(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: A demand factor of 50 percent of ~~maximum possible connected~~ calculated load shall be permitted for all portable feeders.
Substantiation: If a portable feeder is rated for 200 amperes (maximum connected load), the demand would be amperes. If the calculated load for this feeder is 100 amperes, the demand would be 50 amperes. Since this load is applied to the service and other supply conductors and equipment, a phantom load would have to be provided for.
Panel Meeting Action: Reject
Panel Statement: Substantiation is incomprehensible. Current wording clearly describes proven, industry-specific safe practice.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-224 Log #972 NEC-P15 **Final Action: Reject**
(530.20)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Pendant and portable lamps, stage lighting, stage sound equipment, and other portable and special stage equipment operating at not over 150 volts to ground shall not be required to be grounded.
Substantiation: Grounding of metal raceways, cables and parts is already covered in Article 250 which applies unless modified. The provision should not be limited to dc. If the alternatives and exceptions to grounding permitted in Article 250 are not intended, the first sentence should be retained with the deletion of "as specified in Article 250".
Panel Meeting Action: Reject
Panel Statement: The grounding requirements for AC equipment were specifically added 20 years ago due to the special nature of the equipment. The submitter failed to provide any technical substantiation for the removal of grounding requirements for AC equipment operating at not over 150 volts to ground.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-225 Log #3326 NEC-P15 **Final Action: Reject**
(530.20)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
~~Type MC cable, Type MI cable~~ Metal-enclosed cables metal raceways, and all exposed non-current-carrying metal parts of electrical equipment shall be grounded ~~connected to an equipment grounding conductor~~. This shall not apply to listed stage props such as ~~pendant~~ portable lamps appliances or other equipment with integral or factory-provided flexible cords, or to stage lighting and stage sound equipment operating at ~~not over~~ 150 volts dc or less to ground.
Substantiation: All metal-enclosed cable, such as Type AC permitted in 530.11 should be included. That section requires an insulated equipment grounding conductor. Metal enclosed cables and metal raceways are equipment grounding conductors. This provision is unclear as to intent.
Panel Meeting Action: Reject
Panel Statement: Not all portable lamps in this occupancy are considered stage props. "Exposed" is already covered under the existing language "non-current-carrying" metal parts. Users of these venues understand the intent of this section. The submitter did not provide sufficient technical documentation for the suggested changes. See the panel action on Proposal 15-183 regarding the panel's decision concerning the term "metal enclosed" cables.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-226 Log #971 NEC-P15 **Final Action: Reject**
(530.21(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: The voltage rating of attachment plugs, receptacles, cord connectors, and flanged surface devices (inlets and outlets) shall not be less than the circuit voltage. Ampere ratings for such devices shall not be less than the ampere rating of the circuit to which such devices are connected. (remainder unchanged).
Substantiation: Attachment plugs, cord connectors and flanged surface devices are already required to be rated in amperes (406.2(A) and 406.6). The second sentence should also apply to other devices in the proposal. Present literal wording of the penultimate sentence indicates ampere ratings shall not be less than feeder or branch circuit overcurrent device ratings, which implies a choice between ratings.
Panel Meeting Action: Reject
Panel Statement: It is standard practice to use higher rated receptacles in theaters, motion picture studios, and television studios. These areas and specifically these connections are not accessible to the general public. The most common example - a 60 amp stage pin connector connected to a 50 amp circuit with a 5000 watt load.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-227 Log #4645 NEC-P15 **Final Action: Accept**
(530.51)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change "rigid fixtures" to "rigid luminaires".
Substantiation: Luminaire is not the mandatory term of art in the NEC. This must have been overlooked.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 540 — MOTION PICTURE PROJECTION ROOMS

15-228 Log #385 NEC-P15 **Final Action: Accept**
(540.2.Professional Projector)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as shown:
"A type of projector using 35- or 70-mm film that has a minimum width of 35 mm (1 in.) and has on each edge 212 perforations/meter ~~perforations per meter~~ (5.4 perforations/inch ~~perforations per inch~~), or a type using carbon arc, xenon, or other light source equipment that develops hazardous gases, dust, or radiation."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Panel Statement: Note: The submitter mistyped "35mm (1 in)" - it should be "35 mm (1 3/8 in.)"
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-229 Log #936 NEC-P15 **Final Action: Accept in Principle**
(540.11(A)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part: "...and ~~properly ventilated~~ with approved ventilation from a source of clean air.
Substantiation: Edit. "Properly" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Accept in Principle
Revise text to read:
(2) Separate Rooms or Housings. Be enclosed in separate rooms or housings built of noncombustible material constructed so as to exclude flyings or lint~~, and properly ventilated~~ with approved ventilation from a source of clean air.
Panel Statement: This wording better addresses submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

15-230 Log #935 NEC-P15 **Final Action: Reject**
(540.12)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "and deep" after "wide".
Substantiation: A minimum depth of working space is also necessary.
Panel Meeting Action: Reject
Panel Statement: Depth is inferred from the language "... at the rear thereof."
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 545 — MANUFACTURED BUILDINGS

19-3 Log #1821 NEC-P19 **Final Action: Accept**
(545.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change the word "before" to "after".
Substantiation: Edit. It is unlikely that inspection cannot be performed during the manufacturing process before installation at the site.
Panel Meeting Action: Accept
Panel Statement: The panel makes the assumption that the submitter is referring to the text for "Closed Construction".
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-4 Log #934 NEC-P19 **Final Action: Reject**
(545.4(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
All identified ~~raceway and cable~~ wiring methods included in this Code...". (remainder unchanged)
Substantiation: Limitation to raceway and cable wiring methods does not permit the use of open wiring on insulators where the manufactured building is used for industrial or agricultural purposes (398.10) nor the use of individual open conductors in cable trays, nor the use of auxiliary gutters. All raceway and cable wiring methods appear to amend or negate "permitted" or "not permitted" use in wiring method articles.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided to support the proposed revision.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-5 Log #906 NEC-P19 **Final Action: Reject**
(545.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Service entrance conductors shall be installed after erection of the building at the building site.
Substantiation: Edit.
Panel Meeting Action: Reject
Panel Statement: 545.6 Exception allows for service conductors to be installed when the point of attachment is known prior to manufacture. No technical substantiation has been provided to support the proposed revision.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-6 Log #2039 NEC-P19 **Final Action: Reject**
(545.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Unnecessary; the requirements of 230.70 already apply unless amended.
Panel Meeting Action: Reject
Panel Statement: The current language is clear and specific to a specialized industry. Usability of the NEC by including the specific reference or requirement within this article is far more important than not using references where information could be overlooked.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-7 Log #2038 NEC-P19 **Final Action: Reject**
(545.11)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Bonding/grounding is already covered by Article 250 which applies unless modified. Since there are no specific requirements, it may be assumed all identified means and methods elsewhere in the code apply.
Panel Meeting Action: Reject
Panel Statement: Refer to panel statement on Proposal 19-6.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-8 Log #2037 NEC-P19 **Final Action: Reject**
(545.12)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Where a grounding electrode is required, provisions shall be made to route...(remainder unchanged).
Substantiation: Edit. A grounding electrode is not always required. (250.32(A), Exception).
Panel Meeting Action: Reject
Panel Statement: The provision for the routing of the grounding electrode conductor needs to be provided at the time of manufacture regardless of whether a grounding electrode is required since the grounding requirements may not be known before the building is placed at the site.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

ARTICLE 547 — AGRICULTURAL BUILDINGS

19-9 Log #4177 NEC-P19 **Final Action: Accept**
(547.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: Marcus R. Sampson, Lysistrata Electric
Recommendation: Revise text to read as follows:
547.1 Scope. The provisions of this article shall apply to the following agricultural buildings or that part of a building or adjacent areas of similar or like nature as specified in 547.1(A) ~~and~~ or (B).
Substantiation: The provisions apply when the conditions of EITHER (A) or (B) are present. The current wording implies that BOH are necessary.
Panel Meeting Action: Accept
Panel Statement: CMP-19 notes that it is not authorized to revise the scope statement and respectfully requests the TCC consider the panel action to accept the proposed revision.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-10 Log #4410 NEC-P19 **Final Action: Reject**
(547.1)

Submitter: Dean Hunter, Hunter Electric
Recommendation: Add the following new text:
547.1 The provisions of this article shall apply to the following:
(A) Agricultural buildings, such as animal confinement and milking parlors
(B) Agricultural structures, such as grain handling facilities and bins
(C) Adjacent areas of similar nature as specified in (A) and (B).
Substantiation: Enforcement of the provisions of 547 is difficult when it is not clear whether the rules apply to grain handling facilities. There are occupancies where the only "ag" is the grain storage and processing.
Also, if any part of a building meets the provisions of 547.1(A) or (B) then the entire building shall meet the requirements.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add clarity or improve usability of the code. The existing scope is clear (also see the panel action on Proposal 19-9).
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-11 Log #933 NEC-P19 **Final Action: Reject**
(547.1(B)(1) and (2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (1) and (2) change "may" to "likely to".
Substantiation: Edit. "May" is a term to be avoided per the Style Manual. "Likely" is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: The TCC has the authority to amend the scope of articles. "Likely to" is more inclusive than "may" and it is not the intent of CMP-19 to be more inclusive in this instance.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-12 Log #3415 NEC-P19 **Final Action: Reject**
(547.2.Distribution Point)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
547.2 Definitions.
Distribution Point. An electrical supply point from which service drops, service-entrance conductors, feeders, or branch circuits to buildings or structures utilized under single management are supplied. (The remaining text to be unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: Although the proposal has merit, CMP-19 defers to the action taken by CMP-4 on the definitions of the terms.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-13 Log #708a NEC-P19 **Final Action: Reject**
(547.2.Equipotential Plane)

Submitter: Teri Dwyer, Wyoming, MN
Recommendation: Delete text as follows:
~~547.2 Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.~~
Substantiation: There are currently two definitions of Equipotential Plane in the NEC that contain slightly different terminology. 547.2 allow wire mesh or other conductive elements to be embedded in or placed under concrete without any dimensions as to where the conductive elements are to be placed and is only applicable if concrete is present. How far below the concrete is still going to create a safe equipotential plane? Where 680.2 will allow wire mesh or other conductive elements to be on, embedded in, or placed under the walking surface within 3 in. This definition is not specific to concrete as a walking surface and provides a prescriptive depth that it is to be installed below the area requiring the equipotential plane.
A common definition would not effect the location where the equipotential plane is required to be installed, because 547.10 and 682.33 still identify the required locations. It would benefit the AHJ by creating one definition for a common term.
I have also submitted proposals to delete this definition from 682.2 (CMP-17) and add it to Article 100 (CMP-5).
Panel Meeting Action: Reject
Panel Statement: It is necessary to maintain the separate definition of “equipotential plane” in Article 547. There are differences in requirements for equipotential planes used in other applications.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-14 Log #1720a NEC-P19 **Final Action: Reject**
(547.2.Equipotential Plane (New))

Submitter: Larry T. Smith, National Electrical Seminars, Inc.
Recommendation: Move the existing definition of equipotential plane from 547.2 to Article 100.
Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.
A companion proposal has been submitted to CMP-5 to move the definition to Article 100.
Substantiation: This term is used in Articles 547, 680, and 682 and should be located in Article 100 in accordance with the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-13.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-15 Log #3975 NEC-P19 **Final Action: Reject**
(547.2.Equipotential Plane)

Submitter: Donald W. Zipse, Electrical Forensics, LLC
Recommendation: Delete definition for Equipotential Plane.
Substantiation: It is suggested that the panel consider 547.10 first where the justification and substantiation for the complete removal of Equipotential Planes is given.
The State of Wisconsin has modified the adoption of the NEC several year ago by eliminating the Equipotential Plane requirement from the NEC as the dairy farmers soon found out after the requirement was first introduced, that the installation of an equipotential plane 1) prevented the cows from entering the milking parlor because the cows were receiving an electric shock, 2) reduced the milk production again because the dairy cows were getting an electric shock when being milked while standing on an equipotential plane, 3) injured the cows and resulted in death of the cows in the herd from stray current flowing uncontrolled through not only the legs injuring the ankle joints causing the joints swelled preventing the cow from standing along with other problems from the stray current entering the cow from the equipotential plane.
The continued insertion of this requirement in the NEC for the installation of an equipotential plane is hindering the milk production and is NOT PROTECTING THE COWS FROM ELECTRIC SHOCK, but is applying a condition where the dairy cows ARE GETTING ELECTRIC SHOCKS FROM STANDING ON AN EQUIPOTENTIAL PLANE.
The substation this cycle contains NEW REASONS for acceptance of this proposal than what was submitted last cycle. The attached Institute of Electrical and Electronics Engineers (IEEE) Technical paper titled “EQUIPOTENTIAL PLANES: A FIGMENT OF THE IMAGINATION” was peer reviewed and accepted. The paper explains the misunderstanding that exists today with respect to Equipotential Planes and how to correct the problem. PLEASE remember that three additional years of detailed data had been collected from many dairy farms since the paper was first written. Many changes, improvements have been made in the method of measuring the stray current flowing through the dairy cow.
Mr. Neubauer no longer uses a coil of copper tubing OR COPPER CONDUCTORS (Iron wire now used) or he no longer uses a bucket of water or feed to entice the cow to drink or eat from the bucket in order to obtain the measurement of the flow of stray current through the cow. Today he clips a nose ring onto the cow’s muzzle and makes the measurement of the stray current flowing uncontrolled through the dairy cow.
In summary the paper concludes:
“It is opined that the equipotential plane is no more than an earth electrode, which lacks any ability to maintain or to have zero voltage gradient across it when any amount of electrical current flows over, across or through the equipotential plane. As an electrode-earthing element, the equipotential plane has the potential for uncontrolled stray current from the multigrounded neutral electrical distribution system to flow across the equipotential plane generating a dangerous and hazardous voltage to drive the stray current into and through humans and cows and pigs with devastating results.
“It is opined that the mis-guided agriculture personnel and the NEC Making Panels failed to recognize the three difference conditions between 1) momentary flow of fault current and 2) the continuous flow from stray current emanating from the multigrounded neutral electrical distribution system and 3) the condition where there is no current flow across the equipotential plane.
“It is a fact that there are two methods that stray current enters the so-called equipotential plane. One is the direct primary neutral to secondary neutral connection at the vast majority of utility transformers in North America that has a solid electrical connection between the primary neutral to the equipment grounding conductor and thus to the equipotential plane. The other source of

stray current is the multiple connections, at least 4 per mile, connecting the primary neutral to earth allowing additional stray current to flow uncontrolled over and through the earth.

"Mr. Neubauer's test proved conclusively, that the equipotential plane was just a figment of the imagination by using an instrumented plastic water bucket and plastic feed container and cows, leaving no doubt in the opinion of this author that the so called equipotential plane does not prevent a voltage gradient as proclaimed by the agriculture personnel and the NEC."

Thus the above words in the definition are incorrect and MUST be removed from the NEC in order that the NEC will no longer be incorrect and appear to be foolish.

The paper mentioned above has been provided with this proposal.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: It is necessary to maintain the definition of "equipotential plane" because it is used in Article 547.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

(Note: Sequence 19-16 moved to follow 19-31 on page 721)

19-17 Log #1344 NEC-P19 **Final Action: Reject**
(547.5(A))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Type UF, Type NMC, copper Type SE cables jacketed Type MC cables, copper or stainless steel Type MI cables, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metallic conduit, Type NTRC conduit, nonmetallic wireways and auxiliary gutters, rigid metal conduit and intermediate metal conduit encapsulated in factory-applied polyvinyl chloride, open wiring on insulators, or other cables and raceways shall be the wiring method(s) employed. The wiring methods of Article 502 shall be permitted for areas described in 547.1(A). All wiring methods shall be identified for the use.

Alternatively delete present text and substitute:

Wiring methods identified as suitable for the use in areas covered by 547.1(A) and (B) shall be employed.

Substantiation: The present list does not include liquidtight flexible metal conduit, flexible connectors, or cords permitted in (D) and modifies and negates open wiring on insulators permitted in 398.10 "or other cables or raceways" permits other methods such as indicated in the proposal.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation has been provided to justify the expanded list of wiring systems.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-18 Log #2697 NEC-P19 **Final Action: Reject**
(547.5(A))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Open wiring on insulators, Types UF, NMC, Copper SE cables, jacketed type MC cable, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, Type MI cable, or other identified cables or raceways ~~suitable for the location~~ with ~~approved~~ identified fittings shall be the wiring method employed. (remainder unchanged)

Substantiation: Open wiring on insulators is permitted by 398.10 for agricultural establishments in wet or corrosive conditions. This section appears to modify and negate 398.10 Liquidtight flexible metal conduit is as suitable as jacketed type MC cable and type MI cable also appears suitable.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 19-17.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-19 Log #900 NEC-P19 **Final Action: Reject**
(547.5(C)(2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Change "listed" to "identified".

Substantiation: Edit. All fittings such as straps, clamps, threaded conduit couplings and the like are specifically listed for use in wet locations.

Panel Meeting Action: Reject

Panel Statement: Section 547.5(C)(2) is consistent with Section 314.15 and extends that same degree of protection where normal maintenance of the area creates similar wet conditions. Straps, clamps, and threaded conduit couplings are not included in the requirements of this section or in Section 314.15.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-20 Log #2696 NEC-P19 **Final Action: Reject**
(547.5(D))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise first sentence;

Where necessary to employ flexible connections listed dustight flexible connectors, liquidtight flexible metal conduit liquidtight flexible nonmetallic conduit, or flexible cord or cable identified for extra-hard usage or hard usage and the conditions shall be used.

Substantiation: Edit. Flexible connectors should be listed. Article 400 does not specify listing for cords and cables. Extra-hard usage types should be permitted, and cords and cables should be for the use. All cords and cables are not suitable; e.g., electric vehicle cable, wet locations, oil resistance, sunlight resistance.

Panel Meeting Action: Reject

Panel Statement: The last sentence of this section already requires all fittings and connectors to be listed for the systems for which they are intended to be used. Section 547.5(D) modifies the requirement in Article 400 by requiring the flexible cord to be "listed." The submitter offers no substantiation to change the requirement. Most other cables do not lend to the flexibility addressed by this subsection.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-21 Log #1447 NEC-P19 **Final Action: Reject**
(547.5(D), (E) and (F))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise first sentence of (D): Where necessary to employ flexible connections, listed dusttight flexible connectors, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, or flexible cord or cable ~~listed~~ identified for extra-hard usage or hard usage and the use shall be used and shall include an equipment grounding conductor. (remainder unchanged)

Revise text of (E): All electrical wiring and equipment likely to be subject to physical damage shall be identified for the use or protected by approved means.

Revise text of (F): Where an equipment grounding conductor or a bonding conductor is installed ~~within~~ in a location falling ~~under~~ within the scope of Article 547 it shall be a copper conductor. Where an equipment grounding conductor or a bonding conductor is installed underground in a location within the scope or Article 547 it shall be insulated or covered copper.

Substantiation: Edit. Flexible connectors should be listed. Flexible cables should be permitted and flexible cords and cables should be permitted to be extra-hard usage types. Cords and cables should be identified for the use, (exposure to water, sunlight, etc.) and not for electrical vehicle charging some of which are extra-hard usage types. Article 400 does not require listing.

Panel Meeting Action: Reject

Panel Statement: (D): The last sentence of this section already requires all fittings and connectors to be listed for the systems for which they are intended to be used. Section 547.5(D) modifies the requirement in Article 400 by requiring the flexible cord to be "listed." The submitter offers no substantiation to change the requirement. Most other cables do not lend to the flexibility addressed by this subsection. Section 250.118 contains requirements for equipment grounding conductors. The submitter has offered no substantiation to modify those requirements.

(E): No substantiation has been provided to support the proposed changes. There is no particular identification means for wiring systems that are suitable where "subject to physical abuse," with the exception of flexible cord.

(F): No substantiation has been provided to support the proposed change to add "a bonding conductor." The panel does not believe that the other proposed editorial changes add substantively to clarity.

Number Eligible to Vote: 8

(D) Where necessary to employ flexible connections, listed dusttight flexible connectors, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, or flexible cord or cable ~~listed~~ identified for extra-hard usage or hard usage and the use shall be used and shall include an equipment grounding conductor. (remainder unchanged).
Revise text of (E): All electrical wiring and equipment likely to be subject to physical damage shall be identified for the use or protected by approved means.
Revise text of (F): Where an equipment grounding conductor or a bonding conductor is installed within in a location falling under within the scope of Article 547 it shall be a copper conductor. Where an equipment grounding conductor or a bonding conductor is installed underground in a location within the scope or Article 547 it shall be insulated or covered copper.
Substantiation: Edit. Flexible connectors should be listed. Flexible cables should be permitted and flexible cords and cables should be permitted to be extra-hard usage types. Cords and cables should be identified for the use, (exposure to water, sunlight, etc.) and not for electrical vehicle charging some of which are extra-hard and hard usage types. Article 400 does not require listing. Bonding conductors should be included in the copper and insulated or covered requirement.
Panel Meeting Action: Reject
Panel Statement: (D): The last sentence of this section already requires all fittings and connectors to be listed for the systems for which they are intended to be used. Section 547.5(D) modifies the requirement in Article 400 by requiring the flexible cord to be “listed.” The submitter offers no substantiation to change the requirement. Most other cables do not lend to the flexibility addressed by this subsection. Section 250.118 contain requirements for equipment grounding conductors. The submitter has offered no substantiation to modify those requirements.
(E): No substantiation has been provided to support the proposed changes. There is no particular identification means for wiring systems that are suitable where “subject to physical abuse,” with the exception of flexible cord.
(F): No substantiation has been provided to support the proposed change to add “a bonding conductor.”
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-23 Log #583 NEC-P19 **Final Action: Reject**
(547.5(G))

Submitter: Mitch Feininger, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
GFCI protection shall not be required for an accessible receptacle supplying a permanently installed dedicated load where a GFCI protected receptacle is located within 900 mm (3 ft) of the non-GFCI protected receptacle.
Substantiation: 1) The term “dedicated load” is not defined in the NEC and could be misinterpreted.
2) Nothing in the 2008 NEC prohibits relocation of the “dedicated load” from one or more receptacles fed by this circuit which supplies this “dedicated load.” More than 1 receptacle could be installed for a single dedicated load, leaving non-GFCI protected receptacles with nothing plugged into them.
Panel Meeting Action: Reject
Panel Statement: A “dedicated load” attached to a receptacle is by nature, not “permanently installed.” The proposed language does not add to enforceability of the requirement.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-24 Log #3081 NEC-P19 **Final Action: Accept**
(547.5(G))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(G) Receptacles. All 125-volt, single-phase, 15- and 20-ampere general-purpose receptacles installed in the locations listed in (1) through (4) shall have ground-fault circuit-interrupter protection:
(1) Areas having an equipotential plane
(2) Outdoors
(3) Damp or wet locations
(4) Dirt confinement areas for livestock
~~GFCI protection shall not be required for an accessible receptacle supplying a dedicated load where a GFCI protected receptacle is located within 900 mm (3 ft) of the non-GFCI-protected receptacle.~~
Substantiation: This new allowance that was added to the 2008 NEC flies in the face of the general rules for GFCI-protection discussed in 210.8. Because equipment that is functioning correctly should operate fine on a GFCI-protected outlet, there is no reason for this allowance. A GFCI doesn’t open until the circuit has a leakage current of 4-6mA, and, considering that listed equipment should have no more than 0.5mA of leakage current, this allowance just doesn’t make sense.
Panel Meeting Action: Accept
Panel Statement: CMP-19 has remained sensitive to the special needs of agricultural facilities through many Code cycles. The life saving benefits of GFCI protection for personnel is well documented and the technology has significantly improved to reduce the instances of nuisance tripping and CMP-2 has eliminated many of the exceptions in 210.8 to GFCI use over the last two Code cycles.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 7 Negative: 1
Explanation of Negative:
BAUMAN, B.: As new equipment is purchased the existing option for non-GFCI receptacles is needed at fewer locations. There is fully functional older equipment on farmsteads that will trip a GFCI. Also electric fence controllers will trip a GFCI. Not having the option to install a non-GFCI receptacle adjacent to a GFCI receptacle, will result in customers replacing the GFCI receptacle with a non-GFCI receptacle the first time the GFCI trips on a properly operating appliance. This proposal needs to be rejected to retain the option of installing a non-GFCI receptacle where needed. Having this option increases safety.

19-25 Log #3688 NEC-P19 **Final Action: Accept**
(547.5(G))

Submitter: Joseph P. Fello, Eaton Corp.
Recommendation: Delete the following text:
~~GFCI protection shall not be required for an accessible receptacle supplying a dedicated load where a GFCI protected receptacle is located within 900 mm (3 ft) of the non-GFCI protected receptacle.~~
Substantiation: The existing language is modified to extend GFCI protection to all receptacles in the area. Having a non-GFCI protected receptacle available may cause a safety issue with a potentially hazardous tool.
Panel Meeting Action: Accept
Panel Statement: See the panel statement on Proposal 19-24.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 7 Negative: 1
Explanation of Negative:
BAUMAN, B.: As new equipment is purchased the existing option for non-GFCI receptacles is needed at fewer locations. There is fully functional older equipment on farmsteads that will trip a GFCI. Also electric fence controllers will trip a GFCI. Not having the option to install a non-GFCI receptacle adjacent to a GFCI receptacle, will result in customers replacing the GFCI receptacle with a non-GFCI receptacle the first time the GFCI trips on a properly operating appliance. This proposal needs to be rejected to retain the option of installing a non-GFCI receptacle where needed. Having this option increases safety.

19-26 Log #1343 NEC-P19 **Final Action: Reject**
(547.5(G)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (4):
Dirt or concrete slab confinement areas for livestock.
Substantiation: The requirement should also apply where the confinement area is a concrete slab on grade.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided to support the proposed revision. 547.5(G)(2) “Outdoors” would include concrete slabs.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-27 Log #3013 NEC-P19 **Final Action: Reject**
(547.6)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Delete the following text:
~~547.6 Switches, Receptacles, Circuit Breakers, Controllers, and Fuses. Switches, including pushbuttons, relays, and similar devices, receptacles, circuit breakers, controllers, and fuses, shall be provided with enclosures as specified in 547.5(C).~~
Substantiation: This section serves no purpose, since compliance with 547.5(C) is already required.
Panel Meeting Action: Reject
Panel Statement: 547.5(C) does not contain the requirement that the devices addressed in 547.6 be enclosed.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-28 Log #932 NEC-P19 **Final Action: Reject**
(547.8(B) and (C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Insert "likely to be" ahead of "exposed".
Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The use of the phrase "likely to be" is not appropriate in this instance as the condition of being exposed to physical damage or exposed to water are either evident, or not, at the point of inspection.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-29 Log #3809 NEC-P19 **Final Action: Accept in Principle**
(547.8(C))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal as it relates to the existing "building cleansing water" vs. "building cleaning water" as accepted in the proposal.
This action will be considered by the panel as a public comment.
Submitter: Mike Weitzel, Bechtel
Recommendation: 547.8(C) Exposed to Water. Luminaires exposed to water from condensation, building cleaning water, or solution shall be ~~watertight~~ weatherproof.
Substantiation: This change simply makes the language consistent 547.5(C)(2) where weatherproof is used for a wet location - where water may be present.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
547.8(C) Exposed to Water. Luminaires exposed to water from condensation, building cleaning water, or solution shall be ~~watertight~~ listed as suitable for use in wet locations.
Panel Statement: Luminaires are listed for wet locations, not "weatherproof" or "watertight." The present requirement "watertight" as defined in Article 100 is unenforceable.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-30 Log #898 NEC-P19 **Final Action: Reject**
(547.9)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of (A)(3):
The site-isolating device shall simultaneously disconnect all ungrounded ~~service~~ supply conductors from the premises wiring.
Delete (4) and substitute:
GROUNDING and BONDING. Grounding and bonding shall comply with applicable provisions of Part II of Article 250.
Revise first sentence of (8):
Where the site isolating ~~device~~ disconnecting means is not readily accessible it shall be ~~capable of~~ provided with an identified means for being ~~remotely~~ manually operated by a readily accessible operating handle. ~~Installed at a readily accessible location.~~
Substantiation: Supply conductors are not necessarily service conductors since they may supply site isolating equipment (disconnecting means) without overcurrent protection per (A)(4) whereby it doesn't meet the definition of service equipment. Proposal for (4) provides for more comprehensive requirements for bonding, size and installation of grounding and bonding conductors and grounding electrodes. In (8), "capable" is subjective and not defined, and does not specifically prohibit makeshift methods.
Panel Meeting Action: Reject
Panel Statement: (3): The specific purpose of the site-isolating device is to permit disconnection of the main service to an agricultural property.
(4): Subsections (4) and (5) address bonding and grounding separately and are specific to the site-isolating device.
(8): The editorial proposal does not add substantially to the clarity of the requirement.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-31 Log #3215 NEC-P19 **Final Action: Reject**
(547.9(A)(1))

Submitter: John I. Williamson, Maple Grove, MN
Recommendation: Revise 547.9(A)(1) as follows:
A site-isolating device shall be installed at each ~~the~~ distribution point where two or more agricultural buildings or structures are supplied from the distribution point.
Substantiation: The NEC does not limit the number of distribution points on an agricultural premises. 547.9(E) contains rules for permanent identification plaques or directories when more than one distribution point is on the same agricultural premises. The proposed revision in the wording will be better correlated with 547.9(E).
Panel Meeting Action: Reject
Panel Statement: The proposed revision could be interpreted as requiring site isolation devices in series.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-16 Log #4412 NEC-P19 **Final Action: Accept**
(547.9(A)(2))

TCC Action: The Technical Correlating Committee understands that the text accepted in proposal 19-16 is 547.9(A)(2) not 547.2(A)(2), as written.
Submitter: Dean Hunter, Hunter Electric
Recommendation: Revise text as follows:
547.2(A)(2) Location. The site isolating device shall be pole-top mounted and the conductors shall meet the clearance requirements of 230.24
Substantiation: As written, this requirement contradicts 547.9(A)(8) which requires the site isolating device to be readily accessible – which would seem to allow a grade level switch. But 547.9(A)(2) clearly requires the site-isolating device to be a "pole-top" switch.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-32 Log #3214 NEC-P19 **Final Action: Accept in Principle**
(547.9(A)(2))

Submitter: John I. Williamson, Maple Grove, MN
Recommendation: Revise 547.9(A)(2) as follows:
The site-isolating device shall be pole top-mounted and shall meet the clearance requirements of 230.24.
Substantiation: A simple revision to the wording will make it very clear that the site-isolating device is required to be installed at or near the "top" of the pole. This proposed revision will eliminate any ambiguity. Lacking a thorough understanding of all of the fundamentals of Article 547, or having not read the commentary in the NEC Handbook, more than one installer has made the mistake of installing a site-isolating device on a center yard pole at "grade level" not at the top of the pole.
Panel Meeting Action: Accept in Principle
See the panel action on Proposal 19-16.
Panel Statement: The panel action on Proposal 19-16 meets the submitter's intent.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-33 Log #3427 NEC-P19 **Final Action: Reject**
(547.9(A)(3))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
547.9(A).
(3) Operation. The site-isolating device shall simultaneously disconnect all ungrounded service-entrance conductors from the premises wiring.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and

"Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Reject

Panel Statement: Although the proposal has merit, CMP-19 defers to the action taken by CMP-4 on the definitions of the terms.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-34 Log #3218 NEC-P19 **Final Action: Accept**
(547.9(A)(8))

Submitter: John I. Williamson, Maple Grove, MN

Recommendation: Revise 547.9(A)(8) as follows:

~~Where~~ The site-isolating device ~~is not readily accessible, it~~ shall be capable of being remotely operated by an operating handle installed at a readily accessible location. The operating handle of the site-isolating device, when in its highest position, shall not be more than 2.0 m (6 ft 7 in.) above grade or a working platform.

Substantiation: Site-isolating devices are required to be installed at or near the top of the pole on which they are mounted. They are not readily accessible. However, the operating handle for the site-isolating device shall be readily accessible.

Panel Meeting Action: Accept

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-35 Log #2051 NEC-P19 **Final Action: Reject**
(547.9(B)(3))

Submitter: Larry T. Smith, National Electrical Seminars, Inc.

Recommendation: Add new text to read as follows:

(3) The grounded circuit conductor is not connected to a grounding electrode or to any equipment-grounding conductor on the load side of the distribution point.

Substantiation: In the 2005 NEC, this was 547.9(B)(3)(b)(4); it was deleted from the 2008 NEC and should be reinstated.

- Table 250.3 advises readers of Additional Bonding and Grounding Requirements and specifically points to 547.9,
- 250.24(C) requires a main bonding jumper in the service disconnecting means which bonds the grounded conductor to the equipment grounding conductor,
- 547.9(B)(3)(2) requires the equipment grounding conductor to be connected to the grounded circuit conductor in the site-isolating device at the distribution point, and
- Unless 547.9(B)(3)(b)(4) is reinstated, the grounded and equipment grounding conductor are required by 250.24(C) to be bonded together in the service disconnecting means at the building and 549.9(B)(3) also requires the grounded conductor and the equipment grounding conductor to be bonded together at the site-isolating device which produces a parallel path between the grounded conductor and the equipment grounding conductor.

Reinstatement of 547.9(B)(3)(b)(4) will (1) eliminate installation of the main bonding jumper at the building or structure service disconnecting means as presently required in 250.24(C), (2) retain the connection between the grounded conductor and equipment grounding conductor at the site-isolating device, and (3) get rid of the connection which puts the grounded conductor and equipment grounding conductor in parallel.

Panel Meeting Action: Reject

Panel Statement: The action taken on Proposal 19-26 during the 2008 cycle was specific to eliminating the requirement from 547.9(B)(3). The panel statement clearly indicates that the requirement continues to be covered by 250.32.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-36 Log #941 NEC-P19 **Final Action: Accept in Principle**
(547.9(B)(3)(1))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Change "same size" to "not smaller".

Substantiation: Edit. Literal wording does not permit a larger equipment grounding conductor.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(1) The equipment grounding conductor is ~~the same size as~~ not smaller than the largest supply conductor...".

Panel Statement: The revised wording of the proposal meets the intent of the submitter and permits the use of a larger equipment grounding conductor.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-37 Log #830 NEC-P19 **Final Action: Accept**
(547.9(C))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Where the service disconnecting means and overcurrent protection for each set of feeders or branch circuits are located at the distribution point the feeders or branch circuits to buildings or structures shall ~~meet~~ comply with the ~~requirements~~ provisions of 250.32 and Article 225 Parts I and II.

Substantiation: Branch circuits used as supply conductors should be included. Some provisions of 250.32 are not requirements but "permitted" such as the exceptions for 250.32(A) and (B).

Panel Meeting Action: Accept

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-38 Log #1342 NEC-P19 **Final Action: Reject**
(547.9(D))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Where livestock is housed, any portion of a direct-buried equipment grounding or bonding conductor run to or within the building or structure shall be insulated or covered copper.

Substantiation: Bonding conductors should be included and the provision should also apply to conductors within the building or structure, not just conductors run to it.

Panel Meeting Action: Reject

Panel Statement: See the panel action on Proposal 19-40.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-39 Log #3881 NEC-P19 **Final Action: Reject**
(547.9(D))

Submitter: Gene Garcia, E Light Electric Services

Recommendation: Revise text as follows:

Where livestock is housed, any portion of a direct buried grounding conductor ~~run~~ ran to the building or structure shall be insulated or covered copper.

Substantiation: Correction to make proper English usuage.

Panel Meeting Action: Reject

Panel Statement: See the panel action on Proposal 19-40.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-40 Log #4413 NEC-P19 **Final Action: Accept**
(547.9(D))

Submitter: Dean Hunter, Hunter Electric

Recommendation: Delete the following text:

547.9(D) Direct Buried Equipment Grounding Conductors. Where livestock is housed, any portion of a direct buried equipment grounding conductor run to the building or structure shall be insulated or covered copper.

Substantiation: This section is unnecessary because it is already required by 547.5(F).

Panel Meeting Action: Accept

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-41 Log #940 NEC-P19 **Final Action: Accept in Part**
(547.9(E))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 19-42.

This action will be considered by the panel as a public comment.

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text as follows:

Where a site is supplied by more than one service ~~with any two services located a distance of 150 m (500 ft) or less apart measured in a straight line~~ a permanent durable plaque or directory shall be installed at each ~~distribution point~~ of these services denoting the location of each of the other ~~distribution points~~ service and the building or structures or other areas served by each.

Substantiation: The provision should apply whether or not the services are within 500 ft of each other; if located 510 ft apart the requirement does not apply. On large area premises wiring from multiple services may enter areas served by more than one service.

Panel Meeting Action: Accept in Part

Revise text to read as follows:

(E) Identification. Where a site is supplied by more than one service ~~with any two services located a distance of 150 m (500 ft) or less apart, as measured in a straight line~~, a permanent plaque or directory shall be installed at each of these distribution points denoting the location of each of the other distribution points and the buildings or structures served by each.

Panel Statement: No substantiation has been provided for adding "durable," replacing "distribution points" with "service" or adding "or other areas."

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-42 Log #1705 NEC-P19 **Final Action: Accept in Part**
(547.9(E))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 19-41.

This action will be considered by the panel as a public comment.

Submitter: Mike Theisen, St. Cloud, MN

Recommendation: Revise the nomenclature to be consistent with the title in 547.9 Electrical Supply to Building(s) or Structure(s) from a Distribution Point.

(E) Identification. Where a site is supplied by more than one ~~service~~ distribution point with any two ~~services~~ distribution points located a distance of 150 m (500 ft) or less apart, as measured in a straight line, a permanent plaque or directory shall be installed at each of these distribution points denoting the location of each of the other distribution points and the buildings or structures served by each.

Substantiation: The term "Distribution Point" is used in the title and the term "Service" is not,, the introduction of the term "service" could be confusing. The site electrical service could be located at some distance from the distribution point. Unless the actual location or proximity of the services to each other is the main concern, we are talking about distribution points in 547.9.

Panel Meeting Action: Accept in Part

Revise text to read as follows:

(E) Identification. Where a site is supplied by more than one ~~service~~ distribution point with any two services distribution points located a distance of 150 m (500 ft) or less apart, as measured in a straight line, a permanent plaque or directory shall be installed at each of these distribution points denoting the location of each of the other distribution points and the buildings or structures served by each.

Panel Statement: The panel action accepts replacing the first "service" with "distribution point," and rejects the second revision based on the panel action on Proposal 19-41, which deletes the text.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-43 Log #2964 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Donald Hillman, Michigan State University

Recommendation: Delete 547.10 Equipotential Planes and Bonding of Equipotential Planes.

Substantiation: See the material I have provided regarding "Animal and Human Response To Induced and Contact Ground Currents".

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation provides insufficient technical justification for removing the requirement for equipotential planes. The use of equipotential planes is an accepted practice in various industries for reducing step-touch potential. Removing equipotential planes will reduce the level of safety afforded to livestock and personnel. No practical alternative methods have been proposed to provide an equivalent level of safety.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-44 Log #3587 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Richard H. Schulte, Modified Genetics, SC

Recommendation: Delete Section 547.10 Equipotential Planes and Bonding of Equipotential Planes.

Substantiation: I have been a practicing veterinarian for over 37 years. I have dealt with the objectionable current issues on dairy farms for the past 15 years. In not one instance have I seen improved cattle health with the installation of an equipotential plane. I have seen quite the opposite. In a new installation in Minnesota I saw the systematic decline in health of a herd that had been prosperous before. I have dealt locally with a freestall barn with a plane and the farmer went to the expense of jack hammering out all of the concrete with the plane and replacing just the concrete. The cows are the ultimate judge of what is healthy for them and the response was monumental when the plane was removed. We know from published research that an inflammatory reaction is initiated through the release of interleukin 1 when cows are exposed to imperceptible current levels for as little as 2 weeks. The premise that a cow must perceive electricity to be harmed is as absurd as saying that a human must perceive carbon monoxide to be harmed or must perceive ionizing radiation to be harmed. It is imperative that Section 547.10 be removed.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 19-43.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-45 Log #3976 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Donald W. Zipse, Electrical Forensics, LLC

Recommendation: Delete Section 547.10 Equipotential Planes and Bonding of Equipotential Planes.

Substantiation: I congratulate the Code Making Panel 19 on their courageous, audacious and valiant try at preserving the term Equipotential Plane(s). The object appears to be somehow to protect the dairy cows from (an imaginary) accidental contact with an electrically energized conductor or surface. It is assumed that the false use of bonding an equipotential plane to the equipment grounding conductor, which is already done and is the problem, will allow a fault current contacting the floor or metal surface or a dairy cow to flow over the concrete encased re-bar (equipotential plane) and open the protective device.

How many cows have been electrocuted from contact with an electrically energized surface? Since when has this been a problem?

The panel has developed a reason that is questionable to preserve equipotential planes. However, the panel has not eliminated the everyday 24/7 hour/days hazardous condition of continuous flowing stray current using the equipotential plane to harm the dairy cows. You have managed to concoct, contrive and fabricate a reason to maintain the equipotential plane, which is a figment of the imagination.

Alright, so I have managed to tick you off with the truth. But what you have done is to continue the hazard of existing stray current that cannot be stopped from flowing continuously uncontrolled over the earth and into the equipotential plane (except in Wisconsin and California) and harming the dairy cows continuously.

Evidential you have not visited a FREE STALL DAIRY BARN. Such a dairy facility can be 100 or more feet long with no ground mounted electrical outlets. Overhead fans and lights over 8 feet into the air mounted on usually wooded construction. There is no reason to have an equipotential plane is such an area, except to continuously inflict harm onto the dairy cows. At least remove the requirement for equipotential planes from dairy housing areas.

Recognize that every outlet is required to have an equipment grounding conductor which if an electrical fault should occur would carry the fault current back to the source on the green equipment grounding conductor, which has an exceptionally low impedance path as compared to the concrete / re-bar equipotential plane circuit. The equipment grounding conductor affords a quick and efficient opening of the protective device. So are we now turning a dairy barn into a hospital level redundant equipment grounding system?

The State of Wisconsin years ago modified the adoption of the NEC by eliminating the Equipotential Plane requirement from the NEC as the dairy farmers soon found out that the installation of an equipotential plane 1) prevented the cows from entering the milking parlor because the cows were receiving an electric shock when stepping unto the equipotential plane, 2) reduced the milk production because the dairy cows were getting an electric shock when being milked while standing on an equipotential plane, 3) injured the cows and resulted in death of the cows in the herd and more. Your modification of 547.10 last cycle does NOT do anything to correct the shocking hazard from equipotential planes except continue the hazard.

The continued insertion of the requirement in the NEC for the installation of an equipotential plane is hindering the milk production and is NOT PROTECTING THE COWS FROM ELECTRIC SHOCK from stray continuous flow of stray current, but is applying a condition where the dairy cows ARE GETTING ELECTRIC SHOCKS FROM STANDING ON AN EQUIPOTENTIAL PLANE.

The substation this cycle contains NEW REASONS for acceptance of this proposal than what was submitted last cycle. The attached Institute of Electrical and Electronics Engineers (IEEE) Technical paper titled "EQUIPOTENTIAL PLANES: A FIGMENT OF THE IMAGINATION" was peer reviewed and accepted. The paper explains the misunderstanding that exists today with respect to Equipotential Planes and how to correct the problem.

PLEASE remember that three additional years of detailed data has been collected from many dairy farms since the paper was first written. Many changes, improvements have been made in the method of measuring the stray current flowing through the dairy cow.

Mr. Neubauer no longer uses a coil of copper tubing OR COPPER CONDUCTORS (Iron wire now used) or he is no longer using a bucket of water or feed to entice the cow to drink or eat from the bucket in order to obtain the measurement of the flow of stray current through the cow. Today he clips a nose ring onto the cow's muzzle and makes the measurement of the stray current flowing uncontrolled through the dairy cow immediately.

Note: Supporting material is available for review at NFPA Headquarters.

In summary the paper concludes:

"It is opined that the equipotential plane is no more than an earth electrode, which lacks any ability to maintain or to have zero voltage gradient across it when any amount of electrical current flows over, across or through the equipotential plane. As an electrode-earthing element, the equipotential plane has the potential for uncontrolled stray current from the multigrounded neutral electrical distribution system to flow across the equipotential plane generating a dangerous and hazardous voltage to drive the stray current into and through humans and cows and pigs with devastating results.

"It is opined that the mis-guided agriculture personnel and the NEC Making Panels failed to recognize the three difference conditions between 1) momentary flow of fault current and 2) the continuous flow from stray current emanating from the multigrounded neutral electrical distribution system and 3) the condition where there is no current flow across the equipotential plane.

"It is a fact that there are two methods that stray current enters the so-called equipotential plane. One is the direct primary neutral to secondary neutral connection at the vast majority of utility transformers in North America that has a solid electrical connection between the primary neutral to the equipment grounding conductor and thus to the equipotential plane. The other source of stray current is the multiple connections, at least 4 per mile, connecting the primary neutral to earth allowing additional stray current to flow uncontrolled over and through the earth.

"Mr. Neubauer's test proved conclusively, that the equipotential plane was just a figment of the imagination by using an instrumented plastic water bucket and plastic feed container and cows, leaving no doubt in the opinion of this author that the so called equipotential plane does not prevent a voltage gradient as proclaimed by the agriculture personnel and the NEC."

Thus the above words contained in 547.10 are incorrect and MUST be removed from the NEC in order that the NEC will no longer be incorrect and appear to be foolish.

Section 547.10 FPN No. 1 & 2 are no longer correct since they still recommend equipotential planes and have not been re-affirmed as to their correctness in light of recent findings and to the age of the document. The document has fallen into disrepute based on recent studies showing the resistance of cows is less than 50 percent of the values found in the "Red Book", Document 696 and in light of equipotential plane findings. In additions one of the authors was involved in a law suit based on it is believed, questioning the accuracy of his data found in the Red Book. Financial support has come under attack and the document bias has been revealed.

The attached paper begins as follows:

Preface – Prelude – Prologue
(Take your pick)
to the Institute of Electrical and Electronic Engineers' (IEEE) paper
EQUIPOTENTIAL PLANES, A FIGMENT OF THE IMAGINATION

You may use this paper providing you cite "**Copyright Material IEEE"**

Donald W. Zipse, P.E.
Life Fellow, IEEE
Electrical Forensics, LLC
PO Box 7052
Wilmington DE 19803-0052
USA
don.zip@ieee.org

Mr. Donald W. Zipse offered a very controversial technical paper on equipotential planes stating that the National Electrical Code Sections 547 on Agriculture Buildings and 680 Swimming Pools were incorrect when they state that equipotential planes "... Prevent a difference in voltage from developing within the plane." In addition, Mr. Zipse also states in his paper that four agriculture professors were incorrect in their three papers published in the early 1980s. It appears that they did not understand the difference between IEEE Standard 80 Substation Grounding And Step-Touch Potentials based on high levels of fault current for extremely short time and steady state continuous flowing stray current of very low magnitude flowing continuously.

The IEEE's Industrial and Commercial Power Systems committee at first rejected Mr. Zipse's paper offering. However, cooler heads prevailed stating that the IEEE was the place for new ideas and discussion. The I&CPS Committee went out to 23 persons who were opponents in court cases or were utility employees or agriculture professors requesting that they rebut Mr. Zipse's paper.

Three papers were submitted in rebuttal. The first was authored by one of the original professors, Robert J. Gustafson and co-author LaVerne E. Stetson. The other time slot had two papers by employees of Alabama Power, Keith Wallace and Don Parker. The Alabama papers were no more than regurgitation of the Agriculture Red book, Document 696 and should be totally disregarded.

Dr. Gustafson completely disregards the multigrounded neutral electrical distribution system circuit that connects the primary neutral with solid copper conductors to the equipotential plane. It is this circuit that supplies approximately 50 percent of the stray current flowing in swimming pools and dairy farms. Note that EPRI, the Electrical Power Research Institute, the utilities brain trust, state that 60 percent of the return neutral current on multigrounded neutral electrical distribution system circuits returns over the earth. Only 40 percent returns over the neutral conductor.

Between the draft of Zipse's paper and the presentation Mr. Zipse suggested to Mr. Neubauer, Master Electrician who makes all the electrical measurements, to switch to iron rebar wire which was used for the test conductors and iron plates for contact with the floor, thus eliminating any suggestion of galvanic cell generating the direct current. The section on direct current was inserted to show that three actions were taking place simultaneously, galvanic cell action and rectification of the ac by rebar in concrete as noted in IEEE Standard 80 and the flow of harmful alternating current in the equipotential plane.

What Dr. Gustafson completely ignores is the alternating current measurements that were recorded that harm dairy cows causing decreased milk production, injury, and death to the cows. What is not in the paper is last week we disconnected the phase and neutral and the telephone grounds to a dairy, and still had current flowing over earth and into the equipotential plane and into the cow proving stray current flows over and through the earth and equipotential plane in sufficient magnitude to harm a cow or human. Tests at the Allen Dairy and court records also confirm the flow of uncontrolled current in earth.

See the IEEE paper that was provided to Code-Making Panel 19 with Log 3975 for section 547.2 to delete the definition of "Equipotential Plane".

Note: Supporting material is available for review at NFPA Headquarters.

19-46 Log #4400 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: David Rogers, Stray Voltage Services
Recommendation: Delete Section 547.10 Equipotential Planes and Bonding of Equipotential Planes
Substantiation: 1. The Canadian Electrical Code Rule 10-200 states that concerning "The Rule (for grounding and bonding conductors) does not intend there be current flowing through the bonding and grounding system during normal operation." Its Subrule (3) of Chapter 10-200 states that: "Where by using multiple grounds objectionable flow of current occurs over the grounding conductor:

- One or more of the grounds shall be abandoned;
- The location of the grounds shall be changed;
- The continuity of the conductor between the grounding connections shall be suitably interrupted;
- Other effective action shall be taken to limit the current."

Dairy farm milking parlour equipotential grounding grids do exactly what Rule 10-200 says they should not by creating a situation where objectionable electrical current will normally flow through the grounding system during normal operation.

2. Farm Equipotential Grounding Grids Create a Parallel Circuit Ground Loop

A ground loop can be defined as any objectionable electrical current flowing in a circuit's ground or return path. When the electrical code was written about dairy farm equipotential grounding grids, clamp-on ground resistance testers were not available. We were one of the first to discover a 0.7 Ω reading with a mA reading using an AEMC 3731 on the #6 copper bonding wire connecting an equipotential grid to the main electrical service. These readings confirmed that the instrument identified a ground loop which is a parallel circuit. Objectionable flows of electricity for a cow are as low as 1 mA. Sometimes as much as 900 mA with this 0.7 Ω reading were found on some dairy farms Ref. 4 and 5. In compliance with the Canadian Electrical Code Subrule #3, this #6 wire was disconnected. Many dairy farmers said that after this disconnection they saw the greatest improvement in milking cows they had witnessed in over 20 years.

A dairy herd's average somatic cell count (SCC) is an indicator of the extent to which they are fighting a mastitis infection. In B.C. if there are three consecutive readings which equal or exceed 500,000 SCC per ml, the farm will be ordered not to sell milk by the B.C. milk inspector. One farm which never had high somatic cell counts reached over 400,000 per ml SCC after a new parlour was installed. Many farm experts were called in to discover the cause however all attempts to correct the high SCC level failed. We found a ground loop between the equipotential ground grid and the farm's main service. This parallel circuit only had 9 mA however when it was disconnected their was an immediate drop to 200,000 per ml in SCC's within a week and lower later.

Most farmers wish to keep their average herd's SCC level to about 100,000 counts per ml or less.

3. Farm Equipotential Grounding Grids Do Not Deal with Microsecond mA Events

My farm field tests showed that short duration electrical events such as those caused by electric fence discharges upon contact, were detectable between equipotential grids and remote grounds. These short duration voltage bursts were also detected as direct animal contact between cows' hoofs and the equipotential grid floor they stood on. Initially we measured these events using a Fluke 105B Scopemeter on the 5 ms per division scale but these events were more clearly observable on the 200 µs per division scale. A 500 Ω resistor placed in parallel across the scopemeter's voltage measurement probes confirmed that mA current was present.

Similar short duration voltage readings were then viewed in the equipotential grids and on all bonding conductors including farm's stainless steel milk lines. It was clear the standard methods of mitigating stray voltage in using equipotential grounding grids and bonding conductors failed to deal with short duration Neutral to Earth Voltage events. In removing these short duration NEV events, farmers noticed improvements to cow and goat herd health and productivity and milk let-down. In chickens and pigs they also noticed improved water and feed intakes plus in increased feed conversion ratios.

4. Farm Equipotential Grounding Grids Create Step Potential at Grid Perimeter

The idea behind equipotential grounding grids is that while animals are on them their points of contact kept at the same electrical potential difference which inhibits flow of electrical current. However, even if this is the case, when an animal first steps on to the grid its front legs will be at a different potential difference than its rear legs. For this reason farms often have difficulty getting their cows to enter milking parlours which have equipotential grids for this reason. It's possible to see some cows even stop and sniff the perimeter of the grid. Cows are sensitive to very small amounts of electrical discomfort and being shocked each time they enter and leave their milking parlour discourages them from moving to and from them. It may also create stress in them which could lessen their performance, milk let-down and affect their general health.

5. Farm Equipotential Grounding Grids Do Not Deal With Induction

The inductive force of an Electromagnetic Field (emf) is inversely proportional to the square of its distance from its source, as well as to the contact surface area. With a cow standing under say a faulty fluorescent lamp ballast which emits emf, her large surface area plus distance from the source may create significant ac voltage induction. Even though the floor may have an equipotential grid, the cow will be at a higher potential than it. Where we found such localized emf, cows often won't feed and milk-out poorer and defecate more. In our experience some farmers have faced stress from this problem. It was recognized that our services in assisting farmers to mitigate electrical induction helped prevent herd and farmers' stress plus financial losses occurring from it.

6. Farm Equipotential Grounding Grids Attract Stray Electrical Currents to Cows

Electricity takes the path of least resistance. The low resistance offered by a farm's equipotential grounding grids represents a serious threat to cows in that it provides a low resistance path to where cows are being milked. A classic demonstration of this is in the case where an electric fence controller has a high resistance ground either from a poor installation or through drying or frozen ground conditions. When an animal or object touches the electric fence the normal circuit design is that for a very short duration of time the electricity will flow from the fence to this object through the ground and back to the controller. With a high resistance of the controller's ground, the electricity may head straight for the low resistance equipotential grid of the milking parlour floor bonded to the neutral and then back to the controller through the neutral. Many farmers with electric fences often that the say times when their animals SCC's were highest were during the dry summer months or cold winters.

Result of the Technical Failure of Equipotential Grids in Resolving Stray Voltage

Reliance in equipotential grounding grids dealing with stray voltage is not proved effective and will eventually result in negative outcomes.

Panel Meeting Action: Reject

Panel Statement: Some references in the submitter's substantiation specifically indicate that proper engineering of the system is needed to ensure the intended performance of the equipotential plane. See the panel statement on Proposal 19-43.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-47 Log #4785 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Russ Allen, DePere, WI

Recommendation: Delete Section 547.10 Equipotential Planes and Bonding of Equipotential Planes

Substantiation: I am a victim of the Equipotential Plane and Bonding of Equipotential Plane. Cows kick of milking devices often hard injuring me and my employees, it was very severe at times. I interrupted approximately 20 of our utilities down grounds. After a year and a half our utility reconnect the down grounds and hell returned to our milking parlor proving that the Equipotential Plane and Bonding of the Equipotential Plane does more harm than good. Please listen to what our cows are telling us and delete 547.10.

Panel Meeting Action: Reject

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-48 Log #3014 NEC-P19 **Final Action: Reject**
(547.10, FPN 3)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Delete the following text:

~~FPN No. 3: Low grounding electrode system resistances may reduce potential differences in livestock facilities.~~

Substantiation: This statement is not accurate. The resistance of the grounding electrode system has absolutely nothing to do with reducing potential differences.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation has been provided to support the proposed revision.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-49 Log #710 NEC-P19 **Final Action: Accept in Principle**
(547.10(B))

Submitter: Teri Dwyer, Wyoming, MN

Recommendation: Revise text to read as follows:

(B) Bonding. Equipotential planes shall be connected to the electrical grounding system. The bonding conductor shall be copper, insulated, covered or bare, and not smaller than <u>solid</u> 8 AWG. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.

Substantiation: By adding the word "solid" this promotes consistency with sections 680.26 and 682.33 that currently require a #8 solid AWG copper conductor be used for equipotential bonding. In addition to consistency with other sections of the NEC, the solid conductor will be able to better withstand the harsh environment created by the containment of livestock.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(B) Bonding. Equipotential planes shall be connected to the electrical grounding system. The bonding conductor shall be <u>solid</u> copper, insulated, covered or bare, and not smaller than 8 AWG. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.

Panel Statement: The panel action clarifies its, and meets the submitter's intent.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-50 Log #939 NEC-P19 **Final Action: Accept in Principle**
(547.10(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Insert "solid" ahead of "bonding conductor".

Substantiation: The bonding conductor should be solid because of potential corrosion, as required in 680.26.

Panel Meeting Action: Accept in Principle

See the panel action on Proposal 19-49.

Panel Statement: The panel statement on Proposal 19-49 meets the submitter's intent.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-51 Log #4391 NEC-P19 **Final Action: Accept**
(547.10(B))

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(B) Bonding. Equipotential planes shall be connected to the electrical grounding system. The bonding conductor shall be solid copper, insulated, covered or bare, and not smaller than 8 AWG. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.
Substantiation: The solid conductor will be able to better withstand the harsh environment created by the containment of livestock. By adding the word solid this promotes consistency with sections 680.26 and 682.33 that currently require an 8 AWG solid copper conductor to be used for equipotential bonding.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

ARTICLE 550 — MOBILE HOMES, MANUFACTURED HOMES, AND MOBILE HOME PARKS

19-52 Log #1877 NEC-P19 **Final Action: Reject**
(550.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: The conductors from the mobile home service equipment, including the grounding equipment conductor, together with all the necessary fittings and equipment identified for the purpose of supplying current to the main disconnecting means in the mobile home.
Substantiation: Proposed wording include under-chassis and power supply cord conductors. "Source" of electrical energy is too broad; it includes utility source, generators, and distribution equipment in the mobile home park distribution system. The feeder assembly may terminate in a separate single circuit breaker or fused switch, not a panelboard.
Panel Meeting Action: Reject
Panel Statement: It is not clear what the submitter intends to delete and substitute with the proposed language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-53 Log #2081 NEC-P19 **Final Action: Reject**
(550.2 Appliances and 551.2 Appliances)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Move the definitions in section 680.2 for "EQUIPMENT, FIXED," "EQUIPMENT, PORTABLE," and "EQUIPMENT, STATIONARY" to Article 100, and delete those definitions from Article 680.
Also consider the deletion of similar definitions for "appliances" from Articles 550 and 551 as the existing definition in Article 100 for EQUIPMENT already includes appliances.
A companion proposal has been sent to CMP-17 for the suggested definitions in 680.2.
Substantiation: The concept of "fixed," "portable," and "stationary" equipment is used throughout the NEC and is not defined in a central location such as Article 100. Some examples of places where this occurs are found in: Article 100 "Electric Signs;" sections 210.23(B) and (C); section 220.53 ("fastened in place"); and the titles to Articles 424, 426, and 427 to name a few. The outcome of the acceptance of this proposal is a more coherent and user friendly code by locating important definitions in only one location. The opportunity would then exist to streamline other parts of the code, thereby, increasing usability.
Panel Meeting Action: Reject
Panel Statement: Section 680.2 is not in the scope of CMP-19. The panel prefers that definitions for "Appliances" pertaining to mobile homes and manufactured homes remain in Article 550 as the terms are used within the article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-54 Log #1875 NEC-P19 **Final Action: Reject**
(550.2.Distribution Panelboard)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: DISTRIBUTION EQUIPMENT ~~PANELBOARD~~. The panelboard, fused switch, or circuit breaker supplied by the feeder assembly.
FPN: No Change.
Substantiation: Edit. The definition should include equipment that is not a panelboard such as a single enclosed main circuit breaker or fused switch. These are not prohibited.
Panel Meeting Action: Reject
Panel Statement: There is currently a definition of the term "panelboard" in Article 100; use of "equipment" will lead to confusion. The term "distribution panelboard" is used in Article 550, not the term 'distribution equipment;' therefore the definition is not necessary. The submitter has provided inadequate substantiation to support the revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-55 Log #938 NEC-P19 **Final Action: Reject**
(550.2.Manufactured Home)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "voluntarily" in the second sentence.
Substantiation: Edit. If the certificate is required by the regulating agency it is not voluntary.
Panel Meeting Action: Reject
Panel Statement: The definition of "manufactured home" comes from NFPA 501, *Standard on Manufactured Housing*.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-56 Log #2437 NEC-P19 **Final Action: Reject**
(550.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
Article 100
DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.
Substantiation: If wording for PSP are accepted in 550.13(B), 550.13(E)(3) and 550.32(E) a definition may be required if not in Article 100. There is a proposal for PSP in 100 also.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 19-69 precludes the need for a definition in this article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-57 Log #2080 NEC-P19 **Final Action: Reject**
(550.2 and 551.2.Appliance, Fixed; Appliance, Portable; and Appliance, Stationary)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Relocate current identical definitions for "Appliance, Fixed," "Appliance, Portable," and "Appliance, Stationary" to Article 100 as these definitions are in two NEC articles. This change proposal is in compliance with the NEC Style Manual section 2.2.2.1.
Substantiation: The current 2008 NEC text does not agree with the NEC Style Manual, and the proposed changes would help to make the NEC more user friendly.
Panel Meeting Action: Reject
Panel Statement: Additions to Article 100 are not within the scope of CMP-19. See the panel statement on Proposal 19-53.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-58 Log #1880 NEC-P19 **Final Action: Reject**
(550.2.Manufactured Home, Mobile Home)

Submitter: Dan Leaf, Seneca, SC
Recommendation: In the definition of Manufactured Home and Mobile Home delete the last paragraph.
Substantiation: A manufactured home and mobile home are not the same, one is erected on the site, the other is on wheels without a permanent foundation. All of the provisions of this article are not suitable or applicable for both, e.g., power supply cords, one receptacle per 550.13(D)(1) vs. 210.52(C)(1)(2), 550.32(A) vs. (B), and 550.323(D).
Panel Meeting Action: Reject
Panel Statement: "For the purpose of this code," as stated in both places, permits the requirements to apply to both "unless otherwise indicated."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-59 Log #937 NEC-P19 **Final Action: Reject**
(550.4(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
All electrical material, appliances, fittings and other electrical equipment <u>for which standards have been established</u> shall be listed or labeled by a qualified testing agency...". (remainder unchanged)
Substantiation: All materials and fittings such as straps and hangers and clamps may not have standards by which they are listed.
Panel Meeting Action: Reject
Panel Statement: The requirements in the code for listing drive the development of standards. The AHJ has ultimate authority to approve an installation. The proposed language is unnecessary; the definitions of 'listed' and 'labeled' are located in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-60 Log #887 NEC-P19 **Final Action: Reject**
(550.5)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
<u>Receptacles and switches shall not be installed in a face-up position in any countertop in the living areas.</u>
Substantiation: The provisions of 550.13(F)(2) should apply.
Panel Meeting Action: Reject
Panel Statement: There is no Section 550.5 in Article 550.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-61 Log #1320 NEC-P19 **Final Action: Reject**
(550.5 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
<u>550.XX SERVICE and SERVICE EQUIPMENT. For the purposes of this Article the provisions for services shall also apply where supplied by a system that is not utility owned or operated.</u>
Substantiation: Edit. Where the mobile home park has a distribution system not owned or operated by a utility, the supply conductors are not service conductors per the definition of service.
Panel Meeting Action: Reject
Panel Statement: The provisions of Part III, Services and Feeders already provide the requirements for service and service equipment. The proposal may add confusion to existing requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-62 Log #1820 NEC-P19 **Final Action: Reject**
(550.10(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: rated not less than 50 amperes.
Substantiation: Edit. Though a permanently installed feeder is covered by "feeder assembly", proposal emphasizes the minimum rating also applies to it.
Panel Meeting Action: Reject
Panel Statement: It is not clear where the submitter intends to add the proposed language in 550.10(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-256a Log #CP1906 NEC-P19 **Final Action: Accept**
(550.10(A))

Submitter: Code-Making Panel 19,
Recommendation: Revise 550.10(A) as follows:
550.10 Power Supply.
(A) Feeder. The power supply to the mobile home shall be a feeder assembly consisting of not more than one listed 50-ampere mobile home power-supply cord ~~with an integrally molded or securely attached plug cap~~ or a permanently installed feeder.
Substantiation: The construction of the supply end of the supply cord is clearly stated in 550.10(C). The secure attachment of the plug is also addressed in 550.10(C).
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-63 Log #1378 NEC-P19 **Final Action: Reject**
(550.11)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
The branch circuit <u>distribution</u> equipment shall be permitted to be combined with the <u>main</u> disconnecting means as a single assembly.
Substantiation: Edit. Branch circuit equipment encompasses many things; the intended disconnecting means should be specified.
Panel Meeting Action: Reject
Panel Statement: The existing language is adequate. The proposed language does not add clarity or improve usability of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-64 Log #970 NEC-P19 **Final Action: Reject**
(550.11(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete second sentence and substitute: The main circuit breaker or switch shall be plainly and durably marked "main disconnect"; the maximum ampere rating of main fuses shall be plainly and durably marked on the main fuse(s) enclosure with letters at least 6 mm (1/4 in.) high.
Substantiation: Literal wording requires the marking (main) to be on the circuit breaker or fuses rather than the enclosure.
Panel Meeting Action: Reject
Panel Statement: The submitter has offered no substantiation for more prescriptive marking. The AHJ is not equipped to qualify "durability."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-65 Log #1878 NEC-P19 **Final Action: Reject**
(550.11(A))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete second paragraph and substitute: Where the feed assembly terminates in a panelboard, the panelboard shall have an ampere rating not less than the ampacity of the feeder assembly. The main disconnecting means and overcurrent protection shall have ratings in accordance with the ampacity of the feeder assembly. The outside of the enclosure for the main disconnecting means shall be plainly and durably marked "Main Disconnect". The outside of the enclosure for main fuses shall be plainly and durably marked with the maximum ampere rating of the fuses to be used.
Revise third paragraph: The distribution <u>equipment</u> ~~panelboard~~ shall be ~~located in an~~ readily accessible ~~location~~ but shall not be located in a bathroom, <u>toilet compartment</u>, or ~~clothes~~ closet. A clear working space at least not less than 750 mm (30 in.) wide <u>and not less than the width of the distribution equipment</u> shall be provided. This space shall extend from the floor or standing surface to the top of the distribution <u>equipment</u> ~~panelboard~~, <u>but not less that 750 mm (30 in.)</u>.
Substantiation: Edit. Proposal incorporates present provisions in a less detailed manner. It included provisions for permanently installed (fixed) feeder assemblies covered in 550.10(I). Present wording requires the main current breaker or fuses (not the enclosure) to be marked "main". Closets for utilities storage and other uses than clothes should be included. There should be a minimum height for working space.

~~**Panel Meeting Action: Reject**~~

Panel Statement: Distribution panelboard is the term used in the applications covered by Article 550. There is insufficient substantiation provided to broaden the means of distribution. Where not amended in Article 550, the rules in Chapters 1 through 4 apply. The proposal does not add clarity or increase usability and is not technically substantiated.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-66 Log #1964 NEC-P19 **Final Action: Reject**

(550.11(A))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete second paragraph and substitute: Where the feeder assembly terminates in a panelboard, the panelboard shall have an ampere rating not less than the ampacity of the feeder assembly. The main disconnecting means and overcurrent protection in accordance with the ampacity of the feeder assembly The outside of the enclosure for the main disconnecting means shall be plainly and durably marked "Main Disconnect"... The outside of the enclosure for main fuses shall be plainly and durable marked with the maximum ampere rating of the fuses to be used.

Revise third paragraph: The distribution equipment panelboard shall be located in an accessible location readily accessible, but shall not be located in a bathroom, toilet compartment, or clothes closet. A clear accessible working space at least not less than 750 mm (30 in.) wide and not less than the width of the distribution equipment shall be provided. This space shall extend from the floor or standing surface to the top of the distribution equipment panelboard, but not less than 750 mm (30 in.).

Substantiation: Edit. Proposal incorporates present provisions and includes provisions for permanently installed (fixed) feeder assemblies covered in 550.10(I). Present wording requires the main circuit breaker or fuses, not the enclosure, to be marked "Main". Closets for utilities, storage, and other uses should be included. (550.13)

Submitter: Robert Kopelman, Rockville Centre, NY

Recommendation: Revise text to read as follows:

550.13 Receptacle Outlets. (Shall be thermally protected or combination GFI thermally protected)

(D) Receptacle Outlets Required 1-9

(E) Pipe Heating Cable(s) Outlet. 1-4.

Substantiation: There is a major problem called a glowing connection. As UL 1699 Scope states – AfCI's " 1.3 These devices are not intended to detect glowing connections" Glowing connections are a major cause of fires. There is a new UL document 498 with thermal protection that states that device shall detect abnormal heating in 8 locations in an outlet. These 8 locations are where overheating can and does occur. Attached are documents showing that an AFCI starts to detect Arcs at 5 amps. Also attached are forensic documents showing that the glowing connection can occur with 1 amp. Most electricians and inspectors have never seen a glowing connection because it happens inside the wall. But take an outlet and put a load on it, loosen the screw terminal in a dark room and it is freighting. The screw terminals loosen up over time do to the differential of expansion and contraction of the metals involved. A minute air gap is formed and the natural vibrations of the earth and the vibrations caused by normal living circumstances help to create the glowing connections.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter's recommendation is unclear. A mandatory requirement is not permitted to be included in a section title in accordance with the NEC Style Manual.

550.13 Receptacle Outlets.

(A) Grounding-Type Receptacle Outlets. All receptacle outlets shall comply with the following:

(1) Be of grounding type

(2) Be installed according to 406.3

(3) Except where supplying specific appliances, be 15- or 20-ampere, 125-volt, either single or multiple type, and accept parallel-blade attachment plugs

(4) Be Electrical Fault Circuit Interrupter protected.

Substantiation: Based on data from the 2006 U.S. Fire Administration Report titled, "Live Safely in your Manufactured Home: A Factsheet on Manufactured Home Safety", manufactured homes have a fire death rate per 100,000 housing units 32-50 percent higher than the rate for other dwellings. Over one-fifth of the deaths are young children. Electrical system malfunctions and heating fires are the leading causes of fire and together account for one third of manufactured home fires.

Resistive heating and arcing faults ignite most of the major residential electrical fires. Resistive heating faults ignite 59% of the fires, in spite of branch circuit over-current protection (see "Electrical Ignition Causes of Fires in Ontario 2002-2007," Electrical Safety Authority (ESA) report, 2008). The latest code enhancements, including Arc Fault Circuit Interrupters (per UL Std. 1699), are not designed to protect against resistive heating from current flowing through poor branch circuit connections (high resistance points), overloaded appliances and open neutral conditions. New homes may have aged and potentially faulty appliances, extension cords and lighting fixtures brought in by homeowners. The 2006 NFPA report titled "Selected Residential Electrical Fires" indicates these faults have resulted in numerous fire fatalities.

Electrical Fault Circuit Interrupter (EFCI) technology is designed to provide primary protection against resistive heating ignition mechanisms including high resistance points in branch circuit wiring (cause of 23% of residential electrical fires, per the attached ESA 2008 report), appliance overloads (cause of 17% of the electrical fires), and open neutral conditions (cause of 2% of the electrical fires). EFCI also provides supplementary protection against overloaded circuits (cause of 7% of the electrical fires) and insulation damage that leads to arc tracking (cause of 7% of the electrical fires). A large portion of residential electrical ignitions are caused by resistive heating that cannot be protected by branch circuit overcurrent devices but can be protected by EFCI.

EFCI protection must be located at the junction between the load and branch circuit wiring to detect these faults and cannot be located at the panelboard. EFCI technology is a superior approach compared all relevant alternatives. (see "Alternatives to Electrical Fault Circuit Interrupter (EFCI) Technology", Wayne Hartill, 2D2C Inc., 2008.)

The complete protection of EFCI technology has been previously referred to as the combination of Overload Fault Circuit Interrupter (OFCI) and Power Fault Circuit Interrupter (PFCI) technologies. For simplicity, OFCI and PFCI technologies have been renamed Electrical Fault Circuit Interrupter (EFCI). Some previous documentation refers to the old nomenclature.

Two Fact Finding Reports from independent NRTL's substantiate the performance of EFCI technology. (see "Descriptive Report and Test Results", Todd Hamden, CSA International, Feb 2006 & "Descriptive Report and Test Results", Intertek Testing Services NA Ltd., Jan 2006). A third NRTL Fact Finding Report has been request from Underwriters Laboratories (UL).

Products containing EFCI technology have NRTL certification against UL 498 and UL 498A standards and have been available for sale in the marketplace since 2006. Multiple producers of EFCI technology exist in the marketplace. With a mandate more producers will likely enter the marketplace.

A mandate of EFCI technology is required because the net safety benefit to society is far greater than that of voluntary sales alone.

\ Note that a sister proposal for Electrical Fault Circuit Interrupter (EFCI) has been submitted for a new definition in article 100.

Please review submitted documents of support from the following fire forensics experts including:

- Vytenis Babrauskas, Ph.D., President of Fire Science and Technology Inc. and author of the "Ignition Handbook".
- John S. Robison, President of Robison Forensic Consulting, previously Alabama State Fire Marshal, and previous President of International Fire Marshals Association.
- Chris W Korinek, P.E., President of Synergy Technologies and author of Chapter 10 of "Kirks Fire Investigation" book.
- Doug Crawford, Deputy Fire Marshal of the Ontario Office of the Fire Marshal.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: There are currently no testing standards for this product. Any testing standards noted in the substantiation are for receptacles in general. The testing reports provided are based on performance results for a specific product.

Installation of this device is not currently prohibited by the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-69 Log #2438 NEC-P19 **Final Action: Reject**
(550.13(B))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
550.13 Receptacle Outlets.
(B) ~~Ground-Fault Circuit-Interrupters (GFCI)~~ Power Safe Protectors. All 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed outdoors, in compartments accessible from outside the unit, or in bathrooms, including receptacles in luminaries, shall have ~~GFCI~~ power safe protector protection. ~~GFCI~~ Power safe protector protection shall be provided for receptacle outlets serving countertops in kitchens, and receptacle outlets located within 1.8 m (6 ft) of a wet bar sink.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There are currently no testing standards for this product. Any testing standards noted in the substantiation are for receptacles in general. The testing reports provided are based on performance results for a specific product.
This proposal is brand-specific. The NEC cannot require a specific brand in any article in the code.
Installation of this device is not currently prohibited by the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-70 Log #1446 NEC-P19 **Final Action: Reject**
(550.13(B) and Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise exception and last paragraph as follows:
Exception: GFCI protection shall not be required for appliances in dedicated spaces, such as for dishwashers, disposals refrigerators, freezers, and trash compactors, ~~laundry equipment~~.
Feeders supplying branch circuits for such receptacles shall be permitted to be protected...(remainder unchanged).
Substantiation: Receptacles for laundry equipment within 1.8 m (6 ft) of a sink should not be excluded and modify 210.8(A)(7), which should govern. If that section is necessary for safety, it should apply for this article. Feeders with GFCI protection should be specified as supplying the outlets specified. Proposed revised exception is a complete statement.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 19-71. There is no technical substantiation for making the requirement more restrictive for receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-71 Log #2399 NEC-P19 **Final Action: Accept in Principle**
(550.13(B) Exception)

Submitter: Douglas A. Lee, U.S. Consumer Product Safety Commission
Recommendation: Revise text to read as follows:
550.13(B) Exception: ~~Receptacles installed for appliances in dedicated spaces, such as for dishwashers, disposals, refrigerators, freezers, and laundry equipment~~. Exceptions listed in 210.8 shall be permitted.
Substantiation: During the development of the 2008 NEC, CMP-2 recognized that present-day ground-fault circuit-interrupter (GFCI) devices are compatible with electrical appliances in the home and that there is no need to exclude refrigerators, freezers, and laundry equipment from GFCI protection. Exceptions shall only be permitted as recognized in 210.8 to provide users with the optimum electric shock protection by extending this expansion of GFCI protection to manufactured housing.
Panel Meeting Action: Accept in Principle
Revise the proposal by eliminating the exception completely and adding the following as an additional sentence to the first paragraph in 550.13(B):
"The exceptions in 210.8(A) shall be permitted."
Panel Statement: The panel action restricts the permitted exceptions to dwelling units and meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-72 Log #3551 NEC-P19 **Final Action: Reject**
(550.13(C))

Submitter: Steven R. Montgomery, 2D2C Inc.
Recommendation: Revise text to read as follows:
Cord-Connected Fixed Appliance. A grounding-type receptacle outlet with Electrical Fault Circuit Interrupter protection shall be provided for each cord-connected fixed appliance installed.
Substantiation: Based on data from the 2006 U.S. Fire Administration report title, "Live Safely in your Manufactured Home: A Factsheet on Manufactured Home Safety", manufactured homes have a fire death rate per 100,000 housing units 32-50 percent higher than the rate for other dwellings. Over one-fifth of the deaths are young children.
Based on data from the 2007 U.S. Fire Administration report titled "Clothes Dryer Fires in Residential Buildings", 12,700 clothes dryer fires occur in residential buildings, annually, resulting in 15 deaths and 300 injuries. 80% of clothes dryer fires occur in residential buildings. Electrical failure or malfunction account for 15.3% of residential dryer fires. Mechanical failure or malfunction account for 32.6%.
Electrical Fault Circuit Interrupter (EFCI) is designed to prevent electrical failure fires caused by resistive heating ignition mechanisms that cannot be protected by branch circuit overcurrent protection including poor connections / high resistance points, appliance overloads, and open neutral conditions. EFCI could also detect mechanical failure fires such as seized motor bearings. Due to their nature, these faults cannot be detected by branch circuit overcurrent devices but can be detected by EFCI. EFCI protection must be located at the junction between the load and branch circuit wiring to detect these faults and cannot be located at the panelboard.
EFCI technology is a superior approach compared to relevant alternatives. (see "Alternatives to Electrical Fault Circuit Interrupter (EFCI) Technology: Dryer", Wayne Hartill, 2D2C Inc., 2008).
The complete protection of EFCI technology has been previously referred to as the combination of Overload Fault Circuit Interrupter (OFCI) and Power Fault Circuit Interrupter
(PFCI) technologies. For simplicity, OFCI and PFCI technologies have been renamed Electrical Fault Circuit Interrupter (EFCI). Some previous documentation refers to the old nomenclature.
Two Fact Finding Reports from independent NRTL's substantiate the performance of EFCI technology. (see "Descriptive Report and Test Results", Todd Hamden, CSA International, Feb 2006 & "Descriptive Report and Test Results", Intertek Testing Services NA Ltd., Jan 2006). A third NRTL Fact Finding Report has been requested from Underwriters Laboratories (UL). These Fact Finding Reports tested the implementation of EFCI technology in NEMA 5-15R duplex receptacles. The results of these reports also support EFCI as implemented into a NEMA 14-50R dryer receptacle since they differ only in form factor.
Products containing EFCI technology have been NRTL tested against UL standards and available for sale in the marketplace since 2006. Multiple producers of EFCI technology exist in the marketplace. With a mandate more producers will likely enter the marketplace.
A mandate of EFCI technology in a NEMA 14-50R dryer receptacle is required because the net safety benefit to society is far greater than that of voluntary sales alone.
Note that a sister proposal for Electrical Fault Circuit Interrupter (EFCI) has been submitted for a new definition in article 100.
Please review submitted documents of support from the following fire forensics experts including:
● Vytenis Babrauskas, Ph.D., President of Fire Science and Technology Inc. and author of the "Ignition Handbook".
● John S. Robison, President of Robison Forensic Consulting, previously Alabama State Fire Marshal, and previous President of International Fire Marshals Association.
● Chris W Korinek, P.E., President of Synergy Technologies and author of Chapter 10 of "Kirks Fire Investigation" book.
● Doug Crawford, Deputy Fire Marshal of the Ontario Office of the Fire Marshal.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-68.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-73 Log #4760 NEC-P19 **Final Action: Reject**
(550.13(D))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 2-274.

This action will be considered by the panel as a public comment.

Submitter: D. Jerry Flaherty, East Islip, NY
Recommendation: Add revised text to read as follows:

(D) Receptacle Outlets required. Except in the bath, closet, and ~~**hall**~~ **hallway** areas, receptacle outlets shall be installed at wall spaces 600 mm (2 ft) wide or more so that no point along the floor line is more than 1.8 m (6 ft) measured horizontally from an outlet in that space. In addition, a receptacle outlet shall be installed in the following locations:

Substantiation: No definition for "hall" in NEC.

Webster dictionary has several definitions that are not in line with this section of NEC.

1) "Entrance space into which the main door to house" — new large homes have "halls" that are quite large, fully furnished with tables (table lamps) and seating. By definition and code these "halls" need only one receptacle. I have inspected many with extension cords which are a fire hazard.

210.52(H) Hallways.

2) Webster definition - "A communally owned building where public business is transacted or where people meet etc. "which is in line with other areas of the NEC (assembles halls, dance halls, etc.) but not with this section of the code.

3) The end of habitable rooms with two or more doors at one end meets the definition of a hall and again usually only one receptacle is provided.

"Hallway" is not defined in the NEC and Webster defines as a passage connecting two or more rooms which is closer to what the NEC is referring too, but not quite.

See Proposal for a definition of a Hallway.

Hallways. A walled corridor used exclusively to connect two or more rooms.

Panel Meeting Action: Reject

Panel Statement: The term "hall" is used correctly in the noted section. Changing the term to "hallway" does nothing to improve the Code. It is noted that the proposed definition of "hallway" was rejected by CMP-1 (Proposal 1-89) prior to balloting.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-74 Log #2439 NEC-P19 **Final Action: Reject**
(550.13(E)(3))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:

550.13 Receptacle Outlets.

(E)(3) Pipe Heating Cable(s) Outlet. ~~On a circuit where all of the outlets are on the load side of the ground fault circuit interrupter~~ <u>Shall consist of a power safe protector receptacle.</u>

Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.

The Power Safe Protector (PSP) device overcomes these limitations in three ways:

1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.

2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.

3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

This proposal makes changes to help make the code consistent with proposed changes to 550.13(B) for use of power safe protector receptacles.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 19-69.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-75 Log #474 NEC-P19 **Final Action: Accept**
(550.13(F)(1))

Submitter: Paul W. Abernathy, Electrical Service Specialists & The Electrical Guru
Recommendation: Revise text to read as follows:

(F) Receptacle Outlets Not Permitted. Receptacle outlets shall not be permitted in the following locations:

(1) Receptacle outlets shall not be installed within <u>or directly over</u> a bathtub or shower space.

(2) A receptacle shall not be installed in a face-up position in any countertop.

(3) Receptacle outlets shall not be installed above electric baseboard heaters, unless provided for in the listing or manufacturer's instructions.

Substantiation: This change would clear up any question as to if a receptacle is allowed directly over a bathtub or shower space in a mobile home, it is addressed in 406.8(2)(C) but is left open under the present listing 550.13(F)(1) which creates a potential hazard for the consumer.

Panel Meeting Action: Accept

Panel Statement: It is noted that the reference to 406.8(2)(C) in the submitter's substantiation should be to 406.8(C).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-76 Log #473 NEC-P19 **Final Action: Reject**
(550.13(G))

Submitter: Paul W. Abernathy, Electrical Service Specialists & The Electrical Guru
Recommendation: Delete text to read as follows:

(G) Receptacle Outlets Not Required. Receptacle outlets shall not be required in the following locations:

(1) In the wall space occupied by built-in kitchen or wardrobe cabinets

~~(2) In the wall space behind doors that can be opened fully against a wall surface~~

(3) In room dividers of the lattice type that are less than 2.5 m (8 ft) long, not solid, and within 150 mm (6 in.) of the floor

(4) In the wall space afforded by bar-type counters

Substantiation: The requirements for a Dwelling Unit are as follows:

(1) Spacing. Receptacles shall be installed so that no point measured horizontally along the floor line in any wall space is more than 1.8 m (6 ft) from a receptacle outlet.

When dealing with a Mobile Home, the space behind the door area has the same use and potential as it does in the requirements of 210.52(A)(1) and should be required to meet the same spacing requirements. Section 550.13 of the National Electrical Code makes provisions for the same spacing requirements of 6 feet from an outlet. In the spacing, requirements of 210.52(A)(1) there is no relief from the space behind a door and so it should also not be shown under 550.13(G)(2) and should be deleted.

Panel Meeting Action: Reject

Panel Statement: Chapter 5 modifies Chapters 1 through 4 as permitted by Section 90.3. No technical substantiation has been provided to support deleting the noted provision. Consideration relative to size constraints is needed for this specialized industry.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-77 Log #1448 NEC-P19 **Final Action: Reject**
(550.14(C)and (D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (C); delete text of (D) and substitute: Luminaires, lighting track, lampholders, pendants, and ceiling suspended (paddle) fans shall comply with 410.10(D).

Substantiation: Since pendant luminaries or cords are not prohibited there is no need to specifically permit them. Section 410.10 is more specific and restrictive, and if necessary for safety should be applicable for this article.

Panel Meeting Action: Reject

Panel Statement: Particularly for mobile homes, the acceptability of pendant luminaries or pendant cords is not intuitive. 410.10(D) only calls for damp location luminaries within the defined space. The requirement in 550.14(D) is intended to be more restrictive given the relatively lower ceilings in the bath and shower areas. Products such as track lighting, lampholders, and ceiling suspended (paddle) fans are not practical in a bathtub or shower stall.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-78 Log #1189 NEC-P19 **Final Action: Reject**
(550.14(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete, or substitute: Luminaires and other lighting equipment, pendants, and paddle fans installed in bathtub and shower areas shall comply with 410.10(D).
Substantiation: Section 410.10 is more comprehensive and some of its provisions are not modified by this section, which therefore apply; this can be confusing.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-77.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-79 Log #1188 NEC-P19 **Final Action: Reject**
(550.15)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise as follows:
Except as specifically limited in this section, the identified wiring methods and materials included in this Code shall be used in mobile homes.
Substantiation: Edit. The wiring methods and materials should be suitable for the use. All wiring methods are not suitable.
Panel Meeting Action: Reject
Panel Statement: The proposed language does not add clarity or improve usability of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-80 Log #1831 NEC-P19 **Final Action: Reject**
(550.15(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Where a range, clothes dryer, dishwasher, trash compactor, or other appliance is directly connected by metal covered cable or flexible ~~metal~~ conduit, a length of not less than 900 mm (3 ft), but not longer than necessary, of unsupported cable or conduit shall be provided to ~~service~~ permit access to terminations ~~on the appliance~~. The cable or conduit shall be secured ~~to the wall~~ at the point where the unsupported length begins. Nonmetallic sheathed cables, Type SE, Type UF, Type MI, cables, flexible metallic tubing, and electrical nonmetallic tubing shall not be used for this purpose. ~~To connect a range or dryer~~.
Delete remainder.
Substantiation: Edit. Although this provision applies to metal covered cable and flexible metal conduit, it doesn't apply to flexible nonmetallic conduit or other wiring methods permitted by 550.15. Access to terminations appears to be the intent and should apply to terminations that may be made at an outlet box where the cable or conduit may be connected. A maximum length should be specified to exclude excessive lengths and comply with 110.12. Some additional wiring methods should be noted as not suitable.
Panel Meeting Action: Reject
Panel Statement: There is no justification to remove the requirement for flexible metal conduit. In this type of installation, the metallic covering affords an extra level of protection against physical damage. The panel points out to the submitter that the requirement is not directed at LFMC and LFNMC; it is directed at metal covered cable and FMC (Article 348). See the first sentence of 550.15.
"Where the unsupported length begins" is unnecessary language as the unsupported length clearly begins after the last support.
No substantiation has been provided to extend the list of cable and other products that are not to be used.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-81 Log #888 NEC-P19 **Final Action: Reject**
(550.15(G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
Switches shall not be installed in a face-up position in any countertop in living area.
Substantiation: The provision of 550.13(F)(2) should apply.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation was provided to address switches. The substantiation only addresses receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-81a Log #CP1904 NEC-P19 **Final Action: Accept**
(550.15(H))

Submitter: Code-Making Panel 19,
Recommendation: Revise 550.15(H) as follows:
H) Under-Chassis Wiring (Exposed to Weather). Where outdoor or under-chassis line-voltage (120 volts, nominal, or higher) wiring is exposed to moisture or physical damage, it shall be protected by rigid metal conduit or intermediate metal conduit except as provided in 1 or 2 below. The conductors shall be suitable for wet locations.
1. Where closely routed against frames and equipment enclosures, reinforced thermosetting resin conduit (RTRC) listed for above ground use, Type MI cable, electrical metallic tubing or rigid polyvinyl chloride conduit (PVC) shall be permitted.
2. Where extending vertically from a direct burial depth of at least 457 mm (18 in.) below grade and terminated to a factory installed conduit or enclosure, Schedule 80 PVC, or reinforced thermosetting resin conduit (RTRC) listed for exposure to physical damage.
~~Exception: Type MI cable, electrical metallic tubing, or rigid nonmetallic conduit shall be permitted where closely routed against frames and equipment enclosures.~~
Substantiation: This proposal intends to meet the intent of the submitters of proposals 19-82 and 19-83. See the substantiation for those proposals. The panel also agreed that RTRC conduit is suitable for use where closely routed against the frames and equipment enclosures where listed for above ground use.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-82 Log #4170 NEC-P19 **Final Action: Accept in Principle**
(550.15(H) Exception)

Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Revise text to read as follows:
550.15(H) Under-Chassis Wiring (Exposed to Weather)
Exception: Type MI cable, electrical metallic tubing, or ~~rigid nonmetallic conduit~~, rigid polyvinyl chloride conduit shall be permitted where closely routed against frames and equipment frames and equipment enclosures, or Schedule 80 PVC conduit where extending vertically from a burial depth of at least 18 inches below grade and terminating to a factory installed conduit or enclosure.
Substantiation: Mobile homes and manufactured homes have historically been provided with a PVC conduit extending from the panelboard inside the home to below the underside of the structure for the purpose of attaching to the feeder conduit. From the time that this responsibility was under HUD's jurisdiction, this has been the practice and the typical installation was to extend a conduit from a location underground in the vertical position to attach to this conduit provided by the manufacturer. Schedule 80 PVC is identified for use where exposed to physical damage and should be acceptable for this application. At the present, many AHJs are not permitting this due to the conduit not being installed against the frame of the mobile home or manufactured home. This change should clarify, as acceptable, an installation that has been used for over 30 years.
Panel Meeting Action: Accept in Principle
See panel action on Proposal 19-81a.
Panel Statement: The panel action on Proposal 19-81a meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-83 Log #4730 NEC-P19 **Final Action: Accept in Principle**
(550.15(H) Exception)

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
550.15 Wiring Methods and Materials.
(H) Under-Chassis Wiring (Exposed to Weather). Where outdoor or under-chassis line-voltage (120 volts, nominal, or higher) wiring is exposed to moisture or physical damage, it shall be protected by rigid metal conduit or intermediate metal conduit. The conductors shall be suitable for wet locations.
Exception: Type MI cable, electrical metallic tubing, ~~or~~ rigid ~~nonmetallic~~ polyvinyl chloride conduit (PVC) or reinforced thermosetting resin conduit (RTRC), shall be permitted where closely routed against frames and equipment enclosures.
Substantiation: This is an addition from the result of the 2008 NEC adding of new code articles for each of the specific nonmetallic raceways and the conditions for their intended use. Remove the reference of "nonmetallic" and add in each of the specific raceway types. Non-metallic conduit now has four different types of raceways and not all non-metallic raceway types would be acceptable in all locations.

Panel Meeting Action: Accept in Principle
See panel action on Proposal 19-81a.
Panel Statement: The panel action on Proposal 19-81a meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-83a Log #CP1905 NEC-P19 **Final Action: Accept**
(550.16)

Submitter: Code-Making Panel 19,
Recommendation: Revise text to read as follows:
550.16 **Grounding**. Grounding of both electrical and non-electrical metal parts in a mobile home shall be through connection to a grounding bus in the mobile home distribution panelboard, ~~the grounding bus~~ <u>and</u> shall be connected through the green-colored insulated conductor in the supply cord or the feeder wiring to the ~~service ground~~ <u>grounding bus</u> in the service-entrance equipment located adjacent to the mobile home location. Neither the frame of the mobile home nor the frame of any appliance shall be connected to the grounded circuit conductor in the mobile home. Where the distribution panelboard is the service equipment as permitted by 550.32(B), the neutral conductors and the equipment grounding bus shall be connected.
Substantiation: The language change is consistent throughout the Code. "Grounding bus" is used several times in Article 230 Services and Article 250 Grounding and Bonding. This panel proposal addresses the concerns of Proposal 19-85.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-84 Log #1094 NEC-P19 **Final Action: Reject**
(550.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first paragraph and (A)(1) and substitute:
GROUNDING. Where grounding is provided in or on a mobile home it shall be by connection to a grounding bus or terminal(s) in the main disconnecting means specified in 550.11(A). The grounding bus or terminal(s) shall be connected by the feeder equipment grounding conductor to the grounding electrode conductor in the service equipment.
(A) GROUNDED CONDUCTORS.
(1) The grounded circuit conductors in or on the mobile home shall be insulated from grounding and bonding conductors, equipment enclosures, and other parts except terminations insulated from ground. The grounded circuit terminals in the distribution equipment, appliances, and other utilization equipment shall be insulated from equipment enclosures. Bonding means for grounded conductors in or on a mobile home shall be removed.
Revise text of (A)(2):...shall be made with <u>an identified</u> 4-conductor flexible cord <u>or cable containing an equipment grounding conductor</u> and <u>with</u> a 3-pole, 4-wire grounding type plug.
Revise text of (B)(1): The ~~green colored insulated~~ feeder equipment grounding conductor shall be connected to the grounding terminal(s) in the <u>main</u> disconnecting means.
Revise text of (B)(3): Cord and plug-connected appliances ~~such as washing machines, clothes dryers, refrigerators, and so forth~~ and <u>other equipment rated at over 25 volts</u> shall be grounded by means of an <u>identified flexible</u> cord ~~with~~ <u>containing an equipment grounding conductor</u> and grounding type attachment plug.
<u>*Exception: Listed appliances and equipment identified as suitable for non-grounding.*</u>
Substantiation: The feeder may terminate in a single circuit breaker of fused switch, which are not panelboards; "green-colored" and "supply cord" are superfluous. Removal of bonding means should be clear it only applies to the grounded circuit conductors. Flexible cord of (B)(1) should be identified for the use (wet locations, sunlight resistance, etc.). Proposed (B)(3) is more inclusive and the provisions should exempt low voltage equipment and listed equipment such as portable table and floor lamps, toasters, hair curlers, blow dryers, smoothing irons, etc. Requiring bonding means to be discarded is unnecessary and unenforceable.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided insufficient technical substantiation to support the proposed revisions. The reference in the proposed exception to the use of "non-grounding-type appliances" is neither a recognized nor an enforceable term.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-85 Log #1876 NEC-P19 **Final Action: Reject**
(550.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: In the second sentence of the first paragraph change "service ground" to "grounding electrode conductor...".
Substantiation: Edit. "service ground" is not a defined term.
Panel Meeting Action: Reject
Panel Statement: The proposed revision does not add clarity or improve usability of the code. See the panel action and statement on Proposal 19-83a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-86 Log #879 NEC-P19 **Final Action: Reject**
(550.16(B)(1))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part:...shall be effectively bonded to the grounding terminals ~~or enclosures~~ of the ~~distribution panelboard~~ <u>disconnecting means</u>.
Substantiation: There may not always be a panelboard if there is only one branch circuit. The supply system grounding conductor terminals are in the disconnecting means that should be the "effective" bonding point.
Panel Meeting Action: Reject
Panel Statement: The term "distribution panelboard" is used throughout Article 550. Mobile homes are not permitted to be served by a single branch circuit; therefore the submitter's substantiation is incorrect. The proposed revision to delete 'or enclosures' does not relate to 550.16(B)(1).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-87 Log #1879 NEC-P19 **Final Action: Reject**
(550.16(B)(1))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: (1) The green-colored insulated grounding wire in the supply cord or permanent feeder wiring shall be connected to the grounding bus in the ~~distribution panelboard or~~ main disconnecting means <u>enclosure</u>.
Substantiation: 550.11(A) requires a main disconnecting means which may be an individual separate circuit breaker of fused switch that is not part of a panelboard, and where the grounding conductor in the supply is terminated.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add clarity or increase usability of the code. In addition, it does not reflect current manufactured housing industry practice. See also the panel statement on Proposal 19-86.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-88 Log #1183 NEC-P19 **Final Action: Reject**
(550.16(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (1) and substitute:
All exposed noncurrent-carrying fixed metal parts that are likely to become energized shall be effectively bonded to the grounding terminal(s) in the main disconnecting means. A continuous solid copper bonding conductor shall be connected between the grounding terminal(s) in the main disconnecting means and an accessible terminal on the chassis. This bonding conductor shall be sized in accordance with Table 250.122 but shall not be smaller than 8 AWG. This bonding conductor shall be provided with approved means of protection where likely to be subject to physical damage.
Revise text of (2):
Grounding and bonding terminals shall be of the solderless type and listed as pressure connectors identified for the wire size and material used.
Substantiation: "May" is a term to be avoided per the Style Manual. "Likely" is a term used in many sections. The main disconnecting means grounding terminals provide the most direct and lowest impedence path to the service equipment. Present wording does not require a larger than 8 AWG conductor if required by table 250.122. The chassis bonding conductor should be continuous and solid due to possible corrosion from deicing salts or other conditions. Present wording of (2) appears related to the chassis bonding conductor but literal wording applies it to all bonding conductors.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-89.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-89 Log #1777 NEC-P19 **Final Action: Accept in Part**
(550.16(C)(1) and (2))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: (1) All exposed fixed noncurrent-carrying metal parts that ~~may~~ are likely to become energized shall be effectively bonded to the grounding terminal of the ~~distribution panelboard~~ disconnecting means specified in 550.11(A). A solid copper bonding conductor shall be connected between the ~~distribution panelboard~~ mobile home main disconnecting means grounding terminal and the chassis, sized in accordance with Table 250.122 but not smaller than 8 AWG. The bonding conductor shall be routed so as not likely to be subject to physical damage, or be protected by identified means.
(2) Grounding and bonding terminals shall be of the solderless type and be listed as pressure terminal connectors ~~recognized~~ identified for the wire type and size.
Delete remainder.
Substantiation: The bonding conductor should be copper and solid to minimize corrosion. Connections should be to the main disconnecting means grounding terminals for the most direct low impedance grounding path, and sized in accordance with 250.122 which may require a size larger than 8 AWG. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Accept in Part
The panel accepts deleting "may" and substituting "are likely to." The remainder of the text remains unchanged.
Panel Statement: There is neither sufficient evidence nor substantiation for the remainder of the changes proposed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-90 Log #386 NEC-P19 **Final Action: Reject**
(550.16(C)(4)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as shown:
"The lower panel of the metallic exterior covering is secured by metallic fasteners at a cross member of the chassis by two metal straps for each ~~per~~ mobile home unit or section at opposite ends."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect. The use of the word "per" in this application is appropriate. The proposed revision does not add clarity or improve usability. The NEC Style Manual does not prohibit the use of "per."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-91 Log #1375 NEC-P19 **Final Action: Reject**
(550.17(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (1):
An electrical continuity test and where possible, a visual inspection. To ensure that all electrically conductive parts are properly, effectively bonded.
Substantiation: Visual inspection should also be required. Continuity tests unless of high amperage do not always indicate loose connections and cannot determine if connectors are listed for wire size and material.
Panel Meeting Action: Reject
Panel Statement: A visual inspection is unnecessary. Electrical continuity can be verified using the appropriate test equipment. A visual inspection is unenforceable and impractical in many cases.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-92 Log #1319 NEC-P19 **Final Action: Reject**
(550.18)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change "leg" to "conductor".
Substantiation: Edit. Leg is a vernacular and nonspecific term.
Panel Meeting Action: Reject
Panel Statement: The term "leg" is clearly understood. The proposed revision does not add clarity or improve usability of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-93 Log #387 NEC-P19 **Final Action: Reject**
(550.18(A)(5))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as shown:
"First 3000 total volt-amperes at 100 percent plus remainder at 35 percent equals volt-amperes to be divided by 240 V ~~volts~~ to obtain current (amperes) for each ~~per~~ leg."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: Use of the word "volts" rather than the abbreviation "V" is appropriate because in this context it is not referring to a rating as described in the NEC Style Manual. See also the panel statement on Proposal 19-90.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-94 Log #1182 NEC-P19 **Final Action: Reject**
(550.18(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
In (2) change "leg" to "ungrounded conductor or"
In (3) add: "and continuous load"
Substantiation: "Leg" is vernacular and undefined. Continuous loads such as a water heater should be provided for.
Panel Meeting Action: Reject
Panel Statement: The term "leg" is clearly understood.
The addition of 'and continuous load' adds confusion to the requirement. Insufficient technical substantiation has been provided for the proposed revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-95 Log #388 NEC-P19 **Final Action: Reject**
(550.18(B)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise the last sentence as shown:
"Where an air conditioner is not installed and a 40 ampere power-supply cord is provided, allow 15 amperes for each ~~per~~ leg for air conditioning."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-90.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-96 Log #1346 NEC-P19 **Final Action: Reject**
(550.20(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
"or wet" after "damp".
Substantiation: Equipment listed for wet locations is suitable for damp locations.
Panel Meeting Action: Reject
Panel Statement: The proposal is addressed by 406.8(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-97 Log #2398 NEC-P19 **Final Action: Accept**
(550.25)

Submitter: Douglas A. Lee, U.S. Consumer Product Safety Commission
Recommendation: Revise text to read as follows:
550.25 Arc-Fault Circuit-Interrupter Protection.
(B) ~~Bedrooms of~~ Mobile Homes and Manufactured Homes. All 120-volt branch circuits that supply 15- and 20- ampere outlets installed in family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas of mobile homes and manufactured homes shall comply with 210.12(B)
Substantiation: CMP-2 recognized the fire prevention capabilities of arc-fault circuit-interrupters (AFCIs) by expanding areas requiring AFCI protection as set forth in 210.12 during the 2008 NEC code-making cycle. From 1999-2002, the fire death rate is roughly twice as high in manufactured homes as in other one- and two-family dwellnigs, and electrical distribution equipment continues to be one of the leading causes of manufactured home fires[1]. By making the requirements for manufactured homes consistent with the requirements for other dwelling units, additional electrical wiring system fires can be mitigated.
[1]. Hall, John R., Jr Manufactured Home Fires, National Fire Protection Association, February 2005.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-98 Log #3082 NEC-P19 **Final Action: Reject**
(550.25)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
550.25 Arc-Fault Circuit-Interrupter Protection.
~~(A) Definition. Arc-fault circuit interrupters are defined in Article 210.12(A).~~
~~(B) Bedrooms of Mobile Homes and Manufactured Homes. All 120-volt branch circuits that supply 15- and 20-ampere outlets installed in bedrooms of mobile homes and manufactured homes shall comply with 210.12(B).~~
Arc-fault circuit-interrupters shall be provided in accordance with 210.12.
Substantiation: This code section is always one code cycle behind the requirements of Article 210, because nobody ever makes proposals to this section. By simply referring the code user to the section, we can stop having the rules out of synch with each other.
Panel Meeting Action: Reject
Panel Statement: See the panel's action and statement on Proposal 19-97. The panel continues to believe that the requirements should be restated in Article 550 since this is still emerging technology and other standards, including HUD, need clear guidance from the NEC in applying the expanding requirements in applications addressed by Article 550.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-99 Log #504 NEC-P19 **Final Action: Reject**
(550.25(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Insert a hyphen between "circuit" and "interrupters".
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: The words are not hyphenated in the definition in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-100 Log #1345 NEC-P19 **Final Action: Accept in Principle**
(550.25(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete:
"bedrooms of".
Substantiation: Other areas included in 210.12(B) should be included. If those requirements are necessary for safety, mobile homes should be included.
Panel Meeting Action: Accept in Principle
See panel action on Proposal 19-97.
Panel Statement: The panel action on Proposal 19-97 meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-101 Log #3900 NEC-P19 **Final Action: Reject**
(550.32)

Submitter: Colin Beckham, E Light Electric Services
Recommendation: Revise text as follows:
The mobile home service equipment shall be located adjacent to the mobile home and not mounted in or on the mobile home. The service equipment shall be located in site from and not more than 9.00 m (30 ft) from the exterior wall of the mobile home it services. the service equipment shall be permitted to be located elsewhere on the premises, provided that disconnection means suitable for use as service equipment is located within sight from and not more than 9.0 m (30 ft) from the ~~exterior wall of the mobile home~~ service of the mobile home ~~it serves~~ and is rated not less than that required for service equipment per 550.32(C). Grounding at the disconnection means shall be in accordance with 250.32.
Substantiation: I believe this change will allow electricians to make safe installations and allow more flexibility in their installations reduce cost and not decrease safety.
Panel Meeting Action: Reject
Panel Statement: The submitter's intent is unclear based on the proposed revisions. Insufficient technical substantiation has been provided.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-102 Log #389 NEC-P19 **Final Action: Reject**
(550.32(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise the third sentence as shown:
"…rated not less than that required for service equipment in accordance with ~~per~~ 550.32(C)."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-90.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-103 Log #1187 NEC-P19 **Final Action: Reject**
(550.32(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence as follows: The mobile home service equipment shall ~~be located adjacent to the mobile home and~~ not be mounted in or on the mobile home.
Substantiation: Edit. Proposed deletion is superfluous; "adjacent" is effective defined by the 30 ft requirement.
Panel Meeting Action: Reject
Panel Statement: The current text is clear. The word "adjacent" clearly implies that the service equipment should be placed as close as practical to the mobile home.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-104 Log #1823 NEC-P19 **Final Action: Reject**
(550.32(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Manufactured home service equipment shall be permitted in accordance with 550.32(B).
Substantiation: Edit. The definition of Mobile Home includes manufactured homes unless indicated otherwise. (A) indicates service equipment shall not be located on a mobile home (manufactured home). A conflict may be perceived between (A) and (B).
Panel Meeting Action: Reject
Panel Statement: The recommendation is unclear as to where to add the proposed text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-105 Log #1186 NEC-P19 **Final Action: Reject**
(550.32(B)(6))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Subsection (B)(4) already covers this and should govern, not the manufacturers instructions.
Panel Meeting Action: Reject
Panel Statement: When a mobile home is placed in a mobile home park, or a manufactured home is located, the minimum size grounding electrode conductor needs to be compatible with the service.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-106 Log #505 NEC-P19 **Final Action: Reject**
(550.32(E))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between “circuit” and “interrupter”.
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: The words are not hyphenated in the definition in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-107 Log #2440 NEC-P19 **Final Action: Reject**
(550.32(E))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
550.32 Additional Receptacles. Additional receptacles shall be permitted for connection of electric equipment located outside the mobile home, and all such 125-volt, single phase, 15- and 20-ampere receptacles shall be protected by a listed ~~ground fault circuit interrupter~~ power safe protector.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a “Power Off” safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-69.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-108 Log #1377 NEC-P19 **Final Action: Reject**
(550.33(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change “capacity” to “an ampacity”.
Substantiation: Edit. “Ampacity” is defined; “capacity” is not. The Style Manual, 3.2.5.1, indicates ampacity is the term to be used in the sense of current-carrying capability.
Panel Meeting Action: Reject
Panel Statement: The term “capacity” is used throughout the code and is clear to the users.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 19-109 was not used)

ARTICLE 551 — RECREATIONAL VEHICLES AND RECREATIONAL VEHICLE PARKS

19-110 Log #1354 NEC-P19 **Final Action: Reject**
(551.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change “panel” to “equipment”.
Substantiation: Edit. Where supplied by one circuit (551.42) a single fused switch or circuit breaker may not be deemed a panel.
Panel Meeting Action: Reject
Panel Statement: It is not clear which definition the submitter intends to revise based on the reference to 551.2. The substantiation does not support the proposed revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-111 Log #1376 NEC-P19 **Final Action: Accept**
(551.2.Air-Conditioning or Comfort-Cooling Equipment)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
All of that equipment intended or installed for the purpose of processing the treatment of air so as to control simultaneously <u>or individually</u> its temperature, humidity, cleanliness, and distribution to meet the requirements of the conditioned space.
Substantiation: Edit. Some equipment does not simultaneously control all the functions listed.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-112 Log #891 NEC-P19 **Final Action: Reject**
(551.2.Distribution Panelboard)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
<u>DISTRIBUTION EQUIPMENT</u> ~~PANELBOARD~~
Add to present paragraph:
...or other equipment that constitutes the disconnecting means and overcurrent protection for the branch circuit(s) supplied.
Substantiation: A panelboard may not always be required; see 551.42(A) and (B).
Panel Meeting Action: Reject
Panel Statement: The term “distribution panelboard” is used in Article 551, not the term ‘distribution equipment’ therefore the definition is not necessary. The submitter has provided inadequate substantiation to support the revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-113 Log #1822 NEC-P19 **Final Action: Accept in Principle**
(551.2.Low Voltage)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise Low Voltage definition: An electromotive force rated 24 volts, nominal, or less, supplied from a transformer, converter, ~~or~~ battery, generator, or solar voltaic system.
Substantiation: Generators and solar voltaic systems may also be power sources.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Low Voltage. An electromotive force rated 24 volts, nominal, or less~~, supplied from a transformer, converter, or battery~~.
Panel Statement: The panel action meets the submitter's intent by not limiting the power source within the definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-114 Log #2441 NEC-P19 **Final Action: Reject**
(551.2.Power Safe Protector (PSP) (New))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
Article 100
DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.
Substantiation: If 551.41(C) and/or 551.71 for PSP are accepted a definition may be required. Proposal also being sent to Article 100.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 19-134 precludes the need for a definition in this article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-115 Log #1374 NEC-P19 **Final Action: Accept in Principle**
(551.2.Transformer)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Revise:Transformer. A device that when ~~used~~ energized, inductively couples primary and secondary windings ~~raises or lowers the voltage of alternating current~~.
Alternatively, delete.
Substantiation: Some transformers have one-to-one ratios. Transformers can also operate from a "chopped" (intermittent) dc current as was done in old vacuum tube radios in automobiles to produce the higher voltages needed for the vacuum tubes. Article 100 Scope indicates commonly defined terms do not need definitions.
Panel Meeting Action: Accept in Principle
Delete the definition of "transformer" in 551.2.
Panel Statement: The panel action accepts the submitter's alternative suggestion of deleting the definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-116 Log #3083 NEC-P19 **Final Action: Accept**
(551.4)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
551.4 General Requirements.
(A) Not Covered. A recreational vehicle not used for the purposes as defined in 551.2 shall not be required to meet the provisions of Part IV ~~I~~ pertaining to the number or capacity of circuits required. It shall, however, meet all other applicable requirements of this article if the recreational vehicle is provided with an electrical installation intended to be energized from a 120-volt, 208Y/120-volt, or 120/240-volt, nominal, ac power-supply system.
(B) Text to remain unchanged.
FPN: Text to remain unchanged.
Substantiation: It appears that this section is in error, as Part I of the article contains only definitions and this section. It doesn't address the "the number or capacity of circuits required." If the proposal refers to the wrong part of the Article, please accept the change in principal to clarify the intent of the section.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 19-117 moved to follow 19-128 on page 738)

19-118 Log #1207 NEC-P19 **Final Action: Reject**
(551.17(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Section already applies unless modified or amended.
Panel Meeting Action: Reject
Panel Statement: Section 551.17(E) does not exist.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-119 Log #1373 NEC-P19 **Final Action: Reject**
(551.20)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
Circuits fed ~~from ac transformers~~ supplied from ac or dc sources shall not supply equipment that is not identified for use on such sources ~~dc appliances~~.
Substantiation: The provision should apply whether the source is an ac transformer generator or battery and include equipment other than appliances. Some equipment may be identified for use on either type of current.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add clarity or improve usability of the code. Dual voltage fixtures, including luminaires or appliances, are already referenced in 551.20(D).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-120 Log #283 NEC-P19 **Final Action: Accept**
(551.20(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "formula" to "percentages".
Substantiation: The term formula normally refers to a chemical composition whereas the information that follows provides the percentages to be used to calculate the converter rating.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-121 Log #1369 NEC-P19 **Final Action: Reject**
(551.20(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Where a recreational vehicle is equipped with an ac system, a low-voltage system, or both, receptacles, cord caps, cord connector, and flanged surface devices of the low-voltage system shall have a configuration that is incompatible with such devices of the 120-volt or higher ac system.
Delete the last sentence or substitute:
Where a vehicle equipped with a battery or other low-voltage system has an electrical connection provisions for connection to an external source of low-voltage power, the means for connection shall be identified for the use and provide for disconnection of the integral power source(s). A permanent and durable label shall be provided at the connection point stating: Warning Disconnect all 24 volts or less internal power sources before connecting external power. This connection is only for a supply rated _____ volts _____ current _____ amperes. Applicable voltage type of current (ac or dc) and ampere rating shall be provided.
Substantiation: The last sentence is vague and not specific. Configuration of devices cannot prevent connection of ac power, only prevent use of devices that are not compatible.
Panel Meeting Action: Reject
Panel Statement: Insufficient technical substantiation has been provided for the first part of the submitter's recommendation. The substantiation for the second part of the recommendation is incorrect; there are 12-volt configurations that would prevent connection to ac power.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-122 Log #1962 NEC-P19 **Final Action: Reject**
(551.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Equipment shall be installed to ensure that the ~~current carrying~~ supply circuit conductors from the engine generator and from an outside source are not connected to a vehicle circuit ~~at the same time~~ simultaneously...
Substantiation: Edit. Current-carrying conductors are not defined and literally describes conductors with a flow of current. Neutrals are at times not considered current-carrying. Proposal clarifies that a neutral is included.
Panel Meeting Action: Reject
Panel Statement: Not all supply circuit conductors (equipment grounding conductors) are always disconnected. The recommendation is not strictly editorial. In this context, "at the same time" is more correct than "simultaneously."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 19-123 moved to follow 19-124)

19-124 Log #3833 NEC-P19 **Final Action: Accept in Principle**
(551.30(B))

Submitter: Douglas B. Tilghman, Technology Research Corp
Recommendation: Add new text to read as follows:
(B) Generator Protection. Equipment shall be installed to insure that the current-carrying conductors from the engine generators and from outside source are not connected to a vehicle circuit at the same time. Recreational Vehicle electronically controlled (automatic) transfer switch must include a mechanically device to prevent simultaneous connection.
Substantiation: Transfer equipment utilizing relays or separate non-mechanically interlocked contactors will not prevent the generator and utility power from being connected at the same time in the event of a welded contact or relay failure. In the event of welded contact(s) or relay failure, simultaneous connected power from both sources will cause damage and/or fire. The purpose of this proposal is to protect the consumer.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(B) Generator Protection. Equipment shall be installed to insure that the current-carrying conductors from the engine generators and from an outside source are not connected to a vehicle circuit at the same time. Automatic transfer switches in such applications shall be listed for use in one of the following:
(1) Emergency systems
(2) Optional standby systems.
Panel Statement: This revised language provides greater clarity and meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-123 Log #890 NEC-P19 **Final Action: Reject**
(551.30(E)(1))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "panelboard" to "distribution equipment" in (1) and the last paragraph.
Substantiation: There may not always be a panelboard; see 551.42(A) and (B).
Panel Meeting Action: Reject
Panel Statement: The submitter has not technically substantiated the proposed revision. The reference to 551.42(A) and (B) in the submitter's substantiation is not germane to the proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 19-125 moved to follow 19-126)

19-126 Log #1371 NEC-P19 **Final Action: Reject**
(551.31(B) and (D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change "capacity" to "current rating".
Substantiation: Edit. Capacity is not a Code-defined term.
Panel Meeting Action: Reject
Panel Statement: The term "capacity" as used applies to output of a generator which is appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-125 Log #3834 NEC-P19 **Final Action: Accept in Principle**
(551.33)

Submitter: Douglas B. Tilghman, Technology Research Corp
Recommendation: Add new text to read as follows:
551.33 Alternate Source Restrictions. Transfer equipment, if not integral with the listed power source, shall be installed to ensure that the current-carrying conductors from other sources of ac power and from an outside source are not connected to the vehicle circuit at the same time. Recreational Vehicle electronically controlled (automatic) transfer switch must include mechanically interlocked device to prevent simultaneous connection.
Substantiation: Transfer equipment utilizing relays or separate non-mechanically interlocked contactors will not prevent the generator and utility power from being connected at the same time in the event of a welded contact or relay failure. In the event of welded contact(s) or relay failure, simultaneous connected power from both sources will cause damage and/or fire. The purpose of this proposal is to protect the consumer.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Add new text to read as follows:
551.33 Alternate Source Restrictions. Transfer equipment, if not integral with the listed power source, shall be installed to ensure that the current-carrying conductors from other sources of ac power and from an outside source are not connected to the vehicle circuit at the same time. Automatic transfer switches in such applications shall be listed for use in one of the following:
(1) Emergency systems
(2) Optional standby systems
Panel Statement: This revised language provides greater clarity and meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-127 Log #506 NEC-P19 **Final Action: Reject**
(551.40(C))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "circuit" and "interrupter" in three places.
Substantiation: The addition of the hyphen will provide consistency with the title of 551.40 and throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: The words are not hyphenated in the definition in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-128 Log #1370 NEC-P19 **Final Action: Reject**
(551.41)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(C)(1) ~~Adjacent to a bathroom lavatory~~ Within 1.8 m (6 ft) of the outside edge of a sink.
(2) Where the receptacles are installed to serve kitchen countertop surfaces ~~and are within 1.8 m (6 ft) of any lavatory or sink~~.
Exception No. 1: Receptacles installed for appliances in dedicated spaces such as dishwashers, food waste disposers, trash compactors, refrigerators, and freezers. ~~And laundry equipment.~~
(D) Face-up Postion. A receptacle or snap switch shall not be installed flush in any kitchen countertop. ~~Or similar horizontal surface in the living area.~~
Substantiation: "Adjacent" and "similar" are subjective and terms to be avoided per the Style Manual. The 6 ft dimension is used in 210.8. If 210.8(7) requires GFCI protection for laundry area receptacles within 6 ft of a sink, for safety reasons, why are those reasons not applicable for recreational vehicles? GFCI protection for countertop receptacles should not be limited to within 6 ft of a sink; if safety requires the provision of 210.8(A)(6) why not for recreational vehicles? There may be grounded surfaces farther than 6 ft from a sink such as dishwashers, trash compactors. Some horizontal surfaces may be suitable for a receptacle such as a window seat or built-in desk top.
Panel Meeting Action: Reject
Panel Statement: The term "adjacent" is currently used in other portions of 551.41. While the requirements of 551.41(C) and 210 are different, RVs are different in size and usage than dwellings and therefore the existing criteria spelled out in (C)(1) and (2) and Exception No. 1 are needed. In addition, no substantiation was provided for changes in (D).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-117 Log #4759 NEC-P19 **Final Action: Reject**
(551.41(A))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 2-274.
This action will be considered by the panel as a public comment.
Submitter: D. Jerry Flaherty, East Islip, NY
Recommendation: Add revised text to read as follows:
551.41 Receptacle Outlets Required.
(A) Spacing. Receptacle outlets shall be installed at wall spaces 600 mm (2 ft) wide or more so that no point along the floor line is more than 1.8 m (6 ft), measured horizontally, from an outlet in that space.
Exception No. 1: Bath and ~~hall~~ hallway areas.
Substantiation: No definition for "hall" in NEC.
Webster dictionary has several definitions that are not in line with this section of NEC.
1) "Entrance space into which the main door to house" — new large homes have "halls" that are quite large, fully furnished with tables (table lamps) and seating. By definition and code these "halls" need only one receptacle. I have inspected many with extension cords which are a fire hazard.
210.52(H) Hallways.
2) Webster definition - "A communally owned building where public business is transacted or where people meet etc. "which is in line with other areas of the NEC (assembles halls, dance halls, etc.) but not with this section of the code.
3) The end of habitable rooms with two or more doors at one end meets the definition of a hall and again usually only one receptacle is provided.
"Hallway" is not defined in the NEC and Webster defines as a passage connecting two or more rooms which is closer to what the NEC is referring too, but not quite.
See Proposal for a definition of a Hallway.
Hallways. A walled corridor used exclusively to connect two or more rooms.
Panel Meeting Action: Reject
Panel Statement: The term "hall" is used correctly in the noted section. Changing the term to "hallway" does nothing to improve the code. It is noted that the proposed definition of "hallway" was rejected by CMP-1 (Proposal 1-89) prior to balloting.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-129 Log #1883 NEC-P19 **Final Action: Reject**
(551.41(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (A) and (B) and Exception No. 1 and substitute: Receptacle outlets shall be provided in accordance with 210.52(A), (C), and (D).
Revise: Exception: Wall space occupied by ~~kitchen~~ cabinets, ~~wardrobe~~ cabinets, built in furniture <u>or appurtenances that occupy the wall space from floor level to a height of 1.5 m 5 ft. In such cases a floor receptacle(s) in accordance with 210.52(A)(3) shall be provided.</u>
Substantiation: A reference to 210.52 provides more comprehensive provisions which are not fully covered in this section, and those provisions apply unless specifically modified. Wall spaces behind doors are not excluded in Article 210 and many times provides the easiest access to a receptacle due to furniture layout, likewise tdo hall receptacles. Cabinets should not be limited to wardrobe or kitchen cabinets. Excluded wall space should only apply where cabinets, built-in furniture etc., do not leave an available wall space. In those cases, floor receptacles should be required so as not to leave possible entire walls without a receptacle.
Panel Meeting Action: Reject
Panel Statement: While the requirements of 551.41(A) and (B) and 210.52(A)(3) are different, RVs are different in size and space usage than dwellings and the differences are needed. This section has not been an issue for the RV industry in the past and usability of the NEC by the industry by having the RV requirements maintained within Article 551 is far more important than using references where information could be overlooked.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-130 Log #1372 NEC-P19 **Final Action: Reject**
(551.41(A) Exception No. 2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete:
"behind doors that open fully against a wall surface."
Substantiation: In many instances, this location is the one most easily accessible and not likely obstructed by furniture or other appurtenances. This space is not exempted in Article 210; why should it be in this article?
Panel Meeting Action: Reject
Panel Statement: Chapter 5 modifies Chapters 1 through 4 as permitted by Section 90.3. No technical substantiation has been provided to support deleting the noted provision. Consideration relative to size constraints is needed for this specialized industry.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-131 Log #1960 NEC-P19 **Final Action: Reject**
(551.41(B)(4) (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: (4) In bathrooms, within 900 mm (3 ft) of the outside edge of each bathroom lavatory at this location.
Substantiation: A receptacle outlet should be required to avoid the use of extension cords, and be GFCI protected as required in (C), but does not require the receptacle.
Panel Meeting Action: Reject
Panel Statement: While most people would agree a receptacle is desired in a bathroom, many RV baths are a combination use-space where there is a lavatory, shower, and toilet in a single compartment. Manufacturers typically provide a GFCI receptacle outside the bath area when there is no receptacle provided within the bathroom itself.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-132 Log #1327 NEC-P19 **Final Action: Reject**
(551.41(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete present (1), (2), and (3) and Exception No. 1 for (2) and substitute:
(1) Within 1.8 m (6 ft) of a sink, tub, or shower.
(2) Where the receptacles are installed to serve kitchen countertop surfaces.
Exception: Receptacles installed in dedicated spaces solely for specific appliances such as dishwashers, disposals, refrigerators, freezers, and trash compactors.
Substantiation: "Adjacent" is subjective and a term to be avoided per the Style Manual. In (3), "area" is not defined, a compartment with only a toilet is not likely to have a receptacle installed. If the requirements of 210.8(A)(6) and (7) (countertops and laundry areas) are necessary for safety, which do not exempt countertops regardless of sinks, and laundry receptacles, they should also apply to this article. Present Exception No. 1 only requires the appliances to be in dedicated spaces, not the receptacles which could be a countertop receptacle.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-128.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-133 Log #1961 NEC-P19 **Final Action: Reject**
(551.41(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "where provided"...
Substantiation: Edit. Superfluous; if receptacles are not provided, the requirement is of no effect.
Panel Meeting Action: Reject
Panel Statement: Deletion of "where provided" could mandate the use of receptacles where they are currently optional. An example would be an exterior receptacle as stated in 551.41(C)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-134 Log #2442 NEC-P19 **Final Action: Reject**
(551.41(C))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
(C) ~~Ground-Fault Circuit-Interrupter~~ <u>Power Safe Protector</u> Protection. Where provided, each 125-volt, single-phase, 15- or 20-ampere receptacle outlet shall have ~~ground-fault circuit-interrupter~~ <u>power safe protector</u> protection for personnel in the following locations:
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.

3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: There are currently no testing standards for this product. Any testing standards noted in the substantiation are for receptacles in general. The testing reports provided are based on performance results for a specific product.

This proposal is brand-specific. The NEC cannot require a specific brand in any article in the code.

Installation of this device is not currently prohibited by the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-135 Log #826 NEC-P19 **Final Action: Reject**
(551.43(C))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete and substitute RECEPTACLE RATINGS

Receptacle ratings shall comply with 210.21(B)(1) or (B)(3) as applicable.

Substantiation: Edit. Section 210.21 is more comprehensive and covers other ratings.

Panel Meeting Action: Reject

Panel Statement: The current language is clear and is specific to the RV industry. Usability of the NEC by the industry by having the RV requirements maintained within Article 551 is far more important than using references where information could be overlooked.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-136 Log #825 NEC-P19 **Final Action: Reject**
(551.45)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.

This action will be considered by the panel as a public comment.

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise DISTRIBUTION EQUIPMENT ~~PANELBOARD~~

(A) A listed ~~and appropriately rated~~ distribution panelboard or other listed equipment ~~listed for the purpose~~ identified for the use and rated not less than the power supply assembly shall be used.

In (B), the exception to (B) and (C) change “panelboard” to “distribution equipment”.

Substantiation: The text relates to equipment which may not be a “panelboard”. There may only be one circuit as covered in 551.42.

Panel Meeting Action: Reject

Panel Statement: 551.45(A) already includes ‘listed’ and ‘or other equipment’ so there is no need to add the proposed language. No substantiation for the deletion of the phrase ‘listed for the purpose’ has been provided. Power supply assemblies are addressed by 551.46. See also the panel statement on Proposal 19.112.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-137 Log #572 NEC-P19 **Final Action: Reject**
(551.45(C) Exception (New))

Submitter: Kent Perkins, Recreation Vehicle Industry Association

Recommendation: Add a new Exception to read as follows:

Exception: Recreational vehicle distribution panelboards shall be exempted from the hold down requirements for back fed circuit breakers in 408.36(D).

Substantiation: 408.36(D) addresses the use of a hold down bracket in a distribution panelboard for circuit breakers that are “back fed.” This means the 120 VAC power is provided to the “bottom” of the breaker itself, and electricity flows through to the top of the breaker to energize the busbar where all the other circuit breakers receive their power. The NEC is requiring this hold down bracket to prevent accidental electrocution or shock, because with a back-fed breaker, the breaker remains “hot” even when it is removed from the panelboard. If the pressure connection of the breaker to its bus was not held in place, it could inadvertently become loose and fall away from the bus. Should it touch the unsuspecting service technician or assembler, while the 120 VAC is energized, someone could be hurt or killed.

RVs, unlike dwellings, are cord connected, and, therefore, the power to the distribution panelboard can be easily disconnected. This is not true in most dwelling electrical systems. Since there is no reason for a service technician to ever work on a live distribution panelboard, this hold down requirement is unnecessary in RV distribution panelboards.

Panel Meeting Action: Reject

Panel Statement: Insufficient technical substantiation has been provided to counter the requirements in 408.36(D).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-138 Log #822 NEC-P19 **Final Action: Reject**
(551.46(A))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise:

(1) Where a separable power supply assembly ~~consisting of a cord with a female connector and molded attachment plug cap~~ is provided, the vehicle shall... (remainder unchanged).

Delete (2) and substitute:

PERMANENTLY CONNECTED. Where a recreational vehicle is supplied by a fixed-in-place (permanent type) wiring method the supply conductors shall terminate directly on the supply terminals of the distribution equipment or to conductors in a junction box that are directly connected to supply terminals of the distribution equipment. The circuit from the recreational vehicle site supply equipment to the recreational vehicle distribution equipment shall contain insulated conductors, including an equipment grounding conductor, and have an ampacity not less than the ampere rating of the distribution equipment.

Substantiation: The present provisions are somewhat confusing; “permanently connected” implies a fixed “hard wired” type supply system and not a flexible cord power supply assembly, and since flexible cord power supply assemblies are to connect to a flanged surface inlet per 551.46(A)(1) the present provisions don’t correlate with that section. The proposed deletion in (1) is superfluous; the definition of power supply assembly includes cord connector and plug cap (not necessarily molded type).

Panel Meeting Action: Reject

Panel Statement: The current language is not confusing to the users. In an effort for the submitter to “clarify” the requirements, many needed criteria are being deleted. Examples include the strain relief, the molded attachment plug cap, and permanent provision for protection cord in transit.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-139 Log #573 NEC-P19 **Final Action: Accept in Principle**
(551.46(A)(2))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.

This action will be considered by the panel as a public comment.

Submitter: Kent Perkins, Recreation Vehicle Industry Association

Recommendation: Add new last sentence to the end of the paragraph as follows:

The cord shall be protected from physical damage.

Substantiation: The current language only requires protection where the cord passes through walls or floors. This language makes it clear that the power cord must be protected from any type of physical damage that could occur during cord removal, storage, etc.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(2) Permanently Connected. Each power-supply assembly shall be connected directly to the terminals of the distribution panelboard or conductors within a junction box and provided with means to prevent strain from being transmitted to the terminals. The ampacity of the conductors between each junction box and the terminals of each distribution panelboard shall be at least equal to the ampacity of the power-supply cord. The supply end of the assembly shall be equipped with an attachment plug of the type described in 551.46(C). Where the cord passes through the walls or floors, it shall be protected by means of conduit and bushings or equivalent. The cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the vehicle is in transit, or while the cord assembly is being stored or removed for use.

Panel Statement: The panel action meets the submitter’s intent.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-140 Log #823 NEC-P19 **Final Action: Reject**
(551.46(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete texts (except fine print notes) and substitute:
(C) SEPARABLE POWER SUPPLY ASSEMBLIES
(1) UNITS WITH ONE 15-AMPERE BRANCH CIRCUIT
A separate power supply assembly supplying a recreational unit having only a 15-ampere branch circuit shall consist of the following:
(1) An extra-hard usage flexible cord with an ampacity not less than 15 amperes containing an equipment grounding conductor identified for use in wet locations and sunlight resistance
(2) Equipped with a firmly attached cord cap (plug) and cord connector body rated 15 amperes 125 volts that shall be 2-pole 3-wire grounding type conforming to the configuration shown in Figure 551.46(C)(2) UNITS WITH ONE 20-AMPERE BRANCH CIRCUIT
A separable power supply assembly supplying a recreational vehicle having only a 20-ampere branch circuit shall consist of the following:
(1) An extra-hard usage type of flexible cord with an ampacity not less than 20 amperes containing an equipment grounding conductor, identified for use in wet locations and sunlight resistance
(2) Equipped with a firmly attached cord cap (plug) and cord connector body rated 20 amperes 125 volts conforming to the configuration shown in Figure 551.46 (C)(3) UNITS WITH TWO TO FIVE 15 OR 20 AMPERE BRANCH CIRCUITS
A separable power supply assembly supplying a recreational vehicle with two to five 15-or 20 ampere branch circuits shall consist of the following:
(1) An extra-hard usage flexible cord with an ampacity not less than 30 amperes containing an equipment grounding conductor.
(2) Equipped with a firmly attached cord cap (plug) and cord connector rated 30 amperes 125 volts, conforming to the configuration shown in Figure 551.46(C)(4) UNITS WITH 50 AMPERE POWER SUPPLY ASSEMBLY
A separable power supply assembly rated 50 amperes as required by 551.42(D) shall consist of the following:
(1) An extra-hard usage type flexible cord or cable with an ampacity not less than 50 amperes, containing an equipment grounding conductor and identified for use in wet locations and sunlight resistance
(2) Equipped with a firmly attached cord cap (plug) and cord connector body rated 50 amperes 125/250 volts, conforming to the configuration shown in Figure 551.46(C).
Substantiation: Proposal is largely editorial. Provisions should clearly apply to separable power supply assemblies since fixed (permanent) wiring methods are not prohibited. Proposal provides specifics for cords and includes cord connector bodies that appear to be necessary by 551.46 (A)(1).
Panel Meeting Action: Reject
Panel Statement: The panel is unable to decipher what the submitter intends to revise. The proposal is more than editorial. Additionally, the submitter is confused regarding the meaning of a cord that is permanently connected or separable. The industry clearly understands the requirements, and further clarification is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-141 Log #2710 NEC-P19 **Final Action: Reject**
(551.46(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (C) ~~ATTACHMENT PLUGS~~ POWER SUPPLY ASSEMBLY in (1), (2) and (3) Change "an attachment plug" to "power supply assembly".
Substantiation: Edit. The definition of power supply assembly is inclusive of more than attachment plugs; (C)(4) uses the phrase "power supply assembly".
Panel Meeting Action: Reject
Panel Statement: The requirement addresses the attachment plug, not the power supply assembly. The power supply assembly is addressed in Article 551.44.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-142 Log #824 NEC-P19 **Final Action: Reject**
(Figure 551.46(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add "cord connectors" after "receptacles" and "flanged surface inlets" after "caps".
Substantiation: Edit. These devices should be included.
Panel Meeting Action: Reject
Panel Statement: The submitter provides no technical justification for the addition of "cord connector" or "flanged surface inlets."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-142a Log #CP1900 NEC-P19 **Final Action: Accept**
(551.47)

Submitter: Code-Making Panel 19,
Recommendation: Revise as follows:
(L) ~~Metal~~ Receptacle Faceplates. Metal faceplates shall comply with Section 406.5 (A). ~~be of ferrous metal not less than 0.76 mm (0.030 in.) in thickness or of nonferrous metal not less than 1.0 mm (0.040 in.) in thickness.~~ Nonmetallic faceplates shall ~~be listed~~ comply with Section 406.5(C).
Substantiation: The title in 551.47(L) only addresses metal faceplates and contains the same requirements as for metal receptacle faceplates in 406.5(A). The panel concluded that it is simpler to refer to the appropriate requirement in 406.5 and also include the reference to requirements for nonmetallic receptacle faceplates. See panel action on Proposal 19-150.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-142b Log #CP1903 NEC-P19 **Final Action: Accept**
(551.47)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 19,
Recommendation: Revise as follows:
(I) Cable Supports. Where connected with cable connectors or clamps, cables shall be supported within 300 mm (12 in.) of outlet boxes, distribution panelboards, and splice boxes on appliances. Supports shall be provided at least every 1.4 m (4½ ft) at other places.
Substantiation: The present language does not technically permit closer support intervals.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-143 Log #821 NEC-P19 **Final Action: Reject**
(551.47(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already more adequately covered by 314.20 which also covers noncombustible material.
Panel Meeting Action: Reject
Panel Statement: Section 551.47(D) modifies Section 314.20.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-144 Log #1833 NEC-P19 **Final Action: Reject**
(551.47(F) and (G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of (F): Raceways and coverings of cables ~~sheaths~~ shall be continuous between termination points. ~~boxes and other enclosures.~~
Delete text of (G) and substitute: Cables and raceways installed through framing members shall comply with 300.4(A) through (E).
Substantiation: Edit. All cables do not have "sheaths". Present (G) is more adequately covered in 300.4 which includes raceways and metal framing members.
Panel Meeting Action: Reject
Panel Statement: The current language in (F) is clear and the requirements within (G) are specific to the RV industry. Usability of the NEC by the industry by having the RV requirements maintained within Article 551 is far more important than using references where information could be overlooked.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-145 Log #820 NEC-P19 **Final Action: Reject**
(551.47(G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by 300.4 which applies unless amended.
Panel Meeting Action: Reject
Panel Statement: The current language is clear and specific to a specialized industry. Usability of the NEC by including the specific reference or requirement within this article is far more important than not using references where information could be overlooked.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-146 Log #819 NEC-P19 **Final Action: Reject**
(551.47(I))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or substitute:
Cables and raceways shall be securely supported and fastened in place in accordance with the applicable raceway or cable article.
Substantiation: Edit. Some cables such as Type MI may have different support requirements which should be acceptable. Support requirements for cables are covered in the respective cable articles, as are raceways which are not noted.
Panel Meeting Action: Reject
Panel Statement: While there are various cable support criteria depending on the type of cable being used, the existing requirement within Article 551.47(I) is set at 4 1/2 ft. There is no known cable that requires support less that 4 1/2 ft. The NMS cable is the most common cable used within the RV industry, and 4 1/2 feet is identified as the acceptable support dimension in Article 334.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-147 Log #2720 NEC-P19 **Final Action: Accept in Principle**
(551.47(I))

(551.47(L))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Sections 404.9(C) and 406.5(C) cover faceplates and do not require listing.
Panel Meeting Action: Accept in Part
Accept the deletion of the last sentence in Section 551.47(L) as this is covered by Section 551.40(B). Reject the remainder of the proposal.
Panel Statement: See panel statement on Proposal 19-145.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-151 Log #878 NEC-P19 **Final Action: Reject**
(551.47(P)(1)(a))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
That portion of a branch circuit that is installed in an expandable unit shall be connected to the portion of the branch circuit in the main body of the vehicle by means of a grounding type attachment plug and flexible cord ~~listed~~ identified for hard usage or extra-hard usage and the installation. The cord ~~and its connections shall comply with all provisions of article 400 and~~ shall be considered as a permitted use under 400.7 (remainder unchanged).
Substantiation: The attachment plug should be a grounding type. Extra-hard usage cords should be permitted; all cords should be identified as suitable for the use. Cords and connectors are already required to comply with applicable provisions of Article 400 and other articles.
Panel Meeting Action: Reject
Panel Statement: The proposal is editorial and provides no additional clarity to the requirements. The requirement for a grounding type attachment plug is covered by reference to Article 400. Acceptance of extra hard usage cord is implied by the requirement for hard usage cord. No substantiation is given to reduce the requirement for "listed" cord.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-152 Log #894 NEC-P19 **Final Action: Reject**
(551.47(P)(1)(a))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part of first sentence:
...by means of ~~an~~ a grounding type attachment plug and a flexible cord ~~listed~~ identified for extra-hard usage or hard usage and the application. The cord and its connections ~~shall comply with all provisions of Article 400 and~~ shall be considered a permitted use under 400.7.
Substantiation: Cords are not required to be listed by Article 400. Extra hard usage types should be permitted and cords should be identified for the application. Provisions of Article 400 already apply unless modified.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-151.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-153 Log #3927d NEC-P19 **Final Action: Accept in Principle in Part**
(551.47(P)(2) and 551.80(B))

Submitter: Goran Haag, Champion Fiberglass, Inc.
Recommendation: Add new text to read as follows:
Everywhere Schedule 80 PVC is mentioned, "Type RTRC marked with the suffix -XW" should also be included.
Substantiation: For the NEC 2008, Type RTRC marked with the suffix –XW and Schedule 80 PVC were added as sufficient for Class I Division 2 installations. The Type RTRC marked with the suffix –XW were "forgotten" at some places in the NEC, needs to be corrected.
Panel Meeting Action: Accept in Principle in Part
1. Accept the reference to RTRC by revising the second paragraph of 551.47(P)(2)(e) as follows:
Where subject to physical damage, the flexible cord shall be protected with RMC, IMC, Schedule 80 PVC, reinforced thermosetting resin conduit (RTRC) listed for exposure to physical damage, or other approved means and shall extend at least 150 mm (6 in.) above the floor. A means shall be provided to secure the flexible cord where it enters the recreational vehicle.
2. Accept the reference to RTRC by revising 551.80(B) as follows:
(B) Protection Against Physical Damage. Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, ~~or~~ Schedule 80 PVC conduit, or reinforced thermosetting resin conduit (RTRC) listed for exposure to physical damage. All such protection shall extend at least 450 mm (18 in.) into the trench from finished grade.
3. Reject the proposed text "marked with the suffix -XW."
Panel Statement: The addition of the references to RTRC as shown in the panel action meets the submitter's intent.
The addition of "marked with the suffix -XW" is rejected because it is not included in Article 355, but the submitter's intent is addressed by the requirement "listed for exposure to physical damage."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-154 Log #574 NEC-P19 **Final Action: Accept in Part**
(551.47(R)(1))

Submitter: Kent Perkins, Recreation Vehicle Industry Association
Recommendation: Revise text as follows:
(1) Circuit conductors shall be appropriately sized in relation to the anticipated load as stated on the label required in (4) below. ~~and shall be protected by an overcurrent device in accordance with their ampacities. Where the generator provides overcurrent protection for the conductors, additional overcurrent protection is not required.~~
Substantiation: The words at the end of the first sentence are unnecessary. If a generator prep is provided in accordance with (2), the conductor will terminate in junction boxes at either end of the conductor run. With no connection to the electrical system provided, no current can run through the conductor and overcurrent protection would not be needed. Adding the requirement that only RV listed gensets be used ensures overcurrent protection when the genset is installed as protection for the output of the genset is a listing requirement for any RV generator set. The last sentence makes no sense since this paragraph is addressing a generator prep not a generator installation and no generator is present.
Panel Meeting Action: Accept in Part
Revise text to read as follows:
(1) Circuit conductors shall be appropriately sized in relation to the anticipated load as stated on the label required in (4) below and shall be protected by an overcurrent device in accordance with their ampacities. ~~Where the generator provides overcurrent protection for the conductors, additional overcurrent protection is not required.~~
Panel Statement: The text at the end of the first sentence is being retained to maintain the requirement for overcurrent protection of the circuit conductors. If the proposal were accepted as submitted, circuit conductors from the generator could be installed with no overcurrent protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-155 Log #889 NEC-P19 **Final Action: Reject**
(551.51(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
<u>A switch shall not be installed in a face up position in any countertop within the living area.</u>
Substantiation: The provisions of 551.41(D) should also apply to switches.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation was provided to address switches. The substantiation only addresses receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
MICHAELIS, R.: Any switch installed face up on a counter top is an accident just waiting to happen. While it is less likely to have liquids or other contaminants enter the switch it is very likely that the switch is accidentally turned on, in the case of a disposal or other equipment this could be hazardous.

19-156 Log #893 NEC-P19 **Final Action: Reject**
(551.53(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (A) and (B).
Revise (C): OUTDOOR <u>EQUIPMENT.</u> ~~OUTLETS, LUMINAIRES, AIR COOLING EQUIPMENT AND SO ON~~ ~~Outdoor~~ <u>L</u>uminaires and other <u>utilization</u> equipment <u>installed outdoors</u> shall be ~~listed~~ <u>identified for the location</u>.
Substantiation: All equipment installed outdoors may not be specifically listed for "outdoor" use such as straps, hangers, connectors listed for wet locations, weatherproof boxes and covers, etc.
Panel Meeting Action: Reject
Panel Statement: No substantiation is provided to delete (A) or (B). Section 551.53(C) is consistent with Section 314.15 and extends that same degree of protection for "other equipment" as it pertains to this Section. Straps and hangers are not included in the requirements of this section or in Section 314.15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-157 Log #1835 NEC-P19 **Final Action: Reject**
(551.53(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Outdoor luminaires, lampholders and other electrical equipment shall be ~~listed~~ <u>identified</u> for outdoor use.
Substantiation: Edit. Some equipment such as straps, supports, conductors, etc., may not be specifically listed for "outdoor" use. Luminaires and lampholders and other equipment required to be listed are evaluated for outdoor use in the listing.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add clarity or improve usability of the code. Insufficient technical substantiation has been provided to support the proposed revisions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-158 Log #1834 NEC-P19 **Final Action: Accept in Part**
(551.54(B))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: The distribution panelboard <u>or other identified distribution equipment</u> shall have a grounding bus with ~~sufficient~~ terminals for all grounding <u>and bonding</u> terminals. ~~or other approved means.~~
Substantiation: "Sufficient" is subjective and a term to be avoided per the Style Manual. A grounding bus provides the most direct low impedence connection to the service and should also be the terminal connection for bonding conductors. A single circuit breaker or fused switch for a one circuit installation may not be considered a "panelboard".
Panel Meeting Action: Accept in Part
Accept the deletion of "sufficient"; reject the remaining proposed revisions.
Panel Statement: 551.45(A) already includes "or other equipment" so there is no need to add the proposed language. The terminals within the panelboard are for grounding; therefore the addition of "bonding" may create confusion.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-159 Log #575 NEC-P19 **Final Action: Reject**
(551.54(C))

Submitter: Kent Perkins, Recreation Vehicle Industry Association
Recommendation: Revise the title and first and second sentences as follows:
(C) Insulated Grounded Conductor <u>(Neutral)</u>. The grounded circuit conductor <u>(neutral)</u> shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded circuit conductor <u>(neutral)</u> terminals in the distribution...
Substantiation: This provides clarity. Even though the term "grounded circuit conductor" is now commonly used for the neutral or white wire, this is confusing since in RVs this conductor is not "grounded" as it is in residential applications.
Panel Meeting Action: Reject
Panel Statement: The term "grounded conductor" replaced "neutral" in many locations in the 2008 NEC. The panel does not agree with the last sentence of the submitter's substantiation. The grounded conductor is bonded to ground as in residential applications.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HOPKINS, B.: Please change your vote to "accept"
I am requesting that you change your vote to "accept," placing the term "(neutral)" into the text following "Insulated grounded conductor" or "grounded conductor" in 3 places.
Since the neutral is isolated or insulated from ground throughout the RV, calling the white or neutral conductor "a grounded conductor" is correct. However, in the terminology used within the RV industry, which has been based on previous language in the NEC, this wire has commonly been referred to as the "neutral" inside the RV circuits. The reason is that this conductor does not get grounded until the vehicle is stationary and connected in the park (pedestal or at the park's service entry).
RVIA is directly involved in developing training and conducting training clinics for RV service technicians. As many new technicians have prior trade experience, and have a tendency to move from employer to employer, many have worked in the building trades and are familiar with grounded conductors. Teaching that this grounded conductor is a "neutral" and, in RVs, cannot be commingled with circuit ground wires always leads to extended discussions. Current training materials on this subject are attached.

Placing the term "(neutral)" in this paragraph where requested helps drive home the point that the white wire is to be insulated from the equipment enclosures and other grounded parts. It also validates that the "neutral training" that has been provided over the years, is still anchored in the NEC.

It should also be understood that there exists unlisted aftermarket products. On rare occasion, we see an adaptor plug or cord that has manufactured-in reverse polarity. In fact, even cutting the third pin off the permanently required power supply cord, or using an improper extension cord could lead to reverse polarity. In the event there is a short while reverse polarity exists, a "hot skin" on a metal-sided RV could lead to a hazardous electrical condition causing injury or death. One recent example of this was a death in PA where reversed polarity was created by the use of an orange extension cord with no third pin, to energize the RV. In addition, it was later learned the neutral wire on the exterior recept wire had worked loose and was touching the RV's exterior covering. Unknowingly, the owner bent over to pick up some trash, and backed against a fence while his hand was on the hood of the RV.

To continue to support the existing RV industry training and continue to support the need for an isolated neutral in an RV, please change your vote to "accept."

See the information I have provided with this negative vote.

Note: Supporting Material is available at NFPA Headquarters.

19-160 Log #1898 NEC-P19 **Final Action: Reject**
(551.55)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: These provisions are already covered by Article 250 and Part V of Article 410. The last sentence of (C)(3) is unclear; it appears to permit luminaire attachment screws as a grounding conductor attachment while 250.148(C) requires a screw used for grounding not be used for other purposes. (C)(3) indicates OTHER than a mounting or cover screw be used. 314.40(D) applies unless modified.
Panel Meeting Action: Reject
Panel Statement: RVs are different than dwellings, and the differences in the requirements are needed. This section has not been an issue for the RV industry in the past. Maximizing usability of the NEC by the RV industry by having the RV requirements maintained within Article 551 is far more important than using references in a manner where important information is likely to be overlooked.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-161 Log #1742 NEC-P19 **Final Action: Reject**
(551.55(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "...or other identified distribution equipment" after "panelboard".
Substantiation: A single circuit breaker or switch/fuse (other approved distribution equipment) for a one-circuit installation may not be deemed a "panelboard".
Panel Meeting Action: Reject
Panel Statement: 551.45(A) already includes "or other equipment" so there is no need to add the proposed language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-162 Log #2725 NEC-P19 **Final Action: Reject**
(551.55(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:

Grounding of electrical equipment shall be in accordance with part VII of Article 250.
Substantiation: Edit. Since Article 250 applies unless amended a simple reference to more comprehensive provisions is sufficient.
Panel Meeting Action: Reject
Panel Statement: Refer to panel statement on Proposal 19-145.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-163 Log #1201 NEC-P19 **Final Action: Reject**
(551.55(C)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

The equipment grounding conductor ~~in nonmetallic sheathed cable~~ shall be permitted to be secured under a <u>machine</u> screw threaded into the luminaire canopy <u>with at least two threads engaged</u>, <u>or secured with a machine screw and nut</u>, other than a mounting screw or cover screw, or attached to a listed grounding means (plate) in a nonmetallic ~~outlet~~ box. ~~for grounding~~. ~~Grounding means shall also be permitted for luminaire attachment screws.~~

Alternatively delete this section.
Substantiation: An EGC in nonmetallic raceways should be included. Machine screws with at least two threads engaged or secured with a nut should be specified. Other sections require a grounding screw to be used for no other purpose. This section could be deleted since fixtures are required to be listed by 410.6 and 551.53(B) which will provide a grounding means. Field alterations such as drilling and screw attachments may void listing since these may not have been evaluated in the listing process.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-160.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-164 Log #1190 NEC-P19 **Final Action: Accept in Part**
(551.55(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

A connection between the one or more <u>equipment</u> grounding conductors brought into a nonmetallic ~~outlet~~ box <u>or enclosure</u> shall be so arranged that a connection <u>of the equipment grounding conductor</u> can be made to any fitting or devise in <u>or supplied from</u> the box <u>or enclosure</u> that ~~requires grounding~~ <u>is to be grounded</u>.
Substantiation: Edit. The provision should include enclosures that are not "boxes" or "outlets", and fittings or devices that are supplied from the box or enclosure and grounded by choice (not required).
Panel Meeting Action: Accept in Part

Accept the references to equipment grounding conductors, and reject the remaining proposed revisions as follows:

(D) Grounding Connection in Nonmetallic Box. A connection between the one or more <u>equipment</u> grounding conductors brought into a nonmetallic outlet box shall be so arranged that a connection <u>of the equipment grounding conductor</u> can be made to any fitting or device in that box that requires grounding.
Panel Statement: No technical substantiation has been provided for the rejected proposed revisions. The heading of the subsection addresses only nonmetallic boxes. The other editorial proposals add no additional clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-165 Log #1959 NEC-P19 **Final Action: Reject**
(551.55(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: ~~A connection between the~~ <u>O</u>ne or more grounding conductors brought into a nonmetallic box <u>or enclosure</u> shall be so arranged that a connection can be made to any fitting or device in that box <u>or enclosure or supplied from that box or enclosure</u> that ~~requires grounding~~ <u>is to be grounded</u>.
Substantiation: Edit. There cannot be a connection between grounding conductors if there is only one. Where grounding is done by choice and not required, present literal wording exempts the rule.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-164.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-166 Log #2724 NEC-P19 **Final Action: Reject**
(551.55(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by 250.148(B) and (D) which apply unless amended.
Panel Meeting Action: Reject
Panel Statement: Refer to panel statement on Proposal 19-145.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-167 Log #1211 NEC-P19 **Final Action: Accept in Part**
(551.56)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
(A): All exposed noncurrent-carrying metal parts that ~~may~~ are likely to become energized shall be effectively bonded to the grounding terminal(s) in the main disconnecting means ~~or enclosure of the distribution panelboard~~.
Delete (B) and substitute: A bonding conductor shall be connected between the grounding terminal(s) in the main disconnecting means and an accessible terminal on the chassis. The bonding conductor shall be solid copper, insulated or bare, and sized in accordance with Table 250.122 based on the rating of the main overcurrent device but not smaller than 8 AWG.
Exception: Any recreational vehicle that employs a unitized metal chassis frame construction to which the distribution panelboard main disconnecting means is securely fastened with a threaded bolt connection or bolt and nut with lock washer or by welding shall be considered to be bonded.
Revise (C): BONDING CONDUCT~~OR REQUIREMENTS~~ TERMINALS. ~~Grounding~~ Bonding terminals shall be of the solderless type listed as pressure terminals ~~recognized~~ identified for the wire size and type material used. ~~The bonding conductor shall be solid or stranded, insulated or bare and shall be minimum 8 AWG copper or equal~~.
Substantiation: "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections. There may not be a "panelboard" where an individual switch or circuit breaker is used. The bonding conductor should be solid and copper to minimize corrosion. "Equal" is not defined as to what size or material is equal. Bonding terminals should be identified for the wire size and material.
Panel Meeting Action: Accept in Part
The panel accepts deleting "may" and substituting "are likely to." The remainder of the text remains unchanged.
Panel Statement: There is neither sufficient evidence nor substantiation for the remainder of the changes proposed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-168 Log #2723 NEC-P19 **Final Action: Reject**
(551.56(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
HEATING and AIR CONDITIONING METAL AIR DUCT BONDING
Heating and air conditioning (including evaporative coolers) metal circulating air ducts shall be effectively bonded to the grounded metal enclosures of the equipment.
Substantiation: Heating may be done with a heat pump. Evaporative coolers should be noted as they may not be considered as air conditioners.
Panel Meeting Action: Reject
Panel Statement: The present wording is inclusive of any metal ducting system that may be installed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-169 Log #576 NEC-P19 **Final Action: Accept**
(551.60)

Submitter: Kent Perkins, Recreation Vehicle Industry Association
Recommendation: Add new sentence to end of the first paragraph to read as follows:
The dielectric test must be performed in accordance with the test equipment manufacturer's written instructions.
Substantiation: This ensures the test procedure is performed properly relative to each specific type or model of dielectric test equipment.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-170 Log #2721 NEC-P19 **Final Action: Reject**
(551.60)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(1) An electrical continuity test and visual inspection to ~~ensure~~ verify that all metal parts are bonded and grounded as required.
Substantiation: Continuity tests can be visual and/or electrical, but don't necessarily "ensure" that parts are properly bonded unless fault currents are employed in testing tests should also check for grounding; ungrounded bonded parts do not protect against shock.
Panel Meeting Action: Reject
Panel Statement: A visual inspection is unnecessary. Electrical continuity can be verified using the appropriate test equipment. A visual inspection is unenforceable and impractical in many cases.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-171 Log #2443 NEC-P19 **Final Action: Reject**
(551.71)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
551.71 Type Receptacles Provided.
All 125-volt, single-phase, 15- and 20-ampere receptacles shall have listed ~~ground fault circuit-interrupter~~ power safe protector protection for personnel.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-134.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-172 Log #1321 NEC-P19 **Final Action: Reject**
(Table 551.73)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise heading:
DEMAND FACTORS for SITE FEEDERS and SERVICE ~~ENTRANCE~~ CONDUCTORS:
Substantiation: Edit. The FPN for the definition of service-entrance conductors, underground system indicates there may be no service-entrance conductors (service lateral). Based on definitions in Article 100 all service-entrance conductors are service conductors but all service conductors are not service-entrance conductors. The demand factors should also apply to service laterals.
Panel Meeting Action: Reject
Panel Statement: The proposal adds no clarity and does not improve usability of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-173 Log #273 NEC-P19 **Final Action: Accept**
(551.73(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “computed” to “calculated” in the second paragraph.
Substantiation: The term “calculated” more accurately describes the operation. It is not necessary to have a computer to do the calculations, they can also be done manually.
This is one of a series of proposals to provide consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-174 Log #390 NEC-P19 **Final Action: Reject**
(551.73(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change “per” to “for each” in four places.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The submitter’s substantiation is incorrect. The use of the word “per” in this application is appropriate. The proposed revision does not add clarity or improve usability. The NEC Style Manual does not prohibit the use of “per.”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-175 Log #1210 NEC-P19 **Final Action: Reject**
(551.73(B))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Change “panelboards” to “equipment”.
Substantiation: Secondary distribution may be provided by other than panelboards; e.g., individual switches or circuit breakers.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-112.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-176 Log #391 NEC-P19 **Final Action: Reject**
(551.73(C))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change “per” to “for each”.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-174.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-177 Log #2719 NEC-P19 **Final Action: Reject**
(551.73(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Revise last sentence:
The ~~neutral~~ grounded conductor shall have an ampacity not less than the ungrounded conductors.
Substantiation: Edit. A grounded conductor center tapped from a winding of a 4-wire delta transformer connection is not a neutral.
Panel Meeting Action: Reject
Panel Statement: The submitter’s substantiation is incorrect. The use of the term “neutral conductor” is appropriate in this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-178 Log #1209 NEC-P19 **Final Action: Reject**
(551.74)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Superfluous; Article 240 applies unless amended.
Panel Meeting Action: Reject
Panel Statement: Refer to panel statement on Proposal 19-145.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-179 Log #2722 NEC-P19 **Final Action: Reject**
(551.74)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Article 240 already applies unless amended.
Panel Meeting Action: Reject
Panel Statement: Refer to panel statement on Proposal 19-145.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-180 Log #1208 NEC-P19 **Final Action: Reject**
(551.77(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
~~A~~ An identified ~~disconnecting~~ switch(es) or circuit breaker(s) shall be provided in the site supply equipment for simultaneously disconnecting the ungrounded conductors ~~power supply~~ supplying each class of receptacles that are part of the ~~equipment~~ vehicle site supply equipment ~~for disconnecting the power supply to the recreational vehicle~~.
Substantiation: The disconnecting means should be identified for the use (rating, number of poles, weather proof, etc.) Power supply (park service, transformers, switchboards, etc. is not disconnected but conductors are.
Panel Meeting Action: Reject
Panel Statement: The switch or circuit breaker used is already required to be listed and used within the terms of its listing. No substantiation is given for adding the requirement for simultaneous disconnection of the ungrounded conductors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-181 Log #1900 NEC-P19 **Final Action: Reject**
(551.77(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows: A disconnecting switch or circuit breaker shall be provided in the site equipment for disconnecting the receptacle(s) supplying the power supply assembly ~~to the recreational vehicle~~.
Substantiation: Edit. Proposal is more specific. “Power supply” literally includes the site feeder and service while intent appears intended to apply to the receptacle(s).
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-180.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-182 Log #1206 NEC-P19 **Final Action: Reject**
(551.79)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered in Article 225 unless amended.
Panel Meeting Action: Reject
Panel Statement: Refer to panel statement on Proposal 19-145.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-183 Log #1899 NEC-P19 **Final Action: Reject**
(551.79)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. This is already essentially covered by 225.18 and 225.19. The requirement for a 3 ft. horizontal clearance is vague; it appears to apply to areas subject to vehicle movement as it literally requires horizontal clearance from roads and parking areas but appears intended to apply to clearances from buildings or structures.
The FPN is unnecessary as 225.60 and 225.61 apply unless amended.
Panel Meeting Action: Reject
Panel Statement: Refer to panel action and statement on Proposal 19-145. Section 551.79 provides additional requirements not located in Sections 225.18 and 225.19 for all areas subject to recreational vehicle movement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-184 Log #1045 NEC-P19 **Final Action: Reject**
(551.80(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Exposed direct-buried conductors and cables emerging from a trench or concrete or asphalt slab shall be protected by identified raceways or enclosures where likely to be exposed to physical damage. All such protection shall extend below finished grade not less than the required burial depth of the conductors or cables.
Substantiation: This provision should be limited to where conductors or cables are exposed and likely to be subject to physical damage, and cover such wiring embedded in concrete or asphalt slabs. Conductors and cables may emerge into a wall, a pad or floor mounted equipment. Or a lighting pole, and not require protection. Protection should extend to the minimum required depth since for example Table 300.5 indicates direct buried conductors under highways, roads, alleys, and parking lots require a minimum cover of 24 inches for protection.
Panel Meeting Action: Reject
Panel Statement: The submitter provides no technical substantiation for the proposed revisions. Current language is specific to methods used in RV campground construction and provides better usability than the proposed language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-185 Log #4731 NEC-P19 **Final Action: Accept**
(551.80(B))

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
551.80 Underground Service, Feeder, Branch-Circuit, and Recreational Vehicle Site Feeder-Circuit Conductors.
(A) General. All direct-burial conductors, including the equipment grounding conductor if of aluminum, shall be insulated and identified for the use. All conductors shall be continuous from equipment to equipment. All splices and taps shall be made in approved junction boxes or by use of material listed and identified for the purpose.
(B) Protection Against Physical Damage. Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid ~~nonmetallic~~ polyvinyl chloride conduit(PVC), nonmetallic underground conduit with conductors (NUCC), high density polyethylene conduit (HDPE), reinforced thermosetting resin conduit (RTRC), liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, or Schedule 80 PVC conduit. All such protection shall extend at least 450 mm (18 in.) into the trench from finished grade.
FPN: See 300.5 and Article 340 for conductors or Type UF cable used underground or in direct burial in earth.
Substantiation: This is an addition from the result of the 2008 NEC adding of new code articles for each of the specific nonmetallic raceways and the conditions for their intended use. Remove the reference of “nonmetallic” and add in each of the specific raceway types. Non-metallic conduit now has four different types of raceways and not all non-metallic raceway types would be acceptable in all locations.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 552 — PARK TRAILERS

19-186 Log #1380 NEC-P19 **Final Action: Reject**
(552.1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
The provisions of this article cover the ~~conductors~~ wiring and equipment installed within or on park trailers and accessory wiring and equipment associated with the park trailer.
Substantiation: Edit. This article covers wiring and equipment that is not within or on the park trailer; e.g., 552.43 and power supply receptacles.
Panel Meeting Action: Reject
Panel Statement: CMP-19 is not authorized to modify the scope of Article 552. The existing language is sufficiently inclusive.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-187 Log #3238 NEC-P19 **Final Action: Reject**
(552.1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
The provisions of this article cover the electrical conductors and equipment installed in or on park trailers and its power supply assembly.
Substantiation: Parts of power supply assemblies are not in or on the trailer. It is not clear which parts of Articles 550 and 551 also apply. If they were referenced by section many provisions in this article could be deleted.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-186.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-188 Log #2801 NEC-P19 **Final Action: Accept**
(552.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text
~~552.3 Other Articles.~~
~~Wherever the provisions of other articles and Article 552 differ, the provisions of Article 552 shall apply.~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 552.3 repeats the requirements previously expressed in 90.3 and serves no additional purpose. It should also be noted that other “Special” articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-189 Log #1348 NEC-P19 **Final Action: Reject**
(552.10(C)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or substitute:
CONNECTIONS. Conductors shall be connected in accordance with applicable provisions of 110.14.
Substantiation: Already covered by 110.14 which covers splices and other connections which this provision does not address; is this omission considered to revise 110.14?
Panel Meeting Action: Reject
Panel Statement: The reference to Article 110.14 in the substantiation is for general wiring methods. Article 552.10(C)(2) is for industry specific low voltage wiring methods.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 19-190 moved to follow 19-195 on page 747)

19-191 Log #1353 NEC-P19 **Final Action: Reject**
(552.20(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
Circuits ~~fed~~ supplied from ac transformers shall not supply dc appliances or equipment unless the current is rectified or the appliance or other equipment is identified for such use.
Substantiation: Either condition in the proposal should be acceptable. (See 552.20(B)).
Panel Meeting Action: Reject
Panel Statement: The proposal does not add clarity or improve usability of the code. Dual voltage fixtures, including luminaires or appliances, are already referenced in 552.20(D).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-192 Log #282 NEC-P19 **Final Action: Accept**
(552.20(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "formula" to "percentages" in the second paragraph, second sentence.
Substantiation: There is no formula or equation, the information provides the percentages to be applied when calculating the load.
This is one of a series of proposals to provide consistent terminology through the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-193 Log #1347 NEC-P19 **Final Action: Reject**
(552.40(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Electrical materials, devices, appliances, fittings, and other electrical material intended for use in, or attached to, or associated with the park trailer shall be listed where listing standards have been established. All products and equipment shall be identified for the use. ~~Shall be used only in the manner for which they have been listed and found suitable for the use.~~
Substantiation: Listing should only be required for electrical material and only where standards have been established. Supports for cables and raceways are not generally listed. The manner in which something has been listed is generally unknown to installers.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided for changing this requirement. Nowhere in the NEC is it implied that cable and raceway supports are required to be listed although standards do exist, UL2239 and UL1565.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-194 Log #1243 NEC-P19 **Final Action: Reject**
(552.41)

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A), Exception No. 2, delete: "Behind doors that may fully open against a wall surface."
In (B), add: (4) Within 900 mm (3 ft.) of a lavatory.
Revise text of (F)(2): A receptacle or switch shall not be installed in a face-up position in any countertop unless specifically approved.
Substantiation: The space behind an opened door is not omitted in 210.52(A) and may be the only place where a receptacle is conveniently accessible. if this space is considered in 210.52 as necessary, for safety, per 90.1(B), why not for occupants of a park trailer? A receptacle should be required at a lavatory location (GFCI protected) to permit use of personal grooming devices without the use of extension cords from receptacles without GFCI protection. Snap switches should not be permitted in countertops due to potential liquids and accidental turn-on.
Panel Meeting Action: Reject
Panel Statement: Regarding the proposed changes to (A) and (B): Chapter 5 modifies Chapters 1 through 4 as permitted by Section 90.3.
Regarding the proposed changes to (F): Switches are outside the scope of (F), which is limited to receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-195 Log #1350 NEC-P19 **Final Action: Reject**
(552.41(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (A) and (B) and substitute:
(A) SPACING. 125-volt 15-and 20-ampere receptacle outlets shall be installed in accordance with applicable provisions of 210.52(A) and (C). Receptacles required by this section shall be in addition to any receptacle that is part of a luminaire or appliance, located within cabinets, cupboards, or other enclosures, or more than 1.7 m (5 1/2 ft) above the floor.
Exception No. 1: Bath and hall areas not exceeding 3 m (10 ft) in length.
Exception No. 2: Wall spaces occupied by cabinets, built-in furniture or other appurtenances.
Substantiation: 210.52 provides comprehensive provisions (which apply unless amended) but may not be considered when applying this article. "Adjacent" is subjective and a term to be avoided. If a receptacle in a wall space behind a door is required by 210.52 based on 90.1(A) and (B,) how is safety not impinged by exempting space behind a door? 210.52 has pertinent provisions re: receptacles part of a luminaire, in cabinets, and over 5 1/2 ft above the floor, which are not specifically amended, but since specific provisions are noted in this article may be assumed to be amended or overlooked.
Panel Meeting Action: Reject
Panel Statement: The word "adjacent" provides flexibility for placement within the constraints for spacing in 552.41(A). See also the panel statement on Proposal 19-194.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HOPKINS, B.:

19-190 Log #4761 NEC-P19 **Final Action: Reject**
(552.41(A))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 2-274.
This action will be considered by the panel as a public comment.
Submitter: D. Jerry Flaherty, East Islip, NY
Recommendation: Add revised text to read as follows:
552.41 Receptacle outlets shall be installed at wall spaces 600 mm (2 ft) wide or more so that no point along the floor line is more than 1.8 m (6 ft), measured horizontally, from an outlet in that space.
Exception No. 1: Bath and ~~hall~~ hallway areas.
Substantiation: No definition for "hall" in NEC.
Webster dictionary has several definitions that are not in line with this section of NEC.
1) "Entrance space into which the main door to house" — new large homes have "halls" that are quite large, fully furnished with tables (table lamps) and seating. By definition and code these "halls" need only one receptacle. I have inspected many with extension cords which are a fire hazard.
210.52(H) Hallways.
2) Webster definition - "A communally owned building where public business is transacted or where people meet etc. "which is in line with other areas of the NEC (assembles halls, dance halls, etc.) but not with this section of the code.
3) The end of habitable rooms with two or more doors at one end meets the definition of a hall and again usually only one receptacle is provided.
"Hallway" is not defined in the NEC and Webster defines as a passage connecting two or more rooms which is closer to what the NEC is referring too, but not quite.
See Proposal for a definition of a Hallway.
Hallways. A walled corridor used exclusively to connect two or more rooms.
Panel Meeting Action: Reject
Panel Statement: The term 'hall' is used correctly in the noted section. Changing the term to 'hallway' does nothing to improve the Code. It is noted that the proposed definition of 'hallway' was rejected by CMP-1 (Proposal 1-89) prior to balloting.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-196 Log #2444 NEC-P19 **Final Action: Reject**
(552.41(C))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
552.41 Receptacle Outlets Required.
(C) ~~Ground-Fault Circuit-Interrupter~~ Power Safe Protector Protection. Each 125-volt, single-phase, 15- or 20-ampere receptacle outlet shall have ~~ground-fault circuit-interrupter~~ power safe protector protection for personnel in the following locations:
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There are currently no testing standards for this product. Any testing standards noted in the substantiation are for receptacles in general. The testing reports provided are based on performance results for a specific product.
This proposal is brand-specific. The NEC cannot require a specific brand in any article in the code.
Installation of this device is not currently prohibited by the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-197 Log #2622 NEC-P19 **Final Action: Reject**
(552.41(D)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
~~On a circuit where all of the outlets are on the load side of the~~ Provided with ground-fault circuit interruption protection for personnel.
Substantiation: Where supplied by a circuit with other interior outlets, there doesn't seem to be a safety reason to require all the interior outlets to be GFCI protected.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided to support the proposed revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-198 Log #2621 NEC-P19 **Final Action: Reject**
(552.41(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: At least one readily accessible receptacle outlet shall be installed outdoors on the exterior of the park trailer.
Substantiation: Edit. Present text doesn't specify the location to be on the trailer or readily accessible. Location should be on the trailer to assure it is available when the trailer is moved.
Panel Meeting Action: Reject
Panel Statement: Insufficient technical substantiation has been provided to support the proposed revision. The receptacle outlet should not be required to be "readily accessible" for security purposes. Special flexibility is provided in the requirements for purposes of security and physical protection during relocation when necessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-199 Log #1242 NEC-P19 **Final Action: Accept in Principle in Part**
(552.43)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (A) and substitute: The power supply to the park trailer shall be a feeder assembly in accordance with 552.44 or a permanently installed feeder.
In (B) change "panelboard" to "equipment".
In (C)(1) delete "color coded".
Substantiation: Power supply assemblies per 552.44 are assumed to be acceptable. Additionally, why should a single 15-ampere branch circuit require a 30-or 50-ampere supply cord? Distribution equipment other than a "panelboard" such as a fused switch or circuit breaker may be used where only one branch circuit is supplied. "Color-coded" is not defined; does it mean different colors? Any insulated conductor has color. The Code does not generally specify colors other than white or green for general use.
Panel Meeting Action: Accept in Principle in Part
1. Accept in principle the revision to 552.43(A) by making the following revisions:
(A) Feeder. The power supply to the park trailer shall be a feeder assembly consisting of not more than one listed 30-ampere or 50-ampere park trailer power-supply cord and in accordance with 552.44 ~~with an integrally molded or securely attached cap,~~ or a permanently installed feeder.
2. Reject the proposed revisions to 552.43(B) and (C).
Panel Statement: 1. Regarding the proposed changes to 552.43(A): The construction of the supply end of the supply cord is clearly stated in 552.44(C). The term "securely attached" is vague and the word "cap" is inconsistent with the term "attachment plug" used in 552.44. Listing as required for power supply cords provides for performance-based criteria that qualifies "securely attached."
2. The proposed revisions to 552.43(B) and (C) are not technically substantiated and do not add clarity or improve usability of the Code. Color coding is pervasive throughout the NEC and is clearly understood.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
CHILTON, R.: The Panel's action is inconsistent with Section 550.10(A) for "mobile homes" where similar requirements for feeders are addressed. Also, attachment plugs typically are manufactured with a molded plug "cap" or may be provided with the same type removable "cap" as the cover for the attachment plug and is a commonly understood term.

19-200 Log #2709 NEC-P19 **Final Action: Reject**
(552.44(C)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise heading ~~ATTACHMENT PLUGS~~ POWER SUPPLY ASSEMBLY Change "attachment plugs in (1) to: "power supply assembly".
Substantiation: Edit. 552.43 includes the power supply cord; (C)(2) uses the phrase "power supply assembly".
Panel Meeting Action: Reject
Panel Statement: Insufficient technical substantiation has been provided to support the proposed revision. The title of the section accurately reflects what is covered therein.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-201 Log #1212 NEC-P19 **Final Action: Reject**
(552.45(A), (B) and (C))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A,) (B), and (C) change "panelboard" to "equipment".
In (B), add: and _____ mm (_____in._) high.
Substantiation: A single fused switch or circuit breaker may be distribution equipment, especially where only one branch circuit is provided. Since no height requirement is specified 110.33 applies. Proposal is intended to allow the panel to specify a height if different than 110.33.
Panel Meeting Action: Reject
Panel Statement: 552.45 identifies only the use of a distribution panelboard. The substantiation for the proposed revision to (B) refers to 110.33, which is only for systems over 600 volts.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-202 Log #707 NEC-P19 **Final Action: Accept**
(552.46(B)(1))

Submitter: Joe Tedesco, Boston, MA
Recommendation: The lighting circuits shall be permitted to serve built-in gas ovens with electric service only for lights, clocks or timers, or listed cord-connected kitchen waste disposers.
Substantiation: The term "kitchen waste disposers" is the correct term, and is used in 422.16(B)(1).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-203 Log #1241 NEC-P19 **Final Action: Reject**
(552.46(B)(3)(b))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Where the power supply and branch circuits supplies continuous load(s) or any combination of continuous loads and noncontinuous loads, the ~~branch circuit~~ conductors ~~shall be in accordance with 210.19(A)~~ have an ampacity not less than 125 percent of the continuous load plus 100 percent of the noncontinuous load.
Substantiation: The same reason for this equipment (heating at terminals and overcurrent devices) should apply to all supply conductors. Example D3, D3(a) calculate continuous loads for feeders and service conductors at 125 percent.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is unclear and does not follow the proper style for legislative format. The code reference is inaccurate and confusing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-204 Log #392 NEC-P19 **Final Action: Reject**
(552.47(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
In the last paragraph change "per" to "for each".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect. The use of the word "per" in this application is appropriate. The proposed revision does not add clarity or improve usability. The NEC Style Manual does not prohibit the use of "per."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-205 Log #393 NEC-P19 **Final Action: Reject**
(552.47(B)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change "per" to "for each".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-204.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-206 Log #1099 NEC-P19 **Final Action: Reject**
(552.48)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (B):
~~CONDUIT and TUBING~~ RACEWAYS and CABLES. Where ~~rigid metal conduit or intermediate metal conduit is~~ raceways or cables are terminated at an enclosure with a locknut or locknut and bushing connections, at least two locknuts shall be provided, one inside and one outside of the enclosure... (remainder unchanged).
Delete (C), (D), (G), (H), (I), (K), (L).
Substantiation: The double locknut provision should also apply to cables where connectors may loosen and impair grounding continuity or subject conductors to abrasion by the knockout opening. The proposed deletions are already covered elsewhere in the Code and apply unless amended. Additionally (D) doesn't cover installations in noncombustible material; (G) is covered by 300.4(A) and (B) which includes all raceways and cables; (H) is covered by the respective cable articles, which may have different support requirements, e.g., 310.30 m, 332.30; (K) is covered by 406.5(A) and (C) which doesn't require listing; (L) is covered by 406.5(B); (I) is covered by 334.30(C).
Panel Meeting Action: Reject
Panel Statement: Section 552.48(B) addresses threaded conduits installed without fittings using locknuts. Cables are always installed with fittings and all materials and equipment are required to be listed per Section 552.40(B). The current language is clear and specific to a specialized industry. Usability of the NEC by including the specific reference or requirement within this article is far more important than not using references where information could be overlooked.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-207 Log #1379 NEC-P19 **Final Action: Reject**
(552.48)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (A) and substitute:
Identified cables and raceways covered by Articles 320, 322, 330 through 340, 342 through 362, 368, and 388 shall be the wiring method(s) employed and shall be permitted in accordance with their respective articles, except as otherwise specified in this article.
Delete first sentence of (B) and substitute:
Where conduit, tubing, raceways or cables are terminated at an enclosure with a locknut or locknut and bushing at least two locknuts shall be provided, one of which shall be outside of the enclosure.
Substantiation: "Shall be permitted" is not a requirement; 90.5(B) states: "shall be permitted" describes actions allowed but not required. The locknut provisions all raceways and cables which utilize locknut connections for termination fittings (connectors) to maintain grounding continuity and prevent abrasion of conductors if the connectors become loose or detached from the enclosure.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is unclear and does not follow the proper style for legislative format. See the panel action on Proposal 19-206.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-208 Log #2645 NEC-P19 **Final Action: Reject**
(552.48)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete: (H),(I),(J),(K) and (L).
Revise latter part of (M): "...or by other raceway or cable identified for the application.
Substantiation: Edit. (H) is already covered by referenced articles in (A); the last sentence literally does not permit support at intervals less than 4-1/2 ft. (I) is covered in 314.17(C) exception and 334.30(C) which apply unless amended.
(J) is already covered by 110.27(B) and 334.15(B).
(K) is already covered by 406.5(A)(C).
(L) is covered by 406.5(B).
Literal wording in (M) indicates the specified raceway/cable may be routed against other raceway or cable identified for the use.
Panel Meeting Action: Reject
Panel Statement: The current language is clear and specific to a specialized industry. Usability of the NEC by including the specific reference or requirement within this Article is far more important than not using references where information could be overlooked. The addition of the word "by" before "other raceway or cable identified for the application" is not needed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-209 Log #1240 NEC-P19 **Final Action: Reject**
(552.48(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Boxes and cabinets shall comply with 312.2 and 314.20. Alternatively, delete this section.
Substantiation: This is already covered by 312.2 and 314.20 which also covers cabinets and noncombustible finishes.
Panel Meeting Action: Reject
Panel Statement: The submitter has not offered any technical substantiation for adding cabinets. The current language is clear and specific to a specialized industry. Usability of the NEC by including the specific reference or requirement within this Article is far more important than not using references or requirements where information could be overlooked.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-210 Log #1239 NEC-P19 **Final Action: Accept in Principle**
(552.48(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
~~SHEATH ARMOR~~ Cable Covering. The ~~sheath~~ outer covering of ~~nonmetallic sheathed~~ cables and flexible cords, metal-clad cable, and Type AC metal-covered cables shall be continuous between ~~outlet~~ boxes and other enclosures or terminations.
Substantiation: Edit. All metal-clad cable (Type MC) may not have a "sheath". This provision does not presently apply to such Type MC cable with an interlocking armor, Type MI, UF, and SE cable.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Cable Sheath ~~Armor~~. The sheath of nonmetallic-sheathed cable, and the armor of metal-clad cable, and Type AC cable shall be continuous between outlet boxes and enclosures.
Panel Statement: The sheath of nonmetallic-sheathed cable is not armor. CMP-19 does not agree with the submitter's substantiation; however, the panel action meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-211 Log #1059 NEC-P19 **Final Action: Reject**
(552.48(G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Already substantially covered by 300.4 which applies unless amended.
Panel Meeting Action: Reject
Panel Statement: The current language is clear and specific to a specialized industry. Usability of the NEC by including the specific reference or requirement within this Article is far more important than not using references or requirements where information could be overlooked.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-211a Log #CP1902 NEC-P19 **Final Action: Accept**
(552.48(H))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 19,
Recommendation: Revise as follows:
(H) Cable Supports. Where connected with cable connectors or clamps, cables shall be supported within 300 mm (12 in.) of outlet boxes, distribution panelboards, and splice boxes on appliances. Supports shall be provided at least every 1.4 m (4½ ft) at other places.
Substantiation: The present language does not technically permit closer support intervals.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-212 Log #1235 NEC-P19 **Final Action: Reject**
(552.48(J), (K) and (L))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of (J): Where likely to be exposed to physical damage, ~~exposed~~ nonmetallic cable shall be protected by covering boards, guard strips, raceways, or other identified means.
Delete (K) and (L).
Substantiation: Edit. "Likely" is defined as such a nature or circumstance to make something probable and is used in many sections. (K) and (L) are superfluous, already covered in 404.9 and 406.5.
Panel Meeting Action: Reject
Panel Statement: The use of the phrase "likely to be" is not appropriate in this instance as the condition is either evident, or not, at the point of inspection. No substantiation is provided for the addition of the word "identified". See panel action and statement on proposal 19-208 for not deleting (K) and (L).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-212a Log #CP1901 NEC-P19 **Final Action: Accept**
(552.48(K))

Submitter: Code-Making Panel 19,
Recommendation: Revise as follows:
(K) ~~Metal~~ Receptacle Faceplates. Metal faceplates shall comply with Section 406.5 (A). ~~be of ferrous metal not less than 0.76 mm (0.030 in.) in thickness or of nonferrous metal not less than 1.0 mm (0.040 in.) in thickness.~~ Nonmetallic faceplates shall ~~be listed~~ comply with Section 406.5(C).
Substantiation: The title in 552.48(K) only addresses metal faceplates and contains the same requirements as for metal receptacle faceplates in 406.5(A). The panel concluded that it is simpler to refer to the appropriate requirement in 406.5 and also include the reference to requirements for nonmetallic receptacle faceplates. The requirement that faceplates be listed is already covered by 552.40(B).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-213 Log #1098 NEC-P19 **Final Action: Reject**
(552.48(O)(1) and (2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence in (1):
That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the branch circuit by means of an extra-hard usage type flexible cord or cable identified for the application, with or without an attachment plug, and containing an equipment grounding conductor.
Revise last sentence of (2):
A flexible cord or cable located on the outside of a unit shall be identified for ~~outdoor~~ use in wet locations and sunlight resistance.
Substantiation: Article 400 does not require listing. Flexible cables should also be permitted. Cords and cables should be identified for the application and contain an EGC. All hard usage and extra-hard usage cords are not suitable, e.g., electric vehicle cables Article 400 covers wet and damp locations and sunlight resistance, but not "outdoor" use.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided to open the application to any flexible cable type. Use of "extra-hard usage cord" is implied by specification of "hard usage cord." Listed cord is intended for this application as is the reference to section 400.7 permitted use.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-224 Log #1911 NEC-P19 **Final Action: Reject**
(552.56(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by 250.119.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-211.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-225 Log #1100 NEC-P19 **Final Action: Reject**
(552.56(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first sentence and substitute:

Grounding and bonding of electrical equipment shall be in accordance with applicable provisions of Part IV, V, and VI of Article 250.

Delete (1) and (2).

Revise (3):

The equipment grounding conductor in nonmetallic sheathed cable or nonmetallic raceway shall be permitted to be secured under a machine screw threaded into the metal luminaire canopy with at least two threads engaged, or secured with a machine screw and nut, other than a mounting or cover screw, or attached to ~~a listed~~ an integral grounding means (plate) in a nonmetallic box ~~for luminaire mounting~~. ~~(Grounding means shall also be permitted for luminaire attachment screws.)~~ A metal luminaire securely attached to a grounded metal box or fitting with machine screws shall be considered grounded.

Substantiation: (C)(1) and (2) are already covered by 250.118 and 250.148(C) which apply unless amended. A machine screw with a minimum number of threads engaged should be required. Listed boxes will include the integral grounding plate. "Permitted" grounding does not entail a requirement per 90.5(B). Luminaire attachment (mounting) screws are not identified for connection of a wire-type equipment grounding conductor and should not be permitted; other sections require a grounding screw to be used for no other purpose.
Panel Meeting Action: Reject
Panel Statement: The panel rejects deleting 552.56(C)(1) and (2). The current language is clear and specific to a specialized industry. Usability of the NEC by including the specific reference or requirement within this article is far more important than not using references or requirements where information could be overlooked. The proposed revisions to 552.56(C)(3) present substantial modifications to Section 250.8 that are not allowable grounding methods or add requirements that are already covered in Section 250.118. The submitter has provided no substantiation to add nonmetallic raceway to this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-226 Log #1940 NEC-P19 **Final Action: Reject**
(552.56(C) and (D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. These provisions are already covered elsewhere in the Code.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-211.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-227 Log #1368 NEC-P19 **Final Action: Reject**
(552.56(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of (D):

A connection between the one or more grounding conductors brought into a nonmetallic box or enclosure shall be arranged so that a connection can be made to any ~~fitting or device~~ equipment in ~~that~~ or fed from the box or enclosure that ~~requires~~ is to be, grounded.

Revise text of (E):

Where ~~more than~~ one or more wire-type equipment grounding or bonding conductors ~~of a branch circuit~~ enters a box or other enclosure all such conductors ~~shall be in good electrical contact with each other~~ shall be connected together and to the box or enclosure (if metal) and the arrangement shall be such that disconnection or removal of any device, luminaire, or other equipment contained in or fed from the box or enclosure ~~will~~ does not interfere with or interrupt the grounding continuity.

Substantiation: The provisions of (D) should apply to enclosures which are not "boxes" and include equipment in the box or enclosure or fed from it to be grounded whether or not grounding is required. The provisions of (E) should also apply where only one grounding or bonding conductor is installed and require connection to a metal box or enclosure.

Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided for the proposed revisions. The heading of the subsection addresses only nonmetallic boxes. The proposed revisions do not add clarity or improve usability of the code.
Number Eligible to Vote: 12

19-229 Log #1988 NEC-P19 **Final Action: Reject**
(552.56(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by 250.114.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-211.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-230 Log #1993 NEC-P19 **Final Action: Reject**
(552.57)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

(A) Where the wiring system is 120-volts or 120/240 volts all exposed noncurrent-carrying metal parts that ~~may~~ are likely to become energized, and the trailer components specified in 552.57(D), (E), and (F) shall be effectively bonded to the grounding terminal(s) ~~or enclosure~~ of the ~~distribution panelboard~~ main disconnecting means specified in 525.45(C).

Revise last sentence of (C): The bonding conductor specified in 552.57(B) shall be of... (remainder unchanged). Revise (F): ~~FURNACE and~~ METAL AIR DUCT BONDING ~~Furnace and~~ Metal circulating air ducts associated with electrically operated heating and cooling systems shall be bonded and grounded by approved means.

Substantiation: It doesn't seem necessary to apply (A) to low voltage systems. Metal parts should also be grounded; bonded, by definition does not necessarily provide grounding. The main disconnecting means grounding. The main disconnecting means grounding terminals provide the most direct ground path to the service. Air ducts not associated with electric equipment should not require bonding or grounding; "likely" is defined as probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The substantiation suggests that this requirement applies to low voltage systems, which is not the case since this requirement falls under Part IV, Nominal 120-Volt or 120/240-Volt Systems. It is unnecessary to add the suggested code references within (A) and (C) since the current language requires "All" exposed non-current carrying metal parts to be bonded. The proposed changes in (F) only add confusion to the current requirement. Typical AC ducting is not metal and nowhere else in the section is the phrase "and grounded by approved means" currently stated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-231 Log #1367 NEC-P19 **Final Action: Reject**
(552.57(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:

~~Grounding~~ Bonding conductor terminals shall be of the solderless type and listed as pressure terminal connectors ~~recognized~~ identified for the wire size and material used. The bonding conductor shall be solid copper ~~or stranded~~ insulated covered or bare and be minimum 8 AWG. ~~copper minimum or equivalent.~~

Substantiation: Grounding is not the same as bonding. Terminals should also be identified for the conductor material (copper). Solid copper is less likely to have corrosion problems. "8 AWG copper minimum or equivalent" is not specific. What or who is to determine if a smaller than 8 AWG noncopper conductor is equivalent? "Equivalent" is subjective and a term to be avoided.
Panel Meeting Action: Reject
Panel Statement: There is neither sufficient evidence nor technical substantiation for the proposed changes. For example, there is no evidence that the area beneath a park trailer is a corrosive environment warranting a solid copper covered conductor.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-231a Log #1987 NEC-P19 **Final Action: Accept**
(552.59(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete, or alternatively revise last sentence: Outdoor receptacle ~~or convenience~~ outlets shall be in accordance with 406.8(A) and (B). ~~of a gasketed cover type suitable for use in wet locations~~. Switches and circuit breakers installed outdoors shall comply with 404.4.
Substantiation: "Convenience" outlet is not defined. This section does not encompass the requirements of 406.8(B), without apparent justification.
Panel Meeting Action: Accept
Panel Statement: Accept the submitter's amendment to Section 552.59(A). See panel action and statement on Proposal 19-211.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-232 Log #1366 NEC-P19 **Final Action: Reject**
(552.59(A))

TCC Action: It is the understanding of the Technical Correlating Committee that the proposals referenced in the panel statement should be Proposals 19-211 and 19-231a.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Already covered by 110.11, 406.8, 410.10. Is this section intended to modify 406.8(B)(2)(a) for "bubble" type covers? "Convenience" type outlets are not defined. Switches are not covered, therefore, 404.4 applies, likewise other appropriate sections should govern.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposals 19-211 and 19-232a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-233 Log #1365 NEC-P19 **Final Action: Reject**
(552.60(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (1):

A visual and continuity test to ensure that required bonding is accomplished ~~all metal parts are properly bonded~~.

Revise (4):

Receptacles with ~~requiring~~ GFCI protection shall be tested for correct function by the use of a GFCI testing device.

Substantiation: A visual "test" may permit verification of proper connectors, wire size and type and secure connections. Unless of high amperage a continuity test will not necessarily indicate loose connections. "All" metal parts are not required to be bonded. All receptacles with GFCI protection whether or not required should be tested.
Panel Meeting Action: Reject
Panel Statement: A visual inspection is unnecessary. Electrical continuity can be verified using the appropriate test equipment. A visual inspection is unenforceable and impractical in many cases.

Existing language in (4) is clear as written. The proposed revision does not add clarity or improve usability of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 553 — FLOATING BUILDINGS

19-234 Log #1050 NEC-P19 **Final Action: Reject**
(553.1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
All metal parts in contact with the water, all metal piping, and all noncurrent-carrying metal parts that ~~may~~ are likely to become energized shall be connected by approved means to the equipment grounding terminal(s) ~~bus~~ in the ~~panelboard~~ floating building distribution equipment where the supply conductors terminate.
Substantiation: "May" is subjective and a term to be avoided per the Style Manual. "Likely" is defined as such by a nature or circumstance as to make something probable and is used in many sections. Since the means of connection bonding is not specific it should be acceptable to the AHJ re: manner and material.
Panel Meeting Action: Reject
Panel Statement: The submitter is incorrect in his reference to Section 553.1.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-235 Log #1249 NEC-P19 **Final Action: Reject**
(553.1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "may" to "is likely to".
Substantiation: Edit. "May" is a term to be avoided per the Style Manual. "Likely" is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 19-234.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-236 Log #1363 NEC-P19 **Final Action: Reject**
(553.2.Floating Building)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete:
"not located on the premises".
Substantiation: "Premises" is defined as a tract of land which includes the shore or land area adjacent to floating buildings or docks.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect. The term "premises wiring system" is defined in Article 100.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-237 Log #2802 NEC-P19 **Final Action: Accept**
(553.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text
~~553.3 Application of Other Articles.~~
~~Wiring for floating buildings shall comply with the applicable provisions of other articles of this Code, except as modified by this article.~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 553.3 repeats the requirements previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-238 Log #4288 NEC-P19 **Final Action: Accept**
(553.3)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Delete this section.
~~553.3 Application of Other Articles.~~
~~Wiring for floating buildings shall comply with the applicable provisions of other articles of this Code, except as modified by this article.~~
Substantiation: NEC 90.3 indicates Chapters 1-4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 553.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-239 Log #1364 NEC-P19 **Final Action: Reject**
(553.4)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
The service equipment for a floating building shall be located ~~adjacent~~ in close proximity to where the floating building is moored, but not in or on the floating building or on any floating structure.
Substantiation: Edit. "Adjacent" is subjective and a term to be avoided.
Panel Meeting Action: Reject
Panel Statement: The term "in close proximity to where" provides no clearer definition than "adjacent." The proposal does not add clarity or improve usability of the code.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-240 Log #3656 NEC-P19 **Final Action: Reject**
(553.4)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
553.4 Location of Service Equipment.
The service equipment or means of disconnect for a floating building shall be located adjacent to, but not on or in, the floating structure.
Where the area within 15 m (50 ft) of the floating building is in the 100 year flood plane, the service equipment or means of disconnect shall be located outside of the 100 year flood plane and shall be capable of being opened by the use of a remote control device located at the shore access point to the floating building.
Substantiation: Not all floating buildings are served by service equipment. The intent of the rule is to provide a local disconnect for the floating building, not to require that the floating building be supplied by service equipment. In many cases locating the service equipment or means of disconnect adjacent to the floating structure will result in the equipment being damaged by flood waters. A provision to locate a remotely operated disconnect outside of the flood plane will provide the means for a local emergency disconnect as well as protect the disconnect from flood damage.
Panel Meeting Action: Reject
Panel Statement: Many floating buildings are located well within a flood plane. This proposal can result in locating the disconnecting means miles from the floating building, which is not practical.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 7 Negative: 1
Explanation of Negative:
MICHAELIS, R.: There needs to be a means to disconnect power to floating buildings during flooding so that damage can be evaluated safely before power is restored. As CMP 19 pointed out this disconnect could be at a great distance from the floating building in order to get outside of the 100 year flood level. This is exactly where this disconnect needs to be, at a location well above the flood level.

19-241 Log #4765 NEC-P19 **Final Action: Reject**
(553.4)

Submitter: Joseph P. Fello, Eaton Corp.
Recommendation: Add new text to read as follows:
Location of Service Equipment. The service equipment for a floating building shall be located adjacent to, but not on or in, the building or any floating structure. The Main over current protective device which feeds the building or floating structure distribution system shall have GFCI protection for personnel. Individual branch GFCI protection for personnel fed by that feeder is a suitable alternate to main GFCI protection.
Substantiation: Shore power leakage currents on board vessel or due to aging infrastructure, lack of maintenance, conduit and or wire corrosion, etc. pose a hazard for potential leakage to ground that may cause electric shock drowning, fire, wasted energy, and property damage. GFCI protection will add protection from such occasions. I have provided additional information from the Milke Holt Newsletter dated October 17, 2007. In summary, the intent of this proposal is to protect personnel from hazardous leakage from wiring associated with a floating building.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Although the recommendation has merit, additional technical substantiation and product development is needed. The use of GFCI for personnel protection is not prohibited by the current Code. The proposed requirement for GFCI personnel protection (6 mA leakage) is not practical for all floating building environments.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-242 Log #3408 NEC-P19 **Final Action: Reject**
(553.5)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
553.5 Service-Entrance Conductors. One set of service-entrance conductors shall be permitted to serve more than one set of service equipment.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Reject
Panel Statement: Although the proposal has merit, CMP-19 defers to the action taken by CMP-4 on the definitions of the terms.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-243 Log #1362 NEC-P19 **Final Action: Reject**
(553.6)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change “panelboard” to “distribution equipment”.
Substantiation: Edit. All floating buildings may not have distribution equipment that is a “panelboard”.
Panel Meeting Action: Reject
Panel Statement: There is currently a definition of the term “panelboard” in Article 100; “distribution equipment” is not defined in Article 100 and its use may lead to confusion. The submitter has provided inadequate substantiation to support the revision.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-244 Log #1361 NEC-P19 **Final Action: Reject**
(553.7(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
All wiring shall be installed so that motion of the water surface or floating building and changes in the water level is not likely to ~~will not~~ result in undue strain on the feeder wiring method or connections ~~unsafe conditions~~.
Substantiation: Edit. Motion of the building not caused by the water should be considered. “Undue” strain is subjective and not defined as is “unsafe conditions” and which is difficult to predict.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add clarity or improve usability of the code.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-245 Log #1251 NEC-P19 **Final Action: Reject**
(553.8(A))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A) change “panelboard” to “distribution equipment”.
Substantiation: Edit. All floating buildings may not have a panelboard as distribution equipment.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-243.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-246 Log #1205 NEC-P19 **Final Action: Reject**
(553.8(A) and (B))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A) change “panelboard” to “distribution equipment”
Revise text of (B) as follows: The equipment grounding conductor shall be installed in the same raceway or portable power cable containing the feeder conductors and connected to a grounding terminal in the service equipment and main disconnecting means in the floating building.
Substantiation: A floating building may have a single switch or circuit breaker as a main disconnecting means, which are not “panelboard”. “Installed with the feeder conductors” is not explicit and may be deemed to modify the requirement to be run in the same raceway or cable with circuit conductors.
Panel Meeting Action: Reject
Panel Statement: There is currently a definition of the term “panelboard” in Article 100; “distribution equipment” is not defined in Article 100 and its use may lead to confusion. The submitter has provided inadequate technical substantiation to support the revisions.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-247 Log #1250 NEC-P19 **Final Action: Reject**
(553.9)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Change “panelboard” to “distribution equipment”.
Substantiation: Edit. All floating buildings may not have a “panelboard”.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-243.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-248 Log #1058 NEC-P19 **Final Action: Accept in Part**
(553.11)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
All metal parts in contact with the water, all metal piping,and all non-current-carrying metal parts that ~~may~~ are likely to become energized shall be connected to an equipment grounding ~~bus~~ terminal(s) in the ~~panelboard~~ floating building distribution equipment by approved means where the supply conductors terminate.
Substantiation: "May" is subjective and a term to be avoided per the Style Manual. "Likely" is defined as such a nature or circumstance as to make something probable and is a term used many times in the Code. Since the means of connection (bonding) are not specific, it should be acceptable to the AHJ re: manner and material.
Panel Meeting Action: Accept in Part
The panel accepts deleting "may" and substituting "are likely to." The remainder of the text remains unchanged.
Panel Statement: There is neither sufficient evidence nor substantiation for the remainder of the changes proposed.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

ARTICLE 555 — MARINAS AND BOATYARDS

19-249 Log #4764 NEC-P19 **Final Action: Accept in Principle**
(555.2)

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Submitter: Joseph P. Fello, Eaton Corp.
Recommendation: An enclosed assembly that can include receptacles, circuit breaker, fused switches, fuses, Watt Hour Meters, distribution panel, transformer and monitoring means approved for marine use.
Substantiation: The current paragraph Marine Power Outlets does not fully describe all equipment which can contain a distribution panel and or transformer and still be designated as a Power Outlet. The need for this clarification has arisen due to the comparisons of a stand alone transformer enclosure to a power outlet which contains a transformer. This equipment with the addition of a distribution panel or transformer will allow for terminations no less than 12 in. above a floating pier as Per 555.9
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
An enclosed assembly that can include equipment such as receptacles, circuit breakers, fused switches, fuses, Watt Hour Meters, distribution panels, and monitoring means approved for marine use.
Panel Statement: The revised language allows additional equipment without having to cite all possibilities and meets the intent of the submitter. By adding the language "equipment such as," a transformer would be permitted to be located in the marine power outlet assembly.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-250 Log #1360 NEC-P19 **Final Action: Reject**
(555.2.Marine Power Outlet)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
An enclosed assembly listed for marine use that can include receptacles, circuit breakers, fused switches, fuses, watt-hour meter(s) and monitoring means, ~~approved~~ identified for marine use."
Substantiation: Edit. "Approved" is not the same as listed and identified, but merely acceptable to the AHJ.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided to require listing of marine power outlets beyond that required in 555.19(A)(1). The term "approved" as defined in Article 100 is what is intended.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-251 Log #2445 NEC-P19 **Final Action: Reject**
(555.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
Article 100
DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.
Substantiation: If 555.19(B)(1) is accepted to include PSP requirements, there may be a need to put this in definitions. A proposal is also being sent to panel 1, Article 100.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 19-276 precludes the need for a definition in this article.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-252 Log #4766 NEC-P19 **Final Action: Reject**
(555.3)

Submitter: Joseph P. Fello, Eaton Corp.
Recommendation: Add new text to read as follows:
555.3 Personnel Protection. GFCI protection for personnel shall be provided for the marina distribution system. The GFCI protection for personnel shall be provided in either the main over current protective device, or in the over current protective devices of each individual branch or feeder circuit.
Substantiation: Shore power leakage currents on board vessel or due to aging infrastructure, lack of maintenance, conduit and or wire corrosion, etc. pose a hazard for potential leakage to ground that may cause electric shock drowning, fire, wasted energy, and property damage. GFCI protection for personnel will add protection from such occasions. I have provided additional information from the Mike Holt Newsletter dated October 17, 2007.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Although the recommendation has merit, additional technical substantiation and product development is needed. The use of GFCI for personnel protection is not prohibited by the current code. The proposed requirement for GFCI personnel protection (6 mA leakage) is not practical for all marina environments.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 8 Negative: 1
Explanation of Negative:
MICHAELIS, R.: Ground fault monitoring is now recommended in the Marina Electrical Safety Standard NFPA-303-2006.
Marinas have both a legal and moral obligation to provide guests, customers, and marina personnel with the safest environment possible. This standard describes "best practices" that were authored by knowledgeable people in the industry and addresses issues that are known causes of injury and property damage. Ignoring these sections is really not an option. The proposal should be accepted with the addition of ground fault monitoring and alarms being available for marinas with qualified supervision.

19-253 Log #1359 NEC-P19 **Final Action: Reject**
(555.5)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change "specifically approved" to "identified".
Substantiation: Edit. "Approved" is acceptable to the AHJ which is not necessarily the same as identified.
Panel Meeting Action: Reject
Panel Statement: The proposed revisions are not strictly editorial. Insufficient technical substantiation has been provided to support the proposal.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-254 Log #3657 NEC-P19 **Final Action: Reject**
(555.7)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
555.7 Location of Service Equipment.
The service equipment or means of disconnect for floating docks or marinas shall be located adjacent to, but not on or in, the floating structure.
Where the area within 15 m (50 ft) of the dock is in the 100 year flood plane, the service equipment or means of disconnect shall be located outside of the 100 year flood plane and shall be capable of being opened by the use of a remote control device located on the shore end of the dock or immediately adjacent thereto.
Substantiation: Not all floating docks are served by service equipment. The intent of the rule is to provide a local disconnect for the floating dock, not to require that the dock be supplied by service equipment. In many cases locating the service equipment or means of disconnect adjacent to the floating structure will result in the equipment being damaged by flood waters. A provision to locate a remotely operated disconnect outside of the flood plane will provide the means for a local emergency disconnect as well as protect the disconnect from flood damage.
Panel Meeting Action: Reject
Panel Statement: Many marinas are often located well within a flood plane. This proposal can result in locating the disconnecting means miles from the marina, which is not practical.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-255 Log #1706 NEC-P19 **Final Action: Accept**
(555.9)

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise text as follows:
555.9 Electrical Connections.
Electrical connections shall be located at least 305 mm (12 in.) above the deck of a floating pier. Conductor splices, within approved junction boxes, utilizing sealed wire connector systems listed and identified for submersion shall be permitted where located above the waterline but below the electrical datum ~~field~~ plane for floating piers.
All electrical connections shall be located at least 305 mm (12 in.) above the deck of a fixed pier but not below the electrical datum plane.
Substantiation: The term “electrical datum field” is not defined, but “electrical datum plane” is defined in 555.2.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-256 Log #1322 NEC-P19 **Final Action: Reject**
(555.10 and Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Permanently installed electrical equipment enclosures installed on piers and docks ~~above deck~~ level shall be securely and substantially supported by structural members independent of any ~~conduit~~ raceway connected to them. ~~If enclosures are not attached to mounting surfaces by means of external ears or lugs, the internal screw heads.~~ Internal openings for support fasteners shall be sealed to ~~prevent~~ minimize ~~seepage of water~~ entrance of moisture through mounting holes.
Exception: Threaded rigid steel conduit or steel intermediate metal conduit shall be permitted to support a conduit body not larger than the trade size of the conduit and electrical metallic tubing and rigid nonmetallic conduit shall be permitted to support a conduit body no larger than the trade size of the tubing where the conduit body does not support equipment or contain devices other than splicing devices.
FPN: One method of support for conduit bodies is a strap or clamp on at least two hubs secured to structural support.
Substantiation: The provision should apply to permanently installed equipment and include locations below deck level. Support fasteners may be bolts or nail in addition to screws. Sealing of openings may minimize moisture entrance but not prevent it due to cracking and drying of the sealant. Conduit bodies not larger than the trade size of the raceway and not supporting equipment should be substantially equal to the raceway in strength.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no substantiation for the technical changes that have been proposed. The intent of the requirement for sealing of internal screw heads is to prevent the seepage of water through these screw openings. The Code does not define the distinction between a “dock” and a “pier.” No proposal or substantiation has been provided to suggest the need for such distinction.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

(Note: Sequence 119-256a was moved to follow 19-62 on page 727)

19-257 Log #1248 NEC-P19 **Final Action: Reject**
(555.10(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Permanently installed electrical equipment installed on piers or docks ~~above deck level~~ shall be securely ~~and substantially~~ fastened in place and supported by structural members. ~~Independent of any conduit connected to them. if enclosures are not attached to mounting surfaces by means of external cars or lugs the~~ Internal mounting holes ~~screw heads~~ shall be sealed to prevent ~~seepage~~ entrance of water.
Substantiation: Edit. Docks should be included. “Substantially” is subjective and a term to be avoided per the Style Manual. Proposed deletion beginning with “independent” is superfluous. “Conduit” does not include all raceways, such as EMT. The provision should apply to permanently installed equipment and that installed below dock level.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 19-256.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-258 Log #1057 NEC-P19 **Final Action: Reject**
(555.11)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Circuit breakers, ~~and~~ switches, panelboards, power outlets, and cabinets ~~installed~~ in ~~gasketed~~ wet locations shall be listed and identified for the application and externally manually operable arranged ~~to permit manual operation without exposing the interior of the enclosure. All such enclosures shall be arranged with a weep hole to discharge condensation.~~
Substantiation: The provision should include panelboards and power outlets listed and identified for wet locations should be sufficient; all such equipment does not have gaskets. Watertight equipment will not have weepholes.
Panel Meeting Action: Reject
Panel Statement: Insufficient technical substantiation has been provided to support the proposal. Power outlets and other equipment are only intended to be required to be approved for marine use except as specified in 555.19(A).
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-259 Log #4646 NEC-P19 **Final Action: Accept**
(Table 555.12)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: In the header over the left column, revise the wording to “Number of Shore Power Receptacles”.
Substantiation: The submitter has become aware of attempts to include convenience receptacles in the total receptacle numbers, thereby artificially manipulating the applicable demand factors. Although it is possible to reach the desired result through extended code analysis and discussion, this proposal makes it simple.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-260 Log #1233 NEC-P19 **Final Action: Reject**
(555.13)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (A) and substitute:
(A) Wiring Methods.
(1) General. Wiring methods employed shall be identified for the use.
(2) Portable Power Cables. Type G, GC, and W portable power cables shall be permitted as follows:
(1) As fixed wiring on the underside of piers and docks (floating or fixed) where not continuously immersed in water.
(2) Where flexibility is necessary on floating piers or docks. Cables shall be sunlight resistant where exposed to direct rays of the sun.
(A)(3) No change.
Revise (B): Installation.
(B)(1) Overhead Wiring. Overhead wiring shall be installed so as ~~avoid~~ prevent contact with masts and other parts of boats, boat hoists, and movable equipment, ~~being moved~~ in the yard. Overhead conductors and cables shall be routed ~~to avoid wiring closer than~~ not less than 6.0 m (20 ft) from the outer edge of any portion of the yard that ~~can~~ is likely to be used for moving vessels or stepping or unstepping masts.
Delete text of (B)(5) and substitute: Protection. Except as permitted in (A)(2). Rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit identified for the use shall be installed to protect wiring on piers and docks that is not enclosed in buildings or structures. Rigid metal conduit, intermediate metal conduit and fittings shall be threaded or unthreaded with watertight threadless fittings. The conduit of fittings shall be threaded into hubs or threaded openings in enclosures.

Exception No. 1: Threadless watertight connectors shall be permitted for connection to threaded hubs or openings in enclosures.

Exception No. 2: Where connected to sheet metal enclosures, a locknut/bushing connection shall be permitted, provided a sealing type locknut is installed on the outside of the enclosure.

Substantiation: There are only three portable power cables indicated in Table 400 which should be suitable for the use. Article 400 does not specify listing. “Suitable” and “avoid” are terms to be avoided per the Style Manual. “Temperature extreme” is not defined. No portable power cables are indicated as resistant to ozone, acids, or chemicals. IMC is permitted in 553.13(A). Wiring inside of enclosed structures should be excluded. “Connected to enclosures by full standard threads does not prohibit locknut/bushing connections. The present latter part re: special fittings is vague and unclear. Threadless watertight fittings should be acceptable. Proposed Exception No. 2 seems reasonable and safe for connections to enclosures without threaded hubs or openings.

Panel Meeting Action: Reject

Panel Statement: The existing text in 555.13(A)(1), in addition to particular requirements in this section, is sufficient to permit the effective enforcement of the requirements. Other editorial proposals provide no additional clarity. “Threadless watertight fittings” are not readily available.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-261 Log #4732 NEC-P19 **Final Action: Accept in Principle**
(555.13)

Submitter: James M. Imlah, City of Hillsboro

Recommendation: Revise text to read as follows:

555.13 Wiring Methods and Installation.

(B) Installation.

(5) Protection. Rigid metal or ~~nonmetallic~~ <u>rigid polyvinyl chloride</u> conduit <u>(PVC) or reinforced thermosetting resin conduit (RTRC)</u>suitable for the location shall be installed to protect wiring above decks of piers and landing stages and below the enclosure that it serves. The conduit shall be connected to the enclosure by full standard threads. The use of special fittings of nonmetallic material to provide a threaded connection into enclosures on rigid ~~nonmetallic~~ <u>polyvinyl chloride</u> conduit <u>(PVC) or reinforced thermosetting resin conduit (RTRC)</u> employing joint design as recommended by the conduit manufacturer, for attachment of the fitting to the conduit shall be acceptable, provided the equipment and method of attachment are approved and the assembly meets the requirements of installation in damp or wet locations as applicable.

Substantiation: This is an addition from the result of the 2008 NEC adding of new code articles for each of the specific nonmetallic raceways and the conditions for their intended use. Remove the reference of “nonmetallic” and add in each of the specific raceway types. Non-metallic conduit now has four different types of raceways and not all non-metallic raceway types would be acceptable in all locations such as a dock.

Panel Meeting Action: Accept in Principle

See panel action on Proposal 19-268a.

Panel Statement: The panel action on Proposal 19-268a meets the submitter’s intent.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-262 Log #1247 NEC-P19 **Final Action: Reject**
(555.13(A)(1) and (2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise as follows:

(1) <u>Identified</u> wiring methods of Chapter 3 shall be <u>the wiring method(s) employed</u> permitted ~~where identified for use in wet locations~~.

(2) Change “listed” to “identified”.

Substantiation: All wiring methods identified for wet locations may not be suitable for the use. “Permitted” per 90.5(B) is not a requirement. Article 400 does not require listing.

Panel Meeting Action: Reject

Panel Statement: Except as specifically amended in Article 555, the existing text in (1) is correct. Article 555 specifically calls for “listed” extra-hard usage portable cable when used in these applications.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-263 Log #3658 NEC-P19 **Final Action: Reject**
(555.13(A)(2)(3))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Add new (3) to read as follows:

555.13(A)(2)<u>(3) As feeders from the service equipment or means of disconnect to the floating piers or docks.</u>

Substantiation: The current rule does not permit the use of portable power cables as the feeder to the dock. The feeder, in the case of a floating dock requires more flexibility that the wiring on the dock itself and portable power cables are very flexible and well suited for the purpose of supplying power to the dock.

Panel Meeting Action: Reject

Panel Statement: The submitter’s substantiation is incorrect; the use of portable power cables as the feeder to the dock is permitted in 555.13(A)(2) and (B)(4). Portable power cables are prohibited as a means of disconnect.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-264 Log #1062 NEC-P19 **Final Action: Reject**
(555.13(B)(1))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Where used, overhead wiring shall be installed to avoid <u>accidental</u> contact with masts ~~and~~ other parts of boats, <u>boat hoists, dry docks</u>, other structures <u>and movable equipment</u> ~~being moved in the yard~~.

Substantiation: Edit. Accidental contact with hoists, dry docks, and other structures should be included, including boats in the water.

Panel Meeting Action: Reject

Panel Statement: The proposed revisions are not strictly editorial. Insufficient technical substantiation has been provided to support the proposal. The use of “accidental” is not warranted; any contact with masts etc. is to be avoided.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-265 Log #1061 NEC-P19 **Final Action: Reject**
(555.13(B)(2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

Outside branch circuits and feeders shall comply with Parts I, II and III of Article 225. (remainder unchanged).

Substantiation: Edit. Proposal is more specific. Reference should not be made to an entire article per the Style Manual.

Panel Meeting Action: Reject

Panel Statement: The proposed revision does not add to the existing text as Parts I, II, and III comprise Article 225.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-266 Log #969 NEC-P19 **Final Action: Reject**
(555.13(B)(4))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

(1) Cables shall be ~~properly~~ <u>securely</u> supported <u>by approved means</u>

(4) Cables shall not be installed where <u>likely to be</u> subject to physical damage.

Substantiation: “Properly” is subjective and a term to be avoided per the Style Manual. “Likely” is defined as such a nature or circumstance as to make something probable and is used many times throughout the Code.

Panel Meeting Action: Reject

Panel Statement: The term “properly” is correct for this application.

The use of the phrase “likely to be” is not appropriate in this instance as the condition is either evident, or not, at the point of inspection.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-267 Log #4776 NEC-P19 **Final Action: Accept in Principle**
(555.13(B)(4)(b))

Submitter: Julian R. Burns, Quality Power Solutions, Inc.

Recommendation: Add: <u>Exception No. 1 Where listed portable power cables are installed in accordance to the requirements as permitted by 551.13(4)(a) and terminate in a listed marina pedestal/power center employing terminal blocks/bars, the installation of a junction shall not be required.</u>

Substantiation: New listed and advanced marina power pedestals and power centers are available and in today’s applications, boats are the size of mobile homes requiring, in some cases, two 100 Amp feeders. By installing an additional junction box, when the flexible cables can in many cases run continuous from the supply to the power pedestal just provides an additional point for corrosion and burnt up connections. The power pedestals already have the terminal blocks.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(b) Where portable power cables are used as permitted in 555.13(A)(2)(2), there shall be an approved junction box of corrosion-resistant construction with permanently installed terminal blocks on each pier section to which the feeder and feeder extensions are to be connected. <u>A listed marine power outlet employing terminal blocks/bars shall be permitted in lieu of a junction box.</u> Metal junction boxes and their covers, and metal screws and parts that are exposed externally to the boxes, shall be of corrosion-resistant materials or protected by material resistant to corrosion.

Panel Statement: The panel action reformats the proposal to eliminate the addition of a new exception. The panel action meets the intent of the submitter.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-268 Log #4786 NEC-P19 **Final Action: Reject**
(555.13(B)(4)(b))

Submitter: Louis Marcelli, PEICO, Inc.
Recommendation: Delete section 555.13(B)(4)(b) completely.
Substantiation: Section was brought into the NEC from NFPA 303 without comment in the 2002 NEC edition. The apparent original intent of NFPA 303 (1960 was when this verbiage 1st showed up) is now satisfied by modern power pedestals. Loose interpretation of this section is requiring unnecessary connection points, which add additional corrosion points and unnecessary expense to the marina owner. Precedent has been set by the State of Washington passing legislation that this section of the code does not apply in their State (WAC 296-46B-555).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 19-267, which precludes the need to delete the section.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-268a Log #CP1907 NEC-P19 **Final Action: Accept**
(555.13(B)(5))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with regard to the deleted word "full" that was left out of the revised text without explanation.
This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 19,
Recommendation: Revise 555.13(B)(5) as follows:
(5) Protection. Rigid metal, ~~or~~ ~~nonmetallic~~ reinforced thermosetting resin conduit (RTRC) conduit listed for aboveground use, or rigid polyvinyl chloride (PVC) conduit suitable for the location shall be installed to protect wiring above decks or piers and landing stages and below the enclosure that it serves. The conduit shall be connected to the enclosure by standard threads or fittings listed for use in damp or wet locations as applicable. ~~The use of special fittings of nonmetallic material to provide a threaded connection into the enclosures on nonmetallic conduit, employing joint design as recommended by the conduit manufacturer, for attachment of the fitting to the conduit shall be acceptable, provided the equipment and method of attachment are approved and the assembly meets the requirements of installation in damp or wet locations as applicable.~~
Substantiation: The general requirement in 555.13(A) is modified by 555.13(B)(5) to require rigid type conduits. Nonmetallic conduits "suitable for the location…" implies the potential need for resistance to ultra-violet light or perhaps resistance to other effects in the installed environment. Section 300.15 requires all fittings to be listed for use with the specific wiring methods for which they are intended, and Section 314.15 addresses fittings installed in damp and wet locations.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-269 Log #1254 NEC-P19 **Final Action: Reject**
(555.15)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Wiring and equipment within the scope of this article shall be grounded ~~as specified in Article 250~~ and as required by 555.15(A) through (E).
Revise second sentence of (B): The equipment grounding conductor contained within Type MI cable shall ~~be permitted to be~~ identified after it emerges from the cable. ~~at terminations~~
Substantiation: Article 250 has alternatives and exceptions to grounding which do not appear intended to apply. Many sections simply specify "shall be grounded" which leaves no doubt as to intent. Similar requirements worded differently may cause confusion per the Style Manual. "Permitted" per 90.5(B) does entail a requirement.
Panel Meeting Action: Reject
Panel Statement: All of the requirements in Article 250 apply to Article 555 except as modified in 555.15. The panel's proposed text meets the intent of the submitter and clarifies that color coding of the equipment grounding conductor is not required for Type MI cable.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-270 Log #1352 NEC-P19 **Final Action: Reject**
(555.15)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Wiring methods and equipment within the scope of this Article shall be grounded ~~as specified in Article 250~~ and also comply with 555.15(A) through (E).
In (A) add:
(4) Metal yokes and straps of snap switches, dimmers, and other devices.
Revise second sentence of (B):
The equipment grounding conductor contained within Type MI cable shall be ~~permitted to be~~ identified in accordance with 250.119 ~~at terminations~~.
Substantiation: Grounding provisions of Article 250 have exceptions and alternatives which do not appear intended to apply. Many sections simply state: "shall be grounded". Similar provisions stated differently may cause confusion per the Style Manual. Since (A) requires the EGC to be within a cable, that EGC and not the cable sheath, that should be the one to be identified. "Permitted" per 90.5(B) is not a requirement. Metal yokes and straps are required to be grounded by 404.9, but it does not require the EGC to be an insulated copper conductor as required by (B).
Panel Meeting Action: Reject
Panel Statement: See the panel action on proposal 19-269.
The addition of (4): The requirement in 404.9 applies to Article 555 according to 90.3 and has not been modified.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-271 Log #1253 NEC-P19 **Final Action: Reject**
(555.15(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "panelboard" to "distribution equipment".
Substantiation: Edit. A circuit may be supplied by a single individual switch or circuit breaker which is not a "panelboard".
Panel Meeting Action: Reject
Panel Statement: There is currently a definition of the term "panelboard" in Article 100; "distribution equipment" is not defined in Article 100, and its use may lead to confusion. The submitter has provided inadequate substantiation to support the revision.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-272 Log #1060 NEC-P19 **Final Action: Reject**
(555.17(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
The disconnecting means shall ~~be permitted to~~ consist of a circuit breaker, switch, or both...(remainder unchanged).
Substantiation: Edit. "Permitted" is not a requirement per 90.5(B).
Panel Meeting Action: Reject
Panel Statement: The text in 555.17(A) does not presently contain the text the submitter proposes to remove.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-273 Log #1252 NEC-P19 **Final Action: Reject**
(555.17(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
The disconnecting means shall consist of a circuit breaker, switch, or both that simultaneously disconnects all ungrounded conductors of the circuit it controls and shall be ~~properly~~ durably identified as to which receptacle(s) it controls.
Substantiation: Edit. Simultaneous disconnection should be specified as is done in similar sections. (See 3.3.5 of the Style Manual. "Properly" is a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The proposed revisions are not strictly editorial. Insufficient technical substantiation has been provided to support the proposal.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-274 Log #1232 NEC-P19 **Final Action: Reject**
(555.19)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (A)(1) and substitute: Receptacles used to supply shore power to boats or other watercraft in the water shall be supplied from a listed marine power outlet assembly or a receptacle outlet that is weatherproof with the attachment plug inserted or removed. The weatherproof qualities of the power outlet assembly or receptacle outlet shall not be affected when the receptacles are in use with any type of booted or unbooted attachment plug/cap. (See 406.8(2)(a)).

Revise text of (A)(3): Each ~~single~~ receptacle that supplies shore power to boats or other watercraft on the water shall be supplied from a listed marine power outlet assembly ~~or panelboard~~ by an individual branch circuit with voltage and current ratings ~~of the voltage class and rating~~ corresponding to the ratings of the receptacle it supplies. The receptacle shall be provided with ground-fault circuit interruptor protection, overcurrent protection and disconnecting means.

Substantiation: The shore power outlet assembly should be listed. The provision should also apply to watercraft that are not boats, such as floating structures. "Integrity" is not specific as to intent. The provisions should be limited to watercraft on the water. GFCI protection should be specified as it is in 555.19(B). Marine power outlet assemblies are designed for marine use while panelboards generally are not. The definition of Marine Power Outlet does not specify single receptacles. Disconnecting means and overcurrent protection should be specified; the definition of marine power outlet what can be included but there are no specific requirements for GFCI protection, overcurrent protection, or disconnecting means. Disconnecting a 100 ampere pin and sleeve plug under load could be hazardous.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect. Floating structures are regulated by Article 553. The revised text "other watercraft on the water" is ambiguous and unenforceable. Insufficient technical substantiation has been provided to support the proposal. Power outlets and other equipment are only intended to be required to be approved for marine use except as specified in 555.19(A). For 15 A and 20 A receptacles, the requirements are covered by 555.19(B)(1). See the panel statement on Proposal 19-252.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-275 Log #1358 NEC-P19 **Final Action: Accept in Principle in Part**
(555.19(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
In (1), change "buildings" to "structures".
In (2), insert "durably" ahead of "marked".
Substantiation: Edit. All buildings are structures, but all structures are not buildings. Marking should be durable due to atmospheric conditions.
Panel Meeting Action: Accept in Principle in Part
In (1), change "buildings" to "buildings or structures."
Reject the proposed revision to (2).
Panel Statement: The panel action changing "buildings" to "buildings or structures" is consistent with the rest of the Code and meets the submitter's intent.
"Durability" is not an enforceable term.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-276 Log #2446 NEC-P19 **Final Action: Reject**
(555.19(B)(1))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
555.19
(B) Other Than Shore Power.
(1) ~~Ground-Fault Circuit-Interrupter (GFCI)~~ Power Safe Protector Protection for Personnel. 15- and 20-ampere, single-phase, 125-volt receptacles installed outdoors, in boathouses, in buildings used for storage, maintenance, or repair where portable electrical hand tools, electrical diagnostic equipment, or portable lighting equipment are to be used shall be provided with ~~GFCI~~ power safe protector protection for personnel. Receptacles in other locations shall be protected in accordance with 210.8(B).
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There are currently no testing standards for this product. Any testing standards noted in the substantiation are for receptacles in general. The testing reports provided are based on performance results for a specific product.
This proposal is brand-specific. The NEC cannot require a specific brand in any article in the code.
Installation of this device is not currently prohibited by the code.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-277 Log #3015 NEC-P19 **Final Action: Accept**
(555.21, FPN)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Delete the following text:
~~FPN: See 500.4(A) for documentation requirements.~~
Substantiation: This FPN is not necessary, since compliance with 500.4(A) is required in order to utilize the exception. I obviously must "see 500.4(A)" if I am using the exception.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

ARTICLE 590 — TEMPORARY INSTALLATIONS

3-107 Log #1335 NEC-P03 **Final Action: Reject**
(590.1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
The provisions of this article apply to temporary electrical power and lighting installations except as covered by 525.1.
Substantiation: Article 525 covers installations that are or may be temporary with different provisions.
Panel Meeting Action: Reject
Panel Statement: 525.3 already provides the suggested text in accordance with the following:
"525.3 Other Articles.
(A) Portable Wiring and Equipment. Wherever the requirements of other articles of this Code and Article 525 differ, the requirements of Article 525 shall apply to the portable wiring and equipment."
Additional text in Article 590 is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-108 Log #2447 NEC-P03 **Final Action: Reject**
(590.1(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
Article 100
DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.
Substantiation: If 590.6(A) for PSP is accepted, a definition may be required. A proposal is also being sent to Article 100.
Panel Meeting Action: Reject
Panel Statement: This proposed definition is related to both the GFCI definition and the AFCI definition already assigned to Code-Making Panel 2 by the NEC Technical Correlating Committee; therefore, this definition should be assigned to Code-Making Panel 2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-109 Log #1355 NEC-P03 **Final Action: Reject**
(590.1(A), FPN (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
FPN: See Article 520 for theatre and Motion Picture Studios and Article 525 for Carnivals, Circuses, Fairs, and similar events.
Substantiation: Edit. Temporary wiring for Articles 520 and 525 is specifically covered in those articles with no reference to this article.
Panel Meeting Action: Reject
Panel Statement: 590.2 states that all other requirements of the code for permanent wiring shall apply to temporary wiring installations, except as specifically modified by Article 590.
In addition, 525.3(A) further states that wherever the requirements of other articles in the NEC and Article 525 differ, the requirements of Article 525 apply to portable wiring and equipment. Article 520 has specific requirements in Parts IV and V for portable applications that may or may not be temporary installations, where Article 590 might apply. Article 590 would apply unless specifically deemed otherwise by the other article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-110 Log #1357 NEC-P03 **Final Action: Reject**
(590.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change "requirements" to "applicable provisions".
Substantiation: Edit. In addition to requirements, optional exceptions, other provisions, and permitted alternatives should apply.
Panel Meeting Action: Reject
Panel Statement: The text is specific to requirements since all other exceptions, provisions, or permitted alternatives would be permissive based on 90.5(B); therefore, changing the text here is not necessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-111 Log #1066 NEC-P03 **Final Action: Reject**
(590.4)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the actions on Proposals 1-234 and 9-130a.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete(A).
Revise second sentence of (B):
~~Overcurrent protection shall be provided in accordance with 240.4, 240.5, 240.100, and 240.101.~~
Feeders shall originate in an identified ~~approved distribution center~~ switchboard, panelboard, fused switch, or circuit breaker
Substantiation: Edit. Article 240 already applies unless modified. Distribution center is not defined.
Panel Meeting Action: Reject
Panel Statement: The NEC Style Manual permits reference to specific important sections as the referenced sections relate to the application in 590.4(B) for feeders, and this is done throughout the NEC.
"Distribution center" does not need to be defined for commonly used technical terms. The term "distribution board" is used in the scope of Article 408 for switchboards and panelboards.
90.1(C) states the NEC is not intended as an instruction manual for untrained persons and feeder "distribution board or center" is certainly a commonly used technical phrase in the electrical industry.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-112 Log #1234 NEC-P03 **Final Action: Reject**
(590.4)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (H): Protection from Accidental Damage. ~~Flexible cords and cables~~ Temporary wiring methods shall be protected from accidental damage by approved methods where likely to be subject to physical damage. (remained unchanged)
(I) Terminations. ~~at devices Flexible cords and cables entering enclosures containing devices requirinig termination~~ Temporary wiring methods shall be secured to ~~the~~ boxes and other enclosures with fittings ~~designed~~ identified for the purpose, except that single individual conductors shall enter the box or enclosure through bushed fittings.
(J) Support. ~~Cable assemblies and flexible cords and cables~~ Temporary wiring methods shall be supported and fastened in place at approved intervals. ~~That ensure they will be protected from physical damage. Support~~ Fastening shall be in the form of staples, cable ties, straps, or ~~similar type fittings~~ other approved means installed so as not to cause damage. (remainder unchanged)
In the Exception, change "proper" to "identified".
Substantiation: Single conductors permitted by the Exception for 590.4(B) should be included. Fastening should be included at supports. Support does not ensure protection from damage: (H) requires protection. "Proper" in the exception is subjective and a term to be avoided per the Style manual. Whether or not enclosures contain devices is irrelevant.
(I) should apply where conductors are spliced and soldered in enclosures.
Panel Meeting Action: Reject
Panel Statement: 590.4(H) specifically covers flexible cords and cable that may be subject to damage. Changing the text to apply to all temporary wiring is unnecessary since most other wiring methods have specific coverage for physical protection. 110.2 already requires approval of wiring methods as well as whether protection is necessary therefore, the suggested change "approved methods where likely to be subject to physical damage" is a judgment call by the AHJ and the change is unnecessary.
The suggested changes in (I) are unnecessary since single individual conductor entrance into an enclosure is already covered in 300.3(A), 300.3(B), and 300.20, as well as other areas of the NEC.
The suggested changes in (J) are unnecessary since cable assemblies can be adequately supported with securing or fastening, as methods of supporting the cable assemblies and flexible cords and cables.
For example, heavy-duty tie wraps can be used for temporary support where connected to overhead trusses or joists. Approved means is not required since 110.2 already provides for approval.
Relative to the word "proper" in the exception, see the panel action and substantiation on 3-133a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-113 Log #1308 NEC-P03 **Final Action: Reject**
(590.4(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Delete "permitted" in third sentence.
Substantiation: Edit. The provision should be a requirement; 90.5(B) indicates the provision is allowed, but not required by the use of "permitted".
Panel Meeting Action: Reject
Panel Statement: Removing the word "permitted" would indicate the only wiring method that could be used would be "within cable assemblies or within multiconductor cords or cables of a type identified in Table 400.4 for hard usage or extra-hard usage".
Feeder conductors could certainly be used in other methods also.
The exception to 590.4(B) would also permit single insulated conductors to be used where installed for the purposes of 590.3(C).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-114 Log #1227 NEC-P03 **Final Action: Reject**
(590.4(B) Exception and (C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Single insulated circuit conductors and insulated or bare equipment grounding conductors shall be permitted for the purpose specified in 590.3
(C)Where accessible only to qualified persons. A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a transition is made to a different wiring method.
Substantiation: The provision should clearly include grounding conductors. Proposed last sentence is similar to (G) which doesn't cover single conductors.
Panel Meeting Action: Reject
Panel Statement: Inserting "circuit" into the text in the exception is unnecessary since the exception applies to feeder conductors directly in the section above.
Permission to install single insulated or bare equipment grounding conductors is in 250.120(C), 250.130, and other places within Article 250, and since the equipment grounding conductor would be part of the feeder, inserting grounding conductors into the text is unnecessary.
The proposed text in (C) is already covered in 300.15, 300.16, and in 590.4(G).
There was no technical substantiation provided for the changes, and the panel is unsure about the intent of the proposal.
The submitter is very vague about both intent and substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-115 Log #1334 NEC-P03 **Final Action: Accept in Part**
(590.4(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
All branch circuits shall originate in an approved power outlet, switchboard, panelboard, motor control center, fused switch, or circuit breaker.
Substantiation: Edit. Branch circuits may also originate from the proposed additional equipment.
Panel Meeting Action: Accept in Part
The panel accepts all of the recommended changes to the proposed first sentence, except the words "or circuit breaker" to read as follows:
"(C) **Branch Circuits.** All branch circuits shall originate in an approved power outlet switchboard or panelboard, motor control center, or fused switch enclosure."
Panel Statement: The panel accepted all of the changes with the exception of the words "or circuit breaker" since the branch circuit cannot originate within a circuit breaker.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
PACE, D.: The proposal should have been rejected. The current text in 590.4(C) is appropriate. The revised text is redundant. Switchboards, Motor Control Centers and Fused Switches are power outlets as defined in Article 100. Addition of these items will create confusion. Many will interpret that these are the only things that a temporary branch circuit can originate in. Additionally, a single circuit breaker can be installed in an enclosure and used as a power outlet. The panel statement will lead people to think that circuit breakers can not be used for temporary branch circuits. If the panel wants to revise the text then it should be revised to read follows:
"Branch Circuits. All Branch Circuits shall originate in an approved power outlet, switchboard, panelboard, motor control center, or fused switch or circuit breaker enclosure."

3-116 Log #648 NEC-P03 **Final Action: Reject**
(590.4(C)(1) (New))

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Add a new subsection (1) to 590.4(C).
(1) Construction Site Lighting. On construction sites, temporary lighting shall be installed on a dedicated branch circuits without receptacles.
Substantiation: The intent of the change is to clarify the no receptacles requirement on construction site temporary lighting as stated in 590.4(D), and which eliminates the possibility of connecting temporary lighting stringers to GFCI protected receptacle circuit. The dedicated branch circuit without receptacles as required by 590.4(D) or contact points (cord cap and cord plugs) would ensure that construction workers would not be able to connect any power tools or equipment that could cause the activation of a fuse, circuit breaker, or GFCI, due to a fault or equipment overload, that would de-energize the lighting circuit.
Panel Meeting Action: Reject
Panel Statement: The third sentence in 590.4(D) already states that receptacles must not be installed on branch circuits that supply temporary lighting; therefore, the proposed text for (C) is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-117 Log #649 NEC-P03 **Final Action: Reject**
(590.4(C)(1) (New))

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Add a new subsection (1) to 590.4(C).
(1) Construction Site Lighting. On construction sites, temporary lighting shall be installed on a dedicated branch circuits.
Substantiation: The intent of the change is to clarify the no receptacles requirement on construction site temporary lighting as stated in 590.4(D), and which eliminates the possibility of connecting temporary lighting stringers to GFCI protected receptacle circuit. The dedicated branch circuit without receptacles as required by 590.4(D) or contact points (cord cap and cord plugs) would ensure that construction workers would not be able to connect any power tools or equipment that could cause the activation of a fuse, circuit breaker, or GFCI, due to a fault or equipment overload, that would de-energize the lighting circuit.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-116.
While this proposal does not include the phrase "without receptacles," the substantiation and intent is the same as in Proposal 3-116.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-118 Log #974 NEC-P03 **Final Action: Reject**
(590.4(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Unless installed in a continuous metal raceway or metal covered cable that qualifies as an equipment grounding conductor in accordance with 250.118 ~~or a continuous metal covered cable that qualifies as an equipment grounding conductor in accordance with 250.118~~ all ~~branch~~ lighting and power circuits shall contain a separate wire-type equipment grounding conductor or be provided with an equipment bonding conductor. ~~And all receptacles shall be electrically connected to the equipment grounding conductor.~~
Substantiation: Edit. Proposal eliminates unnecessary wording. "Lighting and power" circuits will include feeders. Since metal raceways and metal covering of cables are literally separate conductors, a wire type should be specified. Bonding conductors should be permitted where, for example, a raceway or cable that does not qualify as an EGC is interposed between raceways cables or equipment that does qualify as an EGC. Section 406.3(B) already applies and covers grounding of receptacles, as does 404.9(B) for switches, which is not specified in this article.
Panel Meeting Action: Reject
Panel Statement: The existing text in this section does not have unnecessary wording.
The first sentence that the submitter has recommended to delete ensures that all receptacles must be of the grounding type and must remain.
The phrase "that qualifies as an equipment grounding conductor in accordance with 250.118" has been repeated to ensure that it applies to both continuous metal raceways and to continuous metal cables.
The requirement applies to "all branch circuits," and there was no technical substantiation to replace it with "lighting and power" branch circuits.
Compliance with Articles 250 and 406 are already a requirement, and this section does not deal with switches in Article 404, therefore; the other suggested changes are unnecessary. The existing text ensures compliance with the appropriate requirements for connecting receptacles to an equipment grounding conductor.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-119 Log #1306 NEC-P03 **Final Action: Reject**
(590.4(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
All receptacles shall be of the grounding type. Unless installed in a continuous metal raceway or a continuous metal covered cable that qualifies as an equipment grounding conductor in accordance with 250.118, all branch circuits shall include a separate wire-type equipment grounding conductor and all receptacles shall be connected to the equipment grounding conductor. Receptacles on construction sites shall not ~~be installed on branch circuits~~ connected to an ungrounded circuit conductor that supplies temporary lighting. ~~Receptacles shall not be connected to the same ungrounded conductor of multiwire circuits that supply lighting.~~
Substantiation: Edit. Metal covered cables should be included. Receptacles should not be connected to ungrounded conductors of circuits supplying lighting whether or not multiwire.
Panel Meeting Action: Reject
Panel Statement: The suggested change for a continuous metal cable is already in the existing text and the existing last two sentences are very clear and concise as to their application with the suggested text introducing a possibility of misapplication.
Receptacles must not be installed on individual or multiwire branch circuits with lighting, and the existing text provides that requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-120 Log #3016 NEC-P03 **Final Action: Reject**
(590.4(D))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
(D) Receptacles. All receptacles shall be of the grounding type. ~~Unless installed in a continuous metal raceway that qualifies as an equipment grounding conductor in accordance with 250.118 or a continuous metal-covered cable that qualifies as an equipment grounding conductor in accordance with 250.118, all branch circuits shall include a separate equipment grounding conductor, and all receptacles shall be electrically connected to the equipment grounding conductor(s).~~ Receptacles on construction sites shall not be installed on branch circuits that supply temporary lighting. Receptacles shall not be connected to the same ungrounded conductor of multiwire circuits that supply temporary lighting.
Substantiation: The proposed deleted text is simply repetitive text. These provisions are already found in Article 250, and nothing in Article 590 supplements or modifies the requirements (90.3).
Panel Meeting Action: Reject

Panel Statement: The existing text makes it clear to the user of the NEC that the continuous metal raceway or metal cable assembly requirement qualifies as an equipment grounding conductor.

It emphasizes the importance of the grounding path since an installer of a temporary branch circuit to a receptacle may try to install a splice in the conductors without proper connection to the grounding system (mid-span tap from an MC cable without the proper connection to both the metal cable sheathing and the equipment grounding conductor as the complete path for possible fault current).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-121 Log #3345 NEC-P03 **Final Action: Reject**
(590.4(D))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete last two sentences and substitute:

Branch circuits (including multiwire circuits) that supply temporary lighting shall not supply receptacles or any other type of equipment. Ground-fault circuit interrupter protection shall not be installed for branch circuits or feeders supplying temporary lighting.

Substantiation: These provisions are apparently intended to minimize outages of lighting circuits and should apply to other than construction sites (demolition, emergencies, tests, experiments, etc.) Equipment other than receptacles, such as motors, electric welders, etc., may cause outages. A 2-pole common trip circuit breaker in compliance with the last sentence will not prevent outage of the lighting circuit if one ungrounded conductor supplying receptacles is overloaded and trips the circuit breaker. GFCI protection can also cause outages.

Panel Meeting Action: Reject

Panel Statement: This section only covers receptacles and the branch circuits supplying the receptacles in accordance with the title of the subsection, therefore; coverage of temporary lighting with other electrical equipment on the branch circuit is not appropriate here.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-122 Log #3702 NEC-P03 **Final Action: Reject**
(590.4(D))

TCC Action: The Technical Correlating Committee directs this proposal be reconsidered and correlated with the action taken on Proposal 18-54.

This action will be considered by the panel as a public comment.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise 590.4(D) as follows:

(D) Receptacles.

<u>(1) All Receptacles.</u> All receptacles shall be of the grounding type. Unless installed in a continuous metal raceway that qualifies as an equipment grounding conductor in accordance with 250.118 or a continuous metal-covered cable that qualifies as an equipment grounding conductor in accordance with 250.118, all branch circuits shall include a separate equipment grounding conductor, and all receptacles shall be electrically connected to the equipment grounding conductor(s). Receptacles on construction sites shall not be installed on branch circuits that supply temporary lighting. Receptacles shall not be connected to the same ungrounded conductor of multi-wire circuits that supply temporary lighting.

<u>(2) Receptacles in Wet Locations.</u> <u>15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall comply with Section 406.8(B)(1).</u>

Substantiation: This proposal, and the companion proposal in Section 406.8(B)(1) recognize that more durable products already exist that will help ensure that the degree of protection for receptacles envisioned by the requirement in 406.8(B) will be retained in these harsher use environments. Requirements for listed “extra-duty” outlet box hoods are under development in UL 514D.

The durability of presently listed outlet box hoods provided for compliance with the requirements in Section 406.8(B)(1) has been called into question by an increasing number of inspection authorities. NEMA manufacturers of these outlet box hoods have proposed more rigorous performance requirements in UL 514D to improve the general durability of all listed hoods. However, the inspection authorities that have been consulted during NEMA’s investigation have indicated that outlet box hoods in particular installations are more susceptible to damage. Among these are temporary installations in wet locations such as construction jobsites, with enclosures with enclosed receptacles supported from grade as described in Section 314.23 (B) and enclosures with enclosed receptacles supported as described in Section 314.23 (F).

This proposal reinforces that the present requirement in Section 406.8(B)(1) applies to temporary installations and complements the companion proposal in that Section by accentuating that certain applications require outlet box hoods of the “extra-duty” type.

Panel Meeting Action: Reject

Panel Statement: The panel rejects the proposed change in 590.4(D).

The panel notes that the proposal to add extra duty outlet box hoods in a wet location in a proposed revision to 406.8(B)(1) must first be accepted by Code-Making Panel 18.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

EASTER, L.: Based on the action taken by CMP 18 on proposal 18-54, a NEMA vote to against the panel action is appropriate. CMP18 Accepted in Principle, the companion proposal (18-54) that adds requirements for listed “extra duty outlet box hoods”. The substantiation provided for the proposal in 590.4(D) is consistent with the proposal and action taken in 406.8(B)(1). Field reports indicate that presently listed While in Use (WIU) covers are not sufficiently robust for jobsite applications.

3-123 Log #4569 NEC-P03 **Final Action: Accept in Principle**
(590.4(D))

Submitter: Phil Simmons, Simmons Electrical Services

Recommendation: Revise the existing text of the 2008 NEC as follows:

(D) Receptacles. All receptacles shall be of the grounding type. Unless installed in a continuous metal raceway that qualifies as an equipment grounding conductor in accordance with 250.118 or a continuous metal-covered cable that qualifies as an equipment grounding conductor in accordance with 250.118, all branch circuits shall include a separate equipment grounding conductor, and all receptacles shall be electrically connected to the equipment grounding conductor(s). Receptacles on construction sites shall not be ~~installed on~~ <u>connected to the same individual, general purpose, or multiwire</u> branch circuits that supply temporary lighting. ~~Receptacles shall not be connected to the same ungrounded conductor of multiwire circuits that supply temporary lighting.~~

Substantiation: Lighting on construction sites should not be connected to the same branch circuit(s) that supply receptacles to help ensure that areas are not put into darkness due to the operation of portable power tool. This is important for all types of branch circuits, not just to the same conductor of multiwire branch circuits. Since 210.4(B) requires simultaneous disconnection of multiwire branch circuits, it is important that the lighting equipment not be on any of the multiwire branch circuit conductors.

Panel Meeting Action: Accept in Principle

The panel accepts the deletion of the last sentence.

In the recommended text, delete the last sentence, add “any” to the second to last sentence, make “circuits” a singular “circuit”, and change “supply” to “supplies” to read as follows:

“Receptacles on construction sites shall not be installed on any branch circuit that supplies temporary lighting.”

Panel Statement: Adding the word “any” to the sentence and making “circuits” singular will ensure that all branch circuits will be covered, such as individual, other than individual, multiwire, or general purpose branch circuits.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

CASPARRO, P.: I support the action taken by the Panel on this proposal.

3-124 Log #549 NEC-P03 **Final Action: Reject**
(590.4(E))

Submitter: Margarito Aragon, Jr., Aragon’s Electrical Consulting

Recommendation: Delete the second sentence.

590.4(E) Disconnecting Means. Suitable disconnecting switches or plug connectors shall be installed to permit the disconnection of all ungrounded conductors of each temporary circuit. ~~Multiwire branch circuits shall be provided with a means to disconnect simultaneously all ungrounded conductors at the power outlet or panelboard where the branch circuit originated.~~ Identified handle ties shall be permitted.

Substantiation: To conform to the Style Manual. Section 210.4(B) already requires the disconnecting simultaneously of all ungrounded conductors on multiwire branch circuit and applies per 90.3

Panel Meeting Action: Reject

Panel Statement: Repeating this very important requirement in 590.4(E) helps remind the user of the NEC that simultaneous disconnection of multiwire branch circuits for a temporary installation is a safety issue.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-125 Log #1356 NEC-P03 **Final Action: Reject**
(590.4(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
~~Suitable~~ Identified disconnecting switches, circuit breakers, or plug connectors shall be installed to ~~permit the disconnection of~~ simultaneously disconnect all ungrounded conductors of each temporary circuit.
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual. Simultaneous disconnection should apply to all circuits not just multiwire, such as 2-wire and 3-phase.
Panel Meeting Action: Reject
Panel Statement: The definition of "identified" uses the term "suitable." The substantiation has not identified a problem with the use or misuse of the term "suitable" in this particular application. The suggested change for "simultaneous disconnection" of a single circuit breaker in an individual branch circuit is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-126 Log #1449 NEC-P03 **Final Action: Reject**
(590.4(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: A switch or circuit breaker, or plug connector that simultaneously disconnects all ungrounded conductors of the circuit it controls shall be installed at the point where the circuit originates. Identified handle ties shall be permitted.
Substantiation: Edit. "Suitable" is a term to be avoided per the Style Manual. Circuit breakers should be included, and the provision should also apply to feeders. Circuits may originate from single fused switches or circuit breakers which are not power outlets (not defined) or panelboards.
Panel Meeting Action: Reject
Panel Statement: A circuit breaker can be considered to be a switch as covered in 404.8(A), therefore, the existing text adequately covers the requirements for disconnecting ungrounded conductors without starting a laundry list of "switches."
See the panel statement for Proposal 3-125 for the term "suitable."
The additional proposed text does not add any further clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-127 Log #3017 NEC-P03 **Final Action: Reject**
(590.4(E))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
(E) Disconnecting Means. Suitable disconnecting switches or plug connectors shall be installed to permit the disconnection of all ungrounded conductors of each temporary circuit. ~~Multiwire branch circuits shall be provided with a means to disconnect simultaneously all ungrounded conductors at the power outlet or panelboard where the branch circuit originated. Identified handle ties shall be permitted.~~
Substantiation: The proposed deleted text is no longer needed, now that all multiwire branch circuits require simultaneous disconnect [210.4(B)].
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-124.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-128 Log #4179 NEC-P03 **Final Action: Accept in Principle**
(590.4(E))

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: Delete text as follows:
Receptacles shall not be connected to the same ~~ungrounded conductor of~~ multiwire branch circuits that supply temporary lighting.
Substantiation: Art. 590.4(E) requires, that IF a multiwire branch circuit is installed onto a breaker, that it must be installed onto a multi-pole (common trip or tie handles) breaker. If a short circuit or over current were to occur in the outlet portion of this circuit, it would cause the breaker to trip, leaving a work area without power to outlets AND lights. Workers attempting to locate the problem, reset the breaker, or to leave the area, are at increased risk of injury due to the lack of lighting. If all multiwire branch circuits were restricted to ONLY lighting or outlets, I believe that a much safer work site will occur, while still allowing multiwire branch circuit(s) to be utilized.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 3-123, which addresses the submitter's concern.
This proposal is not dealing with text in 590.4(E) but rather text in 590.4(D).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-129 Log #4467 NEC-P03 **Final Action: Reject**
(590.4(E))

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: Revise text to read as follows:
~~Identified t~~Tie handles shall not be permitted.
Substantiation: All other locations [see 210.4 (B)] in the code that involve multiwire branch circuits now require a common trip breaker. Typically, temporary panels used for job site power are beat up, banged around, and generally abused. It would be very easy for a tie handle to come loose, fall off, or otherwise become non-functional, thus turning this "multiwire" branch circuit into 2 or even 3 single pole circuits, thus increasing the chance of neutral backfeed and the resulting shock hazard.
Panel Meeting Action: Reject
Panel Statement: The substantiation is incorrect. 210.4(B) states each multiwire branch circuit shall be provided with a means to simultaneously disconnect all ungrounded conductors. The simultaneous disconnection could be with a handle tie. 240.15(B) also permits handle ties in three different applications.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-130 Log #4570 NEC-P03 **Final Action: Reject**
(590.4(E))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing text of the 2008 NEC as follows:
(E) Disconnecting Means. Suitable disconnecting switches or plug connectors shall be installed to permit the disconnection of all ungrounded conductors of each temporary circuit. ~~Multiwire branch circuits shall be provided with a means to disconnect simultaneously all ungrounded conductors at the power outlet or panelboard where the branch circuit originated. Identified handle ties shall be permitted.~~
Substantiation: Section 210.4(B) requires that multiwire branch circuits be provided with simultaneous disconnecting means at the point the branch circuit originates. This identical requirement is not required in Article 590 due to the provisions of 90.3.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 3-124.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-131 Log #1228 NEC-P03 **Final Action: Reject**
(590.4(G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
~~On construction sites a~~ A box or other enclosure shall not be required for splices ~~or junction connections~~ where the circuit conductors are multiconductor flexible cord or flexible cable assemblies or Type NM or NMC cables, provided that the equipment grounding conductor continuity in maintained ~~with or without the box~~ and there is no strain on the splices. See 110.14(B) and 400.9. ~~A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made to a conduit or tubing system or a metal sheathed cable system.~~
Substantiation: If this provision is suitable for construction sites, it should be suitable for all temporary wiring. Flexible cables of Article 400 should be included. This provision primarily addresses splices for certain wiring methods that are not conduit, tubing, or metal cables. The last sentence is superfluous and already covered by other provisions in the Code. It doesn't cover metallic cables that are not sheathed (Type AC). It requires a box, conduit body or terminal fitting where a change from conduit to tubing is made even though this transition is commonly with a coupling which is not a "terminal fitting". Open splices should be protected against strain. "With or without the box" is irrelevant since a box is not required.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to limit the multiconductor cord or cable assemblies to flexible cord or NM cable. There also was no technical substantiation provided to expand this permitted use from construction sites to other types of temporary installations.
The last sentence should not be deleted and is not superfluous since it reinforces the requirement for transitioning between cords and cable assemblies to raceways or cords to metal sheathed cable assemblies.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-132 Log #1495 NEC-P03 **Final Action: Reject**
(590.4(G))

Submitter: Robert G. Fahey, City of Janesville
Recommendation: Add new text as follows:
(G) Splices on construction sites, a box shall not be required for splices or junction connections where the circuit conductors are multiconductor cord or cable assemblies, provided (1) the splices are not readily accessible, and (2) that the equipment grounding continuity is maintained with or without the box. See 110.14(B) and 400.9. A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made to a conduit or tubing system or a metal-sheathed cable system.
Substantiation: The problem I have encountered on a construction site, is the electrical contractor has installed service entrance cable (SER) to a job trailer, the contractor has sleeved the SER cable to protect it from physical damage, but has spliced 2 different SER cables together on top of the earth where it is accessible to the public and others who may not be familiar with the risks of an open splice. The other concern I have with this installation, is the individual conductors are accessible and risk the possibility of damage, by inserting the wording "not readily accessible", it will require open splices to be located where they are not readily accessible, in other words they will be located where these open splices cannot be touched or accessed by anyone without the use of a ladder.
Panel Meeting Action: Reject
Panel Statement: Adding the wording that splices shall not be readily accessible does not prevent the possibility of physical damage or that another trade will not have access to the splice.
Temporary splices on a construction site can be adequately installed where the splice is not a danger to anyone on the site.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-133 Log #1337 NEC-P03 **Final Action: Reject**
(590.4(J))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Cable assemblies and flexible cords and cables utilized as branch circuits or feeders shall be securely supported in place at intervals that minimize the likelihood of physical damage ~~ensure that they will be protected from physical damage~~. (remainder unchanged).
Substantiation: This provision should be limited to flexible cords and cables used as branch circuits and feeders; it is not practical for cords used for or attached to portable equipment. Support in itself does not "ensure" protection from physical damage.
Panel Meeting Action: Reject
Panel Statement: Since services and service conductors based on 590.4(A) must comply with the requirements in Article 230, the supporting section in (J) will only apply to feeders and branch circuits based on 590.4(B) and (C).
Appropriately, supporting cable assemblies, as well as flexible cords and cables, can help ensure that undue stress and strain does not occur to cause damage to the cables.
The substantiation does not provide any information on what is considered "securely" supported.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-133a Log #CP300 NEC-P03 **Final Action: Accept**
(590.4(J), Exception)

Submitter: Code-Making Panel 3,
Recommendation: In 590.4(J) Exception, remove the word "proper".
Substantiation: The word "proper" is vague and unenforceable.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-134 Log #1595 NEC-P03 **Final Action: Reject**
(590.4(J) Exception)

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Revise text to read as follows:
Exception: (~~For holiday lighting~~) In accordance with 590.3(B), where the conductors or cables are arranged with proper strain relief devices, tension take up devices, or other approved means to avoid damage from the movement of the live vegetation, trees shall be permitted to be used for the support of overhead spans of (feeder or) branch-circuit conductors or cables.
Substantiation: The intent of my original proposal for the 2005 NEC (May 2004 ROP Proposal 3-119, Log 2512, Section 527.4(J) exception) was not to limit this application to "holiday lighting" only, but to allow this use for other installations such as quickly arranging a temporary power source for parking lot lighting where the pavement may need to be excavated in order to make repairs to a damaged underground cable or pipe. Stringing up temporary power through trees is a quick way to restore power temporarily. Finding the faulty underground wiring using faultfinders and cable locators, and then hiring an excavator to dig up a parking lot so permanent repairs can be made and the power restored can be time consuming. This can be of great concern for people's safety and security if the lights were to remain dark for an extended period of time. Using trees to support some overhead wires can be a quick temporary solution that would still be subject to 90 days' usage.
Panel Meeting Action: Reject
Panel Statement: The ninety-day limit has applied only to Christmas lighting and holiday lighting since its insertion into the NEC in the 1980s.
The exception permitting overhead spans to support holiday lighting was inserted in 590.4(J), Exception in the 2005 NEC to permit very limited applications for holiday lighting and was never intended to apply to parking lighting and much heavier load applications. The chafing and possible insulation damage to overhead conductors that can occur while supported by live vegetation has been a major issue.
To again allow trees and other vegetation to support temporary installations, besides holiday lighting, brings up an enforcement issue: How does the AHJ evaluate the load bearing characteristics of a tree limb?
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-135 Log #1336 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and 590.6(B). ~~This section shall only apply to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, repair, or demolition of buildings structures, equipment, nor similar activities.~~
Substantiation: Temporary wiring as covered in 590.3(A) and (B) can describe installations covered by Article 525. Section 525.23(A) has different requirements for GFCI protection.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any substantiation, technical or otherwise, to delete the sentence for GFCI protection requirements in 590.6 covering "temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities."
The submitter is correct in his statement that Article 525, covering fairs and circuses, has different requirements for GFCI protection than Article 590; however, that is not a reason for deleting the sentence in 590.6.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-136 Log #3601 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text to read as follows:
590.6 Ground-Fault Protection for Personnel.
Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and (B). This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities. This section shall apply to power derived from an electric utility company or from an on-site-generated power source.
Where ground-fault circuit interrupter protection for personnel is supplied by plug-and-cord-connection to the branch circuit or to the feeder, the GFCI protection shall be listed as portable GFCI protection or provide a level of protection equivalent to a portable GFCI, whether assembled in the field or at the factory.
(A) Receptacle Outlets. All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit-interrupter protection for personnel. If a receptacle(s) is installed or exists as part of the permanent wiring of the building or structure and is used for temporary electric power, ground-fault circuit-interrupter protection for personnel shall be provided. ~~For the purposes of this section, cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.~~
[remainder of 590.6 unchanged by this Proposal]
Substantiation: "Portable GFCIs" are required by the trinational *Standard for Ground-Fault Circuit-Interrupters, NMX-J-520-ANCE-2006* 1, *CSA C22.2 No. 144.1-06* 2, *ANSI/UL943-2005* 3, Clause 6.7.2.1, and construction-site portable power-distribution equipment is similarly required by standard *Portable Power-Distribution Equipment, UL1640* 3, Clauses 53.3 - 53.5 and 63.3 - 63.4, additionally to de-energize the "load" output contacts and terminals when one or more of the following defects occurs:

the grounded conductor to the power supply is opened

the grounded conductor is transposed with an ungrounded conductor to the power supply

one of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened

When Underwriters Laboratories (in UL product category KCXS) and CSA International (in CSA product class 1451-81) list such GFCI products, both certifiers specifically identify these as "portable GFCIs" to differentiate them from other GFCIs. Listed portable GFCIs can be embodied not only as GFCI plugs and in-line GFCI cord sets but even some GFCIs for permanent wiring such as SOME faceless GFCI receptacles can be additionally Listed and identified as portable GFCIs.

[1] Asociación de Normalización y Certificación (Association of Standardization and Certification),

[2] Canadian Standards Association

[3] Underwriters Laboratories Inc.

When conventional GFCIs intended for permanent, inspected hard-wiring are used in what should be portable GFCI applications, where the any of the indicated defect conditions occur, the ground-fault-detection circuitry is NOT powered and the GFCI protection cannot operate but power is nonetheless delivered UNinterrrupted EVEN IN THE PRESENCE OF A GROUND-FAULT. Any GFCI protection the user assumes is present is in fact UNAVAILABLE.

Amongst those NOT directly involved in GFCI manufacture who are nonetheless involved with this *Code*, there is a significant misperception that GFCI protection of personnel will provide a panacea against ALL causes of lethal electric shock. Due to their misunderstanding of the differences between GFCIs for permanent installation and portable GFCIs, a significant number of cord reel manufacturers unwittingly extrapolated their Listings for portable (cord-and-plug-connected) cord reels [having ordinary receptacles as outlet components] and their Listings for HARD-WIRED cord reels acceptably having GFCI receptacles as outlet components, without the overt knowledge of at least two major certifiers, to incorrectly encompass portable (cord-and-plug-connected) cord reels having GFCI receptacles (no open neutral protection) as outlet components where portable GFCI protection (with open neutral protection) was warranted.

It is also common to find cord-and-plug-connected field assemblies employing GFCI receptacles (no open neutral protection) as outlet components rather than portable GFCI protection (with open neutral protection) of the outlets. Some times, these are field repairs misperceived as safety upgrades where conventional receptacles in plug-and-cord-connected equipment are replaced with conventional GFCI receptacles. Furthermore, field repairs of plug-and-cord-connected equipment are occasionally encountered where portable GFCIs (faceless-receptacle-type) have been field-replaced with more-readily available, conventional GFCI receptacles under the mistaken belief that they are equivalent. In either situation, where the indicated defects occur, the user has a false sense of security because power is still delivered.

Companion proposals have been made to 100 "Ground-Fault Circuit Interrupter (GFCI), *Portable (as applied to ground-fault circuit interrupters)*" [NEW], to 210.8, to 215.9, and to 518.3(B)*.

* NOTE: That 518.3(B) proposal regarding portable GFCI protection is separate from another proposal I submitted for 518.3(B) involving GFCI protection required elsewhere in the *Code*.

Panel Meeting Action: Reject

Panel Statement: The last sentence in 590.6(A) provides the requirement for cord sets and/or devices incorporating listed ground-fault circuit-interrupter protection for personnel to be identified for portable use, thereby covering the open neutral requirement for portable GFCI devices. Cord and plug connected GFCIs can be supplied by a branch circuit (the final overcurrent protective device to the outlet), but the proposed text has also inserted feeders.

No technical substantiation has been provided for including the use of feeders and the requirement for open neutral GFCI protection.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-137 Log #3661 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Melvin K. Sanders, TECo., Inc.

Recommendation: Revise text as follows:

590.6 Ground-Fault Protection for Personnel. Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) ~~and~~ or 590.6(B).

Substantiation: The literal wording of the present text requires both (A) and (B) to be employed. By changing the term "and" to "or", the original intent of this statement would be clarified.

The result will be to continue to allow instances where receptacle outlets not meeting the conditions of 590.6(A) to utilize both parts of 590.6(B).

Panel Meeting Action: Reject

Panel Statement: The intent of 590.6(A) is to require all 125-volt 15-, 20-, and 30-ampere single phase receptacles, not part of permanent wiring, to be GFCI protected where used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities.

The intent of 590.6(B) is to require all other receptacles other than those in 590.6(A) to be GFCI protected or use the "assured equipment grounding conductor program".

By replacing "and" with "or", the user of this section could pick either (A) or (B), but would not be required to do both.

This could leave 15-, 20-, and 30-ampere 125-volt receptacles without GFCI protection or all others without GFCI protection.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-138 Log #3871 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Mike Weitzel, Bechtel

Recommendation: Revise text to read as follows:

590.6 Ground-Fault Protection for Personnel. Ground-fault circuit interrupter protection for personnel... utility generated power source.

Substantiation: It seems appropriate to clarify that the fault protection supplied this section is the circuit-interrupter type with the objective of protecting personnel, and not to protect equipment, in this case. Clarification from the Code panel will be appreciated.

Panel Meeting Action: Reject

Panel Statement: If only GFCI protection were being applied in this section, then it would be appropriate to make the change suggested by the submitter; however, the assured equipment grounding conductor program is a form of ground-fault protection for personnel by ensuring that all cord sets and equipment connected by cord and plug have a verified grounding path by testing before first use on the site, when there is evidence of damage, before equipment is returned to service following any repairs and at intervals not exceeding 3 months.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-139 Log #4416 NEC-P03 **Final Action: Accept in Principle**
(590.6)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.

Recommendation: 590.6 Ground-Fault Protection for Personnel. Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and (B). ~~This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities.~~ This section shall apply to power derived from an electric utility company or from an on-site-generated power source. For the purposes of this section, cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.

(A) Receptacle Outlets. Temporary receptacle installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities shall comply with the requirements in 590.6(A)(1) through 590.6(A)(4), as applicable.

(1) Receptacle Outlets Not Part of Permanent Wiring. All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit-interrupter protection for personnel.

(2) Receptacle Outlets Existing or Installed as Permanent Wiring. All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets ~~If a receptacle(s) is~~ installed or existing as part of the permanent wiring of the building or structure and ~~is~~ used for temporary electric power, shall be provided with ground-fault circuit-interrupter protection for personnel.

(3) Receptacles on 15 kW or less Portable Generators. All 120 and 120/240 volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are a part of a 15 kW or smaller portable generator shall have listed ground-fault circuit interrupter protection for personnel.

(4) Receptacle Outlets in Industrial Establishments. ~~Exception:~~ In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power were interrupted or having a design that is not compatible with GFCI protection.

(B) Use of Other Outlets. For temporary wiring installations, ~~R~~ receptacles, other than those covered by 590.6(A)(1) through 590.6(A)(4)~~, 125-volt, single-phase, 15-, 20-, and 30-ampere receptacles~~ used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities, shall have protection in accordance with (B)(1) or the assured equipment grounding conductor program in accordance with (B)(2).

(Remainder of subsection to remain as is.)

Substantiation: A similar change has been proposed in new 445.20 requiring all 125-volt, single phase, 15-, 20-, and 30-ampere on 15 kW or smaller generators to be GFCI protected but not requiring GFCI protection for 20-ampere, 30-ampere, and larger 120/240 single phase, 3-wire with ground receptacles as well as 3-phase receptacles so a small generator could be connected to a transfer switch for a house or a small commercial building where the potential for shock is much less than on a construction site. Providing the proper transfer switch or transfer method with the proper compliance with the requirements in Article 250 for separately derived systems or non-separately derived systems is incumbent upon the installer of the system.

The rewrite of 590.6(A) incorporates the existing text into five subsections. The new text in (A) provides an introduction for (A)(1) through (A)(5). Subsection (A)(1) provides all 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel to have ground-fault circuit-interrupter protection for personnel.

Subsection (A)(2) requires all 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets installed or existing as part of the permanent wiring of the building or structure and used for temporary electric power, ground-fault circuit-interrupter protection for personnel to be provided.

Subsection (A)(3) requires all 120 and 120/240 volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are a part of a 15 kW or smaller portable generator to have listed ground-fault circuit interrupter protection for personnel.

New subsection (A)(4) covers the previous exception for receptacle outlets in industrial establishments with qualified personnel permitting the use of the assured equipment grounding program for those receptacles where loss of power from a tripped GFCI would create a greater hazard.

This proposal was developed by a Task Group composed of Task Group Chairman Paul Casparro and Chair of Panel 3 (NJATC); Jim Wiseman at Square D Schneider-Electric and Panel 15 (NEMA); John R. Kovacik with Underwriters Laboratories, Panels 10, 13 and the NEC TCC (UL); Richard Owen with City of St Paul, Minnesota, Panel 3, and the NEC TCC (IAEI); and Mark C. Ode with Underwriters Laboratories, Panels 3, 13, and the NEC TCC (UL).

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 3-140.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

CASPARRO, P.: Continue to Accept in Principle. See 3-140.

3-140 Log #4419 NEC-P03 **Final Action: Accept in Principle**
(590.6)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and (B). ~~This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities.~~ This section shall apply to power derived from an electric utility company or from an on-site-generated power source. ~~For the purposes of this section, cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.~~

(A) Receptacle Outlets. Temporary receptacle installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities shall comply with the requirements in 590.6(A)(1) through 590.6(A)(3), as applicable. Portable GFCI cord sets or devices shall be permitted to be used in accordance with 590.6(A)(4).

(1) Receptacle Outlets Not Part of Permanent Wiring. All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit-interrupter protection for personnel.

(2) Receptacle Outlets Existing or Installed as Permanent Wiring. All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets ~~If a receptacle(s) is~~ installed or existing as part of the permanent wiring of the building or structure and ~~is~~ used for temporary electric power, ground-fault circuit-interrupter protection for personnel shall be provided.

(3) Receptacle Outlets in Industrial Establishments. ~~Exception:~~ In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power were interrupted or having a design that is not compatible with GFCI protection.

(4) Portable GFCI Cord Sets or Devices. ~~For the purposes of this section,~~ Cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted but shall not be used as a substitute for any of the requirements in 590.6(A)(1) through 590.6(A)(3).

(B) Use of Other Outlets. For temporary wiring installations, ~~R~~ receptacles, other than those covered by 590.6(A)(1) through 590.6(A)(4)~~, 125-volt, single-phase, 15-, 20-, and 30-ampere receptacles~~ used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities, shall have protection in accordance with (B)(1) or the assured equipment grounding conductor program in accordance with (B)(2).

(Remainder of Section is unchanged.)

Substantiation: The section was rewritten to provide ease of use and user-friendliness, as has been the goal for many of the changes in the past three or four Code cycles. In addition, the intent of the change in the use of portable GFCI cord sets or devices is to continue to permit personal portable GFCI devices during construction, remodeling, maintenance, repair, or demolition of buildings but require GFCI protection at the source of the circuit, rather than at the end of the circuit. A cable is often installed from the source of supply for the temporary circuit to a spider box or other splitting device or cord where the supply cord can and often is damaged. Since GFCI protection is located at the spider box or splitting device or cord, there isn't GFCI protection for the temporary cable where damage may have occurred. This suggested change will still permit spider box GFCI protection or personal GFCI protection but will additionally require the supply to be GFCI protected, however, the personal device cannot be used as a substitute for protecting temporary wiring, thus protecting the worker on the construction site to damaged supply cables.

This proposal was developed by a Task Group composed of Task Group Chairman Paul Casparro and Chair of Panel 3 (NJATC); Jim Wiseman at Square D Schneider-Electric and Panel 15 (NEMA); John R. Kovacik with Underwriters Laboratories, Panels 10, 13 and the NEC TCC (UL); Richard Owen with City of St Paul, Minnesota, Panel 3, and the NEC TCC (IAEI); and Mark C. Ode with Underwriters Laboratories, Panels 3, 13, and the NEC TCC (UL).

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

"590.6 Ground-Fault Protection for Personnel.

Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and (B). This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities. This section shall apply to power derived from an electric utility company or from an on-site-generated power source.

(A) Receptacle Outlets. Temporary receptacle installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities shall comply with the requirements in 590.6(A)(1) through 590.6(A)(3), as applicable.

Exception: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power were interrupted or having a design that is not compatible with GFCI protection.

(1) Receptacle Outlets Not Part of Permanent Wiring. All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit-interrupter protection for personnel.

(2) Receptacle Outlets Existing or Installed as Permanent Wiring. Ground-fault circuit-interrupter protection for personnel shall be provided for all 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets ~~If a receptacle(s) is~~ installed or existing as part of the permanent wiring of the building or structure and ~~is~~ used for temporary electric power. Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.

(3) Receptacles on 15 kW or less Portable Generators. All 125-volt and 125/250-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are a part of a 15 kW or smaller portable generator shall have listed ground-fault circuit interrupter protection for personnel. Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted for use with 15kW or less portable generators manufactured or remanufactured prior to January 1, 2011.

(B) Use of Other Outlets. For temporary wiring installations, ~~R~~ receptacles, other than those covered by 590.6(A)(1) through 590.6(A)(3)~~, 125-volt, single-phase, 15-, 20-, and 30-ampere receptacles~~ used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities, shall have protection in accordance with (B)(1) or the assured equipment grounding conductor program in accordance with (B)(2).

The remainder of subsection to remain as is.

Panel Statement: The revised wording retains the exception for industrial locations as found in the 2008 NEC.

In addition, the provisions for permanent and non-permanent applications for GFCI protection were clarified with the provision for use of portable GFCI protection in permanent wiring locations.

The revisions to the wording also clarified the requirements for GFCI protection on 15 kW or less portable generators, with information added, that will ensure that this requirement does not apply to manufactured or remanufactured generators prior to January 1, 2011.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

CASPARRO, P.: Continue to Accept in Principle. Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and (B). This section shall apply to power derived from an electric utility company or from an on-site-generated power source.

3-141 Log #2280 NEC-P03 **Final Action: Reject**
(590.6(A))

Submitter: David H. Kendall, Thomas & Betts Corp.

Recommendation: Add the following text to the end of 590.6(A), before the exception:

(A) Receptacle Outlets. All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit-interrupter protection for personnel. If a receptacle(s) is installed or exists as part of the permanent wiring of the building or structure and is used for temporary electric power, ground-fault circuit-interrupter protection for personnel shall be provided. For the purposes of this section, cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted. 15- and 20-ampere, 125- and 250-volt receptacles, that are part of a separately derived system, such as a portable generator, installed in a damp or wet location shall comply with Section 406.8.

Substantiation: Receptacles that are part of separately derived systems, such as portable generators, commonly used in temporary installations, present the same risks as fixed installations in damp, wet and dry locations. GFCI protection is required for such receptacles, and the GFCI receptacles should also be given the same degree of protection as is called for in 406.8. These generators typically come with cautions for use only in areas protected from weather. However, since they are usually gas powered the user is directed to only use the equipment outdoors with sufficient ventilation.

Panel Meeting Action: Reject

Panel Statement: Requiring a portable generator to comply with 406.8, where used in a damp or wet location during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities, would be almost impossible to enforce.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

EASTER, L.: This proposal should have been accepted by Panel 3. The entire Article 590 requires inspection. The panel statement that this requirement would be "unenforceable" seems to imply that the protection needs to be added to the generator by the installer. In fact, with the force of the Code, generator manufacturers would be compelled to provide the required protection, and thus the degree of safety required by 406.8. GFCI receptacles in portable generators on job sites should have WIU protection.

3-142 Log #2448 NEC-P03 **Final Action: Reject**
(590.6(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.

Recommendation: Revise text to read as follows:

590.6 ~~Ground Fault~~ Power Safe Protection for Personnel.

~~Ground-fault protection~~ Power Safe Protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and (B). This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities. This section shall apply to power derived from an electric utility company or from an on-site-generated power source.

(A) Receptacle Outlets.

(1) 15 and 20 Ampere Receptacles. All 125-volt, single-phase, 15- and 20-, ~~and 30-~~ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ~~ground-fault circuit-interrupter~~ power safe protector protection for personnel. If a receptacle(s) is installed or exists as part of the permanent wiring of the building or structure and is used for temporary electric power, ~~ground-fault circuit-interrupter~~ power safe protector protection for personnel shall be provided. For the purposes of this section, cord sets or devices incorporating listed ~~ground-fault circuit-interrupter~~ power safe protector protection for personnel identified for portable use shall be permitted.

(2) 30 Ampere Receptacles. All 125-volt, single-phase, ~~15-, 20-, and~~ 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit-interrupter protection for personnel. If a receptacle(s) is installed or exists as part of the permanent wiring of the building or structure and is used for temporary electric power, ground-fault circuit-interrupter protection for personnel shall be provided. For the purposes of this section, cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.

Exception: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in 590.6(B)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power were interrupted or having a design that is not compatible with ~~GFCI~~ power safe protector protection.

Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:

1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.

2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.

3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the submitter's substantiation and supporting material for the following reasons:

1. On page 13 of the supporting material, the submitter states: "tests conducted by Energy Safe, Inc. showed that this current (GFCI protected circuit) can be several amperes, which is enough to be fatal under certain circumstances."

Based on testing for GFCIs, the UL 943 standard, and the FPN in the Article 100 definition in the NEC for GFCI, Class A ground-fault circuit interrupters trip when the current to ground is 6 mA or higher and do not trip when the current to ground is less than 4 mA. For further information, see UL 943, Standard for Ground-Fault Circuit Interrupters. Since GFCIs have a proven track record of saving lives by tripping off during a ground fault involving a person, one would have to take exception to the allegation that a GFCI protected circuit could still provide a fatal shock.

2. There was no technical substantiation provided that the Power Safe device provided the same level of shock protection for personnel and that the Power Safe device provided the same circuit protection as a combination AFCI device.

3. The problem needs more study into the fire hazards and risks associated with receptacle devices, and the possible technologies to address these hazards.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-143 Log #626 NEC-P03 **Final Action: Reject**
(590.8 (New))

Submitter: Travis Edward Whitesides, Prevention Products Inc.

Recommendation: Add new text to read as follows:

During the period of construction, socket guard covers must be installed in order to prevent electrical shock. Also, operational Switch Guard Covers need to be installed as well. This will enable a safe working environment for the job.

Substantiation: The purpose of proposal is not only to prevent electrical shock on receptacles and light switches during construction, but also to prevent paint, and sheetrock mud from filling the boxes and making wires unnoticeable for electricians.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: These covers are already permitted by the NEC, but not required. The design of the covers appears, based on the pictures provided with the proposal to fit into the receptacle and to screw on the switch.

The submitter did not provide any technical substantiation or reasoning why regular switch or receptacle covers could not be installed, since the switches and receptacles were already installed and energized on the jobsite.

The other trades, such as painters and drywall installers, must provide a reasonable amount of protection for the installed receptacles and switches while doing their work.

This does not appear to be a safety issue.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

ARTICLE 600 — ELECTRIC SIGNS AND OUTLINE LIGHTING

18-197 Log #4020 NEC-P18 **Final Action: Accept in Part**
(600.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Revise text to read as follows:
This article covers the installation of conductors, ~~and~~ equipment, and field wiring for electric signs and outline lighting, decorative elements, skeleton tubing, or art forms, regardless of voltage. All installations and equipment ~~using~~ for electric signs and outline lighting, including but not limited to the following light sources, are covered by this article: cold cathode luminous neon tubing, high intensity discharge lamps, fluorescent or incandescent lamps, light emitting diodes (LEDs), electroluminescent and inductance lighting. ~~such as signs, decorative elements, skeleton tubing or art forms, are covered by this article.~~
Substantiation: Scope statement does not provide a complete description of light sources and voltages used for electric signs. The application of light sources other than neon and illumination techniques with a wide range of secondary circuit voltages is included within the scope of electric signs in UL's *Guide for Electrical Equipment*. Additionally, the changes recommended harmonize Article 600.1 with scope statements for electric signs in UL48 and the Canadian Electrician Code, Part 1. Amending the Scope Statement facilitates the introduction of rules for secondary sign circuit field wiring for other than high voltage neon tubing.
The following references were used as a basis for the substantiation:
2007 Guide Information for Electrical Equipment® Underwriters Laboratories Inc.
This category covers electric signs employing incandescent lamps, LEDs (light emitting diodes), electro-luminescent panels, neon tubing, fluorescent lamps, high intensity discharge lamps or combinations thereof for installation in accordance with Article 600 of NFPA 70, "National Electrical Code."
UL 48 Standard for Electric Signs (14th Edition)
1 Scope 1.1 These requirements cover electric signs, referred to as signs, using incandescent lamps, fluorescent lamps, HID lamps, neon tubing and other combinations, for use in accordance with the National Electrical Code, NFPA 70.
UL 48 Standard for Electric Signs (15th Edition in STP process)
1 Scope 1.1, 1.2 These requirements cover all signs, art forms and outline lighting for use in accordance with the National Electrical Code, NFPA 70. Electric signs include all signs that are electrically operated and/or electrically illuminated, including but not limited to the following methods of illumination: incandescent, fluorescent, high intensity discharge (HID), electric discharge tubing including neon, light emitting diode (LED), skeletal neon tubing, cold-cathode lighting systems, and electroluminescenct lighting. [UL 48, 1 Scope 1.1, 1.2 (15th Edition in STP process)]
34-000 Scope 2006 Canadian Electrical Code, Part 1
(1) This Section applies to signs and outline lighting with which the sources of light are
(a) incandescent lamps;
(b) fluorescent lamps;
(c) high-voltage luminous discharge tubes, commonly known as cold-cathode or neon tubes;
(d) high intensity discharge lamps; and
(e) other light-emitting sources, such as the LED
Panel Meeting Action: Accept in Part
600.1 to read as follows:
600.1 Scope. This article covers the installation of conductors, ~~and~~ equipment and field wiring for electric signs and outline lighting regardless of voltage. All installations and equipment using neon tubing, such as signs, decorative elements, skeleton tubing, or art forms are covered by this article.
FPN: Sign and outline lighting illumination systems include, but are not limited to cold cathode neon tubing, high intensity discharge lamps (HID), fluorescent or incandescent lamps, light emitting diodes (LEDs), and electroluminescent and inductance lighting.
Panel Statement: CMP-18 refers the proposed changed scope to the TCC for their consideration and direction.
CMP-18 accepts those portions of the proposal pertaining to "wiring" and "regardless of voltage."
CMP-18 does not accept the other mandatory sections and they are instead included as a FPN.
There is a concern in the industry that the scope did not cover all the wiring and illumination systems employed in the industry. The FPN was added to the scope for clarity. The fine print note was added to "neon tubing" to explain that when cold cathode electric discharge tubing is used in signs and outline lighting it is called "neon tubing" and listed under UL 48. When used for general illumination, electric discharge tubing is referred to as "cold cathode" and listed under UL IFAY.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-198 Log #3545 NEC-P18 **Final Action: Accept in Principle**
(600.2.LED Lighting)

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Add new text to read as follows:
LED Lighting. A complete listed lighting system for use in signs and outline lighting classified to be used together consisting of light sources (LEDs), power supplies with a class II secondary output in accordance with UL 1310, and the wire and connectors to complete the installation.
Substantiation: The new definition should clarify that this is a system needed to be classified to be used together and rule out mixing and matching a bag of parts.
Panel Meeting Action: Accept in Principle
Add new definition for LED Sign Illumination System to 600.2 in alphabetical order to read as follows:
LED Sign Illumination System. A complete lighting system for use in signs and outline lighting consisting of light emitting diode (LED) light sources, power supplies, wire, and connectors to complete the installation.
Panel Statement: This definition is needed to clarify that certain compatible components are needed to be used together to provide a system for sign illumination.
CMP-18 edited the definition for clarity. 4.2 of the NEC Style Manual prohibits references to other standards.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-199 Log #4023 NEC-P18 **Final Action: Reject**
(600.2.Light Emitting Diode. (LED))

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Add new title as follows:
Light Emitting Diode. (LED) A semiconductor that emits light when an electric current is applied in the forward direction of the device, as in the simple LED circuit.
Substantiation: Wide application of LEDs in signs, outline lighting and section signs requires a definition for designating applicable low voltage installation rules.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-198.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-200 Log #4021 NEC-P18 **Final Action: Accept in Principle**
(600.2.Neon Tubing)

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Revise text to read as follows:
Neon Tubing. Electric-discharge cold cathode luminous tubing filled with various inert gases that is manufactured into shapes ~~that~~ to illuminate signs and outline lighting, form letters, parts of letters, skeleton tubing, ~~outline lighting,~~ other decorative elements, or art forms ~~and filled with various inert gases~~.
Substantiation: The production of neon tubing utilizes technology that is distinguished from other luminous tubes by the use of cold cathode electrodes in combination with high voltage. Defining neon by labeling it as a "cold cathode luminous tube" accurately describes neon tubing and is necessary to clear up a gray area in the Code. Luminous tubing with the trade moniker "cold cathode" is used in a variety of configurations, including cold cathode fluorescent lamps (CCFLs) for sign illumination. This raises an issue as to what Chapter in the Code is applicable — 410 or 600.
Where cold cathode luminous tubes, (neon tubes) are installed for general illumination, Article 410 of the NEC applies. Luminous tube lighting is required to be listed in 410.140(A). Cold cathode luminous tubing, (neon tubing) installed as outline lighting or for sign illumination are covered by Article 600. With the exception of skeleton neon tubing installations, signs with cold cathode neon light sources are also required to be listed. 600.3.
The application/use of luminous cold cathode neon tubes determines the NEC installation rules that apply and the appropriate UL Standard for listing.
Inserting "to illuminate signs" in the neon tubing definition depicts cold cathode as having uses besides being manufactured into letter font shapes, decorative elements or art forms. This reflects the current practice in the sign industry where cold cathode luminous tubing is used within signs as a light source. It also clears up the gray area now in the Code by stipulating that luminous tubing with the trade name "cold cathode," when used to illuminate electric signs and outline lighting, is governed by 600 rules and not 410.
Referencing the following sources illustrates the inseparable relationship of cold cathode terminology with neon tubing.
"This category covers indoor and outdoor use cold cathode transformers and power supplies for use as part of a cold cathode electric discharge lighting system, sign, field-assembled skeletal neon sign and outline lighting system, or field-installed neon outline lighting system." [Cold Cathode Transformers and power Supplies (DUEC), UL *General Information for Electrical Equipment*]

1.3.46 NEON TUBING – An industry term for electric-discharge lamps or tubing used in signs and outline lighting, including cold-cathode lamps, regulated by Article 600 of the National Electric Code, NFPA 70. [UL 879 Electric Sign Component Standard]

The encyclopedia Wikipedia Web Site describes cold cathode luminous tubes in several ways: "A neon tube is a luminous tube with cold cathode electrodes." "A common cold cathode application is in neon signage." "Neon lamps are a very common example of a cold cathode lamp."

UL 879 / 1.3.46 NEON TUBING – An industry term for electric-discharge lamps or tubing used in signs and outline lighting, including cold-cathode lamps, regulated by Article 600 of the National Electric Code, UL879.

The standard for cold Cathode Luminaires is a combination of the Standard for Luminaires, UL 1598 and Standard for Signs, UL 48. UL 48 is used because UL 1598 does not have requirements for voltages above 1000 volts.

Panel Meeting Action: Accept in Principle

Add new definition for Neon Tubing to 600.2 in alphabetical order to read as follows:

Neon Tubing. Electric-discharge luminous tubing that is manufactured into shapes that illuminate signs, form letters, parts of letters, skeleton tubing, outline lighting, other decorative elements, or art forms and filled with various inert gases.

FPN. Where used in illumination systems for signs, outline lighting or skeleton tubing, decorative elements or art forms, cold cathode luminous tubes are neon tubing as defined by this article.

Panel Statement: CMP-18 edited the text and added the FPN for clarity.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-201 Log #4022 NEC-P18 **Final Action: Accept**
(600.2.Skeleton Tubing)

Submitter: Richard D. Gottwald, International Sign Association

Recommendation: Revise text to read as follows:

Skeleton Tubing. Neon tubing that is itself the sign or outline lighting and is not attached to an enclosure or sign body.

Substantiation: Insertion of new word is an editorial revision for grammatical clarity.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-202 Log #4024 NEC-P18 **Final Action: Accept**
(600.3)

Submitter: Richard D. Gottwald, International Sign Association

Recommendation: Revise text to read as follows:

600.3 Listing. Electric signs, section signs, and outline lighting — fixed, mobile, or portable — regardless of voltage shall be listed and installed in conformance with that listing, unless otherwise approved by special permission.

Substantiation: The text revision eliminates a gray area in the *Code*. Power limited circuits or the equipment such circuits energize, are not required in 725 to be listed systems. Article 600 identifies and applies numerous requirements in 725 for low voltage sign and outline lighting illumination systems, leading some to the conclusion that signs and outline lighting with low voltage illumination systems are exempt from listing. Adding "regardless of voltage" to the listing requirement clarifies that there are no exceptions to sign listing based on operating voltages.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-203 Log #394 NEC-P18 **Final Action: Accept**
(600.4(B))

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise text to read as follows:

Change "per" to "for each".

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-204 Log #4025 NEC-P18 **Final Action: Accept in Principle**
(600.4(B))

TCC Action: The Technical Correlating Committee understand that the statement refers to Proposal 18-206a.

Submitter: Richard D. Gottwald, International Sign Association

Recommendation: Add new text to read as follows:

(B) Visibility. The markings required in (A) and listing labels shall be visible at time of installation but shall not be required to be visible after installation.

Substantiation: Electric signs and outline lighting are unique, custom manufactured electrical equipment and are widely accepted as art forms. Because signs are tools for branding and marketing in the public environment, graphic and structural design is integrated by design professionals. Signs may also convey subliminal messages through the use of exotic materials and sophisticated illumination schemes. All of this is effort, expense and design management is compromised by the application of rules that require signs to display listing labels that are visible after installation. Listing labels on electrical equipment are not marks intended to be viewed by the general public. Listing is employed as a basis for approval and used exclusively by the AHJ.

An effort was made to correct this situation in the 1999 NEC by removal of the requirement that marks specified in 600.4(A) be visible after installation. This proposal further clarifies that listing marks are included with the general marking requirements and visibility of marks on signs is no different than other electrical equipment after completion of the approval process by the AHJ.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-136a.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

COSTELLO, P.: The panel statement is incorrect it should refer to the panel proposal 18-206a.

WRIGHT, R.: See Panel Action and Statement on Proposal 18-136a.

I feel the panel statement for the three proposals above is either a typo or incorrectly recorded. My notes reflect the panel statement reference is incorrect it should refer to the panel proposal 18-206a

---

18-205 Log #1230 NEC-P18 **Final Action: Accept in Principle**
(600.4(B) and (C))

TCC Action: The Technical Correlating Committee understand that the statement refers to Proposal 18-206a.

Submitter: Dan Leaf, Seneca, SC

Recommendation: Add "and durable" after "installed" in (B).

In (C) add "which in wet locations shall be weatherproof".

Substantiation: Edit. Marking should be suitable for the environment. "Suitable" in Code provisions is a term to be avoided per the Style Manual.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-136a.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

COSTELLO, P.: The panel statement is incorrect it should refer to the panel proposal 18-206a.

WRIGHT, R.: See my Comment on Affirmative on Proposal 18-204 (Log #4025).

18-206 Log #4026 NEC-P18 **Final Action: Accept in Principle**
(600.4(C)and (D))

TCC Action: The Technical Correlating Committee understand that the statement refers to Proposal 18-206a.

Submitter: Richard D. Gottwald, International Sign Association

Recommendation: Revise text to read as follows:

~~(B)~~ (**C**) **Signs with Lampholders for Incandescent Lamps**. Signs and outline lighting systems with lampholders for incandescent lamps shall be marked to indicate the maximum allowable lamp wattage per lampholder. The markings shall be permanently installed, in letters at least 6 mm (1/4 in.) high, and shall be located where visible during relamping.

~~**(C)**~~ **(D)** Section Signs. Section signs shall be marked to indicate that field-wiring and installation instructions are required.

Substantiation: Relabel (B) with (C) and (C) with (D) to maintain alpha sequence of 600.4 required to accommodate proposed new rule in 600.4.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-136a.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

COSTELLO, P.: The panel statement is incorrect it should refer to the panel proposal 18-206a.

WRIGHT, R.: See my Comment on Affirmative on Proposal 18-204 (Log #4025).

18-206a Log #CP1800 NEC-P18 **Final Action: Accept**
(600.4(C) and (D) (New))

Submitter: Code-Making Panel 18,
Recommendation: Add (C) Visibility and (D) Durability to read as follows:
(C) Visibility. The markings required in (A) and listing labels shall not be required to be visible after installation but must be permanently applied in a location visible during servicing.
(D) Durability. Marking, labels shall be permanent, durable and when in wet locations shall be weatherproof.
Renumber existing (C) to (E) to read as follows:
(E) Section Signs. Section signs shall be marked to indicate that field-wiring and installation instructions are required.
Substantiation: CMP-18 clarified the long standing issue that the labels required in (A) are not required to be visible, only available, after installation. CMP-18 provided a renumbered list of items to include visibility and durability.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-206b Log #CP1801 NEC-P18 **Final Action: Accept**
(600.5(B))

Submitter: Code-Making Panel 18,
Recommendation: Revise 600.5(B) to read as follows:
(B) Rating. Branch circuits that supply signs shall be rated in accordance with 600.5(B)(1) or (B)(2).
(1) Neon Signs. Branch circuits that supply neon tubing installations shall not be rated in excess of 30 amperes.
(2) All Other Signs. Branch circuits that supply all other signs and outline lighting systems shall be rated not to exceed 20 amperes.
Substantiation: CMP-18 added text to 600.5(B) to accommodate the new sign technologies and eliminate conflict with existing 600.5(B)(2).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-207 Log #4752 NEC-P18 **Final Action: Accept in Principle**
(600.5(B))

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Add revised text to read as follows:
600.5(B) Rating. Branch circuits that supply signs shall be rated in accordance with 600.5(B)((1) or (B)(2) and shall be considered to be continuous loads.
Substantiation: Signs are in almost all cases required to be in operation for periods exceeding three hours. Signs are energized in most establishments in conformance with the hours of operation of the establishment.
Panel Meeting Action: Accept in Principle
600.5(B) to read as follows:
600.5(B) Rating. Branch circuits that supply signs shall be rated in accordance with 600.5(B)((1) or (B)(2) and shall be considered to be continuous loads for the purposes of calculations.
Panel Statement: CMP-18 wants to ensure that the designer and the installer treat a sign as a continuous load.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-208 Log #4027 NEC-P18 **Final Action: Accept in Principle**
(600.5(B)(1))

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Revise text to read as follows:
~~Incandescent and Fluorescent~~ Signs and Outline Lighting. Branch circuits that supply signs and outline lighting systems ~~containing incandescent and fluorescent forms of illumination~~ shall be rated not to exceed 20 amperes.
Substantiation: As identified in the Scope for 600, light sources and associated equipment other than incandescent and fluorescent are used in electric sign systems. Heading of section needs to be general in description. Forms of lighting supplied by power limited sources are rated for use on 20 ampere circuits as required by *Code* and by Underwriters Laboratories.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-206b.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-209 Log #1294 NEC-P18 **Final Action: Reject**
(600.5(C)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part:
...shall be permitted to contain ~~both~~ branch circuits, feeders, and secondary circuit conductors of ballasts, transformers, and electronic power supplies provided the enclosure conductor fill requirements and dimensions comply with applicable provisions of Article 314.
Substantiation: Feeders supplying the signs should also be included. Since branch circuits are generally secondary circuits, “secondary” appears intended to apply to ballasts, transformers, and electronic power supplies. The proposed reference to Article 314 clarifies that applicable provisions are not modified.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-210 Log #1013 NEC-P18 **Final Action: Accept in Principle in Part**
(600.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: DISCONNECTS. Each feeder and branch circuit supplying a sign(s) or outline lighting system(s) shall be supplied by a circuit breaker or fused switch that simultaneously opens all ungrounded conductors of the circuit it controls. Signs and outline lighting systems located within pools or fountains shall have the disconnecting means located in accordance with 680.12. The branch circuit switch or circuit breaker shall be the disconnecting means for exit signs. The disconnecting means for cord-connected signs shall be permitted to be an attachment plug.
(A) LOCATION
(1) WITHIN SIGHT OF THE SIGN. The disconnecting means shall be within sight of the sign(s) or outline lighting system(s) and shall have identified permanent integral means for locking in the open (off) position.
Exception: The branch circuit or feeder disconnecting means shall not be required to be within sight of the sign(s) or outline lighting system(s) or lockable where an approved disconnecting means is in or on the sign(s) or outline lighting system(s). The presence and location of such disconnecting means shall be plainly and durably marked at the sign(s) and outline lighting system(s).
Substantiation: The disconnecting means should simultaneously open all ungrounded conductors of the circuit it controls not “all” ungrounded conductors of more than one circuit. A disconnecting means is required for exit signs in the sense that the supply branch circuit requires one. An attachment plug for cord-connected signs is a disconnecting means even though Exception No. 2 implies it is not. Signs that have a component disconnecting means should not require lockable branch circuit or feeder disconnecting means. The provisions for locking should be identified for the use, permanent, and integral to the disconnecting means and lock the device, not the cover in the open (off) position. Present wording does not preclude makeshift methods.
Panel Meeting Action: Accept in Principle in Part
600.6 to read as follows:
Each sign and outline lighting system, or feeder circuit, or branch circuit supplying a sign or outline lighting system shall be controlled by an externally operable switch or circuit breaker that will open all ungrounded conductors and controls no other load. Signs and outline lighting systems located within fountains shall have the disconnect located in accordance with 680.12.
Retain remainder of text.
Panel Statement: CMP-18 reaffirms the principle that the disconnect controls only the sign and adds the term “controls no other load.”
CMP-18 does not accept other changes proposed by the submitter as they do not add clarity. CMP-18 disagrees with the submitter’s substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-211 Log #1292 NEC-P18 **Final Action: Reject**
(600.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
Each sign and outline lighting system or feeder ~~or~~ and branch circuit supplying a sign or outline lighting system shall be controlled by a manually externally operable switch or circuit breaker. That ~~will~~ simultaneously opens all ungrounded conductors of the circuit it controls. Signs and outline lighting systems located within fountains or reflecting pools shall have the disconnecting means located in accordance with 680.12.
Exception No. 1: A disconnecting means other than the branch circuit disconnecting means shall not be ~~required~~ provided for an exit or other directional sign located in a building or structure.
Exception No. 2: A disconnecting means other than the branch circuit disconnecting means shall not be required for cord-and-plug connected signs ~~with an attachment plug~~.
Substantiation: Disconnecting means should be provided for both branch circuits and feeders, not "or" one or the other and should open ungrounded conductors it controls, not "all" conductors, which includes other circuits. Reflecting pools should be included. In the reference to 680.12, Exception No. 1 should clearly not include a branch circuit disconnect and should include structures which are not deemed "buildings". All directional signs (which may be related to safety) should be included with exit signs. "Will" does not comply with the Style Manual which states "do not write in future tense".
Panel Meeting Action: Reject
Panel Statement: Stating that something "should" be done does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects in that there is no statement of the problem or why the proposal solves the problem.
See panel action and statement on Proposal 18-210.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-212 Log #4028 NEC-P18 **Final Action: Accept in Principle**
(600.6)

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Revise text to read as follows:
Each sign and outline lighting system, or feeder circuit or branch circuit supplying a sign ~~or,~~ outline lighting system or skeleton neon tubing, shall be controlled by an externally operable switch or circuit breaker that will open all ungrounded conductors. Signs and outline lighting systems located within fountains shall have the disconnect located in accordance with 680.12.
Substantiation: Unlisted skeleton tubing must comply with the rules in Part 1 as well as Part 2. [600.30] There is no exception to the disconnect rule in Part 1 for skeleton neon installations. Revising the text to include skeleton neon tubing in the requirement for a disconnect dispenses with a gray area in the *Code*, while at the same time advancing electrical safety.
Panel Meeting Action: Accept in Principle
Change the first paragraph of 600.6 to read as follows:
Each sign and outline lighting system, feeder circuit, or branch circuit supplying a sign, outline lighting system, or skeleton tubing shall be controlled by an externally operable switch or circuit breaker that will open all ungrounded conductors. Signs and outline lighting systems located within fountains shall have the disconnect located in accordance with 680.12.
Panel Statement: CMP-18 changed skeleton neon tubing to skeleton tubing for consistency.
CMP-18 clarifies that the change only impacts the first paragraph.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-213 Log #1570 NEC-P18 **Final Action: Accept in Part**
(600.6(A))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered by Code-Making Panel 18 based upon the action of Code-Making Panel 1 taken on Proposal 1-63.
This action will be considered by the panel as a public comment.
Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
(A) Location.
(1) Within Sight of the Sign. The disconnecting means shall be within sight of the sign or outline lighting system that it controls. Where the disconnecting means is out of the line of sight from any section that is able to be energized **the disconnecting means shall be lockable**. ~~the disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.~~
(2) Within Sight of the Controller. The following shall apply for signs or outline lighting systems operated by electronic or electromechanical controllers located external to the sign or outline lighting system:
(1) The disconnecting means shall be permitted to be located within sight of the controller or in the same enclosure with the controller.
(2) The disconnecting means shall disconnect the sign or outline lighting system and the controller from all ungrounded supply conductors.
(3) The **lockable** disconnecting means shall be designed such that no pole can be operated independently ~~and shall be capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.~~
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Accept in Part
600.6(A) to read as follows:
(A) Location.
(1) Within Sight of the Sign. The disconnecting means shall be within sight of the sign or outline lighting system that it controls. Where the disconnecting means is out of the line of sight from any section that is able to be energized the disconnecting means shall be lockable. The provision for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.
(2) Within Sight of the Controller. The following shall apply for signs or outline lighting systems operated by electronic or electromechanical controllers located external to the sign or outline lighting system:
(1) The disconnecting means shall be permitted to be located within sight of the controller or in the same enclosure with the controller.
(2) The disconnecting means shall disconnect the sign or outline lighting system and the controller from all ungrounded supply conductors.
(3) The lockable disconnecting means shall be designed such that no pole can be operated independently and shall be capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.
Panel Statement: CMP-18 accepts the proposed revisions except the deletion of the new text added in 2008 to 600.6(A)(1) and (A)(2)(3).
No substantiation was presented addressing deletion of these sentences.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
CARPENTER, F.: Since the proposal (1-63) which would have added an Article 100 definition for "Disconnecting Means, Lockable" was rejected by CMP-1, this terminology should not be used in this section of the code.

18-214 Log #4648 NEC-P18 **Final Action: Reject**
(600.6(A)(1) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following exception:
A sign or outline lighting system operated by an electronic or electromechanical controller shall be permitted to omit the disconnect by 600.6(A)(1) where the disconnect described in 600.6(A)(2) controls the sign or outline lighting system and no other load.
Substantiation: The question of what constitutes "operated by electronic or electromagnetic controllers" in 600.6(A)(2) frequently arises in the context of modern energy management systems that turn signs on and off along with other building lighting. The purpose of the disconnect rule is to provide maintenance personnel with a secure means to ensure that the equipment they are working on is disconnected and that it will stay that way until they are ready to reenergize it. By long usage and custom, a maintenance disconnect is unique to its equipment. No one would seriously suggest that because a service disconnect could be locked in the open position, all NEC requirements for disconnects of specific loads were met. Any maintenance worker on any downstream equipment would feel compelled to work the downstream equipment hot rather than inconvenience the enterprise to that extent. Therefore, if the energy management system operates a contactor for a sign among other control devices for other loads, this proposal requires that contactor to be in sight of a disconnect, that disconnect will be capable of being locked open, and a second disconnect would not be required at the sign location. On the other hand, if the contactor operated a lighting panel for which the sign was one load among many, then this proposal requires that a local disconnect for the sign must be installed.

This submitter was involved in the litigation of a fatality caused in part by the lack of clarity in this part of the Code. No local disconnect was provided because the neon lighting was controlled through a panel that controlled many other loads, and the lighting in question was energized through this panel. The worker felt constrained not to shut the panel down, and was killed when working on the live parts. Consider a service disconnect with a lock-open capability for an entire shopping mall sitting within sight of a lighting panel supplying signs and outline lighting fed through a contactor. As noted, the literal text of this section can be read to omit a local disconnect for that equipment. If this sounds outrageous, it is, but look at 600.6(A)(2) (1-3). The lock-open service switch clearly meets conditions (1), (2), and (3). This has been an area of controversy for decades, and now has contributed to at least one fatality. It is time to clarify this once and for all.

Panel Meeting Action: Reject

Panel Statement: The submitter uses a code violation as his substantiation. The first sentence in 600.6(A)(2) states “The following shall apply” CMP-18 sees no use in attempting to further clarify its intent.

See panel action and statement on Proposal 18-210.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-215 Log #1005 NEC-P18 **Final Action: Reject**
(600.6(A)(2))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text as follows:

(1) The disconnecting means shall be ~~permitted to be~~ located within sight of the controller or in the same enclosure with the controller.

(2) The disconnecting means shall ~~be designed so that no pole can be operated independently~~ simultaneously open all ungrounded conductors of the circuit it controls and shall ~~be capable of being locked in the open position~~ have identified permanent integral means for locking in the open (off) position. ~~The provision for locking or adding a lock to the disconnecting means shall remain in place at the switch or circuit breaker whether or not the lock is installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.~~

Substantiation: “Permitted” does not provide a requirement; (See 90.5(B)). Proposal provides for specific locking requirements which are identified for the use, permanent, and integral to the disconnecting means and “off” applies to the mechanism not the cover of the disconnecting means.

Panel Meeting Action: Reject

Panel Statement: The use of “permitted” is correct. As to the balance of the proposal, it does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects in that there is no statement of the problem or why the proposal solves the problem.

See 3.1.2 for permissive rules in the NEC Style Manual.

(600.7)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise text to read as follows:

600.7 Grounding and Bonding.

~~(A) Grounding.~~

~~(1)~~ (A) Equipment Grounding. Signs and metal equipment of outline lighting systems shall be grounded by connection to the equipment grounding conductor of the supply branch circuit(s) or feeder using the types of equipment grounding conductors specified in 250.118.

Exception: Portable cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.

~~(2) Size of Equipment Grounding Conductor. The equipment grounding conductor size shall be in accordance with 250.122 based on the rating of the overcurrent device protecting the branch circuit or feeder conductors supplying the sign or equipment.~~

~~(3) Connections. Equipment grounding conductor connections shall be made in accordance with 250.130 and in a method specified in 250.8.~~

~~(4) Auxiliary Grounding Electrode. Auxiliary grounding electrode(s) shall be permitted for electric signs and outline lighting systems covered by this article and shall meet the requirements of 250.54.~~

~~(5) Metal Building Parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.~~

~~(B) Bonding.~~

~~(1) Bonding of Metal Parts. Metal parts and equipment of signs and outline lighting systems shall be bonded together and to the associated transformer or power-supply equipment grounding conductor of the branch circuit or feeder supplying the sign or outline lighting system and shall meet the requirements of 250.90.~~

~~(2) Bonding Connections. Bonding connections shall be made in accordance with 250.8.~~

~~(3) Metal Building Parts. Metal parts of a building shall not be permitted to be used as a means for bonding metal parts and equipment of signs or outline lighting systems together or to the transformer or power-supply equipment grounding conductor of the supply circuit.~~

~~(4)~~ (B) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

~~(5)~~(C) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized, and spaced at least 19 mm (¾ in.) from neon tubing, shall not require bonding.

~~(6)~~ (D) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1½ in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1¾ in.) when the circuit is operated at over 100 Hz.

~~(7)~~ (E) Bonding Conductors. ~~Bonding conductors shall comply with (a) and (b).~~

~~(a) Bonding conductors shall be copper and not smaller than 14 AWG.~~

~~(b)~~ Bonding conductors installed externally of a sign or raceway shall be protected from physical damage.

~~(8)~~ (F) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts bonded to the equipment grounding conductor of the branch circuit for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

FPN: Refer to 600.32(J) for restrictions on length of high-voltage secondary conductors.

Substantiation: The proposed deleted text is simply repetitive text. These provisions are already found in Article 250, and nothing in Article 600 supplements or modifies the requirements (90.3). The real problem, however, is that when two different code making panels have the same provisions in their articles, over time they change and become inconsistent. This makes an unneeded burden on the installer, the inspector and the designer.

Panel Meeting Action: Reject

Panel Statement: The sections are in this location as a reminder to the inspector, the installer, and the designer. Article 600 is intended to modify the requirements of Chapters 1 thru 4. The submitter has failed to comply with the provisions of 4.3.3 of the NFPA Regulations Governing Committee Projects and provide sufficient substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-218 Log #4031 NEC-P18 **Final Action: Reject**
(600.7(A)(1))

Submitter: Richard D. Gottwald, International Sign Association

Recommendation: Revise text to read as follows:

Exception No. 1: Portable cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.

Substantiation: Adding proposed new Exception No. 2 to 600.7 requires a numerical revision.

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.

Renumbering is an editorial function.

Ballot Results: Affirmative: 12

18-219 Log #4030 NEC-P18 **Final Action: Reject**
(600.7(A)(1) Exception No. 2 (New))

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Add new text to read as follows:
Exception No. 2: Metal parts of a section sign or outline lighting system that are electrically isolated from a Class 2 power source, shall not be required to be connected to an equipment grounding conductor.
Substantiation: Dead metal on the load side containing only Class 2 components should not be required to be grounded. The connection of dead metal in a section sign or outline lighting to the equipment grounding conductor serves no purpose.

According to Underwriters Laboratories, Class 2 requirements specify that the output of a Class 2 supply must be isolated from the line and ground. This being the case, grounding dead metal that houses Class 2 components will not result in clearing a fault at the branch circuit. Should a Class 2 circuit become grounded for some reason, the energy will not go to ground since the secondary circuit is not ground referenced. Grounding of the dead metal has absolutely no benefit. A Class 2 power source secondary circuit is isolated from ground and supply. The output from the power source has no ground reference so the potential for a shock or fire hazard due to ground fault is reduced to zero. Should the output contact dead metal that is grounded, the output would then become ground referenced. This could result in the supply side of the output becoming more of a potential hazard since most problems occur when there is a ground fault.

CMP18 established that lighting systems operating at 30 volts or less are exempt from grounding. 411.415(A) Class II power sources used with sign lighting systems are limited to 30 volts or less by UL Standards and the *Code.* What electrical theory distinguishes low voltage lighting used in outline lighting and signs from low voltage systems used for general lighting under 411? If a fire and shock hazard is the basis for requiring grounding for listed signs with low voltage illumination, how was it determined that no hazard existed with lighting systems operating at 30 volts or less, energized by a isolating power supply?

Shock from low voltage (30 volts or less) landscape lighting, to which 411 has been applied since 1996 has not been a safety issue. Landscape lighting contains metal parts and is embedded in the ground in wet locations, at pedestrian level while section signs and outline lighting is mostly accessible to qualified service personnel only.

Article 90 provides that the rules in Chapters 1-4 apply generally and allows the general rules to be modified or supplemented in Chapters 5, 6, and 7. In its rejection of a similar proposal during the 2008 Code Cycle, CMP 18 stated:

According to 250.112(I), the exceptions for grounding that may exist in Article 725 only apply to Class 2 or Class 3 circuits used for remote-control, signaling, or fire alarm circuits. This exception does not apply to a low-voltage lighting circuit of the type used in section signs.

The exception being sought is not from Article 725 but Article 600.7. The exception to grounding metal parts of signs powered by power limited power sources is being pursued in Article 600 because listed section signs or outline lighting are "electrical utilization equipment" to which 725 is not applicable. The scope of 725 is:

This article covers remote-control, signaling and power limited circuits that are not an integral part of a device or appliance.

While an electric sign is not an "appliance," by Code definition it shares the same distinction since an appliance like an electric sign is "utilization equipment."

In an article published in Electrical Contractor, January 2000, Mark Ode, a UL Engineer and contributor to a number of published papers on the subject of low voltage lighting, noted regarding the wording in the Scope of 725, "similar wording is in Section 300-1(B) and both the Scope Statements in 300 and 725 make it totally clear that the interior wiring of equipment are not covered by this article."

Field wiring on Section Signs or outline lighting systems is not "interior wiring." The listed section sign is an assembly of components that include the electrical connections (field wiring) of subassemblies. Field wiring rules for neon and other sign lighting sources are covered by 600. And as specified in 600, field wiring rules for power limited circuits in listed signs or outline lighting are covered in Article 725. But 725 contains no rules for grounding or wiring of listed equipment.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Reject
Panel Statement: CMP-18 does not agree that this change is required for grounding. This should be located in the bonding section.

See panel action and statement on Proposal 18-223.

18-220 Log #4787 NEC-P18 **Final Action: Reject**
(600.7(A)(1) Exception No. 2)

Submitter: Terry T. Maier, City of West Allis Wisconsin
Recommendation: Add the following new text:
Exception No. 2: Metal equipment supplied from the load side of a Class 2 transformer shall not be required to be connected to the equipment grounding conductor where LED lighting is the sole light source. The transformer supply shall not exceed 150 volts to ground.
Substantiation: The load side wiring of LED signs are usually wired with a Class 2 cable that does not provide a ground path. 600.12(C)(2) allows Class 2 cables to be used. Why allow Class 2 cables if a grounding means is required. Proposal to delete 600.24(B) will be separate submittal.

Per 2008 NEC Article 725.2 Definitions, a Class 2 circuit limits fire initiation and provides acceptable protection from electric shock.

Per 2008 NEC 250.20(A) A Class 2 power supply is not required to have the load side grounded under conditions used for wiring signs.

Grounding the signs would not provide any useful function.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-219.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-221 Log #3344 NEC-P18 **Final Action: Reject**
(600.7(A)(2) and (3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by the referenced sections which apply unless amended. (A)(2) does amend 250.122 which provides that flexible cords, for example, may have an equipment grounding conductor smaller than required in Table 250.122.
Panel Meeting Action: Reject
Panel Statement: Delete what?

The proposal does not comply with 4.3.3(c) and (d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.

The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-222 Log #1214 NEC-P18 **Final Action: Reject**
(600.7(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (6), change "required" to "installed".

Revise 7(B): Bonding conductors installed externally of a sign or raceway or cable shall be protected where likely to be subject to physical damage.
Substantiation: Edit. The provision should apply where a bonding conductor is optionally installed and not required, and also where a cable type wiring method is used. "Likely" is defined as a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The proposed revisions are not considered editorial.

The requirement for an external bonding conductor is to eliminate the cross talk that happens with high voltage currents. 600.7(B)(1) requires the installation of an external bonding conductor. This is not an option. In the proposed changes to (B)(7), the submitter is attempting to require the bonding conductor to be a part of the GTO Cable.

"Likely" is vague and unenforceable according to 3.2.1 of the NEC Manual of Style.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-223 Log #4789 NEC-P18 **Final Action: Accept in Principle**
(600.7(B)(1))

Submitter: Terry T. Maier, City of West Allis Wisconsin
Recommendation: Add the following new text:
Exception No. 1: Metal equipment supplied from the load side of a Class 2 transformer shall not be required to be bonded together or connected to the equipment grounding conductor where LED lighting is the sole light source. The transformer supply shall not exceed 150 volts to ground.
Substantiation: The load side wiring of LED signs are usually wired with a Class 2 cable that does not provide a bonding path.

Per 2008 NEC Article 725.2 Definitions, a Class 2 circuit limits fire initiation and provides acceptable protection from electric shock.

Per 2008 NEC 250.90 Bonding is provided to conduct safely any fault current. A Class 2 circuit provides suitable protection in its power supply.

Bonding the metal parts together would not provide any additional safety.
Panel Meeting Action: Accept in Principle

Add new exception to 600.7(B)(1) to read as follows:

Exception: Remote metal parts of a section sign or outline lighting system only supplied by a remote Class 2 power supply shall not be required to be bonded to an equipment grounding conductor.

Panel Statement: Without altering the intent of the proposal, CMP-18 changed the wording for clarity and usability.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-224 Log #4032 NEC-P18 **Final Action: Accept in Principle**
(600.7(B)(1) Exception (New))

Submitter: Richard D. Gottwald, International Sign Association

Recommendation: Add new text to read as follows:

Exception: Metal parts of a section sign or outline lighting system that are electrically isolated from a Class 2 power source, shall not be required to be bonded.

Substantiation: Dead metal on the load side containing only Class 2 components should not be required to be bonded to the equipment ground. The connection of dead metal in a section sign or outline lighting to the equipment ground conductor serves no purpose.

According to Underwriters Laboratories, Class 2 requirements specify that the output of a Class 2 supply must be isolated from line and ground. This being the case, grounding dead metal that houses Class 2 components will not result in clearing a fault at the branch circuit. Should a Class 2 circuit become grounded for some reason, the energy will not go to ground because the secondary circuit is not ground referenced. Bonding of the dead metal has absolutely no benefit. A Class 2 power source secondary circuit is isolated from ground and supply. The output from the power source has no ground reference so the potential for a shock or fire hazard due to ground fault is zero. In the event the output contact dead metal that is grounded, the output would then become ground referenced. This could result in the supply side of the output becoming more of a potential hazard because most problems occur when there is a ground fault.

CMP18 established that lighting systems operating at 30 volts or less are exempt from grounding. 411.415(A) Low voltage LED lighting systems, 30 volts or less are used in outline lighting and section signs. What electrical theory distinguishes low voltage lighting used in outline lighting and signs form low voltage systems used for general lighting under 411? If a fire and shock hazard are the basis for requiring grounding for listed signs with low voltage illumination, how was it determined that no hazard existed with lighting systems operating at 30 volts or less, energized by a isolating power supply?

Shock from low voltage (30 volts or less) landscape lighting, to which 411 has been applied since 1996 has not been a safety issue. Landscape lighting contains metal parts and is embedded in the ground in wet locations, at pedestrian level while section signs and outline lighting is mostly accessible to qualified service personnel only.

Article 90 provides that the rules in Chapters 1-4 apply generally and allows the general rules to be modified or supplemented by Chapters 5, 6, and 7. In its rejection of a similar proposal during the 2008 Code Cycle, CMP 18 stated:

According to 250.112(I), the exceptions for grounding that may exist in Article 725 only apply to Class 2 or Class 3 circuits used for remote-control, signaling, or fire alarm circuits. This exception does not apply to a low-voltage lighting circuit of the type used in section signs.

The exception being sought is not from Article 725 but Article 600.7. The exception to grounding metal parts of signs powered by power limited power sources is being pursued in Article 600 because listed section signs or outline lighting are “electrical utilization equipment” to which 725 does not apply. The scope of 725 is:

This article covers remote-control, signaling and power limited circuits that are not an integral part of a device or appliance.

While an electric sign is not an “appliance,” by Code definition it shares the same distinction because an appliance, like an electric sign, is “utilization equipment.”

In an article published in Electrical Contractor, January 2000, Mark Ode, a UL Engineer and contributor to a number of published papers on the subject of low voltage lighting, noted regarding the wording in the Scope of 725, “similar wording is in Section 300-1(B) and both the Scope Statements in 300 and 725 make it totally clear that the interior wiring of equipment is not covered by this article.”

Field wiring on Section Signs or outline lighting systems is not “interior wiring.” The listed section sign is an assembly of components that include the electrical connections, (field wiring) of subassemblies. Field wiring rules for neon and other sign lighting sources are covered by 600. And as specified in 600, field wiring rules for power limited circuits in listed signs or outline lighting are covered in Article 725. But 725 contains no rules for grounding or wiring listed equipment.

Section 3.3.4 of the NEC Style Manual states that “where” should not be used to mean “when” or “if.” This proposal intends to use the word “if” where appropriate.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-223.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-225 Log #2549 NEC-P18 **Final Action: Reject**
(600.7(B)(4))

Submitter: Thomas Sanford, Huron Sign Co.

Recommendation: Add new text as follows:

Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing <u>or that encloses the secondary wiring from class 2 power sources</u> shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

Substantiation: Language is added to update this section of the code to include the now common use of class 2 wiring in this type of section sign.

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.

The present allowance for the use of up to 100 ft of flexible metal conduit for bonding of remote sign sections is based on the technical rationale associated with the impedance characteristics of high voltage neon conductors run in the flexible metal conduit. No technical substantiation was provided to support a similar acceptance of up to 100 ft of flexible metal conduit for bonding of remote sign sections supplied by low voltage Class 2 supplies such as those used for LED sign sections.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-226 Log #1219 NEC-P18 **Final Action: Reject**
(600.8(A) and (D))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text as follows:

(A) Enclosures shall have ~~ample~~ strength and rigidity identified for the use.

(D) Metal parts of equipment shall be <u>corrosion resistant or</u> protected from corrosion <u>by identified methods</u>.

Substantiation: Edit. “Ample” is subjective and not defined. “Approved” is not necessarily the same as “identified”. Present wording of (D) should specify that protection other than corrosion resistant metal should be by methods suitable for the use.

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.

CMP-18 has no idea what an “identified method” is.

The proposed editorial revisions do not substantially improve clarity of the present requirements and, in general, these requirements are currently addressed more specifically and in greater detail in the product safety standard applicable to these when evaluated for listing.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-227 Log #1218 NEC-P18 **Final Action: Reject**
(600.10)

Submitter: Dan Leaf, Seneca, SC

Recommendation: In (A), change “adequately” to “securely”.

Revise text of (B): An attachment plug shall be provided for each portable or mobile sign <u>except those that are an integral part of self-contained equipment including a generator battery, solar voltaic, or other power supply as the sole source of power.</u>

Delete text of (C)(1) and substitute: Field–installed flexible cords shall be hard service or junior hard service types covered in Table 400.4, identified for the use and sunlight resistant where exposed to direct sunlight. Cords shall contain an equipment grounding conductor. The cord shall not exceed 4.5 m (15 ft) in length.

Delete (D).

Substantiation: Edit. Although “adequately” and “securely” are possibly unenforceable terms, securely is an often used term in the Code and more readily determined. The provisions should recognize portable and mobile signs that have an associated independent power supply. The proposal for (C)(1) covers the requirements of (D).

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.

There was no technical substantiation provided to change the wording. The proposed changes will not result in additional safety or clarity to the code.

This proposal is not considered an editorial change.

600.10(C) Wet or Damp Location.
(2) ~~Ground-Fault Circuit Interrupter~~ **Power Safe Protector.** Portable or mobile signs shall be provided with factory-installed ~~ground-fault circuit-interrupter~~ power safe protector protection for personnel. The ~~ground-fault circuit interrupter~~ power safe protector shall be an integral part of the attachment plug or shall be located in the power-supply cord within 300 mm (12 in.) of the attachment plug.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a “Power Off” safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle is actively supplying power to an appliance, it provides traditional GFCI protection.
2. PSP receptacles monitor the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.

Field-installed secondary circuit wiring for electric signs and outline lighting systems shall be in accordance with 600.12(A), (B), or (C). Field installed secondary wiring for skeleton tubing systems shall be in accordance with Part II.
Substantiation: The rules for secondary field wiring described in this section are also applicable to skeleton tubing. Part II contains special rules for unlisted skeleton tubing installations. Over the past two *Code* cycles, sections of Part II originally designated for skeleton tubing, 600.31 and 600.32 have been assigned to field installed wiring for listed section signs in 600.12. This additional text removes a gray area in the *Code* and clarifies all of Part II apply to skeleton tubing installations.
Panel Meeting Action: Reject
Panel Statement: CMP-18 believes that the current wording adequately describes the requirements. No further change is required.
The submitter has not adequately described the “gray area.”
See panel action and statement on Proposal 18-229.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-232 Log #3547 NEC-P18 **Final Action: Accept in Principle in Part**
(600.12(C))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.
This action will be considered by the panel as a public comment.
Submitter: Randall K. Wright, RKW Consulting
Recommendation: Revise text to read as follows:
(C) Class 2 Less Than ~~50~~ 30 Volts. Secondary class 2 circuit wiring less than ~~50~~ 30 volts shall be installed in accordance with either of the following:
(1) Any wiring method included in Chapter 3 suitable for the conditions.
(2) Where the power source provides class 2 output, complies with the output voltage in accordance with UL 1310 and the requirements in ~~725.121, wiring methods shall be permitted to be installed in accordance with 725.130(A) or (B).~~ 600.33.
Substantiation: To clarify class 2 output in accordance with a UL requirement. This is needed because I am proposing to allow the secondary circuits to not require an equipment grounding conductor on dead metal parts and the only way to insure the safety of the output is the current UL reference. I have also proposed to write the wiring regulations for signs in 600.33 and not reference a general low voltage section because of confusion.
Panel Meeting Action: Accept in Principle in Part
600.12(C) to read as follows:
(C) Class 2. Secondary Class 2 circuit wiring shall be installed in accordance with either of the following:
(1) Any wiring method identified in 600.33 and in Chapter 3 suitable for the conditions
(2) Where the power source provides Class 2 output and complies with the requirements in 600.33
Panel Statement: CMP-18 does not accept the technical justification for citing voltage.
Mandatory references to other standards is not permitted by 4.2 of the NEC Style Manual.
(4.2 References to Other Standards. References to other standards shall not be in mandatory Code text. References to product standards shall be in an informative annex. References to other Standards shall be in the Fine Print Notes.)
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
COSTELLO, P.: The reference in (2) is incorrect it should refer to 600.24 not 600.33.

18-233 Log #4034 NEC-P18 **Final Action: Accept in Principle**
(600.12(C))

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Revise text to read as follows:
(C) Less Than 50 Volts. Secondary circuit wiring less than 50 volts shall be installed in accordance with ~~either of the following~~ 600.33.
~~(1) Any wiring method included in Chapter 3 suitable for the conditions.~~
~~(2) Where the power source complies with the requirements in 725.121, wiring methods shall be permitted to be installed in accordance with 725.130 (A) or (B).~~
Substantiation: Refer to substantiation for new 600.33.
(1) and (2) are deleted and referenced in new Section 600.33.
The use of LEDs in Section Letter signs and outline lighting presents a unique situation. Chapter 6 contains Article 600, which is designated for Electric Signs and Outline Lighting. The purpose of this proposal is to consolidate the majority of the rules for power limited wiring used in signs and outline lighting into the chapter that regulates signs.
Signs, including listed Section Signs, are defined as “electrical utilization equipment.” These signs may require types of field wiring other than neon circuitry to complete the installation. In the past two Code Cycles, 2005 and 2008, CMP 18 has recognized this and from within Article 600 has included various references to Article 725 for rules applicable to power limited circuit wiring.

However the Scope of Article 725 only covers remote-control, signaling, and power limited circuits that are *not an integral part of a device or appliance*. A sign is not an appliance, but Code definitions link *appliance* and *sign* because both are electrical utilization equipment. [100. Definitions]

In an article published in *Electrical Contractor* January 2000, Mark Ode, a UL engineer noted regarding the wording in the Scope of 725, "similar wording is in Section 300-1(b) and both the Scope Statements in 300 and 725 make it totally clear that the interior wiring of equipment is not covered by this article."

It may be argued that field wiring is not "interior wiring" but a Section Sign with all its remote parts, including the field wiring between remote sections, comprises the sign as described on the installation instructions.

Section signs and outline lighting are listed electrical equipment, and according to Mark Ode's interpretation, Article 725 would not apply to electric signs. Code panel 18 hinted at this during the 2008 Code Cycle, by suggesting that grounding exemptions applied only to Remote-Control, Signaling and Fire Alarm circuits. [Panel Statement, 2008 ROC] Adding a new section to Article 600 renders this possible conflict with the *Code* moot. Placing requirements for sign wiring within the Code Article for Signs and Outline Lighting, Article 600 facilitates the NFPA goal to make the Code more user friendly and the industy's goal to keep all rules relating to sign wiring within Article 600.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 18-232.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-234 Log #1217 NEC-P18 **Final Action: Reject**
(600.12(C)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (1):

(1) Any wiring method included in Chapter 3 ~~suitable~~ <u>identified</u> for the conditions.

Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: CMP-18 believes that "suitable" in this instance is appropriate.

The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.

The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-235 Log #1216 NEC-P18 **Final Action: Reject**
(600.21(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

Ballasts, transformers, ~~and~~ electronic power supplies <u>and other equipment</u> shall be of the weather proof type or be ~~of the~~ <u>listed for</u> outdoor ~~type~~ <u>use</u> ~~,and~~ <u>or</u> shall be protected from the weather by a sign body or <u>identified</u> enclosure.

Substantiation: Equipment marked for outdoor use should not require additional weather protection of a sign body or separate enclosure.
Panel Meeting Action: Reject
Panel Statement: Transformers and power supplies used in the sign industry are marked for outdoor use but require additional enclosures when used in a wet location.

The proposal does not does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects in that there is no statement of the problem or why the proposal solves the problem. Stating that something should be changed is not substantiation, it is an opinion.

Equipment of the outdoor type requires additional protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-236 Log #1291 NEC-P18 **Final Action: Reject**
(600.22 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:

<u>Ballasts covered in 410.130(E)(2) and (3) shall not be required to have thermal protection and ballasts covered by 410.130(E)(3) and (4) shall not have thermal protection.</u>

Substantiation: Edit. Correlation between sections; this section amends and negates 410.130.
Panel Meeting Action: Reject
Panel Statement: 410.30 deals with supports and is not applicable here. The design of the Code is that Chapter 6 modifies the requirements of Chapters 1 thru 4. This is exactly what is happening here. See 4.3.3 of the NFPA Regulations Governing Committee Projects.

The proposed revision is not considered editorial.

(600.24(A), (B) and (C))

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Revise text to read as follows:
600.24 Class 2 Power Sources. Signs and outline lighting systems supplied by Class 2 transformers, power supplies, and power sources shall comply with the applicable output voltage in UL 1310 and the requirements of Article 600 and 600.24(A), (B), and (C).
(A) Listing. Class 2 Power supplies and power sources shall be listed for use with electric signs and outline lighting systems and shall comply with ~~725.121.~~ the output voltage in accordance with UL 1310.
~~**(B) Grounding.** Metal parts of signs and outline lighting systems shall be grounded and bonded in accordance with 600.7.~~
(B) Wiring Methods on the Supply Side of the Class II Power Supply. Conductors and equipment on the supply side of the power source shall be installed in accordance with the appropriate requirements of Chapter 3. Transformers or other devices supplied from electric light or power circuits shall be protected by an overcurrent device rated not over 20 amperes, and shall be connected to an equipment grounding conductor.
(C) Secondary Wiring. Secondary wiring from Class 2 power sources shall comply with 600.12(C) and 600.33.
Exception No. 1: The secondary dead metal parts of a field installed section sign or outline lighting system shall not be required to have an equipment grounding conductor provided the power supply is remote and supplies Class II output voltage in accordance with UL 1310. The power supply is required to be connected to an equipment grounding conductor.
Substantiation: (A) The reference to UL 1310 is used to insure the secondary voltage is safe.
(B) Changed in include the requirements for the supply side of the power supply only
(C) Exception No. 1: When the secondary output is controlled as in accordance with UL 1310 we can be assured that the primary voltage can not short or otherwise bring line voltage to the secondary equipment therefore insuring it's safety from electric shock, and fire initiation.
Panel Meeting Action: Accept in Principle in Part
600.24 to read as follows:
600.24 Class 2 Power Sources. Signs and outline lighting systems supplied by Class 2 transformers, power supplies, and power sources shall comply with the requirements of Class 2 circuits and 600.24(A), (B), (C), and (D).
(A) Listing. Class 2 power supplies and power sources shall be listed for use with electric signs and outline lighting systems.
(B) Grounding. Metal parts of signs and outline lighting systems shall be grounded and bonded in accordance with 600.7.
(C) Wiring Methods on the Supply Side of the Class 2 Power Supply. Conductors and equipment on the supply side of the power source shall be installed in accordance with the appropriate requirements of Chapter 3.
(D) Secondary Wiring. Secondary wiring from Class 2 power sources shall comply with 600.12(C) and 600.33.
Panel Statement: CMP-18 revised the submitter's text for clarity.
CMP-18 did not accept the submitter's part (B) and exception.
Mandatory references to other standards is not permitted by 4.2 of the NEC Style Manual.
4.2 References to Other Standards. References to other standards shall not be in mandatory Code text. References to product standards shall be in an informative annex. References to other Standards shall be in the Fine Print Notes.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
WRIGHT, R.: I do not disagree with the panel action and comment. I do however feel there may need to have further clarification that class 2 power supplies need to be connected to an equipment grounding conductor where the primary voltage is terminated. If terminated within a sign letter or sign body then the equipment grounding conductor needs extended to that location. Each power supply listed for use with a sign, outline lighting and skeleton neon installation shall be provided with either a termination or terminal for the purpose.

18-242 Log #4037 NEC-P18 **Final Action: Reject**
(600.24(B))

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Revise text to read as follows:
(B) Grounding. Metal parts of ~~signs and outline lighting systems~~ Class 2 power supplies and power sources shall be grounded and bonded in accordance with 600.7.
Substantiation: New text separates grounding requirements for metal parts of power sources from the grounding requirements for metal parts isolated from the power source in a Class 2 system. This harmonizes with proposed new grounding and bonding exceptions, 600.7(A)(1), 600.7(B)(1).
Panel Meeting Action: Reject
Panel Statement: The submitter failed to provide sufficient substantiation for the removal of signs and outline lighting systems. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-243 Log #4788 NEC-P18 **Final Action: Reject**
(600.24(B))

Submitter: Terry T. Maier, City of West Allis Wisconsin
Recommendation: Delete the following text:
~~600.24(B) Grounding. Metal parts of signs and outline lighting systems shall be grounded and bonded in accordance with 600.7.~~
600.24(C) would become 600.24(B)
Substantiation: This is in conjunction with other proposals to change 600.7(A) and (B) by adding exceptions for Class 2 circuits
The load side wiring of LED signs are usually wired with a Class 2 cable that does not provide a ground path. 600.12(C)(2) allows Class 2 cables to be used. Why allow Class 2 cables if a grounding means is required. Proposal to delete 600.24(B) will be separate submittal.
Per 2008 NEC Article 725.2 Definitions, a Class 2 circuit limits fire initiation and provides acceptable protection from electric shock.
Per 2008 NEC 250.20(A) A Class 2 power supply is not required to have the load side grounded under conditions used for wiring signs.
Grounding the signs would not provide any useful function.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12

18-244 Log #4038 NEC-P18 **Final Action: Accept in Principle**
(600.24(C))

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Add new text to read as follows:
(C) Secondary Wiring. Secondary wiring from Class 2 power sources shall comply with 600.12(C) and 600.33.
600.33 Secondary Circuit Wiring, 30 Volts Nominal or Less.
These requirements are in addition to the requirements in Part I
Secondary Wiring. Secondary wiring shall be permitted to be installed using listed power limited cable rated for the installation environment as described in Table 725.154 and on Table 725.154(G) and 725.179
(1) Cable listed as a part of a LED sign and outline lighting system shall be permitted to be substituted when rated for the installation environment
(2) Power limited cable shall be permitted to be installed exposed.
(3) Exposed power limited cables shall be securely fastened in place and comply with 725.24, and 725.143.
(4) Connection of splices shall be made with listed, insulated splicing devices and shall not be required to be enclosed in a dry or damp location. Splices and connections in power limited cable shall be accessible after installation
(5) Conductors shall be sized for the load imposed on the secondary circuit and shall be short as possible and not smaller that 18 AWG.
Power sources and supplies. Power sources and supplies shall be securely fastened in place.
(1) Power sources shall comply with 600.24.
Substantiation: Field wiring requirements have been consolidated in new Section 600.33.
600.33 Substantiation
The use of LEDs in Section Letter signs and outline lighting presents a unique situation. Chapter 6 contains Article 600, which is designated for Electric Signs and Outline Lighting. The purpose of this proposal is to consolidate the majority of the rules for power limited wiring used in signs and outline lighting into the chapter that regulates signs.
Signs, including listed Section Signs are defined as "electrical utilization equipment." These signs may require field wiring of other than neon circuitry to complete the installation. In the past two Code Cycles, 2005 and 2008, CMP 18 has recognized this and from within Article 600, has included various references to Article 725 for rules applicable to power limited circuit wiring.
However the Scope of Article 725 only covers remote-control, signaling, and power limited circuits that are not an integral part of a device or appliance. A sign is not an appliance, but Code definitions link appliance and sign because both are electrical utilization equipment. [100. Definitions]
In an article published in Electrical Contractor January 2000, Mark Ode, a UL engineer noted regarding the wording in the Scope of 725, "similar wording is in Section 300-1(b) and both the Scope Statements in 300 and 725 make it totally clear that the interior wiring of equipment are not covered by this article."
It may be argued that field wiring is not "interior wiring" but a Section Sign with all its remote parts, including the field wiring between remote sections compromises the sign as described on the installation instructions.

Section signs and outline lighting are listed electrical equipment, and according to Mark Ode's interpretation, Article 725 would not apply to electric signs. Code panel 18 hinted at this during the 2008 Code Cycle, by suggesting grounding exemptions only applied to Remote-Control, Signaling and Fire Alarm circuits. [Panel Statement, 2008 ROC] Adding a new section to Article 600 renders this possible conflict with the Code moot. Placing requirements for sign wiring within the Code Article for Signs and Outline Lighting, Article 600 facilitates the NFPA goal to make the Code user friendly and the industries goal to keep all rules relating to sign wiring within Article 600.

(600, Part II)

Submitter: Richard D. Gottwald, International Sign Association

Recommendation: Revise text to read as follows:

II. Field-Installed <u>Secondary</u> ~~Skeleton Tubing and~~ Wiring.

Substantiation: Revise title of Section to a general statement that applies Part II to all field installed secondary wiring for signs, outline lighting and skeleton neon tubing, regardless of voltage. The reference to secondary wiring harmonizes with 600.12, "Field-Installed Secondary Wiring." Refer to Substantiation for 600.30.

Panel Meeting Action: Accept in Principle

Article 600, Part II section title to read as follows:

II. Field-Installed Skeleton Tubing, Outline Lighting, and Secondary Wiring.

Panel Statement: CMP-18 revised the section title for clarity.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-247 Log #4040 NEC-P18 **Final Action: Accept in Principle**

(600.30)

Submitter: Richard D. Gottwald, International Sign Association

Recommendation: Revise text to read as follows:

Part II of this article shall apply to all <u>field wiring for secondary circuits in signs, outline lighting, and skeleton tubing.</u> ~~of the following:~~

~~(1) Field installed skeleton tubing~~

~~(2) Filed installed skeleton tubing wiring~~

Substantiation: The sign industry CMP 18 principal introduced a reorganization of Article 600 during the 1996 Code Cycle that resulted in a more logical order of the requirements for sign installations and field wiring. The changes adopted for the 1996 Code made it easier for electric sign companies to follow the rules, and for the AHJ to apply them during the approval process.

During the re-write and updating of Article 600 in 1996, it was decided, that in addition to needed changes in the scope of Article 600, the goal would be to draft Article 600 as a performance code as opposed to a specification code. Whenever possible construction requirements would be eliminated where there were applicable UL 48 standards for listing that would apply.

To implement this new paradigm, Article 600 was divided into two parts, Part A and Part B. Part A was applicable generally to requirements for list signs and Part B for unlisted skeleton neon tubing. Construction requirements for listed signs were in the UL48 Standard, making the recitation of sign electrical equipment construction unnecessary in the Code. This was deemed necessary because UL48 did not have within its scope skeleton neon tubing, (which also was first defined in the Code in 1996). This category of neon was assembled and wired in the field and attached to structures that "could not be brought into the factory for evaluation by UL making listing unavailable at that time. As a result an exception to listing for skeleton tubing was added to 600-3.

In the 1996 Code, the first requirement under "B. Field Installed Skeleton Tubing", Article 600-30 read:

Part B of this article shall apply only to field installed skeleton tubing. These requirements are in addition to the requirements of Part A, General.

(Commencing with the 2002 NEC®, the designations for the two parts of Article 600 were changed from alpha "A" and "B" to numeric "1" and "2").

This description of the limited application of Part II remained in the Article 600-30 for three Code Cycles, 1999, 2002 and 2005 until the AHJ began to raise concerns about the lack of rules in Article 600 that could be applied to field wiring in listed Section Signs. As written, the Code wording that described neon field wiring was only applicable to "field installed skeleton neon tubing."

To address this omission, and mitigate this gray area in the Code, during 2005, new Section 600.12 was added referencing 600.31 and 600.32 in Part II as being applicable also to field wiring for listed signs. But the wording of 600.30 regarding the limited applicability of Part II was not changed during the 2005 Code Cycle.

More tweaking on the application of Part II, Article 600.30 occurred during the 2008 Code Cycle.

II. Field-Installed Skeleton Tubing and Wiring

600.30 Applicability. Part II of this article shall apply to all of the following:

(1) Field-installed skeleton tubing

(2) Field-installed skeleton tubing wiring

Clearly, the original intent of the sign industry and CMP 18, establishing Part II exclusively for wiring skeleton is no longer in play.

The rewrite and additions to Article 600.12 in the 2008 NEC® reference 600.31, 600.31 and are intended to cover other than field skeleton tubing or skeleton tubing wiring. But Part II continues to imply Part II applies principally to field installed skeleton tubing and wiring, when it fact it applies to field wiring for listed section signs with neon illumination schemes.

The original intent of this partition in 600 is no longer applicable because of new technology with field wiring for listed Section Signs employing other than neon illumination. Advancement in sign illumination technology during the interim from 1996 to 2011 is significant. The proposed amendments to the Scope of 600 during this Code Cycle and the proposal by the industry to add a new section in Part 2, applicable to power limited sign circuits, recommend changing the Applicability of 600.30 to include all field installed wiring in Part II.

Panel Meeting Action: Accept in Principle

600.30 to read as follows:

600.30 Applicability. Part II of this article shall apply to all of the following:

(1) Field installed skeleton tubing

(2) Field installed secondary circuits

(3) Outline lighting.

Panel Statement: CMP-18 chooses to retain subsections and adds a third section called "Outline Lighting" for clarity.

Ballot Results: Affirmative: 12

18-249 Log #3549 NEC-P18 **Final Action: Reject**

(600.32(G))

Submitter: Randall K. Wright, RKW Consulting

Recommendation: Revise text to read as follows:

(G) Conductors in Raceways. ~~The insulation on all conductors shall extend not less than 65 mm (21/2 in.) beyond the metal conduit or tubing.~~

<u>**(1) Damp or Wet Locations.** In damp or wet locations, the insulation on all conductors shall extend not less than 100 mm (4 in.) beyond the metal conduit or tubing.</u>

<u>**(2) Dry Locations.** In dry locations, the insulation on all conductors shall extend not less than 65 mm (21/2 in.) beyond the metal conduit or tubing.</u>

Substantiation: To return the time tested safety from the previous code. The code was changed based on a test, which was not real application of the environment this wiring is used in.

I have provided an e-mail correspondence as Supporting Material

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The Fact Finding Investigation providing the technical basis for the previous change was not repudiated or contradicted in the substantiation. Indeed, it appears to have been reconfirmed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-249a Log #CP1804 NEC-P18 **Final Action: Accept**
(600.33)

Submitter: Code-Making Panel 18,
Recommendation: Add new section 600.33 to read as follows:
600.33 LED Sign Illumination Systems, Secondary Wiring.
The wiring methods and materials shall be installed in accordance with the sign manufacturer's installation instructions using any applicable wiring methods from Chapter 3.
(A) Insulation and Sizing of Class 2 Conductors. Listed class 2 cable that complies with Table 725.154(G) shall be installed on the load side of the class 2 power source. The conductors shall not be smaller than 22 AWG.
a. Wet Locations. Class 2 cable used in a wet location shall be identified for use in wet locations or have a moisture-impervious metal sheath.
b. Damp Locations. Class 2 cable used in a damp location shall be identified for use in a damp location or shall have the outer jacket of sunlight- and moisture-resistant nonmetallic material.
c. Other locations. In other locations, any applicable cable permitted in Table 725.154(G) may be used.
(B) Installation. Circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D).
(C) Protection Against Physical Damage. Where subject to physical damage the conductors shall be protected, and installed in accordance with 300.4.
(D) Grounding and Bonding. Refer to 600.7 for grounding and bonding.
Substantiation: CMP-18 combined several proposals to provide needed LED sign illuminations system wiring requirements into 600.33.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
CARPENTER, F.: There are no Class 2 cables for damp locations. The Panel will have to address this section to allow for use of wet location cable in damp locations.

18-250 Log #3543 NEC-P18 **Final Action: Accept in Principle**
(600.33)

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Add new text to read as follows:
600.33 **LED Secondary-Circuit Wiring Class II 30 volts or less.**
(A) Wiring Methods. Wiring methods and materials on the load side of the Class 2 power source shall be in accordance with the wiring methods in Chapter 3, as classified and specified per the systems installation instructions and 600.33 (A), (B), (C), (D).
(1) Insulation and Size. Conductors shall be type PLTC nonmetallic-sheathed, power-limited tray cable listed as being suitable for cable trays and shall consist of a factory assembly of two or more insulated conductors under a nonmetallic jacket. The insulated conductors shall be 22 AWG through 12 AWG. The conductor material shall be copper (solid or stranded). Insulation on conductors shall be rated for 300 volts. The cable shall be listed as being resistant to the spread of fire.
a. Wet Locations. Type PLTC cable used in a wet location shall be listed for use in wet locations or have a moisture-impervious metal sheath.
b. Damp Locations. Type PLTC cable used in a damp location shall be listed for use in a damp location or shall have the outer jacket be a sunlight- and moisture-resistant nonmetallic material.
(2) Installation. Class 2 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed in a dry location on the surface of ceilings and sidewalls shall be supported by the interior building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D).
(3) Protection Against Physical Damage. Where subject to physical damage, as where they transition from inside (dry) to outside to feed remote mounted letters or outline lighting (damp-wet) the conductors shall be protected, and installed in accordance with 300.4.
(B) Bonding and Grounding. Metal parts of a remote wired channel letter sign or outline light shall not be required to be connected to an equipment grounding conductor provided the power supply meets the class 2 output in accordance with UL 1310.
Substantiation: The requirements need to be in Article 600 to be clear for the requirements of the class 2 led circuits when used for electric signs and outline lighting.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-249a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-251 Log #4041 NEC-P18 **Final Action: Accept in Principle**
(600.33 (New))

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Add new text to read as follows:
600.33 Secondary Circuit Wiring, 50 Volts Nominal or Less.
These requirements are in addition to the requirements in Part I
Secondary Wiring. Secondary wiring shall be permitted to be installed using listed power limited cable rated for the installation environment as described in Table 725.154 and on Table 725.154(G) and 725.179
Exception: Listed power limited cable that is part of a listed sign or outline lighting system.
(1) Power limited cable shall be permitted to be installed exposed.
(2) Exposed power limited cables shall be securely fastened in place and comply with 725.24, and 725.143.
(3) In damp or dry locations, connection of splices shall be made with listed, insulated splicing devices and shall not be required to be enclosed.
(4) Conductors shall be sized for the load imposed on the secondary circuit and shall be short as possible and not smaller that 18 AWG.
Power sources and supplies. Power sources and supplies shall be securely fastened in place.
(1) Power sources shall comply with 600.24.
Substantiation: The use of LEDs in Section Letter signs and outline lighting presents a unique situation. Chapter 6 contains Article 600, which is designated for Electric Signs and Outline Lighting. The purpose of this proposal is to consolidate the majority of the rules for power limited wiring used in signs and outline lighting into the chapter that regulates signs.
Signs, including listed Section Signs, are defined as "electrical utilization equipment." These signs may require types of field wiring other than neon circuitry to complete the installation. In the past two Code Cycles, 2005 and 2008, CMP 18 has recognized this and from within Article 600 has included various references to Article 725 for rules applicable to power limited circuit wiring.
However the Scope of Article 725 only covers remote-control, signaling, and power limited circuits that are *not an integral part of a device or appliance*. A sign is not an appliance, but Code definitions link *appliance* and *sign* because both are electrical utilization equipment. [100. Definitions]
In an article published in *Electrical Contractor* January 2000, Mark Ode, a UL engineer noted regarding the wording in the Scope of 725, "similar wording is in Section 300-1(b) and both the Scope Statements in 300 and 725 make it totally clear that the interior wiring of equipment is not covered by this article."
It may be argued that field wiring is not "interior wiring" but a Section Sign with all its remote parts, including the field wiring between remote sections, comprises the sign as described on the installation instructions.
Section signs and outline lighting are listed electrical equipment, and according to Mark Ode's interpretation, Article 725 would not apply to electric signs. Code panel 18 hinted at this during the 2008 Code Cycle, by suggesting that grounding exemptions applied only to Remote-Control, Signaling and Fire Alarm circuits. [Panel Statement, 2008 ROC] Adding a new section to Article 600 renders this possible conflict with the *Code* moot. Placing requirements for sign wiring within the Code Article for Signs and Outline Lighting, Article 600 facilitates the NFPA goal to make the Code more user friendly and the industy's goal to keep all rules relating to sign wiring within Article 600.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-249a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-252 Log #1472 NEC-P18 **Final Action: Reject**
(600.41)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Field-installed skeleton tubing shall not be installed where likely to be subject to physical damage. Where tubing is readily accessible to other than qualified persons, field-installed tubing shall be provided with ~~suitable~~ identified means of protection. ~~Guards or protected by other approved means.~~
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: "Likely" is also a term to be avoided. The panel is satisfied with "suitable." See 3.2.1 of the NEC Style Manual.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects for the substantiation does not contain a statement of the problem.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-253 Log #4042 NEC-P18 **Final Action: Reject**
(600.41)

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Revise text to read as follows:
600.41 Skeleton ~~Neon~~ **Tubing.**
Substantiation: When Part II was accepted by CMP 18 during the 1996 *Code* cycle, Part II contained rules designated exclusively for skeleton tubing. Skeleton tubing was (is) not covered by the UL 48 Sign Standard leading CMP 18 to adopt specifications for the secondary circuit wiring as well as the neon tubing, In as much as the in-force Standard UL 48 continues to exclude skeleton tubing form its scope, the Code must identify specifications for neon tubing and wiring used in these installations. As a safety measure, only listed parts are eligible for use with non-listed skeleton tubing.
Panel Meeting Action: Reject
Panel Statement: Neon tubing is the correct term and is more encompassing in that it includes skeleton tubing. The proposal did not provide sufficient substantiation to change it.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-254 Log #4018 NEC-P18 **Final Action: Reject**
(600.42)

Submitter: Richard D. Gottwald, International Sign Association
Recommendation: Revise text to read as follows:
600.42 Skeleton Tubing E**lectrode Connections.**
Substantiation: When Part II was accepted by CMP 18 during the 1996 *Code* cycle, Part II contained rules designated exclusively for skeleton tubing. Skeleton tubing was (is) not covered by the UL 48 Sign Standard leading CMP 18 to adopt specifications for the secondary circuit wiring as well as the neon tubing. In as much as the in-force Standard UL 48 continues to exclude skeleton tubing from its scope, the Code must identify specifications for neon tubing and wiring used in these installations. Because a qualified electrical test laboratory does not evaluate skeleton tubing, as a safety measure, only listed parts are eligible for the use with non-listed skeleton tubing installations.
Panel Meeting Action: Reject
Panel Statement: 600.42 is in Part II, which covers field installed skeletal tubing, and the recommendation is therefore redundant.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 604 — MANUFACTURED WIRING

19-278 Log #3019 NEC-P19 **Final Action: Reject**
(604)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Relocate Article 604 to a new Article 3xx, under the purview of CMP 7.
Substantiation: Manufactured wiring systems are more of a “wiring method” than “special equipment”. As such, the requirements should be in Chapter three, near the cable wiring method articles.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter’s substantiation. A manufactured wiring system, by definition, is an off-site assembly of components put together using the wiring methods of Chapter 3. It cannot be inspected on site without damage or destruction of the assembly. The code-making panel does not have the authority to relocate an existing article in the code.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-279 Log #4339 NEC-P19 **Final Action: Reject**
(604.1)

Submitter: Ralph Occhipinti, ADCO Electrical Corp.
Recommendation: Add the following new text:
(*) Multiwire Manufactured Wiring System circuits shall comply with **Article 210 Section.4** provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates.
Substantiation: My objections of Manufacturing Wiring Systems reflect more restrictive consideration towards the installation used as general branch building wiring. Non Qualified persons can compromise the integrity of the installation of Manufacturing Wiring Systems. Therefore, Manufacturing Wiring Systems used as a substitute of general wiring methods such as conduit and wire or listed armored cabling (AC / MC)shall have limitations and confined to within specified locations such as modular furniture or prewired store fixtures.
Panel Meeting Action: Reject
Panel Statement: Section 90.3 implies that the requirements of Article 210, Section 4 already apply to installations of manufactured wiring systems.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-280 Log #4462 NEC-P19 **Final Action: Reject**
(604.1)

Submitter: Ross Johnson, Haworth Inc.
Recommendation: Revise text to read as follows:
604.1 Scope. The provisions of this article apply to field-installed wiring using off-site manufactured subassemblies for branch circuits, remote-control circuits, signaling circuits, and communications circuits ~~in accessible areas~~.
Substantiation: The words “in accessible areas” are out of place in the “Scope” section of article 604. Sections 604.4 and 604.5 are the sections that clearly and fully define the permitted and not permitted uses of manufactured wiring systems. Sections 604.4 and 604.5 already include the requirements for “accessible” along with additional requirements and exceptions for manufactured wiring systems.
Panel Meeting Action: Reject
Panel Statement: The intention of the scope is to limit manufactured wiring assemblies to “accessible areas” only, except as permitted by limited exception in Section 604.4.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-281 Log #2803 NEC-P19 **Final Action: Accept**
(604.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text
~~604.3 Other Articles.~~
~~Except as modified by the requirements of this article, all other applicable articles of this Code shall apply.~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 604.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other “Special” articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-282 Log #4287 NEC-P19 **Final Action: Accept**
(604.3)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Delete this section.
~~604.3 Other Articles.~~
~~Except as modified by the requirements of this article, all other applicable articles of this Code shall apply.~~
Substantiation: NEC 90.3 indicates Chapters 1-4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 604.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other “Special” articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-283 Log #4335 NEC-P19 **Final Action: Reject**
(604.4)

Submitter: Ralph Occhipinti, ADCO Electrical Corp.
Recommendation: Add the following next text:
(*) Manufactured Wiring System branch circuit wiring shall only be used for general lighting circuits above the finished hung ceiling line and not exposed to unfinished open ceilings.
Substantiation: My objections of Manufacturing Wiring Systems reflect more restrictive consideration towards the installation used as general branch building wiring. Non Qualified persons can compromise the integrity of the installation of Manufacturing Wiring Systems. Therefore, Manufacturing Wiring Systems used as a substitute of general wiring methods such as conduit and wire or listed armored cabling (AC / MC)shall have limitations and confined to within specified locations such as modular furniture or prewired store fixtures.
Panel Meeting Action: Reject
Panel Statement: The statement is an opinion and is not substantiated by the submitter. All wiring systems can be compromised by non-qualified persons. Per Section 604.2, the definition of a manufactured wiring system, not being able to inspect the component parts, makes it less likely to be accessed by non-qualified persons.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-284 Log #4336 NEC-P19 **Final Action: Reject**
(604.4)

Submitter: Ralph Occhipinti, ADCO Electrical Corp.
Recommendation: Add the following new text:
(*) Manufactured Wiring System zone distribution boxes shall be listed and marked by the Manufacturer with their volume in accordance with **Article 314 Section.16.**
Substantiation: My objections of Manufacturing Wiring Systems reflect more restrictive consideration towards the installation used as general branch building wiring. Non Qualified persons can compromise the integrity of the installation of Manufacturing Wiring Systems. Therefore, Manufacturing Wiring Systems used as a substitute of general wiring methods such as conduit and wire or listed armored cabling (AC / MC)shall have limitations and confined to within specified locations such as modular furniture or prewired store fixtures.
Panel Meeting Action: Reject
Panel Statement: No explanation of a “zone distribution box” is provided. Since this component is not addressed elsewhere in 604.6, it is presumed to be covered by 604.6(D) which would meet the submitter’s intent for listing of the component. According to Section 90.3, the requirement in 314.16 also applies to boxes.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-285 Log #4337 NEC-P19 **Final Action: Reject**
(604.4)

Submitter: Ralph Occhipinti, ADCO Electrical Corp.
Recommendation: Add the following next text:
(*) Manufactured Wiring System branch circuit wiring shall comply with **Article 210 Section.19** for allowance of 3% volt drop at the last outlet supplying power and light.
Substantiation: My objections of Manufacturing Wiring Systems reflect more restrictive consideration towards the installation used as general branch building wiring. Non Qualified persons can compromise the integrity of the installation of Manufacturing Wiring Systems. Therefore, Manufacturing Wiring Systems used as a substitute of general wiring methods such as conduit and wire or listed armored cabling (AC / MC) shall have limitations and confined to within specified locations such as modular furniture or prewired store fixtures
Panel Meeting Action: Reject
Panel Statement: As explicitly stated in Section 90.3, the requirements in Article 210, Section 19 already apply to installations of manufactured wiring systems. Section 90.3 provides this general guidance for Chapters 5, 6 and 7. The reference in NEC 210.19 to a 3 percent voltage drop is in a fine print note (FPN No. 4). Fine print notes are not enforceable code; they are explanatory only.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-286 Log #4338 NEC-P19 **Final Action: Reject**
(604.4)

Submitter: Ralph Occhipinti, ADCO Electrical Corp.
Recommendation: Add the following new text:
(*) Manufactured Wiring System branch circuits for lighting and power shall be provided to supply the loads calculated in accordance with **Article 220 Section.10**.
Substantiation: My objections of Manufacturing Wiring Systems reflect more restrictive consideration towards the installation used as general branch building wiring. Non Qualified persons can compromise the integrity of the installation of Manufacturing Wiring Systems. Therefore, Manufacturing Wiring Systems used as a substitute of general wiring methods such as conduit and wire or listed armored cabling (AC / MC) shall have limitations and confined to within specified locations such as modular furniture or prewired store fixtures
Panel Meeting Action: Reject
Panel Statement: As explicitly stated in Section 90.3, the requirements in Article 220, Section 10 already apply to installations of manufactured wiring systems. Section 90.3 provides this general guidance for Chapters 5, 6, and 7.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-287 Log #4461 NEC-P19 **Final Action: Reject**
(604.4 Exception No. 3 (New))

Submitter: Ross Johnson, Haworth Inc.
Recommendation: Add new text to read as follows:
<u>Exception No. 3: In concealed spaces, manufactured wiring system assemblies shall be permitted where all field wiring connections are accessible.</u>
Substantiation: In a manner consistent with current wiring practices regarding concealed spaces and accessible field terminations, this exception would allow wider use of manufactured wiring systems to satisfy the industry’s requirement for quicker and less expensive wiring options.
Exception No. 3 would allow manufactured wiring system assemblies to route through or be located in a concealed space as long as the field wiring connections are accessible. The field wiring connections being receptacle connections and other connection openings described in section 604.6(C).
Section 604.3 would not allow assemblies to be used in concealed locations not permitted for the cable or conduit type used in the assembly’s construction. Additionally, section 604.7 would require the same installation conditions be met in those concealed spaces as are required for the cable or conduit type used.
This exception is consistent with the current permitted uses of the cable and conduit used in manufactured wiring system assemblies. This exception is consistent with current general wiring practices that require field terminations to be accessible. The internal connections of a manufactured wiring system component are highly reliable, they must pass extensive UL testing before being listed, and are 100% factory tested. In addition, the internal connections of a manufactured wiring system are not serviceable, are not accessible by field personnel, and are fully enclosed.
Panel Meeting Action: Reject
Panel Statement: Manufactured wiring systems are not required to be listed, only the components of the system addressed in Section 604.6(D). The present limits imposed on installations of manufactured wiring systems in concealed locations are due to the nature of their assembly, which by the definition is not able to be fully inspected at the point of installation. The submitter presented the panel with information on the specific product design addressed by his proposal and it appears to rely on electrical connections that are not enclosed in the box, which is not permitted in concealed locations.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-288 Log #4460 NEC-P19 **Final Action: Reject**
(604.4 Exception No. 4 (New))

Submitter: Ross Johnson, Haworth Inc.
Recommendation: Add new text to read as follows:
<u>Exception No. 4: Manufactured wiring systems installed in concealed spaces shall be listed for use in concealed spaces.</u>
Substantiation: This exception would allow wider use of manufactured wiring systems to satisfy the industry’s requirement for quicker and less expensive wiring options.
New technology has improved connections and connectors to the point that industry should be allowed to develop stringent listing standards that allow wider use of modular wiring systems in building wiring systems.
Panel Meeting Action: Reject
Panel Statement: The present limits imposed on installations of manufactured wiring systems in concealed locations are due to the nature of their assembly, which by the definition, is not able to be fully inspected at the point of installation. The code does not imply that listing of a product is a substitute for field inspection at the point of installation.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-289 Log #68 NEC-P19 **Final Action: Reject**
(604.6 and 604.7 (New))

Note: This Proposal appeared as Comment 19-49 on Proposal 19-131 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 19-131, which was also held, was:
Revise text to read as follows:
604.6(A) Cable or Conduit Types. <u>Manufactured wiring systems shall be listed as manufactured wiring systems assemblies or shall be constructed in accordance with (1), (2) or (3). FPN: One method of determining applicable requirements for listing of manufactured wiring systems is to refer to ANSI/UL 183-2004, the Standard for Manufactured Wiring Systems.</u> Remainder of section unchanged.
Submitter: Dean Negrelli, Wiremold/Legrand
Recommendation: Note: The panel “held” only the portions of Comment 19-49 from the 2007 Annual Meeting Report on Comments as shown below:
Revise text to read as follows:
<u>604.6 Listing Requirements. Manufactured wiring systems shall be listed manufactured wiring systems or shall be constructed in accordance with 604.7.</u>
<u>FPN: One method of determining applicable requirements for listing of manufactured wiring systems is to refer to ANSI/UL 183-2004, Standard for Manufactured Wiring Systems.</u>
604.~~6~~<u>7</u> Construction. <u>Manufactured wiring systems that are not listed manufactured wiring systems shall be constructed in accordance with (A) through (E).</u>
(A) Wiring Methods. ~~Manufactured wiring systems shall be listed as manufactured wiring systems assemblies or shall be constructed in accordance with (1), (2), or (3).~~
~~FPN: One method of determining applicable requirements for listing of manufactured wiring systems is to refer to ANSI/UL 182-2004, Standard for Manufactured Wiring Systems.~~

Substantiation: The title of 604.6(A) has been revised to "Wiring Methods" in the ROP draft, but this section deals with the listing of the entire manufactured wiring system as well as wiring methods.

This section should be changed to "Listing Requirements" and remaining sections reidentified. The final result of this comment is that the listing requirements for manufactured wiring systems are covered by 604.6 and the construction requirements for manufactured wiring systems that are not listed are covered by 604.7.

Panel Meeting Action: Reject

Panel Statement: See the panel action on Proposal 19-295.

(604.6(A))

NOTE: This proposal appeared as Comment 19-52 on Proposal 19-131 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 19-131 was:

Revise text to read as follows:

604.6(A) Cable or Conduit Types. <u>Manufactured wiring systems shall be listed as manufactured wiring systems assemblies or shall be constructed in accordance with (1), (2) or (3). FPN: One method of determining applicable requirements for listing of manufactured wiring systems is to refer to ANSI/UL 183-2004, the Standard for Manufactured Wiring Systems.</u> Remainder of section unchanged.

Submitter: Linda J. Little, St. Louis, MO

Recommendation: This proposal should have been Accept in Principle and in Part.

Substantiation: The FPN product standard reference should be accepted and it should be moved to Annex A as per the NEC Style Manual. The remainder of the proposal should have been Rejected.

If this proposal is allowed to be Accepted, there are two major issues of concern. First, is the appropriateness of allowing manufactured wiring systems assemblies to be constructed of component parts that are not individually listed for use or allowed by the NEC. If listing laboratories have inconsistent interpretations of the standards, competitive manufacturers can possibly use substandard components for listed assemblies. The Standard for Manufactured Wiring Systems ANSI/UL 183 permits metal conduit that may not be listed. This alone should not be a reason for the NEC to reduce its standards to allow non-listed components.

The second concern is that by accepting this proposal, Code-Making Panel 19 is setting a dangerous precedent. The substantiation for this change states that some manufactured wiring systems have been constructed with flexible metal conduit that is not listed, in violation of the requirement in 604.6(A)(2). It is inappropriate to make a change based upon the fact that the current rule is being violated. If some manufactured wiring systems are being constructed with component parts that are listed, those are the ones we should be using. If we change the code because someone is violating the requirements, we are undermining the issue of safety. Rather than compromising the minimum standards set forth by the code, we should require the manufactured wiring systems assemblies to be constructed of listed components.

Panel Meeting Action: Accept in Principle

See panel action on Proposal 19-295.

Ballot Results: Affirmative: 8

19-293 Log #1296 NEC-P19 **Final Action: Accept in Principle in Part**
(604.6(A)(3))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete first sentence and substitute:

Flexible cords and cables identified for extra-hard usage or hard usage and the application, with minimum No. 12 conductors and an equipment grounding conductor, shall be permitted...(remainder unchanged).

Revise last sentence:

The flexible cord or cable shall be visible for its entire length <u>and shall be provided with identified strain relief devices where likely to be subject to strain on the terminals</u> ~~and shall not be subject to strain or physical damage~~.

Substantiation: "Suitable" is subjective and a term to be avoided per the Style Manual. All hard usage cords may not be suitable for the use, such as sunlight resistance, exposed to oil or liquids, or where indicated as electric vehicle cable. An EGC should be specified. Physical damage is covered by 400.8(7).

Panel Meeting Action: Accept in Principle in Part

Accept in principle the need for strain relief. Reject the remainder of the proposal.

Revise the last sentence in 604.6(A)(3) to read as follows:

"The cord shall be visible for the entire length, shall not be subject to physical damage, and shall be provided with identified strain relief."

Panel Statement: Flexible cord is only permitted to be used as part of a "listed factory-made assembly…," therefore its "suitability" for the intended application will be determined as part of its listing. The acceptability of "extra hard usage" cord is sufficiently implied by the requirement for "hard usage" cord. It is not always practical to install manufactured wiring systems where they are not subject to strain on the electrical connections.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-294 Log #155 NEC-P19 **Final Action: Reject**
(604.6(A)(2) Exception No. 2)

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Change "communication" to "communications".

Substantiation: Section 3.3.3 of the NEC Style Manual States: "**3.3.3 Plural.** Unless referring to a single item of equipment, references to electrical components and parts shall be plural rather than singular. This results in greater consistency and makes it clear that the *NEC* provision refers to *all* components or parts of a given type or class." Changing "communication" to "communications" will correlate with the title of Chapter 8, "Communications Systems"**.**

Panel Meeting Action: Reject

Panel Statement: "Circuits" at the end of the sentence modifies "communication" and makes it plural.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-295 Log #1170 NEC-P19 **Final Action: Accept**
(604.6(A)(2) Exception No. 3 to (2) (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal regarding 4.1.1 of the NEC Style Manual to not reference an entire article.
This action will be considered by the panel as a public comment.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: 604.6(A)(2) Add new Exception No. 3 as follows:
Exception No. 3 to (2) : Listed manufactured wiring systems containing unlisted flexible metal conduit of non-circular cross section and/or trade sizes smaller than permitted in Article 348 when supplied with fittings and conductors.
Substantiation: This proposal is intended to address the following held comments from the 2008 NEC cycle: ROC 19-49, 19-51, 19-52 and 19-53 to Proposal 19-131.
An Ad Hoc Task Group consisting of members of NEC Code-making Panel 19 and other interested parties met by teleconference to discuss the original proposal, the held comments and concerns on the subject expressed during the 2008 NEC cycle. This proposal represents the consensus of the Task Group.
This proposal directly addresses the situation of listed manufactured wiring systems that use trade sizes and oval shaped flexible metal conduit not included in the scope of Article 348 or in the listing standard for flexible metal conduit, UL 1. The 2008 Proposal ROP 19-131 is seen as too broad and unsubstantiated. A representative of the organization of the original submitter of ROP 19-131 was a member of the Ad Hoc Task Group and has agreed that this proposal meets the immediate intent and subject of the original Proposal, ROP 19-131. Note also that NEC Section 348.20(A)(3) already recognizes such an option of other sizes when specifically addressed in Article 604.
The text of UL Certification Requirements Decision (CRD) to UL 183 is provided as supporting material. It was published to contain the requirements for fittings and conductor fill for unlisted flexible metal conduit used in manufactured wiring systems.
Panel Meeting Action: Accept
Panel Statement: The following is the supporting information that was provided to NFPA:
UL 183 CRD published June 12, 2008
7.4 Flexible metal conduit, liquid-tight flexible metal conduit, or liquid-tight flexible nonmetallic conduit shall comply with the Standard for Flexible Metal Conduit, UL 1, the Standard for Liquid-Tight Flexible Steel Conduit, UL 360, or the Standard for Liquid-Tight Flexible Nonmetallic Conduit, UL 1660.
Exception: Flexible metal conduit is not required to comply with all specified construction dimensions under the following conditions:
a) Trade sizes of 9/16-inch and 5/8-inch oval shaped and flexible metal conduit shall comply with the 1/2-inch trade size performance requirements in UL 1, and trade size of 3/8-inch reduced wall flexible conduit shall be provided with internal and external diameters as specified in Table 7.1. All other construction and performance requirements shall be in accordance with UL 1;
b) All mating fittings and connector assemblies used with conduit specified in (a) shall be factory installed;
c) The field installation end of a fitting or connector intended for field assembly to the building electrical system shall comply with the construction requirements of the Standard For Safety For Conduit, Tubing, and Cable Fittings, UL 514B;
d) All conduit specified in (a) shall be provided with factory installed conductors;
c) e) The flexible metal conduit in (a) shall be subjected to follow up evaluation on performance testing in accordance with UL 1 on the indicated trade sizes.
13.11 The free length of a lead inside an outlet box, wiring compartment or at the end of a length of conduit shall be a minimum of 6 in (150 mm) long if the lead is intended for field connection.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-296 Log #1169 NEC-P19 **Final Action: Accept**
(604.6(A)(4))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
604.6(A)(4) Busways. Busways shall be listed plug-in or continuous plug-in type containing factory mounted, bare or insulated conductors, which shall be copper or aluminum bars, rods, or tubes. The busway shall be ~~grounded and~~ provided with an equipment ground ~~busbar equivalent in size to the ungrounded busbar~~. The busway shall be rated nominal 600 volts, 20, 30, or 40 amperes. Busways shall be installed in accordance with 368.12, 368.17(D), and 368.30.
Substantiation: Plug-in busway, like continuous plug-in busway, is a wiring method that has no exposed bus bars. Both types are intended for general use, including installation within the reach of persons. Both types are factory assembled wiring methods that readily support reconfiguration of electrical distribution systems. The 2008 NEC was modified to include continuous plug-in busway in this section. However, as worded, the text seems to exclude traditional constructions of plug-in busway. Adding the text indicated would clarify that either type of construction is acceptable provided the remaining requirements are met. The terminology "busbar equivalent in size to the ungrounded busbar" is not necessary because busways are listed to a standard which includes requirements for the ground conductor sizing and performance. In some constructions, the busway ground conductor is a different configuration or material. For instance, the equipment ground may be the housing of the busway and not a busbar per se.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 7 Negative: 1
Explanation of Negative:
LICHTENSTEIN, T.: This is a safety issue. It was the Code Panels intent in the 2008 cycle to include only "continuous plug in busway" because this type of busway is required to be evaluated for accessibility of live parts even when plugging into the busway. The traditional "plug-in" busway that the submitter wants to include, requires the removal of a cover to make a plug in connection to the busway. When the cover is removed there is full access of the unisulated live bus bars by users. This was not the intent of the Code Panel. The intent was to require "continuous plug in busway" because the requirements in UL 857, The Standard for Safety for Busways require that even during plugging in to the busway, live parts are not accessible to the user. The majority of Manufactured wiring systems are modular connector type systems, in many applications they are installed within reach of the general public (e.g. in office furniture, under library tables, big box store displays, grocery stores to power freezers, etc.) not 30 feet in the air above an factory assembly line accessible only to trained personnel, that is why it is critical that accessibility of live parts is restricted. Continuous plug in busway is the only type of busway permitted for use in manufactured Wiring Systems in the Standard for Safety for Manufactured Wiring Systems, UL 183.
The NEC does not define "continuous plug-in busway". Appendix A of the NEC references UL 857, the Standard For Safety For Busways. UL 857 has specific requirements for "continuous plug-in busway". Other busways are not prohibited from having plug in constructions and they are not required to comply with the accessibility requirements for "Continuous plug-in busway". See references below.
For reference, excerpts are provided from the Standard For Safety For Busways, UL 857, Twelfth Edition
Dated January 15, 2001.
Definition of continuos plug in busway
2.3.4.3 Continuous plug-in busway
A continuous plug-in busway is rated at 225 A or less, has no exposed bus bars, and is intended for general use, including installation within the reach of persons.
7.4.5 For a continuous plug-in busway, an uninsulated live part shall be located or shielded so it is not accessible to unintentional contact by persons during intended use.
7.4.5.1 An uninsulated live part is considered not to be accessible if a probe as illustrated in Figure 2 cannot be made to touch any part that involves the risk of electric shock to earth ground or to another uninsulated live part when the system is completely installed as intended. No force is to be used when placing the probe in the opening.
Comment on Affirmative:
MCNEIVE, T.: The Panel should continue to accept Proposal 19-296. Plug-in busway is a well known and accepted wiring method that is comprised of factory assembled components which are field assembled into a system. Article 368 covers uses permitted and not permitted for all busway. As presently worded, one type of busway (plug-in) is excluded, while continuous plug-in is permitted.

19-297 Log #2074 NEC-P19 **Final Action: Accept**
(604.6(A)(5) (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal regarding complete sentences to comply with 3.3.1 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Michael Everhart, Steelcase Inc.
Recommendation: Add new text to read as follows:
(5) Raceway. Prewired, modular, surface mount raceways shall be listed for the use. Rated nominal 600 Volt, 20 Amp and installed in accordance with 386.12, 386.30, 386.60, and 386.100.
Substantiation: The NEC does not recognize "factory built, prewired, modular" surface raceways. This proposal would allow a factory built, modular, surface raceway to be listed as a Manufactured Wiring System using a construction type other than the currently identified "AC, MC, FMC, Flexible Cord or Busway" construction. Requiring that factory built, modular, surface raceways be "Listed for the use" will ensure that all construction and performance concerns, as they relate to safety, have been addressed.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

ARTICLE 605 — OFFICE FURNISHINGS (CONSISTING OF LIGHTING ACCESSORIES AND WIRED PARTITIONS)

18-255 Log #2804 NEC-P18 **Final Action: Accept**
(605.2(B) and (C))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and re-identify existing 605.2(C) as 605.2(B).
~~(B) Other Articles. Except as modified by the requirements of this article, all other articles of this Code shall apply.~~
~~(C)~~(B) Hazardous (Classified) Locations. Where used in hazardous (classified) locations, these assemblies shall comply with Articles 500 through 517 in addition to this article.
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 605.2(B) repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-256 Log #1458 NEC-P18 **Final Action: Accept in Part**
(605.5)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Lighting Accessories. Lighting equipment shall be listed and identified for use with wired partitions and shall comply with 605.5(A), (B), and (C).
(A) Support. ~~a~~ An identified means for secure attachment and ~~or~~ support shall be provided.
(B) Connection. Where cord-and plug connection is provided, the cord length shall ~~be suitable for the intended application but~~ shall not exceed 2.7 m (9 ft) in length. The cord shall not be smaller than 18 AWG, shall contain an equipment grounding conductor, and shall be of the extra-hard usage or hard usage type identified for the use. Connection by other means shall be identified as suitable for the use.
In (C) delete "convenience".
Substantiation: Edit. Attachment and support should be identified as suitable for the use. Extra-hard usage types should also be suitable. All types should be identified for the use; some are not, (e.g., EVJT, EVJ, EVJE, and those not identified for wet or oil or direct sunlight conditions). "convenience" is superfluous and not defined.
Panel Meeting Action: Accept in Part
605.5 to read as follows:
Lighting Accessories. Lighting equipment shall be listed and identified for use with wired partitions and shall comply with 605.5(A), (B), and (C).
(A) Support. A means for secure attachment or support shall be provided.
(B) Connection. Where cord-and-plug connection is provided, the cord length shall be suitable for the intended application but shall not exceed 2.7 m (9 ft) in length. The cord shall not be smaller than 18 AWG, shall contain an equipment grounding conductor, and shall be of the hard usage type. Connection by other means shall be identified as suitable for the condition of use.
(C) Receptacle Outlet. Receptacles shall not be permitted in lighting accessories.
Panel Statement: CMP-18 accepts the changes in the first sentence as shown in the proposal.
CMP-18 reject the changes in (A) and (B) as there is no definitive substantiation provided to show a problem exists with the present text.
CMP-18 accepts the change in (C), removing the word "convenience".
The panel notes that the proposed revisions are not considered editorial.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-257 Log #550 NEC-P18 **Final Action: Accept**
(605.6)

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Delete the second sentence.
605.6 Fixed-Type Partitions.
Wired partitions that are fixed (secured to building surfaces) shall be permanently connected to the building electrical system by one of the wiring methods of Chapter 3. ~~Multiwire branch circuits supplying power to the partition shall be provided with a means to disconnect simultaneously all ungrounded conductors at the panelboard where the branch circuit originates.~~
Substantiation: To conform to the Style Manual. Section 210.4(B) already requires the disconnecting simultaneously of all ungrounded conductors on multiwire branch circuit and applies per 90.3
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-258 Log #1295 NEC-P18 **Final Action: Reject**
(605.6)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change "panelboard" to "distribution equipment".
Substantiation: Edit. All branch circuits do not originate in panelboards, e.g., individual fused switches or circuit breakers.
Panel Meeting Action: Reject
Panel Statement: All multiwire circuits relating to the scope of Article 605 originate in panelboards or similar equipment.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
The panel notes that the proposed revisions are not considered editorial.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 606 — PREFABRICATED (WIRING) ASSEMBLIES

19-298 Log #3554 NEC-P19 **Final Action: Accept in Principle in Part**
(606 (New))

TCC Action: The Technical Correlating Committee requests that the panel clarify the need for the Article, since it appears the installation requirements of the product are already covered in the Code. The remaining requirements are prescriptive and are better suited for a product standard.
The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Rejects the panel action related to the Scope. As written, the Scope more clearly defines what a prefabricated wiring assembly is not, rather than what it is.
The Technical Correlating Committee notes that the proposed Scope will appear in the NEC ROP Draft so that it is available for public comment.
This action will be considered by the panel as a public comment.
Submitter: Timothy P. McNeive, Thomas & Betts Corporation
Recommendation: Add new text to read as follows:
Article 606 (New) Prefabricated (Wiring) Assemblies
606.1 Scope.
The provisions of this article apply to assemblies, partial systems of components, or unassembled kits of components, produced at a factory or assembled in areas not directly subject to inspection by the authority having jurisdiction.
This Article does not pertain to:
a) Manufactured Wiring Systems covered in Article 604;
b) Nonmetallic Underground Conduit with Conductors (NUCC) covered in Article 354;
c) Listed manufactured prewired assemblies covered in Articles 356 and 362;
d) Assemblies consisting only of outlet boxes, junction boxes, conduit bodies of fittings supplied with a cover, whether or not it is assembled;
e) Box support brackets attached by factory welding or other permanent means;

f) Assemblies consisting only of outlet boxes, device boxes or junction boxes provided with a ground screw, grounding pigtail or similar device intended to comply with section 250.148 (C), whether or not it is assembled;
g) Floor boxes; or
h) Poke through floor fittings.

606.2 Definition.

Prefabricated (Wiring) Assembly. Assemblies of system components that are able to be inspected at the building site without damage or destruction to the assembly. Each component of an assembly is suitable for separate installation in accordance with this Code. Assemblies include factory made subassemblies, combinations of subassemblies and separate system components in a single kit.

Listed Prefabricated (Wiring) Assembly. A factory made prefabricated (wiring) assembly carrying the certification mark of a nationally recognized testing laboratory.

606.3 Other Articles.

Except as modified by the requirements of this article, all other applicable articles of this Code shall apply.

606.4 Uses Permitted.

Prefabricated (wiring) assemblies shall be permitted in accordance with the other applicable articles of this Code for the wiring method used in its construction.

606.5 Uses Not Permitted.

Prefabricated (wiring) assemblies shall not be permitted where limited by the applicable article in Chapter 3 for the wiring method used in its construction.

606.6 Construction.

(A) General.

(1) Prefabricated (wiring) assemblies include subassemblies, combinations of subassemblies and separate system components, or separate system components in a kit form. Components consist of combinations of outlet boxes; junction boxes; device boxes; box extensions; extension rings; wiring devices; box support brackets; conduit, tubing or cable fittings; conductors; slicing or terminal connectors; cables; raceways and other similar products.

(2) Each component of a prefabricated (wiring) assembly shall be suitable for separate installation in accordance with this Code.

(3) Listed prefabricated (wiring) assemblies shall be entirely constructed from separately listed components.

Exception: A component of a listed prefabricated (wiring) assembly is not required to comply with a specific requirement that involves a feature or characteristic not required in the specific application for which the assembly is identified and marked. Such component(s) shall be factory assembled.

(4) Assemblies shall be able to be inspected at the building site without damage or destruction of the assembly or any component even when partial disassembly is deemed necessary.

(5) Prefabricated (wiring) assemblies shall include the required means for bonding that will ensure a continuous electrical bonding connection between metallic components included in the assembly.

(B) Assembly.

The following applies to pre-assemblies. This does not apply to unassembled kits of components.

(1) Unless otherwise specified, assembly of a prefabricated (wiring) assembly shall be strictly in accordance the applicable Articles of this Code.

(2) A prefabricated (wiring) assembly shall only be assembled to the extent that when installed at the building site, wiring devices or conductors when included in the assembly do not need to be disconnected or disassembled to install the assembly.

(3) Assemblies of permanently connected components shall be listed. Examples of permanent connections include factory applied rivets, or specialty tool applied fasteners.

(C) Protection of Wiring Devices and Conductors

A prefabricated (wiring) assembly that includes an outlet box, device box or junction box or other enclosure intended for flush mounting, that contains conductors or wiring devices shall be provided with a protective cover that will prevent damage to the conductors and wiring devices during preparation and installation of the finished wall or ceiling surface. The protective cover if metallic, need not be electrically bonded or fixed by screws to the box but shall remain in place. The protective cover shall provide mechanical protection equivalent to the enclosure to which it is attached and shall be able to be easily removed without damage to the box or enclosure, the enclosed conductors or wiring devices.

(D) Terminals and Splices.

(1) Outlet boxes, junction boxes and device boxes, or other compartments for containing a wire terminal or spice shall be complete and shall enclose all field wiring and connections. They shall be sized in accordance with Section 314.16.

(2) A terminal or splice compartment for power supply connections shall be so located that the connections are accessible for inspection after the installation of the wiring system.

(3) The compartment shall be located so that when making conduit connections, internal wiring and enclosed components are not exposed to mechanical abuse or strain.

(4) A terminal compartment intended for assembly of a supply raceway shall have a provision to prevent turning with respect to the raceway and to the support surface.

(5) Terminals and splices shall comply with the requirements in Section 110.14 and shall be prevented from turning or shifting in position by means other than friction between the surfaces. A terminal intended solely for connection of an equipment grounding conductor shall comply with Section 250.8 and shall be capable of securing the intended grounding conductor size.

(6) The length of free conductors located inside a box or wiring compartment for spices or the connection of luminaries or devices shall be in accordance with Section 300.14.

606.7 Installation.

(A) Securing and Supporting

Prefabricated (wiring) assemblies shall be secured and supported in accordance with the applicable requirements in this Code.

(B) Secureness of Connections.

The secureness of all pre-assembled mechanical and electrical connections shall be verified at installation.

Substantiation: This is a NEW Article for the 2011 National Electrical Code for Prefabricated (Wiring) Assembles. Realizing that only the Technical Correlating Committee can assign an Article number and define the scope, it seems appropriate that this Article is placed in Chapter 6 and under the scope of Code-making panel 19 as the subject is quite complementary to Article 604.

Considering that NEC Article 604, *Manufactured Wiring Systems*, has worked closely in concert with UL 183, *Manufactured Wiring Systems*, for many years to provide flexibility and safety to the installed environment, it is appropriate that the NEC contain an Article for other *Prefabricated (Wiring) Assemblies*, that gives guidance to industry product standards such as the outline of investigation, UL 2453, *Prefabricated Wiring Assemblies.* These assemblies differ from a Manufactured Wiring System in that they can be inspected at the point of installation without damage or destruction of the assembly.

Prior to initiating development of the present outline of investigation, UL 2453, UL reportedly listed prefabricated wiring assemblies (UL CCN QQYZ) in accordance with the prevailing edition of the National Electrical Code. This outline of investigation continues fundamentally to adhere to this practice but because of its attempt to repeat specific NEC requirements, it risks lagging behind the revisions to the NEC. Importantly, the UL Guide Information states "Acceptability of the field assembly is to be determined by the Authority Having Jurisdiction". Development of UL 2453 began as the result of calls from the inspection community through UL's Electrical Council. Unfortunately, the more prescriptions included in UL 2453, the more likely becomes lack of correlation with the prevailing edition of the NEC over time. And, in my opinion, the present language of the outline of investigation leaves open the option for UL or any NRTL, with or without access to the UL 2453 outline, to list such assemblies using components that do not adhere to all of the requirements for the separately listed component or relegates the NRTL to judge suitability for use where the Code does not strictly require a component to be listed. Development and publication of UL 2453 has stalled in recent times and there are now many such assemblies, listed and unlisted being provided to the market. Providing fundamental guidance in the NEC will help provide uniformity among the various NRTLs for listed assemblies and will hopefully create a renewed interest in completing and publishing UL 2453.

1) I believe that inspectors want to have confirmation from the NRTL of the component makeup of the assembly, especially where some components such as conductors may be sufficiently concealed so that inspection at the point of final installation of the assembly is difficult without disassembly.

2) I believe that inspectors do not wish to delegate to the NRTL their responsibility for approval of unlisted components in such assemblies even where the Code permits their use, other than perhaps permanent or specialty securement means.

3) And finally, I do not believe that the NRTL is capable in most cases of ensuring the final securement of attachments, for either mechanical or electrical purposes, prior to final installation of the assembly. This responsibility needs to be retained at the point of installation.

Panel Meeting Action: Accept in Principle in Part

Accept the proposal as modified as follows:

Article 606 (New) Prefabricated (Wiring) Assemblies

606.1 Scope.

The provisions of this article apply to assemblies, partial systems of components, or unassembled kits of components, produced at a factory or assembled in areas not directly subject to inspection by the authority having jurisdiction.

This article does not pertain to the following:

(1) Manufactured wiring systems covered in Article 604
(2) Nonmetallic underground conduit with conductors (NUCC) covered in Article 354
(3) Listed manufactured prewired assemblies covered in Articles 356 and 362
(4) Assemblies consisting only of outlet boxes, junction boxes, conduit bodies of fittings supplied with a cover, whether or not it is assembled
(5) Box support brackets attached by factory welding or other permanent means
(6)Assemblies consisting only of outlet boxes, device boxes, or junction boxes provided with a ground screw, grounding pigtail or similar device intended to comply with section 250.148 (C), whether or not it is assembled
(7) Floor boxes
(8) Poke through floor fittings
(9) Multioutlet assemblies covered in Article 380

606.2 Definition.

Prefabricated (Wiring) Assembly. Assemblies of system components that are able to be inspected at the building site without damage or destruction to the assembly. Each component of an assembly is suitable for separate installation in accordance with this *Code*. Assemblies include factory made subassemblies, combinations of subassemblies, and separate system components in a single kit.

~~Listed Prefabricated (Wiring) Assembly. A factory made prefabricated (wiring) assembly carrying the certification mark of a nationally recognized testing laboratory.~~

~~606.3 Other Articles.~~

~~Except as modified by the requirements of this article, all other applicable articles of this Code shall apply.~~

~~606.4~~ **606.3 Uses Permitted.**

Prefabricated (wiring) assemblies shall be permitted in accordance with the other applicable articles of this *Code* for the wiring method used in its construction.

~~606.5~~ **606.4 Uses Not Permitted.**

Prefabricated (wiring) assemblies shall not be permitted where limited by the applicable article in Chapter 3 for the wiring method used in its construction.

~~606.6~~ **606.5 Construction.**

(A) General.

(1) Prefabricated (wiring) assemblies include subassemblies, combinations of subassemblies and separate system components, or separate system components in a kit form. Components consist of combinations of outlet boxes; junction boxes; device boxes; box extensions; extension rings; wiring devices; box support brackets; conduit, tubing or cable fittings; conductors; slicing or terminal connectors; cables; raceways and other similar products.

(2) Each component of a prefabricated (wiring) assembly shall be suitable for separate installation in accordance with this *Code*.

(3) Listed prefabricated (wiring) assemblies shall be entirely constructed from separately listed components.

Exception: A component of a listed prefabricated (wiring) assembly is not required to comply with a specific requirement that involves a feature or characteristic not required in the specific application for which the assembly is identified and marked. Such component(s) shall be factory assembled.

(4) Assemblies shall be able to be inspected at the building site without damage or destruction of the assembly or any component even when partial disassembly is deemed necessary.

(5) Prefabricated (wiring) assemblies shall include the required means for bonding that will ensure a continuous electrical bonding connection between metallic components included in the assembly.

(B) Assembly.

The following applies to pre-assemblies. This does not apply to unassembled kits of components.

(1) Unless otherwise specified, assembly of a prefabricated (wiring) assembly shall be strictly in accordance the applicable articles of this *Code*.

(2) A prefabricated (wiring) assembly shall only be assembled to the extent that when installed at the building site, wiring devices or conductors when included in the assembly do not need to be disconnected or disassembled to install the assembly.

(3) Assemblies of permanently connected components shall be listed. Examples of permanent connections include factory applied rivets, or specialty tool applied fasteners.

~~(C) Protection of Wiring Devices and Conductors~~

~~A prefabricated (wiring) assembly that includes an outlet box, device box or junction box or other enclosure intended for flush mounting, that contains conductors or wiring devices shall be provided with a protective cover that will prevent damage to the conductors and wiring devices during preparation and installation of the finished wall or ceiling surface. The protective cover if metallic, need not be electrically bonded or fixed by screws to the box but shall remain in place. The protective cover shall provide mechanical protection equivalent to the enclosure to which it is attached and shall be able to be easily removed without damage to the box or enclosure, the enclosed conductors or wiring devices.~~

(~~D~~C) Terminals and Splices.

(1) Outlet boxes, junction boxes and device boxes, or other compartments for containing a wire terminal or spice shall be complete and shall enclose all field wiring and connections. They shall be sized in accordance with Section 314.16.

(2) A terminal or splice compartment for power supply connections shall be so located that the connections are accessible for inspection after the installation of the wiring system.

(3) The compartment shall be located so that when making conduit connections, internal wiring and enclosed components are not exposed to mechanical abuse or strain.

(4) A terminal compartment intended for assembly of a supply raceway shall have a provision to prevent turning with respect to the raceway and to the support surface.

(5) Terminals and splices shall comply with the requirements in 110.14 and shall be prevented from turning or shifting in position by means other than friction between the surfaces. A terminal intended solely for connection of an equipment grounding conductor shall comply with 250.8 and shall be capable of securing the intended grounding conductor size.

(6) The length of free conductors located inside a box or wiring compartment for spices or the connection of luminaries or devices shall be in accordance with 300.14.

~~606.7~~ **606.6 Installation.**

(A) Securing and Supporting.

Prefabricated (wiring) assemblies shall be secured and supported in accordance with the applicable requirements in this *Code*.

(B) Secureness of Connections.

The secureness of all pre-assembled mechanical and electrical connections shall be verified at installation.

606.7 Marking.

(1) Wiring assemblies shall be marked with the conduit, tubing or cable type, and the conductor size and type to permit determination of their suitability for a specific application and ampacity in accordance with the NEC.

(2) A parts list shall be provided with each assembly to identify the extent of the product.

Panel Statement: The addition of 606.1(i) is appropriate. The definition of listed prefabricated wiring assemblies was determined to be unnecessary. The requirement for a protective cover for prefabricated assemblies implies that a protective cover is needed for all outlet and device boxes during the construction process. A proposal was made during the 2008 NEC cycle and was ultimately held by CMP-3 (ROP 3-32, ROC 3-8). A task group has submitted a new proposal, 9-74, for consideration by CMP-9. Article 606 will be covered according to 90.3, by the resulting general decision by CMP-9. Section 606.8 Marking was added to assist the AHJ in the inspection of these prefabricated (wiring) assemblies.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

Comment on Affirmative:

MCNEIVE, T.: NEMA does not believe that the addition of the very prescriptive requirement in Section 606.8 is appropriate in the Code. NEC Section 110.3 provides necessary enforcement for what is intended by the proposed text. Deliberation during development of a consensus standard for Prefabricated (Wiring) Assemblies is a better forum for determining the degree of prescriptive marking requirements that are necessary according to 110.3(B).

ARTICLE 610 — CRANES AND HOISTS

12-4 Log #2261 NEC-P12 **Final Action: Accept in Principle**
(610.2 (New), 610.11(E), and 610.13(C))

TCC Action: The Technical Correlating Committee directs that the last two sentences in proposed 610.2 be deleted from the definition to comply with 2.2.2 of the NEC Style Manual.

This action will be considered by the panel as a public comment.

Submitter: Susan L. Stene, Underwriters Laboratories

Recommendation: Revise text to read as follows:

610.2 (NEW) Definitions.

Festoon Cable - Single- and multiple-conductor cable intended for use and installation in accordance with Article 610 where flexibility is required. The cable consists of one or more insulated conductors cabled together with an overall jacket. The cable is rated 60°C, 75°C, 90°C or 105°C and 600 V.

610.11 (E) Flexibility to Moving Parts. Where flexibility is required for power or control to moving parts, listed festoon cable or a cord suitable for the purpose shall be permitted, provided the following shall apply:

(1) Suitable strain relief and protection from physical damage is provided.

(2) In Class I, Division 2 locations, the cord is approved for extra-hard usage.

610.13 (C) Flexibility. Where flexibility is required, listed flexible cord or cable, or listed festoon cable shall be permitted to be used and, where necessary, cable reels or take-up devices shall be used.

Substantiation: There are festoon cables and flexible cords on the market that are not listed and therefore, may not be suitable for the particular application. Adding the word 'listed' will provide assurance that the cable has been evaluated for its' ratings and use.

Festoon cable is specifically intended for use and installation in Crane and Hoist Electrification Systems in
accordance with Article 610 the National Electrical Code. It has long been an accepted wiring method under Article 610 where flexibility is required. However, there is no mention of this type of cable in the Article. Festoon cable is listed by UL under the product category CCN, "ZIPF." The basic requirements used to investigate products in this category are contained in UL Subject 2273, ''Outline of Investigation for Festoon Cables.''

There are festoon cables and flexible cords on the market that may not be listed or appropriate for this use.

Panel Meeting Action: Accept in Principle

Add a new definition to 610.2 in alphabetical order to read as follows:

Festoon Cable. Single- and multiple-conductor cable intended for use and installation in accordance with Article 610 where flexibility is required. The cable consists of one or more insulated conductors cabled together with an overall jacket. The cable is rated (140°F) 60°C, (167°F) 75°C, (194°F) 90°C or (221°F) 105°C and 600 V.

Panel Statement: CMP-12 accepts the submitter's recommendation and adds the required Fahrenheit equivalents for the temperature ratings.

CMP-12 accepts the remainder of the submitter's recommendations without change.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

12-5 Log #1231 NEC-P12 **Final Action: Reject**
(610.3(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Insert "identified" between "listed" and "luminaire".
Substantiation: Edit. Present wording may be deemed to modify pertinent provisions of Article 410.
Panel Meeting Action: Reject
Panel Statement: The referenced words in the proposal are not found in Section 610.3(B) of the 2008 NEC. The proposal appears to reference the wrong section.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-6 Log #4199 NEC-P12 **Final Action: Reject**
(610.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
610.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: Section 110.2 already states that electrical equipment or conductors required or permitted by the NEC must be approved so repeating this text in 610.5 is unnecessary. Section 90.4, as well as 90.7, provides a method for the AHJ to use "listing" as a means of accepting electrical equipment, especially where the AHJ does not have access to the listing standards, does not have the qualifications, or does not have the time for evaluation of the electrical equipment. Where electrical equipment is one of a kind or not listed at the time of installation, Sections 90.4 and 90.7 permit field equipment evaluation so this text is unnecessary.
Item No. 3 of the proposed text permitting manufacturer's self-evaluation or an owner's engineering judgment, may permit equipment to be installed as unevaluated, untested, and uninspected since many states only have electrical inspection in the major metropolitan areas, not counties or unincorporated areas.
Number Eligible to Vote: 14

610.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

610.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

(610.11(C)(D)(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence. Conductors shall be enclosed in identified raceways or be...(remainder unchanged).
Delete text of (C), (D), and (E) and substitute: (C) FLEXIBLE CONNECTIONS. Where flexible connections are necessary, flexible stranded conductors shall be used. Conductors shall be identified flexible raceways except as permitted in 610.11(E).
(D) Where multiconductor flexible cord or cable is used with a suspended pushbutton or other type control station the control station shall be supported by identified means that prevents strain on the conductors.
(E) Where flexibility is required to movable or moving parts a flexible cord or cable identified for the purpose shall be permitted provided the following apply:
(1) Identified strain relief devices are provided to prevent tension on terminations
(2) The flexible cord or cable is not likely to be subject to physical damage
(3) The flexible cord or cable contains an equipment grounding conductor
(4) The current does not exceed the ampacity of the flexible cord or cable
(5) In Class I Division 2 locations the flexible cord or cable is identified for extra-hard usage.
Substantiation: All raceways should be identified for the use. "Identified flexible raceways" eliminates the need for specific types, and includes flexible metallic tubing and electrical nonmetallic tubing. The requirement for moving parts to be "power or control" is superfluous. Strain relief should be provided by devices suitable for the use, not taping or tieing to supports; "suitable" is subjective and a term to be avoided per the Style Manual. "Approved for extra-hard usage" is whatever is acceptable to the AHJ; "identified for the purpose" includes, where necessary, water, oil, sunlight resistance.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects. The substantiation does not contain a statement of the problem.

12-13 Log #1571 NEC-P12 **Final Action: Reject**
(610.31(2))

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
610.31 Runway Conductor Disconnecting Means.
A disconnecting means that has a continuous ampere rating not less than that calculated in 610.14(E) and (F) shall be provided between the runway contact conductors and the power supply. Such disconnecting means shall consist of a motor-circuit switch, circuit breaker, or molded-case switch. This disconnecting means shall be as follows:
(1) Readily accessible and operable from the ground or floor level.
(2) **A lockable disconnecting means.** ~~Capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at and remain with the equipment.~~
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: CMP-12 does not agree with the removal of detailed requirements for the disconnect lockout means. In addition, CMP-12 does not agree with establishing one set definition for the term "disconnecting means, lockable" as each individual chapter and article has special considerations that need to be considered. A global definition will not be able to cover all these considerations.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise the last two sentences of the second paragraph to read as follows:
The trolley frame and bridge frame shall ~~not~~ be considered as electrically grounded through the bridge and trolley wheels and ~~its~~ their respective tracks unless local conditions, such as paint or other insulating material, prevent reliable metal-to-metal contact. In this case,. a separate bonding conductor shall be provided.
Substantiation: This proposal, which restores the 2002 NEC wording, is intended to force a reconsideration of the action in the 2005 NEC cycle to disqualify a trolley-to-bridge rolling connection as an equipment grounding return path. The wording change only covered the trolley frame, and not the bridge girder as its wheels turn on the runway, even though the contact surfaces seem identical. There was no substantiation to distinguish one from the other, nor was there any loss experience presented to suggest that the prior allowance, unchanged since the 1962 NEC, was deficient.
Panel Meeting Action: Reject
Panel Statement: The requirement for a separate bonding conductor eliminates the effects of ambient conditions, such as paint, dirt, and unreliable electrical continuity of wheels, bearings, and rail systems.
CMP-12 expresses safety concerns due to the uncertainty of continuous wheel to metal contact.
CMP-12 considered this in the 2005 cycle to add a separate conductor, and the submitter's proposal does not justify reverting back to prior text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 620 — ELEVATORS, DUMBWAITERS, ESCALATORS, MOVING WALKS, WHEELCHAIR LIFTS, AND STAIRWAY CHAIR LIFTS

12-16a Log #CP1201 NEC-P12 **Final Action: Accept**
(620.1)

Submitter: Code-Making Panel 12,
Recommendation: Revise FPNs in 620.1 to read as follows:
FPN No. 1: For further information, see ~~ASME A17.1-2004~~ ASME A17.1-2007/CSA B44-07, Safety Code for Elevators and Escalators.
FPN No. 3: The term wheelchair lift has been changed to platform lift. For further information, see ~~ASME A18.1–2003~~ ASME A18.1-2008, Safety Standard for Platform Lifts and Stairway Lifts.
Revise FPN in 620.23 to read as follows:
FPN: See ~~ASME A17.1-2004~~ ASME A17.1-2007/CSA B44-07, Safety Code for Elevators and Escalators, for illumination levels.
Revise FPN in 620.24 to read as follows:
FPN: See ~~ASME A17.1-2004~~ ASME A17.1-2007/CSA B44-07, Safety Code for Elevators and Escalators, for illumination levels.
Revise FPN in 620.51 to read as follows:
FPN: For additional information, see ~~ASME A17.1-2004~~ ASME A17.1-2007/CSA B44-07, Safety Code for Elevators and Escalators.
Revise FPN in 620.91 to read as follows:
FPN: See ~~ASME A17.1-2004~~ ASME A17.1-2007/CSA B44-07, Safety Code for Elevators and Escalators, ~~and CSA B44-04, Elevator and Escalator Electrical Equipment Certification Standard~~ 2.27.2, for additional information.
Substantiation: The latest Edition of the A17.1 Safety Code for Elevators and Escalators is now a fully bi-national standard for the US and Canada thereby necessitating the new designation. A18.1 now has a new Edition as well.
The FPN notes in the above referenced articles should reflect the latest Edition of the referenced standards.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-17 Log #2449 NEC-P12 **Final Action: Reject**
(620.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
Article 100
DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.
Substantiation: If 620.85 for PSP is accepted,a definition may be required. A proposal is also being sent to Article 100.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided definitive substantiation that changes are necessary.
There are no product requirements for power safe protector (PSP) protection. A thorough study of wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. The NEC does not currently prohibit installation of these devices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
MARCOVICI, S.: The design of the PSP which incorporates the functions of the GFCI and of the AFCI, appears to be acceptable. However, the new paradigm being introduced, of having the receptacles energized only at the time of plug-insertion, requires further evaluation. The main concern about this product is it's unproven reliability and the fact that it is not listed yet.

12-18 Log #716 NEC-P12 **Final Action: Reject**
(620.3(A))

Submitter: Joe Tedesco, Boston, MA
Recommendation: Insert new FPN: NFPA 70E-2009, Standard for Electrical Safety in the Workplace, covers arc flash hazard analysis, 130.3.
Substantiation: NFPA 70E does not require signs reading: "DANGER HIGH VOLTAGE KEEP OUT".
Panel Meeting Action: Reject
Panel Statement: The necessity of the FPN in the proposal is not understood, and the substantiation does not clarify the need for it.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-19 Log #257 NEC-P12 **Final Action: Reject**
(620.11(A))

Submitter: Keith Bunish, Next Level Services Inc.
Recommendation: Revise text to read as follows:
620.11(A) Elevator Hoistway Door Interlock Wiring. The conductors to the hoistway door interlocks from the hoistway riser shall be flame retardant and suitable for a temperature of not less than 200°C (392°F). Conductors shall be Type SF or equivalent.
Exception No. 1: Freight Elevators not for general public use with mechanical door interlocks whereby the lift must be physically present to allow the door to be opened.
Substantiation: The use of type SF wiring for a dumbwaiter door interlock which cannot carry people, emergency personnel, or present a hazard whereby the door is opened and someone walks into the hoistway without the lift being present should not be required to have type SF wiring. Hence, the new text specifies "Elevator" specifically to exclude dumbwaiters. Additionally, the Exception suggested is for freight elevators that are not for public use and only those elevators with mechanical interlocks that unlocked the door only when the lift is present, thus, eliminating any concern of walking into an open hoistway. This type of interlock still contains a control circuit switch that verifies the doors are closed before the lift is allowed to move, but this control circuit is no less disabling of lift movement than i.e., the lift position limit switches in the hoistway. Hence, I question the logic of this requirement for interlocks while excluding other control circuits and believe an additional Exception should be created where "smart" controls automatically react to fire/smoke detection and bypass these circuits.
Panel Meeting Action: Reject

Panel Statement: The submitter assumes that the reason for type SF or equivalent wiring is to protect against someone walking through open doors into a hoistway without the elevator being there. In fact, the requirement for this type of wiring is to assure that the elevator, dumbwaiter, etc. will not inadvertently run with doors open due to shorting of the interlock wiring due to a fire or after a fire situation. Dumbwaiters and freight elevators are loaded and unloaded and if they were to move during such work, the freight handler or operator of the dumbwaiter would be at great risk.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-20 Log #1259 NEC-P12 **Final Action: Accept**
(620.21(A)(1))

Submitter: Andy Juhasz, Kone, Inc. / Rep. NEII (National Elevator Industry Inc.)
Recommendation: Revise text to read as follows:

620.21 Wiring Methods.

Conductors and optical fibers located in hoistways, in escalator and moving walk wellways, in platform lifts, stairway chairlift runways, machinery spaces, control spaces, in or on cars, in machine rooms and control rooms, not including the traveling cables connecting the car or counterweight and hoistway wiring, shall be installed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, rigid nonmetallic conduit, or wireways, or shall be Type MC, MI, or AC cable unless otherwise permitted in 620.21(A) through (C).

(A) Elevators.

(1) Hoistways.

~~(a) Flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit shall be permitted in hoistways between risers and limit switches, interlocks, operating buttons, and similar devices.~~

(~~b~~a) Cables used in Class 2 power-limited circuits shall be permitted to be installed between risers and signal equipment and operating devices, provided the cables are supported and protected from physical damage and are of a jacketed and flame-retardant type.

(~~c~~b) Flexible cords and cables that are components of listed equipment and used in circuits operating at 30 volts rms or less or 42 volts dc or less shall be permitted in lengths not to exceed 1.8 m (6 ft), provided the cords and cables are supported and protected from physical damage and are of a jacketed and flame-retardant type.

(~~d~~c) The following wiring methods shall be permitted in the hoistway in lengths not to exceed 1.8 m (6 ft):

(1) Flexible metal conduit
(2) Liquidtight flexible metal conduit
(3) Liquidtight flexible nonmetallic conduit
(4) Flexible cords and cables, or conductors grouped together and taped or corded, shall be permitted to be installed without a raceway. They shall be located to be protected from physical damage and shall be of a flame-retardant type and shall be part of the following:

a. Listed equipment
b. A driving machine, or
c. A driving machine brake

Exception 620.21(A)(1)(c)(1), (2) and (3): the length is not limited between risers and limit switches, interlocks, operating buttons and similar devices.

(~~e~~d) A sump pump or oil recovery pump located in the pit shall be permitted to be cord connected. The cord shall be a hard usage oil-resistant type, of a length not to exceed 1.8 m (6 ft), and shall be located to be protected from physical damage.

Substantiation: 620.21(A)(1)(d) was revised for clarification in the 2008 Edition and inadvertently affected the wiring methods permitted in 620.21(A)(1)(a).

Since at least the 1951 Edition of the National Electrical Code [see 6206a], flexible metal conduit has been permitted by the NEC as an approved wiring method in hoistways between riser and limit switches, interlocks, push buttons or similar devices. The length of these wiring methods has never been limited between the riser and the specified devices and indeed has been used for the full length between the riser and these devices. These provisions have evolved to the current requirements in 620.21(A)(1)(a) to include liquidtight flexible metal conduit, and liquidtight flexible nonmetallic conduit.

The provisions of 620.21(A)(1)(d) first appeared in the 2002 Edition of the NEC, and the substantiation for their inclusion indicated that the same wiring methods for equipment located on the car or the counterweight [see Articles 620-21(a)(2)(d) and 620-21(a)(4)] should be afforded to the same type of equipment or driving machines located in the hoistway itself. The substantiation for the clarification of 620.21(A)(1)(d) in the 2008 Edition stated that "The current wording is not grammatically correct and leads to misinterpretation. It is only the flexible cords and cables or conductors grouped together and taped or corded that are not required to be installed in a raceway. The other methods listed are raceways themselves. For clarity revise the wording as shown in the proposal."

This proposal clarifies that this important and long used wiring method can be used for the full length from the riser to the specified devices.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

MARCOVICI, S.: The proposed Exception replaces 620.21(A)(1)(a). For clarity reasons, the text of the Exception should be changed to read: "Exception: The length of flexible metal conduit, liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall not be limited when used between risers and limit switches, interlocks, operating buttons and similar devices.

12-21 Log #1391 NEC-P12 **Final Action: Accept in Principle**
(620.21(A)(1))

Submitter: Geraldine Burdeshaw, American Society of Mechanical Engineers (ASME)
Recommendation: Revise text to read as follows:

Comment on Affirmative:
MARCOVICI, S.: See My Affirmative With Comment on 12-23.

12-26 Log #1172 NEC-P12 **Final Action: Reject**
(620.37(D))

TCC Action: It was the action of the Technical Correlating Committee that the NEC Technical Correlating Committee Task Group on Broader Issues be expanded to include members from Code-Making Panel 12, members of the NFPA 72 Technical Committee, and ASME A17.1, Safety Code for Elevators and Escalators, to study and resolve this issue.
Submitter: Merton W. Bunker, Jr., US Department of State
Recommendation: Add a new 620.37(D) to read as follows:
"(D) Fire Alarm System Interface. Elevator control wiring used to effect elevator recall shall not extend beyond the room or space containing the elevator controls."
Substantiation: NFPA 72 no longer permits the use of auxiliary contacts on smoke detectors to actuate elevator recall, which in essence requires the use of control modules located at the elevator controls. However, some jurisdictions do not widely adopt NFPA 72, National Fire Alarm Code. This proposed change is necessary in those jurisdictions that do not adopt NFPA 72, in order to ensure that auxiliary contacts are not used. The primary reason for this requirement is because the wiring must be monitored for integrity. The use of auxiliary contacts on smoke detectors does not result in monitored circuits, and is inherently less reliable.
Acceptance of this proposal will enhance the correlation between the NEC, ASME A17.1, Safety Code for Elevators and Escalators and NFPA 72, National Fire Alarm Code.
This proposal is the work of the NEC TCC Task Group on Broader Fire Alarm Issues. Task Group Members include: Mark Ode, Ron Janikowski, Tom Norton, and Wayne Moore.
Panel Meeting Action: Reject
Panel Statement: This is yet another attempt to extend adoption of NFPA 72 "requirements". NFPA 70 is for the practical safeguarding of persons and property from hazards arising from the use of electricity, not one for the supervision of wiring or extending the adoption of NFPA 72. The submitter's proposal to require the outputs to be kept within the room, or space containing the elevator controls goes beyond what is required in NFPA 72, Article 6.15.2.2, which only requires the interface to be within 1 m (3 ft) of the controlled circuit or appliance.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
CROUSHORE, T.: It is understood that this proposal was created by a technical group dealing with broader fire alarm issues in an attempt to unify requirements between The Fire Alarm Code (NFPA 72) and The National Electrical Code (NFPA 70). It is also noted that this proposal is not the first proposal that CMP-12 has seen on this topic as noted in the strong words of the panel statement.
In my opinion as Panel Chair, the Fire Alarm folks are trying to put a requirement on the elevator folks that the elevator folks do not want nor do they believe is necessary. In short, the fire alarm folks want this specific requirement and elevator folks do not. Therefore, until the Fire Alarm folks work out a compromise with the elevator folks for a requirement in this section, this proposal will continue to be rejected. As panel chair, I have attempted to facilitate such discussion between the interested parties. I am optimistic that the issues can be understood and resolved if both groups work together.
MARCOVICI, S.: It would be helpful to verify the correlation between NFPA 72 and ASME A17.1.

12-27 Log #1847 NEC-P12 **Final Action: Reject**
(620.43)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: Traveling cables shall be located so as to ~~reduce to a minimum~~ minimize the likelihood of damage due to the cables coming into contact with the hoistway construction or equipment in the hoistway.
Substantiation: Edit. "Minimum" is subjective, difficult to ascertain. "Likelihood" describes a nature or circumstance as to make something probable. "Likely" is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided definitive substantiation that the changes are necessary. The current wording is well understood and has withstood the test of time.
The proposed change is not editorial in nature.

(620.53)

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
620.53 Car Light, Receptacle(s), and Ventilation Disconnecting Means. Elevators shall have a single **lockable disconnecting** means for disconnecting all ungrounded car light, receptacle(s), and ventilation power-supply conductors for that elevator car.
The **lockable** disconnecting means shall be an enclosed externally operable fused motor circuit switch or circuit breaker capable of being locked in the open position and shall be located in the machine room or control room for that elevator car. ~~The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at and remain with the equipment.~~ Where there is no machine room or control room, the **lockable** disconnecting means shall be located in a machinery space or control space outside the hoistway that is readily accessible to only qualified persons.
All disconnecting means shall be numbered to correspond to the identifying number of the elevator car whose light source they control.
All ~~The~~ disconnecting means shall be provided with a sign to identify the location of the supply side overcurrent protective device.
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-13.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-33 Log #3951 NEC-P12 **Final Action: Accept in Principle**
(620.53 Exception No. 1 (New))

Submitter: Daniel Winslow, CNY Elevator Consultants
Recommendation: Add new text as follows:
Exception No. 1: Where an individual branch circuit supplies car lighting, receptacle(s), and a ventilation motor not exceeding 2-hp, the disconnecting means required by 620.53 shall be permitted to comply with 430.109(C). This disconnecting means shall be listed and shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at the disconnecting means and shall remain with the equipment.
Substantiation: The proposed exception duplicates the exception to use a general-use switch as a disconnecting means in *"Part 620.51 Disconnecting Means"* Exception 1, when that switch conforms *to Part 430 Disconnecting means 430.109(C)* for stationary motors 2 horsepower or less. In a case where the disconnect services only a car light and/or car receptacle(s), a fused-motor circuit switch in the machine space is completely unnecessary. Additionally, in the overwhelming number of cases where the same circuit also supplies ventilation, a standard car ventilation fan motor is 1/2 HP or less (most commonly 1/4 HP or less). Where larger elevator cab ventilation systems with heating or air conditioning are used, they are covered already in 620.54. See also 620.55 which also recognizes that fused motor circuit is not required for

"Other Utilization Equipment" recognizing that a fused motor circuit is not necessary for all uses. ASME A17.1 does not require a fused motor circuit leaving it up to NFPA to define. This proposal will lower the cost of construction without any reduction in safety.

Panel Meeting Action: Accept in Principle

Add new text as follows:

Exception: Where an individual branch circuit supplies car lighting, receptacle(s), and a ventilation motor not exceeding 2-hp, the disconnecting means required by 620.53 shall be permitted to comply with 430.109(C). This disconnecting means shall be listed and shall be capable of being locked in the open position. 12-36 Log #3689 NEC-P12 **Final Action: Reject**
(620.62)

Submitter: Christopher G. Walker, Eaton Corp.

Recommendation: Add new text to read as follows:

<u>Where ground-fault protection has been provided for the operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, and has been provided per 620.61(C) or 620.61(D), then an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load.</u>

<u>Where ground-fault protection has been provided, these means shall be selectively coordinated such that the feeder level device, but not the service level device, shall open on ground faults on the load side of the feeder level device.</u>

<u>A 6 cycle minimum separation time between the service and feeder ground fault trip response bands shall be provided.</u>

Substantiation: Ground faults are typically believed to be the most common type of fault experienced in operating energized electrical systems, per ANSI/IEEE Std 242-1986 Buff book, chapter 7. Professional design engineers tell stories of ballast or small motor failures that have caused main or feeder devices to open. Why is this so? In some instances, a ground fault condition existed that went undetected and precipitated the protective device to open. In other cases, ground fault protective devices were improperly set, or not set at all. In others, a selective coordination study may not have been done, or may have been done improperly.

Therefore, with the goal of using selective coordination as the process by which electrical systems may achieve maximum uptime, it is important that all the key areas of impact are addressed in the design of these electrical systems.

The NEC has for many years required ground fault protection of equipment, but only at the service disconnect level (with noted special exceptions), per 230.95. The relatively recent 2005 and 2008 NEC versions, requires selective coordination in applications related to life safety, public safety, and/or national security applications where reliable electrical power systems are required.

These relatively new requirements for selective coordination in these types of applications are needed throughout the entire service level, feeder and branch levels of the electrical system.

With the goal in mind of maximizing the reliability and uptime of electrical systems, and giving consideration that the most common types of faults are ground fault related, it becomes a reasonable approach that whenever selective coordination is required by the Code, that the requirements for ground fault protection of equipment be extended to all appropriate areas in the electrical system beyond just the service level.

This proposal, therefore, seeks to clarify that the selective coordination requirements of Article 620.62 applies to both phase faults and ground faults, and that where ground fault protection of equipment is provided, that the ground fault protective devices shall be selectively coordinated in all applicable levels of the system.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided definitive substantiation that the changes are necessary for elevator feeders.

The intent of this proposal is to make sure that the system remains selectively coordinated for all fault conditions, including ground faults. But, the selective coordination required by 620.62 already includes all types of overcurrents, including, but not limited to, phase-to-phase and three-phase faults, and phase-to-ground, double phase-to-ground, and three phase-to-ground faults. As such, the intent of this proposal is already met, because total selective coordination is already required for all types of overcurrents, including ground faults.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-37 Log #4378 NEC-P12 **Final Action: Reject**
(620.62)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Alan Manche, Square D Company/Schneider Electric
Recommendation: Add a new sentence to the end of the main paragraph of 620.62:
A means to intentionally defeat selectivity shall not be permitted.
Substantiation: Although selectivity was placed in the NEC based on the lack of identification between the location of the feeder serving the branch circuit device, the panel continues to support the requirement for selective coordination, even after that identification was addressed in the following code development cycle. The panel clearly is taking a position that selectivity is included for life safety reasons for egress purposes or getting emergency personnel to an upper floor to address the situation. Establishing selectively coordinated systems can increase the arc-flash hazard when maintenance is performed on the system depending upon the design of the system. The concern of increased arc-flash hazard was presented to the panel in past cycles and the panel accepted those risks in favor of the benefit of selectivity on these systems. Some system designers are now including a means to defeat selectivity by installing systems that can turn the selectivity off by temporarily changing breaker settings via a switch or sensor in order to protect the electrical worker. There is no prohibition established in the NEC to restrict defeating selectivity, or the life safety aspect for which it was installed, in order to protect the electrical worker.

Unfortunately the enhanced protection for the electrical worker can be a trade-off by defeating the life safety function of the selectively coordinated system in the egress system or means to access the emergency situation provided by the elevator. The most likely time for an incident to happen that would require the system to be selective is when a working is doing maintenance on the system. If the selectivity is defeated, an arc event small or large could initiate a fire hazard or take down lighting, ventilation, or egress / access provisions that are critical to serve the structure in the event of an emergency which places the life safety of others in a dangerous position.

There are solutions available to support the reduction of arc-flash in selectively coordinated system without intentionally defeating selectivity to enhance worker safety.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 2 Negative: 10
Explanation of Negative:

ANDERSON, W.: The NEC should not prohibit any measures to increase personnel safety.

Primary direction of NFPA 70E is to De-Energize electrical equipment for worker safety.

A hazard risk analysis is required to consider protective device selectivity to optimize protection for personnel.

If any work needs to be performed on energized equipment a hazard risk analysis must be conducted justifying why the system can not be de-energized. A similar requirement for first de-energizing electrical equipment unless it is infeasible to do so exists in OSHA subpart S.

CROUSHORE, T.: There are reasons to defeat selective coordination when qualified personnel are working upon energized equipment to prevent higher incident energy release when an arc-flash is accidentally created. This proposal should have been rejected.

HEDGES, T.: The proposed text will eliminate the use of, adjustable trip circuit breakers, zone selective interlocking and energy reduction maintenance switches. These methods have been successfully employed in electrical systems, including selectively coordinated systems for many years. A review of the submitters' substantiation clearly reveals a desire to eliminate manual energy reduction maintenance switches. The last sentence of the substantiation states "There are solutions available to support the reduction of arc-flash in selectively coordinated system without intentionally defeating selectivity to enhance worker safety." Selective coordination is required in 620.62 to provide the highest degree of reliability possible. It is imperative to note that when a building owner decides to perform energized work, the system reliability is severely compromised. If a fault is created during the course of energized work, there will be an outage, a loss of power will occur.
There is no practical reason to prohibit the continued use of adjustable trip circuit breakers, zone selective interlocking and energy reduction maintenance switches in selectively coordinated systems. The preferred method of a single manufacturer is not adequate substantiation to eliminate other proven methods.

KOVACIK, J.: Due to the nature of the comments, and the fact that most were not introduced during the discussions on the proposal at the ROP meeting, we believe the original proposal needs further discussion by the entire panel during the next stage of this revision cycle.

LOTTMANN, T.: A system that is selectively coordinated can be designed to additionally limit the amount of energy produced in an arc flash event. Where a system is selectively coordinated using circuit breakers without instantaneous trips the inclusion of an energy reducing maintenance switch for the protection of persons maintaining the system may be required. Selectively coordinated systems as required in Articles 620, 700, 701, and 708 represent electrical systems in venues that are likely to meet the justification requirements of NFPA 70E for energized work. It is not desirable to prohibit a means to reduce the amount of let-through energy in these systems while energized work is being performed.

MARCOVICI, S.: The added sentence is basically a clarification to the requirement of this section. Accordingly, this clarification is redundant and unnecessary. The section is very clear about the requirement for selectivity.

MCCLINTOCK, T.: The submitter has raised some very valid points in regard to electrical worker safety. While we must strike a balance between maintaining the integrity of the means of egress and ensuring fire department access, it is equally important to protect worker safety. The substantiation states there are solutions available to support the reduction of arc-flash in selectively coordinated system without intentionally defeating selectivity to enhance worker safety; however none of "these solutions" have been included in the proposal. Furthermore, have there been any documented incidents wherein the selective coordination was bypassed and resulted in injury? This proposal should provide more direction to the code user as to what should be provided to accomplish both selectivity and reduce the incident energy to protect from arc-flash hazards.

QUAVE, D.: The proposed text will eliminate the use of, adjustable trip circuit breakers, zone selective interlocking and energy reduction maintenance switches. These methods have been successfully employed in electrical systems, including selectively coordinated systems for many years. A review of the submitters' substantiation clearly reveals a desire to eliminate manual energy reduction maintenance switches. The last sentence of the substantiation states "There are solutions available to support the reduction of arc-flash in selectively coordinated system without intentionally defeating selectivity to enhance worker safety." The submitter is referring to the preferred method of the manufacturer he represents. This preferred method is the use of zone selective interlocking. This manufacturer states that their "preferred method" does … "not involve compromises to selective coordination." It is an opinion not shared by other manufacturers or the electrical industry in general. See the preferred method of this manufacturer at:
http://www.powerlogic com/downloads/3000DB0810R608_ArcFlash.pdf

Selective coordination is required in 620.62 to provide the highest degree of reliability possible. It is imperative to note that when a building owner decides to perform energized work, the system reliability is severely compromised. If a fault is created during the course of energized work, there will be an outage, a loss of power will occur.
There is no practical reason to prohibit the continued use of adjustable trip circuit breakers, zone selective interlocking and energy reduction maintenance switches in selectively coordinated systems. The preferred method of a single manufacturer is not adequate substantiation to eliminate other proven methods.
SCHAMEL, D.: Reject this proposal. For electrical worker safety, it is not appropriate to prohibit a system that reduces incident energy levels while performing energized work.

WHITE, K.: By eliminating the use of a maintenance bypass switch you have removed additional protection, that could be provided to the electrician who is being exposed to the electrical hazard. This switch reduces the trip values for the associated equipment and this will reduce the arc flash hazard. The logic behind the proposal was that you could strand other folks who are using the elevator. The only time that this switch would be used is if there is a problem with the elevator. So it should be taken out of service for use anyways, because there is a problem. Also by using this logic you are sacrificing the electrician for the rest of the folks who might be inconvenienced by using another elevator or using the stairs.

12-38 Log #4650 NEC-P12 **Final Action: Reject**
(620.62 Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following exception and fine print note:
Exception: Where the elevator system electrical design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the extent practicable. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction.
FPN: Overcurrent protective devices used for elevator circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system.
Substantiation: The current NEC rule is being improperly used to drive the market share of a particular species of overcurrent protective device, often frustrating legitimate design objectives of the engineering community, and without any documented loss experience to justify such a consequence. The submitter has attended meetings where compelling testimony was received from engineers that have been subjected to extraordinary hardship resulting from the lack of flexibility in the current NEC provisions. This proposal is consistent with NFPA 110 (which language underlies the fine print note) and provides the necessary flexibility to allow competent engineering work that maintains selective coordination as an important element in the electrical design process, but not to the exclusion of all other issues.
Panel Meeting Action: Reject

Panel Statement: The proposed language will be unenforceable and reduces the safety of elevator systems by limiting the selectivity of overcurrent devices without providing any technical substantiation to support the request for the reduction in safety for these elevator circuits. Selectively coordinated overcurrent protective devices provide the desired level of system reliability necessary for elevator circuits.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-39 Log #2450 NEC-P12 **Final Action: Reject**
(620.85)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:

620.85 ~~Ground-Fault Circuit-Interrupter~~ Power Safe Protector Protection for Personnel. Each 125-volt, single-phase, 15- and 20-ampere receptacle installed in pits, in hoistways, on elevator car tops, and in escalator and moving walk wellways shall be of the ~~ground-fault circuit-interrupter~~ power safe protector type.

All 125-volt, single-phase, 15- and 20-ampere receptacles installed in machine rooms and machinery spaces shall have ~~ground-fault circuit-interrupter~~ power safe protector protection for personnel.

A single receptacle supplying a permanently installed sump pump shall not require ~~ground-fault circuit-interrupter~~ power safe protector protection.

Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:

1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.

2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.

3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Note: Supporting material is available for review at NFPA Headquarters.

12-40 Log #1260 NEC-P12 **Final Action: Accept**
(620.91(C))

Submitter: Andy Juhasz, Kone, Inc. / Rep. NEII (National Elevator Industry Inc.)
Recommendation: Revise text to read as follows:

620.91 Emergency and Standby Power Systems.

(C) Disconnecting Means. The disconnecting means required by 620.51 shall disconnect the elevator from both the emergency or standby power system and the normal power system.

Where an additional power source is connected to the load side of the disconnecting means, <u>which allows automatic movement of the car to permit evacuation of passengers,</u> the disconnecting means required in 620.51 shall be provided with an auxiliary contact that is positively opened mechanically, and the opening shall not be solely dependent on springs. This contact shall cause the additional power source to be disconnected from its load when the disconnecting means is in the open position.

Substantiation: The requirement for this additional contact on this disconnecting means first appeared in the 1996 Edition of the NEC as a result of NFPA 70 A95 ROP Proposal 12-32 and 12-85. The substantiation for adding 620.91(c) stated "to harmonize with the Canadian Electrical Code requirements in Section 38-036(3). The auxiliary contact prevents the operation of the elevator when the disconnecting means is open." At that time equipment was appearing in the marketplace that provided an additional power source that when normal and emergency or standby power was all lost or unavailable on hydraulic elevators, the additional power source would permit the elevator to be automatically recalled to the bottom landing and doors were automatically opened to allow passengers to evacuate from the elevator. Unfortunately the loss of power or the opening of the disconnecting means is rather indistinguishable to the elevator control and automatic movement of the elevator with the disconnecting means open posed a hazard to elevator personnel working on the equipment. Thus the contact on the disconnecting means is used to prevent the automatic operation of the elevator when the disconnect contact is open. These power sources' capacities were limited and generally allowed only the recall to the bottom landing.

In the 1999 Edition, 620.91(C) was revised as a result of NFPA 70 A98 ROP Proposal 12-76. That proposal stated: "Revise opening sentence of second paragraph to read as follows:

"…the disconnecting means required in Section 620-51 shall ~~include~~ <u>be provided with</u> an auxiliary contact <u>that is positively opened mechanically and the opening shall not be solely dependent on springs</u>. This contact shall … in the open position." The substantiation stated: "To harmonize with CEC C22.1-1994, Rule 38-026." The Panel Action was to accept with 13 out of 13 panel members eligible to vote, voting affirmative. No additional action was taken regarding this proposal or section in the ROC.

Inexplicably the second paragraph was published with the following changes: "Where an additional power source is connected to the load side of the disconnecting means~~, which allows movement of the car to permit evacuation of passengers~~, the disconnecting means required in Section 620-51 shall ~~include~~ <u>be provided with</u> an auxiliary contact <u>that is positively opened mechanically and the opening shall not be solely dependent on springs.</u>. This contact shall …in the open position."

620.91(C) has remained like this since then and it was never recognized that the additional wording "which allows movement of the car to permit evacuation of passengers" was deleted. This is clearly an Editorial error. The wording "which allows movement of the car to permit evacuation of passengers" was never intended or voted to be removed.

Today with the advent of machineroom-less elevators and high efficiency machine designs these additional power sources are now also being used on traction elevators making it even more important that 620.91(C) be correct and clarified. Additionally the elevator code has changed in recent years to require some elevators to have manual movement capabilities when normal and emergency and standby power may not be available. The Code allows the use of additional power sources to perform this function, thereby necessitating the addition of the wording "automatic", which as has been described earlier was always the intention.

Panel Meeting Action: Accept

ARTICLE 625 — ELECTRIC VEHICLE CHARGING SYSTEM EQUIPMENT

12-42 Log #3961 NEC-P12 **Final Action: Accept in Principle**
(625.1)

TCC Action: The Technical Correlating Committee understands that the reference in the panel statement on Proposal 12-43a should be to Proposal 12-42a.

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council

Recommendation: Add new text as follows:

The provisions of this article cover the electrical conductors and equipment external to an electric vehicle that connect an electric vehicle to a supply of electricity by conductive or inductive means, and the installation of equipment and devices related to electric vehicle charging.

Wherever electric vehicle or electric vehicle supply equipment is referred to, it also includes plug-in hybrid electric vehicle or plug-in hybrid electric vehicle supply equipment.

Substantiation: Industry has developed a new type of vehicle with many similarities to electric vehicles with respect to their connection to a supply of electricity for vehicle charging. In the title and throughout the text of Article 625, there are multiple references to "electric vehicle" which could be alternatively modified to include "plug-in hybrid electric vehicle" as well. This particular proposal identifies plug-in hybrid electric vehicle supply equipment as an alternative and equivalent type of supply equipment. See definitions.

Panel Meeting Action: Accept in Principle

Panel Statement: CMP-12 accepts the intent of the submitter to include hybrid electric vehicle supply equipment within the definition of electric vehicle in Article 625. It is not necessary to include the plug-in hybrid electric vehicle in the scope text as it would be covered by the definition of electric vehicle.

See panel Proposal 12-43a and panel action on Proposal 12-43.

12-42a Log #CP1200 NEC-P12 **Final Action: Accept**
(625.2)

Submitter: Code-Making Panel 12,

Recommendation: Add definition to 625.2 in alphabetical order to read as follows:

Plug-in Hybrid Electric Vehicle (PHEV): A hybrid vehicle intended for on-road use with the ability to store and use off-vehicle electrical energy in the rechargeable energy storage system. The PHEV also has a second source of motive power.

Substantiation: Industry has developed a new type of vehicle with many similarities to electric vehicles with respect to their connection to a supply of electricity for vehicle charging. In the title and throughout the text of Article 625, there are multiple references to "electric vehicle" which could be alternatively modified to include "plug-in hybrid electric vehicle" as well. This particular proposal identifies plug-in hybrid electric vehicle supply equipment as an alternative and equivalent type of supply equipment.

CMP-12 has worked in a Task Group and proposed this definition to be included in the definition of electric vehicle and in the scope.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LOTTMANN, T.: This definition is not needed as the term "plug in hybrid electric vehicle" is not used anywhere in the requirements contained in Article 625. The inclusion of this term in the definition for electric vehicle will meet the intent of the submitter of proposal 12-42 which was the basis for the task group that created this panel proposal. NEMA questions whether this meets the NEC Style Manual Rules for definitions. The only place this term would be used is in another definition.

Comment on Affirmative:

MARCOVICI, S.: According to NREL, a plug-in hybrid-electric vehicle (PHEV) is a hybrid-electric vehicle (HEV) with the ability to recharge its electrochemical energy storage with electricity from an off-board source. A hybrid-electric vehicle is a vehicle propelled by an internal combustion engine and an electric motor generally powered by electric batteries.

12-43 Log #3962 NEC-P12 **Final Action: Accept in Principle**
(625.2.Electric Vehicle)

TCC Action: The Technical Correlating Committee understands that the reference in the panel statement to Proposal 12-43a should be to Proposal 12-42a.

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council

Recommendation: Revise text to read as follows:

Electric Vehicle. An automotive-type vehicle, licensable for on-road use, that plugs into a source of electricity to charge an on-board rechargeable energy storage system that powers an electric motor for vehicle propulsion for on-road use. ~~such as~~This includes passenger automobiles, buses, trucks, vans, neighborhood electric vehicles, and the like.~~, primarily powered by an electric motor that draws current from a rechargeable storage battery, fuel cell, photovoltaic array, or other source of electric current.~~ For the purpose of this article, electric motorcycles and similar type vehicles and off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.

Substantiation: Industry has developed a plug-in hybrid electric vehicle with many similarities to electric vehicles with respect to their connection to a supply of electricity for vehicle charging. This particular proposal expands the definition of electric vehicle to include both types of vehicles. The term "licensable" has been added to reinforce the intent that these are vehicles complying with the Federal Motor Vehicle Safety Standards.

Panel Meeting Action: Accept in Principle

Revise the definition of electric vehicle to read as follows:

Electric Vehicle. An automotive-type vehicle for on-road use, such as passenger automobiles, buses, trucks, vans, neighborhood electric vehicles, and the like, primarily powered by an electric motor that draws current from a rechargeable storage battery, fuel cell, photovoltaic array, or other source of electric current. Plug-in hybrid electric vehicles (PHEV) are considered electric vehicles. For the purpose of this article, electric motorcycles and similar type vehicles and off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.

Panel Statement: See panel proposal 12-43a that defines plug-in hybrid electric vehicles.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-44 Log #3963 NEC-P12 **Final Action: Reject**
(625.2.Electric Vehicle)

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council

Recommendation: Revise text to read as follows:

Electric Vehicle. An automotive-type vehicle for on-road use, such as passenger automobiles, buses, trucks, vans, neighborhood electric vehicles, electric motorcycles and the like, primarily powered by an electric motor that draws current from a rechargeable storage battery, fuel cell, photovoltaic array, or other source of electric current. For the purpose of this article, ~~electric motorcycles and similar type vehicles and~~ off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.

Substantiation: Electric motorcycles have become another means of on-road electric transportation that uses a source of electricity to charge on-board batteries used as part of the propulsion system. These electric motorcycles are licensable and operate at voltages similar to other electric vehicles.

Panel Meeting Action: Reject

Panel Statement: CMP-12 rejects the revision to the definition for electric vehicle to include motorcycles.

Typically, motorcycles are charged from standard 120-volt,15-ampere receptacles due to lower battery capacity and would not be subject to the requirements of this article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-45 Log #3964 NEC-P12 **Final Action: Accept in Principle**
(625.2.Electric Vehicle Connector)

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council
Recommendation: Revise text to read as follows:
Electric Vehicle Connector. A device that, by insertion into an electric vehicle inlet, establishes an electrical connection to the electric vehicle for the purpose of ~~charging~~power transfer and information exchange, see 625.26. This device is part of the electric vehicle coupler.
Substantiation: This proposed change acknowledges the bi-direction energy transfer as already permitted by Article 625.26, Interactive Systems.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Electric Vehicle Connector. A device that, by insertion into an electric vehicle inlet, establishes an electrical connection to the electric vehicle for the purpose of ~~charging~~ power transfer and information exchange. This device is part of the electric vehicle coupler.
Add FPN to read as follows:
For further information, see 625.26 for interactive systems.
Panel Statement: CMP-12 relocates the submitter's reference to 625.26 to a FPN.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
CROUSHORE, T.: Changing the term "charging" to "power transfer" in this definition reinforces the option to use a plug-in hybrid vehicle as an optional standby power system or a utility interactive power supply system as per the requirements of 625.26. However, care must be taken when operating a vehicle as a power production source and the issues of vehicle exhaust, fire hazard, and electrical safety must be part of the overall system to prevent fires, injuries, and fatalities. Further work should be investigated by other technical committees such that operation of a plug-in hybrid vehicle does not reduce the overall safety of the user. This additional technical investigation on these safety issues of an automotive vehicle providing power to premises wiring is beyond the scope of CMP-12.

12-46 Log #3965 NEC-P12 **Final Action: Accept in Principle**
(625.2.Electric Vehicle Inlet)

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council
Recommendation: Revise text to read as follows:
Electric Vehicle Inlet. The device on the electric vehicle into which the electric vehicle connector is inserted for ~~charging~~power transfer and information exchange, see 625.26. This device is part of the electric vehicle coupler. For the purposes of this Code, the electric vehicle inlet is considered to be part of the electric vehicle and not part of the electric vehicle supply equipment.
Substantiation: This proposed change acknowledges the bi-direction energy transfer as already permitted by Article 625.26, Interactive Systems.
Panel Meeting Action: Accept in Principle
Revise text to read as follows**:**
Electric Vehicle Inlet. The device on the electric vehicle into which the electric vehicle connector is inserted for ~~charging~~ power transfer and information exchange. This device is part of the electric vehicle coupler. For the purposes of this code, the electric vehicle inlet is considered to be part of the electric vehicle and not part of the electric vehicle supply equipment.
Add FPN to read as follows:
For further information, see 625.26 for interactive systems.
Panel Statement: CMP-12 relocated the submitter's reference to 625.26 to a FPN.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-47 Log #3967 NEC-P12 **Final Action: Reject**
(625.2.Electric Vehicle Nonvented Storage Battery)

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council
Recommendation: Delete text as follows:
~~Electric Vehicle Nonvented Storage Battery. A hermetically sealed battery, comprised of one or more rechargeable electrochemical cells, that has no provision for the release of excessive gas pressure, or for the addition of water or electrolyte, or for external measurements of electrolyte specific gravity.~~
Substantiation: Nonvented storage batteries have not been used in electric vehicle applications. The term can also be deleted in Article 625.29(C).
Panel Meeting Action: Reject
Panel Statement: CMP-12 chooses to retain the definition as such a product may be available.
CMP-12 disagrees with the substantiation as such a product was available.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-48 Log #1827 NEC-P12 **Final Action: Reject**
(625.2.Electric Vehicle Supply Equipment)

Submitter: Dan Leaf, Seneca, SC
Recommendation: ELECTRIC VEHICLE SUPPLY EQUIPMENT. Add: "Fixed" after "premises".
Substantiation: Edit. Though the electric vehicle supply cable is premises wiring, the intent appears to apply to fixed premises wiring.
Panel Meeting Action: Reject
Panel Statement: Electric supply vehicle equipment is not required to be fixed.
"Premises wiring" is a defined term.
The proposed change is not editorial in nature.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-49 Log #3966 NEC-P12 **Final Action: Accept in Principle**
(625.2.Electric Vehicle Supply Equipment)

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council
Recommendation: Revise text to read as follows:
Electric Vehicle Supply Equipment. The conductors, including the ungrounded, grounded, and equipment grounding conductors and the electric vehicle connectors, attachment plugs, and all other fittings, devices, power outlets, or apparatus installed specifically for the purpose of ~~delivering~~transferring energy between ~~from~~ the premises wiring ~~to~~and the electric vehicle, see 625.26.
Substantiation: This proposed change acknowledges the bi-direction energy transfer as already permitted by Article 625.26, Interactive Systems.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Electric Vehicle Supply Equipment. The conductors, including the ungrounded, grounded, and equipment grounding conductors and the electric vehicle connectors, attachment plugs, and all other fittings, devices, power outlets, or apparatus installed specifically for the purpose of ~~delivering~~ transferring energy between ~~from~~ the premises wiring ~~to~~ and the electric vehicle.
Add FPN to read as follows:
For further information, see 625.26 for interactive systems.
Panel Statement: CMP-12 relocated the submitter's reference to 625.26 to a FPN.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-50 Log #3968 NEC-P12 **Final Action: Accept**
(625.2.Rechargeable Energy Storage System)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with 2.2.2 of the NEC Style Manual that states that definitions shall not contain the term being defined.
This action will be considered by the panel as a public comment.
Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council
Recommendation: Add new text as follows:
Rechargeable Energy Storage System. A rechargeable energy storage system is any energy storage system that has the capability to be charged and discharged. Examples include batteries, capacitors, and electro mechanical flywheels.
Substantiation: This definition updates the definition to include other technologies that could be used for energy storage systems such as capacitors. This definition is consistent with SAE J1715 "Hybrid Electric Vehicle (HEV) & Electric Vehicle (EV) Terminology" (revised February 2008).
Panel Meeting Action: Accept
Panel Statement: Editorial: Correct spelling of the term "electro mechanical" to "electromechanical"
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LOTTMANN, T.: This definition is not needed as the term "rechargeable energy storage systems" is not used anywhere in the requirements contained in Article 625. The acceptance of this would add a definition for a term that was used in the definition for another term "plug in hybrid electric vehicles" that is used in the definition of electric vehicle. NEMA questions whether this meets the NEC Style Manual Rules for definitions. The only place this term would be used is in another definition.

Comment on Affirmative:

MARCOVICI, S.: Electromechanical flywheels are not commercial yet and should not be added. The code should only reference commercially ready technologies. Also, the type of capacitors used for energy storage are called "supercapacitors" or "ultracapacitors". Use of the term "capacitors" might lead to confusion.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-54 Log #3696 NEC-P12 **Final Action: Reject**
(625.13)

Submitter: Donald B. Karner, Electric Transportation Engineering Corp.
Recommendation: Revise text to read as follows:

Electric vehicle supply equipment rated at 125 volts, single phase, 15 or 20 amperes ~~or part of a system identified and listed as suitable for the purpose and meeting the requirements of 625.18, 625.19, and 625.29~~ shall be permitted to be cord-and-plug-connected. All other electric vehicle supply equipment shall be permanently connected and fastened in place. This equipment shall have no exposed live parts.

Substantiation: It is vital to the successful deployment of electric vehicles that a common infrastructure, compatible with all grid-connected vehicles, be developed. Automotive manufacturers, through the Society of Automotive Engineers and their J1772 standards committee, are assuring commonality at the vehicle to connector/cord interface with the development of a standard connection to an electric vehicle for Level 1 and Level 2 charging (as defined in 625.14). 625 must provide for similar commonality at the interface between the cord and the facility where connection to the grid is made. Article 625.13 addresses this by requiring that the charge cord be connected to the grid through electric vehicle supply equipment "permanently connected and fastened in place", eliminating any interface issues. It allows an exception for "125 volts, single phase, 15 or 20 amperes" connections to be "cord-and-plug-connected", taking advantage of the universality of the 15 and 20 ampere convenience outlet infrastructure existing in the United States. However, the existing phrase, "or part of a system identified and listed as suitable for the purpose and meeting the requirements of 625.18, 625.19, and 625.29" is being interpreted to allow connections of any voltage and ampacity to be cord and plug connected as long as the requirements of 625.18, 625.19 and 625.29 are met. This will result in a patchwork electric vehicle charging infrastructure consisting of various receptacle based charge stations using incompatible plugs of various voltages and ampacities. The proposed deletion will clarify the need for a universal electric vehicle charging infrastructure.
Panel Meeting Action: Reject
Panel Statement: Cord and plug connected electric vehicles are already permitted. CMP-12 does not accept eliminating equipment that meets the requirements of 625.18, 625.19, and 625.29.

This is outside the scope of the NEC as it deals with the hazards of fire and shock, and the NEC does not regulate product development.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

MARCOVICI, S.: The use of a universal charging system connector is not possible yet, due to the existance of 3 levels of charging (Level 1, Level 2 & Level 3). These levels of charging use different voltage levels for achieving different charging times (the higher the voltage, the shorter the charging time. This forces the use of different types/sizes of connectors.

(625.13)

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council
Recommendation: Revise text to read as follows:

Electric vehicle supply equipment rated at 125 volts, single phase, 15 or 20 amperes <u>shall be permitted to be cord-and-plug-connected. EVSE rated greater than 20 amperes and not more than 250 volts and</u> ~~or~~<u>a</u> part of a system identified and listed as suitable for the purpose and meeting the requirements of 625.18, 625.19, and 625.29 shall be permitted to be cord-and-plug-connected. All other electric vehicle supply equipment shall be permanently connected and fastened in place. This equipment shall have no exposed live parts.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects. The submitter has not substantiated the proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-56 Log #3695 NEC-P12 **Final Action: Reject**
(625.14)

Submitter: Donald B. Karner, Electric Transportation Engineering Corp.
Recommendation: Revise text to read as follows:

Level 3. The EV equivalent of a commercial gasoline dispensing station, this high-speed, high-power method charges an EV in about the same time it takes to refuel a conventional vehicle. Because of individual supply requirements and available source voltages, exact voltage and load specifications for Level 3 charging have not been defined as in Level 1 and Level 2. These power requirements are specified by the equipment manufacturer. <u>However, for all voltages above 240 volts or 208 volts and for all load currents greater than 32 amperes, short circuit currents shall be limited through impedance additions or power conversion to direct current.</u>

Substantiation: Appropriately, this Article leaves the specification of Level 3 power requirements to the equipment manufacturer. However, at voltages above 240 volts or 208 volts, and currents above 32 amperes, short circuit currents are too great to be allowed onboard a vehicle for which the integrity of wiring can be compromised due to wear, impacts, and tampering. It is imperative that the short circuit current be limited to protect against large energy releases and potential vehicle fires resulting from failure of vehicle onboard wiring and devices. A requirement to limit short circuit current will ensure that equipment manufacturers do not create a hazard by allowing low impedance circuits to be directly connected to electric vehicles.
Panel Meeting Action: Reject
Panel Statement: The language in 625.14 does not address any "levels;" rather, it simply requires the electrical vehicle supply equipment to have sufficient rating to supply the load served. The submitter appears to have submitted a proposed change to the NEC handbook commentary. CPM-12 does not author the handbook.

Short circuit protection is mandated by 110.10 and applies to 625.23. There is insufficient substantiation to limit short circuit current by using only inserted impedance. Short circuit protection can also be accomplished by the proper selection of overcurrent devices.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
MARCOVICI, S.: Charging Levels 1, 2 & 3 need to be first defined in the NEC. These definitions should be proposed by EPRI's National Electric Transportation Infrastructure Working Council (NETIWC). This is the group that wrote Articles 625 and 626.

12-57 Log #3697 NEC-P12 **Final Action: Reject**
(625.14)

Submitter: Donald B. Karner, Electric Transportation Engineering Corp.
Recommendation: Revise text to read as follows:
Level 2. This is the primary and preferred method of EV charging at both private and public facilities. It requires special equipment and connection to an electric power supply dedicated to EV charging. The voltage of this connection is either 240 volts or 208 volts. The maximum load is 32 amperes (7.7 kVA at 240 volts or 6.7 kVA at 208 volts). ~~The minimum circuit and overcurrent rating for this connection is 40 amperes (32_1.25_ 40 amperes).~~ Electric vehicles are treated as continuous loads. See 625.21 for sizing overcurrent devices.
Substantiation: The phrase "The minimum circuit and overcurrent rating for this connection is 40 amperes (32_1.25=40 amperes)" is redundant to the phrase that follows it referring to 625.21 for sizing overcurrent protection devices. This phrase proposed for deletion has been interpreted to allow load currents greater than 32 amperes for Level 2 charging. This interpretation, and future changes to this Article allowing load currents greater than 32 amperes, are not appropriate due to the increased short circuit currents and protective devices let through energy available at voltages and currents higher than the allowed 240/208 volts at 32 amperes. As the condition of a vehicle platform cannot be assured (due to wear, impacts, and tampering) it is imperative that the short circuit current and let through energy be limited to protect against large energy releases and potential vehicle fires resulting from failure of vehicle onboard wiring and devices.
Panel Meeting Action: Reject
Panel Statement: The language in 625.14 does not address any "levels;" rather, it simply requires the electrical vehicle supply equipment to have sufficient rating to supply the load served. The submitter appears to have submitted a proposed change to the NEC handbook commentary. CMP-12 does not author the handbook.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
MARCOVICI, S.: See My Affirmative With Comment on 12-56.

12-58 Log #161 NEC-P12 **Final Action: Reject**
(625.17)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
625.17 Cable. The electric vehicle supply equipment cable shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Article 400 and Table 400.4. Ampacities shall be as specified in Table 400.5(A) for 10 AWG and smaller, and in Table 400.5(B) for 8 AWG and larger. The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a cable management system that is listed as suitable for the purpose. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid ~~communications~~, signal, and optical fiber cables, shall be permitted.
Substantiation: Section 625.17 has requirements for communications circuits. However, 90.3 states:
"Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8."
Since Article 800 has no reference to Article 625, the requirement for the use of communications cables in 625.17 is not correlated with Article 800 and should be deleted.
Panel Meeting Action: Reject
Panel Statement: Including the term "communications" in the list that describes the cable attributes as suitable for this particular purpose is correct in this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-59 Log #162 NEC-P12 **Final Action: Accept in Principle**
(625.17)

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
625.17 Cable. The electric vehicle supply equipment cable shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Article 400 and Table 400.4. Ampacities shall be as specified in Table 400.5(A) for 10 AWG and smaller, and in Table 400.5(B) for 8 AWG and larger. The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a cable management system that is listed as suitable for the purpose. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and ~~optical fiber~~ cables, shall be permitted.
Substantiation: Article 770 has definitions for optical fiber cables:
"Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering. "
"Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors."
The terminology in Article 770 for a "hybrid" optical fiber cable is a composite optical fiber cable. Section 770.3(A) states:
"(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable."
Since a hybrid (composite) optical fiber cable is classified and installed according to the type of electrical cable the fiber in installed in, there is no need to mention "hybrid" optical fiber cables.
Panel Meeting Action: Accept in Principle
Revise 625.17 to read as follows:
625.17 Cable. The electric vehicle supply equipment cable shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Article 400 and Table 400.4. Ampacities shall be as specified in Table 400.5(A) for 10 AWG and smaller, and in Table 400.5(B) for 8 AWG and larger. The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a cable management system that is listed as suitable for the purpose. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and <u>composite</u> optical fiber cables, shall be permitted.
Panel Statement: CMP-12 adds "composite" ahead of "optical fiber" and meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MARCOVICI, S.: A "hybrid cable" is a combination cable comprised of individual communication, signaling and fiber optic cables enclosed by a common jacket. Some hybrid cables include a power component. The change should rather read:
"hybrid (communications, signal and optical fiber) cables."

12-60 Log #4797 NEC-P12 **Final Action: Reject**
(625.22)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
625.22 Personnel Protection System.
The electric vehicle supply equipment shall have a listed system of protection against electric shock of personnel. The personnel protection system shall be composed of listed <u>power safe protector</u> ~~personnel~~ protection devices and constructional features. Where cord-and-plug-connected electric vehicle supply equipment is used, the ~~interrupting~~ <u>power safe protector</u> device of a listed personnel protection system shall be provided and shall be an integral part of the attachment plug or shall be located in the power supply cable not more than 300 mm (12 in.) from the attachment plug.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle is actively supplying power to an appliance, it provides traditional GFCI protection.
2. PSP receptacles monitor the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject

(625.23)

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
625.23 Disconnecting Means.
A lockable disconnecting means shall be installed to disconnect all ungrounded supply conductors to ~~For~~ electric vehicle supply equipment rated more than 60 amperes or more than 150 volts to ground, the disconnecting means shall be ~~provided and~~ installed in a readily accessible location. ~~The disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.~~
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-13.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-62 Log #1828 NEC-P12 **Final Action: Reject**
(625.23)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: The disconnecting means for electric vehicle supply equipment shall be readily accessible. The disconnecting means shall be a switch or circuit breaker with identified permanent integral means for locking in the open (off) position.
Substantiation: If safety requires lockable disconnects for over 60 ampere rated supply equipment it should be required for all supply equipment ratings. "Capable" of being locked is subjective, not specific as to means; proposal is specific and doesn't allow for makeshift methods.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects. "Capable" is used consistently throughout the code with the same phraseology. The submitter has not provided proof of a problem related to subjectivity.
CMP-12 does not agree that the requirements should be extended below 60 amps. The submitter has not provided any evidence of a problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-63 Log #2584 NEC-P12 **Final Action: Reject**
(625.28)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Section 90.3 indicates Chapters 5, 6, and 7 already apply to special occupancies, equipment, or conditions.
Panel Meeting Action: Reject
Panel Statement: CMP-12 does not accept the submitter's substantiation. The submitter's interpretation of 90.3 is incorrect.
The reference to Article 500 - 516 in 625.28 are appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-64 Log #3970 NEC-P12 **Final Action: Reject**
(625.29(B))

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council
Recommendation: Revise text to read as follows:
(B) Height. Unless specifically listed for the purpose and location, the coupling means of the electric vehicle supply equipment shall be stored or located at a height of not less than ~~450~~ 600 mm (~~18~~ 24 in.) and not more than 1.2 m (4 ft) above the floor level.
Substantiation: 625.29(B) should be in compliance with the Americans With Disabilities Act (ADA) requirements. The like requirement in 625.30(B) indicates a minimum height of 24 inches and is in compliance with the ADA requirements. This proposal changes the 18 inch minimum height to 24 inches so that it agrees with 629.30(B) and the ADA minimum requirements.
Panel Meeting Action: Reject
Panel Statement: The requirements falling under the purview of 625.30 pertain to outdoor installations. The 24 inch minimum height is similar to the 24 inch minimum height for mobile homes per 550.32(F). This minimum height requirement is for physical protection as well as protection from vegetation. In addition, ADA Accessibility Guidelines, Section 4.27.3, requires the highest operable part of controls, dispensers, receptacles, and other operable equipment to be placed within at least one of the reach ranges specified in 4.2.5 and 4.2.6. Electrical and communications system receptacles on walls are to be mounted no less than 15 in above the floor. Therefore, the 18 inch minimum meets the requirements of the ADA Guidelines.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-65 Log #3971 NEC-P12 **Final Action: Reject**
(625.29(C))

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Chairman, Plug-in Hybrid & Electric Vehicle Working Group, EPRI National Electric Transportation Infrastructure Working Council
Recommendation: Revise text to read as follows:
(C) Ventilation Not Required. ~~Where electric vehicle nonvented storage batteries are used or w~~Where the electric vehicle supply equipment is listed or labeled as suitable for charging electric vehicles indoors without ventilation and marked in accordance with 625.15(B), mechanical ventilation shall not be required.
Substantiation: Nonvented storage batteries have not been used in electric vehicle applications. The term "nonvented storage batteries" and its definition in 625.2, Definitions, have been proposed to be deleted.
Panel Meeting Action: Reject
Panel Statement: CMP-12 chooses to retain the text as such a product may be available.
CMP-12 disagrees with the substantiation as such a product was available.

ARTICLE 626 — ELECTRIFIED TRUCK PARKING SPACES

12-70 Log #1863 NEC-P12 **Final Action: Reject**
(626.2.Separable Power Supply Cable Assembly)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: SEPARABLE POWER SUPPLY ~~CABLE~~ CORD ASSEMBLY. A flexible cord ~~including ungrounded, grounded, and equipment grounding conductors~~ containing an equipment grounding conductor, provided with a grounding type cord connector, a grounding type attachment plug and all other...(remainder unchanged).
Substantiation: Edit. For consistency with 626.25(B)(4)(a) and (B)(5).
Panel Meeting Action: Reject
Panel Statement: The proposal limits application and does not represent existing application requirements which may be either cables or cords depending upon the parking space design.
The proposed change is not editorial in nature.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-71 Log #3287 NEC-P12 **Final Action: Reject**
(626.4(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
The provisions of this article do not apply to that portion of equipment ~~in residential, commercial, or industrial facilities~~ that requires electric power ~~for devices~~ to load or unload cargo and equipment, operate conveyors, hoists and other ~~devices~~ equipment used on the site or truck.
Substantiation: Edit. “Residential, commercial, and industrial facilities” is superfluous and does not cover agricultural facilities which are not commercial. “Devices” per definition do not require power (watts or volt-amperes).
Panel Meeting Action: Reject
Panel Statement: These requirements were found to be necessary to avoid misapplication to equipment often in proximity to the truck parking space.
The proposal does not provide adequate substantiation in accordance with 4.3.3(d) of the Regulations Governing Committee Projects. Model building codes characterize structures based on use and occupancy. Accordingly, anything that does not fall under the purview of residential or industrial, would be characterized as commercial.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-72 Log #397 NEC-P12 **Final Action: Accept**
(626.11(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change “per” to “for each” in the second sentence.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-73 Log #272 NEC-P12 **Final Action: Accept**
(626.11(C))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “computed” to “calculated.”
Substantiation: The term “calculated” more accurately describes the mathematical operation. It is not necessary to have a computer to do the calculations, they can also be done manually.
The term “computed” is only used 3 times in the code while the term “calculated” is used more than 175 times. This is one of a series of proposals to provide consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
SCHAMEL, D.: Reject this proposal. Definition of compute is “to determine by calculation”.

12-74 Log #4750 NEC-P12 **Final Action: Accept in Principle**
(626.11(D))

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Revised text to read as follows:
(D) Conductor Rating. Truck space branch-circuit ~~conductors shall have an ampacity not less than the loads supplied~~ loads shall be considered to be continuous.
Substantiation: In all probability these loads will be required to continue for 3 hours or more. The continued operation of truck heating and refrigeration equipment while the truck is parked for extended periods is of paramount importance.
Panel Meeting Action: Accept in Principle
Revise 626.11(D) to read as follows:
(D) Conductor Rating. Truck space branch-circuit supplied loads shall be considered to be continuous.
Panel Statement: CMP-12 retained “supplied” for clarity.
CMP-12 agrees with the submitter to require the branch-circuit loads to be considered as continuous.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
SCHAMEL, D.: Accept in Principal:
Revised text to read as follows:
(D) Conductor Rating. Truck space branch-circuit conductors shall have an ampacity not less than the loads supplied and shall be considered to be continuous.

12-75 Log #2030 NEC-P12 **Final Action: Reject**
(626.20)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: The provisions of this section are already covered in Article 250, which applies unless amended. Additionally (A)(1) does not include equipment that is not “fixed”; apparently does not permit connections or splices in an equipment grounding conductor (continuous); requires bonding (not the same as grounding) by an equipment grounding conductor which is defined as performing a different function.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3 of the Regulations Governing Committee Projects as it does not provide the proper reference to the section under revision.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-76 Log #2029 NEC-P12 **Final Action: Reject**
(626.21)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: The provisions of this section already apply per 90.3 and as stated by many panels such provisions do not need repeating.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with section 4.3.3 of the Regulations Governing Committee Projects as it does not provide the proper reference to the section under revision.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-77 Log #3289 NEC-P12 **Final Action: Reject**
(626.22(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
All electrical truck parking space supply equipment (disconnecting means, receptacles, overcurrent devices) shall be readily accessible by an unobstructed entrance or passageway not less than 600 mm (2 ft) wide and not ~~more~~ less than 2.0 m (6 ft 6 in.) high and provided with working space in accordance with 110.34.
Substantiation: The heading implies the working space is covered by the dimensions indicated which may modify 110.34. There is no safety reason to limit the height to 6 ft. Access and working space would be readily accessible. “supply equipment” without modification includes all conductors and equipment including feeders and services.
Panel Meeting Action: Reject
Panel Statement: The proposed change does not reflect the actual allowable truck parking space equipment configuration.

Section 626.4(B) specifies the voltages falling under the purview of this article which does not include over 600 volts. The submitter suggests current language that may modify 110.34, which applies to over 600 volt applications.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-78 Log #1581 NEC-P12 **Final Action: Reject**
(626.22(D))

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
(D) Disconnecting Means. A **lockable** disconnecting **means** ~~switch or circuit breaker~~ shall be provided to disconnect one or more electrified truck parking space supply equipment sites from a remote location. The disconnecting means shall be ~~provided and~~ installed in a readily accessible location ~~and shall be capable of being locked in the open position. Portable means for adding a lock to the switch or circuit breaker shall not be permitted as the means required to be installed at and remain with the equipment.~~
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on proposal 12-13.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-79 Log #2028 NEC-P12 **Final Action: Reject**
(626.22(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part of text: The disconnecting means shall be ~~provided and~~ installed in a readily accessible location and shall be ~~capable of being locked~~ provided with identified permanent integral means for locking in the open (off) position. ~~Portable means for adding a lock to the circuit breaker or switch shall not be permitted as the means required to be installed at and remain with the equipment.~~
Substantiation: "Capable of being locked" does not specifically require a locking means. Proposal is specific and doesn't allow for makeshift methods.
Panel Meeting Action: Reject
Panel Statement: The proposal does not represent the allowed equipment driven configuration of the installation.
See panel action and statement on proposal 12-13.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-80 Log #163 NEC-P12 **Final Action: Reject**
(626.23(A))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
(A) Cable Management. Electrified truck parking space equipment provided from either overhead gantry or cable management systems shall utilize a permanently attached power supply cable in electrified truck parking space supply equipment. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid ~~communications~~, signal, and optical fiber cables, shall be permitted.
Substantiation: Section 626.23(A) has requirements for communications circuits. However, 90.3 states:
"Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8."
Since Article 800 has no reference to Article 626, the requirement for the use of communications cables in 626.23(A) is not correlated with Article 800 and should be deleted.
Panel Meeting Action: Reject
Panel Statement: Article 800 has provisions for wire and cables in buildings and for wires and cables entering buildings. It has no provision for the installations covered by Article 626.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-81 Log #164 NEC-P12 **Final Action: Accept in Principle**
(626.23(A))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
(A) Cable Management. Electrified truck parking space equipment provided from either overhead gantry or cable management systems shall utilize a permanently attached power supply cable in electrified truck parking space supply equipment. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and ~~optical fiber~~ cables, shall be permitted.
Substantiation: Article 770 has definitions for optical fiber cables:
"Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering. "
"Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors."
The terminology in Article 770 for a "hybrid" optical fiber cable is a composite optical fiber cable. Section 770.3(A) states:
"(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable."
Since a hybrid (composite) optical fiber cable is classified and installed according to the type of electrical cable the fiber in installed in, there is no need to mention "hybrid" optical fiber cables.
Panel Meeting Action: Accept in Principle
Revise 626.23(A) to read as follows:
(A) Cable Management. Electrified truck parking space equipment provided from either overhead gantry or cable management systems shall utilize a permanently attached power supply cable in electrified truck parking space supply equipment. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and composite optical fiber cables, shall be permitted.
Panel Statement: CMP-12 adds "composite" ahead of "optical fiber" and meets the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
MARCOVICI, S.: See My Negative Comment on 12-59.

12-82 Log #4099 NEC-P12 **Final Action: Reject**
(626.24(B))

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC / Rep. Chairman, EPRI IWC Transportation Electrification Committee/Code Task Group
Recommendation: Revise text to read as follows:
(B) Receptacle. All receptacles shall be listed and of the non-locking and grounding type. Every truck parking space with electrical supply shall be equipped with (B)(1) and (B)(2).
Substantiation: During the development of the code article, the intent was to require a non-locking and grounding type. This is reflected in the fact that the non-locking type was identified in the Fine Print Note. However, during preparation, the identification of a non-locking type was left out of 626.24(B). This proposal addresses that omission.
Panel Meeting Action: Reject
Panel Statement: The article does not require non-locking types for situations and systems which choose to use the locking types, even though the locking types would have to provide a non-locking type extension cable; this was the purpose for the FPN.
The submitter is encouraged to provide additional substantiation as to the need for a non-locking requirement.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
MARCOVICI, S.: The purpose of specifying the non-locking type receptacles is part of the "break-away" concept that is used at gas stations for connecting eh dispensing hoses.

12-83 Log #4727 NEC-P12 **Final Action: Reject**
(626.24(B))

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC / Rep. EPRI IWC Transportation Electrification Committee/Code Task Force
Recommendation: Revise text as follows:
(B) Receptacle. All receptacles shall be listed and of the non-locking and grounding type. Every truck parking space with electrical supply shall be equipped with (B)(1) and (B)(2).
Substantiation: During the development of the code article, the intent was to require a non-locking and grounding type. This is reflected in the fact that the non-locking type was identified in the Fine Print Note. However, during preparation, the identification of a non-locking type was left out of 626.24(B), this proposal addresses that omission.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on proposal 12-82.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
MARCOVICI, S.: See My Negative Comment on 12-82.

12-84 Log #4651 NEC-P12 **Final Action: Accept**
(626.24(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
Two duplex receptacles, each 2-pole, 3-wire grounding type and rated 20 amperes,125 volts, and each connected to a separate branch circuit that shall have no other outlets.
(FPN unchanged)
Substantiation: This rewording makes it possible for a conventional GFCI receptacle to be used, since GFCI protection is required in (D), this is only practical. As written, the individual branch-circuit requirement disallows duplex receptacles, and since no single-GFCI receptacles are now in production, the consequence of this wording is to place the GFCI protection in a remote panel as part of a circuit breaker. It is difficult to understand why a single receptacle is being mandated. In addition, a widely circulated color photo of one of these umbilical assemblies clearly shows GFCI duplex receptacles. The submitter believes that this wording is therefore in the NEC in the mistaken belief that a branch circuit that supplies a duplex receptacle and not other outlets is an individual branch circuit. It is not, and this wording is intended to achieve the intended outcome.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
MARCOVICI, S.: The intention of the authors of Article 626, EPRI's National Electric Transportation Infrastructure Working Council, was to have 2 separate 20A, 125 V receptacles. This is due to the size and shape (round) of the industrial type plug, NEMA 5-20, used for this application. Two of these plugs would be too close to each other when plugged into a duplex receptacle.

12-85 Log #1928 NEC-P12 **Final Action: Reject**
(626.24(B)(1) and (2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (1) Two single receptacles, each <u>a</u> 2-pole 3-wire grounding type, rated 20-amperes 125 volts, and <u>each</u> connected to an individual <u>20-ampere</u> branch circuit.
(2) One single receptacle, a 3-pole 4-wire grounding type, single-phase rated either 30-amperes 208y/120 volts or 125/250 volts <u>connected to an individual 30-ampere branch circuit.</u>
Substantiation: Circuit rating should be specified. 210.21(B) does not prohibit a single receptacle on an individual branch circuit from having a higher rating than the branch circuit.
Panel Meeting Action: Reject
Panel Statement: By virtue of 210.21(B), the receptacle must at least meet the rating of the branch circuit, therefore, meeting the minimum branch circuit ratings for 626.24.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-86 Log #4652 NEC-P12 **Final Action: Reject**
(626.24(B)(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
One single receptacle, 3-pole, 4-wire grounding-type, of an appropriate configuration for a 30-ampere single-phase circuit originating in a 208Y/120-volt distribution and having no other outlets
FPN: For configurations of straight-blade receptacles, see ANSI/NEMA WD6-2002, *Standard for Dimensions of Attachment Plugs and Receptacles*, Figure 14-30. For various configurations of 30-ampere pin and sleeve receptacles, see ANSI/UL 1686, *Standard for Pin and Sleeve Configurations*, Figure C2.9 or Part C3.
Substantiation: Since there is no NEMA configuration for a 208Y/120 single phase receptacle at any amperage, the current language is confusing at best. The fine print note following describes a standard for pin-and-sleeve devices. However, that is not a requirement, and 30 ampere 125/250V NEMA 14-30 plugs and receptacles are used by the million on identical distributions as these. The majority of multifamily housing is supplied through 208Y/120-V three-phase services, and almost without exception, the feeder to each apartment consists of two-phase conductors and a neutral. Every conventional dryer receptacle outlet will have one of these devices providing the same sort of connectivity on the identical distribution system. It appears the reference to 208 V may have been an attempt by a proprietary interest to game the process.
This proposal leaves the NEC absolutely neutral as to which configuration will win out, with both configurations presented on an equal footing. It correctly addresses the essential safety objectives. It also mandates an individual branch circuit, which had apparently been overlooked in drafting the 2008 wording.
Panel Meeting Action: Reject
Panel Statement: Dual configurations were included in this section to allow for different types of supply systems to be used as per 626.10.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-87 Log #1498 NEC-P12 **Final Action: Accept**
(626.24(B)(2) Exception (New))

Submitter: Greg Ward, IdleAire, Inc.
Recommendation: Revise text as follows:
Exception: Where electrified truck parking space supply equipment provides the <u>heating,</u> air-conditioning and comfort cooling function without requiring a direct electrical connection at the truck, only the two receptacles identified in 626.24(B)(1) shall be required.
Substantiation: 626.24(B) requires every truck parking space to be provided with the receptacles indicated in (B)(1) and (B)(2). This exception allows the receptacle identified in (B)(2) to be omitted if the electrified truck parking space supply equipment provides the air-conditioning and comfort cooling function from an external source without requiring a direct electrical connection to the truck.
Reference to the heating function was inadvertently omitted and should be added as the heating load is the largest single load (5 kW) in the system. A system providing only the air-conditioning and comfort cooling function would still require connections capable of delivering this 5 kW load which cannot be accomplished using the two receptacles identified in (B)(1).
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-88 Log #2027 NEC-P12 **Final Action: Reject**
(626.24(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part of text: The disconnecting means shall be provided and installed in a readily accessible location and shall be ~~capable of being locked~~ <u>provided with identified permanent integral means for locking in the open (off) position</u>. ~~Portable means for adding a lock to the circuit breaker or switch shall not be permitted as the means required to be installed at and remain with the equipment.~~
Substantiation: "Capable of being locked" does not specifically require a locking means. Proposal is specific and doesn't allow for makeshift methods.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on proposal 12-13.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-89 Log #1788 NEC-P12 **Final Action: Reject**
(626.25)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: SEPARABLE POWER SUPPLY CORD ASSEMBLIES.
(A) RATINGS.
(1) TWENTY-AMPERE POWER-SUPPLY CORD ASSEMBLY. Each power supply cord assembly supplied by a receptacle specified in 626.24(B)(1) shall be rated 20 amperes.
(2) THIRTY AMPERE POWER SUPPLY CORD ASSEMBLY. Each power supply cord assembly supplied by a receptacle specified in 626.24(B)(2) shall be rated 30 amperes.
(B) POWER SUPPLY CORD. The power supply assembly cord shall be Type G, G-GC, PPE, SOW, SOOW, STW, STOW, or STOOW. Where subject to direct rays of the sun cords shall be identified as sunlight-resistant. The overlength of each cord shall not exceed 7.5 m (25 ft) unless part of a cord management system or cord take-up system.
(2) ATTACHMENT PLUG. The attachment plug and cord connector shall be molded to or securely attached to the cord outer jacket. If a right-angle attachment plug is used the receptacle shall be installed vertically so that the cord hangs freely downward to avoid undue strain in the conductors. A 125/250 volt attachment plug shall be permitted to be used with a 208Y/120 volt single-phase receptacle.
Substantiation: Article 400 does not require listing. The first paragraph is akin to a definition, which is covered in 626.2. Specific types of cords are proposed as all extra hard types may not be suitable such as EV, EVE, EVT, SE, SEO, SEOO, SO, SOO, ST, which are not indicated for wet locations, gasoline, oil, acid, or chemical resistance. The proposed types of cords are rated 600 volts and contain an EGC, and are oil-resistant. The exceptions involve cords used under the same conditions as cords for other uses and should be covered by provisions for those cords. A 15-ampere rated cord used with a 20-ampere receptacle of 626.24(B) on a 20-ampere circuit violates 240.5(A).
Panel Meeting Action: Reject
Panel Statement: There is insufficient technical substantiation to justify the removal of the existing requirements in 626.25 and provide the reduced requirements recommended in this proposal.
Existing requirements are intended to coordinate with SAE and other truck cab manufacturer's standards.
The first sentence of 626.25 contains a requirement and is not akin to a definition.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-90 Log #3315 NEC-P12 **Final Action: Reject**
(626.25)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: SEPARATE POWER SUPPLY CORD ASSEMBLY. A separable power supply cord assembly shall be identified and consist of a power supply cord, a single cord connector body, attachment plug, and shall comply with 626.25(A) and (B). The cord shall be one continuous length and adapters and pigtail ends shall not be used.

(A) RATINGS.

(1) TWENTY-AMPERE POWER-SUPPLY CORD ASSEMBLIES. Equipment supplied from a 20-ampere 125-volt receptacle in accordance with 626.24(B)(1) shall use a 20-ampere power-supply cord assembly.

(2) THIRTY-AMPERE POWER SUPPLY CORD ASSEMBLY. Equipment supplied from a 30-ampere 208Y/120 volt or 125/250 volt receptacle in accordance with 626.24(B)(2) shall be a 30-ampere power supply cord assembly.

(B) ENGINE BLOCK HEATER. A separate power supply cord assembly in accordance with applicable provisions of this section and used solely for connection to an engine block heater shall be permitted to have an ampacity not less than 15-amperes and an attachment plug and cord connector body rated not less than 15-amperes.

(C) POWER SUPPLY CORD.

(1) CONDUCTORS. The cord shall contain three or four conductors, as required, one of which shall be an equipment grounding conductor.

(2) CORD LENGTH. The length of the power supply cord shall not exceed 7.5 m (25 ft) unless the cord is provided with an identified cord take-up and support equipment.

(3) ATTACHMENT PLUG and CORD CONNECTOR BODY. The attachment plug and cord connector body shall be molded to the cord or otherwise securely attached to the cord jacket. If a right-angle attachment plug is used the grounding member of the receptacle for the attachment plug shall be oriented so the power supply cord hangs downward without a bend at the receptacle.

Substantiation: “Identified” removes the need for “intended for connection to a flanged surface inlet”. Article 400 does not specify listing.

The exception for (A)(1) Requires hard service or extra hard service cords, whereas the first paragraph merely requires the assembly to be identified. (suitable for use). Hard service cords are rated for 600 volts not 125 volts and are not marked 15 amperes, but have an ampacity that may require adjustment. The exception for 15-ampere cords should specify a sole use. “Existing” vehicle is not defined; any vehicle in being is existing. The equipment of (A)(1)(2) is not wired with a 20- or 30-ampere receptacle but is supplied by it. The phrase “for single-phase connection” in (B)(1) implies cords are marked or designated for single-phase three-phase, or dc use. The current (B)(2) is unnecessary and covered by the proposed word “identified” in the first paragraph. Attachment plugs are already required to be listed.” The present (C) defining the length of the exposed cord is unnecessary since the overall length is specified. The requirement for attachment plugs in (B)(4) should include cord connector bodies; listing is covered by “identified” Present Article 406 does not specify listing for cord connectors. “Where a flexible cord is provided” is superfluous since that is covered by the heading for 625.25. The present (B)(4) and exception are superfluous and covered by the proposed word “identified” and proposed (A)(1) and (A)(2). There was no substantiation for a nonlocking attachment plug for a 20-ampere receptacle and no similar requirement for a 30-ampere cord assembly connectors.

Panel Meeting Action: Reject
Panel Statement: There is insufficient technical substantiation to justify the removal of existing requirements in 626.25 and provide the reduced requirements recommended in this proposal.

Existing requirements are intended to coordinate with SAE and other truck cab manufacturer’s standards.

(626.25(A)(1) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete “for existing vehicles”.
Substantiation: Edit. It is not clear what is intended by “existing vehicles”; any vehicle is existing.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

MARCOVICI, S.: The use of the term “existing vehicles” was intended to refer to older models vehicles.

12-92 Log #3270 NEC-P12 **Final Action: Reject**
(626.25(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise as follows:

(B) POWER SUPPLY CORD. The cord shall ~~be a listed type with~~ and contain three or four conductors, as required, ~~for single phase connection~~ one of which shall be an equipment grounding conductor. Identified in accordance with ~~40.23~~ Flexible cords used as part of a power cord assembly or permanently connected in accordance with 626.23(A) shall be one of the following types indicated in Table 400.4: S, SE, SEW, SEO, SEOW, SEOO, SEOOW, ST, STW, STO, STOO, STOW, STOOW. Where applicable, cords shall be identified for wet locations and sunlight resistance.

Delete exception for (B)(1).

Delete text of (B)(2) and the exception and substitute: (2) CORD OVERALL LENGTH The length of the cord shall not exceed 7.5 m (25 ft) unless provided with an identified cord management system.

~~(4)~~ (3) ATTACHMENTS PLUG. The attachment plug(s) ~~shall be listed by itself or part of a cord set for the purpose~~ and cord connector shall be molded to, or securely attached to the cord jacket ~~at the point where the cord enters the attachment plug. If a right angle cap is used the configuration shall be oriented so that the grounding member is farther from the cord.~~ Orientation of the receptacle shall be such that the cord extends downward without a bend at the cap. ~~Where a flexible cord is provided the attachment plug shall comply with 250.138(A).~~

(a) CONNECTION TO A 20-AMPERE RECEPTACLE. A 20-ampere power supply ~~cable~~ cord assembly ~~for connection to a truck flanged surface rated at 20 amperes~~ shall have ~~a nonlocking type~~ an attachment plug and cord connector body that shall be 2-pole, 3-wire, grounding type rated 20-amperes, 125 volts. ~~And intended for use with a 20 ampere 125 volt~~ receptacle.

Delete exception for (a)

FPN: No change.

(b) CONNECTION to a 30-AMPERE RECEPTACLE. A 30-ampere separable power supply ~~cable~~ cord assembly ~~for connection to a truck flanged surface rated at 30 amperes~~ shall have an attachment plug and cord connector body that shall be 3-pole 4 wire grounding type rated 30-amperes 208Y/120 volts or 125/250 volts ~~and intended for use with the receptacle in accordance with 626.24(B).~~ The 125/250-volt attachment plug and cord connector body shall be permitted to be used on 208Y/120 volt single-phase circuit. Delete (5) and the exception. FPN: No change.

Substantiation: Cords are required to comply with 400.3 and 400.4. Article 400 does not require cords to be listed, nor is there any reference for single-phase connection use or 3-phase or dc use. Designations are specific and helpful to Code users, and types that are rated for 600 volts, and for damp or wet locations, as may be required. The present exception for (B)(1) re: number of conductors and equipment grounding conductor does not except any provision of (B)(1) and the rating is already covered in the exception for (A)(1). Present (B)(2) is replaced by specifying cord types, and “shall be permitted where flexibility is necessary” is superfluous since flexible cords are required for supply assemblies. Cords are not resistant to temperature extremes (extreme is not defined) but can only be suitable or rated within temperature limits. All truck parking spaces may not be wet locations or subject to direct sunlight where enclosed or under a canopy. Table 400.4 does not indicate sunlight resistant types; 400.4 indicates that type shall be subject to special investigation (not defined). Cord length not equipped with a cord management system should be a specified fixed length, not modified to permit a longer unspecified length entering a truck. Cord management systems such as tag lines, take-up devices, etc., and should be identified but not necessarily listed. Attachment plugs are already required to be listed by 406.2(A). Present requirements of (B)(5) are incorporated in the proposal and “nonlocking type” is a somewhat unique requirement and may be deemed to violate 90.1 (C). There is no similar requirement for a 30-ampere attachment plug or supply receptacles. If the intent is to provide disconnection of the plug in the event of a truck moving while connected, there is no provision for the receptacle to face in a direct line with the direction of travel of the truck, and even if that were the scenario it would not disconnect a right-angle cap without damage.

Panel Meeting Action: Reject
Panel Statement: There is insufficient technical substantiation to justify the removal of existing requirements in 626.25(B) and provide the reduced requirements recommended in this proposal. The revised wording adds no clarity to the rule.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-93 Log #1840 NEC-P12 **Final Action: Reject**
(626.25(B)(4)(a))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: A separable power supply ~~cable~~ cord assembly ~~for connection to a truck flanged surface inlet~~ shall have ~~a nonlocking type~~ an attachment plug that shall be 2-pole 3-wire grounding type, rated 20 amperes 125 volts ~~and intended for use with the 20-ampere 125-volt receptacle~~.
Delete exception.
Substantiation: "Cord" is the word used in the heading of (B) and is the wiring method compatible with attachment plugs, cord connectors, and flanged surface inlets. Describing the use of the separable power supply assembly is superfluous; already covered in the definition of the assembly. The intended use of a 20-ampere 125-volt attachment plug is also obvious and need not be specified. The requirement for a nonlocking type plug is not substantiated. If a truck drives away with cord attached, a nonlocking type plug does not assure it will be pulled out without damage.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on proposal 12-94.
The submitter has provided a different set of requirements for the same section as requested in proposal 12-94. The submitter has not provided any evidence of a problem existing in the field or with this requirement.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-94 Log #1859 NEC-P12 **Final Action: Reject**
(626.25(B)(4)(a))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: A separable power supply cable assembly for connection to a truck 20-ampere rated flanged surface inlet shall have a nonlocking type attachment plug and cord connector that shall be 2-pole 3-wire grounding type rated 20 amperes 125 volts. ~~and intended for use with the 125-volt receptacle~~.
Exception: A separable power supply cable assembly provided for the connection of an engine block heater only, shall be permitted to be rated 15 amperes. ~~Shall have an attachment plug that shall be 2-pole 3-wire grounding type rated 15 amperes. 125 volts.~~
Substantiation: "Rated at 20 amperes" is not clear whether referring to the flanged surface inlet or the power supply cable assembly. The cord connector should be included in the grounding and rating requirements. Present exception does not specifically permit the use of a 15 ampere rated assembly to modify the 20 ampere requirement of (A).
Panel Meeting Action: Reject
Panel Statement: There is insufficient technical substantiation to justify the removal of the existing requirements in 626.25(B)(4)(a) and provide the reduced requirements recommended in this proposal. The revised wording adds no clarity to the rule.
Number Eligible to Vote: 11

12-99 Log #3302 NEC-P12 **Final Action: Accept**
(626.26)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be reported as "Accept".
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Identified means shall be provided... (remainder unchanged).
Substantiation: Edit. The means should be suitable for the use. Disconnection by means of a plug/receptacle at the truck parking space supply equipment can be an unacceptable means to comply with this section.
Panel Meeting Action: Accept in Principle
Panel Statement: CMP-12 accepts the submitter's recommendation to insert "identified" ahead of "means" but does not accept the substantiation. Since "identified" is a defined term, it provides proper description for the means to prevent energy backfeed from the truck supply equipment.
The proposed change is not editorial in nature.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
CROUSHORE, T.: This revision looks harmless, but by inserting the word identified makes the equipment specifically require a specific identification for this purpose. The term "identified" is a specific term defined in Article 100 meaning a specific set of requirements. The original work of the task group on electrified truck parking spaces reviewed this information placed in this section and did not choose in a previous cycle to place the word identified as a requirement of this section. This proposal should have been rejected.

12-100 Log #1500 NEC-P12 **Final Action: Reject**
(626.28 (New))

Submitter: Cedric Daniels, Alabama Power/Southern Company / Rep. Acting Chairman, Infracture Steering Committee, EPRI National Electric Transportation Infracture Working Council
Recommendation: Add new text to read as follows:
626.28 Means to Prevent Connection or Disconnection Under Load. Each 30 ampere receptacle required by 626.24(B)(2) shall meet one of the following requirements:
(A) Include an interlocked receptacle with an associated switching device of an interlocking type,
(B) Be provided with a switch rated receptacle-plug combination, or
(C) Be provided with a comparable means identified and listed for the purpose to prevent connection or disconnection under load.
The means to prevent connection or disconnection under load shall prevent user access to live parts.
Substantiation: This proposal introduces the use of interlocked or switch-rated wiring devices for the 208Y/120 volt or 125/250 volt, 30 ampere connection as a part of the electrified truck parking space equipment. It also permits the use of a comparable means to prevent connection or disconnection under load.
Experience has shown that the truck operators do not always shut off power at the electrified parking space equipment before disconnecting either the attachment plug or connector. Moreover, truck drivers are not trained specifically to handle connection and disconnection of energized power supply cords under load and during adverse weather conditions, unlike port facilities where transport refrigerated units are connected daily by employees of the facilities who have been properly trained.
At the container staging areas in ports, similar connection equipment that employs suitable interlocks and switch-rated devices prevents connections and disconnections to be made under load. Since the same type of electrical connection and disconnection hazards exists at the electrified truck parking spaces, the same level of safety should be provided for the untrained truck operator.
The use of an interlock mechanism, a switch-rated receptacle or other means that provide a comparable function will prevent an arc-over or electrical damage to the connection devices, and ensure that no live parts are exposed to contact during connection or disconnection.
These features provide an additional level of safety to protect the users, both in normal operation and in overload situations. They also extend the life of the devices used to connect or disconnect the truck to and from the equipment. Given that the connectors used in travel center (truck stop) applications will be used hundreds of times per year in adverse environmental conditions, the operating life of the device must also be an important consideration.
Panel Meeting Action: Reject
Panel Statement: There is insufficient technical substantiation to justify the limitation to inter-locking type, switch-rated receptacles or with a comparable means identified and listed for the purpose to prevent connection or disconnection under load.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
KOVACIK, J.: For Proposal 12-100, the Panel Action should have been Accept in Principle.
The Submitter, representing the EPRI National Electric Transportation Infrastructure Working Council, proposed to add to Article 626 an additional safeguard that likely would reduce potential hazards involved with electrical loads and associated components being disconnected under load (potentially up to 30 amps). The Submitter provided realistic and likely scenarios that substantiate such an additional safeguard. Also, generally, electrical components should be designed/rated for the intended application, including typical use and foreseeable misuse, and the options proposed by the Submitter for demonstrating compliance are compatible with this principle. Finally, since Electrified Truck Parking Spaces covered by Article 626 are a relatively new form of construction, it should not be expected that the Submitter would have to provide specific field incidents as principal technical substantiation.
We support an Accept in Principle committee action since we agree with the intent of the Submitter, but believe relocation of the proposed requirement in 626.24(B) and slightly modified wording is more appropriate. The revised wording in part (A) more accurately describes the type of devices on the market, and the phrase "for the purpose" in part (C) is not needed since the purpose of the comparable means is stated.
Recommendation:
Place the following wording directly after the FPN for 626.24(B)(2):
~~626.28 Means to Prevent Connection or Disconnection Under Load~~.
~~Each~~ The 30 ampere receptacle required by 626.24(B) shall ~~meet~~ be one of the following ~~requirements~~ constructions:
(A) ~~Include a~~ An interlock~~ed~~ receptacle with disconnect ~~an associated switching device of an interlocking type~~.
(B) ~~Be provided with a~~ A switch rated receptacle-plug combination, or
(C) ~~Be provided with a~~ A comparable means identified and listed ~~for the purpose~~ to prevent connection or disconnection under load.
The means to prevent connection or disconnection under load shall prevent user access to live parts.

12-101 Log #1812 NEC-P12 **Final Action: Accept**
(626.30(A))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on the proposal as it relates to "or 480-volt, 3-phase" in 626.30(A).
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: TRU spaces shall be supplied from 208-volt 3-phase branch circuits and with an equipment grounding conductor ~~in accordance with 250.118~~.
Substantiation: Edit. Since no specifics are indicated, the provisions of 250.118 already apply.
Panel Meeting Action: Accept
Panel Statement: The proposed change is not editorial in nature.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
MARCOVICI, S.: Despite the appearance of redundancy, the reference to 250.18 provides a useful reminder and clarification. Such a reminder has proven useful in many jurisdictions.

12-102 Log #1813 NEC-P12 **Final Action: Reject**
(626.31(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text: of (A) and substitute: An identified switch or circuit breaker shall be provided to simultaneously disconnect all ungrounded conductors of each branch circuit supplying a refrigerated unit. The disconnecting means shall be readily accessible and provided with identified integral and permanent provisions for locking in the open (off) position.
Revise text of (B): The disconnecting means shall be readily accessible, located not more than 762 mm (30 in.) from the receptacle it controls or the point of connection of a permanently connected power supply cord specified in 626.23(A).
Substantiation: Present text implies the disconnecting means is a switch or circuit breaker. It should be identified (suitable for the use.) and the standard requirement for simultaneous disconnection should be noted. The proposal for locking is specific, applies to the disconnect position not the cover and prohibits makeshift methods. The requirement for (B) should also apply to permanently connected power supply cords of 526.23(A). If a disconnecting means controls a receptacle, it will inherently be in the supply circuit ahead of the receptacle.
Panel Meeting Action: Reject

Panel Statement: The proposed text in (A) does not add clarity to the rule. Insufficient substantiation was provided for the removal of the detailed requirements for having a permanently attached locking means.

For (B), there is no standard connection for transport refrigerated units (TRU). It is anticipated that with respect to transport refrigerated units, the electrified truck parking space will have receptacles and supply a cable assembly (if trucker does not supply a separable power supply cable assembly) to match the TRU's mobile receptacle. The permanently connected power supply cord specified in 626.23(A) is feeding the electrified truck parking space connecting equipment mounted receptacles that are used to then feed power to the truck and not directly connect to a truck or a refrigerated unit.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-103 Log #1811 NEC-P12 **Final Action: Reject**

(626.31(C))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: ~~All receptacles shall be listed and of the grounding type.~~ Every electrified truck parking space supply equipment intended to provide an electrical supply for transport refrigerated units shall be equipped with one or both of the following: (remainder no change).

Substantiation: Receptacles are already required to be listed by 406.2(A) 3-pole 4-wire receptacles of (1) and (2) are grounding type. The receptacle should be indicated as required at the supply equipment, not the parking space.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-104 Log #1784 NEC-P12 **Final Action: Reject**

(626.32)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: SEPARABLE POWER SUPPLY ~~CABLE~~ CORD ASSEMBLY. A separable power supply cable cord assembly ~~consisting of a cord with an attachment plug and cord connector~~ shall be one of the types and ratings specified in 626.32(A), (B), and (C). ~~Cords with adapters and pigtail ends, extension cords and similar items shall not be used~~.

(A) RATINGS. The power supply cord ~~cable~~ assembly shall be ~~listed~~ rated in accordance with (1) or (2):

(1) 30-ampere 480 volts 3-phase.

(2) 60-ampere, 208-volts 3-phase.

Delete present (B) and substitute: CORD The cord shall contain four conductors, one of which shall be an equipment grounding conductor. Cords shall be extra-hard usage types SEOOW, SOW, SOOW, STOW, or STOOW, and where subject to direct rays of the sun shall be sunlight-resistant.

Substantiation: The proposal is specific and eliminates confusion since all extra-hard usage cords are not indicated in Table 400.4 as suitable for wet locations or oil resistance. None are indicated as resistant to gasoline, ozone, aids, or chemicals nor do they have temperature ratings. Flexibility is generally always required. Present wording "shall be permitted" per 90.5(B) identifies provisions allowed, but not required, therefore, the provisions of this section re: extra-hard usage cords are not mandatory. Temperature extremes are not quantified or identified. All locations (roofed or enclosed) may not be subject to direct sunlight. The power supply assembly is already defined as a cord with plug and cord connector and doesn't include adapters, pigtails, etc.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-105 Log #1499 NEC-P12 **Final Action: Reject**

(626.33 (New))

Submitter: Cedric Daniels, Alabama Power/Southern Company / Rep. Acting Chairman, Infracture Steering Committee, EPRI National Electric Transportation Infracture Working Council

Recommendation: Add new text to read as follows:

626.33 Means to Prevent Connection or Disconnection Under Load. Each receptacle provided by the electrified truck parking space supply equipment shall meet one of the following requirements:

(A) Include an interlocked receptacle with an associated switching device of an interlocking type,

(B) Be provided with a switch rated receptacle-plug combination, or

(C) Be provided with a comparable means identified and listed for the purpose to prevent connection or disconnection under load.

The means to prevent connection or disconnection under load shall prevent user access to live parts.

Substantiation: This proposal introduces the use of interlocked or switch-rated wiring devices similar to those already being used at port facilities to connect transport refrigerated units. It also permits the use of a comparable means to prevent connection or disconnection under load.

Transport refrigerated units (TRU) are connected and disconnected in all weather conditions. At port facilities, these connections to the supply equipment, as shown in Figures 1 and 2 that I have provided, are made on a daily basis by trained personnel specifically tasked to handle, operate and connect the refrigerated containers using equipment provided with interlocking mechanisms or a comparable means.

For these TRUs, a similar connection is made at electrified truck parking spaces. Many of the truck operators, however, are not trained specifically to handle, operate and connect the refrigerated containers. They will not always shut off power at the electrified parking space equipment before disconnecting either the attachment plug or connector. Therefore, the use of interlocked or switch-rated wiring devices or a comparable means at the electrified truck parking spaces would provide a level of protection comparable to that existing at the port facilities today.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: There is insufficient technical substantiation to justify the limitation to inter-locking type, switch-rated receptacles or with a comparable means identified and listed for the purpose to prevent connection or disconnection under load.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

ARTICLE 630 — ELECTRIC WELDERS

12-106 Log #281 NEC-P12 **Final Action: Accept**

(630.12(B), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Change "formula" to "equation".

Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematical expression which follows the section.

This is one of a series of proposals to have consistent terminology throughout the code.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

SCHAMEL, D.: Reject this proposal. "Equation" is not currently in the text of the code. The submitter used only one of many definitions of "formula" in his proposal.

12-107 Log #1836 NEC-P12 **Final Action: Accept in Principle**

(630.13)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise second paragraph: The disconnecting means shall be a switch or circuit breaker identified for the use and its current rating shall not be less than the required ampacity of the supply conductors and that necessary to accommodate overcurrent protection as specified under 620.12.

Substantiation: Edit. The rating should also be not less than the conductor ampacity.

Panel Meeting Action: Accept in Principle

Revise 630.13 to read as follows:

An identified disconnecting means shall be provided in the supply circuit for each arc welder that is not equipped with a disconnect mounted as an integral part of the welder.

The disconnecting means shall be a switch or circuit breaker and its rating shall be not less than that necessary to accommodate overcurrent protection as specified under 630.12.

Panel Statement: CMP-12 accepts the submitter's concept to insert "identified."

CMP-12 does not accept the submitter's text.

See panel action and statement on Proposal 12-99.

The proposed change is not editorial in nature.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

CROUSHORE, T.: This revision looks harmless, but by inserting the word identified makes the equipment specifically require a specific identification for this purpose. The term "identified" is a specific term defined in Article 100 meaning a specific set of requirements. This proposal should have been rejected.

12-108 Log #398 NEC-P12 **Final Action: Accept**
(630.31(B)(3))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Change "(216,000 cycles per hour)" to "(216,000 cycles/hour)".
Change "15-cycle welds per hour" to "15-cycle welds/hour".
Substantiation: This revision will comply with the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-109 Log #1851 NEC-P12 **Final Action: Reject**
(630.32(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "rating" to "ampacity".
Substantiation: Edit. Ampacity is more specific.
Panel Meeting Action: Reject
Panel Statement: The rating of a conductor differs from the ampacity depending on several conditions. Implementation of this change would change the intent of the code.
The proposed change adds no clarity to the code.
The proposed change is not editorial in nature.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
KOVACIK, J.: The Submitter proposed to replace the existing term conductor "rating" with conductor "ampacity." "Ampacity'" is defined in Article 100. "Rating" is a general term that is not defined. Also, conductors typically are only individually `rated' for Voltage and Temperature. The text of 630.32(B) applies to conductor ampacity, not conductor voltage or temperature While the term "rating" is correct in the context of 630.32 (Overcurrent Protection), it is not in 630.22(B) (For Conductors), and the term "rating" should be changed to "ampacity."
It is noted that for most other uses of the term "conductor rating" in the NEC (e.g., 400.5(A), 610.14(B)), the term is used in conjunction with supplementary information that clarifies the context of the use of the term. The use of the term `conductor rating' in 630.32(B) does not provide this supplementary context.

ARTICLE 640 — AUDIO SIGNAL PROCESSING, AMPLIFICATION, AND REPRODUCTION EQUIPMENT

Minute Item Note: The Technical Correlating Committee directs that the second sentence of 640.25, FPN, be deleted as the referenced NFPA Standard no longer exists.

12-110 Log #741 NEC-P12 **Final Action: Reject**
(640.2.Abandoned Audio Distribution Cable)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Delete text to read as follows:
640.2 Definitions.
For purposes of this article, the following definitions apply.
~~**Abandoned Audio Distribution Cable.** Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.~~
[remainder of 640.2 unchanged by this Proposal]
Substantiation: Companion proposals have been made to add a single generalized definition in Article 100 and to delete the corresponding definitions for the various abandoned cables, supply circuits, etc., in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2.
NEC® Manual of Style 2.2.2.1. Consolidation into a new, single generalized definition in Article 100 of nearly identical definitions appear in multiple Articles, specifically in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2. Although these individual definitions served a valid transitional purpose to support the independent additions of individual requirements in 640.6(C), 645.5(F), 645.5(G), 725.25, 800.25, 820.25, and 830.25, these discreet definitions can be broadly consolidated into a single definition in Article 100.
The specific method by which identification for future use is achieved ("… with a tag") is conveyed in the definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 violates *NEC® Manual of Style* 2.2.2 ("Definitions shall not contain requirements …") and is omitted in the generalized definition for "Abandoned" being added in Article 100. This identification-with-a-tag requirement in these definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 is redundant to the actual requirement statements in 640.6(C), 645.5(G), 725.25, 800.25, 820.25, and 830.25, respectively. Also, words regarding the possibility of ceasing connection to an electric supply have been added in the generalized definition for "Abandoned" to correlate to 90.2(A)(3), since abandonment entails disconnection from either the terminating equipment or the electric supply (or both).
Panel Meeting Action: Reject
Panel Statement: For the 2008 NEC, a TCC directed task group including representation from CMP-3, CMP-12, and CMP-16 determined there were enough differences in the installation of abandoned cables to justify them being addressed in individual articles. The current code wording is aligned with what was proposed by the task group.
CMP-12 disagrees with the deletion of this definition.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-111 Log #809 NEC-P12 **Final Action: Reject**
(640.2.Abandoned Audio Distribution Cable)

Submitter: J. L. Richardson, Engineering Services Group, Inc.
Recommendation: Delete the following text:
~~Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.~~
Substantiation: To be replaced by general definition Article 100, Definitions.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-110.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-112 Log #3456 NEC-P12 **Final Action: Accept**
(640.3(M))

Submitter: Arthur E. Schlueter, Jr., A. E. Schlueter Pipe Organ Company / Rep. American Institute of Organ Builders & American Pipe Builders Association
Recommendation: Add: (M) Additions of pipe organ pipes to an electronic organ shall be in accordance with Article 650.
Substantiation: Electronic organ installations are in some instances, installing wind blown pipes which are controlled by low voltage signal and power circuits covered under Article 650. The installation of pipe organ pipes and their associated electrical circuits should be per Article 650.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
MARCOVICI, S.: The cross reference already exists in 650.3 and it is not necessary to repeat it here.

12-113 Log #2685 NEC-P12 **Final Action: Reject**
(640.6(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
The accessible (as applied to wiring methods) portions of audio distribution cables (including) (not including) cables in raceways shall be removed. (Alternate choices in parentheses).
Substantiation: Proposal is intended to allow panel to clarify this requirement.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with section 4.3.3 of the Regulations Governing Committee Projects as it does not provide a clear recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-114 Log #4547 NEC-P12 **Final Action: Reject**
(640.6(C))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
640.6 Mechanical Execution of Work.
(A) Neat and Workmanlike Manner. Audio signal processing, amplification, and reproduction equipment, cables, and circuits shall be installed in a neat workmanlike manner.
(B) Installation of Audio Distribution Cables. Cables installed exposed on the surface of ceilings and sidewalls shall be supported in such a manner that the audio distribution cables will not be damaged by normal building use. Such cables shall be secured by straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall conform to 300.4 and 300.11(A).
(C) Abandoned Audio Distribution Cables. The accessible portion of abandoned audio distribution cables shall be removed. Removal of abandoned cables shall be performed in a neat and workmanlike manner.
(D) Installed Audio Distribution Cable Identified for Future Use.
(1) Cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.
(2) Cable tags shall have the following information:
(1) Date cable was identified for future use
(2) Date of intended use
(3) Information related to the intended future use of cable

Substantiation: This proposal recommends added wording to ensure that abandoned cables are removed appropriately. Section 110.12 addresses installation and so does section 640.6. It is important to point out that similar care must be taken when removing cables.

110.12 Mechanical Execution of Work.

Electrical equipment shall be installed in a neat and workmanlike manner.

FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.

Consistent wording is being proposed for other sections in the code.

For information, see relevant definitions in the NEC.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Panel Meeting Action: Reject

Panel Statement: The requirement is unenforceable. Disposition of removed materials is not a code responsibility.

The remaining installation is required to be in accordance with 110.3, which is enforceable.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

12-115 Log #268 NEC-P12 **Final Action: Reject**
(640.8)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Change the word “bundled” to “installed”.

Substantiation: This change in terminology clarifies the intent without changing any requirements and eliminates the confusion of multiple definitions of “bundled” used in other sections of the Code.

Section 520.2 includes the following definition:

Bundled. Cables or conductors that are tied, wrapped, taped, or otherwise periodically bound together.

There was a proposal for the 2008 code, that was not accepted, to include that definition in Article 100 which would have applied throughout the code.

It does not appear that the intent in 640.8 is to require that the conductors be physically tied, wrapped, taped, or bound together; but merely installed in the same raceway or enclosure.

Panel Meeting Action: Reject

Panel Statement: Within this particular article, as it is in section 520.2, it is the intent in 640.8 to permit conductors be physically tied, wrapped, taped, or bound together (e.g., bundled).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

12-116 Log #4103 NEC-P12 **Final Action: Accept**
(640.9(B))

Submitter: Ray Stanko, Underwriters Laboratories, Inc.

Recommendation: Revise text to read as follows:

(B) Auxiliary Power Supply Wiring. Equipment that has a separate input for an auxiliary power supply shall be wired in compliance with Article 725. Battery installation shall be in accordance with Article 480. <u>This section shall not apply to the use of uninterruptible power supply (UPS) equipment, or other sources of supply, that are intended to act as a direct replacement for the primary circuit power source and are connected to the primary circuit input.</u>

~~FPN No. 1: This section does not apply to the use of uninterruptible power supply (UPS) equipment, or other sources of supply, that are intended to act as a direct replacement for the primary circuit power source and are connected to the primary circuit input.~~

FPN ~~No. 2~~: Refer to *NFPA 72*-2007, *National Fire Alarm Code*, where equipment is used for a fire alarm system.

Substantiation: This requirement is more than an informative statement and belongs in the body of the Code.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

MARCOVICI, S.: There is no need to incorporate the FPN No. 1 into the text of the section. The offered clarification is sufficient as a FPN.

12-117 Log #510 NEC-P12 **Final Action: Reject**
(640.10(A))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be reported as “Reject”. The existing text is in compliance with the NEC Style Manual (Annex B, Subsection G) where used as a noun.

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Add a hyphen between “circuit” and “interrupter”.

Substantiation: The addition of the hyphen will provide consistency throughout the Code.

Additional proposals are being submitted to make similar corrections throughout the Code.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

MARCOVICI, S.: See My Affirmative with Comment on 12-23.

12-118 Log #160 NEC-P12 **Final Action: Reject**
(640.21(B) and (C))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

(B) Between Loudspeakers and Amplifiers or Between Loudspeakers. Cables used to connect loudspeakers to each other or to an amplifier shall comply with Article 725. Other listed cable types and assemblies, including optional hybrid ~~communications~~, signal, and optical fiber cables, shall be permitted.

(C) Between Equipment. Cables used for the distribution of audio signals between equipment shall comply with Article 725. Other listed cable types and assemblies, including optional hybrid ~~communications~~, signal, and optical fiber cables, shall be permitted. Other cable types and assemblies specified by the equipment manufacturer as acceptable for the use shall be permitted in accordance with 110.3(B).

Substantiation: Sections 640.21(B) & (C) have requirements for communications circuits. However, 90.3 states:

“Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8.”

Since Article 800 has no reference to Article 640, the requirements for the uses of communications cables in 640.21(B) & (C) are not correlated with Article 800 and should be deleted.

Panel Meeting Action: Reject

Panel Statement: Communications cables are permitted to substitute for Class 2 and 3 cables.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

12-119 Log #165 NEC-P12 **Final Action: Accept in Principle**
(640.21(B) and (C))

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

(B) Between Loudspeakers and Amplifiers or Between Loudspeakers. Cables used to connect loudspeakers to each other or to an amplifier shall comply with Article 725. Other listed cable types and assemblies, including optional hybrid communications, signal, and ~~optical fiber~~ cables, shall be permitted.

(C) Between Equipment. Cables used for the distribution of audio signals between equipment shall comply with Article 725. Other listed cable types and assemblies, including optional hybrid communications, signal, and ~~optical fiber~~ cables, shall be permitted. Other cable types and assemblies specified by the equipment manufacturer as acceptable for the use shall be permitted in accordance with 110.3(B).

Substantiation: Article 770 has definitions for optical fiber cables:

“Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering. “

“Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors.”

The terminology in Article 770 for a “hybrid” optical fiber cable is a composite optical fiber cable. Section 770.3(A) states:

“(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable.”

Since a hybrid (composite) optical fiber cable is classified and installed according to the type of electrical cable the fiber in installed in, there is no need to mention “hybrid” optical fiber cables.

Panel Meeting Action: Accept in Principle

Revise 640.21(B) and (C) to read as follows:

(B) Between Loudspeakers and Amplifiers or Between Loudspeakers. Cables used to connect loudspeakers to each other or to an amplifier shall comply with Article 725. Other listed cable types and assemblies, including optional hybrid communications, signal, and composite optical fiber cables, shall be permitted.

(C) Between Equipment. Cables used for the distribution of audio signals between equipment shall comply with Article 725. Other listed cable types and assemblies, including optional hybrid communications, signal, and composite optical fiber cables, shall be permitted. Other cable types and assemblies specified by the equipment manufacturer as acceptable for the use shall be permitted in accordance with 110.3(B).

Panel Statement: CMP-12 adds "composite" ahead of "optical fiber."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
MARCOVICI, S.: See My Negative Comment on 12-59.

12-120 Log #4653 NEC-P12 **Final Action: Accept in Principle**
(640.45)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following text at the end: "It shall be permitted to bury cables, and the requirements of 300.5 shall not apply in this case.
Substantiation: This proposal incorporates the permission afforded comparable applications at carnivals, as covered in 525.20(G). These uses are similar and the permission for shallow burial is well suited for this wiring.
Panel Meeting Action: Accept in Principle
Add the following text as a last sentence to the end of 640.45:
The cover requirements of 300.5 shall not apply to wiring protected by burial.
Panel Statement: CMP-12 accepts the concept that the submitter has presented and changes the text as shown.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
SCHAMEL, D.: Reject this proposal. If the cable is burred it is not accessible to the public.
Comment on Affirmative:
MARCOVICI, S.: The Panel's proposed text should be re-phrased to read as follows:
"For buried cables and cords, the cover requirements of 300.5 shall not apply."

ARTICLE 645 — INFORMATION TECHNOLOGY EQUIPMENT

12-121 Log #2060 NEC-P12 **Final Action: Accept**
(645.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group
Recommendation: 645.1 Scope. This article covers equipment, power-supply wiring, equipment interconnecting wiring, and grounding of information technology equipment and systems ~~including terminal units,~~ in an information technology equipment room.
Substantiation: There is no need to include the phrase "terminal units" from among the many types of IT equipment. It suggests monitors and computer displays should be held to a different standard.
This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation.
Panel Meeting Action: Accept
Panel Statement: CMP-12 recognizes that scope is under the purview of the TCC. CMP-12 recommends acceptance of this proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-122 Log #2061 NEC-P12 **Final Action: Accept**
(645.1, FPN)

TCC Action: The Technical Correlating Committee directs that the panel reconsider its action on this proposal to comply with the 3.1.3 of the NEC Style Manual with respect to mandatory requirements in Fine Print Notes.
This action will be considered by the panel as a public comment.
Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group
Recommendation: 645.1 Scope
... FPN: Use of the requirements in Article 645 is based on the assumption that construction of the information technology equipment room complies with NFPA 75. For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*
Substantiation:
645.1 Scope: The NEC Handbook is the source of the suggested additional sentence in the FPN. It adds clarity.

This is one of a group of Proposals prepared by the CMP-12 Article 645 task group.

This committee was comprised of the following members:	
Tim McClintock	Wayne County, Ohio
Lori Tennant	Square D Company/Schneider Electric
Christopher P. O'Neil	NSTAR Electric & Gas
Bill Anderson	Procter & Gamble
Tom Hedges	Hedges Electric & Construction Inc.
Robert Johnson	ITE Safety
Tom Burke	Underwriters Laboratories Inc.
David Boston	Site Uptime Network
Steve McCluer	Schneider Critical Power & Cooling Systems
Richard Schlosser	TiePoint Engineering, PC
Tom Wysocki	Guardian Services, Inc.
Stanley Kaufman	CableSafe, Inc.
Jeffrey A. Betz	AT&T Inc
Ralph Transue	The RJA Group, Inc.
Ron Marts	Telcordia Technologies
Walter Schachtschneider	Bell Canada
Roux, Richard	NFPA
Timothy M. Croushore	Allegheny Power
Amos McCormick	AT&T

Proposed changes to Article 645

The action of the committee was to recommend the following proposed changes to article 645. Each is independent of the other and can be approved or changed without significant impact on the other proposals.
645.1
This change to the scope deleting "terminal units" is submitted separately since it is addressed by the coordinating committee.
645.1 FPN
Addition of FPN to improve clarity
645.2 ITE
New definition of ITE equipment
645.2 Room
New definition of equipment room
645.3
Changes of an editorial nature to improve clarity and use of the article
645.4
Changes intended to clarify the application of article 645
645.5
Changes primarily editorial and to clarify rules regarding cabling.
645.5(D)(2)
Proposing that underfloor raceways need not be fastened to the floor.
645.10
Proposing changes to the disconnecting means control.
645.25
Allowing calculation of ampacity for feeder and service loads.

Combined text of proposed changes to Article 645

645.1 Scope. This article covers equipment, power-supply wiring, equipment interconnecting wiring, and grounding of information technology equipment and systems ~~including terminal units,~~ in an information technology equipment room.
FPN: Use of the requirements in Article 645 is based on the assumption that construction of the information technology equipment room complies with NFPA 75. For further information, see NFPA 75-20039, *Standard for the Protection of Information Technology Equipment.*
645.2 Definitions.
Abandoned Supply Circuits and Interconnecting Cables. Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.
Critical Operations Data System. An Information Technology Equipment System that requires continuous operation for the reasons of public safety, emergency management, national security, or business continuity.
Information Technology Equipment (ITE).
Equipment, and systems rated 600V or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, which are used for creation, and manipulation of data, voice, video and similar signals.
Information Technology Equipment Room. A room within the information technology equipment area that contains the information technology equipment [**75**:3.3.9].
Remote Disconnect Control - An electric device and circuit that controls a disconnecting means through a relay or equivalent device**.**
Zone. A physically identifiable area (such as barriers or separation by distance) within an information technology equipment room with dedicated power and cooling systems for the information technology equipment or systems.
645.3 Other Articles. Circuits and equipment shall comply with 645.3(A) through (H), as applicable.
(A) Spread of Fire or Products of Combustion. Sections 300.21, 770.26, 800.26, and 820.26 shall apply to penetrations of the fire resistant room boundary

(B) Ceiling Cavity Plenums. Sections 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in ceiling cavity plenums above an information technology equipment room.

(C) Grounding. The non-current-carrying conductive members of optical fiber cables in an information technology equipment room shall be grounded in accordance with 770.101.

(D) Electrical Classification of Data Circuits. Sections 725.121(A)(4) shall apply to the electrical classification of listed information technology equipment signaling circuits. 725.139(D)(1) and 800.133(A)(1)(b) shall apply to the electrical classification of class 2 and class 3 circuits in the same cable with communications circuits.

(E) Critical Operations Power Systems. The definition of Critical Operations Power Systems in Article 708 shall apply.

(F) Fire Alarm Equipment. Article 760 shall apply to fire alarm systems equipment installed in an information technology equipment room.

(G) Communications Equipment. Article 800 shall apply to communications equipment installed in an information technology equipment room. Article 645 shall apply to the powering of communications equipment in an information technology equipment room.

FPN No. 1: See Part I of Article 100, Definitions, for a definition of communications equipment.

FPN No. 2: See 90.3, Code Arrangement.

(H) Community Antenna Television and Radio Distribution Systems Equipment. Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an information technology equipment room. Article 645 shall apply to the powering of community antenna television and radio distribution systems equipment installed in an information technology equipment room.

FPN: See 90.3, Code Arrangement.

645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to apply, ~~provided~~ when all of the following conditions are met:

FPN: This article provides alternate wiring methods to the provisions of chapters 1 through 4 for power wiring and Article 725.154(A) for signaling wiring for information technology equipment rooms constructed in compliance with NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*

(1) Disconnecting means complying with 645.10 are provided.

(2) A separate heating/ventilating/ air- conditioning (HVAC) system is provided that is dedicated for information technology equipment use and is separated from other areas of occupancy. Any HVAC system that serves other occupancies shall be permitted to also serve the information technology equipment room if fire/smoke dampers are provided at the point of penetration of the room boundary. Such dampers shall operate on activation of smoke detectors and ~~also~~ by operation of the disconnecting means required by 645.10.

FPN: For further information, see NFPA 75-200~~3~~9 , *Standard for the Protection of Information Technology Equipment*, Chapter 10, 10.1, 10.1.1, 10.1.2, and 10.1.3.

(3) All ~~Listed~~ information technology and communications equipment ~~is~~ installed in the room is listed.

(4) The room is occupied ~~only~~ by, and accessible to, only those personnel needed for the maintenance and functional operation of the installed information technology equipment.

(5) The room is separated from other occupancies by fire-resistant-rated walls, floors, and ceilings with protected openings.

FPN: For further information on room construction requirements, see NFPA 75-200~~3~~9, *Standard for the Protection of Information Technology Equipment*, Chapter 5.

645.5 Supply Circuits and Interconnecting Cables.

(A) Branch-Circuit Conductors. The branch-circuit conductors supplying one or more units of ~~a data processing system~~ information technology equipment shall have an ampacity not less than 125 percent of the total connected load.

(B) Power Cord ~~and Plug~~ Connections. ~~The data processing system~~ Information technology equipment shall be permitted to be connected to a branch circuit by ~~any of the following listed means:~~ cord sets or flexible cord and plug cap assemblies.

(1) Power cords shall not ~~Flexible cord and attachment plug cap not to~~ exceed 4.5 m (15 feet).

~~(2) Cord set assembly, where run on the surface of the floor, shall be protected against physical damage.~~

(2) Power cords shall be listed and suitable for information technology equipment.

FPN: One method of determining cords are suitable for the purpose is found in UL 60950 *Standard for Information Technology Equipment – Safety – Part 1*

(C) Interconnecting Cables. Separate ~~data processing~~ information technology equipment units shall be permitted to be interconnected by means of listed cables and cable assemblies.

FPN: The 4.5 m (15 ft) limitation in (B) does not apply to interconnecting cables.

(D) Physical protection. Where exposed to physical damage, ~~the installation~~ supply circuits and interconnecting cables shall be protected. ~~by approved means~~.

(E~~D~~) Under Raised Floors. Power cables, communications cables, connecting cables, interconnecting cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted under a raised floor, provided the following conditions are met:

(1) The raised floor is of suitable construction, and the area under the floor is accessible.

(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of 300.11.

Exception; Compliance with 300.11(A) shall not be required when raceway is supported by the floor of the building under the raised floor.

(3) Supply cords of listed information technology equipment in accordance with 645.5(B).

(4) Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2). The ventilation system shall be so arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space, the circulation of air will cease.

(5) Openings in raised floors for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.

(6) Cables, other than those covered in (E~~D~~)(2) and (E)(3) and those complying with (E)(6)(a) or (E)(6)(b), ~~(D)(6)(a), (D)(6)(b) or (D)(6)(c)~~, shall be listed as Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room.

a. Interconnecting cables enclosed in a raceway.

b. ~~Interconnecting cables listed with equipment manufactured prior to July 1, 1994, being installed with that equipment.~~

~~c.~~ Cable type designations shown in Table 645.5 shall be permitted. Green, or green with one or more yellow stripes, insulated single-conductor cables, 4 AWG and larger, marked "for use in cable trays" or "for CT use" shall be permitted for equipment grounding.

FPN: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.* The smoke measurements in the test method are not applicable. Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables*.

Table 645.5 Cable Types Permitted Under Raised Floors

Article	Plenum	Riser	General Purpose

725	CL2P & CL3P	CL2R & CL3R	CL2, CL3 & PLTC
727			ITC
760	NPLFP & FPLP	NPLFR & FPLR	NPLF & FPL
770	OFNP & OFCP	OFNR & OFCR	OFN & OFC
800	CMP	CMR	CM & CMG
820	CATVP	CATVR	CATV

(~~F~~E) **Securing in Place**. Power cables; communications cables; connecting cables; interconnecting cables; and associated boxes, connectors, plugs, and receptacles that are listed as part of, or for, information technology equipment shall not be required to be secured in place.

(~~G~~F) **Abandoned Supply Circuits and Interconnecting Cables.** The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a ~~metal~~ raceway.

(~~H~~G) **Installed Supply Circuits and Interconnecting Cables Identified for Future Use.**

(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.

(2) Supply circuit tags and interconnecting cable tags shall have the following information:

a. Date identified for future use
b. Date of intended use
c. Information relating to the intended future use

645.6 Cables Not in Information Technology Equipment Room. Cables extending beyond the information technology equipment room shall be subject to the applicable requirements of this Code.

FPN: For signaling circuits, refer to Article 725; for optical fiber cables and raceways, refer to Article 770; ~~and~~ for communications circuits, refer to Article 800~~. F~~; for fire alarm systems, refer to Article 760; and for CATV circuits, refer to Article 820.

~~**645.7 Penetrations.** Penetrations of the fire-resistant room boundary shall be in accordance with 300.21~~

645.10 Disconnecting Means. An approved means shall be provided to disconnect power to all electronic equipment in the information technology equipment room or in designated zones within the room. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the room or designated zones and shall cause all required fire/smoke dampers to close. Disconnecting means shall be implemented by either (A) or (B) below.

~~The control for these disconnecting means shall be grouped and identified and shall be readily accessible at the principal exit doors. A single means to control both the electronic equipment and HVAC systems in the room or in a zone shall be permitted. Where a pushbutton is used as a means to disconnect power, pushing the button in shall disconnect the power. Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.~~

Exception: Installations qualifying under the provisions of Article 685.

(A) Remote Disconnect Controls

(1) Remote Disconnect Controls shall be located at approved locations readily accessible in case of fire to authorized personnel and emergency responders.

(2) The Remote Disconnect Controls for the control of electronic equipment power and HVAC systems shall be grouped and identified. A single means to control both shall be permitted.

(3) Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.

(4) Additional means to prevent unintentional operations of remote disconnect controls shall be permitted.

FPN: *For further information see NFPA 75-2009 Standard for the Protection of Information Technology Equipment.*

(B) Remote disconnecting controls shall not be required for critical operations data systems when all of the following are met:

(1) An approved procedure has been established and maintained for removing power and air movement within the room or zone.

(2) Qualified personnel are continuously available to meet emergency responders and to advise them of disconnecting methods.

(3) A smoke-sensing fire detection system is in place.
FPN - For further information see NFPA 72-2007, National Fire Alarm Code

(4) An approved fire suppression system suitable for the application is in place.

(5) Cables installed under a raised floor, other than branch circuit wiring and power cords installed in compliance with 645.5(D)(2) or (3), are in compliance with 300.22(C) , 725.154(A), 770.154(A), or 800.154(A).

645.11 Uninterruptible Power Supplies (UPSs). Except for installations and constructions covered in 645.11(1) or (2), UPS systems installed within the information technology equipment room, and their supply and output circuits, shall comply with 645.10. The disconnecting means shall also disconnect the battery from its load.

(1) Installations qualifying under the provisions of Article 685.
(2) Power sources limited to 750 volt-amperes or less derived either from UPS equipment or from battery circuits integral to electronic equipment.

645.15 Grounding. All exposed non–current-carrying metal parts of an information technology system shall be bonded to the equipment grounding conductor in accordance with Article 250 or shall be double insulated. Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.20(D). Where signal reference structures are installed, they shall be bonded to the equipment grounding conductor provided for the information technology equipment.

FPN No. 1: The bonding requirements in the product standards governing this listed equipment ensure that it complies with Article 250.

FPN No. 2: Where isolated grounding-type receptacles are used, see 250.146(D) and 406.2(D).

645.16 Marking. Each unit of an information technology system supplied by a branch circuit shall be provided with a manufacturer's nameplate, which shall also include the input power requirements for voltage, frequency, and maximum rated load in amperes.

645.17 Power Distribution Units. Power distribution units that are used for information technology equipment shall be permitted to have multiple panelboards within a single cabinet, provided that ~~each panelboard has no more than 42 overcurrent devices and~~ the power distribution unit is utilization equipment listed for information technology application.

645.25 Engineering Supervision. Feeder and service load calculations for new or existing loads shall be permitted by a licensed and qualified professional engineer. Feeder conductors shall not be required to be of greater ampacity than the service conductors. Service or feeder conductors shall be permitted to have neutral load determined by 220.61.

Proposed final text with task group changes to Article 645

645.1 Scope. This article covers equipment, power-supply wiring, equipment interconnecting wiring, and grounding of information technology equipment and systems in an information technology equipment room.

FPN: Use of the requirements in Article 645 is based on the assumption that construction of the information technology equipment room complies with NFPA 75. For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*

645.2 Definitions.

Abandoned Supply Circuits and Interconnecting Cables. Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.

Critical Operations Data System. An Information Technology Equipment System that requires continuous operation for the reasons of public safety, emergency management, national security, or business continuity.

Information Technology Equipment (ITE).
Equipment, and systems rated 600V or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, which are used for creation, and manipulation of data, voice, video and similar signals.

Information Technology Equipment Room. A room within the information technology equipment area that contains the information technology equipment [**75**:3.3.9].

Remote Disconnect Control - An electric device and circuit that controls a disconnecting means through a relay or equivalent device**.**

Zone. A physically identifiable area (such as barriers or separation by distance) within an information technology equipment room with dedicated power and cooling systems for the information technology equipment or systems.

645.3 Other Articles. Circuits and equipment shall comply with 645.3(A) through (H), as applicable.

(A) Spread of Fire or Products of Combustion. Sections 300.21, 770.26, 800.26, and 820.26 shall apply to penetrations of the fire resistant room boundary.

(B) Ceiling Cavity Plenums. Sections 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in ceiling cavity plenums above an information technology equipment room.

(C) Grounding. The non-current-carrying conductive members of optical fiber cables in an information technology equipment room shall be grounded in accordance with 770.101.

(D) Electrical Classification of Data Circuits. Sections 725.121(A)(4) shall apply to the electrical classification of listed information technology equipment signaling circuits. 725.139(D)(1) and 800.133(A)(1)(b) shall apply to the electrical classification of class 2 and class 3 circuits in the same cable with communications circuits.

(E) Critical Operations Power Systems. The definition of Critical Operations Power Systems in Article 708 shall apply.

(F) Fire Alarm Equipment. Article 760 shall apply to fire alarm systems equipment installed in an information technology equipment room.

(G) Communications Equipment. Article 800 shall apply to communications equipment installed in an information technology equipment room. Article 645 shall apply to the powering of communications equipment in an information technology equipment room.

FPN No. 1: See Part I of Article 100, Definitions, for a definition of communications equipment.

FPN No. 2: See 90.3, Code Arrangement.

(H) Community Antenna Television and Radio Distribution Systems Equipment. Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an information technology equipment room. Article 645 shall apply to the powering of community antenna television and radio distribution systems equipment installed in an information technology equipment room.

FPN: See 90.3, Code Arrangement.

645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to apply, when all of the following conditions are met:

FPN: This article provides alternate wiring methods to the provisions of chapters 1 through 4 for power wiring and Article 725.154(A) for signaling wiring for information technology equipment rooms constructed in compliance with NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*

(1) Disconnecting means complying with 645.10 are provided.

(2) A separate heating/ventilating/ air- conditioning (HVAC) system is provided that is dedicated for information technology equipment use and is separated from other areas of occupancy. Any HVAC system that serves other occupancies shall be permitted to also serve the information technology equipment room if fire/smoke dampers are provided at the point of penetration of the room boundary. Such dampers shall operate on activation of smoke detectors and by operation of the disconnecting means required by 645.10.

FPN: For further information, see NFPA 75-2009 , *Standard for the Protection of Information Technology Equipment,* Chapter 10, 10.1, 10.1.1, 10.1.2, and 10.1.3.

(3) All information technology and communications equipment installed in the room is listed.

(4) The room is occupied by, and accessible to, only those personnel needed for the maintenance and functional operation of the installed information technology equipment.

(5) The room is separated from other occupancies by fire-resistant-rated walls, floors, and ceilings with protected openings.

FPN: For further information on room construction requirements, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment,* Chapter 5.

645.5 Supply Circuits and Interconnecting Cables.

(A) Branch-Circuit Conductors. The branch-circuit conductors supplying one or more units of information technology equipment shall have an ampacity not less than 125 percent of the total connected load.

(B) Power Cord Connections. Information technology equipment shall be permitted to be connected to a branch circuit by cord sets or flexible cord and plug cap assemblies.

(1) Power cords shall not exceed 4.5 m (15 feet).

(2) Power cords shall be listed and suitable for information technology equipment.

FPN: One method of determining cords are suitable for the purpose is found in UL 60950 *Standard for Information Technology Equipment – Safety – Part 1*

(C) Interconnecting Cables. Separate information technology equipment units shall be permitted to be interconnected by means of listed cables and cable assemblies.

FPN: The 4.5 m (15 ft) limitation in (B) does not apply to interconnecting cables.

(D) Physical protection. Where exposed to physical damage, supply circuits and interconnecting cables shall be protected.

(E) Under Raised Floors. Power cables, communications cables, connecting cables, interconnecting cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted under a raised floor, provided the following conditions are met:

(1) The raised floor is of suitable construction, and the area under the floor is accessible.

(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of 300.11.

Exception; Compliance with 300.11(A) shall not be required when raceway is supported by the floor of the building under the raised floor.

(3) Supply cords of listed information technology equipment in accordance with 645.5(B).

(4) Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2). The ventilation system shall be so arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space, the circulation of air will cease.

(5) Openings in raised floors for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.

(6) Cables, other than those covered in (E)(2) and (E)(3) and those complying with (E)(6)(a) or (E)(6)(b), shall be listed as Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room.

a. Interconnecting cables enclosed in a raceway.

b. Cable type designations shown in Table 645.5 shall be permitted. Green, or green with one or more yellow stripes, insulated single-conductor cables, 4 AWG and larger, marked "for use in cable trays" or "for CT use" shall be permitted for equipment grounding.

FPN: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.* The smoke measurements in the test method are not applicable. Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables*.

Table 645.5 Cable Types Permitted Under Raised Floors

Article	Plenum	Riser	General Purpose
336			TC

727			ITC
760	NPLFP & FPLP	NPLFR & FPLR	NPLF & FPL
770	OFNP & OFCP	OFNR & OFCR	OFN & OFC
800	CMP	CMR	CM & CMG
820	CATVP	CATVR	CATV

(F) Securing in Place. Power cables; communications cables; connecting cables; interconnecting cables; and associated boxes, connectors, plugs, and receptacles that are listed as part of, or for, information technology equipment shall not be required to be secured in place.

(G) Abandoned Supply Circuits and Interconnecting Cables. The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a raceway.

(H) Installed Supply Circuits and Interconnecting Cables Identified for Future Use.

(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.

(2) Supply circuit tags and interconnecting cable tags shall have the following information:

a. Date identified for future use

b. Date of intended use

c. Information relating to the intended future use

645.6 Cables Not in Information Technology Equipment Room. Cables extending beyond the information technology equipment room shall be subject to the applicable requirements of this Code.
FPN: For signaling circuits, refer to Article 725; for optical fiber cables and raceways, refer to Article 770; for communications circuits, refer to Article 800; for fire alarm systems, refer to Article 760; and for CATV circuits, refer to Article 820.

645.10 Disconnecting Means. An approved means shall be provided to disconnect power to all electronic equipment in the information technology equipment room or in designated zones within the room. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the room or designated zones and shall cause all required fire/smoke dampers to close. Disconnecting means shall be implemented by either (A) or (B) below.
Exception: Installations qualifying under the provisions of Article 685.
(A) Remote Disconnect Controls
(1) Remote Disconnect Controls shall be located at approved locations readily accessible in case of fire to authorized personnel and emergency responders.
(2) The Remote Disconnect Controls for the control of electronic equipment power and HVAC systems shall be grouped and identified. A single means to control both shall be permitted.
(3) Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.
(4) Additional means to prevent unintentional operations of remote disconnect controls shall be permitted.
FPN: *For further information see NFPA 75-2009 Standard for the Protection of Information Technology Equipment.*

(B) Remote disconnecting controls shall not be required for critical operations data systems when all of the following are met:
(1) An approved procedure has been established and maintained for removing power and air movement within the room or zone.
(2) Qualified personnel are continuously available to meet emergency responders and to advise them of disconnecting methods.
(3) A smoke-sensing fire detection system is in place.
FPN - For further information see NFPA 72-2007, National Fire Alarm Code

(4) An approved fire suppression system suitable for the application is in place.
(5) Cables installed under a raised floor, other than branch circuit wiring and power cords installed in compliance with 645.5(D)(2) or (3), are in compliance with 300.22© , 725.154(A), 770.154(A), or 800.154(A).

645.11 Uninterruptible Power Supplies (UPSs). Except for installations and constructions covered in 645.11(1) or (2), UPS systems installed within the information technology equipment room, and their supply and output circuits, shall comply with 645.10. The disconnecting means shall also disconnect the battery from its load.
(1) Installations qualifying under the provisions of Article 685.
(2) Power sources limited to 750 volt-amperes or less derived either from UPS equipment or from battery circuits integral to electronic equipment.

645.15 Grounding. All exposed non–current-carrying metal parts of an information technology system shall be bonded to the equipment grounding conductor in accordance with Article 250 or shall be double insulated. Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.20(D). Where signal reference structures are installed, they shall be bonded to the equipment grounding conductor provided for the information technology equipment.
FPN No. 1: The bonding requirements in the product standards governing this listed equipment ensure that it complies with Article 250.
FPN No. 2: Where isolated grounding-type receptacles are used, see 250.146(D) and 406.2(D).

645.16 Marking. Each unit of an information technology system supplied by a branch circuit shall be provided with a manufacturer's nameplate, which shall also include the input power requirements for voltage, frequency, and maximum rated load in amperes.

645.17 Power Distribution Units. Power distribution units that are used for information technology equipment shall be permitted to have multiple panelboards within a single cabinet, provided that the power distribution unit is utilization equipment listed for information technology application.

645.25 Engineering Supervision. Feeder and service load calculations for new or existing loads shall be permitted by a licensed and qualified professional engineer. Feeder conductors shall not be required to be of greater ampacity than the service conductors. Service or feeder conductors shall be permitted to have neutral load determined by 220.61.
Panel Meeting Action: Accept
Panel Statement: CMP-12 recognizes that scope is under the purview of the TCC. CMP-12 recommends acceptance of this proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-123 Log #742 NEC-P12 **Final Action: Reject**
(645.2.Abandoned Supply Circuits and Interconnecting Cables)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Delete the definition and consequently the entire Section 645.2:
~~**645.2 Definition.**~~
~~**Abandoned Supply Circuits and Interconnecting Cables.** Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.~~
Substantiation: Companion proposals have been made to add a single generalized definition in Article 100 and to delete the corresponding definitions for the various abandoned cables, supply circuits, etc., in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2.
NEC® Manual of Style 2.2.2.1. Consolidation into a new, single generalized definition in Article 100 of nearly identical definitions appear in multiple Articles, specifically in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2. Although these individual definitions served a valid transitional purpose to support the independent additions of individual requirements in 640.6(C), 645.5(F), 645.5(G), 725.25, 800.25, 820.25, and 830.25, these discreet definitions can be broadly consolidated into a single definition in Article 100.
The specific method by which identification for future use is achieved ("… with a tag") is conveyed in the definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 violates *NEC® Manual of Style* 2.2.2 ("Definitions shall not contain requirements …") and is omitted in the generalized definition for "Abandoned" being added in Article 100. This identification-with-a-tag requirement in these definitions in 640.2, 645.2, 725.2, 800.2, 820.2, and 830.2 is redundant to the actual requirement statements in 640.6(C), 645.5(G), 725.25, 800.25, 820.25, and 830.25, respectively. Also, words regarding the possibility of ceasing connection to an electric supply have been added in the generalized definition for "Abandoned" to correlate to 90.2(A)(3), since abandonment entails disconnection from either the terminating equipment or the electric supply (or both).
Panel Meeting Action: Reject
Panel Statement: For the 2008 NEC, a TCC directed task group including representation from CMP-3, CMP-12 and CMP-16 determined there were enough differences in the installation of abandoned cables to justify them being addressed in individual articles. The current code wording is aligned with what was proposed by the task group.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-124 Log #810 NEC-P12 **Final Action: Reject**
(645.2.Abandoned Supply Circuits and Interconnecting Cables)

Submitter: J. L. Richardson, Engineering Services Group, Inc.
Recommendation: Delete the following text:
~~Abandoned Supply Circuits and Interconnecting Cables. Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.~~
Substantiation: To be replaced by general definition Article 100, Definitions.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-123.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-125 Log #2062 NEC-P12 **Final Action: Accept in Principle**
(645.2.Information Technology Equipment (ITE))

Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group
Recommendation: 645.2 Definitions.
Information Technology Equipment (ITE).
Equipment and systems rated 600V or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, which are used for creation, and manipulation of data, voice, video and similar signals.
Substantiation: This definition is derived from UL.
It is necessary to be able to distinguish between IT equipment and communications equipment in order to know what Article applies. Both might be installed in the same room. Section 90.3 states:
Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8
This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-126.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-126 Log #3737 NEC-P12 **Final Action: Accept in Principle**
(645.2.Information Technology Equipment (ITE))

TCC Action: The Technical Correlating Committee directs that the panel reconsider its action on this proposal to comply with 2.2.2 and 3.1.3 of the NEC Style Manual with respect to mandatory requirements in Fine Print Notes.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc. / Rep. The Society of the Plastics Industry
Recommendation: Add the following new text:
Information Technology Equipment (ITE).
Equipment and systems rated 600V or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, which are used for creation, and manipulation of data, voice, video and similar signals that are not communications equipment as defined in Part I of Article 100 and do not process communications circuits as defined in 800.2.
Substantiation: I am a member of the Panel 12 Article 645 Task Group. I reviewed the task group's proposals with a member of the NEC TCC, Mr. James Dollard. Mr. Dollard noted that some of the proposals did not fully comply with the NEC Style Manual and others had correlation issues. In order to address these issues before the deadline for proposals, I prepared amended proposals and submitted them for the panel to consider.
Bob Johnson proposed the following definition.
"Information Technology Equipment (ITE).
Equipment and systems rated 600V or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, which are used for creation, and manipulation of data, voice, video and similar signals."
The substantiation for the above definition is:
"This definition is derived from UL.
It is necessary to be able to distinguish between IT equipment and communications equipment in order to know what Article applies. Both might be installed in the same room. Section 90.3 states:
Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8
This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation."
Unfortunately the definition submitted by the Bob Johnson for task group has serious correlation issues. I agree with the statement in the substantiation that "It is necessary to be able to distinguish between IT equipment and communications equipment in order to know what Article applies. Both might be installed in the same room."
A comparison of the definition of communications equipment from Article 100 with the proposed definition of IT equipment submitted by Bob Johnson for the task group shows the task group's proposal will actually include communications equipment in the definition of IT equipment.
Article 100 Definition of Communications Equipment
"Communications Equipment. The electronic equipment that performs the telecommunications operations for the transmission of audio, video, and data, and includes power equipment (e.g., dc converters, inverters, and batteries) and technical support equipment (e.g., computers)."
Definition of IT equipment from Bob Johnson's proposal
"Information Technology Equipment (ITE).
Equipment and systems rated 600V or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, which are used for creation, and manipulation of data, voice, video and similar signals."
If a definition is IT equipment is adopted that includes communications equipment, then article 645 will cover communications equipment in a computer room. That will be a clear violation of section 90.3.
The simple solution to this conundrum is to define IT equipment is such a manner that it does not include communications equipment. Acceptance of this proposal will achieve that goal and avoid bringing about a lack of correlation between Articles 645, 100 and 800.
Panel Meeting Action: Accept in Principle
Accept the definition of Information Technology Equipment and add to 645..2 as proposed in the recommendation. In addition, add a FPN to read as follows:
FPN: UL 60950-1 includes listing requirements for both information technology equipment and communications equipment.
Panel Statement: CMP-12 accepts the submitter's proposal.
Additionally, CMP-12 adds a FPN. The FPN following the definition clarifies that the code makes a distinction between ITE and communications equipment on functionality, whereas a single term may be used by equipment standards.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-127 Log #2063 NEC-P12 **Final Action: Accept**
(645.2.Information Technology Equipment Room)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to locate the reference to NFPA 75:3.3.9 in a FPN and include the document title.
This action will be considered by the panel as a public comment.
Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group
Recommendation: 645.2 Definitions.
Information Technology Equipment Room. A room within the information technology equipment area that contains the information technology equipment. [**75**:3.3.9].
Substantiation: This term is used several times in Article 645. This definition is found in NFPA 75.3.3.9.
This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation.

12-128 Log #2058 NEC-P12 **Final Action: Accept in Principle**
(645.2 and 645.10)

Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group
Recommendation: 645.2 Definitions
Critical Operations Data System. An Information Technology Equipment System that requires continuous operation for the reasons of public safety, emergency management, national security, or business continuity.
Remote Disconnect Control - An electric device and circuit that controls a disconnecting means through a relay or equivalent device**.**
Zone. A physically identifiable area (such as barriers or separation by distance) within an information technology equipment room with dedicated power and cooling systems for the information technology equipment or systems.
645.10 Disconnecting Means. An approved means shall be provided to disconnect power to all electronic equipment in the information technology equipment room or in designated zones within the room. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the room or designated zones and shall cause all required fire/smoke dampers to close. Disconnecting means shall be implemented by either (A) or (B) below.
~~The control for these disconnecting means shall be grouped and identified and shall be readily accessible at the principal exit doors. A single means to control both the electronic equipment and HVAC systems in the room or in a zone shall be permitted. Where a pushbutton is used as a means to disconnect power, pushing the button in shall disconnect the power. Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.~~
Exception: Installations qualifying under the provisions of Article 685.
(A) Remote Disconnect Controls
(1) Remote Disconnect Controls shall be located at approved locations readily accessible in case of fire to authorized personnel and emergency responders.
(2) The Remote Disconnect Controls for the control of electronic equipment power and HVAC systems shall be grouped and identified. A single means to control both shall be permitted.
(3) Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.
(4) Additional means to prevent unintentional operations of remote disconnect controls shall be permitted.
FPN: *For further information see NFPA 75-2009 Standard for the Protection of Information Technology Equipment.*
(A) Remote disconnecting controls shall not be required for critical operations data systems when all of the following are met:
(1) An approved procedure has been established and maintained for removing power and air movement within the room or zone.

(2) Qualified personnel are continuously available to meet emergency responders and to advise them of disconnecting methods.
(3) A smoke-sensing fire detection system is in place.
FPN - *For further information see NFPA 72-2007, National Fire Alarm Code.*
(4) An approved fire suppression system suitable for the application is in place.
(5) Cables installed under a raised floor, other than branch circuit wiring and power cords installed in compliance with 645.5(D)(2) or (3), are in compliance with 300.22(C), 725.154(A), 770.154(A), or 800.154(A).

Substantiation: Definition- Critical Operations Data System: This term is used in 645.5 and 645.10(B).

Definition- Remote Disconnect Control: This term is used in proposed 645.10. The definition clarifies the distinction between the disconnect itself and the controls to operate it. "Control" has always been implied and practiced. This proposal clarifies the existing practice.

Definition- Zone: NEC 2008 permits "zones" within an ITE room, but it does not provide a definition. This definition clarifies that a zone is separated from the rest of the room so that all power within a zone can be shut down and fire or products of combustion will not spread to adjacent areas or to other zones within the ITE room. Other zones and the rest of the ITE room itself can remain operational.

This proposal for 645.10 is partly editorial and partly technical. It implements the NEC Style Manual (3.3.2) instructions to use lists or tables. It also introduces two acceptable methods of implementation of a disconnecting means. Part A is primarily an editorial revision of existing Code and adds some clarifying material. Part B is new Material that explains when a disconnecting means may not be required.

The nature of Information Technology (IT), as well as the features of an IT equipment room, have changed dramatically since the requirements for a disconnecting means were put into Article 645 almost 50 years ago. Today all business as well as telecommunications systems, building controls, and mission critical operations run through IT Equipment. Examples include medical robotic control; voice-over-internet telephone systems (VoIP); process controls; air traffic controls; disaster preparedness and response; on-line transactions; medical records; internet commerce; GPS, on-board safety/navigation systems; etc.

Unintentional operation of disconnecting means has been a problem. The proposal permits increased security and greater protection. This is vitally important for safety systems, including those using Critical Operations Power Systems (COPS).

The requirement for a disconnecting means can introduce a single point of failure that increases the possibility of operation shutdown due to human error, mechanical failure, or deliberate sabotage. This proposal restricts the operation to its intended use

Erroneous operation of the disconnecting means can frequently jeopardize life safety, but also can creates severe financial losses. [Note: as used here, "erroneous" operation can include deliberate sabotage, human error, and mechanical error.]

This proposal creates a two-level hierarchy of criticality.

645.10(A) is a normal operation and has nearly the same requirements as the existing (2008) Code, except as specifically noted.

(A)(1) has been revised to ensure that the location of the disconnecting means is consistent with its intended use.

(A)(2) is reformatting; it does not introduce any new material.

(A)(3) is reformatting; it does not introduce any new material.

(A)(4) is new. It permits additional means to prevent unintended operation

(A)(4)(FPN) is new. It helps the reader coordinate the requirements of 645 with the relevant NFPA standard for items covered by this clause.

645.10(B) introduces an alternate method for those who choose to invest in a higher level of systems and procedures to assure system availability while also ensuring safety for critical operations. It lists a higher level of criteria that must be met for fire detection, fire suppression, continuous staffing, and documented training of personnel. It says when unplanned operation of a disconnecting means could pose a threat to a critical mission (such as posing a threat to life safety), a Remote Disconnect Control (single point of failure) does not have to be provided. It also permits the same exemption as exists in the 2008 Code for installations qualifying under Article 685. It ensures that the presence of a disconnecting means is consistent with its intended use.

645.10(B)(1-5) list all of the conditions that must be met to permit the alternative method.

Although no requirement exists to report loss of operation due to operation of disconnecting means, polls of organizations such as AFCOM (3,600 IT and Facility Managers) and the Site Uptime Network (85 mostly Fortune 500 member companies) document that nearly all disconnecting means activation is either unintentional or sabotage. Attachments (B) and (C) give some examples of the industry's history with disconnecting means.

This proposal recognizes that a disconnecting means is often necessary, but it also addresses situations when the disconnecting means can create more hazards than it prevents. It offers a reasonable balance between conflicting needs.

Following is the experience of a single company with multiple data center facilities. It demonstrates that the "disconnecting means" is not being used as intended (i.e., for emergencies). It is creating a single point of failure that shuts down the IT equipment due to human or mechanical error, thereby creating major financial loss and potentially threatening the safety of people and equipment.

This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation.

Note: Supporting material is available for review at NFPA Headquarters.

(645.2.Critical Operations Data System, Remote Disconnect Control, Zone and 645.10)

Submitter: Stanley Kaufman, CableSafe Inc. / Rep. The Society of the Plastics Industry

Recommendation: Revise text as follows:

645.2 Definitions

Critical Operations Data System. An Information Technology Equipment System that requires continuous operation for the reasons of public safety, emergency management, national security, or business continuity.

Remote Disconnect Control - An electric device and circuit that controls a disconnecting means through a relay or equivalent device**.**

Zone. A physically identifiable area (such as barriers or separation by distance) within an information technology equipment room with dedicated power and cooling systems for the information technology equipment or systems.

645.10 Disconnecting Means. An approved means shall be provided to disconnect power to all electronic equipment in the information technology equipment room or in designated zones within the room. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the room or designated zones and shall cause all required fire/smoke dampers to close. Disconnecting means shall be implemented by either (A) or (B).

~~The control for these disconnecting means shall be grouped and identified and shall be readily accessible at the principal exit doors. A single means to control both the electronic equipment and HVAC systems in the room or in a zone shall be permitted. Where a pushbutton is used as a means to disconnect power, pushing the button in shall disconnect the power. Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.~~

Exception: Installations qualifying under the provisions of Article 685.

(A) Remote Disconnect Controls
(1) Remote Disconnect Controls shall be located at approved locations readily accessible in case of fire to authorized personnel and emergency responders.
(2) The Remote Disconnect Controls for the control of electronic equipment power and HVAC systems shall be grouped and identified. A single means to control both shall be permitted.
(3) Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.
(4) Additional means to prevent unintentional operations of remote disconnect controls shall be permitted.
FPN: *For further information see NFPA 75-2009 Standard for the Protection of Information Technology Equipment.*

(B) Critical Operations Data Systems. Remote disconnecting controls shall not be required for critical operations data systems when all of the following are met:
(1) An approved procedure has been established and maintained for removing power and air movement within the room or zone.
(2) Qualified personnel are continuously available to meet emergency responders and to advise them of disconnecting methods.
(3) A smoke-sensing fire detection system is in place.FPN - For further information see NFPA 72-2007, National Fire Alarm Code
(4) An approved fire suppression system suitable for the application is in place.
(5) Cables installed under a raised floor, other than branch circuit wiring and power cords installed in compliance with 645.5(D)(2) or (3), are in compliance with 300.22(C), 725.154(A), 770.154(A), or 800.154(A).

Substantiation: I am a member of the Panel 12 Article 645 Task Group. I reviewed the task group's proposals with a member of the NEC TCC, Mr. James Dollard. Mr. Dollard noted that some of the proposals did not fully comply with the NEC Style Manual and others had correlation issues. In order to address these issues before the deadline for proposals, I prepared amended proposals and submitted them for the panel to consider.

The substantiation for this proposal as submitted by Bob Johnson for the task group is:

"Definition- Critical Operations Data System: This term is used in 645.5 and 645.10(B).

Definition- Remote Disconnect Control: This term is used in proposed 645.10. The definition clarifies the distinction between the disconnect itself and the controls to operate it. "Control" has always been implied and practiced. This proposal clarifies the existing practice.

Definition- Zone: NEC 2008 permits "zones" within an ITE room, but it does not provide a definition. This definition clarifies that a zone is separated from the rest of the room so that all power within a zone can be shut down and fire or products of combustion will not spread to adjacent areas or to other zones within the ITE room. Other zones and the rest of the ITE room itself can remain operational.

This proposal for 645.10 is partly editorial and partly technical. It implements the NEC Style Manual (3.3.2) instructions to use lists or tables. It also introduces two acceptable methods of implementation of a disconnecting means. Part A is primarily an editorial revision of existing Code and adds some clarifying material. Part B is new Material that explains when a disconnecting means may not be required.

The nature of Information Technology (IT), as well as the features of an IT equipment room, have changed dramatically since the requirements for a disconnecting means were put into Article 645 almost 50 years ago. Today all business as well as telecommunications systems, building controls, and mission critical operations run through IT Equipment. Examples include medical robotic control; voice-over-internet telephone systems (VoIP); process controls; air traffic controls; disaster preparedness and response; on-line transactions; medical records; internet commerce; GPS, on-board safety/navigation systems; etc.

Unintentional operation of disconnecting means has been a problem. The proposal permits increased security and greater protection. This is vitally important for safety systems, including those using Critical Operations Power Systems (COPS).

The requirement for a disconnecting means can introduce a single point of failure that increases the possibility of operation shutdown due to human error, mechanical failure, or deliberate sabotage. This proposal restricts the operation to its intended use

Erroneous operation of the disconnecting means can frequently jeopardize life safety, but also can creates severe financial losses. [Note: as used here, “erroneous” operation can include deliberate sabotage, human error, and mechanical error.]

This proposal creates a two-level hierarchy of criticality.

645.10(A) is a normal operation and has nearly the same requirements as the existing (2008) Code, except as specifically noted.

(A)(1) has been revised to ensure that the location of the disconnecting means is consistent with its intended use.

(A)(2) is reformatting; it does not introduce any new material.

(A)(3) is reformatting; it does not introduce any new material.

(A)(4) is new. It permits additional means to prevent unintended operation

(A)(4)(FPN) is new. It helps the reader coordinate the requirements of 645 with the relevant NFPA standard for items covered by this clause.

645.10(B) introduces an alternate method for those who choose to invest in a higher level of systems and procedures to assure system availability while also ensuring safety for critical operations. It lists a higher level of criteria that must be met for fire detection, fire suppression, continuous staffing, and documented training of personnel. It says when unplanned operation of a disconnecting means could pose a threat to a critical mission (such as posing a threat to life safety), a Remote Disconnect Control (single point of failure) does not have to be provided. It also permits the same exemption as exists in the 2008 Code for installations qualifying under Article 685. It ensures that the presence of a disconnecting means is consistent with its intended use.

645.10(B)(1-5) list all of the conditions that must be met to permit the alternative method.

Although no requirement exists to report loss of operation due to operation of disconnecting means, polls of organizations such as AFCOM (3,600 IT and Facility Managers) and the Site Uptime Network (85 mostly Fortune 500 member companies) document that nearly all disconnecting means activation is either unintentional or sabotage. Attachments (B) and (C) give some examples of the industry’s history with disconnecting means.

This proposal recognizes that a disconnecting means is often necessary, but it also addresses situations when the disconnecting means can create more hazards than it prevents. It offers a reasonable balance between conflicting needs.

Following is the experience of a single company with multiple data center facilities. It demonstrates that the “disconnecting means” is not being used as intended (i.e., for emergencies). It is creating a single point of failure that shuts down the IT equipment due to human or mechanical error, thereby creating major financial loss and potentially threatening the safety of people and equipment.”

Please see Bob Johnson’s proposal to see the remainder of his substantiation. This proposal introduces two changes in order to comply with the NEC Style Manual. The text as proposed by the task group and Bob Johnson does not have a title for proposed section 645.10(B). This proposal introduces a title for the subsection. The word “below” was struck from the end of the first paragraph in section 645.10 of the task group’s proposal. See sections 3.3.4 and 2.1.5.2 of the NEC Style Manual.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

12-130 Log #4564 NEC-P12 **Final Action: Reject**

(645.3 (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Recommendation: Add the following new text:

645.3 Mechanical Execution of Work.

Information technology circuits and equipment shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4 and 300.11.

Substantiation: This proposal recommends added wording, consistent with that in articles 640, 725, 760, 770 and others to ensure that cables are installed appropriately. This article lacks the corresponding information.

Panel Meeting Action: Reject

Panel Statement: It should not be necessary to reiterate 110.12 in each code section.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

12-131 Log #2064 NEC-P12 **Final Action: Accept in Principle**

(645.3, 645.6, and 645.7 (New))

TCC Action: The Technical Correlating Committee directs that the panel delete FPN No. 2 in 645.3(F) and the FPN in 645.3(G) since compliance with 90.3 is already required and revise the references in (E), (F), and (G) from entire Articles to specific parts or sections to comply with 2.5 and 4.1.1 of the NEC Style Manual.

This action will be considered by the panel as a public comment.

Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group

Recommendation: **645.3 Other Articles.** Circuits and equipment shall comply with 645.3(A) through (H), as applicable.

(A) **Spread of Fire or Products of Combustion**. Sections 300.21, 770.26, 800.26, and 820.26 shall apply to penetrations of the fire resistant room boundary

(B) **Ceiling Cavity Plenums.** Sections 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in ceiling cavity plenums above an information technology equipment room.

(C) **Grounding.** The non-current-carrying conductive members of optical fiber cables in an information technology equipment room shall be grounded in accordance with 770.101.

(D) **Electrical Classification of Data Circuits.** Sections 725.121(A)(4) shall apply to the electrical classification of listed information technology equipment signaling circuits. 725.139(D)(1), and 800.133(A)(1)(b) shall apply to the electrical classification of class 2 and class 3 circuits in the same cable with communications circuits.

(E) **Critical Operations Power Systems**. The definition of Critical Operations Power Systems in Article 708 shall apply.

(F) **Fire Alarm Equipment**. Article 760 shall apply to fire alarm systems equipment installed in an information technology equipment room.

(G) **Communications Equipment.** Article 800 shall apply to communications equipment installed in an information technology equipment room. Article 645 shall apply to the powering of communications equipment in an information technology equipment room.

FPN No. 1: See Part I of Article 100, Definitions, for a definition of communications equipment.FPN No. 2: See 90.3, Code Arrangement.

(H) **Community Antenna Television and Radio Distribution Systems Equipment.** Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an information technology equipment room. Article 645 shall apply to the powering of community antenna television and radio distribution systems equipment installed in an information technology equipment room.FPN: See 90.3, Code Arrangement.

645.6 Cables Not in Information Technology Equipment Room. Cables extending beyond the information technology equipment room shall be subject to the applicable requirements of this Code.

FPN: For signaling circuits, refer to Article 725; for optical fiber cables and raceways, refer to Article 770; ~~and~~ for communications circuits, refer to Article 800~~. F~~; for fire alarm systems, refer to Article 760; and for CATV circuits, refer to Article 820.

~~**645.7 Penetrations.** Penetrations of the fire-resistant room boundary shall be in accordance with 300.21~~**4.**

Substantiation: 645.3: Adoption of an “Other Articles” section will add clarity.

In recent code cycles, significant emphasis has been placed on making the NEC a more user-friendly document. The addition of Section 645.3, *Other Articles,* will add clarity and enhanced usability for proper application of the Code.

Installations falling under the scope of Article 645, many times will include, in addition to IT equipment, equipment and systems subject to additional requirements contained in later chapters of the NEC. Referencing other sections will ensure that special requirements in Chapter 7 will be met. In addition, 90.3, Code Arrangement, clearly identifies that Chapter 8 is a stand-alone chapter and is not subject to the requirements of earlier chapters.

645.6: FPN: Article 820 had been omitted.

Reference to CATV circuits was overlooked and is added with this change.

645.7: This paragraph is not necessary as it duplicates the reference in proposed section 645.3.

This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation.

Panel Meeting Action: Accept in Principle

Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an information technology equipment room. Article 645 shall apply to the powering of community antenna television and radio distribution systems equipment installed in an information technology equipment room.

FPN: See 90.3, Code Arrangement.

645.6 Cables Not in Information Technology Equipment Room. Cables extending beyond the information technology equipment room shall be subject to the applicable requirements of this Code.

FPN: For signaling circuits, refer to Article 725; for optical fiber cables and raceways, refer to Article 770; ~~and~~ for communications circuits, refer to Article 800~~. F~~; for fire alarm systems, refer to Article 760; and for CATV circuits, refer to Article 820.

~~**645.7 Penetrations.** Penetrations of the fire-resistant room boundary shall be in accordance with 300.21~~

Substantiation: I am a member of the Panel 12 Article 645 Task Group. I reviewed the task group's proposals with a member of the NEC TCC, Mr. James Dollard. Mr. Dollard noted that some of the proposals did not fully comply with the NEC Style Manual and others had correlation issues. In order to address these issues before the deadline for proposals, I prepared amended proposals and submitted them for the panel to consider.

The substantiation for the proposal submitted by Bob Johnson for the task group is:

"645.3: Adoption of an "Other Articles" section will add clarity.

In recent code cycles, significant emphasis has been placed on making the NEC a more user-friendly document. The addition of Section 645.3, *Other Articles*, will add clarity and enhanced usability for proper application of the Code.

Installations falling under the scope of Article 645, many times will include, in addition to IT equipment, equipment and systems subject to additional requirements contained in later chapters of the NEC. Referencing other sections will ensure that special requirements in Chapter 7 will be met. In addition, 90.3, Code Arrangement, clearly identifies that Chapter 8 is a stand-alone chapter and is not subject to the requirements of earlier chapters.

645.6: FPN: Article 820 had been omitted.

Reference to CATV circuits was overlooked and is added with this change.

645.7: This paragraph is not necessary as it duplicates the reference in proposed section 645.3.

This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation."

Bob Johnson and the task group proposed the test below:

"645.3 Other Articles. Circuits and equipment shall comply with 645.3(A) through (H), as applicable.

(A) Spread of Fire or Products of Combustion. Sections 300.21, 770.26, 800.26, and 820.26 shall apply to penetrations of the fire resistant room boundary

(B) Ceiling Cavity Plenums. Sections 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in ceiling cavity plenums above an information technology equipment room.

(C) Grounding. The non-current-carrying conductive members of optical fiber cables in an information technology equipment room shall be grounded in accordance with 770.101.

(D) Electrical Classification of Data Circuits. Sections 725.121(A)(4) shall apply to the electrical classification of listed information technology equipment signaling circuits. 725.139(D)(1), and 800.133(A)(1)(b) shall apply to the electrical classification of class 2 and class 3 circuits in the same cable with communications circuits.

(E) Critical Operations Power Systems. The definition of Critical Operations Power Systems in Article 708 shall apply.

(F) Fire Alarm Equipment. Article 760 shall apply to fire alarm systems equipment installed in an information technology equipment room.

(G) Communications Equipment. Article 800 shall apply to communications equipment installed in an information technology equipment room. Article 645 shall apply to the powering of communications equipment in an information technology equipment room.FPN No. 1: See Part I of Article 100, Definitions, for a definition of communications equipment.FPN No. 2: See 90.3, Code Arrangement.

(H) Community Antenna Television and Radio Distribution Systems Equipment. Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an information technology equipment room. Article 645 shall apply to the powering of community antenna television and radio distribution systems equipment installed in an information technology equipment room.FPN: See 90.3, Code Arrangement."

This proposal differs from the task group proposal by offering the following additional substantiation.

It is common practice for an electric inspector to require compliance with Article 645 for any room marked "computer room" on the building plans. Because of this common error, it is important for Article 645 to clearly state where it applies and where other chapters in the code apply. The relationship between Article 645 and the power wiring articles in the front of the code (1 through 4) is clear; additional clarifications have been offered by the task group's proposals. Likewise section 90.3 is quite clear that chapters 5, 6 and 7 modify chapters 1 through 4. However, section 90.3 is silent on the relationship between chapters 5, 6 and 7. Article 645 modifies the requirements of Articles 725 and 770 without any authorization from 90.3. Hence the relationship between Article 645 and provisions of Articles 725, 760 and 770 are proper material for new section 645.3. Notwithstanding the clarity of section 90.3 on the relationship between Chapter 8 and the rest of the code, it is not at all widely understood that communications cables and equipment in a computer room must comply with Article 800. Also, Article 800 is completely silent on the powering of communications equipment. This proposal clarifies that Article 645 applies to the power wiring.

The text of proposed 645.3(B) has been modified to avoid using the undefined term "ceiling cavity plenum".

The reference to the definition of critical operations power systems in the task group's proposal has been deleted from this proposal because the term "critical operations power system" is not used in any text in the task group's proposals other than in the task group's proposed 645.3(B). It also does not exist in the current Article 645.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

12-133 Log #2065 NEC-P12 **Final Action: Accept in Principle**
(645.4)

Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group
Recommendation: 645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to apply, ~~provided~~ when all of the following conditions are met:
FPN: This article provides alternate wiring methods to the provisions of chapters 1 through 4 for power wiring and Article 725.154(A) for signaling wiring for information technology equipment rooms constructed in compliance with NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*
(1) Disconnecting means complying with 645.10 are provided.
(2) A separate heating/ventilating/air-conditioning (HVAC) system is provided that is dedicated for information technology equipment use and is separated from other areas of occupancy. Any HVAC system that serves other occupancies shall be permitted to also serve the information technology equipment room if fire/smoke dampers are provided at the point of penetration of the room boundary. Such dampers shall operate on activation of smoke detectors and ~~also~~ by operation of the disconnecting means required by 645.10.
FPN: For further information, see NFPA 75-200~~3~~9, Standard for the Protection of Information Technology Equipment, Chapter 10, 10.1, 10.1.1, 10.1.2, and 10.1.3.
(3) All ~~Listed~~ information technology and communications equipment ~~is~~ installed in the room is listed.
(4) The room is occupied ~~only~~ by, and accessible to, only those personnel needed for the maintenance and functional operation of the installed information technology equipment.
(5) The room is separated from other occupancies by fire-resistant-rated walls, floors, and ceilings with protected openings.
FPN: For further information on room construction requirements see NFPA 75-200~~3~~9, *Standard for the Protection of Information Technology Equipment, Chapter 5.*
Substantiation: This rewording and a new FPN clarify the original intent of the article. It gives permission for specialized equipment to be exempt from Chapters 1-4 provided more restrictive measures are met in order to correlate with 90.3.
(3) is editorially changed to improve it's meaning.
(4) clarifies that both limited occupancy and limited access are required. Not only is the ITE room minimally occupied, but access is restricted. Only authorized personnel can get in, usually by an access security system such as a card reader, biometric analyzer, and/or pass code.
Changes made to reflect the latest date of NFPA 75.
This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 12-134.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-134 Log #3739 NEC-P12 **Final Action: Accept**
(645.4)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by removing the mandatory text in the first Fine Print Note under the 645.4 text.
This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, CableSafe Inc. / Rep. The Society of the Plastics Industry
Recommendation: Revise text as follows:
645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to apply, ~~provided~~ when all of the following conditions are met:
FPN: This article provides alternate wiring methods to the provisions of chapters 1 through 4 for power wiring, and 725.154(A) and 770.154(A) for signaling wiring and optical fiber cabling, for information technology equipment rooms constructed in compliance with NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*
(1) Disconnecting means complying with 645.10 are provided.
(2) A separate heating/ventilating/air-conditioning (HVAC) system is provided that is dedicated for information technology equipment use and is separated from other areas of occupancy. Any HVAC system that serves other occupancies shall be permitted to also serve the information technology equipment room if fire/smoke dampers are provided at the point of penetration of the room boundary. Such dampers shall operate on activation of smoke detectors and ~~also~~ by operation of the disconnecting means required by 645.10.
FPN: For further information, see NFPA 75-200~~3~~9, Standard for the Protection of Information Technology Equipment, Chapter 10, 10.1, 10.1.1, 10.1.2, and 10.1.3.
(3) All ~~Listed~~ information technology and communications equipment ~~is~~ installed in the room is listed.
(4) The room is occupied ~~only~~ by, and accessible to, only those personnel needed for the maintenance and functional operation of the installed information technology equipment.
(5) The room is separated from other occupancies by fire-resistant-rated walls, floors, and ceilings with protected openings.
FPN: For further information on room construction requirements see NFPA 75-200~~3~~9, *Standard for the Protection of Information Technology Equipment. Chapter 5*
Substantiation: I am a member of the Panel 12 Article 645 Task Group. I reviewed the task group's proposals with a member of the NEC TCC, Mr. James Dollard. Mr. Dollard noted that some of the proposals did not fully comply with the NEC Style Manual and others had correlation issues. In order to address these issues before the deadline for proposals, I prepared amended proposals and submitted them for the panel to consider.
The substantiation for this proposal as submitted by the Bob Johnson for the task group is:
"This rewording and a new FPN clarify the original intent of the article. It gives permission for specialized equipment to be exempt from Chapters 1-4 provided more restrictive measures are met in order to correlate with 90.3.
(3) is editorially changed to improve it's meaning.
(4) clarifies that both limited occupancy and limited access are required. Not only is the ITE room minimally occupied, but access is restricted. Only authorized personnel can get in, usually by an access security system such as a card reader, biometric analyzer, and/or pass code.
Changes made to reflect the latest date of NFPA 75.
This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation."
The only change from the task group's proposal is in the fine print note as shown below:
FPN: This article provides alternate wiring methods to the provisions of chapters 1 through 4 for power wiring and Article 725.154(A) for signaling wiring for information technology equipment rooms constructed in compliance with NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*
The fine print note has been changed in this proposal to delete the word 'Article" because the reference is to subsection 725.154(A), not to an article. Furthermore a reference or section 770.154(A) was added to include optical fiber cables. The modified proposed fine print note reads as follows:
FPN: This article provides alternate wiring methods to the provisions of chapters 1 through 4 for power wiring, and 725.154(A) and 770.154(A) for signaling wiring and optical fiber cabling, for information technology equipment rooms constructed in compliance with NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-135 Log #4751 NEC-P12 **Final Action: Accept in Principle**
(645.4)

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Add a new 645.4(6) and FPN to read: Electrical equipment and wiring not directly associated with the operation of the information technology room shall not be installed in the information technology room.
FPN: HVAC systems, communications systems and monitoring systems such as telephone, fire alarm systems, security systems, water detection systems and other related protective equipment are examples of equipment associated with the operation of the information technology room.
Substantiation: Relaxation of the rules relating to plenum wiring as shown in 300.22 were made based on the limited wiring methods shown in 645.5. The disconnecting means required in 645.10 is based on an emergency condition where all electrical wiring within the ITE room would be easily and conveniently deenergized. The five provisions of 645.4 provide for the sanctity of the ITE room related to the relaxed or less stringent requirements and in accordance all non associated equipment and wiring should be prohibited.
Panel Meeting Action: Accept in Principle
Add a new 645.4(6) to read as follows:
645.4(6) Only electrical equipment and wiring associated with the operation of the information technology room is installed in the room.
FPN: HVAC systems, communications systems, and monitoring systems such as telephone, fire alarm systems, security systems, water detection systems, and other related protective equipment are examples of equipment associated with the operation of the information technology room.
Panel Statement: CMP-12 changed the text to put the requirement into positive code language. The change meets the submitter's intent.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-136 Log #4802 NEC-P12 **Final Action: Reject**
(645.4(6) (New))

Submitter: Eric Brunn, Gainesville, FL
Recommendation: Add: (6) Signage shall be provided at the approved disconnecting means identifying the room as being compliant with this article.
Substantiation: At times electrical circuits are installed according to the relaxed requirements of Article 645. Installers and inspectors should have a readily available means of identifying these rooms as being compliant with this article without doing a field inspection for each installation.
Panel Meeting Action: Reject
Panel Statement: Identification of disconnects is already required. The purpose of identifying compliance with 645 is unclear. The proposal does not provide substantiation in accordance with 4.3.3(d) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-137 Log #2066 NEC-P12 **Final Action: Accept in Principle**
(645.5)

Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group
Recommendation: 645.5 Supply Circuits and Interconnecting Cables.
(A) Branch-Circuit Conductors. The branch-circuit conductors supplying one or more units of ~~a data processing system~~ Information technology equipment shall have an ampacity not less than 125 percent of the total connected load.
(B) Power Cord-~~and-Plug~~ Connections. ~~The data processing system~~ Information technology equipment shall be permitted to be connected to a branch circuit by ~~any of the following listed means:~~ cord sets or flexible cord and plug cap assemblies.
(1) Power cords shall not ~~Flexible cord and attachment plug cap not to~~ exceed 4.5 m (15 feet).
~~(2) Cord set assembly, where run on the surface of the floor, shall be protected against physical damage.~~
(2) Power cords shall be listed and suitable for information technology equipment.
FPN: One method of determining cords are suitable for the purpose is found in UL 60950 *Standard for Information Technology Equipment – Safety – Part 1*
(C) Interconnecting Cables. Separate ~~data processing~~ information technology equipment units shall be permitted to be interconnected by means of listed cables and cable assemblies.
FPN: The 4.5 m (15 ft) limitation in (B) does not apply to interconnecting cables.
(D) Physical protection. Where exposed to physical damage, ~~the installation~~ supply circuits and interconnecting cables shall be protected. ~~by approved means~~.
(E~~D~~) Under Raised Floors. Power cables, communications cables, connecting cables, interconnecting cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted under a raised floor, provided the following conditions are met:
(1) The raised floor is of suitable construction, and the area under the floor is accessible.
(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of 300.11.
Exception; Compliance with 300.11(A) shall not be required when raceway is supported by the floor of the building under the raised floor.
(3) Supply cords of listed information technology equipment in accordance with 645.5(B).
(4) Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2). The ventilation system shall be so arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space, the circulation of air will cease.
(5) Openings in raised floors for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.
(6) Cables, other than those covered in (E~~D~~)(2) and (E)(3) and those complying with (E)(6)(a) or (E)(6)(b), ~~(D)(6)(a), (D)(6)(b) or (D)(6)(c),~~ shall be listed as Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room.
a. Interconnecting cables enclosed in a raceway.
b. ~~Interconnecting cables listed with equipment manufactured prior to July 1, 1994, being installed with that equipment.~~
c. Cable type designations shown in Table 645.5 shall be permitted. Green, or green with one or more yellow stripes, insulated single-conductor cables, 4 AWG and larger, marked "for use in cable trays" or "for CT use" shall be permitted for equipment grounding.

FPN: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, *Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.* The smoke measurements in the test method are not applicable.
Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, *Test Methods for Electrical Wires and Cables*.

(F~~E~~) Securing in Place. Power cables; communications cables; connecting cables; interconnecting cables; and associated boxes, connectors, plugs, and receptacles that are listed as part of, or for, information technology equipment shall not be required to be secured in place.
(G~~F~~) Abandoned Supply Circuits and Interconnecting Cables. The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a ~~metal~~ raceway.
(H~~G~~) Installed Supply Circuits and Interconnecting Cables Identified for Future Use.
(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.
(2) Supply circuit tags and interconnecting cable tags shall have the following information:
a. Date identified for future use
b. Date of intended use
c. Information relating to the intended future use
Substantiation: (B): Cord and Plug Connections - Replace the phrase "data processing system' with the phrase "information technology equipment," which is consistent with the title of Article 645.
Plug caps do not play a part in this requirement and are deleted.
(B)(2): Physical protection is moved to new (D).
UL 60950 lists power cords styles with appropriate durability for ITE applications.
(C): Interconnecting Cables - Replace the phrase "data processing system' with the phrase "information technology equipment."
645.5(B)(1) is sometimes interpreted to mean that no *interconnecting cable* can be longer than 15'. This proposed FPN for (C) clarifies that the 15' limitation applies only to the cord-and-plug connections of IT equipment and not to other types of interconnecting cables.
(D): Physical Protection – separated out and covers both power and interconnect cables. Renumber (D) thru (G) as (E) thru (H)
(E)(2): This exception is a change suggested from an associated proposal by the task group on 645.5(D)(2) presented separately for discussion and approval but reproduced here.
(E)(6): Add exclusion for supply cords of listed information technology equipment in 645.5(E)(3).
Delete 645.5(D)(6)b. This section is no longer needed. Equipment more than 12 years old is unlikely to be reinstalled.
(G): Treat all raceways the same, regardless of the material.
This is one of a group of proposals prepared by the CMP-12 Article 645 Task Group. Refer to the Proposal on 645.1, FPN, for a consolidated presentation.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-139.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-138 Log #2870 NEC-P12 **Final Action: Reject**
(Table 645.5)

Submitter: James M. Imlah, City of Hillsboro
Recommendation:

Table 645.5 Cable Types Permitted Under Raised ~~Floors~~ Platforms

Article	Plenum	Riser	General Purpose
336			TC
725	CL2P & CL3P	CL2R & CL3R	CL2, CL3 & PLTC
727			ITC
760	NPLFP & FPLP	NPLFR & FPLR	NPLF & FPL
770	OFNP & OFCP	OFNR & OFCR	OFN & OFC
800	CMP	CMR	CM & CMG
820	CATVP	CATVR	CATV

Substantiation: This is a companion proposal for changes to 645.5 (D) (1) (5) & (6) for the changing of floor to "platform." "Floor" should be changed to a raised "platform" as the pedestals are required to be on a solid permanent base to assure proper support of equipment and for weight limitations as per manufacturer's documentation. By identifying the raised area as a platform will remove the conflict of article 400.8 (2) for allowing a cord through a "floor." The definition of a floor is (Webster Dictionary) "a main level space distinguished from a platform" and a floor is designed as permanent in nature. Additionally, platform supports can be removed from an area and underneath it is a considered a floor area.
Panel Meeting Action: Reject
Panel Statement: Raised floor is a familiar and recognized term. Changing the term to "platform" is not necessary. "Raised floor" is a term consistent with NFPA 90A.
Article 645 specifically permits flexible cords to be run through "raised floors" in 645.5(D)(5).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(H~~G~~) Installed Supply Circuits and Interconnecting Cables Identified for Future Use.
(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.
(2) Supply circuit tags and interconnecting cable tags shall have the following information:
a. Date identified for future use
b. Date of intended use
c. Information relating to the intended future use
Substantiation: I am a member of the Panel 12 Article 645 Task Group. I reviewed the task group's proposals with a member of the NEC TCC, Mr. James Dollard. Mr. Dollard noted that some of the proposals did not fully comply with the NEC Style Manual and others had correlation issues. In order to address these issues before the deadline for proposals, I prepared amended proposals and submitted them for the panel to consider.
The substantiation for the proposal submitted by the Bob Johnson for the task group is:
"(B): Cord and Plug Connections - Replace the phrase "data processing system' with the phrase "information technology equipment," which is consistent with the title of Article 645.
Plug caps do not play a part in this requirement and are deleted.
(B)(2): Physical protection is moved to new (D).
UL 60950 lists power cords styles with appropriate durability for ITE applications.
(C): Interconnecting Cables - Replace the phrase "data processing system' with the phrase "information technology equipment."
645.5(B)(1) is sometimes interpreted to mean that no *interconnecting cable* can be longer than 15 ft. This proposed FPN for (C) clarifies that the 15' limitation applies only to the cord-and-plug connections of IT equipment and not to other types of interconnecting cables.
(D): Physical Protection – separated out and covers both power and interconnect cables. Renumber (D) thru (G) as (E) thru (H)

(E)(2): This exception is a change suggested from an associated proposal by the task group on 645.5(D)(2) presented separately for discussion and approval but reproduced here.

(E)(6): Add exclusion for supply cords of listed information technology equipment in 645.5(E)(3).

Delete 645.5(D)(6)b. This section is no longer needed. Equipment more than 12 years old unlikely to be reinstalled.

(G): Treat all raceways the same, regardless of the material.

This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation."

This proposal introduces three changes from the task group proposal.

In 645.(5)(2) it corrects a typographical error by changing "and" to "as":

As submitted by Bob Johnson:

"(2) Power cords shall be listed and suitable for information technology equipment."

Change in this proposal:

"(2) Power cords shall be listed as suitable for information technology equipment."

In 645.5(5)(2) the FPN is has a requirement and is therefore not in compliance with the style manual.

"(C) Interconnecting Cables. Separate ~~data processing~~ information technology equipment units shall be permitted to be interconnected by means of listed cables and cable assemblies.

FPN: The 4.5 m (15 ft) limitation in (B) does not apply to interconnecting cables."

This proposal moves the text from the FPN to the second sentence of the mandatory text.

"(C) Interconnecting Cables. Separate ~~data processing~~ information technology equipment units shall be permitted to be interconnected by means of listed cables and cable assemblies. The 4.5 m (15 ft) limitation in (B) shall not apply to interconnecting cables."

The third change is to the exception to 645.5(E) which reads as follows in the task group proposal submitted by Bob Johnson.

"Exception; Compliance with 300.11(A) shall not be required when raceway is supported by the floor of the building under the raised floor."

Since the requirement for securing in place is in multiple places in the code, not just in 300.11(A), the proposed text of the exception in this proposal is:

"Exception: Raceways and cables shall not be required to be securely fastened in place when the raceways and cables are supported by the floor of the building under the raised floor."

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

(B) ~~Cord-and-Plug Connections:~~ Power Supply Cords. ~~The data processing system~~ Information technology equipment shall be permitted to be connected to a branch circuit by ~~any of the following listed means~~ a power supply cord.

(1) ~~Flexible cord and attachment plug cap~~ Power supply cords shall not ~~to~~ exceed 4.5 (15 ft).

(2) ~~Cord set assembly, where run on the surface of the floor, shall be protected against physical damage.~~ Power supply cords shall be listed and suitable for information technology equipment or shall be constructed of listed flexible cord and listed attachment plugs and cord connectors suitable for information technology equipment.

645.5(E)(2) to read as follows:

(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable and associated metallic and nonmetallic boxes or enclosures. These supply conductors shall be installed in accordance with the requirements of 300.11.

Panel Statement: CMP-12 accepts the proposal as submitted except for 645.5(B) and 645.5(E)(2). CMP-12 does not accept 645.5(E)(2) Exception. See revised wording for 645.5(B) and 645.5(E)(2).

The current proposed wording does not accurately describe the type of power supply cords typically used with ITE in ITE rooms.

CMP-12 revised 645.5(E)(2) to incorporate the recommendations from Proposal 12-143.

CMP-12 does not agree with the exception. Securing and supporting of raceways is required.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

KOVACIK, J.: In 645.5(B), FPN, the correct designation of the Standard should be "UL 60950-1, Standard for Information Technology Equipment - Safety - Part 1". This is consistent with the current information in (and proposed clarifications to made to) Annex A (Product Safety Standards).

12-140 Log #2869 NEC-P12 **Final Action: Reject**
(645.5(D)(1), (5), and (6))

Submitter: James M. Imlah, City of Hillsboro

Recommendation: Revise text to read as follows:

645.5 Supply Circuits and Interconnecting Cables.

(D) Under Raised ~~Floors~~ Platform. Power cables, communications cables, connecting cables, interconnecting cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted under a raised ~~floor~~ platform, provided the following conditions are met:

(1) The raised ~~floor~~ platform is of suitable construction, and the area under the ~~floor~~ platform is accessible.

(5) Openings in raised ~~floors~~ platforms for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.

(6) Cables, other than those covered in (D)(2) and those complying with (D)(6)(a), (D)(6)(b), or (D)(6)(c), shall be listed as Type DP cable having adequate fire-resistant characteristics suitable for use under raised ~~floors~~ platforms of an information technology equipment room.

Substantiation: "Floor" should be changed to a raised "platform" as the pedestals are required to be on a solid permanent base to assure proper support of equipment and for weight limitations as per manufacturer's documentation. By identifying the raised area as a platform will remove the conflict of article 400.8 (2) for allowing a cord through a "floor." The definition of a floor is (Webster Dictionary) "a main level space distinguished from a platform" and a floor is designed as permanent in nature. Additionally, platform supports can be removed from an area and underneath it is a considered a floor area.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

12-141 Log #2067 NEC-P12 **Final Action: Reject**
(645.5(D)(2))

Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group

Recommendation: 645.5(D)(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of 300.11.

Exception; Compliance with 300.11(A) shall not be required when raceway is supported by the floor of the building under the raised floor.

Substantiation: The exception is required because 300.11(A) requirement for securing branch circuit supply conductors to floors should not apply to ITE cabling.

General industry practice for decades has been to not secure under the floor because:

1) the wiring methods are supported by the floor and supporting grid system

2) IT environments require ease and frequent installation, removal, and relocation of power cables.

3) no evidence has been provided to suggest that the practice has resulted in damage, fire or injury.

This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation.

Panel Meeting Action: Reject

Ballot Results: Affirmative: 14

12-142 Log #3738 NEC-P12 **Final Action: Reject**
(645.5(D)(2))

Submitter: Stanley Kaufman, CableSafe Inc. / Rep. The Society of the Plastics Industry
Recommendation: Add the following new text:
645.5(D)(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of 300.11.
<u>Exception: Raceways and cables shall not be required to be securely fastened in place when the raceways and cables are supported by the floor of the building under the raised floor.</u>
Substantiation: I am a member of the Panel 12 Article 645 Task Group. I reviewed the task group's proposals with a member of the NEC TCC, Mr. James Dollard. Mr. Dollard noted that some of the proposals did not fully comply with the NEC Style Manual and others had correlation issues. In order to address these issues before the deadline for proposals, I prepared amended proposals and submitted them for the panel to consider.
The substantiation for the proposal submitted by Bob Johnson is:
"The exception is required because 300.11(A) requirement for securing branch circuit supply conductors to floors should not apply to ITE cabling.
General industry practice for decades has been to not secure under the floor because:
1) the wiring methods are supported by the floor and supporting grid system
2) IT environments require ease and frequent installation, removal, and relocation of power cables.
3) no evidence has been provided to suggest that the practice has resulted in damage, fire or injury.
This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation."
Since the requirement for securing in place is in multiple places in the code, not just in 300.11(A), the proposed text of the exception in this proposal is:
<u>"Exception: Raceways and cables shall not be required to be securely fastened in place when the raceways and cables are supported by the floor of the building under the raised floor."</u>

12-145 Log #2968 NEC-P12 **Final Action: Accept in Principle in Part**
(645.5(F))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text as follows:
645.5 Supply Circuits and Interconnecting Cables.
[645.5(A) through 645.5(E) unchanged by this Proposal]
(F) Abandoned Supply Circuits and Interconnecting Cables. The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a ~~metal~~ raceway. <u>Within ducts, plenums, and spaces specified in 300.22(B) and (C), the accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a metal raceway.</u>
[remainder of 645.5 unchanged by this Proposal]
Substantiation: The explicit allowance for abandoned circuit and cables in metal raceways functions as an implicit disincentive for circuits and cables to be installed in allowed nonmetallic raceways if abandoned circuits and cables in nonmetallic raceways must be removed, even if NOT in ducts, plenums or spaces for environmental air-handling. The requirement was written more broadly than the original proposer intended or substantiated.
As presently written, 645.5(F) does not differentiate for abandoned supply circuit and interconnecting cables between those INSIDE of and those OUTSIDE of air-handling spaces (ducts or plenums used for environmental air, the spaces above hung ceilings and below raised floors used for environmental air-handling purposes). Wiring methods are limited to exclude nonmetallic raceways ONLY in 300.22(B) for circuits within ducts or plenums used for environmental air-handling and in 300.22(C) for circuits within spaces above hung ceilings and below raised floors <u>used for environmental air-handling</u>. Elsewhere nonmetallic raceways are permitted. Indeed, for under raised floors, 645.5(D)(2) explicitly allows nonmetallic raceway wiring methods for ACTIVE supply circuits and 645.5(D)(6)a does not distinguish between nonmetallic and metal raceways permitted for ACTIVE interconnecting cables. Within NON-air-handling open spaces of Information Technology Equipment Rooms occupied by personnel, Article 645 does NOT between nonmetallic and metal raceways permitted for ACTIVE supply circuits and interconnecting cables.
645.5(F) in the 2008 *NEC*® originated from Proposal 12-206 (Log #4135) to the 2002 *NEC*®. Proposal 12-206 requested as an addition of a NEW 645.5(<u>**D**</u>)(6) to the requirements UNDER RAISED FLOORS, without mention of metal raceway, for removal of supply circuit conductors and interconnecting cables abandoned UNDER RAISED FLOORS. Its Substantiation indicated: "There is, as yet, no indication that the additional cable in **PLENUMS** causes an added fire hazard, and the fire record of cables in concealed spaces, **BOTH ABOVE CEILINGS AND BELOW FLOORS**, remains excellent. … However, this type of preventive measure is worthwhile." Code Panel 12 Accepted In Principle Proposal 12-106.
Panel Action to Comment 12-55 (Log #660) to this Proposal 12-206 to the 2002 *NEC*® added "unless contained in metal raceway". At that point, the new requirement was still numbered 645.5(D)(6) and still within the requirements for UNDER RAISED FLOORS. Except for lacking the explicit qualification that this spaced under raised floors was being used for environmental air-handling, this Panel Action was completely consistent with requirements for metal raceway in 300.22(B) and 300.22(C).
Proposal 12-116 (Log #2649) to the 2008 *NEC*® relocated this requirement from 645.5(D)(6) to 645.5(F), and in doing so changed the applicability of the requirement NOT from just raised floors to all spaces for environmental air-handling, but to ALL SPACES, REGARDLESS of even if the space is <u>NOT</u> FOR ENVIRONMENTAL AIR-HANDLING. Period. The Substantiation indicated: "The requirement should not be just for under raised floors", but did <u>NOT</u> indicate <u>WHERE</u> it <u>SHOULD</u> be applicable NOR did it justify any other type of spaces.
If the supply circuit conductors and interconnecting cables are OUTSIDE of environmental air-handling spaces and it's permissible to use EITHER METAL OR NONMETALLIC RACEWAY for ACTIVE conductors and cables, then there should be no discrimination in which type of raceway such conductors and cables are abandoned.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: See panel action and statement on Proposal 12-139.
CMP-12 accepts the change in the proposal to delete "metal" in 645.5(F) (NEW 645.5(G)).
CMP-12 does not accept the remainder of the submitter's text because this section does not pertain to 300.22(B) and (C).
It is the intent of CMP-12 that all abandoned cable except in raceway be removed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-146 Log #4548 NEC-P12 **Final Action: Reject**
(645.5(F))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text as follows:
645.5 Supply Circuits and Interconnecting Cables.
(F) Abandoned Supply Circuits and Interconnecting Cables. The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a metal raceway. Removal of abandoned cables shall be performed in a neat and workmanlike manner.
Substantiation: This proposal recommends added wording to ensure that abandoned cables are removed appropriately. Section 110.12 addresses installation and not removal. It is important to point out that similar care must be taken when removing cables.
110.12 Mechanical Execution of Work.
Electrical equipment shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 1-2006, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.
Consistent wording is being proposed for other sections in the code.
For information, see relevant definitions in the NEC.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Panel Meeting Action: Reject
Panel Statement: The requirement is unenforceable. Disposition of removed materials is not a code responsibility.
The remaining installation is required to be in accordance with 110.3, which is enforceable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-147 Log #250 NEC-P12 **Final Action: Accept**
(645.17)

TCC Action: The Technical Correlating Committee recognizes that this proposal is identical to Tentative Interim Amendment 08-1.
Submitter: Rodney Belisle, NIETC
Recommendation: Revise text to read as follows:
645.17 Power Distribution units. Power distribution units that are used for information technology equipment shall be permitted to have multiple panelboards within a single cabinet, provided that ~~each panelboard has no more than 42 overcurrent devices and~~ the power distribution unit is utilization equipment listed for information technology application.
Substantiation: This is a change that was implemented into article 408 during the '08 cycle, with the removal of 408.35, allowing for more than 42 OCPDs in a cabinet or enclosure. Article 645 was unintentional overlooked during the correlation process, yet a very likely place to see the use of a larger panelboard within the new rules. There is no technical reason to limit the number of OCPDs to 42.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-148 Log #2059 NEC-P12 **Final Action: Accept in Principle in Part**
(645.25)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 2 for correlating action in Table 220.3.
This action will be considered by the panel as a public comment.
Submitter: Robert E. Johnson, ITE Safety / Rep. CMP-12 Article 645 Task Group
Recommendation: Add a new section in Article 645 for Engineering Supervision for feeder and service load calculations:
645.25 Engineering Supervision. As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, feeder and service load calculations for new or existing loads shall be permitted to be used if performed by a licensed and qualified professional engineer. Feeder conductors shall not be required to be of greater ampacity than the service conductors. Service or feeder conductors shall be permitted to have neutral load determined by 220.61.
Add row to Table 220.3 to read as follows:
Additional Load Calculation References Article Section
Information Technology Equipment 645 645.25
Substantiation: Information technology equipment rooms are a dynamic with it equipment often being changed, replaced or upgraded. Feeder and Service load calculations performed upon a single equipment snapshot in time do not permit and accurate calculation over the life of the installation. Also, the diversity of the load based on the sum of the nameplate ratings does not provide an accurate representation of the actual load that occurs when this equipment is operated simultaneously. Therefore, special allowances are needed for the unusual load needs of information technology equipment rooms. The following data is provided to show common values and special considerations likely to be encountered. Feeder and Service sizing based on calculations performed by a licensed and qualified professional engineer using such actual performance data are provided by this new section 645.25.
Calculating Projected Loads for Data Center Feeders and Services - Sample Data:
This information is provided to assist engineers and utility providers in estimating total loads for data center facilities. It is drawn from anecdotal data provided in 2008 by a number of companies who operate critical data center facilities in the U.S.A. It should be noted that load density is highly variable and has consistently increased for this comparison group over the last five years, as computer hardware has continued to draw more power. Load densities for smaller facilities or for sites with special computer applications may often be higher. Future computer hardware design changes should be expected to continue to drive load density changes.
The following table depicts average load densities measured at 130 data center facilities in 2008. These were calculated by dividing actual UPS load by electrically active raised floor area on a specific date. "Electrically active" is the gross area minus blocks of space that are empty or electrically inactive (tape storage, office space, etc.).

Load density by industry	Average	Maximum observed for one site
Airlines:	42 W/sf	124 W/sf
Banking/Finance:	42 W/sf	78 W/sf
Computer Mfg.:	77 W/sf	102 W/sf
Web Hosting:	62 W/sf	97 W/sf
Healthcare:	54 W/sf	113 W/sf
Manufacturing:	52 W/sf	78 W/sf
Insurance:	34 W/sf	105 W/sf
Oil:	49 W/sf	112 W/sf
Retail:	56 W/sf	150 W/sf
Telecommunications:	29 W/sf	67 W/sf

Several sample individual site calculations for the maximum loads observed from the table above:

Industry	Watts/ft^2	UPS Load	Active Raised Floor Area
Airline	124	785	6,320
Computer Mfg.	100	722	17,271
Computer Mfg.	102	858	18,238
Healthcare	113	800	7,064
Insurance	104	1,146	11,033
Insurance	105	2,657	25,383
Oil	112	3,363	29,943
Retail	150	2,753	18,362

Data center facility designs must take into account specific areas within a computer room that will likely have significantly higher load densities than the average density for the room. As of 2008, a single server rack could generate up to 25 Kw of load in a 30 square foot area (833 W/sf). Individual branch circuit calculations would be based upon the individual equipment connected to the circuit while feeder and service load calculations would be conducted on either the average, maximum or combination expected load for the particular facility.
Sample "Actual" Load vs. Computer "Nameplate" (Diversity) Load (comparison group of 6 companies)
By bench testing individual computer hardware devices, these companies determined the actual measured continuous load for a given computer device. By company, these are the average "actual" loads measured vs. the load described on the manufacturer's "nameplate":

- Company 1: Continuous load was 47% of nameplate
- Company 2: Continuous load was 50% of nameplate
- Company 3: Continuous load was 50-60% of nameplate
- Company 4: Continuous load was 62% of nameplate
- Company 5: Continuous load was 70-75% of nameplate
- Company 6: Continuous load was 80% of nameplate

It is important to note that actual load will vary considerably for two identical facilities with identical computer hardware employed, based on the operating systems and software applications utilized on the computer hardware.

Cooling load will often be equal to the electronic load.1 Proper planning of power density needs and its deployment will require calculation based on planned and projected equipment needs.2

1 Sawyer, Richard, *Calculating Total Power Requirements for Data Centers*, http://www.apc.com/support/whitepapers, WP3, 2004,

[2] Rasmussen, Neil, Guidelines for Specification of Data Center Power Density, http://www.apc.com/support/whitepapers, WP120, 2005,

This is one of a group of Proposals prepared by the CMP-12 Article 645 task group. Refer to the proposal on 645.1 FPN for a consolidated presentation.

Panel Meeting Action: Accept in Principle in Part

Add a new section in Article 645 for engineering supervision for feeder and service load calculations:

645.25 Engineering Supervision. As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, feeder and service load calculations for new or existing loads shall be permitted to be used if performed by qualified persons under engineering supervision.

Panel Statement: CMP-12 accepts the submitter's text but not the last two sentences.

By virtue of referencing Parts III and IV of Article 220, the last two sentences are redundant. A design of this nature is required to be accomplished under engineering supervision. The requirement for a licensed and qualified professional engineer has been correlated with the concept of 215.2(B)(3).

Further, CMP-12 requests the TCC direct further action to CMP-2 to add the following:

Add row to Table 220.3 in alphabetical order to read as follows:

Additional Load Calculation References Article Section (or Part)

ARTICLE 647 — SENSITIVE ELECTRONIC EQUIPMENT

12-149 Log #4800 NEC-P12 **Final Action: Reject**
(647)

Submitter: Martin Glasband, Equi-Tech Corp.

Recommendation: Revise text to read as follows:

ARTICLE 647 -- SENSITIVE ELECTRONIC EQUIPMENT

647.1 Scope. This article covers the installation and wiring of separately derived systems operating at 120 volts line-to-line and 60 volts to ground for sensitive electronic equipment.

647.3 General. Use of a separately derived 120-volt single-phase 3-wire system with 60 volts on each of two ungrounded conductors to a grounded neutral conductor shall be permitted for the purpose of reducing objectionable noise in sensitive electronic equipment locations provided that ~~the following conditions apply~~ all of the requirements in 647.4 through 647.8 are met.

~~**(1)** The system is installed only in commercial or industrial occupancies.~~

~~**(2)** The system's use is restricted to areas under close supervision by qualified personnel.~~

~~**(3)** All of the requirements in 647.4 through 647.8 are met.~~

647.4 Wiring Methods

(A) Panelboards and Overcurrent Protection. Use of standard single-phase panelboards and distribution equipment with a higher voltage rating shall be permitted. The system shall be clearly marked on the face of the panel or on the inside of the panel doors. Common-trip two-pole circuit breakers that are identified for operation at the system voltage shall be provided for both ungrounded conductors in all feeders and branch circuits.

(B) Junction Boxes. All junction box covers shall be clearly marked to indicate the distribution panel and the system voltage.

(C) Color Coding. All feeders and branch-circuit conductors installed under this section shall be identified as to system at all splices and terminations by color, marking, tagging or equally effective means. The means of identification shall be posted at each branch-circuit panelboard and at the disconnecting means for the building.

(D) Voltage Drop. The voltage drop on any branch circuit shall not exceed 1.5 percent. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.5 percent.

(1) Fixed Equipment. The voltage drop on branch circuits supplying equipment connected using wiring methods in Chapter 3 shall not exceed 1.5 percent. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.5 percent.

(2) Cord-Connected Equipment. The voltage drop on branch circuits supplying receptacle outlets shall not exceed 1 percent. For the purposes of making this calculation, the load connected to the receptacle outlet shall be considered to be 50 percent of the branch circuit rating. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.0 percent.

(FPN): The purpose of this provision is to limit voltage drop to 1.5 percent where portable cords may be used as a means of connecting equipment.

647.5 3-phase Systems. Where 3-phase power is supplied, a separately derived 6-phase "Wye" system with 60 volts to ground installed under this article shall be configured as three separately derived 120-volt single-phase systems having a combined total of no more than six main disconnects.

647.6 Grounding.

(A) General. The system shall be grounded as provided in Section 250.30 as a separately derived single-phase 3-wire system.

(B) Grounding Conductors Required. Permanently wired utilization equipment and receptacles shall be grounded by means of an equipment grounding conductor run with the circuit conductors to an equipment grounding bus prominently marked "Technical Equipment Ground" in the originating branch-circuit panelboard. The grounding bus shall be connected to the grounded conductor on the line side of the separately derived system's disconnecting means. The grounding conductor shall not be smaller than that specified in Table 250.122 and run with the feeder conductors. The technical equipment grounding bus need not be bonded to the panelboard enclosure. Other grounding methods authorized elsewhere in this Code shall be permitted where the impedance of the grounding return path does not exceed the impedance of equipment grounding conductors sized and installed in accordance with this article.

FPN No. 1: See Section 250.122 for equipment grounding conductor sizing requirements where circuit conductors are adjusted in size to compensate for voltage drop.

FPN No. 2: These requirements limit the impedance of the ground fault path where only 60 volts applies to a fault condition instead of the usual 120 volts.

647.7 Receptacles.

(A) General. Where receptacles are used as a means of connecting equipment, the following conditions shall be met:

(1) All 15- and 20-ampere receptacles shall be GFCI protected.

(2) All outlet strips, adapters, receptacle covers and faceplates shall be marked with the following words or equivalent:

WARNING - TECHNICAL POWER Do not connect to lighting equipment For electronic equipment use only 60/120 V. 1-phase AC GFCI protected.

(3) A 125-volt, single-phase, 15- or 20-ampere rated receptacle outlet having one of its current carrying poles connected to a grounded circuit conductor shall be located within 1.8 m (6 ft) of all permanently installed 15- or 20-ampere-rated 60/120-volt technical power-system receptacles.

(4) All 125-volt receptacles used for 60/120-volt technical power shall have a unique configuration and be identified for use with this class of system. ~~125-Volt, single phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks and other similar locations that are restricted to use by qualified personnel..~~

(a) International standard configuration type receptacle outlets and cord attachment plugs that are rated at an equal or higher voltage shall be permitted under this article provided that they are NRTL listed and the outlet cover plate is properly identified under 647.7 A(2).

(b) Locking type receptacle outlets and cord attachment plugs that are not identified for use with a grounded circuit conductor and are rated at an equal or higher voltage and shall be permitted under this article provided that the receptacle cover plate is properly identified under 647.7 A(2)

(5) All receptacle outlets in residential occupancies installed under this article shall have a disconnecting means that simultaneously opens all ungrounded conductors that shall be located within sight of the of the receptacles installed under this article.

(6) 125-Volt, single phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks and other similar locations that are restricted to use by qualified personnel. This provision shall apply to commercial and industrial occupancies only.

(C) Isolated ground receptacles. Isolated ground receptacles shall be permitted as described in Section 250.146(D), however, the branch circuit equipment grounding conductor shall be terminated as required in Section 647.6(B).

647.8 Lighting Equipment. Lighting equipment installed under this article for the purpose of reducing electrical noise originating from lighting equipment shall meet the following conditions (A) through (C).

(A) Disconnecting Means. All lighting equipment, luminaires and associated control equipment if provided shall have a disconnecting means that simultaneously opens all ungrounded conductors that shall be located within sight of the luminaire or be capable of being locked in the open position.

(B) Luminaires. All luminaires shall be permanently installed, listed and ballast operated.

(C) Screw-shell. Lighting fixtures installed under this section shall not have an exposed lamp screw-shell.

Substantiation: Presently as it is written, Article 647 does not provide for the use of 120-volt circuits with 60 Volts to ground in residential occupancies.

Residential occupancies present some unique concerns that must be addressed differently for this system to be installed and used safely. The two areas that need to be addressed to avoid unsafe use are: (1) a receptacle device configuration that differentiates this system from conventional 120-volt outlets in residences to prevent abuse and (2) preventative measures to discourage misapplication of this system due to a change of occupants in a residence. The attached proposal to amend Article 647 addresses these issues.

A unique safety problem presents itself because of the potential use of 120-volt portable lighting equipment with exposed lamp screwshells where there are 2 ungrounded circuit conductors present. This issue is particularly problematical where standard "Edison-type" (NEMA 5-15) receptacle outlets may be used such as in locations where permitted (under 647) in specific commercial and industrial areas under close supervision by qualified personnel. Where supervised by qualified persons, misuse of lighting equipment can be avoided. However, this provision cannot hold up in residential occupancies where it is likely that qualified personnel will not be present. Furthermore, a change of occupants could result in widespread misuse under these conditions. To remedy this problem in residences, some unique receptacle configurations are suggested in this proposal that would limit their use strictly to the sensitive electronic equipment for which this system is intended.

One of the suggested configurations included in this proposal is an "International standard type" (ISO/IEC) receptacle configuration commonly known as an "IEC" type receptacle or connector. The C-13, C-14 & C-19, C-20 designations identify some of the specific receptacles and connectors to which this proposal refers. These inlets and outlets are commonly found on the rear of computer chassis and other electronic components for which the use of "balanced AC" is ideal. Additionally, this specific configuration is rarely if ever seen or used with potentially hazardous portable lighting equipment. Aside from labeling and identification requirements, this receptacle configuration is intuitively associated with sensitive electronic equipment by untrained users. These receptacles are typically UL approved for the voltage and current mentioned in 647. Use of this type of receptacle outlet configuration would address these various safety concerns and uniquely configured receptacles could very easily be made available for use in building wiring. The important issue is to provide for a unique receptacle configuration that greatly reduces or eliminates the possibility of misuse in residences. Present code language requires a uniquely configured receptacle however this provision doesn't go far enough to specify a type of receptacle outlet that would be appropriate for residential use. This proposal attempts to clarify this provision by providing acceptable configurations that are unique and appropriate.

The GFCI requirement has also been left intact for all 15- and 20-ampere receptacles and should be anticipated in residences. This requirement is useful because, among other reasons, at least some equipment utilizes internal single-pole AC switching, which could leave components partially energized when presumably turned off. The possibility of a low level short circuit to ground within components so switched would be addressed by the GFCI. Furthermore, new language that requires a 2-pole switch be present that opens all ungrounded circuit conductors allows for complete disconnection of all utilization equipment from the circuit.

It is felt that the above requirements (along with labeling/identification requirements) in the proposed amendment to 647 adequately address the change of occupants issue as well as potential safety issues due to possible misuse of portable lighting equipment with this system in residences.

In a practical sense, where common industry wiring methods in sensitive electronic systems have led to nuisance callbacks for contractors, the option to use "balanced AC" in residences would lead to a greatly improved track record, especially in areas where noise issues and equipment malfunctions have been problematical. As it has been proven in the professional audio/video industries, when "balanced AC" is used, there has been a marked reduction in problems arising from nuisance electrical noise. These problems typically manifest as audible hum and video "hum bars" that can be detected in the final product or at the very least in performance/playback situations in residences. It has also been proven that proper grounding assures quieter performance in sensitive electronics where "balanced AC" is used. This discourages the common practice of lifting grounding wires and terminals as a potentially dangerous method of defeating system noise. Other types of sensitive equipment (including computer based systems) used in other industries has also shown marked improvement in performance due to diminished noise provided by the use of "balanced AC." Better performing equipment and cleaner, clearer audio and video can be expected with fewer nuisance callbacks to resolve when "balanced AC" is properly installed in a home theater wiring system. The home theater and construction industry will also benefit from adoption of this proposal.

As progress leads us towards ever more sophisticated electronic utilization equipment, more and larger switching power supplies find their way into typical residential neighborhoods. Today, the common television set and home computer use power supplies that each consumes upwards of 5 Amps or more. Multiplied by two or 3 or more of these power supplies per household times the number of residences in a neighborhood has resulted in poorer and poorer power quality in residential areas. This is a costly problem for utilities to address. The reactive currents and harmonics produced by these power supplies has been long known by many commercial and industrial users to be quite problematical for everyone involved, from the end user to the utility company. Where "balanced power" is applied to reactive loads, harmonic currents cancel out at the secondary of the "balanced AC" transformer. This leaves power factor in an area unaffected by reactive loads. Adoption of this proposal could put a stop to all of these power quality issues. It would also provide for a higher power factor across the board in bulk power utility grids which could result in the savings of untold millions of dollars and savings of a lot of wasted fuel needed to generate additional power to compensate for low power factor. Use of "balanced AC" is in itself is a "green" solution for today's energy hungry world.

(Additional material can be found on my website: www.equitech.com)

Panel Meeting Action: Reject

Panel Statement: Sensitive electronic equipment powered by separately derived systems operating at 120-Volt line-to-line and 60 volts to ground originally was restricted to TV and motion picture studios (Article 530). In the 2005 NEC, this equipment was moved from Article 530 and put in its own Article 647 (sensitive electronic equipment), but with a restriction limiting its use to commercial/industrial installations under the supervision of qualified personnel.

The submitter admits there would be some potential safety issues expanding permitted use of these types of installations and equipment in a home environment, but he does not provide adequate solutions for addressing those safety issues.

It is noted that the proposed use of "international standard configuration type receptacle outlets and cord attachment plugs" for this type of equipment is not a sound solution since those configurations only address the 'appliance inlet' and "connector" (cord connector body) aspects of the power supply wiring, not the plugs and receptacles, and those configurations already are used prevalently with information technology equipment, consumer electronics, and similar forms of household products.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-150 Log #2708 NEC-P12 **Final Action: Reject**

(647.4(A), (B), and (C))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete text of (A) and substitute:

Use of single-phase panelboards and distribution equipment with a higher voltage rating shall be permitted. The system shall be clearly and durably on or immediately adjacent to panelboards and other distribution equipment. Each branch circuit and feeder shall be protected by a common trip circuit breaker or two-pole fused switch.

Revise text: (B):

All junction box, pull box, and cabinet covers shall be clearly and durably marked to indicate the distribution source ~~panel~~ and the system voltage. (C) All feeder and branch circuit ungrounded conductors ~~installed under this section~~ covered by this article shall be identified as to system at all splices and terminations by color(s) different from other premises wiring systems or by approved marking, tagging or other ~~equally effective~~ approved means. The means if identification shall be posted at each branch-circuit distribution equipment ~~panelboard~~ and at the disconnecting means for the building.

Substantiation: Distribution equipment may be other than a panelboard. Such as the common trip circuit breaker or two-pole fused switch. Pull boxes and cabinets should be included in (B). Since (C) does not modify requirements for grounded circuit conductors which will be with ungrounded conductors they should not require marking. If identification is by color, it should be different from other systems.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-151 Log #2711 NEC-P12 **Final Action: Reject**

(647.6(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text:

~~Permanently wired~~ Utilization equipment ~~and~~ receptacles and flush surface devices shall be grounded by a wire-type equipment grounding conductor run with the branch circuit conductors to an equipment grounding bus or terminal(s) prominante and durable marked "TECHNICAL EQUIPMENT GROUND", in the distribution equipment where the branch circuit originates. ~~Originating branch circuit panelboard.~~ The grounding bus or terminal(s) shall be connected to the grounded circuit conductor on the line side of the separately derived system disconnecting means ~~The grounding conductor shall not be smaller than that specified in table 250.122 and run with the feeder conductors~~. (remainder unchanged).

Substantiation: Edit. "Permanently wired" may imply a wiring method of Chapter 3. The provision should also apply to equipment supplied by permanently connected cords where permitted by 400.7 (A)(6), (7), (8), (9). A wire type EGC should be specified as that seems to be the intent. A branch circuit may originate from equipment which is not a panelboard, e.g., a single circuit breaker or fused switch. Reference to Table 250.122 is superfluous, it already applies unless amended.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.

The proposed change is not editorial in nature.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-152 Log #3257 NEC-P12 **Final Action: Reject**
(647.7(A)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

All 125-volt receptacles, cord connectors, flanged surface devices, and attachment plugs used for a 60/120 technical power shall have a ~~unique~~ configuration that ~~differs from all~~ is not compatible with other such devices on the premises ~~attachment plugs~~ and shall be identified for use on this class system. (remainder unchanged)

Substantiation: Edit. “Unique” has various interpretations; a T-slot or locking type receptacle or plug is unique if all other such devices are parallel straight type. Cord connectors, attachment plugs and flanged surface devices should be included.

Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.

The proposed change is not editorial in nature.

See panel action and statement on Proposal 12-153.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-153 Log #4655 NEC-P12 **Final Action: Accept**
(647.7(A)(4))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows, restoring the exception format that was originally used for this material, as follows:

All 125-volt receptacles used for 60/120-volt technical power shall have a unique configuration and shall be identified for use with this class of system.

Exception: 125-volt, single-phase, 15- or 20-ampere rated receptacles and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks, and other similar locations that are restricted to use by qualified personnel.

Substantiation: The reason for the rules in this section is to make as certain as possible that the receptacles aren’t used for cord- and plug-connected loads designed for use on systems with only one ungrounded conductor. For example, if a floor lamp were connected, the screw shell would remain alive at 60V to ground, even with the switch off, assuming a single-pole lampholder. Item (4) asks for a unique configuration, which has yet to be developed. The exception allows a conventionally configured receptacle in “machine rooms, control rooms, equipment rooms, equipment racks, and similar locations that are restricted to use by qualified personnel.” This is essential because the industry is awaiting a larger market presence for these systems prior to developing the configuration. At some point it may be appropriate for the NEC committee to announce a sunset year for this exception, and to thereby force the issue, but that seems premature as of this writing.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-154 Log #1582 NEC-P12 **Final Action: Reject**
(647.8)

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:

Lighting equipment installed under this article for the purpose of reducing electrical noise originating from lighting equipment shall meet the conditions of 647.8(A) through (C).

Disconnecting Means. All luminaires connected to separately derived systems operating at 60 volts to ground, and associated control equipment if provided, shall have a disconnecting means that simultaneously opens all ungrounded conductors. **A lockable disconnecting means shall be installed where T**he disconnecting means ~~shall be~~ **is not** located within sight of the luminaire**.** ~~or be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.~~

Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.

A companion proposal has been submitted to Article 100 containing a new definition for “Disconnecting Means, Lockable.”

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-13.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 650 — PIPE ORGANS

12-155 Log #3457 NEC-P12 **Final Action: Accept in Principle**
(650.3(A) (New))

Submitter: Arthur E. Schlueter, Jr., A. E. Schlueter Pipe Organ Company / Rep. American Institute of Organ Builders & American Pipe Builders Association
Recommendation: Add text to read as follows:

(A) Electronic organs shall comply with the appropriate provisions of Article 640.

Substantiation: The addition of other articles necessitates adding (A) through (D) to the present wording of 650.3 new lettered (A) is the same wording as previously stated in the 2008 Code. “Electronic organs shall company with the appropriate provisions of Article 640”.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-156.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

MARCOVICI, S.: I agree with paragraph (A). However, the text of 650.3 should be changed to read as follows:

“650.3 Other Articles. Circuits and equipment shall comply with 650.3(A) through (C)”. (Note: (B) and (C) are added by Proposals 12-156 and 12-157).

12-156 Log #3458 NEC-P12 **Final Action: Accept in Principle**
(650.3(B) (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 4.1.1 of the NEC Style Manual relating to references to an entire article.

The Technical Correlating Committee further directs that the action on this proposal be rewritten to comply with the NEC Style Manual 2.1.5.2 related to titles for the first level subdivisions.

This action will be considered by the panel as a public comment.

Submitter: Arthur E. Schlueter, Jr., A. E. Schlueter Pipe Organ Company / Rep. American Institute of Organ Builders & American Pipe Builders Association
Recommendation: Add text to read as follows:

(B) Installations of digital/analog sampled sound production technology and associated audio signal processing, amplification and reproduction equipment shall be in accordance with Article 640.

Substantiation: Some pipe organ installations are incorporating digital/analog sampled sound technology which may include amplification and speakers and associate wiring. In pipe organ installations incorporating such technology, should be per Article 640.

Panel Meeting Action: Accept in Principle

Renumber existing text of 650.3 Other Articles as (A) to read as follows:

(A) Electronic organs shall comply with the appropriate provisions of Article 640.

Add new (B) to read as follows:

(B) Installations of digital/analog sampled sound production technology and associated audio signal processing, amplification, and reproduction equipment shall be in accordance with Article 640.

Panel Statement: CMP-12 renumbers existing text and adds new (B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-157 Log #3459 NEC-P12 **Final Action: Accept**
(650.3(C) (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 4.1.1 of the NEC Style Manual relating to references to an entire article.

The Technical Correlating Committee further directs that the action on this proposal be rewritten to comply with the NEC Style Manual 2.1.5.2 related to titles for the first level subdivisions.

This action will be considered by the panel as a public comment.

Submitter: Arthur E. Schlueter, Jr., A. E. Schlueter Pipe Organ Company / Rep. American Institute of Organ Builders & American Pipe Builders Association
Recommendation: Add text to read as follows:

(C) Installations of optical fiber cable shall be in accordance with Article 770.

Substantiation: Some pipe organ installations use fiber optical cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-158 Log #3460 NEC-P12 **Final Action: Accept in Principle**
(650.3(D) (New))

Submitter: Arthur E. Schlueter, Jr., A. E. Schlueter Pipe Organ Company / Rep. American Institute of Organ Builders & American Pipe Builders Association
Recommendation: Add text to read as follows:
(D) Abandoned cables that are not terminated at equipment are to be identified for future use with a tag.
Substantiation: Electronic signal circuit technologies is replacing cotton covered paraffin covered signal circuits wiring. Installation of new solid state relays necessitates the rewiring of the console and relays, abandoned cables are to be identified with a tag.
Panel Meeting Action: Accept in Principle
Revise 650.7 to read as follows:
650.7 Installation of Conductors.
Cables shall be securely fastened in place and shall be permitted to be attached directly to the organ structure without insulating supports. Cables shall not be placed in contact with other conductors. Abandoned cables that are not terminated at equipment shall be identified with a tag.
Panel Statement: CMP-12 realizes the the submitter's text does not belong in 650.3. Rather, it belongs as new sentence at the end of section 650.7.
Further, CMP-12 revised the new sentence to be in mandatory language and removed the requirement "for future use."
CMP-12 recognizes that some abandoned pipe organ cables are impractical to be removed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 660 — X-RAY EQUIPMENT

12-159 Log #2272 NEC-P12 **Final Action: Accept**
(660.2.Long-Time Rating (X-Ray Equipment) and Momentary Rating (X-Ray Equipment) (New))

TCC Action: The Technical Correlating Committee directs that this proposal be referred to Code-Making Panel 15 for correlating action in Article 517.
This action will be considered by Code-Making Panel 15 as a public comment.
Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Relocate and revise two definitions from Articles 660 and 517 to Article 100.
Long-Time Rating (X-Ray Equipment). A rating based on an operating interval of 5 minutes or longer.
Momentary Rating (X-Ray Equipment). A rating based on an operating interval that does not exceed 5 seconds.
This proposal has also been sent to CMP-15 for 517.2.
Substantiation: These definitions are identical and are used in two separate articles of the NEC. This change proposal is in compliance with the NEC Style Manual section 2.2.2.1.
Panel Meeting Action: Accept
Panel Statement: CMP-12 notes to the TCC relocation of definition and correlation with CMP-15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MARCOVICI, S.: These two definitions are specific to Article 660 and should not be relocated. This is the reason why some Articles include the section titled "Definitions."

12-160 Log #2583 NEC-P12 **Final Action: Reject**
(660.4(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Fixed and stationary X-ray equipment shall be connected to the power supply by means of ~~a~~ an identified wiring method covered in Chapter 3. ~~meeting the general requirements of this Code.~~
Substantiation: Edit. Section 110.1 indicates Article 110 covers general requirements, which do not cover wiring methods. The wiring method should be identified for the use.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
The requirements proposed are covered in 90.3.
The proposed change is not editorial in nature.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-161 Log #1936 NEC-P12 **Final Action: Reject**
(660.6(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add to (A) and (B): Overcurrent protection device ratings shall not exceed the manufacturers specification or recommendation.
Substantiation: No ratings are specified; ratings should be determined by the manufacturer or the panel.
Panel Meeting Action: Reject
Panel Statement: The upper limits for overcurrent protection are covered by existing requirements. The proposal does not add clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
SCHAMEL, D.: Change to "Accept in Principal":
Overcurrent protective devices should be separated out under the existing heading "(A) Branch-Circuit Conductors" and this proposal should apply in principal.

12-162 Log #1935 NEC-P12 **Final Action: Accept**
(660.8)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by 300.17 which applies unless modified, and also covers power circuit conductors not specifically noted in this article.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
CROUSHORE, T.: This revision looks harmless, but it deletes a specific reference to 300.17 that makes the requirement clear. It is my opinion that this section is made less clear by removing the specific reference to a specific section in Chapter 3 of the NEC. This proposal should have been rejected.
MARCOVICI, S.: 300.17 deals with power conductors, while 660.8 addresses "control circuit conductors". 660.8 clarifies that the requirement applicable to power conductors also extends to control circuit conductors. Eliminating 660.8 might lead to confusion. Besides, the FPN at 300.17 does not cross-reference 660.8.

12-163 Log #1934 NEC-P12 **Final Action: Accept**
(660.23(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "current-carrying".
Substantiation: Edit. Superfluous phrase; a part can be live but not conducting current at the same time.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MCCLINTOCK, T.: This proposal should have been a Reject. The substantiation suggests a part can be live but not conducting current at the same time. This is contrary to the definition of Live Parts found in Article 100, which states: Live Parts. Energized conductive components. Accordingly, the inclusion of "live current carrying" clarifies the intent of this section.

ARTICLE 665 — INDUCTION AND DIELECTIC HEATING EQUIPMENT

12-164 Log #1933 NEC-P12 **Final Action: Accept in Principle**
(665.3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Superfluous; Chapters 1 through 4 already apply per 90.3 unless amended.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 12-165.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
MARCOVICI, S.: The statement used in this section, "unless specifically amended by this Article" provides a useful clarification regarding the wiring for heating equipment. Recommend retaining this section.

12-165 Log #2806 NEC-P12 **Final Action: Accept**
(665.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text
~~665.3 Other Articles.~~
~~Unless specifically amended by this article, wiring from the source of power to the heating equipment shall comply with Chapters 1 through 4.~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 665.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
MARCOVICI, S.: See My Negative Comment on 12-164.

12-166 Log #4296 NEC-P12 **Final Action: Accept in Principle**
(665.3)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Delete this section.
~~665.3 Other Articles.~~
~~Unless specifically amended by this article, wiring from the source of power to the heating equipment shall comply with Chapters 1 through 4.~~
Substantiation: NEC 90.3 indicates Chapters 1-4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 665.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-169 Log #717 NEC-P12 **Final Action: Reject**
(665.23)

Submitter: Joe Tedesco, Boston, MA
Recommendation: Add a FPN: NFPA 70E-2009, Standard for Electrical Safety in the Workplace, covers arc flash hazard analysis, 130.3.
Substantiation: Signs - "DANGER HIGH VOLTAGE KEEP OUT" are not used in 70E.
Panel Meeting Action: Reject
Panel Statement: The necessity of the FPN in the proposal is not understood, and the substantiation does not clarify the need for it.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 668 — ELECTROLYTIC CELLS

12-170 Log #967 NEC-P12 **Final Action: Reject**
(668.15)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
For equipment, apparatus, and structural components ~~that are required to be grounded by provisions of Article 668~~ the provisions of Article 250 shall apply except that a water pipe electrode shall not be required to be used. Any electrode or combinations of electrodes described in 250.32 shall be <u>used</u> ~~permitted~~.
Substantiation: Edit. The provision should apply where grounding is done by choice and not required, Article 250 already applies unless amended. "Permitted" does not impose a requirement per 90.5(B).
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
The proposed change is not editorial in nature.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-171 Log #2620 NEC-P12 **Final Action: Reject**
(668.21(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Receptacle, cord connectors, and flanged surface outlets and their mating attachment plugs for ungrounded equipment shall be non-grounding types.
Substantiation: Cord connectors and flanged surface outlets should be included. The configuration of a device, in itself, cannot prevent use for equipment required to be grounded. A nongrounding type attachment plug itself does not prevent its misuse for equipment required to be grounded.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-171a Log #CP1202 NEC-P12 **Final Action: Accept**
(668.30)

Submitter: Code-Making Panel 12,
Recommendation: Revise 668.30(D) to read as follows:
(D) Circuit ~~Overcurrent~~ Protection. Circuit protection shall not be required for control and instrumentation that are totally within the cell line working zone.
Substantiation: In electrolytic cell lines there is instrumentation connected directly to the energized cells. The cells operate in the range from 20,000 amps to 500,000 amps. There are no devices that exist to protect this instrumentation from a backfeed or overcurrent. Overcurrent protection in the title is removed because it is misleading to individuals not familiar to cell line working zones.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-172 Log #958 NEC-P12 **Final Action: Reject**
(668.30(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Insert "overcurrent" between "circuit" and "protection".
Substantiation: Edit. The type of protection should be specified as is commonly done throughout the Code.
Panel Meeting Action: Reject
Panel Statement: In electrolytic cell lines there is instrumentation connected directly to the energized cells. The cells operate in the range from 20,000 amps to 500,000 amps. There are no devices that exist to protect this instrumentation from a backfeed or overcurrent.
See panel proposal 12-171a.
The proposed change is not editorial in nature.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 669 — ELECTROPLATING

12-173 Log #1931 NEC-P12 **Final Action: Reject**
(669.5)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "total connected load" to "maximum current to be employed".
Substantiation: Edit. Load may vary; "connected load" is not defined; is it the same as computed load?
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
The proposed change is not editorial in nature.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-174 Log #1930 NEC-P12 **Final Action: Reject**
(669.6(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "protected from" to "not likely to be subject to".
Substantiation: Edit. Present wording indicates protection is required, without exception. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
The proposed change is not editorial in nature.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 670 — INDUSTRIAL MACHINERY

12-175 Log #957 NEC-P12 **Final Action: Reject**
(670.3(A)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
(1) Supply voltage, <u>type of current (ac or dc)</u>, number of phases and frequency if ac, and full-load current.
Substantiation: Edit. Type of current should be indicated.
Panel Meeting Action: Reject
Panel Statement: This change would cause a conflict with NFPA 79.
The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
The proposed change is not editorial in nature.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-176 Log #1904 NEC-P12 **Final Action: Reject**
(670.4(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: A machine ~~shall be considered as an individual unit and therefore~~ shall be provided with <u>an identified</u> disconnecting means <u>attached to or immediately adjacent to the machine and readily accessible</u>. ~~The disconnecting means shall be permitted to be supplied by branch circuits protected by either fuses or circuit breakers.~~ The disconnecting means shall not be required to incorporate overcurrent protection <u>unless required by manufacturers instructions or other Code provisions</u>.
Substantiation: Whether a machine is considered as an individual unit is irrelevant to a requirement to provide disconnecting means and unnecessary. Location of the disconnecting means should be specified. Whether or not supplied by a branch circuit would normally be dependent on whether other branch circuits on the machine are supplied which make the supply conductors a feeder. "Permitted to be supplied by branch circuits protected by either fuses or circuit breakers" is superfluous; this is normally a requirement; what other overcurrent devices can be used? The disconnecting means should be readily accessible. Overcurrent protection may be required by manufacturers instructions or Code rules re: tap conductors from the disconnecting means.
Panel Meeting Action: Reject
Panel Statement: CMP-12 does not agree with the substantiation as it is critical to know if a machine is an integral unit to allow for proper removal of power for isolating and troubleshooting the equipment.
There is insufficient substantiation for the removal of the requirement for the specific types of overcurrent protective devices that are suitable for the proper protection of a supply circuit to industrial machinery. There are various overcurrent protective devices available on the market that are used for protection of machinery circuits; however only fuses and circuit breakers are suitable for protection of machinery supply circuits.
There is insufficient technical substantiation for the requirement for the disconnecting means to be attached to or be immediately adjacent to the machine.
This change would cause a conflict with NFPA 79.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-177 Log #4406 NEC-P12 **Final Action: Accept in Principle**
(670.5)

Submitter: Jay Tamblingson, Rockwell Automation
Recommendation: Add new paragraph 670.5 as follows:
670.5 Short-Circuit Current Rating. Industrial machinery shall not be installed at a point on the electrical system where the available fault current is in excess of its marked short-circuit current rating as marked per 670.3(A)(4).
Substantiation: The present language in 670.5 includes requirements for short-circuit current rating (SCCR) markings on the nameplate for industrial machinery or its control panel. In many cases, the marked SCCR rating for the panel may be less than the interrupting rating(s) or SCCR's of the branch circuit protective devices and other components in the panel, which can lead to confusion to the suitability for the available fault current. The added paragraph provides clear language that the overall SCCR rating on the panel as determined by 670.3(A)(4) is to be used to evaluate suitability.
Similar language can be found in Article 285.6 for TVSS devices and in Section 4.8 of the 2007 NFPA 79.
Panel Meeting Action: Accept in Principle
Add new paragraph 670.5 as follows:
670.5 Short-Circuit Current Rating. Industrial machinery shall be installed where the available fault current does not exceed its marked short-circuit current rating as marked in accordance with 670.3(A)(4).
Panel Statement: CMP-12 edits the text to put it into positive code language.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
MARCOVICI, S.: Industrial equipment should be sized and selected based on the facility's electrical system rating. The place of installation should dictate the machine's ratings. Accordingly, the text of the section should be re-phrased as follows:
"The short-circuit current rating of an industrial machine shall not be less than the available fault-current at the place of installation."

ARTICLE 675 — ELECTRICALLY DRIVEN OR CONTROLLED IRRIGATION MACHINES

19-299 Log #1903 NEC-P19 **Final Action: Accept**
(675.3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Superfluous; already covered by 90.3.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-300 Log #2807 NEC-P19 **Final Action: Accept**
(675.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and associated text
~~675.3 Other Articles.~~
~~These provisions are in addition to, or amendatory of, the provisions of Article 430 and other articles in this Code that apply except as modified in this article.~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 675.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-301 Log #4295 NEC-P19 **Final Action: Accept**
(675.3)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Delete this section.
~~675.3 Other Articles.~~
~~These provisions are in addition to, or amendatory of, the provisions of Article 430 and other articles in this Code that apply except as modified in this article.~~
Substantiation: NEC 90.3 indicates Chapters 1-4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 675.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-302 Log #2191 NEC-P19 **Final Action: Accept**
(675.5)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
675.5 More Than Three Conductors in a Raceway or Cable.
The signal and control conductors of a raceway or cable shall not be counted for the purpose of ampacity adjustment, ~~derating the conductors~~ as required in 310.15(B)(2)(a).
Substantiation: The term "ampacity adjustment factor" is a term used in 310.15(B)(2)(a).
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-303 Log #3022 NEC-P19 **Final Action: Accept**
(675.5)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
675.5 More Than Three Conductors in a Raceway or Cable.
The signal and control conductors of a raceway or cable shall not be counted for the purpose of ampacity adjustment, ~~derating the conductors~~ as required in 310.15(B)(2)(a).
Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a).
Panel Meeting Action: Accept
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-304 Log #4487 NEC-P19 **Final Action: Accept in Principle**
(675.5)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text to read as follows:
675.5 More Than Three Conductors in a Raceway or Cable.
The signal and control conductors of a raceway or cable shall not be counted for the purpose of ~~derating~~ adjusting the ampacity of current-carrying conductors as required in 310.15(B)(2)(a).
Substantiation: Correlation issue. Also to improve *Code* readability. Table 310.15(B)(2)(a) referenced from here uses the specific term "adjustment factors", not the unspecific generalization "derating factors". 366.23(A) and 376.22(B) for the 2008 *NEC*® had been revised [Proposal 8-127/Log #2243 and Proposal 8-157/Log #2754, respectively] from the inconsistent term "correction factors" and imprecise term "derating factors", respectively, to "adjustment factors", the term specifically used in Table 310.15(B)(2)(a). Per the Substantiation of Proposal 8-157, Accepted In Principle by Code Panel 8, trade persons were being confused by the designation inconsistency with other ampacity-modifying factors used elsewhere in the *Code*.
A companion Proposal for 310.15(B)(2)(a) revises its Exceptions to use terminology consistent with its title and Table 310.15(B)(2)(a).
Panel Meeting Action: Accept in Principle
See panel actions on Proposals 19-302 and 19-303.
Panel Statement: The panel actions on Proposals 19-302 and 19-303 meet the submitter's intent. "Ampacity adjustment" is a more concise way of saying what the submitter intends.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-305 Log #1584 NEC-P19 **Final Action: Reject**
(675.8(B))

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
(B) Main Disconnecting Means.
The main disconnecting means for the machine shall provide overcurrent protection, shall be at the point of connection of electric power to the machine, or shall be **a lockable disconnecting means located where readily accessible and within sight.** ~~visible and not more than 15 m (50 ft) from the machine, and shall be readily accessible~~**.** ~~and capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.~~ This disconnecting means shall have a horsepower and current rating not less than required for the main controller.
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: The term "lockable disconnecting means" is not defined in Article 100. It is noted that CMP-1 rejected the proposed definition as it contained requirements that must be located in the body of the code. No technical substantiation has been provided for the replacement of the specific placement distance.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-306 Log #3301 NEC-P19 **Final Action: Reject**
(675.8(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part of the first sentence:...Shall be readily accessible and ~~capable of~~ have permanent integral identified means for being locked in the open (off) position.
Substantiation: Edit. "Capable of being locked" is not specific and allows for makeshift methods. "Off" clarifies open contacts not covers or doors.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided for the proposed revisions.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

19-307 Log #1897 NEC-P19 **Final Action: Reject**
(675.8(B) and (C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (B) and substitute: (B) A fused switch or circuit breaker that simultaneously disconnects all ungrounded supply conductors shall be provided at the point of connection of electric power to the machine. The disconnecting means shall be readily accessible and provided with identified integral and permanent means for locking in the open (off) position. A fusible switch shall have a horsepower and current rating not less than required by 430.110(C).
Revise text of (C): A disconnecting means in accordance with 430.109 and 430.110 shall be provided...(remainder unchanged).
Substantiation: Present wording does not specifically require a main disconnecting means. Proposal specifies a fusible switch or circuit breaker which is implied by present wording re: locking and the exceptions. Provision for the disconnecting means to be up to 50 ft. away is unrealistic due to traveling distances of the machine. Proposal for locking is specific and eliminates makeshift methods.
Proposal for (C) is more specific.

Panel Meeting Action: Reject
Panel Statement: The proposed revisions do not add clarity or improve usability of the code.
Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

ARTICLE 680 — SWIMMING POOLS, FOUNTAINS, AND SIMILAR INSTALLATIONS

17-90 Log #2357 NEC-P17 **Final Action: Accept**
(680.2.Dry-Niche Luminaire)

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:

Dry-Niche Luminaire. A luminaire intended for installation in the floor or wall of a pool, spa, or fountain in a niche that is sealed against the entry of ~~pool~~ water.

Substantiation: Existing text assumes these units are only for use in the walls of swimming pools or fountains. New designs are intended for floor mounting. They are also installed in spas. The word "pool" was deleted from the last sentence, as it is not necessary to specify pool, fountain or spa water. "Water" alone should be sufficient.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-91 Log #2081a NEC-P17 **Final Action: Reject**
(680.2.Equipment, Fixed; Equipment, Portable; and Equipment Stationary)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Move the definitions in section 680.2 for "EQUIPMENT, FIXED," "EQUIPMENT, PORTABLE," and "EQUIPMENT, STATIONARY" to Article 100, and delete those definitions from Article 680. Also consider the deletion of similar definitions for "appliances" from Articles 550 and 551 as the existing definition in Article 100 for EQUIPMENT already includes appliances.

A companion proposal has been sent to CMP-19 for the suggested definitions in 550.2 and 551.2.

Substantiation: The concept of "fixed," "portable," and "stationary" equipment is used throughout the NEC and is not defined in a central location such as Article 100. Some examples of places where this occurs are found in: Article 100 "Electric Signs;" sections 210.23(B) and (C); section 220.53 ("fastened in place"); and the titles to Articles 424, 426, and 427 to name a few. The outcome of the acceptance of this proposal is a more coherent and user friendly code by locating important definitions in only one location. The opportunity would then exist to streamline other parts of the code, thereby, increasing usability.
Panel Meeting Action: Reject
Panel Statement: See NEC Style Manual 2.2.2.1.

Article 100 is beyond the purview of this panel. CMP-17 refers this proposal to the TCC for correlation if needed.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-92 Log #2451 NEC-P17 **Final Action: Reject**
(680.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:

Article 100

DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.

Substantiation: If proposals 680.22 and 680.32 for PSP are accepted, a definition may be required. A proposal is also being sent to Article 100.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-30.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-93 Log #2358 NEC-P17 **Final Action: Reject**
(680.2.Through-Wall Lighting Assembly)

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Delete text as follows:

~~**Through-Wall Lighting Assembly.** A lighting assembly intended for installation above grade, on or through the wall of a pool, consisting of two interconnected groups of components separated by the pool wall.~~

Substantiation: These units are really variations of a no-niche luminaire. If my proposals for Sections 680.23(D) and 680.23(E) are accepted, this definition would no longer be necessary.
Panel Meeting Action: Reject
Panel Statement: As there are distinctions between the definitions of and the requirements for through-wall lighting assemblies and no-niche type luminaires, this section is still required. This term "through-wall lighting assemblies" is used five times in Article 680.
See action and substantiation on Proposal 17-147.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

BLEWITT, T.: UL believes that the distinction between "no-niche luminaire" and "through-wall lighting assembly" is unnecessary for newer lighting technology. However, we are in agreement with the Panel discussion that the proposal is premature given the continuing availability of older technology.

17-94 Log #3469 NEC-P17 **Final Action: Reject**
(680.2 Indoor Pool, Lightning, Thunder, Thunder Storm & 680.28)

Submitter: Todd W McGibney, Law Office of Marc E. Mandel, LLC
Recommendation: Add text to read as follows:

Article 680.

Swimming Pools, Fountains, and Similar Installations.

680.2 Definitions.

Indoor Pool. Manufactured of field constructed equipment designed to contain water on a permanent or semi-permanent basis and is contained in a permanent structure that provides overhead cover and is used for swimming, wading, immersion, or therapeutic purposes.

Lightning. The flashing of light producd by a discharge of atmospheric electricity; also: the discharge itself.

Thunder. The sound that follows a flash of lighting and is caused by sudden expansion of the air in the path of the electrical discharge.

Thunder Storm. A storm accompanied by lighting and thunder.

680.28 Indoor Pool Safety during a Thunderstorm. An indoor pool should be properly grounded in accordance with this Code. Compliance with this Code and proper maintenance of equipment greatly reduces the risk of injury to swimmers using the indoor pool during a thunderstorm. This code should not be construed to prevent swimmers from using an indoor pool during a thunderstorm.

Substantiation: During inclement weather, many indoor pools operate under the recommendation that swimmers must exit the pool and remain out of the pool for a full 30 minutes from the last report of lightning or thunder. As a result, the swimmer's recreation or therapeutic time in the pool is disrupted. This need not be the case, because there is virtually no risk of injury to an individual who is swimming in a properly grounded building pursuant to the National Electrical Code. In the event that lightning strikes a properly grounded building containing an indoor pool, the charge should be carried away from the body of water and not pose danger to the swimmers. In fact, there has not been any recorded deaths to persons in indoor pools from lightning. Richard Kithil & Kevin Johnston, *Lightning and Aquatics Safety: A Cautionary Perspective for Indoor Pools*, http://www. lightningsafety.com/nlsi pls/indoor pools.html (accessed Nov. 1, 2008).
Panel Meeting Action: Reject
Panel Statement: The proposal provides recommendations concerning pool use. No enforceable NEC requirement is proposed. See 90.1.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-94a Log #CP1700 NEC-P17 **Final Action: Accept**
(Table 680.3)

Submitter: Code-Making Panel 17,
Recommendation: Add a new row to Table 680.3 prior to "Audio Equipment Article 640, Parts I and II" to read as follows:

Topic Section or Article

Site lighting systems operating at 30 volts or less 411.4(B).

Substantiation: CMP-17 adds a reference to 411.4(B) to Table 680.3 for clarity and usability.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-95 Log #1332 NEC-P17 **Final Action: Reject**
(680.3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Except as modified in this article, wiring and equipment in or ~~adjacent~~ associated with pools, ~~and~~ fountains, spas, hot tubs, or hydromassage bathtubs shall comply...(remainder unchanged).
Substantiation: "Adjacent" is subjective, not defined and a term to be avoided. The additional equipment should be included.
Panel Meeting Action: Reject
Panel Statement: The submitter is intending to change the current meaning of the code by using the word "associated."
Spas, hot tubs, or hydromassage bathtubs are presently covered by the code in this section as written. CMP-17 refers the submitter to the definitions in 680.2.
CMP-17 does not agree with the submitter's substantiation. The submitter has not provided technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-96 Log #2808 NEC-P17 **Final Action: Accept in Part**
(680.3)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal to identify what was not accepted and the reason it was not accepted.
This action will be considered by the panel as a public comment.
Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section, associated text and Table
Delete this section and Table.
~~680.3 Other Articles.~~
~~Except as modified by this article, wiring and equipment in or adjacent to pools and fountains shall comply with other applicable provisions of this Code, including those provisions identified in Table 680.3.~~
~~Table 680.3 Other Articles~~

Ballot Results: Affirmative: 11

17-98 Log #1902 NEC-P17 **Final Action: Reject**
(680.4)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: All electrical equipment in the water, walls, walls or decks of pools, fountains, (except portable decorative fountains) ~~and similar installations,~~ or associated with such installations shall comply with applicable provisions of this article.
Substantiation: Proposal clarifies that associated equipment and installations not installed in water, walls or decks are covered. "Similar" is subjective, not defined, and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated a problem to this section of the code.
Portable decorative fountains are addressed in Part V of Article 680.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-99 Log #2359 NEC-P17 **Final Action: Accept in Part**
(680.6)

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
680.6 Grounding. Electrical equipment shall be grounded in accordance with Parts V, VI, and VII of Article 250 and connected by wiring methods of Chapter 3, except as modified by this article. The following equipment shall be grounded:
(1) ~~Through-wall lighting assemblies and~~ U~~u~~nderwater luminaires, other than those ~~low-voltage~~ lighting products listed for the application without a grounding conductor
(2) All electrical equipment located within 1.5 m (5 ft) of the inside wall of the specified body of water
(3) All electrical equipment associated with the recirculating system of the specified body of water
(4) Junction boxes
(5) Transformer and power supply enclosures
(6) Ground-fault circuit interrupters
(7) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the specified body of water
Substantiation: Item 5 is updated to reflect DC rated LED luminaires. The term "Through-wall lighting assemblies" is not necessary. It is really a type of underwater luminaire. "Underwater luminaires" is sufficient. The exception for low-voltage lighting products listed for use without a grounding conductor is overly restrictive. The exception should be made more generic. The standard used for all types of underwater luminaires, UL 676 is being revised to accommodate both low and line voltage luminaires that do not require an equipment grounding conductor.
Panel Meeting Action: Accept in Part
Panel Statement: CMP-17 accepts the submitter's text change for (5) Transformer "and power supply" enclosures.
CMP-17 does not accept the text change pertaining to (1). Substantiation was not provided to justify the requirements for these new installation requirements.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: The proposed revisions were intended to update the Code to address new technologies, particularly the use of LED's and plastics in underwater luminaires. These changes would reduce confusion between installers and Inspection Authorities when dealing with advancing luminaire technologies. More specific substantiation shall be provided during the Comment phase.

17-100 Log #3591 NEC-P17 **Final Action: Reject**
(680.8)

Submitter: Joseph J. White, KCI Technologies
Recommendation: Revise text to read as follows:
680.8 Overhead Conductor Clearances. Overhead conductors shall meet the clearance requirements in this section. Where a minimum clearance from the water level is given, the measurement shall be taken from the maximum water level of the specified body of water. <u>Above ground permanently installed and storable swimming pools not having a walkable surface at the maximum water level or a deck constructed at the top level of the pool may have the conductor clearances in Table 680.8 maintained from the ground.</u>
Substantiation: Pools not having a walkable surface at the maximum water level of the pool or do not have a deck constructed around the perimeter of the pool should not require overhead conductor clearances to be maintained from the maximum water level. It is my understanding that the clearance requirements are intended to protect persons from electrical hazards when using such devices as skimmers. If a walkable surface does not exist, and a person must stand on the ground to use a skimmer, why not maintain the clearances in Table 680.8 from the ground.
Panel Meeting Action: Reject
Panel Statement: The code is clear as written. No substantiation was provided to justify this change. The submitter's change would reduce safety. See 90.1.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-101 Log #532 NEC-P17 **Final Action: Reject**
(Figure 680.8)

Submitter: Alan Chech, Alan Chech Electrical Seminars
Recommendation: Revise text to read as follows:
Figure 680.8 - Dimension "A" is not drawn in the correct place. By definition of max. water level is highest water level it can reach before overflowing?
Substantiation: "A" should be drawn from cable to level of pool deck in this case, unless skimmer level is max. water level?
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
The submitter has not specified which "A" is incorrect and how it (they) is to be redrawn.
Presently, "A" correctly illustrates the clearance in any direction to the water level, edge of water surface, base of diving platform, or permanently anchored raft.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
MALDONADO, J.: This Proposal should have been to "Accept in Principle". The discussion within the ROC meeting was that the "A" dimension in the center of Figure 680.8 only works when the pool has a negative edge at one of the ends of the pool that is not shown in the diagram and the water level as shown is at the level of the outflow level of the pool.
Recommendation: Add an asterisk beside the "A" dimension in the center of the diagram, with a footnote asterisk that Clearly identifies the intent of this dimension. Add "A*" to diagram with a footnote below the diagram that reads "* =This dimension requires the outflow level of the pool water is at the level shown."
Comment on Affirmative:
BLEWITT, T.: The submitter did not provide a drawing depicting the changes requested.

17-102 Log #152 NEC-P17 **Final Action: Reject**
(680.8(B))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Change "communication" to "communications".
Substantiation: Section 3.3.3 of the NEC Style Manual States: "**3.3.3 Plural.** Unless referring to a single item of equipment, references to electrical components and parts shall be plural rather than singular. This results in greater consistency and makes it clear that the *NEC* provision refers to *all* components or parts of a given type or class." Changing "communication" to "communications" will correlate with the title of Chapter 8, "Communications Systems"**.**
Panel Meeting Action: Reject
Panel Statement: CMP-17 contends that the wording in the code is correct in the context as used.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-103 Log #475 NEC-P17 **Final Action: Reject**
(680.10 Exception No. 1 (New))

Submitter: Paul W. Abernathy, Electrical Service Specialists & The Electrical Guru
Recommendation: Revise text to read as follows:
680.10 Underground Wiring Location. Underground wiring shall not be permitted under the pool or within the area extending 1.5 m (5 ft) horizontally from the inside wall of the pool unless this wiring is necessary to supply pool equipment permitted by this article. Where space limitations prevent wiring from being routed a distance 1.5 m (5 ft) or more from the pool, such wiring shall be permitted where installed in complete raceway systems of rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum cover depth shall be as given in Table 680.10.
Table 680.10 Minimum Cover Depths
Wiring Method Minimum Cover mm in.
Rigid metal conduit (150 mm/6 in.)
Intermediate metal conduit (150 mm/6 in.)
Nonmetallic raceways listed for direct burial without concrete encasement (450 mm/18 in.)
Other approved raceways* (450 mm/18 in.)
*Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm (2 in.) thick.
<u>Exception No. 1: Where nonmetallic raceways listed for direct burial serving Residential Branch Circuits rated 120V or Less with GFCI protection and maximum Overcurrent Protection of 20 Amperes are installed below a minimum of (100 m/4 in.) concrete slab or equivalent, the reduction of depth may be reduced to (150 mm/6 in.).</u>
Substantiation: Reason for Exception - While we know the intent of the NEC and 680.10 depth requirement was to reduce the shock effect of saturation around the 5 ft. boundary of a pool or spa area. The adding of a concrete slab area offers additional protection as well as a barrier to excessive moisture. While concrete does absorb moisture its wicking properties would reduce the effects down to the conduit which is already sealed in a direct bury rated conduit. While all conduits underground are considered wet locations the conductors within the conduit will already be rated for wet conditions.
If you go beyond the 5 ft. boundary listed in 680.10 you are able to refer to 300.5 and its depth allowances. In regards to the installation of pool lighting for example, the 20A protected GFCI circuit required by the NEC allows for a reduction if under a concrete slab or equivalent of 6 in.... and if under a 4 in. slab with no vehicle traffic a reduction to 4 in. provided you are outside of the 5 ft. boundary area listed in 680.10.
While I agree the area around the pool is subject to saturation and effects are greater on leaking voltage, I would venture to say the concrete adds for this element of protection as well as the conduit. However, the protection of the circuit by GFCI requirements would protect this as it does for the lighting issue with the wet niche which is in direct contact with the water anyway... reducing the touch potential on the ground around it should be taken care of in regards to the new requirement in 680.25(C) and the equipotential requirement of 3 ft. on the decking slab... which probably should be increased to 5 ft. if you are going to make the DEPTH issue around the pool meet the space requirements of 680.10.
Panel Meeting Action: Reject
Panel Statement: As the submitter proposes, conduit could be run under a pool. Joints are not watertight. This is not an approved installation method.
The submitter has not provided technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-104 Log #1518 NEC-P17 **Final Action: Reject**
(680.12)

Submitter: L. Keith Lofland, IAEI
Recommendation: Revise text to read as follows:
680.12 Maintenance Disconnecting Means. One or more means to ~~simultaneously~~ disconnect all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be readily accessible<u>, grouped,</u> and within sight from its equipment and shall be located at least 1.5 m (5 ft) horizontally from the inside walls of a pool, spa, or hot tub unless separated from the open water by a permanently installed barrier that provides a 1.5 m (5 ft) reach path or greater. This horizontal distance is to be measured from the water's edge along the shortest path required to reach the disconnect.
Substantiation: How does one go about "simultaneously" disconnecting two or more individual disconnects? Changes to Section 680.12 in the 2002 NEC made it clear that more than one individual disconnect was permitted as maintenance disconnects at pools, spas, or hot tubs. May 2001 ROP 20-69 (page 1171) added the words "One or more" for disconnecting means with part of the substantiation stating "…multiple disconnects may be required, and the present language (1999 NEC) suggests only one is allowed." The Panel statement for this proposal states, "The panel agrees that the original wording of 680-12 did not clearly communicate the panel's intention with respect to requirements for disconnects…" (plural).

For the 2008 NEC, the original proposal (17-79) asking for "simultaneously" to be added to 680.12 was rejected. Comment 17-70 brought the "simultaneously" issue back to CMP-17. In the substantiation, the submitter made the following statement: "Simultaneous disconnection should be specified since literal wording, infers that two or three individual disconnecting means may be used." This statement from the submitter went unchecked by the panel and the word "simultaneously" was accepted at 680.12. I believe that statement should have been refuted by CMP-17 since the original 2002 proposal clearly indicated that "two or three individual disconnecting means" are permitted by 680.12.

If it is the intent of CMP-17 (as indicated in 2002) that more than one individual disconnecting means is permitted by 680.12, then "simultaneous" disconnection is unenforceable. Which is it, "simultaneous" disconnection or more than one individual disconnecting means?

Add the word "grouped" here to coincide with other multiple disconnecting means requirements in the Code [225.34, 230.71(A), 230.72(A)].

Panel Meeting Action: Reject

Panel Statement: "Simultaneous disconnection" refers to the conductors within a switch and not to the simultaneous disconnection of more than one disconnect switch. CMP-17 rejects the need to group disconnects for several pieces of equipment.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-105 Log #875 NEC-P17 **Final Action: Reject**
(680.12 Exception (New))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete first sentence and substitute: Approved means to simultaneously disconnect the ungrounded conductors of each branch circuit supplying utilization equipment shall be grounded.

Add: *Exception: The disconnecting means shall not be required to be within sight from the equipment it controls if provided with an identified integral permanent means for locking in the open (off) position.*

Substantiation: The means specified for "all" conductors could be a feeder or service disconnecting means. The proposed exception is similar to other sections where lock-off provisions provide safety. It may not be practical to have disconnecting means within sight (50 ft) of equipment for large pools or fountains.

Panel Meeting Action: Reject

Panel Statement: See panel action and substantiation on Proposal 17-104.

The exception is not acceptable as each means is required to be readily accessible and within sight from its equipment.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-106 Log #3605 NEC-P17 **Final Action: Accept**
(680.13)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with 3.1.3 of the NEC Style Manual regarding mandatory language in Fine Print Notes.

This action will be considered by the panel as a public comment.

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Add new text to read as follows:

680.13 Voltages for Wet Contact.

Requirements of this article recognized for an operating voltage of 15 volts or less and for an operating voltage of more than 15 volts are based the assumed use of sinusoidal ac. Where the supply source is other than sinusoidal ac, the following wet contact voltage values shall apply instead of 15 volts sinusoidal ac:

(1) 21.2 volts peak for nonsinusoidal ac.

(2) 30 volts for continuous dc.

(3) 12.4 volts peak for dc that is interrupted at a rate of 10 to 200 Hz.

FPN: Immersion is not included in the meaning of wet. See Chapter 9, listing references, Table 11(A), Note 2, last sentence, and Table 11(B), Note 4, last sentence.

Substantiation: The result of a July 2008 e-mail discussion amongst some fellow Code Panel 17 members, originating with UL's Code Panel 17 member Gary Siggins, regarding wet contact voltage values necessary for **emerging lighting technologies applied to underwater luminaires**. Energy-saving "green" light source technologies, such as light-emitting diodes (LEDs), use supply sources other than conventional sinusoidal ac, such as continuous dc and switching power supplies. The present values for requirements in Article 680 were based solely on commonly available sinusoidal ac.

These same wet contact voltage values for sinusoidal ac, nonsinusoidal ac, continuous dc and switched dc used to appear as installation requirements in Article 725 but have been relocated to Table 11(A), Note 2, and to Table 11(B), Note 4, solely as listing references ["For listing purposes …", "As part of the listing …", etc.] based on all relevant Article 725 requirements mandating only the use of listed equipment. Article 680 has many requirements mandating use of listed equipment but some installation requirements still govern equipment that may or may not be listed.

Code Panel 17 may wish to add FPNs referencing this new 680.13 to 680.23(A)(3), 680.23(A)(8), 680.24(A)(2), 680.24(A)(2)(c), 680.33(A), 680.33(B), 680.43(B)(2), 680.51(A), and 680.62(F).

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

BLEWITT, T.: This new text may need correlation with that of additional changes introducing the term "Voltages for Wet Contact."

17-107 Log #4656 NEC-P17 **Final Action: Reject**
(680.20(C) (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as the proposal does comply with the NFPA Regulations Governing Committee Projects.

This action will be considered by the panel as a public comment.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Insert the following lettered paragraph:

(C) GFCI Protection. Outlets supplying pool pump motors with short-circuit and ground-fault protection rated 15 or 20 amperes, and connected to 120-volt, 208-volt, or 240-volt branch circuits, single-phase, and whether by receptacle or by direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.

Delete 680.22(B) and reletter Section 680.22 accordingly.

Substantiation: This proposal relocates requirements for swimming pool pump motors from a section that covers area lighting and receptacles to one that actually covers the motors described in the rule. There is little substantive change in this proposal beyond correcting the improper placement of this requirement. The proposal does fix the minor problem that a hard-wire line-to-line connection from a wye distribution is not addressed in the current wording

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.

The submitter did not reference the correct section.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-108 Log #2566 NEC-P17 **Final Action: Accept**
(680.21(A)(5))

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute

Recommendation: Change the last sentence of this section to read:

The flexible cord shall include a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG. The cord shall terminate in a grounding-type attachment plug.

Substantiation: This change corrects a conflict with 680.7(B). Since Part I and Part II of Article 680 pertain to permanently installed pools, there should be no difference between the requirements of 680.7(B) and 680.21(A)(5).

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-109 Log #336 NEC-P17 **Final Action: Accept in Principle**
(680.21(B))

Submitter: Paul J. Cormier, Worcester Electrician School

Recommendation: Revise as follows:

Where the bonding grid is connected to the equipment grounding conductor of the motor circuit in accordance with the second paragraph of ~~680.26(B)(4)~~ 680.26(B)(6)(a), the branch-circuit wiring shall comply with 680.21(A).

Substantiation: The existing referenced article was relocated.

Panel Meeting Action: Accept in Principle

680.21(B) to read as follows:

Where the bonding grid is connected to the equipment grounding conductor of the motor circuit in accordance with the second ~~paragraph~~ sentence of ~~680.26(B)(4)~~ 680.26(B)(6)(a), the branch-circuit wiring shall comply with 680.21(A).

Panel Statement: CMP-17 agrees with the submitter but editorially changes "paragraph" to "sentence."

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-109a Log #CP1701 NEC-P17 **Final Action: Accept**
(680.22)

Submitter: Code-Making Panel 17,

Recommendation: Remove the word "Area" from the title of 680.22.

Substantiation: This section clearly does not cover underwater luminaires, which are covered in 680.23.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-110 Log #511 NEC-P17 **Final Action: Reject**
(680.22)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Insert a hyphen between "circuit" and "interrupter" in (A)(4), (C)(2), (C)(3), and (C)(4).
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-29.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-111 Log #2334 NEC-P17 **Final Action: Reject**
(680.22(A))

Submitter: David Nemchik, Medina County Building Department [Ohio]
Recommendation: Revise text as follows:
(1) Circulation and Sanitation System, Location. Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be located ~~at least 3.0 m (10 ft) from the inside walls of the pool, or~~ not less than 1.83 m (6 ft) from the inside walls of the pool ~~if they meet all of the following conditions:~~
~~(1) Consist of single receptacles~~
~~(2) Employ a locking configuration~~
~~(3) Are of the grounding type~~
~~(4) Have GFCI protection~~
(2) Other Receptacles, Location. Other receptacles shall be located at least 3.0 m (10 ft) from the inside walls of the pool, or not less than 1.83 m (6 ft) from the inside walls of the pool if they meet all of the following conditions:
(1) Employ a locking configuration
(2) Are of the grounding type
Substantiation: When the 2008 NEC deleted 680.22(A)(4) Restricted Space paragraph that was in the 2005 NEC, any reason to treat circulation and sanitation system receptacles differently than other receptacles was eliminated. In the 2008 NEC a receptacle located 6 ft to 10 ft from the pool must only be twist lock if it is for the pool circulation and sanitation system receptacles. The circulation and sanitation system equipment is a known variable with a known safety record. Items powered by the other receptacles are unknown variables with unknown safety and might be handheld and placed on the pool top rail. The safety of these items should be of greater or equal concern than the circulation and sanitation system equipment.
Panel Meeting Action: Reject
Panel Statement: Sanitation equipment receptacles located between 6 ft and 10 ft is a reduction of safety without the additional four requirements.
Receptacles for pool pump motors may be of a higher voltage than 125 V and therefore may present a higher danger than 125 volt circuits.
The submitter has not provided adequate technical substantiation.
For (2), see panel action and substantiation on Proposal 17-119.
Number Eligible to Vote: 11

(680.22(A) and (B))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
680.22 Area Lighting, Receptacles, and Equipment.
(A) Receptacles.
(1) Circulation and Sanitation System, Location. Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be located at least 3.0 m (10 ft) from the inside walls of the pool, or not less than 1.83 m (6 ft) from the inside walls of the pool if they meet all of the following conditions:
(1) Consist of single receptacles
(2) Employ a locking configuration
(3) Are of the grounding type
(4) Have ~~GFCI~~ power safe protector protection
(2) Other Receptacles, Location. Other receptacles shall be not less than 1.83 m (6 ft) from the inside walls of a pool.
(3) Dwelling Unit(s). Where a permanently installed pool is installed at a dwelling unit(s), no fewer than one 125-volt, 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located not less than 1.83 m (6 ft) from, and not more than 6.0 m (20 ft) from, the inside wall of the pool. This receptacle shall be located not more than 2.0 m (6 ft 6 in.) above the floor, platform, or grade level serving the pool.
(4) ~~GFCI~~ Power Safe Protector Protection. All 15- and 20-ampere, single-phase, 125-volt receptacles located within 6.0 m (20 ft) of the inside walls of a pool shall be protected by ~~a ground-fault circuit-interrupter~~ power safe protector.
~~(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15- and 20-amperes, 125 volt or 240 volt, single-phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.~~
(B) Power Safe Protector Protection.
(1) 120V Outlets. Outlets supplying pool pump motors from branch circuits with short-circuit and power safe protector protection rated 15 and 20 amperes, 125 volt or ~~240 volt,~~ single phase, whether by receptacle or direct connection, shall be provided with power safe protector protection for personnel.
(2) 240V Outlets. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, ~~125 volt or~~ 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.
(C)(4) ~~GFCI~~ Power Safe Protector Protection in Adjacent Areas. Luminaires, lighting outlets, and ceiling-suspended (paddle) fans installed in at the area extending between 1.5 m (5 ft) and 3.0 m (10 ft) horizontally from the inside walls of a pool shall be protected by a ~~ground-fault circuit-interrupter~~ power safe protector unless installed not less than 1.5 m (5 ft) above the maximum water level and rigidly attached to the structure adjacent to or enclosing the pool.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Delete entire section 680.22(A)(1).
Substantiation: There is no need for this section with the change of all other receptacles to be permitted to be 6 ft from a pool. If I can have a standard receptacle 6 ft from a pool, why would a receptacle for a pool pump 9 ft from a pool have to comply with all the requirements of 680.22(A)(1)?
Panel Meeting Action: Reject
Panel Statement: See panel action and substantiation on Proposal 17-111.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-116 Log #2543 NEC-P17 **Final Action: Reject**
(680.22(A)(1) and (2))

Submitter: Rick Wohl, Bismarck, ND
Recommendation: Revise text to read as follows:
(1) ~~Circulation and Sanitation System,~~ Location. Receptacles ~~that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system~~ shall be located at least ~~3.0 m (10 ft) from the inside walls of the pool, or not less than~~ 1.83 m (6 ft) from the inside walls of the pool, ~~if they meet all of the following conditions:~~
~~(1) Consist of single receptacles~~
~~(2) Employ a locking configuration~~
~~(3) Are of the grounding type~~
~~(4) Have GFCI protection~~
~~**(2) Other Receptacles, Location.** Other receptacles shall be not less than 1.83 m (6 ft) from the inside walls of a pool.~~
Substantiation: 680.22(A)(2) allows any receptacle other than those for the circulation or sanitation system to be located not less than 6 ft from the inside walls of a pool. 680.22(A)(1), as it is currently written, requires receptacles for the circulation or sanitation system to be located not less than 10 ft from the inside walls of a pool unless (4) four specific requirements are met. If these requirements are met, the distance may be reduced to not less than 6 ft.
If receptacles for purposes other than providing power to the circulation and sanitation systems are allowed within 6 ft of the inside walls of the pool, those for the circulation and sanitation system need not be subjected to additional restrictions.
Panel Meeting Action: Reject
Panel Statement: See panel action and substantiation on Proposal 17-111.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-117 Log #3481 NEC-P17 **Final Action: Reject**
(680.22(A)(2))

Submitter: Danny Thomas, Henderson, NC
Recommendation: Revise text to read as follows:
(2) Other Receptacles, Location. Other receptacles shall be not less than ~~1.83 m (6 ft)~~ 3.0 m (10 ft) from the inside walls of a pool.
Substantiation: 680.22(A)(1) allows a receptacle to be installed for water pumps or for other loads directly related to the circulation and sanitation system as close as 1.83 m (6 ft) if the receptacle meets all of the 4 conditions listed.
This receptacle in 680.22(A)(2) which could be a duplex can be located as close as 1.83 m (6 ft) from the inside wall of the pool without being required to meet any conditions.
Panel Meeting Action: Reject
Panel Statement: See panel action and substantiation on Proposal 17-119.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-118 Log #3483 NEC-P17 **Final Action: Reject**
(680.22(A)(2))

Submitter: Danny Thomas, Henderson, NC
Recommendation: Revise text to read as follows:
(2) Other Receptacles, Location. Other receptacles shall be not less than ~~1.83 m (6 ft)~~ 3.0 m (10 ft) from the inside walls of a pool.
Substantiation: 680.22(A)(1) allows a receptacle to be installed for water pumps or for other loads directly related to the circulation and sanitation system as close as 1.83 m (6 ft) if the receptacle meets all of the 4 conditions listed.
This receptacle in 680.22(A)(2) which could be a duplex can be located as close as 1.83 m (6 ft) from the inside wall of the pool without being required to meet any conditions.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-119 Log #2231 NEC-P17 **Final Action: Reject**
(680.22(A)(2) and (3))

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Revise text to read as follows:
"...shall not be less than 10 ft from the inside wall.
Substantiation: The change to 6 ft in the 2008 NEC increases electrical hazards around the pool. Under the 2008 NEC, a radio with a 6 ft cord would be able to be at the edge of the pool, allowing somebody in the pool to come in contact with an electrical appliance, the change to 6 ft does not comply with 90.1.
Panel Meeting Action: Reject
Panel Statement: CMP-17 reaffirms its position to retain the 6 ft requirement.
The submitter has not provided technical substantiation to make this change.
CMP-17 refers the submitter to Comment 17-85a of the last cycle, with a panel statement that read as follows: "The panel changed 5 ft to 6 ft and 10 ft to 6 ft for receptacle locations relative to distance to water to ensure consistency throughout Article 680. The 10 ft has been in the Code for many years, previous to the introduction of GFCI devices. The panel determined that 6 ft is sufficient. 6 ft correlates with standard power supply cord lengths."
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-120 Log #3482 NEC-P17 **Final Action: Reject**
(680.22(A)(3))

Submitter: Danny Thomas, Henderson, NC
Recommendation: Revise text to read as follows:
Dwelling Units. Where a permanently installed pool is installed at a dwelling unit(s), no fewer than one 125 volt, 15- or 20-ampere receptacle on a general purpose branch circuit shall be located not less than ~~1.83 m (6 ft)~~ 3.0 m (10 ft) and not more than 6.0 m (20 ft) from, the inside wall of the pool.
Substantiation: 680.22(A)(1) allows a receptacle to be installed for water pumps or for other loads directly related to the circulation and sanitation system as close as 1.83 m (6 ft) if the receptacle meets all of the 4 conditions listed.
This receptacle in 680.22(A)(2) which could be a duplex can be located as close as 1.83 m (6 ft) from the inside wall of the pool without being required to meet any conditions.
Panel Meeting Action: Reject

Ballot Results: Affirmative: 11

17-122 Log #193 NEC-P17 **Final Action: Accept in Principle**
(680.22(B))

Submitter: Bryan P. Holland, City of North Port
Recommendation: Revise as follows:
(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with S.C. and G.F. protection rated 15 or 20 amperes, ~~125 volt~~ 120 volt ~~or~~ through 240 volt, single phase...
Substantiation: Changing to 120 volts indicates a nominal outlet rating rather than a 125 volt device rating. Changing from "or" to "through" will include 208 volt systems which could have the same hazard of a 120 volt or 240 volt system.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and substantiation on Proposal 17-126.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-123 Log #337 NEC-P17 **Final Action: Reject**
(680.22(B))

Submitter: Paul J. Cormier, Worcester Electrician School
Recommendation: Revise as follows:
(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, 125 volt or 240 volt, single phase, and outlets supplying pool water heaters, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: Since the NEC has elevated the protection of direct connection pool pump motors, it only seems appropriate to do the same to pool water heaters.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation to support the expansion of this requirement.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-124 Log #567 NEC-P17 **Final Action: Accept in Principle**
(680.22(B))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text to read as follows:
(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, 125 volt ~~or~~ through 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: This proposal is an effort to include this GFCI requirement for all outlets for pool pump motors rated 15 or 20 amperes, 125 volts, 200 volts, 208 volts, and 240 volts. This proposal is an effort to correct an inadvertent oversight in the 2008 NEC development process.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and substantiation on Proposal 17-126.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-125 Log #1521 NEC-P17 **Final Action: Accept in Principle**
(680.22(B))

Submitter: L. Keith Lofland, IAEI
Recommendation: Revise text to read as follows:
680.22(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, 125 volt ~~or 240 volt~~ through 250 volts, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: Wording in 2008 NEC does not require GFCI protection such things as 208 volt motors. We're back to the language and problems that arose from the 1999 NEC. Only two selected voltages (125 volt and 240 volt) require GCI protection as currently written.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and substantiation on Proposal 17-126.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-126 Log #2784 NEC-P17 **Final Action: Accept**
(680.22(B))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise 680.22(B) as shown:
(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, ~~125~~ 120 volt ~~or~~ through 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault-circuit-interrupter protection for personnel.
Substantiation: This proposal is an effort to include this GFCI requirement for all outlets for pool pump motors rated 15 or 20 amperes, 120 V thru 240 volts. We believe that it was an oversight during the 2008 NEC proposal cycle to specify 125 V or 240 V. This leaves out 208 V motors which by all of the substantiation submitted should be included.
In addition, this proposal recommends changing from 125 V to 120 V since the 125 V may not be applicable in all instances. For example, if a 120 V pool motor is direct wired, the "outlet" is not rated 125 V. The 125 V rating is applicable to a receptacle, but not to a generic reference to "outlet".
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-127 Log #3023 NEC-P17 **Final Action: Accept in Principle**
(680.22(B))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, ~~125~~120 volt or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: Circuits are rated 120V, not 125V.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and substantiation on Proposal 17-126.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-128 Log #3669 NEC-P17 **Final Action: Accept in Principle**
(680.22(B))

Submitter: Mark Smythe, Smythe Electric Inc.
Recommendation: Revise text as follows:
680.22(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, 125 volt, 208 volt, or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with a ground-fault circuit-interrupter protection for personnel.
Substantiation: 208 volt single phase would be a very common voltage supplying pool equipment in a non dwelling unit installation. The argument could be made that this is not required to be GFCI protected as presently worded in this article. This installation should be provided the same GFCI protection as the 125 volt and 240 volt systems.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and substantiation on Proposal 17-126.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-129 Log #3808 NEC-P17 **Final Action: Accept in Principle**
(680.22(B))

Submitter: Mike Weitzel, Bechtel
Recommendation: Revise existing text.
680.22(B) Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, ~~125 or 240 volt~~. 120 through 250 volt single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: 2008 NEC Code wording does not include 208-volt single phase pump motors. The suggested language would cover these motors, and the slightly wider range of voltages will aid code enforcement personnel
Panel Meeting Action: Accept in Principle
Panel Statement: See action and substantiation on Proposal 17-126.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-130 Log #4401 NEC-P17 **Final Action: Reject**
(680.22(B))

Submitter: Carvin DiGiovanni, Association of Pool & Spa Professionals
Recommendation: Delete the following text:
~~(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, 125 volt or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.~~
Substantiation: This requirement on all pool pumps is unwarranted and will be costly (minimum $100/pool, up to $500/pool for the more elaborate pools). This requirement will also cause a great deal of service issues.
Panel Meeting Action: Reject
Panel Statement: CMP-17 refers the submitter to the statement in Comment 17-75 of the last cycle.
This change would reduce the level of safety that this requirement provides.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-131 Log #2234 NEC-P17 **Final Action: Reject**
(680.22(C), FPN (New))

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Add new FPN as follows:
(C) Luminaires, lighting outlets and ceiling suspended (paddle) fans.
<u>FPN: See 411.4(B) for lighting systems operating at 30 volts or less.</u>
Substantiation: Make the NEC more user friendly and to remind people of that section for LV lighting around a pool.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 17-94a.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-132 Log #3685a NEC-P17 **Final Action: Reject**
(680.22(C)(6))

Submitter: Richard F. VanWert, Middle Department Inspection Agency
Recommendation: Relocate 411.4(B) to 680.22(C)(6).
This proposal has also been sent to CMP-18 as it references 411.4(B).
Substantiation: This practical and useful information should be included in Article 680.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 17-94a.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-133 Log #192 NEC-P17 **Final Action: Reject**
(680.22(E))

Submitter: Bryan P. Holland, City of North Port
Recommendation: Revise as follows:
(E) Other Outlets. Other outlets shall be not less than ~~3.0 m (10 ft)~~ <u>1.83 m (6 ft)</u> from the inside walls of the pool.
Substantiation: This change will result in a consistent dimension with the rest of Article 680, including 680.22, 680.34, 680.43, 680.62, and 680.71.
Panel Meeting Action: Reject
Panel Statement: CMP-17 rejects the proposal as the requirement would reduce the level of safety.
CMP-17 upholds its position as provided in the last cycle, Comment 17-82 Log #1798.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-134 Log #1522 NEC-P17 **Final Action: Reject**
(680.22(E))

Submitter: L. Keith Lofland, IAEI
Recommendation: Revise text to read as follows:
680.22(E) Other Outlets. Other outlets shall be not less than ~~3.0 m (10 ft)~~ <u>1.83 m (6 ft)</u> from the inside walls of the pool. Measurements shall be determined in accordance with 680.22(A)(5).
FPN: Other outlets may include, but are not limited to, remote-control, signaling, fire alarm, and communications circuits.
Substantiation: These “other outlets” should have the same consistent dimensions as throughout Article 680. This 1.8 m (6 ft) dimension was proposed and accepted for Sections 680.22(A)(1), 680.22(A)(2), 680.22(A)(3), 680.34, 680.43(A), 680.43(A)(1), 680.62(E), an 680.71 for the 2008 NEC.
Panel Meeting Action: Reject
Panel Statement: See panel action and substantiation on Proposal 17-133.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-135 Log #512 NEC-P17 **Final Action: Reject**
(680.23)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Insert a hyphen between “circuit” and “interrupter” in (A)(1), two places in (A)(3), (A)(8), two places in (F)(2)(b), (F)(3), and (F)(3)(3).
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-29.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-136 Log #2364 NEC-P17 **Final Action: Reject**
(680.23)

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(B) Wet-Niche Luminaires.
(1) Forming Shells. Forming shells shall be installed for the mounting of all wet-niche underwater luminaires (fixtures) and shall be equipped with provisions for conduit entries. Metal parts of the luminaire (fixture) and forming shell in contact with the pool water shall be of brass or other approved corrosion-resistant metal. All forming shells used with nonmetallic conduit systems, other than those that are part of a listed ~~low-voltage~~ lighting system not requiring grounding, shall include provisions for terminating an 8 AWG copper conductor.
(2) Wiring Extending Directly to the Forming Shell. Conduit shall be installed from the forming shell to a junction box or other enclosure conforming to the requirements in 680.24. Conduit shall be rigid metal, intermediate metal, liquidtight flexible nonmetallic, or rigid nonmetallic.
(a) *Metal Conduit*. Metal conduit shall be approved and shall be of brass or other approved corrosion-resistant metal.
(b) *Nonmetallic Conduit*. Where a nonmetallic conduit is used, an 8 AWG insulated solid or stranded copper bonding jumper shall be installed in this conduit unless a listed ~~low voltage~~ lighting system not requiring grounding is used. The bonding jumper shall be terminated in the forming shell, junction box or transformer enclosure, or ground-fault circuit-interrupter enclosure. The termination of the 8 AWG bonding jumper in the forming shell shall be covered with, or encapsulated in, a listed potting compound to protect the connection from the possible deteriorating effect of pool water.
(3) Equipment Grounding Provisions for <u>Wet-Niche Luminaires</u> ~~Cords~~. Wet-niche luminaires <u>shall comply with either (a) or (b):</u> ~~that are supplied by a flexible cord or cable shall have all exposed non-current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than 16 AWG.~~
<u>(a) Have all exposed non-current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than 16 AWG.</u>
<u>(b) Be a listed lighting system not requiring grounding.</u>
(4) Luminaire (Fixture) Grounding Terminations. The end of the flexible-cord jacket and the flexible-cord conductor terminations within a luminaire (fixture) shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the luminaire (fixture) through the cord or its conductors. ~~In addition~~ <u>If present</u>, the grounding connection within a luminaire (fixture) shall be similarly treated to protect such connection from the deteriorating effect of the pool water in the event of water entry into the luminaire (fixture).
(5) Luminaire (Fixture) Bonding. <u>Unless listed as not requiring bonding, the</u> ~~The~~ luminaire (fixture) shall be bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to remove the luminaire (fixture) from the forming shell. ~~Bonding shall not be required for luminaires (fixtures) that are listed for the application and have no non-current-carrying metal parts.~~
Substantiation: The proposed text of 680.23(B)(1) only allows the option of a listed low-voltage lighting system to not require grounding. Although rare designs, it is possible to list a line voltage luminaire that does not require grounding. These requirements are being added to the standard used to evaluate underwater luminaires, UL 676.
Similar changes are proposed in 680.23(B) 3, 4 and 5 as grounding would not always be present. The heading of 680.23(B)(3) has been changed for clarity.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation to support this change.
Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
BLEWITT, T.: The proposed revisions were intended to update the Code to address new technologies, particularly plastic LED luminaires that are permanently factory sealed. These changes would help reduce confusion between installers and Inspection Authorities when dealing with advanced luminaire technologies. We are in agreement that the text of the proposal was too broad and might encompass unproven designs. More focused text and specific substantiation shall be provided during the Comment phase.

17-137 Log #2361 NEC-P17 **Final Action: Accept**
(680.23(A))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
680.23 Underwater Luminaires. This section covers all luminaires installed below the normal water level of the pool.
(A) General.
(1) Luminaire Design, Normal Operation. The design of an underwater luminaire supplied from a branch circuit either directly or by way of a transformer or power supply meeting the requirements of this section shall be such that, where the luminaire is properly installed without a ground-fault circuit interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping).
Substantiation: The reference to power supplies is needed to accommodate DC rated LED luminaires.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-138 Log #2360 NEC-P17 **Final Action: Accept in Principle in Part**
(680.23(A)(2))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(2) Transformers and Power Supplies. Transformers and power supplies used for the supply of underwater luminaires, together with the transformer or power supply enclosure, shall be listed for ~~as a~~ swimming pool and spa use ~~transforme~~r. The transformer or power supply shall either incorporate a transformer of the ~~be an~~ isolated winding type with an ungrounded secondary that has a grounded metal barrier between the primary and secondary windings or one that incorporates an approved system of double insulation.
Substantiation: New LED luminaires use DC power supplies. The grounded shield transformer design has bee required so it requires at leaser two faults for line voltage to be fed to the luminaires. Newer transformer designs meet the same intend by employing double insulation. The requirements for construction and test is documented in UL 2097, The Reference Standard for Double Insulation Systems for Use in Electronic Equipment.
Panel Meeting Action: Accept in Principle in Part
680.23(A)(2) to read as follows:
(2) Transformers and Power Supplies. Transformers and power supplies used for the supply of underwater luminaires, together with the transformer or power supply enclosure, shall be listed for ~~as a~~ swimming pool and spa use ~~transforme~~r. The transformer or power supply shall incorporate either a transformer of the ~~be an~~ isolated winding type with an ungrounded secondary that has a grounded metal barrier between the primary and secondary windings or one that incorporates an approved system of double insulation between the primary and secondary windings.
Panel Statement: CMP-17 accepts the submitter's text but appends the last sentence.
CMP-17 edits the submitter's text for clarity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-139 Log #2362 NEC-P17 **Final Action: Accept in Principle in Part**
(680.23(A)(3))

TCC Action: The Technical Correlating Committee directs that the panel comply with the NEC Style Manual 3.1.1 and 3.1.3 and clarify the panel action and panel statement on this proposal to identify what was not accepted and the reason it was not accepted.
This action will be considered by the panel as a public comment.
Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(3) GFCI Protection, Relamping. A ground-fault circuit interrupter shall be installed in the branch circuit supplying luminaires ~~operating at more than 15 volts such that~~ if there is a ~~no~~ shock hazard during relamping. A shock hazard is considered to be present during relamping if the luminaire is supplied from a source that exceeds the Class 2 voltage limits "where wet contact is likely to occur" as specified in Table II(A). The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the luminaire to ground.
Substantiation: Existing text assumes the luminaire is connected to a 60Hz AC source. LED luminaires require DC sources. The present 15 (ac) limit is the Class 2 "wet" voltage limit. The reference to Table II(A) allows for both ac, dc as well as dc interrrupted at a rate of 10 to 200 hz. Also no change to this section would be needed in the future if revisions to these limits were made.
Panel Meeting Action: Accept in Principle in Part
680.23(A)(3) to read as follows:
(3) GFCI Protection, Relamping. A ground-fault circuit interrupter shall be installed in the branch circuit supplying luminaires ~~operating at more than 15 volts such that~~ if there is a ~~no~~ shock hazard during relamping. A shock hazard is considered to be present during relamping if the luminaire is supplied from a source that exceeds the Class 2 voltage limits "where wet contact is likely to occur" as specified in Chapter 9, Tables 11(A) and 11 (B). The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the luminaire to ground.
Panel Statement: CMP-17 accepts the submitter's proposal and adds Table 11(B) to address direct current power sources.
CMP-17 also notes and corrects "Table II" to be "Table 11."
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
ROCK, B.: NEMA supports this Proposal's objective to allow energy-saving luminaires that operate from supplies of other than sinusoidal alternating current but opposes the wording of added sentence in the Panel Action based on the following:
o Readability: The Panel's revisions of the Proposal's wording results in navigation to Tables 11(A) or 11(B) but fails to indicate the required values are NOT in the tabulations but are buried in portions of Note 2 and Note 4. Multiple and ambiguous pointers could add further confusion or misdirection to wrong voltage values. Just state outright what these 4 voltage limits are: 15 volts for sinusoidal ac, 21.2 volts peak for nonsinusoidal ac, 30 volts for continuous dc, and 12.4 volts peak for dc interrupted at a rate of 10 to 200 Hz.
o NEC® Style Manual 3.1.1 and 3.1.3 violations: The added sentence relocates and amplifies what had been a mandatory requirement and must use the verb "shall be" for mandatory requirements, not the verb "is … to be" reserved for explanatory information, normally appearing in either a Fine Print Note or an informative Annex.
o Installation requirement versus Listing reference: The subject matter is an installation requirement. The preamble to Table 11(A) and Table 11(B), however, indicates "For listing purposes, …" and "As part of the listing, …". The absence of definitive wording in the revision may cause misinterpretation that the installation requirements associated with the existing 15 volt (sinusoidal ac) limit, as well as the added voltage levels for nonsinusoidal ac, continuous dc and interrupted dc, would be no longer incumbent upon the installation, only the Listed equipment.
SCHAPP, R.: I agree with the comment on vote submitted by Mr. Yasenchak.
YASENCHAK, R.: Referencing to the Tables 11(A) and (B) could be confusing to the installer. Simply listing the voltages in this section would add clarity and not cause confusion.

17-140 Log #3217 NEC-P17 **Final Action: Reject**
(680.23(A)(3))

Submitter: John I. Williamson, Maple Grove, MN
Recommendation: Revise 680.23(A)(3) as follows:
~~A ground fault circuit interrupter shall be installed in the branch circuit supply~~ Luminaires operating at more than 15 volts shall be provided with ground-fault circuit-interrupter protection for personnel such that there is no shock hazard during relamping.
Substantiation: The proposed revised wording is consistent with other areas of the NEC in which ground-fault circuit-interrupter (GFCI) protection is required. GFCI protection for underwater luminaires could be provided by an upstream 2-pole GFCI feeder circuit breaker that protects ALL branch circuits in a swimming pool sub-panel. GFCI 2-pole circuit breakers are available from at least one manufacturer ranging in size from 15 amperes to 50 amperes. They can be used for feeders, individual branch circuits, and multiwire branch circuits.
Panel Meeting Action: Reject
Panel Statement: See panel action and substantiation on Proposal 17-139.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-141 Log #2233 NEC-P17 **Final Action: Reject**
(680.23(A)(6))

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Revise text to read as follows:
The removed luminaire on the deck or other dry location without lowering the water level or disconnecting the luminaire from the branch circuit conductors, for such maintenance.
Substantiation: This would make this section consistent with the requirements of UL.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted. The submitter references the wrong section.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-142 Log #2363 NEC-P17 **Final Action: Accept in Principle in Part**
(680.23(A)(8))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(8) Compliance. Compliance with these requirements shall be obtained by the use of a listed underwater luminaire
and by installation of a listed ground-fault circuit interrupter in the branch circuit or a listed transformer or power supply for luminaires operating at not more than ~~15 volts~~ the Class 2 voltage limits “where wet contact is likely to occur” as specified in Table II(A).
Substantiation: Existing text assumes the luminaire is connected to a 60Hz AC source. LED luminaires require DC sources. The present 15 (ac) limit is the Class 2 “wet” voltage limit. The reference to Table II(A) allows for both ac, dc as well as dc interrrupted at a rate of 10 to 200 hz. Also no change to this section would be needed in the future if revisions to these limits were made.
Panel Meeting Action: Accept in Principle in Part
Revise 680.23(A)(8) to to read as follows:
(8) Compliance. Compliance with these requirements shall be obtained by the use of a listed underwater luminaire and by installation of a listed ground-fault circuit interrupter in the branch circuit or a listed transformer or power supply for luminaires operating at not more than ~~15 volts~~ the Class 2 voltage limits “where wet contact is likely to occur” as specified in Chapter 9, Tables 11(A) and 11(B).
Panel Statement: CMP-17 accepts the submitter’s proposal and appends Table 11(B) to address direct current power sources.
CMP-17 also notes and corrects “Table II” to be “Table 11.”
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
ROCK, B.: NEMA supports this Proposal’s objective to allow energy-saving luminaires that operate from supplies of other than sinusoidal alternating current but opposes the wording replacing “15 volts” in the Panel Action based on the following:
o Readability: The Panel’s revisions of the Proposal’s wording results in navigation to Tables 11(A) or 11(B) but fails to indicate the required values are NOT in the tabulations but are buried in portions of Note 2 and Note 4. Multiple and ambiguous pointers could add further confusion or misdirection to wrong voltage values. Just state outright what these 4 voltage limits are: 15 volts for sinusoidal ac, 21.2 volts peak for nonsinusoidal ac, 30 volts for continuous dc, and 12.4 volts peak for dc interrupted at a rate of 10 to 200 Hz.
o Installation requirement versus Listing reference: The subject matter is an installation requirement. The preamble to Table 11(A) and Table 11(B), however, indicates “For listing purposes, …” and “As part of the listing, …”. The absence of definitive wording in the revision may cause misinterpretation that the installation requirements associated with the existing 15 volt (sinusoidal ac) limit, as well as the added voltage levels for nonsinusoidal ac, continuous dc and interrupted dc, would be no longer incumbent upon the installation, only the Listed equipment.
SCHAPP, R.: I agree with the comment on vote submitted by Mr. Yasenchak.
YASENCHAK, R.: Referencing to the Tables 11(A) and (B) could be confusing to the installer. Simply listing the voltages in this section would add clarity and not cause confusion.

17-143 Log #1480 NEC-P17 **Final Action: Reject**
(680.23(B)(2)(B))

Submitter: Tony Perdue, Tee Pee Electric Inc.
Recommendation: Add a new Exception: The #8 AWG insulated solid or stranded copper bonding jam shall not be required to be installed in the nonmetallic conduit when the nonmetallic light niche is bonded at the forming shell by a external bonding lug located on the niche.
Substantiation: Will eliminate double bonding, also eliminate extra wire for transient voltage back to swimming pool.
Some cities require us to hook bonding jumper to ground!
Panel Meeting Action: Reject
Panel Statement: Eliminating the internal ground will reduce the level of safety. The installation must comply with 110.3.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-144 Log #2379 NEC-P17 **Final Action: Reject**
(680.23(B)(4))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(4) Encapsulation of Luminaire Grounding Cord Terminations~~.~~ The end of the flexible-cord jacket and the flexible-cord conductor terminations within a luminaire shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the luminaire through the cord or its conductors. ~~In addition, the grounding connection within a luminaire shall be similarly treated to protect such connection from the deteriorating effect of pool water in the event of water entry into the luminaire.~~
(5) Encapsulation of Luminaire Grounding Connection. The main equipment grounding conductor connection and all splices in this path shall be covered with, or encapsulated in, a suitable potting compound to protect such connection from the deteriorating effect of pool water in the event of water entry into the luminaire.
(6)~~(5)~~ Luminaire Bonding. The luminaire shall be bonded to, and secured to, the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to remove the luminaire from the forming shell. Bonding shall not be required for luminaires that are listed for the application and have no non–current-carrying metal parts.
(7)~~(6)~~ Servicing. All wet-niche luminaires shall be removable from the water for inspection, relamping, or other maintenance. The forming shell location and length of cord in the forming shell shall permit personnel to place the removed luminaire on the deck or other dry location for such maintenance. The luminaire maintenance location shall be accessible without entering or going in the pool water.
Substantiation: Title of 680.23(B)(4) – Section 680.23(B)(5) contains two requirements – the requirement for encapsulation of the termination of the flexible cord within the luminaire and the requirement for encapsulation of the connection of the equipment grounding conductor within the luminaire. The present title “Luminaire Grounding Terminations” only reflects the second part of the requirement. The two have been split and the grounding conductor encapsulation requirement clarified as newer luminaire designs frequently splice into the main grounding connection and use the tap for other purposes. These splices must also be protected by encapsulation.
Panel Meeting Action: Reject
Panel Statement: The proposed wording does not add any clarity to the code. The submitter did not provide adequate technical substantiation.
The provisions of the proposed subsection (5) would violate the requirements of 680.23(F)(2).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: The Panel discussion clarified the text. With this clarification, UL agrees that the proposal is not necessary.

17-145 Log #4334 NEC-P17 **Final Action: Reject**
(680.23(B)(5))

Submitter: Carvin DiGiovanni, Association of Pool & Spa Professionals
Recommendation: Revise as follows:
(5) Metal Fittings. Metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 100 mm (4 in.) in any dimension and do not penetrate into the pool structure more than 25 mm (1 in.) shall not require bonding.
Exception: Metallic pool cover anchors intended for insertion in the deck surface, 25 mm (1 in.) or less in diameter and 51 mm (2 in.) or less in length shall not be required to be bonded.
Substantiation: Addition of this exception eliminates a requirement currently being imposed by some AHJs which cannot be met and which also addresses issues created by passage of the Virginia Grahame Baker (VGB) Act, which now requires substantially expanded usage of pool covers to prevent accidental drowning. The proposed exception is clearly within the principles espoused by 680.23(B)(5). Typical pool cover anchors are approximately ¾" (19 mm) in diameter and 1-1/4" (32 mm) to 1-1/2" (38 mm) in length, substantially smaller in surface area and only slightly longer than the Article currently exempts. The anchor length cannot be reduced substantially and still withstand shear forces created by the cover. These anchors are generally installed 3-4 feet (0.9 – 1.2 m) away from the edge of the pool and are not mechanically capable of having a bond wire attached. Further, these anchors are, and are expected to be (in increasing numbers under VGB), installed in existing decks, and bonding, even if mechanically possible, would require expensive partial or total demolition of the deck with little or no increase in safety. The submitter knows of no shock or electrocution incidents involving these anchors. Further, as these anchors are installed in a deck that would already require incorporation of a bonding grid, they would be encompassed by the existing equipotential surface in the same fashion as rope anchors and other similar devices already exempt under this section, and which are allowed substantially larger exposed surfaces.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted. The submitter references the wrong section.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-146 Log #2365 NEC-P17 **Final Action: Reject**
(680.23(C)(1))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(C) Dry-Niche Luminaires.
(1) Construction. A dry-niche luminaire shall be provided with a provision for drainage of water and a means for
accommodating one equipment grounding conductor for each conduit entry. Alternatively, a dry-niche luminaire that is listed and not intended for use with an equipment grounding conductor shall be permitted.
Substantiation: Some new designs of dry-niche luminaires have no metal parts to ground. The requirements for listing in UL 676 allow for such designs.
Panel Meeting Action: Reject
Panel Statement: CMP-17 does not accept this proposal.
Substantiation was not provided to justify these new installation requirements.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
BLEWITT, T.: We agree with the Panel's expressed concern that revised text allowing ungrounded luminaires might inadvertently allow constructions where their long-term suitability is unproven. We believe this concern is unwarranted concerning dry-niche luminaires. The new designs are essentially identical to previous ones except with both the niche and luminaire enclosure now being made of plastic. They have nothing to ground and pose no more electric shock risk than those that have been produced for many years. More specific substantiation will be provided during the Comment phase.

17-147 Log #2366 NEC-P17 **Final Action: Reject**
(680.23(D))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(D) No-Niche Luminaires.
(1) Wiring Method
(a) *Pool Water Filled Conduit* – Conduit extending to the luminaire shall be of the material and type specified in 680.23(B)(2) where the pool water enters the conduit.
(b) *Conduit Not Filled with Pool Water* - Conduit extending to the luminaire shall be of the material and type specified in 680.23(F)(1) where pool water does not enter the conduit.
(2) Luminaires With Immersed Cord – A no-niche luminaire with an immersed flexible cord shall be installed with a mounting bracket that complies with the requirements for forming shells specified in 680.23(B)(1). The luminaire and mounting bracket shall be constructed and installed in accordance with 680.23(B). Where a forming shell is specified, the requirement shall apply for the luminaire mounting bracket.
~~**(D) No-Niche Luminaires.** A no-niche luminaire shall meet the construction requirements of 680.23(B)(3) and be installed in accordance with the requirements of 680.23(B). Where connection to a forming shell is specified, the connection shall be to the mounting bracket.~~
Substantiation: The present text reflects designs needing to be removed for inspection and other maintenance. New LED designs not intended to be relamped, are such that the cord is not exposed to the pool water.
Panel Meeting Action: Reject
Panel Statement: CMP-17 does not accept this proposal.
Substantiation was not provided to justify the requirements for these new installation requirements.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: The proposed revisions were intended to allow the Code to reflect installation options not previously available for underwater luminaires, particularly plastic LED luminaires that are permanently factory sealed. These changes would help reduce confusion between installers and Inspection Authorities when dealing with advancing luminaire technologies. We are in agreement that the text of the proposal might inadvertently encompass unproven designs.

17-148 Log #2367 NEC-P17 **Final Action: Reject**
(680.23(E))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Delete text as follows:
~~**(E) Through-Wall Lighting Assembly.** A through-wall lighting assembly shall be equipped with a threaded entry or hub, or a nonmetallic hub, for the purpose of accommodating the termination of the supply conduit. A through-wall lighting assembly shall meet the construction requirements of 680.23(B)(3) and be installed in accordance with the requirements of 680.23. Where connection to a forming shell is specified, the connection shall be to the conduit termination point.~~
Substantiation: A through-wall lighting assembly is another type of no-niche luminaire design. If my proposal for the revision of Section 680.23(D) defining no-niche luminaires as being either with or without immersed cords, this section would no longer needed.
Panel Meeting Action: Reject
Panel Statement: As there are distinctions between the definitions of and the requirements for through-wall lighting assemblies and no-niche type luminaires, this section is still required. This term "through-wall lighting assemblies" is used five times in Article 680.
See action and substantiation on Proposal 17-147.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: See My Affirmative with Comment on 17-93 (Log #2358).

17-149 Log #4878 NEC-P17 **Final Action: Reject**
(680.23(E))

Submitter: L. Keith Lofland, IAEI
Recommendation: Revise text as follows:
680.23(E) Through-Wall Lighting Assembly. This section needs to be relocated to Part III of Article 680. Perhaps new 680.33(C).
Substantiation: When this section was introduced into the 2002 NEC, it was intended for Part III of Article 680 for storable pools. (see May 2001 ROP 20-115). In the reorganization of Article 680 for the 2002 NEC, this section was inadvertently placed in Part II for permanently installed pools. In discussions with the original submitter, it was the submitter's intent for this section on through-wall lighting assemblies to be associated with Part III and storable pools.
The substantiation in the May 2001 ROP 20-115 was to recognize changes to UL Standard 676 addressing the testing and listing of these types of lighting assemblies. If you look at UL Standard 676, this standard addresses through-wall lighting assemblies but only for aboveground storable pools.
When you go through Article 680 and in particular, Part II (permanently installed pools), this section on through-wall lighting assemblies has always been like a bump in the road and did not seem to fit in Part II.
Panel Meeting Action: Reject
Panel Statement: Through-wall lighting assembly requirements as described in 680.23(E) do not apply to storable pools.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-150 Log #915 NEC-P17 **Final Action: Reject**
(680.23(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Branch circuit wiring on the supply side of ~~enclosures and junction~~ boxes and other enclosures connected to conduits run to wet-niche and no-niche luminaires, and the field wiring compartments of no-niche luminaires shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit, or Type MI cable. Where installed in or on buildings or structures electrical metallic tubing shall be permitted, and where installed within buildings or structures, electrical nonmetallic tubing, Type MC cable or Type AC cable shall be permitted. ~~In all cases~~ All wiring methods shall contain an insulated copper equipment grounding conductor sized in accordance with Table 250.122, but not ~~less~~ smaller than 12AWG shall be required.
Exception: For one-family dwellings, 680.21(A)(4) shall apply.
Delete present exception.
Substantiation: Enclosures (transformers) are already permitted to be supplied by LFNMC by (F)(1). LFMC is sunlight resistant (350.2) and permitted for flexibility, and protection from liquids or vapors (350.10). Type MI cable (copper or stainless steel) is permitted in wet locations, exposed to oil or gasoline, embedded in concrete, exposed to non-damaging corrosive conditions and where protected from corrosion. Bare copper grounding and bonding conductors are permitted. LTFMC is permitted for motors by 680.21(A)(3) in the same environment without length restriction; what justifies a length restriction for transformers?
Panel Meeting Action: Reject
Panel Statement: MI cable has not been identified for pool use.
The wiring methods as described in the submitter's substantiation have not been evaluated for the environment.
CMP-17 refers the submitter to Proposal 17-104 and Comment 17-84 of the last cycle.
The exception for one-family dwellings is not acceptable.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-151 Log #998 NEC-P17 **Final Action: Reject**
(680.23(F)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as the proposal does comply with the NFPA Regulations Governing Committee Projects.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Branch circuit wiring on the supply side of ~~enclosures and~~ junction boxes and other enclosures connected to conduits run to wet-niche and no-niche luminaries, and the field wiring compartments of no-niche luminaries shall be installed using rigid metal conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, rigid polyvinyl chloride conduit, or reinforced thermostat thermosetting resin conduit. Where installed in or on buildings or structures electrical metallic tubing shall be permitted, and where installed within buildings or structures electrical nonmetallic tubing, Type MI cable, Type MC cable, electrical metallic tubing or Type AC cable shall be permitted. In all cases an insulated copper equipment grounding conductor sized in accordance with Table 250.122 but not less smaller than 12 AWG shall be ~~required~~ provided within the wiring method. For a one-family dwelling the provisions of 680.2(A) shall be permitted. Delete exception.
Substantiation: Section 350.10 permits LFMC where flexibility or protection from vapors or liquids is required and does not limit the vapors or liquids to corrosive types. It may be used for direct burial. LFMC is permitted for motors per 680.21(A)(3) in the same environment. Type MI cable is resistant to damage and the sheath (copper or stainless steel) is no more susceptible to corrosion than bare copper grounding/bonding conductors that are permitted.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
See panel action and statement on Proposal 17-150.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-152 Log #1051 NEC-P17 **Final Action: Reject**
(680.23(F)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as the proposal does comply with the NFPA Regulations Governing Committee Projects.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Branch circuit wiring on the supply side of enclosures junction boxes and other enclosures connected to conduits run to wet-niche and no-niche fixtures and the field wiring compartments of dry-niche luminaires shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit, or Type MI cable. Where installed in or on buildings or structures electrical metallic tubing shall be permitted and where installed within buildings or structures, electrical nonmetallic tubing Type MC cable, electrical metallic tubing, ~~or~~ and Type AC cable shall be permitted. ~~In all cases~~ All wiring methods shall contain an insulated copper equipment grounding conductor ~~sized in accordance with table 250.122 but~~ not ~~less~~ smaller than 12 AWG.
Exception: For one-family dwellings 680.21(A)(4) shall apply.
Delete present exception.
Substantiation: LFMC should be permitted since 350.10(1) permits use for protection from liquids or vapors whether or not corrosive. It may be listed for direct burial in earth or concrete per 350.10(3) which may be corrosive. LFMC is permitted for motors per 680.21(A)(3) in a pool environment, and in the present exception for 680.23(F). Since transformers are, LFMC should be permitted for other enclosures. Requirements for grounding conductors apply. Type MI cable is resistant to damage, permitted in wet locations, underground and in concrete, and the copper or stainless steel sheath appears just as suitable as bare copper permitted for grounding and bonding conductor in the pool area.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
See panel action and statement on Proposal 17-150.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-153 Log #1450 NEC-P17 **Final Action: Reject**
(680.23(F)(1)and Exception)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as the proposal does comply with the NFPA Regulations Governing Committee Projects.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Branch circuit wiring on the supply side of junction boxes and other enclosures connected to conduits run to wet-niche and no-niche luminaries, and the fixed wiring compartments of dry-niche luminaries, shall be installed using rigid metal conduit identified for the use, intermediate metal conduit, Type PVC conduit, Type RTRC conduit, or Type MI cable identified for the use. Where installed within or on buildings or structures electrical metallic tubing shall be permitted, and where installed within buildings or structures, Type AC cable or Type MC cable shall be permitted. All wiring methods shall contain an insulated copper equipment grounding conductor sized in accordance with Table 250.122 but not smaller than 12 AWG.
FPN: For one-family dwellings see 680.21(A)(4).
Substantiation: Rigid metal conduit should be identified for the use [344.10(B)(2)]. Type MI cable suitable for the use should be permitted: bare copper is permitted for bonding. The exception appears to limit the use of flexible nonmetallic conduit and the proposal deletes it. Reference to 680.21 removes a perceived conflict.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
See panel action and statement on Proposal 17-150.
CMP-17 believes the exception is required.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-154 Log #4657 NEC-P17 **Final Action: Accept**
(680.23(F)(1) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the phrase "or liquidtight flexible nonmetallic conduit" and the last sentence.
Substantiation: Liquidtight flexible nonmetallic conduit is permitted by right within the rule, and therefore does not need to be covered in the exception. The length allowance in the last sentence is superfluous as well, since it only parrots the provision in Chapter 3 [356.10(5)]. These provisions add nothing to the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-155 Log #2368 NEC-P17 **Final Action: Reject**
(680.23(F)(2))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
~~**(2) Equipment Grounding.** Through-wall lighting assemblies, wet-niche, dry-niche, or no-niche luminaires shall be connected to an insulated copper equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (F)(2)(a) and (F)(2)(b). The equipment grounding conductor shall be sized in accordance with Table 250.122 but shall not be smaller than 12 AWG.~~
~~*Exception: An equipment grounding conductor between the wiring chamber of the secondary winding of a transformer and a junction box shall be sized in accordance with the overcurrent device in this circuit.*~~
~~(a) If more than one underwater luminaire is supplied by the same branch circuit, the equipment grounding conductor, installed between the junction boxes, transformer enclosures, or other enclosures in the supply circuit to wet-niche luminaires, or between the field-wiring compartments of dry-niche luminaires, shall be permitted to be terminated on grounding terminals.~~
~~(b) If the underwater luminaire is supplied from a transformer, ground-fault circuit interrupter, clock-operated switch, or a manual snap switch that is located between the panelboard and a junction box connected to the conduit that extends directly to the underwater luminaire, the equipment grounding conductor shall be permitted to terminate on grounding terminals on the transformer, ground-fault circuit interrupter, clock-operated switch enclosure, or an outlet box used to enclose a snap switch.~~
(F)(2) Equipment Grounding.
(a) Underwater Luminaires (lighting fixtures). Underwater luminaires (lighting fixtures) shall comply with (1) or (2):
(1) The luminaire shall be connected to an insulated copper equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (F)(2)(b) and (F)(2)(c). The equipment grounding conductor shall be sized in accordance with Table 250.122 but shall not be smaller than 12 AWG
(2) The luminaire shall be listed as not requiring grounding,
Exception: An equipment grounding conductor between the wiring chamber of the secondary winding of a transformer and a junction box shall be sized in accordance with the overcurrent device in this circuit.
(b) Multiple Underwater Luminaires. If more than one underwater luminaire (lighting fixture) is supplied by the same branch circuit, the equipment grounding conductor, installed between the junction boxes, transformer or power supply enclosures, or other enclosures in the supply circuit to wet-niche luminaires (fixtures), or between the field wiring compartments of dry-niche luminaires (fixtures) shall be permitted to be terminated on grounding terminals.
(c) Enclosure Between Junction Box and Panelboard. If the underwater luminaire (lighting fixture) is supplied from a transformer, power supply, ground-fault circuit interrupter, clock-operated switch, or a manual snap switch that is located between the panelboard and a junction box connected to the conduit that extends directly to the underwater luminaire (lighting fixture); the equipment grounding conductor shall be permitted to terminate on grounding terminals on the transformer, power supply, ground-fault circuit interrupter, clock-operated switch enclosure, or an outlet box used to enclose a snap switch.
Substantiation: Existing text mentioning through-wall lighting assemblies, wet-niche, dry-niche and no-niche luminaires was replaced by the more generic "underwater luminaires".
The option in proposed in F(2)(a)(1) reflects constructions that do not require grounding. These options are being added to the standard used for the listing of underwater luminaires, UL 676.
Headings were added to b and c with no other changes except for adding references to the power supplies used for DC rated luminaires.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
BLEWITT, T.: The proposed revisions were intended to update the Code to address new technologies, particularly plastic LED luminaires that are permanently factory sealed. These changes would help reduce confusion between installers and Inspection Authorities when dealing with advanced luminaire technologies. We are in agreement that the text of the proposal was too broad and might encompass unproven designs. More focused text and specific substantiation will be provided during the Comment phase.

17-156 Log #513 NEC-P17 **Final Action: Reject**
(680.24)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Insert a hyphen between "Circuit" and "Interrupter" in the title of the Section. Add a hyphen between "circuit" and "interrupter" in (B) and (E).
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-29.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-157 Log #1481 NEC-P17 **Final Action: Reject**
(680.24(A)(1))

Submitter: Tony Perdue, Tee Pee Electric Inc.
Recommendation: Revise text as follows:
~~Swimming pool~~ U.L. Listed.
Substantiation: There are several manufactures of all plastic boxes that are watertight and corrosion-resistant, but because they do not have "swimming pool" listed on box, they are not allowed.
Panel Meeting Action: Reject
Panel Statement: CMP-17 rejects the submitter's proposal as a listed swimming pool box is the only acceptable box for this application.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-158 Log #1507 NEC-P17 **Final Action: Reject**
(680.24(A)(1))

Submitter: Tony Perdue, Tee Pee Electric Inc.
Recommendation: Revise text to read as follows:
~~Swimming pool~~ - Approved testing laboratory.
Substantiation: There are several manufactures of plastic boxes that are watertight and corrosion-resistant, but because they do not have "swimming pool" listed on the box, they are not allowed.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-157.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-159 Log #2369 NEC-P17 **Final Action: Accept in Principle**
(680.24(A)(2))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(2) Installation. Where the luminaire operates over the "where wet contact is likely to occur" voltage limit for a Class 2 circuit as specified in Table 11(A) ~~15 volts~~, the junction box location shall comply with (A)(2)(a) and (A)(2)(b). Where the luminaire operates at a voltage less than the Class 2 limit specified above ~~15 volts or less~~, the junction box location shall be permitted to comply with (A)(2)(c).
Substantiation: The present text assumes a luminaire used on an ac supply. LED luminaires are used on dc supplies. The proposed text also reflects the original rationale for the 15 volt limit.
Panel Meeting Action: Accept in Principle
Revise 680.24(A)(2) to read as follows:
(2) Installation. Where the luminaire operates over the voltage limit for a Class 2 circuit "where wet contact is likely to occur" as specified in Chapter 9, Tables 11(A) and 11(B) ~~15 volts~~, the junction box location shall comply with (A)(2)(a) and (A)(2)(b). Where the luminaire operates at a voltage at or less than the Class 2 limit specified above ~~15 volts or less~~, the junction box location shall be permitted to comply with (A)(2)(c).
680.24(A)(2)(c) to read as follows:
(c) Flush Deck Box. If used on a lighting system operating at or less than the voltage limit for a Class 2 circuit "where wet contact is likely to occur" as specified in Chapter 9, Tables 11(A) and 11(B) ~~15 volts or less~~, a flush deck box shall be permitted if both of the following apply:
(1) An approved potting compound is used to fill the box to prevent the entrance of moisture.
(2) The flush deck box is located not less than 1.2 m (4 ft) from the inside wall of the pool.

Panel Statement: CMP-17 adds reference to Chapter 9 and adds Table 11(B) to the submitter's proposal.
Additionally, CMP-17 modifies 680.24(A)(2)(c) to revise the requirement from 15 volts to Class 2 limits; the change meets the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
ROCK, B.: NEMA supports this Proposal's objective to allow energy-saving luminaires that operate from supplies of other than sinusoidal alternating current but opposes the wording replacing "15 volts" and "15 volts or less" in the Panel Action based on the following:
o Readability: The Panel's revisions of the Proposal's wording results in navigation to Tables 11(A) or 11(B) but fails to indicate the required values are NOT in the tabulations but are buried in portions of Note 2 and Note 4. Multiple and ambiguous pointers could add further confusion or misdirection to wrong voltage values. Just state outright what these 4 voltage limits are: 15 volts for sinusoidal ac, 21.2 volts peak for nonsinusoidal ac, 30 volts for continuous dc, and 12.4 volts peak for dc interrupted at a rate of 10 to 200 Hz.
o Installation requirement versus Listing reference: The subject matter involves installation requirements. The preamble to Table 11(A) and Table 11(B), however, indicates "For listing purposes, …" and "As part of the listing, …". The absence of definitive wording in the revision may cause misinterpretation that the installation requirements associated with the existing 15 volt (sinusoidal ac) limit, as well as the added voltage levels for nonsinusoidal ac, continuous dc and interrupted dc, would be no longer incumbent upon the installation, only the Listed equipment.
o NEC® Style Manual 3.3.4 (top of Page 16) violation: "specified above" referring to location of text.
SCHAPP, R.: I agree with the comment on vote submitted by Mr. Yasenchak.
YASENCHAK, R.: Referencing to the Tables 11(A) and (B) could be confusing to the installer. Simply listing the voltages in this section would add clarity and not cause confusion. I do believe that DC voltages should be included in the code to allow for new products which operate using DC.

17-160 Log #4658 NEC-P17 **Final Action: Reject**
(680.24(A)(2)(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete all wording after "ground level, or pool deck".
Substantiation: This removes the 8-in rise requirement above the maximum water level. The submitter is responsible for the current wording of this requirement. It was intended to create a more reasonable mounting height so compliance with 680.24(C) would be more easily accomplished, and so it did until CMP 17 imposed a definition of maximum water level that is completely unrealistic during almost all conditions. Since the panel refuses to modify that definition, the only alternative is to remove the water level reference. The presumed maximum water level is now tantamount to the level of the deck. Most diving boards will not accommodate a swimming pool junction box beneath them if it is mounted 8 in. to the bottom. Remember that the domed covers require another approximately 6 in. of clearance to lift the cover and work the connections; this was the reason for the current requirement when the skimmer defined the ware level. Relief is need now just as it was when this rule was changed. What loss experience suggests otherwise?
Panel Meeting Action: Reject
Panel Statement: The ground level could be significantly lower than the maximum water level.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-161 Log #2370 NEC-P17 **Final Action: Accept**
(680.24(D))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(D) Grounding Terminals. Junction boxes, transformer <u>and power supply</u> enclosures, and ground-fault circuit-interrupter enclosures connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche luminaire shall be provided with a number of grounding terminals that shall be no fewer than one more than the number of conduit entries.
Substantiation: The present text assumes only ac low-voltage luminaires using transformers. DC rated LED luminaires require dc swimming pool power supplies. The text is revised accordingly.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-162 Log #2371 NEC-P17 **Final Action: Accept**
(680.24(E))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(E) Strain Relief. The termination of a flexible cord of an underwater luminaire within a junction box, transformer <u>or power supply</u> enclosure, ground-fault circuit interrupter, or other enclosure shall be provided with a strain relief.
Substantiation: The present text assumes only ac low-voltage luminaires using transformers. DC rated LED luminaires require dc swimming pool power supplies. The text is revised accordingly.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-163 Log #977 NEC-P17 **Final Action: Reject**
(680.24(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise the latter part of the sentence: "...shall be connected to the equipment grounding terminal of the panelboard <u>or to the grounded metal enclosure of an individual fused switch or circuit breaker where the circuit originates.</u>
Substantiation: Edit. All branch circuits do not originate from a panelboard.
Panel Meeting Action: Reject
Panel Statement: The box is not permitted to be used as a terminal.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-164 Log #1040 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Feeders shall be installed in rigid metal conduit, intermediate metal conduit, intermediate metal conduit, <u>liquidtight flexible nonmetallic conduit,</u> liquidtight flexible metal conduit, rigid polyvinyl chloride conduit or reinforced thermosetting resin conduit <u>or Type MI cable</u>. Electrical metallic tubing shall be permitted where installed within a building <u>or structure</u>. Aluminum conduits shall not be permitted in the pool area where <u>likely to be</u> subject to corrosion.
Delete present exception and substitute:
Exception: In the interior of dwelling units or accessory buildings associated with a dwelling unit, any identified wiring method of Chapter 3 that contains a separate equipment grounding conductor shall be permitted.
Substantiation: LTFMC is permitted for protection from liquids or vapors (unspecified types) and is permitted in 680.21(A)(3), 680.42(A)(1), and the exception for 680.23(F)(1). All feeders are not exposed to liquids or vapors and the proposed exception does not diminish safety. Present exception has a retroactive aspect and is not needed for existing approved installations that do not constitute a hazard. Type MI cable is permitted underground, embedded in masonry, in wet locations, and a copper or stainless steel sheath is no more subject to destructive corrosion than bare copper grounding and bonding conductors used in a pool area.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-150.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-165 Log #2232 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Add to wiring methods, MC cable where listed for location and contains an insulated equipment ground.
Substantiation: MC cable would make the installation of feeders in existing buildings easier, MC cable is already an acceptable wiring method for branch circuits for underwater luminaires.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-166.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-166 Log #4571 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise text to read as follows:
(A) Wiring Methods. Feeder~~s~~ wiring methods shall be shall be identified for the environmental condition where installed and shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, rigid polyvinyl chloride conduit, ~~or~~ reinforced thermosetting resin conduit, or Type MC cable. Electrical metallic tubing shall be permitted if ~~where~~ installed on or within a building., ~~and~~ Electrical nonmetallic tubing shall be permitted if ~~where~~ installed within a building. Aluminum conduits shall not be permitted in the pool area where subject to corrosion.
Substantiation: Type MC cable provides excellent protection from physical damage in compliance with the UL Product Safety Standard. Specific tests the cable must pass that are related to protection against physical damage include:
Impact Test
Crushing Test – All Cable
Crushing Test – Cable Marked for Direct Burial
Type MC cable must also pass a Fault Current Test and an Overload Current Test.
Ordinary Type MC cable is suitable for a dry and damp location. Type MC cable is also produced with an impervious PVC outer jacket and is suitable for installation in wet locations, for direct earth burial and for installation in poured concrete.
Obviously, wire installed in conduit or tubing is not required to pass these tests. Type MC cable is a superior wiring method and is superbly suited for installation as a feeder for panelboards used for applications covered by this section.
In addition, Type MC cable contains an insulated equipment grounding conductor that is in compliance with Section 250.122. This ensures a reliable and low impedance ground fault current return path. As a result, Type MC cable is an excellent wiring method for feeders to panelboards for swimming pool equipment.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Panel Meeting Action: Reject
Panel Statement: The use of Type MC cable is not permitted as per 330.12.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: The UL Standard For Metal-Clad Cables, UL 1569, does permit metal-clad cables that are wet rated and have an overall PVC jacket to be marked "Suitable for use in swimming pool motor circuits."

17-167 Log #301 NEC-P17 **Final Action: Reject**
(680.25(A)(1))

Submitter: John W. Sheesley, Pinellas County Building Department
Recommendation: Add a new Section as follows:
680.25(A)(1) One-Family Dwellings. In the interior of dwelling units, or in the interior of accessory buildings associated with dwelling units, any of the wiring methods recognized in Chapter 3 of this code that comply with provisions of this section shall be permitted. Where run in cable assembly, the equipment grounding conductor shall be permitted to be uninsulated, but shall be enclosed within the outer sheath of the cable assembly.
Substantiation: This change would clarify the conflict in the code between wiring methods for feeders and branch circuits and follow the same wording and guidelines in 680.21(A)(4). Code-Making Panel 17, on previous occasions, has recognized one-family dwellings as a low risk area in their substantiation on submitted recommendations to Article 680.
Panel Meeting Action: Reject
Panel Statement: The proposal effectively permits interior building wiring but does not consider the corrosive effects of pool surroundings.
CMP-17 disagrees with the submitter's substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
SCHAPP, R.: The proposal should have been accepted. I agree with submitters substantiation. This will clear up confusion with 680.21(A)(4). The proposal states that only wiring methods that comply with the provisions of this section shall be permitted.

17-168 Log #4659 NEC-P17 **Final Action: Accept**
(680.25(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change "Table 250.66" to "250.30(A)(8)".
Substantiation: Although Table 250.66 will still be the usual reference, the technically correct citation is included in the proposal, because there are instances where the required size will exceed that given in Table 250.66.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-169 Log #156 NEC-P17 **Final Action: Reject**
(680.26)

Submitter: David Barrett, AAABAR Swimming Pools, Inc.
Recommendation: Does not work for pools.
Substantiation: This is not for swimming pools. It does nothing for pools, but add more cost on owner, taxes, and pool builder. Please remove this code from pools.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
CMP-17 does not agree with the submitter's proposal; it does apply to pools.
The submitter has not provided adequate technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-170 Log #709 NEC-P17 **Final Action: Reject**
(680.26)

Submitter: Teri Dwyer, Wyoming, MN
Recommendation: Revise text to read as follows:
680.26 Equipotential ~~Bonding~~ Plane.
(A) Performance. The equipotential ~~bonding~~ plane required by this section shall be installed to reduce voltage gradients in the pool area.
(B)(2) Perimeter Surfaces. The perimeter surface shall extend for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall include unpaved surfaces as well as poured concrete and other types of paving. Bonding to perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or (2)(b) and shall be attached to the pool reinforcing steel or copper conductor grid at a minimum of four (4) points uniformly spaced around the perimeter of the pool. For nonconductive pool shells, bonding at four points shall not be required.
(a) Conductive Structural Reinforcing Steel. Structural reinforcing steel installed in concrete walkways that extends a minimum of 1 m (3 ft) shall be bonded in accordance with 680.26(B)(1)(a).
(b) Alternate Means. Where ~~structural reinforcing steel is not available or is encapsulated in a nonconductive compound~~ a concrete 1 m (3 ft) concrete walkway containing conductive reinforcing steel is not installed, a copper conductor(s) shall be utilized where the following requirements are met:
(1) At least one minimum 8 AWG bare solid copper conductor shall be provided.
(2) The conductors shall follow the contour of the perimeter surface.
(3) Only listed splices shall be permitted.
(4) The required conductor shall be 450 to 600 mm (18 to 24 in.) from the inside walls of the pool.
(5) The required conductor shall be secured within or under the perimeter surface 100 mm to 150 mm (4 in. to 6 in.) below the subgrade.
Substantiation: Equipotential Plane is a term used in s 547 and 682 and has a definition. The use of a definable term allows for a more consistent enforcement of the NEC by the AHJ. These changes will eliminate current confusion about code enforcement or the equipotential bonding of the perimeter surfaces when a concrete walkway installed around a pool does not extend out to the horizontally required 3 ft.
Currently, the NEC does not include language as to whether the bonded structural reinforcing in the concrete can be used to extend the bonding to the unpaved portion when the concrete does not extend out horizontally 3 ft from the inside walls of the pool and this is requiring the AHJ to make an interpretation on whether the intent of 680.26(A) is complied with.
It could be debated that since the concrete only extends 2 ft and not the entire 3 ft of the required parameter surface, the structural reinforcing could not be used since the language in 680.26(B)(2) states that the parameter shall extend 3 ft from the inside walls of the pool and shall include unpaved as well as poured concrete and other types of paving and bonding to perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or (2)(b). The word OR gives an option depending on the construction method, but does not require that both have to be met.

680.26(B)(2)(b) is only applicable as an alternative method if structural reinforcing is not available. Structural reinforcing is available for the concrete 680.26(B)(2)(a), but this only extends 2 ft out from the pool. So now we have 12 in. of the 3-foot required parameter surface area of 680.26(B)(2) that does not have structural reinforcing. The AHJ will have to decide, is it the intent of 680.26(B)(2) to identify the 1 ft of unpaved surface area without steel reinforcement to require a bare #8 solid copper conductor buried below the concrete slab so that the equipotential bonding grid is extended out the additional 12 in. to cover the entire required area of 3 ft?

If structural reinforcing steel was not installed in the 2 ft area of concrete, 680.26(B)(2)(b) would be allowed to be the equipotential bonding grid for both the paved and unpaved surface simultaneously, and 680.26(B)(2)(b)(5) would allow it to be installed in or under the parameter surface. Therefore, a single #8 solid copper conductor installed within the 2-ft concrete walkway or under the 2-ft concrete walkway between 18 and 24 in. from the inside wall of the pool would meet the requirements of 680.26(B)(2).

Therefore, the AHJ will have to decide if the structural reinforcing embedded in the 2 ft of concrete walkway is equal to or better then a #8 solid copper conductor installed in or under the concrete as allowed by 680.26(B)(2)(b)(5). 680.26(B)(2)(a) has no prescriptive requirements for the structural steel, but 680.26(B)(2)(b) has very prescriptive requirements when structural steel is considered not available.

Panel Meeting Action: Reject

Panel Statement: The code does not require a 3 ft concrete walkway. The perimeter of the pool is not required to be concrete or paved.

Should the structural reinforced concrete material extend less than 3 ft of the required perimeter, an alternate means is provided in 680.26(B)(2)(b).

The use of the word "plane" is incorrect; equipotential bonding in Article 680 includes more than just the ground.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

BLEWITT, T.: We agree the Panel Statement adequately addresses the Submitter's concerns. We believe for others to best benefit from this interpretation that its content should have been included in the text of Section 680.26.

17-171 Log #3917 NEC-P17 **Final Action: Reject**
(680.26(B)(1)(a))

Submitter: James Grant, Rochester, NH

Recommendation: Revise text as follows:

(a) Structural Reinforcing Steel <u>and Welded Wire Mesh</u>. Unencapsulated ~~structural~~ reinforcing steel shall be bonded together by steel tie wires or the equivalent. Where ~~structural~~ reinforcing steel is encapsulated in a nonconductive compound, a copper conductor grid shall be installed in accordance with 680.26(B)(1)(b).

Substantiation: To clarify that welded wire mesh can be used and not that it "could be" included in the term "structural reinforcing steel" where acceptable to the authority having jurisdiction.

Panel Meeting Action: Reject

Panel Statement: Welded wire mesh embedded in concrete that meets the requirements for structural reinforcing steel as permitted by the building code is permitted.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-172 Log #2871 NEC-P17 **Final Action: Accept in Principle**
(680.26(B)(1)(b))

Submitter: James M. Imlah, City of Hillsboro

Recommendation: Revise text to read as follows:

680.26 Equipotential Bonding.

(B) Bonded Parts. (1) Conductive Pool Shells. Bonding to conductive pool shells shall be provided as specified in 680.26(B)(1)(a) or (B)(1)(b). Poured concrete, pneumatically applied or sprayed concrete and concrete block with painted or plastered coatings shall all be considered conductive materials due to water permeability and porosity. Vinyl liners and fiberglass composite shells shall be considered to be nonconductive materials.

(a) Structural Reinforcing Steel. Unencapsulated structural reinforcing steel shall be bonded together by steel tie wires or the equivalent. Where structural reinforcing steel is encapsulated in a nonconductive compound, a copper conductor grid shall be installed in accordance with 680.26(B)(1)(b).

(b) Copper Conductor Grid. A copper conductor grid shall be provided and shall comply with (b)(1) through (b)(4).

(1) Be constructed of minimum 8 AWG bare solid copper conductors bonded to each other at all points of crossing. <u>The bonding conductor shall be by exothermic welding, approved lugs, approved pressure connectors, approved clamps, or other approved means. Connections depending on solder shall not be used. Lugs, connectors or clamps shall be approved for the bonding electrode conductor material and shall be approved for direct soil burial or concrete encasement.</u>

Substantiation: At the present time there is no method provided for bonding conductors being bonded to each other "at all points of crossing." Also, there is no detail how the connections shall be made by the installer and being acceptable for the inspector. This change would provide a method for connections and what type of identified devices being acceptable for maintaining the continuity of the system. I do not believe the intent was to allow steel tie wires as an acceptable method of connecting bonding conductors.

Panel Meeting Action: Accept in Principle

Revise 680.26(B)(1)(b)(1) to read as follows:

(1) Be constructed of minimum 8 AWG bare solid copper conductors bonded to each other at all points of crossing. <u>The bonding shall be in accordance with 250.8 or other approved means.</u>

Panel Statement: CMP-17 edits the text for simplicity and clarity. The change meets the submitter's intent.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-173 Log #804 NEC-P17 **Final Action: Accept in Part**
(680.26(B)(1)(b)(2))

Submitter: Wayne Robinson, Lothian, MD

Recommendation: Revise text to read as follows:

680.26(B)(1)(b)(2) Conform to the contour of the pool ~~and the pool deck~~ <u>and the perimeter surfaces outlined in 680.26(B)(2).</u>

Substantiation: 680.26(B)(1)(b)(2) conflicts with 680.26(B)(2) perimeter surfaces. The installation of perimeter surfaces is outlined in 680.26(B)(2). Perimeter surfaces shall extend for 1 m (3 ft) horizontally beyond the inside walls of the pool, not to the contour of the pool deck.

Panel Meeting Action: Accept in Part

680.26(B(1)(b)(2) to read as follows:

(2) Conform to the contour of the pool.

Panel Statement: CMP-17 accepts removal of "and the pool deck."

CMP-17 does not accept the submitter's proposed new text.

The perimeter is covered in 680.26(B)(2).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-174 Log #3741 NEC-P17 **Final Action: Accept in Principle**
(680.26(B)(1)(b)(2))

Submitter: Mike Weaver, C&M Enterprises

Recommendation: Revise text as follows:

(2) Conform to the contour of the pool ~~and the pool deck~~

Substantiation: Updated language (in the current format) for 680.26 reflects the best language to date for Code users to apply the minimum requirements for equipotential bonding necessary for permanently installed pools. Clear requirements are now detailed specifically for the conductive pool shell as well as the perimeter surfaces. Within 680.26(B)(1)(b) list item (2), the reader is instructed that the copper conductor grid (when installed) shall conform not only to the contour of the pool but also to the contour of the pool deck. No language currently exists for how far that grid is extended from the pool shell into the deck area. This leaves readers to question as to whether the grid should extend to the far reaches of the pool deck, (which could be 40 feet, deck size dependant more or less) when equipotential bonding for pool deck surfaces have never been required to extend beyond 3 feet from the inside wall of the pool in previous Code cycles. With clearly defined requirements for pool perimeter surfaces detailed within 680.26(B)(2), extending the grid into the perimeter deck areas is redundant and conflicting with 680.26(B)(2). It is additionally confusing when no dimensional requirements have been provided for extending the grid into the pool deck. The final litmus test for substantiation is that deletion of the last four words in list item (2) of 680.26(B)(1)(b) result in no changes to the equipotential bonding requirements of 680.26.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 17-173.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-175 Log #806 NEC-P17 **Final Action: Accept in Principle**
(680.26(B)(2))

TCC Action: The Technical Correlating Correlating directs that the action on this proposal be rewritten to comply with NEC Style Manual 3.1.1 regarding mandatory text "...will require...".

This action will be considered by the panel as a public comment.

Submitter: Wayne Robinson, Lothian, MD

Recommendation: Revise text to read as follows:

680.26(B)(2) Perimeter Surfaces. The perimeter surface shall extend for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall include unpaved surfaces as well as poured concrete surfaces and other types of paving. Perimeter surfaces less than 1 m (3 ft) separated by a permanent wall or building 10 ft in height or more will require an equipotential bonding grid on the pool side of the permanent wall or building.

Substantiation: New text eliminates the need for additional equipotential bonding, when the pool is separated by a wall or building that is less than 1 m (3 ft) from the inside wall of the pool.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

680.26(B)(2) Perimeter Surfaces. The perimeter surface shall extend for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall include unpaved surfaces as well as poured concrete surfaces and other types of paving. Perimeter surfaces less than 1 m (3 ft) separated by a permanent wall or building 1.5 m (5 ft) in height or more will require an equipotential bonding grid on the pool side of the permanent wall or building.

Panel Statement: CMP-17 believes the proposed 10 ft height requirement is not substantiated.

CMP-17 chooses to correlate the wall height with the 5 ft reach requirement of 680.12.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-176 Log #4775 NEC-P17 **Final Action: Reject**
(680.26(B)(2))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety

Recommendation: Revise text to read as follows:

(2) Perimeter Surfaces. The perimeter surface shall extend for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall include unpaved surfaces with direct contact to the earth as well as poured concrete and other types of paving. Bonding to perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or (2)(b) and shall be attached to the pool reinforcing steel or copper conductor grid at a minimum of four (4) points uniformly spaced around the perimeter of the pool. For nonconductive pool shells, bonding at four points shall not be required.

Substantiation: I have seen no documentation that wooden decks with hot tubs on the pools that are partially below grade and have a raised plastic catwalk around them are susceptible to voltages from the earth. It is very hard to defend a copper grid around these installations that are not at risk.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided adequate technical substantiation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-177 Log #3084 NEC-P17 **Final Action: Reject**
(680.26(B)(2)(a))

Submitter: Mike Holt, Leesburg, FL

Recommendation: Revise text as follows:

(2) Text to remain unchanged.

(a) Structural Reinforcing Steel. Structural reinforcing steel arranged in a 450-mm (18-in.) by 450-mm (18-in.) grid shall be bonded in accordance with 680.26(B)(1)(a).

(b) Text to remain unchanged.

Substantiation: This proposal is simply intended to provide uniform enforcement of this provision. Without having a prescriptive requirement, inspectors and installers do not know how to install/inspect to this requirement.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided adequate technical substantiation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-178 Log #3916 NEC-P17 **Final Action: Reject**
(680.26(B)(2)(a))

Submitter: James Grant, Rochester, NH

Recommendation: Revise text as follows:

(a) Structural Reinforcing Steel and Welded Wire Mesh. ~~Structural~~ Reinforcing steel shall be bonded in accordance with 680.26(B)(1)(a).

Substantiation: To clarify that welded wire mesh can be used and not that it "could be" included in the term "structural reinforcing steel" where acceptable to the authority having jurisdiction.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 17-171.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-179 Log #805 NEC-P17 **Final Action: Reject**
(680.26(B)(2)(b))

Submitter: Wayne Robinson, Lothian, MD

Recommendation: Revise text to read as follows:

680.26(B)(2)(b). Where structural reinforcing steel is not available or is encapsulated in a nonconductive compound, a copper ~~conductor(s)~~ grid shall be utilized where the following requirements are met: (1) ~~At least one minimum 8 AWG bare solid copper conductor shall be provided~~ Copper Conductor Grid. A copper conductor grid shall be utilized and shall comply with (b)(1) through (b)(5). (2) ~~The conductors shall follow the contour of the perimeter surface~~. The copper grid shall follow the contour of the perimeter surface extending 1 m (3ft) horizontally beyond the inside walls of the pool. ~~(3) Only listed splices shall be permitted.~~ (3) Only listed splices shall be permitted ~~(4) The required conductor shall be 450 to 600 mm (18 to 24 in.) from the inside walls of the pool.~~ (4) The copper grid shall be constructed of 8 AWG bare copper and be arranged in accordance with 690.26(B)(1)(b)(3). ~~(5) The required conductor shall be secured within or under the perimeter surface 100 mm to 150 mm (4 in. to 6 in.) below the subgrade.~~ (5) The copper grid shall be secured within or under the deck or unpaved surfaces no more than 150 mm (4 in. to 6 in.) from the underside of the deck.

Substantiation: Test data from NEETRAC refutes a single copper conductor application for decks, pavers, unpaved surfaces and supports an equipotential plane or copper grid system, as originally outlined in the 2005 Edition of the NEC. NEETRAC Test data reveals a 70 percent to 90 percent increase in step voltages, when comparing a single conductor installation over a copper grid system.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: CMP-17 does not accept the submitter's substantiation.

The present alternate means of perimeter bonding was not demonstrated to be unsafe.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-180 Log #2372 NEC-P17 **Final Action: Reject**
(680.26(B)(4))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

(4) Underwater Lighting. All metal forming shells and mounting brackets of no-niche luminaires shall be bonded.

Exception: Listed ~~low-voltage~~ lighting systems ~~with nonmetallic forming shells shall~~ that do not require bonding.

Substantiation: Some newer no-niche LED luminaires are such that the cord to the luminaire is not exposed to the pool water. Bonding of a mounting bracket may not be necessary. These designs can be listed under the updated requirements being proposed for UL 676.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided adequate technical substantiation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

BLEWITT, T.: The proposed revisions were intended to update the Code to address new technologies, particularly plastic LED luminaires that are permanently factory sealed. These changes would help reduce confusion between installers and Inspection Authorities when dealing with advanced luminaire technologies. We are in agreement that the text of the proposal was too broad and might encompass unproven designs. More focused text and specific substantiation will be provided during the Comment phase.

17-181 Log #2350 NEC-P17 **Final Action: Reject**
(680.26(B)(5))

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Revise text to read as follows:
All metal fittings within ~~or~~ attached or hinged to the pool structure shall be bonded.
Substantiation: The hinged metallic ladder was resting on an extension cord and the hinged connection to the pool structure could leave a potential difference between the ladder and the pool structure's handrails.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-182 Log #885 NEC-P17 **Final Action: Reject**
(680.26(B)(6)(a))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Since 680.6(3), 680.21(A), and 680.62(D)(1) do not appear to exempt double-insulated pump motors from grounding, the bonding conductor should not be limited for use with a replacement motor which may or may not be double insulated.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation.
Bonding and grounding provide two different purposes.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-183 Log #996 NEC-P17 **Final Action: Reject**
(680.26(B)(7))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Metal covered ~~sheathed~~ cables and metal raceways, metal piping, and all fixed metal parts shall be bonded and grounded.
Exception No. 1: Those not associated with the pool and separated by a permanent fixed barrier that prevents contact by persons in the pools hall not be required to be bonded.
Exception No. 2: Those not associated with the pool and ~~greater~~ more than 1.5 m (5 ft) horizontally outside of the pool shall not be required to comply with the bonding required by this section...~~be bonded~~.
Substantiation: Horizontal separation should be outside the pool and the barrier should be one that prevents contact by persons in the pool. Exception No. 2 should be limited to bonding required by this section; other bonding requirements in the Code may apply.
Panel Meeting Action: Reject
Panel Statement: The proposed text adds no clarity to the code. This adds additional requirements with no technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-184 Log #1708 NEC-P17 **Final Action: Accept in Principle**
(680.26(B)(7))

Submitter: David Barnhart, City of Portland
Recommendation: Revise text to read as follows:
Fixed Metal Parts, Wiring Methods and Equipment. Metal sheathed cables and raceways, metal piping and all fixed metal parts shall be bonded.
Substantiation: The heading for 680.26(B)(7) leads one to believe that it only covers installations that are part of "Wiring Methods and Equipment". This makes it difficult to include metal fences, awnings, door frames, etc. as referenced in the 2008 NEC Handbook.
Panel Meeting Action: Accept in Principle
Revise 680.26(B)(7) to read as follows:
(7) Fixed Metal Parts. All fixed metal parts shall be bonded, including, but not limited to, metal sheathed cables and raceways, metal piping, metal awnings, metal fences, and metal door and window frames.
Exceptions to be retained.
Panel Statement: CMP-17 edits the submitter's text to ensure that all fixed metal parts (e.g., electrical equipment, fences, lamp posts) are included.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-185 Log #3659 NEC-P17 **Final Action: Accept in Principle**
(680.26(B)(7) and (8) (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
(7) Metal Wiring Methods and Electrical Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts of the electrical system shall be bonded.
(8) Other Metal Parts. All other fixed metal parts shall be bonded.
Move the exceptions to after (8) and title them to apply to both items (7) and (8).
Substantiation: The current wording is not clear that this rule is intended to cover more than just electrical parts. Breaking the rule up into two sections will make it clear that both metal parts of non electrical equipment as well as the metal parts of the electrical equipment must be bonded.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and statement on Proposal 17-184.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-186 Log #2541 NEC-P17 **Final Action: Reject**
(680.26(B)(7) Exception No. 2)

Submitter: Mark T. Rochon, Peabody, MA
Recommendation: Add new text as follows:
Those greater than 1.5 m (5 ft) horizontally of the inside walls of the pool or electrical equipment location(s) shall not be required to be bonded.
Substantiation: When a metallic receptacle box is used with a cord attachment plug. When it is unplugged there is no connection between the bonding grid and the equipment grounding system of the premises. A possible potential difference between the arms or a person can be available.
Panel Meeting Action: Reject
Panel Statement: Acceptance would not improve the clarity of the code.
The submitter has not provided adequate technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-187 Log #4319 NEC-P17 **Final Action: Reject**
(680.26(C))

Submitter: Ray Cronise, PGN
Recommendation: Delete the following text:
~~(C) Pool Water. An intentional bond of a minimum conductive surface area of 5806 mm2 (9 in.2) shall be installed in contact with the pool water. This bond shall be permitted to consist of parts that are required to be bonded in 680.26(B).~~
Substantiation: When conductive vs. non conductive shell language was introduced via TIA 05-2 to correct for an unintended consequence of requiring a 12 x 12 bonding grid under pool shells that could not be bonded (vinyl lined and fiberglass), it was done so to point out that a steel reinforced concrete pool shell can act as a ground to conduct stray voltage into the water. If the deck is at a different potential this would allow the person to experience a shock. This has been seen and especially in regions where ground conditions are seasonally wet or dry. The fact remains that an insulated shell, like fiberglass, with no light, no handrail in the water and no other source of conductor CANNOT transmit these stray currents through the ¼-1/2 e-glass reinforced composite material.
The only source of the stray voltage can be the deck acting as a ground plane. If it is bonded to the equipment pad as called out in 680.26(b) then all of these components are at the same potential. In this case, the water is simple sitting in a nonconductive shell.
Further, the introduction of a 9 in2 metal actually creates a PATH for stray current to enter the water. Since water today with higher TDS can be more conductive (salt systems, etc…) this, with complex and difficult to calculate field lines of electricity could actually introduce a problem where none existed before.
As well Panel 17 17-122 Log#1894 voted:
Panel Meeting Action: Reject
Ballot Results: Affirmative: 10 Negative: 1
The submitter has not provided adequate substantiation.
There are issues such as conductivity of water, changes with water temperature, current flow, size of conductors, etc. that need to be addressed.
Later in The ROC, by accepting 17-98, this language was once again placed back into the code. "Bonding water" in principle would be a very complex task to undertake since there are many paths stray voltage/current can take. Arbitrarily introducing a metal bonding element into the water, where none existed before creates an unevenly distributed electric field in the water. The vast majorities of the issues found in the field are introduced by potential differences between the water (introduced by lights, handrails, and other submerged metal shell penetrations), and a deck which does not have adequate bonding (no steel or wire mesh), but can act as a ground plane when wet. When the deck is properly bonded, the problem goes away. When no light, handrail, or other metal is in the pool and the deck is bonded to the equipment pad, the problem goes away. Introducing some sort of sacrificial anode of arbitrary size at an arbitrary location into the pool water is not going to solve this problem and it CAN exacerbate the issue to a problem where none existed.
Panel Meeting Action: Reject
Panel Statement: Not all non-conductive pools are electrically isolated.
CMP-17 disagrees with the removal of this requirement as it would result in a reduction of safety.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:
WEST, L.: I agree with the Submitter's Substantiation, and believe that by Bonding the Water in an insulated Pool, you are Increasing the risk rather than Decreasing the risk. Also, the study associated with the Action is not scientifically supportable.

17-188 Log #4660 NEC-P17 **Final Action: Reject**
(680.26(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee
Recommendation: Revise to read as follows:
(C) Pool Water. Pool water shall have an electrical connection to one or more of the bonded parts described in 680.26(B). Where none of the bonded parts is in direct connection with the pool water, the pool water shall be in direct contact with an approved corrosion-resistant conductive surface that exposes not less than 5800 mm2 (9 in.2) of surface area to the pool water at all times. The conductive surface shall be located where it is not exposed to physical damage or dislodgement during usual pool activities, and it shall be bonded in accordance with 680.26(B).
Substantiation: This wording avoids the word "bond" entirely, which for water is close enough to the Article 100 definition to merit inclusion in 680.26, but which most installers have problems visualizing with repect to a liquid. In addition, it includes enforceable requirements for protection and corrosion resistance of the added surface. The standard of product acceptance chosen here is "approved". Although this should eventually probably be "listed", such a standard may be premature at this time. In addition, one of the better ways to achieve this connection is through the installation of a short, bonded nipple in the drain piping comprised of stainless steel or brass (depending in part on the pool chemicals intended to be used). This nipple functions as a current collector and does not require any penetrations of the pool wall, but would not be generally listed for this purpose. This wording also uses a hard metric conversion; the use of the soft conversion now in the NEC is plainly at odds with 90.9(C) and should be discontinued.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided to make this change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-189 Log #514 NEC-P17 **Final Action: Reject**
(680.27(B)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Insert a hyphen between "circuit" and "interrupter".

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-191 Log #3686 NEC-P17 **Final Action: Reject**
(680.31)

Submitter: Gary L. Lawson, General Foam Plastics Corp.
Recommendation: Delete this part of the requirement:
~~Cord Connected pool filter pumps shall be provided with a ground-fault circuit-interrupter that is an integral part of the attachment plug or located in the power supply cord within 300 mm (12 in.) of the attachment plug.~~
Substantiation: 680.32 addresses the GFCI requirement by requiring a GFCI protected circuit. Having an integral GFCI in the power cord and then requiring it to be plugged into a GFCI protected receptacle is not adding any safety benefit. UL 1081 for Storable Pool Pumps does not require a integral GFCI in the power cord.
See the safety information I have provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Often, a permit may not be required for the installation of a storable pool; a GFCI receptacle may not be available for such an installation.
CMP-17 disagrees with the removal of this requirement as it would result in a reduction of safety.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
HIRSCH, B.: It is the Edison Electric Institute's position that the requirements for end-use electrical devices that are not installed as part of the permanent premises wiring system are best covered by the appropriate product standards. It is not the National Electrical Code's intent or scope to set requirements for end use electrical devices that would typically be purchased by the aftermarket consumer.
The Edison Electric Institute supports the entire electrical safety system that integrates product standards, installation standards, product testing and evaluation, electrical inspection, manufacturer's products, qualified electrical installation and maintenance, electric supply system characteristics, and the owner's use and operation. Covering product standards in the National Electrical Code installation standard could negate the responsibility of the appropriate product standard and adversely impact the entire process.
The integrity of the electrical safety system is anchored in the systematic integration of the National Electrical Code, installation inspection, product safety standard and product testing. If non-premises end-use product safety issues are usurped by the National Electrical Code, the product safety standard process will be weakened resulting in the entire process being weakened. In addition since non-premises, end-use products are not normally in place during the inspection process, enforcement of such requirements under the NEC would be impossible.
Comment on Affirmative:
BLEWITT, T.: We disagree with the Submitter's comment that UL 1081 does not require a GFCI in the power cord of a pump for storable swimming pools. This construction requirement was proposed to be added to UL 1081. This requirement has been adopted and will be published in the next set of revisions.

17-192 Log #516 NEC-P17 **Final Action: Reject**

17-193 Log #2453 NEC-P17 **Final Action: Reject**
(680.32)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
680.32 ~~Ground-Fault Circuit-Interrupters~~ Power Safe Protectors Required.
All electrical equipment, including power-supply cords, used with storable pools shall be protected by ~~ground-fault circuit-interrupters~~ power safe protectors.
All 125-volt receptacles located within 6.0 m (20 ft) of the inside walls of a storable pool shall be protected by ~~ground-fault circuit-interrupter~~ power safe protector. In determining these dimensions, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Note: Supporting material is available for review at NFPA Headquarters.

(680.32)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise the first sentence of the second paragraph to read: "All 125-volt, 15- and 20-ampere receptacles located within 6.0 m (20 ft)...". (remainder unchanged).

Substantiation: This section needs an amperage parameter comparable to 680.22(A)(4).

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-195 Log #2373 NEC-P17 **Final Action: Accept in Part**

(680.33(A))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

680.33 Luminaires. An underwater luminaire, if installed, shall be installed in or on the wall of the storable pool. It shall comply with either 680.33(A) or (B).

(A) **Units connected to isolated supplies** ~~**15 Volts or Less.**~~ A luminaire shall be part of a cord-and-plug-connected lighting assembly. This assembly shall be listed as ~~an assembly for the purpose~~ a luminaire for storable pools and have the following construction features:

~~(1) No exposed metal parts~~

~~(2) A luminaire lamp that operates at 15 volts or less~~ (1) A luminaire lamp that operates at a voltage not exceeding the Class 2 voltage limits "where wet contact is likely to occur" as specified in Table II(A).

~~(3) An impact-resistant polymeric lens, luminaire body, and transformer enclosure~~

~~(4)~~ (2)A transformer or power supply meeting the requirements of 680.23(A)(2) with a primary rating not over 150 volts

Substantiation: The phrase "listed as an assembly for the purpose" is vague and difficult to enforce. It is proposed to be changed to be more specific.

Existing text assumes the luminaire is connected to a 60Hz AC source. LED luminaires require DC sources. A reference to "power supplies" is therefore necessary. The existing 15 volt voltage limit is to address the risk of electric shock during relamping with the luminaire inadvertently left on. A specific voltage limit is not needed. A reference to Table II(A) will allow the voltage limits to evolve with updates to the Class 2 voltage limits. The features specified in Items 1 and 3 reflect the design of the first luminaire of this type. These features are not necessary in all designs to be listed. The only key construction feature is the special isolation needed for the transformer or power supply.

Panel Meeting Action: Accept in Part

Revise 680.33(A)(4) to read as follows:

(4) A transformer or power supply meeting the requirements of 680.23(A)(2) with a primary rating not over 150 volts

Panel Statement: CMP-17 accepts "or power supply" in 680.33(A)(4).

CMP-17 does not accept the remainder of the submitter's proposal.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-196 Log #2374 NEC-P17 **Final Action: Accept in Part**

(680.33(A))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

(B) **Units not powered by an isolated source** ~~**Over 15 Volts But Not over 150 Volts.**~~ A lighting assembly without a transformer or power supply and with the luminaire lamp(s) operating at not over 150 volts shall be permitted to be cord-and-plug-connected where the assembly is listed as ~~an assembly for the purpose~~ a luminaire for storable pools. The installation shall comply with 680.23(A)(5), and the assembly shall have the following construction features:

~~(1) No exposed metal parts~~

~~(2) An impact-resistant polymeric lens and luminaire body~~

(1) ~~(3)~~ A ground-fault circuit interrupter with open neutral conductor protection as an integral part of the assembly

(2) ~~(4)~~ The luminaire lamp permanently connected to the ground-fault circuit interrupter with open-neutral protection

(3) ~~(5)~~ Compliance with the requirements of 680.23(A)

Substantiation: The phrase "listed as an assembly for the purpose" is vague and difficult to enforce. It is proposed to be changed to be more specific. The reference to voltage in the **(B)** heading is not necessary, the maximum 150 volt limit is specified in the first sentence. The luminaire is either powered by a "swimming pool" isolated source or it is not. The 15 volt limit is not needed. The requirements should be used at any voltage if the luminaire assembly is not covered by 680.33(A).

The features specified in Items 1 and 2 reflect the design of the first luminaire of this type. These features are not necessary in all designs to be listed. The only key construction features are those in existing Items 3, 4 and 5 (now 1, 2 and 3).

Panel Meeting Action: Accept in Part

Revise 680.33(B) to read as follows:

(B) Over 15 Volts But Not over 150 Volts. A lighting assembly without a transformer or power supply and with the luminaire lamp(s) operating at not over 150 volts shall be permitted to be cord-and-plug-connected where the assembly is listed as an assembly for the purpose. The installation shall comply with 680.23(A)(5), and the assembly shall have the following construction features:

Panel Statement: CMP-17 notes the submitter's incorrect reference; it should be 680.33(B).

CMP-17 accepts "or power supply" in 680.33(B).

CMP-17 does not accept the remainder of the submitter's proposal.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-198 Log #2229 NEC-P17 **Final Action: Reject**

(680.34)

Submitter: Michael Dempsey, Municipal Code Inspections

Recommendation: Revise text to read as follows:

Receptacles shall not be located less than 10 ft from the inside walls of a pool.

Substantiation: The change to 6 ft in the 2008 NEC, increases electrical hazards around the pool. Under the 2008 NEC, a radio with a 6 ft cord would be able to be at the edge of the pool, allowing somebody in the pool to come in contact with an electrical appliance, the change to 6 ft does not comply with 90.1.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 17-119.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-199 Log #4662 NEC-P17 **Final Action: Reject**

(680.34)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Add the following sentence: "The installation directions for storable pools shall include a prominent mention of this requirement, written in terms of the locations that are acceptable for pool placements as a consequence of its provisions."

Substantiation: No one installs a receptacle for a storable pool, or certainly only very rarely. Storable pools are appliances, and untrained persons take them home from the store and set them up, taking care to find level ground and deciding which plot of grass will be killed this summer. The proximity of a receptacle in terms of the Code requirements is never considered, and no electrical permits and inspections enforce these rules as a practical matter. This proposal does all that the NEC can do, namely, mandate a clearly worded instruction to the end user, and then we hope for the best. Without this proposal, compliance with this rule will be strictly accidental as a practical matter.

Panel Meeting Action: Reject

Panel Statement: The proposed text is not enforceable.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-200 Log #4710 NEC-P17 **Final Action: Reject**
(680.42)

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Revise text as follows:
A spa or hot tub installed outdoors shall comply with the provisions of Part I and II of this article, except where voltage gradients cannot be encountered and as permitted in 680.42(A) and (B)
Substantiation: Clarity is needed that 680.26(B)(2) need not apply when the tub is sitting on a wooden deck over 6 ft above grade.
Panel Meeting Action: Reject
Panel Statement: The proposed text is not enforceable.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
WEST, L.: I agree with the Submitter's Substantiation, and believe that a Wood Deck above grade does not need to be Bonded when a Spa is sitting on that Deck. Also, Reference 17-203.

17-201 Log #3919 NEC-P17 **Final Action: Reject**
(680.42(A)(1))

Submitter: Michael R. Fisher, Bluhm Electric Inc.
Recommendation: Revise text as follows:
(1) Flexible Conduit. Liquidtight flexible metal conduit or liquidtight nonmetallic conduit shall be permitted. ~~in lengths of not more than 1.8 m (6 ft).~~
Substantiation: Liquidtight metal conduit and nonmetallic conduit uses are permitted for protection from liquids and flexibility. It is approved for feeders to swimming pools. When installing a Spa or Hot Tub, it does not allow the use of more than 1.8 m (6 ft) of liquidtight metal conduit which requires the conduit to the Spa or Hot Tub. Which requires a fitting to attach to the sealtight to the conduit, a point that can become separated creating a possible hazard. The uses of Liquidtight metal conduit would create a safer installation if one length was used. We have to pull a ground wire in the liquidtight as per code anyway.
Panel Meeting Action: Reject
Panel Statement: CMP-17 rejects the proposal as the use of unspecified lengths of LFNC may cause significant problems and damage.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-202 Log #518 NEC-P17 **Final Action: Reject**
(680.42(A)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "circuit" and "interrupter".
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-29.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-203 Log #4332 NEC-P17 **Final Action: Reject**
(680.42(B))

Submitter: Carvin DiGiovanni, Association of Pool & Spa Professionals
Recommendation: Revise as follows:
(B) Bonding. Bonding by metal-to-metal mounting on a common frame or base shall be permitted. The metal bands or hoops used to secure wooden staves shall not be required to be bonded as required in 680.26. The equipotential bonding requirements for perimeter surfaces in 680.26 (B)(2) shall not apply to listed portable spas and hot tub packaged units, and insulating mats shall not be required in lieu of equipotential bonding of perimeter surfaces for these portable units.
Substantiation: This proposal eliminates confusion regarding bonding of listed, packaged portable spas and hot tubs located outdoors, and is being submitted concurrent with a similar proposal to clarify language in 680.43 regarding indoor portable spas and hot tubs. Some AHJs recently have begun requiring existing patios, floors and other surfaces (including grass yards) to be torn up and rebuilt with an equipotential bonding grid, or have required the installation of rubber "insulating" mats of unknown quality and questionable dielectric standoff characteristics under and around the spa or hot tub when the property owner purchases and installs a portable spa or hot tub. This is being done on the premise that the reference to Part II in Article 680.42 requires such arrangements. The author has seen no evidence that the CMP ever intended that the surrounding perimeter surfaces associated with these portable devices be incorporated into the equipotential bonding grid or insulated, and there is no similar perimeter bonding requirement for storable (i.e., portable) pools, although the equipotential bonding issues are identical. Such a perimeter bonding requirement (indoors or outdoors) is impractical and cost-prohibitive for portable spas and hot tubs, as the whole point of a portable spa is that it can readily be moved or relocated, and is integrally bonded, grounded and GFCI-protected under other sections of Article 680 and UL 1563. A perimeter surface bonding requirement requires demolition and rebuilding of any and all patio or yard area(s) where a portable spa or hot tub is located any time it is installed or moved, with no concurrent improvement in safety. There are no known reported shock or electrocution incidents associated with step potentials or touch potentials associated with persons making contact with the spa or hot tub and the surrounding perimeter surface that could be attributed to failure to bond the perimeter surface. REQUEST FOR INTERPRETATION???]
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation for this change.
There is no definition for portable spas and hot tub packaged units.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
WEST, L.: I agree with the Submitter's Substantiation, and believe that a Wood Deck above grade does not need to be Bonded when a Spa is sitting on that Deck. Also, Reference 17-203.

17-204 Log #580 NEC-P17 **Final Action: Reject**
(680.42(C))

Submitter: Mitch Feininger, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
One-Family Dwelling or Structure Associated with a One-Family Dwelling. Any of the wiring methods recognized in Chapter 3 of this code that...". (Leave as is for the remainder of Section).
Substantiation: The reference to the interior of dwelling or associated structure misleads NEC users and enforcers to deduce that once wiring is outside of this zone, the wiring must be changed to include an insulated EGC but goes on to allow an uninsulated EGC to be used for the connection to the motor, heating...".
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
The intent of the code is to have an insulated ground at the outdoor location where the branch circuit exits the dwelling.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-205 Log #4411 NEC-P17 **Final Action: Reject**
(680.42(D))

Submitter: Dean Hunter, Hunter Electric
Recommendation: Add the following new text:
680.42(D) Equipotential Bonding. The requirements of 680.26(B)(2) for equipotential bonding shall not be required for a listed spa or hot tub assembly installed outdoors with minimum 1 meter (3 foot) of totally non-conductive perimeter surface, such as a wooden deck.
Substantiation: This is identification used for equipment grounding conductors and commonly used to identify grounding electrode conductors - though it is not required. With the great work done in the 2008 cycle to "clean up" not only the language of grounding but to eliminate the inappropriate (and inadvertent) re-grounding the neutral conductor a requirement to identify the grounding electrode conductor is necessary.
Panel Meeting Action: Reject
Panel Statement: See panel action and substantiation on Proposal 17-203.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
WEST, L.: I agree with the Submitter's Substantiation, and believe that a Wood Deck or Nonconductive Surface does not need to be Bonded when a Spa is sitting on that Deck. Also Reference 17-203.

17-206 Log #519 NEC-P17 **Final Action: Reject**
(680.43)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "circuit" and "interrupter" in (A)(2) and (B)(1)(c).
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-29.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-207 Log #4333 NEC-P17 **Final Action: Accept in Principle in Part**
(680.43)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal concerning the use of the word "when" since the NEC Style Manual considers "when" as a condition of time.

This action will be considered by the panel as a public comment.

Submitter: Carvin DiGiovanni, Association of Pool & Spa Professionals
Recommendation: Revise as follows:

680.43 Indoor Installations. A spa or hot tub installed indoors shall comply with the provisions of Parts I and II of this article except as modified by this section and shall be connected by the wiring methods of Chapter 3.
Exception: Listed spa and hot tub packaged units rated 20 amperes or less shall be permitted to be cord-and-plug connected to facilitate the removal or disconnection of the unit for maintenance and repair.
Exception: The equipotential bonding requirements for perimeter surfaces in 680.26 (B)(2) shall not apply to listed portable spas and hot tub packaged units, and insulating mats shall not be required in lieu of equipotential bonding of perimeter surfaces for these portable units.

Substantiation: This proposal eliminates confusion regarding bonding of listed, packaged portable spas and hot tubs located indoors, and is being submitted concurrent with a similar proposal to clarify language in 680.42(B) regarding outdoor portable spas and hot tubs. Some AHJs have recently begun requiring existing patios, floors and other surfaces (including grass yards) to be torn up and rebuilt with an equipotential bonding grid, or have required the installation of rubber "insulating" mats of unknown quality and questionable dielectric standoff characteristics under and around the unit when the property owner purchases and installs a portable spa or hot tub. This is being done on the stated premise that the reference to Part II in Article 680.43 requires such arrangements. The author has seen no evidence that the CMP ever intended that the surrounding perimeter surfaces associated with these devices be incorporated into the equipotential bonding grid or insulated, and there is no similar perimeter bonding requirement for storable (i.e., portable) pools, although the issues are identical. Such a perimeter bonding requirement (indoors or outdoors) is impractical and cost-prohibitive, as the whole point of a portable spa is that it can readily be moved or relocated, and is integrally bonded, grounded and GFCI-protected under other sections of Article 680 and UL 1563. A perimeter surface bonding requirement requires demolition and reconstruction of any and all floor area(s) where a portable spa or hot tub is located any time it is installed or moved, with no concurrent improvement in safety. Further, conductive floors in buildings are generally steel-reinforced, integral to the building steel, and are required to be bonded to the grounding system, creating an equipotential surface independent of any spa-related bonding grid. There are no known reported shock or electrocution incidents associated with step potentials or touch potentials associated with persons making contact with the spa or hot tub and the surrounding perimeter surface that could be attributed to failure to bond the perimeter surface. [REQUEST FOR INTERPRETATION???]

Panel Meeting Action: Accept in Principle in Part
Existing exception to be renumbered as Exception No. 1.
New exception to read as follows:
Exception No 2: The equipotential bonding requirements for perimeter surfaces in 680.26 (B)(2) shall not apply to a listed ~~portable spas and hot tub packaged units~~ self-contained spa or hot tub ~~and~~ when installed above the finished floor. ~~insulating mats shall not be required in lieu of equipotential bonding of perimeter surfaces for these portable units.~~

Panel Statement: CMP-17 accepts the addition of an exception to the beginning of 680.43.

CMP-17 does not accept "portable spas and hot tub packaged units" and uses "self-contained spa or hot tub," as these are the correct definitions. CMP-17 deletes the submitter's inclusion of insulating mats as these are not required.

CMP-17 also edits the submitter's text to convey that these units are installed above the finished floor and not embedded in the floor.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-208 Log #2192 NEC-P17 **Final Action: Accept**
(680.43(C))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete text as follows:

(C) ~~Wall~~ Switches. Switches shall be located at least 1.5 m (5 ft), measured horizontally, from the inside walls of the spa or hot tub.

Substantiation: The title of this subsection makes it appear that a safety switch installed in a cabinet or cutout box need not comply with the separation requirement. The term "wall switch" would imply a general use snap switch to most code users.

Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-209 Log #3024 NEC-P17 **Final Action: Accept in Principle**
(680.43(C))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:

(C) ~~Wall~~ Switches. Switches shall be located at least 1.5 m (5 ft), measured horizontally, from the inside walls of the spa or hot tub.

Substantiation: The title of this subsection makes it appear that a safety switch installed in a cabinet or cutout box need not comply with the separation requirement. The term "wall switch" would imply a general use snap switch to most code users.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 17-208.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-210 Log #4663 NEC-P17 **Final Action: Reject**
(680.43(D) Exception No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the clause "shall be permitted to differ from the provisions of (1)and (2)."

Substantiation: This makes the exception into a complete sentence, thereby coming into compliance with 3.1.4.1 of the NEC Style Manual. If CMP 17 or UL has more specific information about exactly what variances are being sought under this new exception, feel free to specify them in acting on this proposal. Items (3) and (4) are omitted from this proposal because they are field bonding requirements to conductive items well removed from the listed assembly in the form the testing laboratory would have seen it. This entire lack of clarity, after all, is exactly why exceptions are required to be complete sentences; they are supposed to convey a complete thought. This exception, as presently written, could be rewritten as "listed self-contained spas or hot tubs can be have whatever parts bonded the test lab feels are appropriate, and don't bother with nearby metal piping and surfaces either." This is an extremely irresponsible way to go about writing an exception.

Panel Meeting Action: Reject
Panel Statement: The submitter's recommended text is very confusing and does not add clarity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-211 Log #1602 NEC-P17 **Final Action: Accept in Principle**
(680.43(D)(5))

Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Revise text to read as follows:

(5) Electrical devices and controls that are not associated with the spas or hot tubs (~~and that are~~) (shall be) located not less than 1.5 m (5 ft) from such units; otherwise, they shall be bonded to the spa or hot tub system.

Substantiation: I have read this section over and over and over and it just does NOT make sense. I had to go back several code books (1999 NEC section 680.41(D)(5)) to find the wording that makes sense and meets the intent of this section. The present wording would literally require bonding for ALL devices and controls not associated with the spa or hot tub, those NOT less than 5 ft away, and those within 5 ft. I believe the intent is to require bonding ONLY for the equipment within 5 ft of the spa or hot tub, not equipment located MORE than 5 ft from the spa or hot tub.

Panel Meeting Action: Accept in Principle
Revise 680.43(D)(5) to read as follows:
(5) Electrical devices and controls that are not associated with the spas or hot tubs and that are located less than 1.5 m (5 ft) from such units

Panel Statement: CMP-17 edits the submitter's text for clarity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-212 Log #520 NEC-P17 **Final Action: Reject**
(680.44)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "circuit" and "interrupter" in the first paragraph, (B) and (C).
Substantiation: The addition of the hyphen will provide consistency throughout the Code.

Additional proposals are being submitted to make similar corrections throughout the Code.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-29.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-213 Log #3216 NEC-P17 **Final Action: Accept**
(680.44(C))

Submitter: John I. Williamson, Maple Grove, MN
Recommendation: Delete all of 680.44(C).
Substantiation: 680.44(C) is not correlated with 680.22(B). The 2008 NEC requires ground-fault circuit-interrupter (GFCI) protection for personnel for all 15 or 20 ampere, 125 volts or 240 volt, single phase outlets for pool pump motors, whether the motor connection is by cord and attachment plug into a receptacle outlet or direct (hard-wired) connection. The allowance in 680.44(C) to omit GFCI protection for a combination pool and spa or hot tub installation is no longer permitted because 680.22(B) requires GFCI protection for the pool pump motors.
Panel Meeting Action: Accept

17-215 Log #2375 NEC-P17 **Final Action: Accept in Part**
(680.51(A))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
680.51 Luminaires, Submersible Pumps, and Other Submersible Equipment.
(A) Ground-Fault Circuit Interrupter. Luminaires, submersible pumps, and other submersible equipment, unless listed for operation at <u>a voltage that complies with the limits specified in 680.23A)(8)</u> ~~15 volts or less~~ and supplied by a transformer <u>or power supply</u> that complies with 680.23(A)(2), shall be protected by a ground-fault circuit interrupter.
Substantiation: Present text assumes ac units only. The proposed revision adds the option of dc rated unit.
Panel Meeting Action: Accept in Part
Revise 680.51 to read as follows:
(A) Ground-Fault Circuit Interrupter. Luminaires, submersible pumps, and other submersible equipment, unless listed for operation at 15 volts or less and supplied by a transformer or power supply that complies with 680.23(A)(2), shall be protected by a ground-fault circuit interrupter.
Panel Statement: CMP-17 accepts "or power supply."
CMP-17 does not accept the remainder of the submitter's text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-216 Log #2376 NEC-P17 **Final Action: Reject**
(680.51(F))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Add new text as follows:
(F) Servicing. All equipment shall be removable from the water for relamping or normal maintenance. Luminaires shall not be permanently embedded into the fountain structure such that the water level must be reduced or the fountain drained for relamping, maintenance, or inspection. <u>Alternatively, a luminaire that is listed and not requiring user maintenance shall be permitted.</u>
Substantiation: The present text reflects designs that require periodic relamping as well as seals and gaskets that could fail. Some newer LED luminaire constructions are such that they do not require relamping. They also are permanently sealed so there is no periodic maintenance anticipated.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
BLEWITT, T.: The proposed revisions were intended to update the Code to address new technologies, particularly plastic LED luminaires that are permanently factory sealed. These changes would help reduce confusion between installers and Inspection Authorities when dealing with advanced luminaire technologies. We are in agreement that the text of the proposal was too broad and might encompass unproven designs. More focused text and specific substantiation will be provided during the Comment phase.

17-217 Log #3300 NEC-P17 **Final Action: Reject**
(680.52(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Where the box is ~~fed by~~ <u>connected only to</u> nonmetallic conduit(s) it shall have addition supports and fasteners of copper, brass, or other ~~approved~~ <u>identified</u> corrosion-resistant material <u>unless embedded in the pool structure</u>.
Substantiation: The provision should apply where 314.23 is not applicable, since a box may be "fed" by nonmetallic conduit and also connected to conduits specified in 314.23 which may suffice and make additional support unnecessary. Embedment in pool structure makes additional support unnecessary.
Panel Meeting Action: Reject
Panel Statement: This proposal would change the intent of the current Code text. A combination of PVC and metallic conduit that does not meet the requirements of 314.23 would not require additional support.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-218 Log #2377 NEC-P17 **Final Action: Reject**
(680.54)

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
680.54 Grounding. The following equipment shall be grounded:
(1) All electrical equipment located within the fountain or within 1.5 m (5 ft) of the inside wall of the fountain, <u>unless listed as not requiring grounding.</u>
(2) All electrical equipment associated with the recirculating system of the fountain
(3) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the fountain
Substantiation: Proposed revisions to the requirements for underwater luminaries in UL 676 allow for units that do not require grounding in order to address the risks of electric shock and fire.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
BLEWITT, T.: See My Explanation of Negative on 17-216 (Log #2376).

17-219 Log #2378 NEC-P17 **Final Action: Accept in Part**
(680.55(B))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
~~**(B) Supplied by a Flexible Cord.** Electrical equipment that is supplied by a flexible cord shall have all exposed non–current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The equipment grounding conductor shall be connected to an equipment grounding terminal in the supply junction box, transformer enclosure, or other enclosure~~.
<u>**(B) Supplied by a Flexible Cord.** Electrical equipment that is supplied by a flexible cord shall comply with (1) or (2):</u>
<u>(1) The electrical equipment shall have all exposed non-current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer or power supply enclosure, or other enclosure.</u>
<u>(2) The electrical equipment shall be listed as not requiring grounding.</u>
Substantiation: The reference to "transformers" assumes ac luminaires only. "Power supplies" was added to reflect DC rated LED luminaires. Item 2 is proposed as it is possible to list units that do not require grounding. The revisions being proposed to the standard for underwater luminaires, UL 676, allow for such designs.
Panel Meeting Action: Accept in Part
Revise 680.55(B) to read as follows:
(B) Supplied by a Flexible Cord. Electrical equipment that is supplied by a flexible cord shall have all exposed non–current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The equipment grounding conductor shall be connected to an equipment grounding terminal in the supply junction box, transformer enclosure, power supply enclosure, or other enclosure.
Panel Statement: CMP-17 accepts the addition of "power supply enclosure."
CMP-17 does not accept the remainder of the submitter's text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

BLEWITT, T.: UL agrees with the Panel Action to include "power supply enclosure." The proposed revisions were intended to update the Code to address new technologies, particularly plastic LED luminaires that are permanently factory sealed. These changes would help reduce confusion between installers and Inspection Authorities when dealing with advanced luminaire technologies. We are in agreement that the text of the proposal was too broad and might encompass unproven designs. More focused text and specific substantiation will be provided during the Comment phase.

17-220 Log #522 NEC-P17 **Final Action: Reject**
(680.56(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "Circuit" and "Interrupter" in the title. Add a hyphen between "circuit" and "interrupters" in the last phrase.
Substantiation: The addition of the hyphen will provide consistency throughout the Code.

Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject

17-221 Log #995 NEC-P17 **Final Action: Reject**
(680.56(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

Connections with flexible cord shall be permitted, except that grounding-type attachment plugs and receptacles, <u>cord connectors and flanged surface devices</u> shall be permitted...". (remainder unchanged).
Substantiation: Edit. Cord connectors and flanged surface devices should be included.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-222 Log #523 NEC-P17 **Final Action: Reject**
(680.62)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "circuit" and "interrupter" in (A), (A)(2), and (E).
Substantiation: The addition of the hyphen will provide consistency throughout the Code.

Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-29.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-223 Log #4664 NEC-P17 **Final Action: Reject**
(680.62(B) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the following exception at the end:

Exception: Small conductive surfaces not likely to become energized, such as air and water jets and drain fittings where not connected to metallic piping, towel bars, mirror frames, and similar nonelectrical equipment, shall not be required to be bonded.

Note: also delete the comma after "drain fittings" in 680.43(D) Exception No. 1.
Substantiation: This part of the article needs a small parts exception just as for the case of conventional spas and hot tubs. This wording tracks the text of 680.43(D) Exception No. 1 with the exception that the comma after "drain fittings" is omitted in order to make the next six words make sense. In transferring this material, the submitter realized that the comma should be removed from the spa and hot tub exception, hence the additional note.
Panel Meeting Action: Reject
Panel Statement: The submitter's text is vague and not readily enforceable. The requirement does not address conductive surfaces that may become energized but create a conductive path.

Although not connected to piping, these items may contact metal studs and the like.

The submitter has not provided adequate technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:

BLEWITT, T.: UL disagrees that this proposal should have been rejected. It is essentially the identical "small parts" exception that is allowed for spas in Section 680.42(D)(4) Exception No. 1. This should have been accepted in Accepted in Principle in Part, with the text adjusted to address concerns with mirrors and the like being secured to metal wall studs.

HIRSCH, B.: This proposal extends the exception for bonding for items such as air and water jets, towel bars, mirror frames and drains not connected to metal piping which exists for spas and hot tubs (680.43(D)Exception !, to therapeutic tubs. The proposer suggests that the same wording be used. There is nothing about therapeutic tubs that would make them any different from spas and hot tubs. As such, the proposer is correct in his analysis and the proposal should have been accepted. <u>The panel failed to recognize that the proposal merely extends the bonding exception given to spas and hot tubs to therapeutic tubs. The wording currently exists in the Code and has been previously approved by the Panel.</u>

17-224 Log #1333 NEC-P17 **Final Action: Reject**
(680.70)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:

They shall ~~not be required~~ to comply with other ~~parts~~ <u>applicable provisions</u> of this article.
Substantiation: Present wording exempts provisions for grounding, GFCI protection and other pertinent provisions.
Panel Meeting Action: Reject
Panel Statement: The provisions are provided in 680-71.

CMP-17 does not agree with the submitter's substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-225 Log #1958 NEC-P17 **Final Action: Reject**
(680.70)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence: They shall ~~not~~ be required to comply with other <u>applicable</u> parts of this article.
Substantiation: Present wording removes provisions necessary for safety such as grounding, bonding, luminaries, GFCI protection, wall switches, etc.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-224.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-226 Log #524 NEC-P17 **Final Action: Reject**
(680.71)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "circuit" and "interrupter" in two places.
Substantiation: The addition of the hyphen will provide consistency throughout the Code.

Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject

Ballot Results: Affirmative: 11

17-227 Log #4824 NEC-P17 **Final Action: Reject**
(680.71)

Submitter: David Zinck, Newburyport, MA Wiring Inspector
Recommendation: Revise text to read as follows:

680.71 Protection

Hydromassage bathtubs and their associated electrical components shall be ~~on an individual branch circuit(s) and~~ protected by a ~~readily accessible~~ ground-fault circuit interrupter.
Substantiation: 210.23 already tells us what is acceptable for branch circuit loading. There are tubs available that use very little electricity. Some have only bubbles; some have very small pump motors. Most electricians during the rough wiring stage of the house do not know exactly which unit the home owners are going to get so the vast majority get separate circuits anyway. And most electricians would not do it any other way.

I hate to close the door on the electrician and homeowner who are doing a renovation in an existing house where snaking down to the basement panel is prohibitively expensive. If they are just removing an existing tub and installing a hydromassage tub with a low current draw, than the electrician should be able to apply 210.23 to see if he can feed it from an existing circuit.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation.

This change would reduce the level of safety that this requirement provides.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-228 Log #4900 NEC-P17 **Final Action: Reject**
(680.71)

Submitter: James Grant, Rochester, NH
Recommendation: Revise text as follows:
680.71 Protection. Hydromassage bathtubs and their associated electrical components shall be on an individual branch circuit(s) and protected by a ~~readily~~ accessible ground-fault circuit interrupter. All 125-volt, single-phase receptacles not exceeding 30 amperes and located within 1.83 m (6 ft) measured horizontally of the inside walls of a hydromassage tub shall be protected by a ground-fault circuit interrupter.
Substantiation: The addition of the words “readily accessible” placed an unnecessary role pertaining to the placement of the ground-fault circuit interrupter. With the definition of readily accessible in mind, allowing the word “readily” to remain would not allow a ground-fault interrupter device to be placed in the bathtub’s motor compartment that had a door that was removable via Velcro or pressure clips. Would it permit one if the door was hinged? Do we need to be able to push the test button in a panic? If anything should be “readily accessible” shouldn’t it be a disconnect to shut off the motor that is within sight of the occupants of the tub?
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-227.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-229 Log #4665 NEC-P17 **Final Action: Reject**
(680.73)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee
Recommendation: Add the following sentence to 680.73 at the end: “Where the hydromassage bathtub is cord- and plug-connected with the supply receptacle accessible only through a service access opening, the receptacle shall be installed so that its face is within direct view and not more than 300 mm (1 ft) of the opening.”
Substantiation: The required GFCI protection for hydromassage bathtubs (see 680.71) is now required to be “readily accessible.” This new rule is aimed at making the monthly test feature on the device more likely to be implemented, and, in the case of a receptacle GFCI, would make this proposal unnecessary. However, an “individual branch circuit” must only supply a single receptacle in the case of a cord- and plug-connected load with only a single supply cord. This effectively precludes the use of a GFCI configured as a duplex receptacle, and since single-receptacle GFCIs are no longer manufactured, the GFCI protection will always be elsewhere, such as in the case of a GFCI circuit breaker or a “faceless” GFCI. In such instances this single receptacle should located so as to provide reasonable access for those maintaining the equipment. We routinely see devices so well concealed that two flashlights and a mirror are needed to find them, and a contortionist is required to disconnect the tub. This proposal assures easy access to the receptacles when the access cover is open, while still allowing them to be cosmetically concealed.
Panel Meeting Action: Reject
Panel Statement: The current text of the code requires GFCIs to be readily accessible.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-230 Log #530 NEC-P17 **Final Action: Accept in Principle in Part**
(680.74)

Submitter: George H. Little, Little Enterprises
Recommendation: Revise text as follows:
Bonding. All metal piping systems and all grounded metal parts in contact with the circulating water shall be bonded together using a solid copper bonding jumper, not smaller than 8 AWG. The bonding jumper shall be connected to the terminal on the circulating pump motor that is intended for this purpose. The bonding jumper shall not be required to be connected to a double insulated circulating pump motor. The 8 AWG or larger solid copper bonding jumper shall be required for equipotential bonding in the area of the hydromassage bathtub ~~and shall not be extended or attached to any remote panel board, service equipment, or electrode~~. <u>The 8 AWG shall be long enough to terminate on a replacement non-double insulated pump motor that would require bonding. The 8 AWG shall be terminated to the equipment grounding conductor of the branch circuit of the motor when a double insulated circulating pump motor is used.</u>
Substantiation: Adding the wording that would provide a longer 8 AWG for connection of a replacement of a double-insulated pump with a non-double insulated unit and having the bonding conductor terminate with the equipment grounding conductor would mirror what is done in 680.26(B)(6)(a).
Panel Meeting Action: Accept in Principle in Part
Revise 680.74 to read as follows:
All metal piping systems and all grounded metal parts in contact with the circulating water shall be bonded together using a solid copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG. The bonding jumper shall be connected to the terminal on the circulating pump motor that is intended for this purpose. The bonding jumper shall not be required to be connected to a double insulated circulating pump motor. The 8 AWG or larger solid copper bonding jumper shall be required for equipotential bonding in the area of the hydromassage bathtub and shall not be required to be extended or attached to any remote panelboard, service equipment, or any electrode. <u>The 8 AWG or larger solid copper bonding jumper shall be long enough to terminate on a replacement non-double insulated pump motor, and shall be terminated to the equipment grounding conductor of the branch circuit of the motor when a double insulated circulating pump motor is used.</u>
Panel Statement: CMP-17 accepts the submitter’s text relative to the length of the bonding conductor and the connection of the 8 AWG or larger solid copper bonding jumper to the equipment grounding conductor of the circuit supplying the double insulated pump motor.
CMP-17 does not accept the remainder of the submitter’s text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
JHONSON, D.: I agree with the requirement “The 8 AWG shall be terminated to the equipment grounding conductor of the branch circuit of the motor when a double insulated circulating pump motor is being used”.
However, confusion still exist on what the other end of the #8 AWG should be bonded to. The current text only requires bonding the metal piping systems and grounded metal parts “in contact with the circulating water”.
Hydromassage bathtubs typically use nonmetallic piping for water circulation. Copper water piping supplying a deck mount faucet would not be bonded, as it is not “in contact with the circulating water”. Someone using the Hydromassage tub may contact a potential difference between the metal water piping connected to the faucet and the circulating water in contact with other grounded metal parts of a non-double insulated motor.
In the 2002 NEC, 680.74 required double insulated motors to provide a means for grounding internal non-accessible, non-current carrying metal parts. This was in conflict with the UL Standard for double insulated motors.
In 2005, the NEC was changed by removing text “to provide a means for grounding internal non-accessible, non-current carrying metal parts” which accommodated the UL Standard conflict and in addition resulted in removing text requiring all metal piping systems “associated with a Hydromassage tub” to be bonded with the 8 AWG (weather or not in contact with the circulating water). As proposal 17-230 is addressing an issue of bonding in 680.74 relating to double insulated motors, I am of the opinion it is appropriate for CMP-17 to resolve this issue with revised text clarifying the intent to bond all metal piping systems supplying a Hydromassage bath tub.

17-231 Log #1048 NEC-P17 **Final Action: Reject**
(680.74)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete:
The bonding jumper shall not be required to be connected to a double insulated circulating pump motor.
Substantiation: Section 680.6(3) requires grounding of pool pump motors as does 680.21(A) which do not exempt double insulated motors. 680.62(D)(1)(b) requires a pump motor to be grounded; the last sentence of 680.26(B)(6)(a) indicates an EGC for double insulated motors. Ungrounded double insulated motors do not provide protection where an ungrounded supply conductor shorts to a metal terminal enclosure or the motor frames.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-230.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 682 — NATURAL AND ARTIFICALLY MADE BODIES OF WATER

17-232 Log #708b NEC-P17 **Final Action: Reject**
(682.2.Equipotential Plane)

Submitter: Teri Dwyer, Wyoming, MN
Recommendation: Delete text to follows:
~~682.2 Equipotential Plane. An area where wire mesh or other conductive elements are on, embedded in, or placed under the walk surface within 75 mm (3 in.), bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.~~
Substantiation: There are currently two definitions of Equipotential Plane in the NEC that contain slightly different terminology. 547.2 allow wire mesh or other conductive elements to be embedded in or placed under concrete without any dimensions as to where the conductive elements are to be placed and is only applicable if concrete is present. How far below the concrete is still going to create a safe equipotential plane? Where 680.2 will allow wire mesh or other conductive elements to be on, embedded in, or placed under the walking surface within 3 in. This definition is not specific to concrete as a walking surface and provides a prescriptive depth that it is to be installed below the area requiring the equipotential plane.

A common definition would not effect the location where the equipotential plane is required to be installed, because 547.10 and 682.33 still identify the required locations. It would benefit the AHJ by creating one definition for a common term.

I have also submitted proposals to delete this definition from 547.2. (CMP-19) and add it to Article 100 (CMP-5).

Panel Meeting Action: Reject

Panel Statement: The equipotential plane definitions of the two articles differ. CMP-17 chooses to retain the definition as written in 682.2 because of the differences of location.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-233 Log #2454 NEC-P17 **Final Action: Reject**
(682.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.

Recommendation: Add new text to read as follows:

Article 100

DEFINITION: <u>Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.</u>

Substantiation: If proposal 682.15 for PSP is accepted, a definition may be required. A proposal is also being sent to Article 100.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 17-30.

Article 100 is beyond the purview of this panel. CMP-17 refers this proposal to the TCC for correlation if needed.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-237 Log #69 NEC-P17 **Final Action: Accept in Principle**
(682.14)

Note: This Proposal appeared as Comment 17-111 on Proposal 17-176 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 17-176 was:

Revise as follows:

Submersible or Floating Equipment Power Connection(s). Submersible or floating equipment shall be cord- and plug-connected, using extra hard usage cord, as designated in Table 400.4 and listed with a “W” suffix. The plug and receptacle combination shall be arranged to be suitable for the location while in use. Disconnecting means shall be provided to isolate each submersible or floating electrical equipment from its supply connection(s) without requiring the plug to be removed from the receptacle.

(A) Type. The disconnecting means shall consist of a circuit breaker, switch, or both, or molded case switch, and shall be specifically marked todesignate which receptacle it controls.

(B) Location. The disconnecting means shall be readily accessible on land, located not more than 750 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. The disconnecting means shall be located within sight but not closer than 1.5 m (5 ft) from the shoreline. Uninsulated live parts shall be elevated not less than 300 mm (12 in.) above the datum plane.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Accept the proposal in principle. Accept the text as proposed, but insert the phrase “or other outlet” after “marked to designate which receptacle” in proposed (A), and insert an exception ahead of (A) as follows:

Exception: Equipment listed for direct connection and equipment anchored in place and incapable of routine movement caused by water currents or wind shall be permitted to be connected using wiring methods covered in 682.13.

Substantiation: This comment addresses equipment that might not be connected by flexible cord, as was pointed out in the panel statement. It also puts the live parts issue back on the table, as identified in the comment in the voting. The substantiation for the proposal as originally submitted remains valid.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement in Proposal 17-238.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-238 Log #4666 NEC-P17 **Final Action: Accept in Part**
(682.14)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Mass. Electrical Code Advisory Committee

Recommendation: Revise to read as follows:

<u>682.14 Submersible or Floating Equipment Power Connection(s).</u> Submersible or floating equipment shall be cord- and plug-connected, using extra hard usage cord, as designated in Table 400.4 and listed with a “W” suffix. The plug and receptacle combination shall be arranged to be suitable for the location while in use. Disconnecting means shall be provided to isolate each submersible or floating electrical equipment from its supply connection(s) without requiring the plug to be removed from the receptacle.

<u>Exception:</u> Equipment listed for direct connection and equipment anchored in place and incapable of routine movement caused by water currents or wind shall be permitted to be connected using wiring methods covered in 682.13.

<u>(A) Type and Marking.</u> The disconnecting means shall consist of a circuit breaker, switch, or both, or molded case switch, and shall be specifically marked to designate which receptacle or other outlet it controls.

<u>(B) Location.</u> The disconnecting means shall be readily accessible on land, located not more than 750 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. The disconnecting means shall be located within sight but not closer than 1.5 m (5 ft) from the shoreline. Uninsulated live parts shall be elevated not less than 300 mm (12 in.) above the datum plane.

Substantiation: This proposal provides affirmative commentary on the wording that resulted from 2008 Proposal 17-176 and Comment 17-111 that are now held at the direction of the TCC for lack of sufficient public review. The panel's intended action to create connection rules for submersible and floating equipment is appropriate. By this proposal, we hereby advise CMP 17 that we have implemented the wording now on hold, as of January 1, 2008, without difficulty or adverse public report over the intervening months.
Panel Meeting Action: Accept in Part
Revise 682.14 B to read as follows:
(B) Location. The disconnecting means shall be readily accessible on land, located not more than 750 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. The disconnecting means shall be located within sight but not closer than 1.5 m (5 ft) from the shoreline and shall be elevated not less than 300 mm (12 in.) above the datum plane.
Panel Statement: CMP-17 deletes the reference to uninsulated live parts in the last sentence in (B). This addresses the editorial comments from the ROC. CMP-17 accepts the remainder of the proposal.
Number Eligible to Vote: 11

17-242 Log #2455 NEC-P17 **Final Action: Reject**
(682.15)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
~~682.15 Ground-Fault Circuit-Interrupter (GFCI) Protection. Fifteen- and 20-ampere single-phase, 125 volt through 250 volt receptacles installed outdoors and in or on floating buildings or structures within the electrical datum plane area that are used for storage, maintenance, or repair where portable electric hand tools, electrical diagnostic equipment, or portable lighting equipment are to be less than 300 mm (12 in.) above the established electrical datum plane.~~
682.15 Power Safe Protector (PSP) Protection.
(1) 120V circuits. Fifteen- and 20-ampere single-phase, 125-volt receptacles installed outdoors and in or on floating buildings or structures within the electrical datum plane area that are used for storage, maintenance, or repair where portable electric hand tools, electric diagnostic equipment, or portable lighting equipment are to be used shall be provided with power safe protector protection. The power safe protector device shall be located not less than 300 mm (12 in.) above the established electrical datum plane.
(2) 240V circuits. Fifteen- and 20-ampere single-phase 250-volt receptacles installed outdoors and in or on floating buildings or structures within the electrical datum plane area that are used for storage, maintenance, or repair where portable electric hand tools, electrical diagnostic equipment, or portable lighting equipment are to be used shall be provided with GFCI protection. The GFCI protection device shall be located not less than 300 mm (12 in.) above the established electrical datum plane.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.

17-243 Log #1910 NEC-P17 **Final Action: Reject**
(682.31)

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (B), delete "remote".
Revise: (A) TYPE. Equipment grounding conductors and equipment bonding jumpers shall be insulated copper conductors sized in accordance with 250.122 but not smaller than 12 AWG.
Delete (B,) (C), and (D) and substitute: (B) FEEDERS. Feeders shall contain an equipment grounding conductor connected to a grounding terminal in the equipment where the feeder originates and terminates.
(C) BRANCH CIRCUITS. Branch circuits shall contain an equipment grounding conductor connected to a grounding terminal in the equipment where the branch circuits originates.
(D) CORD-and PLUG-CONNECTED EQUIPMENT. Grounding of cord-and-plug-connected equipment shall be by means of an equipment grounding conductor in the cord and a grounding type attachment plug.
Substantiation: Equipment bonding jumpers (see definition) should be included in (A).
In (B), "remote" is not defined and is irrelevant. A feeder may supply equipment other than a panelboard, such as individual fused switches or circuit breakers.
In (C), branch circuits may originate from equipment other than a panelboard or service equipment such as an individual fused switch or circuit breaker.
In (D), the provision should also apply to equipment other than appliances.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated a problem with this section of the code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-244 Log #1469 NEC-P17 **Final Action: Accept in Part**
(682.31(B) and (C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
(B) Where a feeder supplies a ~~remote~~ panelboard or other distribution equipment an insulated equipment grounding conductor shall extend from the grounding terminal in the service equipment to a grounding terminal ~~and busbar~~ in the panelboard or other distribution equipment.
(C) The insulated equipment grounding conductor for branch circuits shall terminate at a grounding terminal in a ~~remote~~ panelboard or other distribution equipment, or a grounding terminal in the main service equipment.
Substantiation: A feeder may supply equipment other than a panelboard such as individual fused switches or circuit breakers. "Remote" is not defined and immaterial to the provision, and a limiting condition. In (B), "service" includes more than service equipment, which is a switch or circuit breaker.
Panel Meeting Action: Accept in Part
Panel Statement: CMP-17 only accepts the words "or other distribution equipment" in three places.
CMP-17 does not accept other changes as proposed by the submitter.
Number Eligible to Vote: 11

(682.32)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: All metal parts in contact with the water, all metal piping, tanks, and noncurrent-carrying metal parts that ~~may~~ are likely to become energized shall be bonded to the grounding ~~bus~~ terminal in the distribution equipment ~~panelboard~~. The bonding means, if a wire-type conductor, shall be solid copper and sized in accordance with Table 250.122.
Substantiation: "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections. All branch circuits may not originate in a panelboard (682.14). There are no specific provisions where the bonding means is a wire. A bonding wire should be solid copper to deter corrosion. (See 682.33(C)).
Panel Meeting Action: Accept in Part
Revise 682.32 to read as follows:
All metal parts in contact with the water, all metal piping, tanks, and noncurrent-carrying metal parts that ~~may~~ are likely to become energized shall be bonded to the grounding ~~bus~~ terminal in the distribution equipment ~~panelboard~~.
Panel Statement: CMP-17 does not accept the submitter's last sentence. CMP-17 accepts the remainder of the submitter's text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 685 — INTEGRATED ELECTRICAL SYSTEMS

12-178 Log #1952 NEC-P12 **Final Action: Reject**
(685.1(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (1) An orderly shutdown is required to minimize personnel hazard ~~and~~ or equipment damage or malfunction.
Substantiation: Edit. An orderly shutdown may be required due to malfunction even if such condition does not create a hazard or damage.
Panel Meeting Action: Reject
Panel Statement: The scope of Article 685 is to make certain an orderly shutdown is accomplished to ensure safe operation, which is contrary to the substantiation provided, suggesting an orderly shutdown may be required due to malfunction even if such condition does not create a hazard or damage.
The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
The proposed change is not editorial in nature.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-179 Log #455a NEC-P12 **Final Action: Accept**
(Table 685.3)

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Revise text to read as follows:
Change the text "50 Volts to less than 1000 Volts" in the Table noted above.
Substantiation: In Article 250, the grounding provisions for these two code sections currently mention "50 Volts to 1000 Volts". Other Article 250 code sections mention 1 kV and Over. Although minor, the code text as noted can create a code requirement conflict when working on systems of 1000 volts or 1 kV. What code sections apply for these systems? This code change is simply a correlation issues. Sections 200.2(A); 250.21(A)(3); 250.24(C); 250.170, Exception 1; and, 250.174 all mention circuits of less than 100 volts. Table 685.3 references Section 250.21. Therefore, in the interest of consistency and to eliminate conflicting code text, this change should be in order.
I have also submitted a proposal to make the same change in 250.20(B) and 250.21.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-180 Log #2810 NEC-P12 **Final Action: Reject**
(685.3)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete this section and Table.
~~685.3 Application of Other Articles.~~
~~The articles/sections in Table 685.3 apply to particular cases of installation of conductors and equipment, where there are orderly shutdown requirements that are in addition to those of this article or are modifications of them.~~
~~Table 685.3 Application of Other Articles~~
~~Conductor/Equipment Section~~
~~More than one building or other structure 225, Part II~~
~~Ground fault protection of equipment 240.13(1)~~
~~Grounding ac systems of 50 volts to 1000 volts 250.21~~
~~Equipment protection 427.22~~
~~Orderly shutdown 430.44~~
~~Disconnection 430.74, Exception Nos. 1 and 2~~
~~Disconnecting means in sight from controller 430.102(A), Exception No. 2~~
~~Energy from more than one source 430.113, Exception Nos. 1 and 2~~
~~Disconnecting means 645.10, Exception~~
~~Uninterruptible power supplies (UPS) 645.11(1)~~
~~Point of connection 705.12(A)~~
Substantiation: NEC 90.3 indicates Chapters 1 - 4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 685.3 repeats the requirement previously expressed in 90.3 and serves no additional purpose. It should also be noted that other "Special" articles do not include a similar requirement. Inconsistent application of the text could also lead to confusion.
Panel Meeting Action: Reject
Panel Statement: CMP-12 chooses to retain 685.3 and Table 685.3.
The information in this section and table provide detailed references to other specific sections in the NEC and improves the usability of Article 685.
Section 90.3 is silent on how Chapters 5, 6, and 7 modify each other.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
MCCLINTOCK, T.: The majority of Table 685.3 references sections found in Chapters 2 and 4, thus repeating the requirement found in 90.3. However, I agree with the Panel's conclusion that 90.3 is silent on how Chapters 5, 6, and 7 modify each other.

12-181 Log #4285 NEC-P12 **Final Action: Reject**
(685.3)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Delete this section and Table.
685.3 Application of Other Articles.
The articles/sections in Table 685.3 apply to particular cases of installation of conductors and equipment, where there are orderly shutdown requirements that are in addition to those of this article or are modifications of them.

~~**Table 685.3 Application of Other Articles**~~

~~**Conductor/Equipment**~~	~~**Section**~~
~~More than one building or other structure~~	~~225, Part II~~
~~Ground-fault protection of equipment~~	~~230.95, Exception~~
~~Protection of conductors~~	~~240.4~~
~~Electrical system coordination~~	~~240.12~~
~~Ground-fault protection of equipment~~	~~240.13(1)~~
~~Grounding ac systems of 50 volts to 1000 volts~~	~~250.21~~
~~Equipment protection~~	~~427.22~~
~~Orderly shutdown~~	~~430.44~~
~~Disconnection~~	~~430.74, Exception Nos. 1 and 2~~
~~Disconnecting means in sight from controller~~	~~430.102(A), Exception No. 2~~
~~Energy from more than one source~~	~~430.113, Exception Nos. 1 and 2~~
~~Disconnecting means~~	~~645.10, Exception~~
~~Uninterruptible power supplies (UPS)~~	~~645.11(1)~~
~~Point of connection~~	~~705.12(A)~~

Substantiation: NEC 90.3 indicates Chapters 1-4 apply generally and Chapters 5, 6, and 7 supplement or modify the general requirements. The text in 685.3 partially repeats the requirement previously expressed in 90.3 and serves no additional purpose. Providing an incomplete list of applicable requirements from the general rules could lead users to believe that other requirements were not applicable. It should also be noted that other “Special” articles do not include partial list of applicable general requirements which could also lead to confusion.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-180.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-182 Log #1968 NEC-P12 **Final Action: Reject**
(685.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Location of overcurrent devices <u>and disconnecting means</u> that are critical to integrated electrical systems shall be permitted to be accessible, with mounting heights permitted ~~to ensure security from~~ <u>deter</u> operation by unqualified personnel.
Alternatively, delete this section.
Substantiation: Disconnecting means should be included. Elevated mounting height cannot ensure, only deter operation by unqualified personnel. This section could be deleted since locking can accomplish the same thing and be safer due to lower mounting height and ready access.
Panel Meeting Action: Reject
Panel Statement: Not all disconnecting devices include overcurrent functions, and the requirements in 685.10 focus on location of overcurrent protection.
CMP-12 believes that the text of 685.10 is adequate and is needed for proper application of a safe electrical system.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 690 — SOLAR PHOTOVOLTAIC SYSTEMS

4-174 Log #2471 NEC-P04 **Final Action: Accept**
(690.2.Monopole Subarray)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the following definition to 690.2
<u>**Monopole Subarray**. A PV subarray that has two conductors in the output circuit, one positive (+) and one negative(-). Two monopole PV subarrays are used to form a Bipolar PV array.</u>
Substantiation: This definition is needed to support new system topologies and their configuration requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-175 Log #2476 NEC-P04 **Final Action: Reject**
(690.2.Photovoltaic System)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the following definition to 690.2.
<u>**Photovoltaic System.** One or more PV modules connected as a PV source or output circuit either independently or in combination with other devices supplying ac or dc power to utilization equipment. In utility-interactive PV systems, the utility electrical production and distribution network is the utilization equipment. The system devices can include equipment such as inverters, charge controllers, current boosters, and energy storage systems. One or more PV source or PV output circuits can supply power to single utilization equipment.</u>
Substantiation: This definition is needed to clarify the elements of a PV system and to describe how the system relates to other electrical power production sources in terms of the number and grouping of disconnects and the requirements for safely disconnecting all sources of power from a building or structure.
Panel Meeting Action: Reject
Panel Statement: A definition exists in 690.2. The list of devices included is difficult to maintain and is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-176 Log #2472 NEC-P04 **Final Action: Reject**
(690.2.Photovoltaic System Disconnecting Means)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the following definition to 690.2
<u>**Photovoltaic System Disconnecting Means.** A system disconnecting means on the dc photovoltaic output circuit.</u>
Substantiation: Photovoltaic systems can be quite complex in terms of the number of photovoltaic source and output circuits (dc) and the location of the inverters. Many systems have inverters mounted inside the building with the PV disconnecting means on the dc circuit as it penetrates the building. Others have the inverters outside with only ac circuits penetrating the building. A definition of the PV system disconnecting means is needed to support the requirements for this disconnecting means established in 690.13 and 690.14. See related proposals for 690.13 and 690.14.
Panel Meeting Action: Reject
Panel Statement: The definition is self describing and is unnecessary. The term “photovoltaic output circuit disconnecting means” will be used, which contains all defined terms. Proposals that relied on this definition have been changed accordingly.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-177 Log #2473 NEC-P04 **Final Action: Accept in Principle**
(690.2.PV)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the following definition to Section 690.2
<u>**PV.** The Abbreviation for photovoltaic in this Code</u>
Substantiation: This abbreviation, PV, is needed to reduce the use of the long and sometimes difficult-to-pronounce term “photovoltaic”. The use of the abbreviation will shorten the Code. The term “PV” should be substituted for “photovoltaic” in the second and subsequent uses in each section.
Panel Meeting Action: Accept in Principle
The Abbreviation for photovoltaic (PV) is to be added after the first occurrence of photovoltaic in Section 690.1.
Panel Statement: The panel recognizes that the scope is under the purview of the TCC. The panel requests that the TCC review the proposed change to the scope of Article 690. Use of acronyms per 3.2.3 is defined in the style manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-178 Log #2474 NEC-P04 **Final Action: Reject**
(690.2.Stand-Alone Inverter Output Circuit)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the new definition to 690.2
Stand-alone Inverter Output Circuit. Conductors between the output of an inverter in a stand-alone PV power system(s) and the utilization equipment. Also applies to the output conductors (not connected to a utility) of a utility-interactive inverter operating in off-grid stand-alone mode. The circuit can be and is normally energized independent of any utilization equipment.
Substantiation: This definition is needed to support the understanding of stand-alone system requirements. New inverters have been introduced which can include both utility-interactive and stand alone outputs. The stand alone outputs of these utility-interactive inverters do not include anti-islanding circuitry and are designed to remain energized during utility outages or when disconnected from the utility source. This definition, and the companion definition for Utility-interactive Inverter Output Circuit, are added to help clarify the different requirements which pertain to Stand-alone Inverter Output versus Utility-interactive Inverter Output of these multi mode devices. These new definitions also help to differentiate requirements of the utility-interactive inverter ac output connections, which are now covered by the requirements of Article 705 from stand-alone ac output connections, which are covered by Articles 690 and 702.
Panel Meeting Action: Reject
Panel Statement: The term is self defining.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-179 Log #2477 NEC-P04 **Final Action: Accept in Principle**
(690.2.Subarray)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the following definition to 690.2
<u>**Subarray.** An electrical subset of a PV array consisting of any connected configuration of PV modules, interconnect devices, wired circuits and protection.</u>
Substantiation: The definition of subarray is needed to support requirements elsewhere in Article 690.
Panel Meeting Action: Accept in Principle
Revise the text in the definition of Subarray as follows: An electrical subset of a PV array. ~~consisting of any connected configuration of PV modules, interconnect devices, wired circuits and protection.~~
Panel Statement: Simplify and remove the list in the definition that may change over time.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-180 Log #2475 NEC-P04 **Final Action: Reject**
(690.2.Utility-Interactive Inverter Output Circuit)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the new definition to 690.2
<u>**Utility-interactive Inverter Output Circuit**. Conductors between the output of a utility-interactive inverter and the utilization equipment including the utility or other power production sources. The circuit is normally de-energized when the external source is disconnected.</u>
Substantiation: This definition is needed to provide a better understanding of Code requirements. New inverters have been introduced, which can include both utility-interactive and stand-alone outputs. The stand-alone outputs of these utility-interactive inverters do not include anti-islanding circuitry and are designed to remain energized during utility outages or when disconnected from the utility source. This definition, and the companion definition for Stand-alone Inverter Output Circuit, are added to help clarify the different requirements which pertain to Stand-alone Inverter Output versus Utility-interactive Inverter Output of these multi mode devices. These new definitions also help to differentiate the requirements of the utility-interactive inverter ac output connections, which are now covered by Article 705, from stand-alone ac output connections, which are now covered by Articles 690 and 702.
Panel Meeting Action: Reject
Panel Statement: The term is self defining.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BOWER, W.: Although the term is self defining, it clarifies often misinterpreted language in Article 690 and language now appearing in Article 705 associated with PV systems.

4-181 Log #597 NEC-P04 **Final Action: Accept in Principle**
(690.4(A))

Submitter: Mike Kunkel, Kunkel Electric, Inc.
Recommendation: Revise text as follows:
~~A~~ <u>One or more</u> solar photovoltaic system<u>(s)</u> shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).
Substantiation: Some inspectors are interpreting the “A” in the current NEC to mean that we are limited to one system on a building. This becomes a problem on large multi-tenant buildings.
230.2(A) allows “additional services”, and (5) addresses “parallel power production systems”.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 4-182.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-182 Log #2478 NEC-P04 **Final Action: Accept**
(690.4(A))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise 690.4(A) as follows:
690.4 Installation
(A) ~~Solar~~ Photovoltaic Systems. ~~A solar photovoltaic~~ Photovoltaic system<u>(s)</u> shall be permitted to supply a building or other structure in addition to any other electricity supply system(s).
Substantiation: The term “Solar” is deleted because it shortens the Code and does not need to be used throughout article 690 for clarity or understanding. The (s) is added to the word “system” to indicate that one or more PV systems may be added to a building that has other sources of supply. Many buildings such as malls and apartment houses now have a requirement that multiple individual PV systems be installed on a single building and connected to the utility service.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-183 Log #2479 NEC-P04 **Final Action: Accept in Principle**
(690.4(B))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise the existing section 690.4(B) and add the new paragraphs.
(B) Conductors of Different Systems. Photovoltaic source circuits and ~~photovoltaic~~ <u>PV</u> output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as conductors, feeders or branch circuits of other <u>non-PV</u> systems, unless the conductors of the different systems are separated by a partition<u>.</u> ~~or are connected together.~~
<u>**1) Identification and Grouping.** PV system conductors shall be identified and grouped as required in 690.4 (B)(1) (A) through (D). The means of identification shall be permitted by separate color coding, marking tape, tagging, or other approved means.</u>
<u>**(A) Photovoltaic Source Circuits.** Where a PV system has more than one source or output circuit connected in parallel, either directly or through overcurrent protective devices, the parallel-connected conductors shall be identified at all points of termination, connection, and splices.</u>
<u>**(B) Photovoltaic Output and Inverter Circuits.** The conductors of PV output circuits and inverter input and output circuits shall be identified at all points of termination, connection, and splices.</u>
<u>**(C) Conductors of Multiple Systems.** Where the conductors of more than one PV system (subarray or inverter) occupy the same junction box, raceway, or equipment, the conductors of each system shall be identified at all termination, connection, and splice points.</u>
<u>*Exception: Where the identification of the conductors is evident by spacing or arrangement, further identification is not required.*</u>
<u>**(D) Grouping.** Where the conductors of more than one PV system (subarray or inverter) occupy the same junction box or raceway with removable cover(s), the ac and dc conductors of each system shall be grouped separately by wire ties or similar means at least once, and then shall be grouped at intervals not to exceed 1.8 m (6 ft).</u>
Exception: Where the association with and function within each system is evident by the spacing or arrangement, further grouping is not required.

Substantiation: The intent of this requirement is to minimize potentially hazardous contact with energized PV dc source and output conductors that are energized whenever the PV array is illuminated. The existing wording of this section is vague in that it is not clear that conductors connected together through an inverter are considered to be part of the same system. Current language could also be misconstrued in that lighting and other loads connected to the output of a PV system are indeed "connected together" with the PV source and input circuits by means of the inverter.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action on Proposal 4-184.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-184 Log #2480 NEC-P04 **Final Action: Accept in Principle**

(690.4(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by revising the numbering and lettering of (B) since there is only a (1) and no (2). Mandatory text must be used in the text in each exception to comply with the NEC Style Manual 2.6.1.

This action will be considered by the panel as a public comment.

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Revise the existing section 690.4(B) and add the new paragraphs.

(B) Conductors of Different Systems. Photovoltaic source circuits and ~~photovoltaic~~ PV output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as conductors, feeders or branch circuits of other non-PV systems, unless the conductors of the different systems are separated by a partition. ~~or are connected together.~~

1) Identification and Grouping. PV system conductors shall be identified and grouped as required in 690.4 (B)(1) (A) through (D). The means of identification shall be permitted by separate color coding, marking tape, tagging, or other approved means.

(A) Photovoltaic Source Circuits. Where a PV system has more than one source or output circuit connected in parallel, either directly or through overcurrent protective devices, the parallel-connected conductors shall be identified at all points of termination, connection, and splices.

(B) Photovoltaic Output and Inverter Circuits. The conductors of PV output circuits and inverter input and output circuits shall be identified at all points of termination, connection, and splices.

(C) Conductors of Multiple Systems. Where the conductors of more than one PV system (subarray or inverter) occupy the same junction box, raceway, or equipment, the conductors of each system shall be identified at all termination, connection, and splice points.

Exception: Where the identification of the conductors is evident by spacing or arrangement, further identification is not required.

(D) Grouping. Where the conductors of more than one PV system (subarray or inverter) occupy the same junction box or raceway with removable cover(s), the ac and dc conductors of each system shall be grouped separately by wire ties or similar means at least once, and then shall be grouped at intervals not to exceed 1.8 m (6 ft).

Exception: Where the association with and function within each system is evident by the spacing or arrangement, further grouping is not required.

Substantiation: The intent of this requirement is to minimize potentially hazardous contact with energized PV dc source and output conductors that are energized whenever the PV array is illuminated. The existing wording of this section is vague in that it is not clear that conductors connected together through an inverter are considered to be part of the same system. Current language could also be misconstrued in that lighting and other loads connected to the output of a PV system are indeed "connected together" with the PV source and input circuits by means of the inverter.

The additional requirements for grouping the conductors of each system will help service personnel distinguish the conductors of different systems. DC systems present some unique problems for service in that non-contact voltage testers, which can identify energized dc conductors, are not readily available for dc voltages. Distinguishing markings or groupings of circuit conductors for branch circuits and feeders in distribution systems is well-established and already required elsewhere in the *NEC* and can be accomplished simply using readily available means such as tags, ties, and tape. Identification of circuit conductors in power-distribution circuits is common practice and is required for multi-wire branch circuits and feeders. This provision would extend the same means of identification to the conductors of PV systems while being slightly more stringent when dc and ac conductors are accessible within the same raceway. (See 210.4, 210.5, and 215.12.)

Panel Meeting Action: Accept in Principle

Revise (A) as follows:

(A) Photovoltaic Source Circuits. Photovoltaic Source Circuits ~~Where a PV system has more than one source or output circuit connected in parallel, either directly or through overcurrent protective devices, the parallel-connected conductors~~ shall be identified at all points of termination, connection, and splices.

Revise (B) as follows:

(B) Conductors of Different Systems. Photovoltaic source circuits and ~~photovoltaic~~ PV output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as conductors, feeders, or branch circuits of other non-PV systems, unless the conductors of the different systems are separated by a partition.

(1) Identification and Grouping. PV system conductors shall be identified and grouped as required in 690.4 (B)(1) (a) through (d). The means of identification shall be permitted by separate color coding, marking tape, tagging, or other approved means.

(a) Photovoltaic Source Circuits. Photovoltaic source circuits shall be identified at all points of termination, connection, and splices.

(b) Photovoltaic Output and Inverter Circuits. The conductors of PV output circuits and inverter input and output circuits shall be identified at all points of termination, connection, and splices.

(c) Conductors of Multiple Systems. Where the conductors of more than one PV system (subarray or inverter) occupy the same junction box, raceway, or equipment, the conductors of each system shall be identified at all termination, connection, and splice points.

Exception: When the identification of the conductors is evident by spacing or arrangement, further identification is not required.

(d) Grouping. Where the conductors of more than one PV system (subarray or inverter) occupy the same junction box or raceway with removable cover(s), the ac and dc conductors of each system shall be grouped separately by wire ties or similar means at least once, and then shall be grouped at intervals not to exceed 1.8 m (6 ft).

Exception: When the association with and function within each system is evident by the spacing or arrangement, further grouping is not required.

Panel Statement: The panel clarified section (A), removing redundant language.

As per the NEC Style Manual subdivision example, subsection letters were changed from capital to lower case.

Where changed to when as appropriate in the exceptions.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-185 Log #2481 NEC-P04 **Final Action: Accept**

(690.4(C))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

(C) Module Connection Arrangement. The connection to a module or panel shall be arranged so that removal of a module or panel from a photovoltaic source circuit does not interrupt a grounded conductor to ~~an~~other PV source circuits. ~~Sets of modules interconnected as systems rated at 50 volts or less, with or without blocking diodes, and having a single overcurrent device shall be considered as a single source circuit. Supplementary overcurrent devices used for the exclusive protection of the photovoltaic modules are not considered as overcurrent devices for the purposes of this section.~~

Substantiation: "Source circuits" are pluralized as this is the more general case. The following sentence "Sets of modules interconnected as systems rated at 50 volts or less, with or without blocking diodes, and having a single overcurrent device shall be considered as a single source circuit." is deleted because it no longer applies to today's installed PV systems where every string of photovoltaic modules must have overcurrent protection where subjected to external sources of overcurrent. This sentence was added to the Code when blocking diodes were in common use and were used in place of overcurrent devices. Parallel connections of modules without overcurrent protection was common on 12, 24, and 48-volt systems, but is no longer considered safe, nor Code compliant.

The sentence "Supplementary overcurrent devices used for the exclusive protection of the photovoltaic modules are not considered as overcurrent devices for the purposes of this section." is deleted because it is not technically correct (both conductors and PV modules may be protected by a single, properly rated, overcurrent device) and belongs in Section 690.9 where a proposal for a modified version of this requirement is being submitted.

The nearly universal use of modules with permanently attached wire leads and connectors makes it unlikely that this situation will occur. However, a few PV module manufacturers have modules with conduit-ready junction boxes still available on special order.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-186 Log #3662 NEC-P04 **Final Action: Reject**
(690.4(D))

Submitter: Keith W. Brand, Baton Rouge Area Electrical JATC
Recommendation: Add new text as follows:

690.4(D) Equipment. Inverters, motor generators, photovoltaic modules, photovoltaic panels, ac photovoltaic modules, source-circuit combiners, and charge controllers intended for use in photovoltaic power systems shall be identified and listed for the application and be installed by qualified persons with documented training and experience in the installation of and NEC requirements applicable to such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation. Records of qualified persons must be furnished upon request to the local authority having jurisdiction.

Substantiation: Increasing numbers of Photovoltaic (PV) installations are becoming a hazard to the safety of the general populace and the durability of PV systems that are not correctly installed are also creating a hazard, i.e. according to the National Electrical Code specifications. Present day requirements and mandates to adhere to NEC specifications are not available from the Photovoltaics Industry. To require extensive knowledge of electrical systems and associated National Electrical Code specifications would undoubtedly increase the safety level for PV installations across the country; providing a service to the populace that wish to purchase and have installed for them, Photovoltaic Systems. Therefore it is proposed that extensive knowledge of training within the electrical safety codes and standards must be put in place to protect the people and property in which Photovoltaic systems are installed. The following excerpts and complete articles I have provided as references to support this proposal. The following information is provided by members of the Photovoltaics industry in which they recognize potential safety issues.

Perspectives on PV

Why Inspect PV Systems? Link: http://www.iaei.org/subscriber/magazine/07_f/wiles.html

From excerpt of article written by John Wiles for the IAEI Magazine.

...**But Not All Systems Are Code-Compliant and Durable**

Unfortunately, we are still a long way from that ideal scenario. While there are a few PV systems integrators (the larger companies) and other PV installers who have done dozens and possibly hundreds of PV installation, they are not common. PV installers, normally with little electrical installation experience, abound. They are familiar with neither Article 690 in the *NEC* covering PV systems nor the first four chapters of the Code that deal with the basics. On the other side of the installation/inspection equation, inspectors and plan reviewers have had little experience with the unique nature of PV systems and have not worked extensively with these new PV companies. new equipment (inverters and PV modules) is being introduced continually, and all involved with PV systems are hard-pressed to keep up with the ever-changing installation requirements due to the unique nature of each piece of equipment. Unfortunately, even a PV installer who has obtained the NABCEP (North American Board of Certified Energy Practitioners, www.nabcep.org) certificate by passing a 60-question written examination may not have extensive experience installing conventional residential or commercial electrical systems...

I have also provided a complete Article and following excerpt from:

PV INSTALLATIONS, A PROGRESS REPORT

John C. Wiles1, Bill Brooks2, Bob-O Schultze3

Southwest Technology Development Institute, Box 30001/MSC3SOL, Las Cruces, NM 88003, 2. Endecon Engineering, 873 Kells Circle, Vacaville, CA 95688, 3. Electron Connection, POB 203, Hornbrook, CA 96044

"...well-trained and experienced PV designers and installers following the best available information and codes are providing PV electrical power systems that are safe, durable, reliable, and well performing. About 50% of the surveyed installations met this goal [1,7,8,9]. However, the remaining 50% of the installed systems had deficiencies in these same areas of safety, reliability, durability, and performance...".

Additionally, the inclusion of the wording "qualified persons" does have precedence in the NEC.

See: 685.1 Scope.

This article covers integrated electrical systems, other than unit equipment, in which orderly shutdown is necessary to ensure safe operation. An integrated electrical system as used in this article is a unitized segment of an industrial wiring system where all of the following conditions are met:

(1) An orderly shutdown is required to minimize personnel hazard and electrical damage.

(2) The conditions of maintenance and supervision ensure that qualified persons service the system. **The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation.**

A person designated as a qualified person shall possess the skills and knowledge related to the construction and operation of the electrical equipment and installation and shall have received documented safety training on the hazards involved. **Documentation of their qualifications shall be on file with the office of the establishment in charge of the completed installation.**

(3) Effective safeguards acceptable to the authority having jurisdiction are established and maintained.

Also:

215.2(B)(3) Supervised Installations. For supervised installations, feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where all of the following conditions are met:

(1) Conditions of design and installation are provided under engineering supervision.

(2) **Qualified persons with documented training and experience** in over 600-volt systems provide maintenance, monitoring, and servicing of the system. 215.2

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel supports installation of these systems by qualified persons. However, the NEC cannot contain requirements relative to the qualifications of installers for any electrical system, these requirements need to be handled by local or state qualification committees or licensing boards. See Annex H of the NEC for recommendations on establishing such bodies.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

STAFFORD, T.: This Panel Member has determined that extensive training is required for emerging technologies. Increasingly, documented evidence supports the claim for training and proof thereof as there are no license requirements in place for all personnel performing installations of PV. In the period of time between the ROP meeting and the panel voting it was discovered two additional concerns directly related to training with resulting injuries and fire damage. Such accidents occur directly as a result of lack of knowledge and understanding of electrical installation requirements. A large percentage of installers of PV have no electrical background and/or training and there is no license requirement in place to mandate this requirement. The panel statement "The NEC cannot contain requirements relative to the qualifications of the installers for any electrical system, these requirements need to be handled by local state qualification committees or licensing boards" is ineffective for the following reasons.

First, the NEC does contain requirements for qualifications of installers and maintaining documentation thereof, see Article 685 and substantiation provided in the original proposal by submitter. Article 685 describes industrial wiring system and details the importance of necessary training for the personnel involved. The same concerns are present for parallel energy sources. Specifically, an orderly shutdown of the PV system is required upon certain conditions, service of equipment requires someone knowledgeable in the functions and electrical characteristic thereof, and effective safeguards should be in place acceptable to the AHJ. The original proposal attempts to provide the safeguards that are critically needed by a growing industry. The panel may decide that article 685 is not relevant when determining if like requirements should be in place for article 690, but the panel cannot claim the affects are as critical to personnel and equipment.

Second, local license boards are not addressing the issue at a pace to insure safety for the consumer/user of Photovoltaic systems and for the personnel involved. There are several locations within the U.S that does not have any license or qualifications for those installing PV systems. Again, see substantiation provided by submitter.

TOOMER, R.: I realize the NEC can not mandate all electrical installations be installed by qualified persons, however in the NEC now there are exceptions to the NEC requirements if "qualified persons" maintain the systems in at least five locations, 250.52(1) Exception, 250.184(1) Exception 3, 250.186, 280.11, and 685.1(2).

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal, however, the submitter is correct in his concern relative to requiring "qualified persons" to install these systems. This is extremely important for these systems to assure the safety or persons and property where these systems are utilized. Unfortunately the NEC is an installation document and not a qualification document. Any areas of the country that utilize any type of electrical licensing laws should be sure that their laws extend to these installations. Any areas of the country that do not have electrical licensing laws should refer to Annex H of the NEC and consider adopting it as a guide for qualified personnel performing electrical installations.

4-187 Log #2482 NEC-P04 **Final Action: Accept**
(690.4(E))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the new Section 690.4(E) as follows:
690.4(E) Circuit Routing. Photovoltaic source and PV output conductors, in and out of conduit, and inside of a building or structure, shall be routed along building structural members such as beams, rafters, trusses, and columns where the location of those structural members can be determined by observation. Where circuits are imbedded in built-up, laminate, or membrane roofing materials in roof areas not covered by PV modules and associated equipment, the location of circuits shall be clearly marked.
Substantiation: This proposal is derived from on-going discussions with firefighters throughout the country who have expressed concern about the safety of ventilating roofs where PV circuits are present. By routing these circuits along building structural elements, there is a lower probability that they will be contacted by the firefighters. This will increase safety for these personnel. Several PV module systems are integrated into the roof and the circuits associated with these must be marked on the surface of the roof. This circuit-routing requirement should appear in the *NEC* since building codes do not generally address electrical circuit routing.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ROGERS, J.: This proposal should have been rejected if for not other reason other than the fact that it does not meet the requirements for submitting an actual requirement. The portion referencing how to install wiring methods inside of buildings or structures is already covered in Chapter 3 of the NEC. The portion relative to marking is nondescript and unenforceable, there is no description as to what the marking is to state, how it is going to be applied or where it is going to be applied. If the issue is concern relative to firefighters encountering energized conductors and the concern is real then the original requirement for a disconnecting means located at a readily accessible location either inside or outside nearest the point of entrance of the conductors should be restored. The real problem here is that in recent code cycles this requirement has been lessened to the point that these conductors can be installed in unlimited lengths provided they are in metallic wiring methods. Having a disconnecting means in a readily accessible location remedies that problem as emergency response personnel could open that disconnect and then be assured that they would not have to deal with energized conductors running throughout the building.
ZINNANTE, V.: While I wholeheartedly support the safety and well-being of fire-fighting personnel, I am concerned on how this proposal is going to be enforced. Are the circuits going to be clearly marked on the roof, inside the membrane, inside the structure? What happens if the conductors are not run on the roof? It was not demonstrated to me how this “clearly marked” circuit will be visible and apparent to fire-fighting personnel or others trying to identify the PV circuit in an emergency.

4-188 Log #2483 NEC-P04 **Final Action: Accept in Principle**
(690.4(F))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the New paragraph and Exception to 690.4
690.4(F) Bipolar PV Systems. Where the sum, without consideration of polarity, of the PV system voltages of the two monopole subarrays exceeds the rating of the conductors and connected equipment, monopole subarrays in a bipolar PV system shall be physically separated, and the electrical output circuits from each monopole subarray shall be installed in separate raceways until connected to the inverter. The disconnecting means and overcurrent protective devices for each monopole subarray output shall be in separate enclosures. All conductors from each separate monopole subarray shall be routed in the same raceway.
Exception: Listed switchgear containing a physical barrier separating the disconnecting means for each monopole subarray shall be permitted to be used instead of disconnecting means in separate enclosures.
Substantiation: See related proposal for 690.2 defining a monopole subarray. It is imperative that the positive and negative conductors of a bipolar PV array not come into contact with each other. If they come into contact, the sum of the open-circuit monopole subarray voltages (usually between 800 and 1200 volts) may be applied to switchgear, conductors, PV modules, and other equipment listed for 600 volts. Series-circuit breaks, line-to-line faults, and line-to-ground faults must be avoided. Equipment has been damaged and fires started in the past when faults of these types have occurred on bipolar PV systems.
Underwriters Laboratories is revising UL 1741 to address similar requirements in the bipolar inverter where physically separate subarray inputs will be required as well as internal partitions that keep these circuit conductors apart until they are connected to the internal wiring of the inverter.
Panel Meeting Action: Accept in Principle
Revise the exception to begin: Listed switchgear rated for the maximum voltage between circuits containing a physical barrier separating the disconnecting means for each monopole subarray shall be permitted to be used instead of disconnecting means in separate enclosures.
Revise the Exception to read:
Exception: Listed switchgear rated for the maximum voltage between circuits containing a physical barrier separating the disconnecting means for each monopole subarray shall be permitted to be used instead of disconnecting means in separate enclosures.
Panel Statement: The panel clarified by revising the wording that the switchgear needs to be rated for the voltages involved.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BOWER, W.: The language “circuits containing a physical barrier....” does not make sense. I suggest a better change would be to read “circuit wiring and hardware using a physical barrier that separates.....”.

4-189 Log #2484 NEC-P04 **Final Action: Accept**
(690.4(G))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the following new paragraph and exception to 690.4:
690.4 Installations
(G) Multiple Inverters. A PV system shall be permitted to have multiple utility-interactive inverters installed in or on a single building or structure. Where the inverters are remotely located from each other, a directory in accordance with 705.10 shall be installed at each dc PV system disconnecting means, each ac disconnecting means and at the main service disconnecting means showing the location of all ac and dc PV system disconnecting means in the building.
Exception: A directory shall not be required where all inverters and PV dc disconnecting means are grouped at the main service disconnecting means.
Substantiation: PV installations may consist of a number of small (1-7 kW) utility-interactive inverters installed on a building or structure. These multiple inverters are connected in parallel with the existing utility service following the requirements of this Code as allowed by 690.64, 705.12 and 230.2. They operate independently and are designed to operate safely in this manner. There is no safety or operational reason that would preclude the installation of multiple inverters on a single building or connected to a single utility feeder.
Where these inverters are not co-located, a directory shall be required at each dc PV disconnecting means to identify the location of all PV disconnecting means. This directory will facilitate the rapid disconnect of all energized conductors from the PV array(s).
In some cases, all inverters and their associated dc PV disconnecting means are located at the service disconnect, and no directory would be required.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
DEATON, R.: The term “utility” refers to a utility supplying electrical power.

4-190 Log #2485 NEC-P04 **Final Action: Reject**
(690.4(H))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the following new section to 690.4
690.4 Installation.
(H). Multiple Inverter Input Circuits. Each utility-interactive inverter shall be permitted to have multiple PV source or PV output circuits connected to the inverter input circuit(s) where the inverter is identified and labeled to accommodate multiple inputs.
Substantiation: Small PV systems with 1-3 kW inverters may have only a single string of PV modules and a single PV output circuit connected to the utility-interactive inverter, particularly when large, high-wattage PV modules are used. However, many inverters have combining circuits or bus bars at their inputs that accept and properly combine multiple PV output circuits into a single inverter. Instructions and labels on appropriately identified inverters show how these inputs are to be connected.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that this is unnecessary additional code language. No problem statement to substantiate was provided.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-191 Log #26 NEC-P04 **Final Action: Reject**
(690.5)

NOTE: This proposal appeared as Comment 13-28 on Proposal 13-22 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-22 was:

Revise the section as follows:

690.5 Ground-Fault Protection. ~~Roof-mounted dc photovoltaic arrays located on dwellings shall be provided with dc ground-fault protection to reduce fire hazards.~~
Grounded dc photovoltaic arrays shall be provided with dc ground-fault protection meeting the requirements of 690.5 (A) through (C) to reduce fire hazards. Ungrounded dc photovoltaic arrays shall comply with 690.35.
Exception 1: Ground-mounted or pole-mounted photovoltaic arrays with not more than two paralleled source circuits and with all dc source and dc output circuits isolated from buildings shall be permitted without ground-fault protection.
Exception 2: PV arrays mounted on other than dwelling units shall be permitted without ground-fault protection if each equipment-grounding conductor has an ampacity of at least two (2) times the temperature and conduit fill corrected circuit conductor ampacity.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: The original Proposal should be accepted as the Panel Action indicates. A revision is made to EX 2 as follows and a FPN is added for clarity:
Exception 2: PV arrays mounted on other than dwelling units shall be permitted without ground-fault protection if each equipment-grounding conductor, the grounded circuit conductor, and the dc grounded conductor-to-ground bonding conductor has an ampacity of at least 2.8 times the module rated short-circuit current. The ampacity in the equipment-grounding conductors shall be adjusted for the conditions of use including temperature and conduit fill where applicable. No increase in size is required if circuit conductors are oversized.
FPN to EX 2. Where the system and equipment does not employ a ground fault detection device that interrupts the fault current, the equipment-grounding conductors, grounded circuit conductors and the dc grounded conductor-to-ground bonding conductor can carry ground-fault currents continuously, and these currents can be insufficient to cause operation of any overcurrent devices. The equipment-grounding conductors should have conditions-of-use adjustment factors applied.
Substantiation: Many systems will employ equipment that meets the basic requirements of 690.5. See attached explanatory materials.
The revision to EX 2 clarifies the exact ampacity requirement of the equipment grounding conductors, grounded circuit conductors, and the dc system ground-bonding conductor as 2.8 times the module rated short-circuit current and points out that the ampacity should be adjusted for conditions of use, since, under fault conditions, they may have to carry the fault currents continuously where the fault currents are insufficient to operate any overcurrent devices. All conductors that may be subject to these higher ground fault currents are required to be oversized. Note this is not an issue of voltage drop or conductor size limiting the operation of overcurrent devices, it is a problem of insufficient, although somewhat larger than normal, over currents. The FPN is added for clarity.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This has already has been addressed in the 2008 NEC in 690.45. No further action is necessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-192 Log #1966 NEC-P04 **Final Action: Reject**
(690.5(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Insert “durable” between “a: and :warning”.
Substantiation: Edit. The label should be suitable for the enviroment.
Panel Meeting Action: Reject
Panel Statement: This is a general requirement of all labels and will overly clutter the code by adding “durable” in front of every reference to a label.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-193 Log #2486 NEC-P04 **Final Action: Accept**
(690.7(A), FPN)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add this FPN:
690.7(A) FPN
FPN: One source for statistically valid, lowest-expected, ambient temperature design data for various locations is the Extreme Annual Mean Minimum Design Dry Bulb Temperature found in the *ASHRAE Handbook — Fundamentals*. These temperature data can be used to calculate maximum voltage using the manufacturer’s temperature coefficients relative to the rating temperature of 25°C.
Substantiation: This FPN provides clarity to the ambiguous requirement of “lowest-expected temperature” in 690.7(A). The design of PV systems is heavily reliant on an accurate estimate of maximum voltage since it limits the operating voltage at high temperatures. An overly-conservative, lowest-expected temperature (e.g., all-time record low) will yield an overly-conservative estimate of maximum voltage resulting in a lower-than necessary operating voltage on hot summer days. Of all the data provided by the tables in the *ASHRAE Handbook—Fundamentals*, the “Extreme Annual Mean Minimum Design Dry Bulb Temperature” most closely matches the concerns of the *National Electrical Code* by establishing a statistically valid, lowest-expected operating temperature value to use for any table that establishes low-temperature correction factors. These extreme temperature values provide a probability of occurrence that is sufficiently low. Table 690.7 assumes that irradiance is at 1000 W/m2. The most likely scenario for highest voltage will occur on cold mornings at the end of an extreme nighttime temperature when the irradiance is likely to be 200-300 W/m2 before heating of the module reduces voltage. For representative crystalline silicon products, the open-circuit voltage under these extreme conditions will be 90% of the 1000 W/m2 values providing an additional safety factor in the use of the “Extreme Annual” temperature value from ASHRAE. This safety factor is useful because the actual module temperatures may be a few degrees lower than the ambient temperatures due to night-sky radiation effects.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 12

4-193a Log #CP400 NEC-P04 **Final Action: Accept**
(690.7(C))

Submitter: Code-Making Panel 4,
Recommendation: Change Part roman numeral I to IX in the last sentence of 690.7(C) to resolve a typographical error.
Substantiation: Correct typographical error.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-194 Log #2487 NEC-P04 **Final Action: Accept in Principle**
(690.7(E)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with the NEC Style Manual 3.1 and use the term “shall be permitted” instead of “may”.
This action will be considered by the panel as a public comment.
Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise the section as follows and add the exception:
(1) One conductor of each circuit of a bipolar subarray is solidly grounded.
Exception: The operation of ground-fault or arc-fault devices (abnormal operation) may interrupt this connection to ground where the entire bipolar array becomes two distinct arrays isolated from each other and the utilization equipment.
Substantiation: The phrase “of a bipolar subarray” is added for clarity because the entire section is referring to bipolar systems.

Exception: Ground-fault equipment (690.5) may activate switchgear that automatically separates the bipolar array into two isolated monopole arrays that cannot combine to produce voltages that exceeds wiring and switchgear ratings.
Panel Meeting Action: Accept in Principle

Revise text to read:
(1) One conductor of each circuit of a bipolar subarray is solidly grounded.
Exception: The operation of ground-fault or arc-fault devices (abnormal operation) may interrupt this connection to ground when the entire bipolar array becomes two distinct arrays isolated from each other and the utilization equipment.
Panel Statement: The word “where” was changed to “when” to comply with the NFPA Manual of Style.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-195 Log #2488 NEC-P04 **Final Action: Accept in Principle**
(690.8(B))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise as shown
(B) Ampacity and Overcurrent Device Ratings. Photovoltaic system currents shall be considered to be continuous.
~~(1) Sizing of Conductors and Overcurrent Devices. The circuit conductors and overcurrent devices shall be sized~~
(1) Overcurrent Devices. Overcurrent devices, where required, shall be rated as required by 690.8(B)(1)(a) through 690.8(B)(1)(d).
(a) To carry not less than 125% of the maximum currents calculated in 690.8(A).
Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be ~~utilized~~ used at 100 percent of its rating.
(b) Terminal temperature limits shall be in accordance with 110.3(B) and 110.14(C).
(c) Where operated at temperatures greater than 40°C, manufacturer's temperature correction factors shall apply.
(d) The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B), 240.4(C), and 240.4(D).
(2) Internal Current Limitation. Overcurrent protection for photovoltaic output circuits with devices that internally limit the current from the photovoltaic output circuit shall be permitted to be rated at less than the value calculated in 690.8(B)(1). This reduced rating shall be at least 125 percent of the limited current value. Photovoltaic output conductors shall be sized in accordance with 690.8(B)(1).
(2) Conductor ampacity. Circuit conductors shall be sized to carry not less than the larger of 690.8(B)(2)(a) or 690.8(B)(2)(b).
(a) One hundred and twenty-five percent of the maximum currents calculated in 690.8(A) without any additional correction factors for conditions of use.
~~*Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.*~~
(b) The maximum currents calculated in 690.8(A) after conditions of use have been applied.
(c) The conductor selected, after application of conditions of use, shall be protected by the overcurrent protective device, where required.
Substantiation: The proposed changes align the rating of overcurrent devices and the sizing of conductors for PV system circuits with the rating and sizing of overcurrent devices and conductors in other electrical power systems as required in Chapter 2 of the Code. This section in the *2008 NEC* was not specific and did not adequately define the requirements as they apply to common PV installations.
The second Exception is deleted because it applies only to the rating of overcurrent devices and not to sizing conductors.
The previous (2) is deleted because this was applied to PV charge controllers and is now covered by a proposal for 690.72(C).
The word "utilized" is replaced by the more correct term "use" and minimizes the unnecessary use of verbose words.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(c) ~~Where~~ When operated at temperatures greater than 40°C, manufacturer's temperature correction factors shall apply.
(d) The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B), 240.4(C), and 240.4(D).
(2) Conductor Ampacity. Circuit conductors shall be sized to carry not less than the larger of 690.8(B)(2)(a) or 690.8(B)(2)(b).
(a) One hundred and twenty-five percent of the maximum currents calculated in 690.8(A) without any additional correction factors for conditions of use.
Panel Statement: The word "where" was changed to "when" to comply with the NFPA Manual of Style.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
WILLS, R.: I agree with the changes in general, however there was no substantiation for the deletion of 690.8(B).. the section beginning "Internal Current Limitation". There are circumstances where this allowance is necessary for equipment design. For example, a charge controller that internally limits to 3A would be fine on a 5 A fuse even though the 690.8(A) calculated current could be higher. This is akin to allowing load overcurrent protection to be smaller than the source maximum, as is allowed in other parts of the code.

4-196 Log #2489 NEC-P04 **Final Action: Accept**
(690.9(A) Exception)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
Exception: An overcurrent device shall not be required for PV modules or PV source circuit conductors sized in accordance with 690.8(B), where one of the following apply:
(a) There are no external sources such as parallel-connected source circuits, batteries, or backfeed from inverters.
(b) The short-circuit currents from all sources do not exceed the ampacity of the conductors or the maximum overcurrent protective device size specified on the PV module nameplate.
Substantiation: Where there are no overcurrents that can damage either a conductor or a PV module, there is no requirement to protect that conductor or PV module with an overcurrent protective device. Module output currents are inherently current limited and, under the very worst-case conditions, are unlikely to exceed 1.25 times the rated short-circuit current (Isc) from the module. All interconnecting conductors are rated for 1.56 Isc (1.25 x 1.25 Isc) or greater. Only external sources can provide significant overcurrents, and if those sources do not exist or are lower in value than the conductor ampacity or the maximum module reverse current (specified by the size of the overcurrent device on the module label), then no overcurrent device is needed.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-197 Log #2490 NEC-P04 **Final Action: Accept**
(690.9(B) Exception)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise the Exception as shown:
690.9(B) Power Transformers.
Exception: A power transformer with a current rating on the side connected toward the ~~PV power source~~ utility-interactive inverter output, not less than the ~~short-circuit~~ rated continuous output current of the inverter, shall be permitted without overcurrent protection from ~~that source~~ the inverter.
Substantiation: Under short-circuit conditions, the anti-islanding circuits required by UL Standard 1741 in all utility-interactive inverters, sense the near zero voltage and cause the inverters to shut down within 0.1 seconds. These inverters cannot operate when connected to a short circuit. Transformer protection is more properly afforded by comparing the transformer rating to the continuous rated output of the inverter.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-198 Log #3635 NEC-P04 **Final Action: Reject**
(690.9(C))

Submitter: Greg Chontow, Hopatcong, NJ
Recommendation: Revise text to read as follows:
"...shall be ~~accessible but not required to be~~ readily accessible.
Substantiation: Overcurrent devices that are not readily accessible may be difficult and labor intensive if servicing is required.
Panel Meeting Action: Reject
Panel Statement: Ready access will rule out more than half of the PV systems being installed. A commercial rooftop is not readily accessible.
PV often is installed on rooftops where ladders or other means are required for access. Rooftops are usually not readily accessible per the definition in Article 100. Fuses and overcurrent devices included in combiner boxes on the roof seldom fail and are not required to be operated in an emergency. The proposal as submitted is too restrictive, and the submitter has not presented any technical data to support the requirement that these supplemental overcurrent devices be readily accessible.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-199 Log #1965 NEC-P04 **Final Action: Reject**
(690.9(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Fuses and circuit breakers used in any portion of a photovoltaic power system shall be listed for use in dc circuits, have voltage ratings not less than the circuit voltage, and current ratings in accordance with 690.8.
(B) Interrupting ratings shall not be less than the available fault current at their terminals.
Substantiation: Edit. "Appropriate " is subjective and a term to be avoided per the Style Manual. Proposal is more specific.
Panel Meeting Action: Reject
Panel Statement: The proposal as submitted does not add any clarity to the existing language. The submitter has not presented any technical data to support the change. The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(690.9(E))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
(E) Series Overcurrent Protection. In ~~series-connected strings of two or more modules~~ PV source circuits, a single overcurrent device shall be permitted to protect the PV modules and the interconnecting conductors.
FPN: Fuses and circuit breakers are equivalent forms of overcurrent protection in this application.
Substantiation: Some electrical inspectors have not been accepting a single, properly rated overcurrent device to protect both the conductor and the PV modules in a series-connected source circuit. This revision clarifies that intent.
The FPN addresses the fact that a few inspectors in major jurisdictions are taking the fuse requirement marking on the back of the modules literally and are not allowing the use of circuit breakers that provide equivalent protection. They use 110.3(B) as justification, and the requirement on certain control equipment that a fuse must be used.
UL is changing the marking requirements in UL 1703 to require that the module label specify a "maximum overcurrent device."
Panel Meeting Action: Accept in Part
The panel accepts the revisions to (E). The panel does not accept the addition of the fine print note.
Panel Statement: The FPN is not necessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-201 Log #4143 NEC-P04 **Final Action: Reject**
(690.10)

Submitter: Robert H. Wills, Intergrid, LLC / Rep. American Wind Energy Association
Recommendation: Revise text to read as follows:
690.10 Stand-Alone Systems.
The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with the requirements of Article xxx. ~~this Code except as modified by 690.10(A) through (D).~~
~~(A) Inverter Output. The ac output from a stand-alone inverter(s) shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of an alternate energy source shall be equal to or greater than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.~~
~~A stand-alone residential or commercial PV installation may have an ac output and be connected to a building wired in full compliance with all articles of this Code. Even though such an installation may have service-entrance equipment rated at 100 or 200 amperes at 120/240 volts, there is no requirement that the PV source provide either the rated full current or the dual voltages of the service equipment. While safety requirements dictate full compliance with the ac wiring sections of the Code, a PV installation is usually designed so that the actual ac demands on the system are sized to the output rating of the PV system. The inverter output is required to have sufficient capacity to power the largest single piece of utilization equipment to be supplied by the PV system, but the inverter output does not have to be sized for the potential multiple loads to be simultaneously connected to it. Lighting loads are managed by the user based on the available energy from the PV system.~~
~~(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.~~
~~(C) Single 120-Volt Supply. The inverter output of a stand-alone solar photovoltaic system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:~~
~~WARNING~~
~~SINGLE 120-VOLT SUPPLY. DO NOT CONNECT~~
~~MULTIWIRE BRANCH CIRCUITS!~~
~~Multiwire branch circuits are common in one- and two-family dwelling units. When connected to a normal 120/240-volt ac service, the currents in the neutral conductors of these multiwire branch circuits (typically 14-3 AWG) subtract or are, at most, no larger than the rating of the branch-circuit overcurrent device. When these electrical systems are connected to a single 120-volt PV power system inverter by paralleling the two ungrounded conductors in the service entrance load center, the currents in the neutral conductor for each multiwire branch circuit add rather than subtract. The currents in the neutral conductor may be as high as twice the rating of the branch-circuit overcurrent device. With this configuration, neutral conductor overloading is possible.~~
~~(D) Energy Storage or Backup Power System Requirements. Energy storage or backup power supplies are not required.~~
Article 70X – Stand-Alone Electric Systems
Scope: This Article covers electric systems that supply power independently of the electric production and distribution network.
70X.1 Stand-Alone Systems.
The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this Code except as modified by 690.10(A) through (D).
(A) Inverter Output. The ac output from a stand-alone inverter(s) shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of an alternate energy source shall be equal to or greater than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.
A stand-alone residential or commercial PV installation may have an ac output and be connected to a building wired in full compliance with all articles of this Code. Even though such an installation may have service-entrance equipment rated at 100 or 200 amperes at 120/240 volts, there is no requirement that the PV source provide either the rated full current or the dual voltages of the service equipment. While safety requirements dictate full compliance with the ac wiring sections of the Code, a PV installation is usually designed so that the actual ac demands on the system are sized to the output rating of the PV system. The inverter output is required to have sufficient capacity to power the largest single piece of utilization equipment to be supplied by the PV system, but the inverter output does not have to be sized for the potential multiple loads to be simultaneously connected to it. Lighting loads are managed by the user based on the available energy from the PV system.
(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.
(C) Single 120-Volt Supply. The inverter output of a stand-alone solar photovoltaic system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:
WARNING
SINGLE 120-VOLT SUPPLY. DO NOT CONNECT
MULTIWIRE BRANCH CIRCUITS!
Multiwire branch circuits are common in one- and two-family dwelling units. When connected to a normal 120/240-volt ac service, the currents in the neutral conductors of these multiwire branch circuits (typically 14-3 AWG) subtract or are, at most, no larger than the rating of the branch-circuit overcurrent device. When these electrical systems are connected to a single 120-volt PV power system inverter by paralleling the two ungrounded conductors in the service entrance load center, the currents in the neutral conductor for each multiwire branch circuit add rather than subtract. The currents in the neutral conductor may be as high as twice the rating of the branch-circuit overcurrent device. With this configuration, neutral conductor overloading is possible.
(D) Energy Storage or Backup Power System Requirements. Energy storage or backup power supplies are not required.

Substantiation: The section on the application of inverters in stand-alone systems Article 690 is applicable to systems other than photovoltaics. In writing the new proposed article for Small Wind Electric Systems, we copied this language verbatim. These requirements should apply to any stand-alone system, and thus should be moved to a general section of the code.

The problem — language duplicated in several articles, and not being applied for other situations where it is relevant — e.g. small wind, hydro, and something that will be important in the near future — electric vehicles as a power source.

The solution — Create a new article. I believe that this language belongs along side Article 705. If so moved, the same language in the proposed small wind electric system article could be deleted.

Panel Meeting Action: Reject

Panel Statement: The new article is incomplete as proposed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WILLS, R.: The committee rejected this proposals more due to lack of time than lack of substantiation.This issue of moving common language to a suitable common article should be addressed at the ROC meeting. There is also the procedural question as to whether a CMP can create a new article. (Note that I am the author of this proposal).

Stand-alone power systems are essentially a missing section of the code. We have 705 - Interconnected Electric Power Production Sources, and 702 Optional Standby Systems, but there is no section for non-interconnected prime-power systems. Such systems are relatively common, in the form of hybrid battery/inverter/generator systems often powered by solar PV or Wind. There are an estimated 100,000 such systems in the USA. They cannot be classed as standby systems as they do not run in standby service.

There should be an article between 702 and 705 that deals with the specifics of stand-alone power systems (TCC please take note). This new article needs to encompass the needs of small off-grid house power systems and also prime-power off-grid generator sites. To this end, I will communicate with members of CMP13 (Article 445 generators) and provide a draft for a complete “Article 70x Stand-Alone Power Systems” article during the comment period.

4-202 Log #1456 NEC-P04 **Final Action: Reject**
(690.10(E))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Change “panels” to “equipment”.

Substantiation: Edit. The provision should apply where the distribution equipment is a switch(es) or circuit breaker(s) not part of a panelboard.

Panel Meeting Action: Reject

Panel Statement: The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-203 Log #2492 NEC-P04 **Final Action: Accept in Principle**
(690.10(E))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Add the following new section:

690.10(E) Backfed Circuit Breakers. Backfed circuit breakers connected to a stand-alone inverter output in either stand-alone or utility-interactive systems shall be identified and listed for backfeeding and shall be secured in accordance with 408.36(D).

Substantiation: More than 95% of the PV installations are accomplished with utility-interactive inverters that are exempt from having the output back-fed circuit breakers clamped to the panel busbar as permitted by 690.64(B)(5) and (6) and 705.12(D)(5) and (6). Inverters in stand-alone systems and the stand-alone outputs of utility-interactive inverters act as voltage sources without anti-islanding circuits. The stand-alone output circuit does not shut down when the utility-interactive output circuits are disconnected. Installers familiar with utility-interactive systems may fail to clamp the back fed circuit breaker connected to output of a stand-alone inverter or the output of an inverter in a utility-interactive system. Such a circuit breaker represents a safety hazard if inadvertently unplugged from a panel board when energized.

Panel Meeting Action: Accept in Principle

Revise the wording as follows:

690.10(E) Backfed Circuit Breakers. Plug-in type backfed ~~Backfed~~ circuit breakers connected to a stand-alone inverter output in either stand-alone or utility-interactive systems ~~shall be identified and listed for backfeeding and~~ shall be secured in accordance with 408.36(D). Circuit breakers that are marked line and load shall not be backfed.

Panel Statement: Circuit breakers are not “identified” for back feed use. The only identification is that the circuit breaker would not be marked Line and Load. The requirement is only applicable to plug-in breakers and all breakers are not plug in. The referenced Section – 408.36 – clearly only has the requirement for plug-in circuit breakers.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

DEATON, R.: The term “utility” refers to a utility supplying electrical power.

STAFFORD, T.: This panel member has a concern that by having the terms backfed circuit breaker and utility-interactive system in the same sentence it could be confusing to installers and inspectors as to what breaker we are talking about. A breaker that is connected to the stand alone output of a utility-interactive inverter is feeding a critical load panel and not backfeeding a panel unless it is attached to the side terminals of a subpanel that it is feeding. It is already required under 408.36(D) to secure the feed or supply to that sub-panel’s bus.

4-204 Log #2493 NEC-P04 **Final Action: Accept in Principle**
(690.11)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Add the following new section to Article 690.

690.11. DC Arc-fault Circuit Protection. PV systems with dc source and/or output circuits on or penetrating a building operating at a system voltage of 80 volts or greater shall be protected with a listed direct-current, arc-fault circuit interrupter (DCAFCI), PV Type, or other system components listed to provide equivalent protection. The PV Arc-Fault Protection System shall comply with 690.11 (A) through 690.11(D).

(A). The system shall detect series arcing faults in the direct current PV source and output circuits.

(B). The system shall interrupt the arc-fault currents.

(C). The system shall disable or disconnect inverters or charge controllers connected to the faulted circuit when a fault is detected. The system shall require that the disabled or disconnected equipment be manually reconnected and restarted.

(D). The system shall have an annunciator that must be manually disabled.

Exception: Complete, listed PV systems with no accessible dc circuits or components.

Substantiation: PV systems are subjected to extreme environmental conditions including wind, rain, snow, ice, UV radiation, and temperature extremes. The systems are installed in dwellings and commercial locations and are not routinely inspected or maintained by qualified people. These systems, as they deteriorate over time, will eventually develop insulation failures or internal PV module conductor faults. Even new modules with manufacturing defects have faulted and caught fire. These failures will result in fault currents and/or series arcing faults. These fault currents and any arcs are direct current (dc) and are far more difficult to deal with since the arcs are not self extinguishing 120 times per second as are alternating current (ac) arcs. These faults may occur anywhere in the dc system. A voltage of 50V was selected since it applies to nearly all PV systems on buildings that could pose hazards. This would exempt 12V and most 24V PV systems and other similar systems at these operating voltages powered by PV modules

The proposal is written to require that the series arcs be detected and the connected equipment turned off. Audible and visual alarms must manually be turned off to ensure that attention is paid to the faults. It would be premature, at the time this requirement will be enacted, to direct the location of the interruption device or the means of achieving that interruption. It is anticipated that a low cost integrated circuit will be developed that will go into utility-interactive inverters and charge controllers that will sense the series arc fault and turn off the inverter which will interrupt the series arc fault current.

The *Exception* is included to allow for newly developed and evolving complete systems that use highly integrated circuits imbedded in PV modules or packaged systems. These systems will be listed for safety, hence no requirements are needed in the *NEC*.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action on Proposal 4-205.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1

Explanation of Negative:

YOUNG, J.: See comment on 4-205.

Explanation of Abstention:

BOWER, W.: Although I agree that arc faults must be addressed, I am very concerned that this is mandatory language for devices that do not exist and for which there are no set points to address a wide variety of PV system sizes ranging from less than 100 watts to hundreds of kilowatts. Arc fault studies must be completed and device performance verified. I believe the public comment period will provide updates on device availability.

Comment on Affirmative:

ZINNANTE, V.: This proposal was accepted in principal and referenced to proposal 4-205 which states that while products are not available presently, the standards for a commercial product would be developed by the ROP in December 2009 and ultimately a commercial product would be available by the time of publication of the 2011 NEC. If this is not the case, then serious consideration should be taken at the ROP to reject this proposal as written because there will be no commercial product readily available at the time of publication.

4-205 Log #2748 NEC-P04 **Final Action: Accept**
(690.11 (New))

Submitter: Timothy P. Zgonena, Underwriters Laboratories Inc.
Recommendation: Add new text to read as follows:
690.11 Arc-Fault Circuit Protection (DC). PV systems with dc source and/or output circuits on or penetrating a building operating at a PV system maximum system voltage of 80 volts or greater shall be protected by a listed (DC) arc-fault circuit interrupter, PV type, or other system components listed to provide equivalent protection. The PV arc-fault protection means shall comply with the following requirements:
(1) The system shall detect and interrupt arcing faults resulting from a failure in the intended continuity of a conductor, connection, module, or other system component in the direct current PV source and output circuits.
(2) The system shall disable or disconnect one of the following:
a. Inverters or charge controllers connected to the fault circuit when the fault is detected
b. The system components within the arcing circuit
(3) The system shall require that the disabled or disconnected equipment be manually restarted.
(4) The system shall have an annunciator that must be manually disabled.
Substantiation: PV systems may be subjected to extreme environmental conditions including wind, rain, snow, ice, dirt, and temperature extremes. The systems are installed on or near dwellings and commercial locations where they may not be routinely inspected or maintained by qualified people. These systems, can deteriorate over time, and eventually develop insulation failures or internal PV module conductor faults. Under rare occasions, new modules with manufacturing defects have faulted and caught fire. These failures will result in fault currents and/or arcing faults. These fault currents, including arcing faults, are direct current (dc) and are far more difficult to interrupt than ac faults because of the non-time varying (non-zero crossing) nature of dc. Series arcing faults resulting from a failure in the intended continuity of a conductor, connection, module, or other system component are most prevalent and may occur anywhere in the dc system. Fault currents to ground will be detected by the ground-fault protection required by Sec. 690.5(A).

Drawing on the success of arc-fault circuit interrupter protection for dwelling unit branch circuits as described in Sec. 210.12, UL has formed a PV AFCI Ad Hoc Working Group. This group, which consists of AFCI manufacturers and PV experts and system manufacturers, is assisting UL with the research and standards development activities related to requirements for arc-fault circuit interrupter protection for PV system applications. The goal of this effort is to have requirements for a PV AFCI developed by 2009 to enable the Listing of PV AFCIs in 2010 prior to the Publication of the 2011 NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1
Explanation of Negative:
YOUNG, J.: There are no dc rated AFCI devices available and there are no requirements developed for such devices. While there may be a need for such a device it is too early to put a requirement in the Code.
Explanation of Abstention:
BOWER, W.: Although I agree that arc faults must be addressed, I am very concerned that this is mandatory language for devices that do not exist and for which there are no set points to address a wide variety of PV system sizes ranging from less than 100 watts to hundreds of kilowatts. Arc fault studies must be completed and device performance verified. I believe the public comment period will provide updates on device availability.
Comment on Affirmative:
STAFFORD, T.: This panel member recognizes the need for DC arc fault detection and encourages the implementation of such devices when available. It is understood by the panel that testing agencies are to have devices in place, for use; by the time the panel meets for the ROC. At that time, technical substantiation and availability will be reviewed as to performance and installation requirements and listing.
ZGONENA, T.: I would like to thank the panel for its support of this proposal. UL has scheduled a three-day PV AFCI Ad Hoc meeting starting on April 7, 2009 to quickly develop safety requirements for PV AFCI products. These published requirements will allow for the Listing of PV AFCI products as well as PV products that include PV AFCI protection. It is expected that these PV AFCI safety requirements will be published and Listed products will be commercially available by the time that the 2011 NEC is published. In the event that this process encounters delays, the proposal should be modified to allow for a future effective date so this crucial safety technology can be implemented as soon as the industry is ready.

4-206 Log #27 NEC-P04 **Final Action: Accept in Principle**
(690.13)

NOTE: This proposal appeared as Comment 13-38 on Proposal 13-22 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-22 was:
Revise the section as follows:
690.5 Ground-Fault Protection. ~~Roof-mounted dc photovoltaic arrays located on dwellings shall be provided with dc ground-fault protection to reduce fire hazards.~~
Grounded dc photovoltaic arrays shall be provided with dc ground-fault protection meeting the requirements of 690.5 (A) through (C) to reduce fire hazards. Ungrounded dc photovoltaic arrays shall comply with 690.35.
Exception 1: Ground-mounted or pole-mounted photovoltaic arrays with not more than two paralleled source circuits and with all dc source and dc output circuits isolated from buildings shall be permitted without ground-fault protection.
Exception 2: PV arrays mounted on other than dwelling units shall be permitted without ground-fault protection if each equipment-grounding conductor has an ampacity of at least two (2) times the temperature and conduit fill corrected circuit conductor ampacity.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: The PV Industry Forum agrees with and supports the Panel Action without the change suggested by the TCC in 13-31a Log CP 1301. An additional Exception #2 is proposed as follows:
Exception 2: A disconnecting switch shall be permitted in a grounded conductor if it is:
a. used only for PV array maintenance, and
b. accessible only by qualified persons.
Substantiation: The location and correction of ground faults in PV arrays may require that the ungrounded conductor be disconnected from the system and from ground during maintenance operations. This permissive allowance provides that a maintenance-only switch can be added to the system to facilitate such operations.
Panel Meeting Action: Accept in Principle
Revise the language in the proposal as follows:
Exception No. 2 is proposed as follows:
Exception No. 2: A disconnecting switch shall be permitted in a grounded conductor providing the following conditions are met:
a. The switch is used only for PV array maintenance, and
b. The switch is accessible only by qualified persons.
c. The switch is rated for the maximum dc voltage and current that could be present during any operation including ground fault conditions.
Panel Statement: The panel revised the wording in Proposal 4-206. Additionally, some of the text from the original proposal was not in the travel file recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ROGERS, J.: The proposal as submitted presents enforcement problems relative to access limitations. Allowing a switch in the grounded conductor should also mandate simultaneous opening of all circuit conductors.
Comment on Affirmative:
WILLS, R.: This was a badly needed provision in 690 that is now accepted. Allowing a disconnect switch in the grounded conductor for maintenance will ultimately save lives in the field. Hooray!

4-207 Log #1455 NEC-P04 **Final Action: Reject**
(690.13)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
An identified means shall be provided to simultaneously disconnect...". (remainder unchanged)
Substantiation: Edit. The means should be identified as suitable for the use.
Panel Meeting Action: Reject
Panel Statement: It is not clear what use would be identified as suitable for. It should be obvious that all conductors would be opened simultaneously.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this, however, the submitter is correct that the existing requirement does not require simultaneous opening and the panel should review that in the comment period.

4-208 Log #2494 NEC-P04 **Final Action: Accept**
(690.13)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise 690.13 as follows:
690.13 All Conductors. Means shall be provided to disconnect all current-carrying dc conductors of a photovoltaic system ~~power source~~ from all other conductors in a building or other structure.
A switch, circuit breaker, or other device, ~~either ac or dc~~, shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device leaves, the marked, grounded conductor in an ungrounded and energized state.
Exception: A switch or circuit breaker that is part of a ground-fault detection system required by 690.5 or that is part of an arc-fault detection/interruption system required by 690.11 shall be permitted to open the grounded conductor when that switch or circuit breaker is automatically opened as a normal function of the device in responding to ground faults. ~~The switch or circuit breaker shall indicate the presence of a ground fault.~~
Substantiation: The revision clarifies the intent of the Code that the dc conductors of a PV system, as an energy source, must have provisions to allow them to be disconnected from all other (non PV) conductors in a building or structure.
The ac circuits from a utility-interactive PV system are very much like branch circuits and become de-energized when disconnected from the utility supply—just like other branch circuits—and they are disconnected by the disconnecting means required by 690.64(B) and 705.12(D)(2).
The second sentence is moved to a second paragraph because it is a related, but separate, requirement.
The Exception and Fine Print Note remain the same except for the addition of the proposed arc-fault circuit detector/interrupter requirement and assumes that a separate proposal for 690.11 DC Arc Fault Circuit Detection/Interruption Device is approved. The last line of the exception is a requirement (found elsewhere in the Code) and does not pertain to this section of the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
BOWER, W.: I agree with the panel's accept for the changes in 690.13 but question the inclusion of the arc-fault detection/interruption because the arc fault devices are not commercially available. If included this proposal will need coordination with 4-205.

4-209 Log #4331 NEC-P04 **Final Action: Accept in Principle**
(690.13)

Submitter: Jim Eichner, Xantrex Technology, Inc.
Recommendation: Revise wording to:
690.13 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a photovoltaic power source from all other conductors in a building or other structure. A switch, circuit breaker, or other device, either ac or dc, shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.
Exception: A switch or circuit breaker that is part of a ground-fault detection system required by 690.5 shall be permitted to open or unground the grounded conductor when that switch or circuit breaker is automatically opened as a normal function of the device in responding to ground faults, or is opened as a result of some other fault or service condition, such as disconnection of the AC supply circuit. The marking of 690.5(C) shall be revised, or an additional marking added, to list all conditions in which the normally grounded conductor is ungrounded. ~~The switch or circuit breaker shall indicate the presence of a ground fault~~.
Substantiation: Problem: The Exception's restriction to only unground the array during ground faults is overly-restrictive. While fuses are an option for the array grounding and ground-fault system, they can be prone to nuisance tripping and to other problems, so in some systems a relay or contactor is preferable. However allowing ungrounding only as the result of a ground-fault means that normally-open contactors energized with power derived from the AC grid cannot be used, because the contactors would open during loss or disconnection of AC power. The remaining options are not desirable. Normally-closed contactors are inherently less safe because they would re-ground the array if a ground fault trip was accompanied by, or followed by, loss of AC or control power. Providing power to the contactors from the PV array causes increased tare loss and lowered efficiency, and has an undesirable effect on safety because it requires placing connections for that power supply on the array side of the disconnect (so that it has power when the PV disconnect is operated, since that too is not allowed to unground the array) which means with the PV disconnect open, part of the product is still energized.
Proposed Solution:
1. The existing Code allows the grounded conductor to be ungrounded under one abnormal condition (ground fault trip). Extend that to other abnormal conditions such as other faults, disconnection or blackout of the AC grid, and servicing operations. In a typical inverter with integral PV ground fault protection, removing the inverter for servicing leaves the array ungrounded, and in any system during installation the installers are working with energized and ungrounded arrays, so safe working practices have already been established, and the markings make personnel aware of the conditions under which the array is ungrounded. Furthermore, a fully floating array is safer from a fire- and shock-hazard point of view than one with one conductor grounded. From a fire hazard perspective it takes 2 simultaneous ground faults for PV current to flow through an unintentional conducting path. From a shock hazard perspective, the floating array can source only leakage current to ground, while a the ungrounded conductor of a grounded array can source the full array short-circuit current to ground.
2. The sentence "The switch or circuit breaker shall indicate the presence of a ground fault". is proposed to be deleted because it is not appropriate if a fault condition other than ground fault has resulted in the switch or breaker opening, and because the sentence is redundant with the indication requirement in 690.5(A), which already requires this indication, if the ground fault detection is tripped.
Panel Meeting Action: Accept in Principle
Revise the wording of the proposal as follows:
690.13 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a photovoltaic power source from all other conductors in a building or other structure. A switch, circuit breaker, or other device, either ac or dc, shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.
Exception: A switch or circuit breaker that is part of a ground-fault detection system required by 690.5 shall be permitted to open (unground) the grounded conductor when that switch or circuit breaker is automatically opened as a normal function of the device in responding to ground faults, or is opened as a result of some other fault or service condition, such as disconnection of the AC supply circuit. Labeling and marking of the inverter in accordance with 690.5(C) shall be added to list all operating conditions in which the normally grounded conductor may become ungrounded. ~~The switch or circuit breaker shall indicate the presence of a ground fault~~.
Panel Statement: The wording in the proposal is changed to improve readability and clarification.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BOWER, W.: I realize there is a need to unground the the grounded conductors with some inverter topologies, but the acceptance of this without specifying the requirement to provide added marking to the system creates potentially unsafe conditions. The proposal does not provide that marking language and should be rejected until such language is approved. The substantiation and proposal must also provide language covering the conditions under which the grounded conductors are ungrounded.

4-210 Log #2499 NEC-P04 **Final Action: Reject**
(690.14)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: It is proposed that Section 690.14 be restructured and revised to improve clarity and intent. This proposal is an overview proposal. The original section and the revised, integrated proposal are shown together in this submittal with substantiations. Additional proposals are provided on a subsection-by-subsection basis to allow comparisons with proposals submitted by others.
***2008 NEC* Original:**
690.14 Additional Provisions. Photovoltaic disconnecting means shall comply with 690.14(A) through (D).
(A) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment and shall comply with 690.17.
(B) Equipment. Equipment such as photovoltaic source circuit isolating switches, overcurrent devices, and blocking diodes shall be permitted on the photovoltaic side of the photovoltaic disconnecting means.
(C) Requirements for Disconnecting Means. Means shall be provided to disconnect all conductors in a building or other structure from the photovoltaic system conductors.
(1) Location. The photovoltaic disconnecting means shall be installed at a readily accessible location either on the outside of a building or structure or inside nearest the point of entrance of the system conductors.
Exception: Installations that comply with 690.31(E) shall be permitted to have the disconnecting means located remote from the point of entry of the system conductors.
The photovoltaic system disconnecting means shall not be installed in bathrooms.
(2) Marking. Each photovoltaic system disconnecting means shall be permanently marked to identify it as a photovoltaic system disconnect.
(3) Suitable for Use. Each photovoltaic system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.

(4) Maximum Number of Disconnects. The photovoltaic system disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.

(5) Grouping. The photovoltaic system disconnecting means shall be grouped with other disconnecting means for the system to comply with 690.14(C)(4). A photovoltaic disconnecting means shall not be required at the photovoltaic module or array location.

(D) Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations. Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):

(1) A direct-current photovoltaic disconnecting means shall be mounted within sight of or in the inverter.

(2) An ac disconnecting means shall be mounted within sight of or in the inverter.

The requirements in 690.14(D)(1) and (D)(2) provide for servicing disconnects at the inverter.

(3) The ac output conductors from the inverter and an additional ac disconnecting means for the inverter shall comply with 690.14(C)(1).

(4) A plaque shall be installed in accordance with 705.10.

Proposed Reorganized and Revised: Only additions are shown. Deletions and renumbering (where changed) not shown

690.14 Additional Provisions. The direct current (dc) PV system disconnecting means shall comply with (A) through **(**H**)**. AC PV disconnecting means for PV systems or AC PV modules shall comply with (H) and (I**).**

(A) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment and shall comply with 690.17.

(B) Equipment. Equipment such as PV source circuit isolating switches, overcurrent devices and blocking diodes shall be permitted on the PV side of the dc PV disconnecting means.

(C) Location. The dc PV system disconnecting means shall be installed at a readily accessible location either ~~on the~~ outside of a building or structure or inside nearest the point of entrance of the system conductors.

Exception: The location of the PV system disconnecting means for the dc PV source and output circuits that comply with 690.31(E) shall be permitted to be in a location that is remote from the point of entry of the system conductors.

The PV disconnecting means shall not be installed in bathrooms

FPN #1: The readily accessible location requirement for the dc PV system disconnecting means and the requirement that it be at the point of entry of the conductors implies that the PV system conductors remain outside the building until the first disconnect is reached. The exception, when met, allows these conductors to be routed through the building to the disconnecting means location that is still required to be readily accessible, but no longer is required to be at the point of penetration.

(D) Marking. Each dc PV system disconnecting means shall be permanently marked and identified.

(E) Suitable for Use. Each dc PV system disconnecting means shall be suitable for the prevailing conditions. Equipment in hazardous (classified) locations shall comply with Articles 500 through 517.

(F) Maximum Number of Disconnects. Each PV system, as a parallel power production service permitted by 230.2, shall have dc PV system disconnecting means consisting of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a panel board as permitted by 230.71.

(G) Grouping. The dc disconnecting means shall be grouped with the disconnecting means for other services connected to the building or structure. A dc PV disconnecting means shall not be required at the PV module or array location. A dc PV disconnecting means shall be permitted at the array location if that location complies with 690.14 (C).

Exception: The disconnecting means for multiple PV systems on a single building or structure shall not be required to be grouped together where the requirements of 705.10 are met.

(H) Utility-Interactive Inverters Mounted in Not Readily-Accessible Locations,

Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with 690.14(H) (1) through (5):

(1) A dc PV disconnecting means shall be mounted within sight of or in each inverter.

(2) An ac disconnecting means shall be mounted within sight of or in each inverter.

(3) An additional disconnecting means complying with 690.14 (A), (C), and (E) shall be installed on the ac output circuit of the inverter(s).

(4) A plaque shall be installed in accordance with 705.10.

(I) AC PV Disconnect. The main service disconnect on a building or structure shall be permitted to serve as the ac PV disconnect for utility-interactive inverters or ac PV modules connected to the load side of the service disconnect.

Disconnecting means in the ac output circuit shall be required where the individual inverter is not within sight of the main service disconnect.

Where connections, as permitted by 705.12(A), are made on the supply side of the service disconnect, they shall be considered parallel power production systems as permitted by 230.2 and shall be permitted an additional six ac PV disconnects per PV system as allowed by 230.71.

Disconnecting means in the inverter ac output circuit shall be permitted for each individual inverter.

The disconnecting means shall comply with 690.17.

Substantiation: Revision of Section 690.14 has been proposed because it contained duplicate requirements to 690.13 and was not clear that it applied mainly the dc PV system disconnecting means. See the new definition proposed for Photovoltaic System Disconnect in 690.2.

690.14 Introductory Text –First Paragraph

The previous 690.14(C) was removed since it duplicated 690.13 and all other sections were upgraded one level. Several related revisions and clarifications have been made as shown below:

The unneeded reference to 690.14 was removed to comply with the *NEC Style Manual*.

While the main emphases is on the dc PV disconnect some clarification to the ac disconnect is needed in this system and is referenced.

690.14(A) No change

690.14 (B) "PV" added for clarity. Added direct-current (dc) to clarify that these device requirements do not apply to ac circuits.

690.14(C) Removed old 690.14(C) since the requirement is addressed in 690.13. The introduction used to be 690.14(C)1. No change

Exception: The exception was modified so that it pertains only to the dc outputs for modules and arrays. See related proposal for 690.31(E).

FPN #1 has been added because of the continuing inability of PV installers to realize that these disconnecting means requirements (added to the *2002 NEC* at the request of the Technical Correlating Committee) affect the routing of the conductors from the PV array to the inverter. This FPN gives information to improve understanding of the requirement and the exception.

690.14(D). Previously 690.14(C)(2). No change

690.14(E). Previously 690.14(C)(3). No change

690.14(F). Previously 690.14(C)(4). Revised to indicate that each PV system may be considered a separate service per 230.2 and that each service/system may have no more than six dc disconnecting means per 230.71

690.14(G). Previously 690.14(C)(5). Revised to be consistent with 690.14(F) and to indicate that PV disconnecting means may be required in areas normally considered not readily accessible in some situations (e.g. flat roofed buildings with ready access).

The Exception is needed for installations where there are multiple widely spaced PV systems on a large commercial building and it is not feasible to group either the dc or ac disconnects from all systems in a single location. Examples include warehouses, malls, and apartment complexes.

690.14(H) Previously (D) with revisions:

Clarified to be consistent with definitions.

690.14(I)

Utility-interactive inverters and ac PV modules shut down when the utility voltage is not present at their output terminals. Opening the main service disconnect will disable or turn off all utility-interactive inverters and ac PV modules connected to the load side of that disconnect.

In order for the main service disconnect to serve as the required maintenance disconnect, the inverter must be within sight of the main service disconnect. If the inverter and main service are not in sight, then a maintenance disconnect must be installed at each inverter to allow safe servicing. Optional, permitted disconnects may be installed at each inverter for system segregation or other purposes.

Panel Meeting Action: Reject

Panel Statement: The panel sees insufficient justification for the proposed language. The proposed language does not add any clarity.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WILLS, R.: This was a no-doubt well-meant but very confusing proposal. Suggest the submitter shorten the submission by first, not providing original text (we all have copies of the 2008 code), and second, submitting in either in full underline/strikeout format, or if that becomes cumbersome, simply provide the new text in total so that we can compare line by line. This comment applies to 4-211 through 4-216, excluding 4-213 (Leaf)

Comment on Affirmative:

BOWER, W.: With just slight reorganization and adequate substantiation this rewrite of 690.14 will result in a better organized and less ambiguous article. The reference to AC PV modules in H needs to be corrected. The author should provide better substantiation per the panel statement. Perhaps the public comment period can clear up confusion and provide an accurate proposed change.

4-211 Log #2500 NEC-P04 **Final Action: Reject**
(690.14)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: It is proposed that Section 690.14 be restructured and revised to improve clarity and intent. This proposal covers the introduction section of 690.14. An overview proposal has been submitted. Additional proposals are provided on a subsection-by-subsection basis to allow comparisons with proposals submitted by others.
690.14 Additional Provisions. <u>The direct current (dc)</u> photovoltaic disconnecting means shall comply with ~~690.14~~(A) through (~~D~~ <u>H</u>)**.** <u>AC PV disconnecting means for PV systems or AC PV modules shall comply with (H) and (I)</u>.
Substantiation: Section 690.14 has been revised because it contained duplicate requirements to 690.13 and was not clear that it applied primarily the dc PV system disconnecting means. See the new definition proposed for Photovoltaic System Disconnect in 690.2.
The unneeded reference to 690.14 was removed to comply with the *NEC Style Manual*.
Added subsections have been proposed and need to be called out.
While the main emphases is on the dc PV disconnect some clarification to the ac disconnect is needed in this system and is referenced.

(690.14(D))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: It is proposed that Section 690.14 be restructured and revised to improve clarity and intent. This new proposal revises 690.14(D), which is renumbered to (H). An overview proposal has been submitted. Additional proposals are provided on a subsection-by-subsection basis to allow comparisons with proposals submitted by others.
~~(D~~ H) Utility-interactive Inverters Mounted in Not Readily-Accessible Locations,
Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with 690.14(H) (1) through (5):
(1) A dc PV disconnecting means shall be mounted within sight of or in each inverter.
(2) An ac disconnecting means shall be mounted within sight of or in each inverter.
(3) An additional disconnecting means complying with 690.14 (A), (C), and (E) shall be installed on the ac output circuit of the inverter(s).
(4) A plaque shall be installed in accordance with 705.10.
Substantiation: 690.14(H) Previously (D) with revisions: Clarified to be consistent with definitions and other requirements.
Panel Meeting Action: Reject
Panel Statement: See the action and statement on Proposal 4-210.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-216 Log #2498 NEC-P04 **Final Action: Reject**
(690.14(I))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: It is proposed that Section 690.14 be restructured and revised to improve clarity and intent. This proposal covers new proposal 690.14(I). An overview proposal has been submitted. Additional proposals are provided on a subsection-by-subsection basis to allow comparisons with proposals submitted by others.
(I) AC PV Disconnect. The main service disconnect(s) on a building or structure shall be permitted to serve as the ac PV disconnect for utility-interactive inverters or ac PV modules connected to the load side of the service disconnect.
Where connections, as permitted by 705.12(A), are made on the supply side of the service disconnect, they shall be considered parallel power production systems as permitted by 230.2 and shall be permitted an additional six ac PV disconnects per PV system as allowed by 230.71.
Disconnecting means in the ac output circuit shall be required where the individual inverter is not within sight of the main service disconnect.
Disconnecting means in the inverter ac output circuit shall be permitted for each individual inverter.
The disconnecting means shall comply with 690.17.
Substantiation: Utility-interactive inverters and ac PV modules shut down when the utility voltage is not present at their output terminals. Opening the main service disconnect will disable or turn off all utility-interactive inverters and ac PV modules connected to the load side of that disconnect.
Many PV systems, because of their size, are connected on the supply side of the service disconnect. The main service disconnect cannot serve as a disconnect for the supply-side systems and they must have individual disconnects. This is consistent with 230.2(A)(5) and each of these PV systems as parallel power production systems is allowed six disconnects per 230.71.
In order for the main service disconnect to serve as the required maintenance disconnect, the inverter must be within sight of the main service disconnect. If the inverter and main service are not in sight, then a maintenance disconnect must be installed at each inverter to allow safe servicing. Optional, permitted disconnects may be installed at each inverter for system segregation or other purposes.
Panel Meeting Action: Reject
Panel Statement: See the action and statement on Proposal 4-210.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-217 Log #1453 NEC-P04 **Final Action: Reject**
(690.16)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal and identify the specific lack of conformance with 4.3.3(b) of the NFPA Regulations Governing Committee Projects.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Identified ~~disconnecting~~ means shall be provided to disconnect a fuse from all sources of supply if the fuse can be energized from both ~~directions~~ line and load terminals. ~~and is accessible to other than qualified persons.~~ Such a fuse in a photovoltaic circuit shall ~~be capable of~~ have approved means of being disconnected independently of fuses in photovoltaic source circuits.
Substantiation: The disconnecting means should be suitable for the use. The provision should apply where accessible to qualified persons since they should be provided the same protection. "Both directions" is not specific; does it mean North or South or East and West top or bottom or left and right? (facetious)
Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements of 4.3.3. (b) of the Regulations Governing Committee Projects. Additionally, the use of line and load terminals for fuses is technically incorrect.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-218 Log #2501 NEC-P04 **Final Action: Accept**
(690.16(A) and (B))

TCC Action: The Technical Correlating Committee understands that the title of (A) is "Disconnecting Means" and the title for the entire section is "Fuses".
Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Label the existing paragraph as (A) and add the following paragraph B
(B) Fuse Servicing. Disconnecting means shall be installed on PV output circuits where overcurrent devices (fuses) must be serviced that cannot be isolated from energized PV circuits. The disconnecting means shall be within sight and accessible to the location of the fuse or integral with fuse holder and shall comply with 690.17. Where the disconnecting means are located more than 1.8m (6 feet) from the overcurrent device, a directory showing the location of each disconnect shall be installed at the overcurrent device location. Non-load-break rated disconnecting means shall be marked "Do not open under load."
Substantiation: Fuses must be serviced in a safe manner, and this usually means that they be disconnected from all sources of voltage. Most PV combiners use "finger safe" fuse holders for this purpose. Inverters are being manufactured that have internal PV source and output circuit combining fuses on the input circuits connected directly to the inverter input terminals. Unless external disconnecting means are installed, these fuses cannot be safely serviced when the PV array is illuminated. Typical fuses in the inverters used in these larger systems may be 100 amps or larger.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-219 Log #1457 NEC-P04 **Final Action: Reject**
(690.17(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Having ratings not less than the nominal circuit voltage and fault current available at its terminals.
Substantiation: Edit. "Sufficient" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects. The substantiation is not adequate with regard to the recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-220 Log #28 NEC-P04 **Final Action: Accept in Principle**
(690.19 (New))

NOTE: This proposal appeared as Comment 13-44 on Proposal 13-31a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-31a was:
Revise 690-13 to read as follows:
Means shall be provided to disconnect all ~~current-carrying~~ <u>ungrounded</u> conductors of a photovoltaic power source from all other conductors in a building or other structure.
Submitter: Robert H. Wills, Intergrid, LLC
Recommendation: As the submitter of panel actions 13-31a and 13-35a, I request that CMP-13 Reject both actions as they now stand, and also consider modifying 690.13 as follows:
690.13 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a photovoltaic power source from all other conductors in a building or other structure. A switch or circuit breaker shall not be installed in a grounded conductor unless:
(1) ~~that~~ <u>the</u> switch or circuit breaker is part of a ground-fault detection system required by 690.5 and ~~that~~ <u>the</u> switch or circuit breaker is automatically opened and indicated as a normal function of the device in responding to ground faults<u>, or,</u>
<u>(2) an optional switch or circuit breaker is provided in a grounded conductor for maintenance and troubleshooting, and only operable by qualified personnel.</u>
FPN: The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance or troubleshooting by qualified personnel.
Substantiation: I brought up the inconsistency in 690.13 and 690.14(C) that requires means for disconnecting <u>all</u> current-carrying conductors, then go on to say that grounded conductors should not be disconnected.
This resulted in panel actions 13-31a and 13-35a.
Further research has shown that the inconsistency stems from the addition of the second sentence of 690.13 in the 1990s when GFI language was added.
The Fine Print Note: “The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance of troubleshooting by qualified personnel.” was added at the same time.
The original version of Article 690 was written for the 1984 code cycle. One of the authors, Tom Key of Sandia Labs (now at EPRIPEAC) wrote in a paper included in the 1985 IEEE PV Specialists Conference Proceedings (“Grounding Considerations for Non-Isolated Photovoltaic Systems”): *Another frequently overlooked requirement is 690.13 which states that “means shall be provided to disconnect all current carrying conductors”. This applies to the “grounded” conductor of the PV array whether it be the neutral or negative lead. The disconnecting means, if properly rated, can provide a very effective way to extinguish a line-to-ground fault in the array.*
The paper’s Figure 2 showed a 2 pole disconnect opening both current-carrying conductors to the array, with the ground bond being on the inverter side of the switch.
Photovoltaic arrays typically contain many photovoltaic modules and interconnection wiring that can be subject to ground faults.
The requirement has changed over the years form opening all current-carrying conductors to ground fault interruption (which typically opens the grounded conductor) plus a FPN provision for bolted or terminal disconnect.
It is reasonable to consider the GFI equipment as now fulfilling the requirement that grounded conductors be disconnected (if there is a ground fault).
The FPN provision is, however, not a safe or sufficient substitute for a switched disconnect in large-scale photovoltaic systems. If multiple ground faults were to occur on different strings, the grounded conductors of the faulted strings would have to be disconnected in order to find the fault locations.
In doing so, the service person would have to open a bolted connection under load - a potentially hazardous activity.
An optional switched disconnect or circuit breaker in grounded conductors for service use only, and only operable by qualified personnel, satisfies the original intent of this section of the code and allows for the removal of a service hazard in large-scale systems.
Panel Meeting Action: Accept in Principle
Panel Statement: The addition of a new Section 690-19 is unnecessary. This proposal is similar to Proposal 4-206. See panel action on Proposal 4-206.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-221 Log #1916 NEC-P04 **Final Action: Reject**
(690.31)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of (A): All <u>identified</u> raceway and cable wiring methods included in this Code, <u>flexible cords and cables covered in 690.31(C)</u> and other wiring systems specifically intended and identified for use on photovoltaic systems shall be permitted...(remainder unchanged
Delete text of (C) and substitute: Flexible cords and cables shall be permitted to connect moving parts of PV modules and shall be an extra-hard usage type identified for the use, water resistant, and sunlight resistant. (remainder unchanged)
Substantiation: Edit. Wiring methods should be identified for the use. This section can be perceived as modifying uses permitted or not permitted in the raceway and cable articles. Reference to 690.31(C) will correlate with that section. Subsection (C) should specifically indicate cords and cables are permitted if identified for the use. Some extra-hard usage types (EV, EVE, EVJE, EVT, are not suitable. Article 400 does not require listing and no “outdoor” use is indicated.
Panel Meeting Action: Reject
Panel Statement: The addition of “identified” and the reference to Section 690.31(C) is redundant and unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-222 Log #3619 NEC-P04 **Final Action: Reject**
(690.31(A))

Submitter: William Peter Kenney, III, Berkeley, CA
Recommendation: Revise text to read as follows:
Where photovoltaic source and output circuits operating at maximum system voltages greater then 30 volts are installed in readily accessible locations, circuit conductors shall be installed in a <u>metallic</u> raceway<u>, or rendered not readily accessible by approved guards or covers.</u>
Substantiation: These source circuits are considered energized in sunlight at levels up to 600 volts DC. The current installation practice that I have seen in California is to use nonmetallic flexible conduit installed with a one or two hole straps as support. Two concerns.
1. Temperature ratings of the raceway system they are using are not appropriate for the installation.
2. We are encouraging education for these systems to include an up close look at these systems. Families looking at these readily accessible systems often have young children that are looking for anything to occupy their time while the parents are learning about the benefits of a PV system. It would be very easy for a child to see this hanging loop of LFMC or LFNC as a place to swing from if it is less than 8 ft off the ground.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any technical data to support such a severe restriction on wiring methods for these systems. There are already other NEC requirements that address the physical damage concerns of various wiring methods and the temperature limitations for conductors in non-metallic wiring methods. The phrase “or rendered not readily accessible by approved guards or covers” is not the only method to render a system not readily accessible and could be interpreted as the only approved method.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
STAFFORD, T.: This panel member agrees with the submitters substantiation in that LFNC does not have an adequate temperature rating for the installation. Does any nonmetallic raceway have appropriate temperature rating? By adding the word metallic it restricts nonmetallic raceways from being used. It doesn’t restrict non-flexible raceways though. The easiest way is to take these unprotected supply conductors and make them not readily accessible to the general population.

4-223 Log #2502 NEC-P04 **Final Action: Reject**
(690.31(A), FPN 1 and 2)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Renumber the existing FPN on 690.31(A) as #2 and add this new FPN #1 as follows:
<u>FPN #1: Adding fences or barriers around a PV array or installing protective barriers to the mounting racks of the modules may make the circuits not readily accessible.</u>
Substantiation: There are very few PV modules that are made with conduit-ready junction boxes. The great majority of modules being produced today are constructed with factory-attached pigtail leads using exposed, single-conductor cables and quick-connect (soon to be locking) connectors. Only a few manufacturers have special order modules available that can be used with conduits. This Fine Print Note informs the installer and inspectors that there are “out of the box” solutions to this seemingly very difficult requirement.
Panel Meeting Action: Reject

Panel Statement: Section 690.31 covers wiring methods for solar photovoltaic systems. It is not practical nor necessary to render these wiring methods not readily accessible and may also violate the listing of the PV array.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BOWER, W.: The proposed language was a FPN and does not provide for rendering the wiring methods not readily accessible. It simply provides a suggested means for addressing common inspection questions that have been encountered in PV installations. Installations must still be careful to not violate the listing requirements for components and wiring.

4-224 Log #2503 NEC-P04 **Final Action: Accept**
(690.31(B), FPN)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal and comply with the NEC Style Manual 3.1.3 in that Fine Print Notes shall not contain mandatory text.
This action will be considered by the panel as a public comment.
Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Add the following FPN:
FPN: Photovoltaic (PV) Wire (also Photovoltaic (PV) Cable) has a non-standard outer diameter. Conduit fill should be calculated using Table 1, Chapter 9. Conduit fill tables in Annex C should not be used.
Substantiation: Underwriters Laboratories (UL) Subject 4703 establishes the specifications for Photovoltaic Wire/PV Wire/Photovoltaic Cable/PV Cable. It requires that the insulation thickness be at least 15 mils thicker than the insulation on types UF or RHW conductors. This non-standard thickness will not permit the correct use of the conduit fill tables in Annex C. The conduit fill will have to be calculated using the measured outer diameter of the cable (which may vary from manufacturer to manufacturer) and the fill percentages in Table #1, Chapter 9.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ZINNANTE, V.: While I agree that Conduit tables in Annex C should not be used to size the conduit, I'm not sure that a FPN note is the right place for this information. Shouldn't a standard be developed by UL or the manufacturers that would would ensure a "standard" cm area for each size of PV conductors much like the manufacturers of THHN or THW cable did when developing these products?

4-225 Log #3453 NEC-P04 **Final Action: Reject**
(690.31(B), FPN (New))

Submitter: Larry Cross, Local Union #98 IBEW
Recommendation: Provide Fine Print Note: Thermoplastic insulation may stiffen at temperatures lower than - 10 deg. C (+14 deg. F). Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, such as at points of support. Thermoplastic insulation, where used on dc circuits in wet locations, may result in Electro-endosmosis between conductor and insulation.
Substantiation: The installer should be aware of damage to conductor thermoplastic insulation due to the elements and conditions in the Solar Photovoltaic Systems installations. Thermoplastic insulation is the most common conductor insulation used in the marketplace and most installers are not aware of this reaction to thermoplastic insulation on DC circuits, lower temperatures and supports which are common practices on Solar Photovoltaic installation.
Panel Meeting Action: Reject
Panel Statement: This is an exact copy of the FPN in Section 330.13 that already provides the necessary information.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-226 Log #2193 NEC-P04 **Final Action: Accept**
(690.31(D))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
(D) Small-Conductor Cables. Single-conductor cables listed for outdoor use that are sunlight resistant and moisture resistant in sizes 16 AWG and 18 AWG shall be permitted for module interconnections where such cables meet the ampacity requirements of 690.8. 310.15 shall be used to determine the cable ampacity ~~and temperature~~ adjustment and correction ~~derating~~ factors.
Substantiation: The terms "adjustment factors" and "correction" are the terms used in 310.15(B)(2)(a) and 310.16.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BOWER, W.: The word temperature should be retained.

4-227 Log #3025 NEC-P04 **Final Action: Accept in Principle**
(690.31(D))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
(D) Small-Conductor Cables. Single-conductor cables listed for outdoor use that are sunlight resistant and moisture resistant in sizes 16 AWG and 18 AWG shall be permitted for module interconnections where such cables meet the ampacity requirements of 690.8. Section 310.15 shall be used to determine the cable ampacity ~~and temperature~~ adjustment and correction ~~derating~~ factors.
Substantiation: The terms "adjustment factor" and "correction" are the terms used in 310.15(B)(2)(a) and 310.16.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 4-226.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-228 Log #2504 NEC-P04 **Final Action: Accept in Principle**
(690.31(E))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum
Recommendation: Revise the Section as follows:
(E) Direct-Current Photovoltaic Source and Output-Circuits Inside a Building. Where dc photovoltaic source or output circuits ~~of a utility-interactive inverter~~ from a building-integrated or other photovoltaic system are run inside a building or structure, they shall be contained in metal raceways, Type MC metal clad cable, or metal enclosures, from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.14 (A), (B) and (D) through (I).
Wiring methods shall not be installed within 25 cm (10 in)inches of the roof decking or sheathing except where directly below the roof surface covered by PV modules and associated equipment. To the extent practical, circuits shall be run vertically from the roof penetration point to supports a minimum of 25 cm (10 in) below the roof decking.
FPN: The 25 cm (10 in) requirement is to prevent accidental damage from saws used by firefighters for roof ventilation during a structure fire.
Where flexible metal conduit (FMC) or metal clad cable (MC) smaller than metric designator 21 (trade size ¾) containing PV power circuit conductors is installed across ceilings or floor joists, the raceway or cable shall be protected by substantial guard strips that are at least as high as the cable. Where run exposed, other than within 1.8 m (6 feet) of their connection to equipment, these wiring methods shall closely follow the building surface or be protected from physical damage by an approved means.
(1) The wiring methods and enclosures listed in (A) through (C) that contain photovoltaic power source conductors shall be marked with the wording "Photovoltaic Power Source" by means of identified permanently affixed labels or other approved permanent marking
(A) Exposed raceways, cable trays, and other wiring methods.
(B) The covers or enclosures of pull boxes and junction boxes.
(C) Conduit bodies in which any of the available conduit openings are unused.
(2) The labels or markings shall be visible after installation. PV power circuit labels shall appear in every section of the wiring system that is separated by enclosures, walls, partitions, ceilings, or floors. Spacing between labels and/or markings shall not be more than 3 m (10 ft). Labels required by this section shall be suitable for the environment where they are installed.
Substantiation: The reference to utility-interactive inverter was an error and is removed.
Type MC metal clad cable, a metallic cable assembly, has been added because, with the internal equipment-grounding conductor, it may provide equal and possibly superior safety and mechanical protection when compared with the allowed flexible metal conduit (FMC) for these PV output circuit conductors. The proper use of Type MC, metal clad cable, while maintaining system safety, greatly aids in new construction and the retrofit of existing houses with PV power systems. Type AC armored cable is not included, because when it has an aluminum enclosure, it is not allowed to be used for direct-current circuits (ref UL White Book).
Deliberate hand pressure or sharp bending over edges such as ceiling joists in attics can break smaller sizes of flexible metal conduit and metal clad cable. This is a concern because PV output conductors are often run through attics, an area that homeowners frequently use for storage. This is why routing of raceways and cable assemblies is critical, along with the use of guard strips where necessary. In other areas of the home (cellars/basements) children may hang on to or pull upon these raceways. There is also a concern for the safety of firefighters who in fighting a structure fire may inadvertently cut through a raceway.
Marking raceways that contain photovoltaic circuit conductors will help firefighters, homeowners, and electricians identify the location of such circuits within a building. It would also help to ensure that persons seeking to add on to an existing electrical installation do not accidentally connect other building wiring to the PV source or output circuit wiring. Similar marking is already required elsewhere in the *NEC* for fire alarm and intrinsic safety systems.
Panel Meeting Action: Accept in Principle

Revise the recommended text to read as follows:

(E) Direct-Current Photovoltaic Source and Output Circuits Inside a Building. Where dc photovoltaic source or output circuits from a building-integrated or other photovoltaic system are run inside a building or structure, they shall be contained in metal raceways, Type MC metal clad cable that complies with 250.118(10), or metal enclosures, from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.14 (A), (B) and (D) through (I).

Wiring methods shall not be installed within 25 cm (10 in.) of the roof decking or sheathing except where directly below the roof surface covered by PV modules and associated equipment. Circuits shall be run vertically from the roof penetration point to supports a minimum of 25 cm (10 in.) below the roof decking.

FPN: The 25 cm (10 in.) requirement is to prevent accidental damage from saws used by firefighters for roof ventilation during a structure fire.

Where flexible metal conduit (FMC) or metal clad cable (MC) smaller than metric designator 21 (trade size ¾) containing PV power circuit conductors is installed across ceilings or floor joists, the raceway or cable shall be protected by substantial guard strips that are at least as high as the raceway or cable. Where run exposed, other than within 1.8 m (6 ft) of their connection to equipment, these wiring methods shall closely follow the building surface or be protected from physical damage by an approved means:

(1) The following wiring methods and enclosures that contain photovoltaic power source conductors shall be marked with the wording "Photovoltaic Power Source" by means of permanently affixed labels or other approved permanent marking:

(1) Exposed raceways, cable trays, and other wiring methods.

(2) The covers or enclosures of pull boxes and junction boxes.

(3) Conduit bodies in which any of the available conduit openings are unused.

(2) The labels or markings shall be visible after installation. PV power circuit labels shall appear on every section of the wiring system that is separated by enclosures, walls, partitions, ceilings, or floors. Spacing between labels and/or markings shall not be more than 3 m (10 ft). Labels required by this section shall be suitable for the environment where they are installed.

Panel Statement: The panel added wording to clarify the intent of the proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ROGERS, J.: This proposal as written should have been rejected. The language in the first section relative to the installation of wiring methods run vertically to specified distance whereby they can then run horizontally below roof decking "to the extent practical" is contradictory and unenforceable. If there is a concern with firefighters encountering these energized conductors then this does not address that issue. Furthermore if that is really an issue then it si just as great an issue when the wiring methods run vertically through interior partitions as currently allowed and firefighters are cutting interior walls either during suppression or overhaul. The only real way to adequately protect firefighters is to revert to the original language mandating a disconnecting means at a readily accessible location nearest the point of entrance of the conductors and not to allow these conductors to run throughout the building in an allegedly substantially protective metallic outer shell of some sort depending on the wiring method. This is even more important with newer PV systems due to the increased voltage levels and power delivery levels.

ZINNANTE, V.: I believe that there should be a method to distinguish PV source and output circuits from other types of systems, but I don't believe this proposal is that answer. Is this proposal going to define what "clearly marked" is as suggested in proposal 4-187? I also think this proposal contradicts proposal 4-187.

This proposal is saying that wiring methods shall not be installed within 10 inches of the roof decking for DC PV while proposal 4-187 allows PV source and output conductors to be imbedded in the built up laminate or membrane roofing material. Why couldn't there be an industry standard to differentiate PV raceways, much like red marking for fire alarm conduits?

Comment on Affirmative:

STAFFORD, T.: My meeting notes indicate that what showed up on the ROP's Panel action is not what we talked about at the meeting. In the panel action it shows 690.31(E) subsections being misnumbered.

4-229 Log #2755 NEC-P04 **Final Action: Accept in Principle**
(690.31(E))

Submitter: Paul R. Picard, AFC Cable Systems, Inc.

Recommendation: Revise text to read as follows:

(E) Direct-Current Photovoltaic Source and Output Circuits Inside a Building. Where direct-current photovoltaic source or output circuits of a utility-interactive inverter from a building-integrated or other photovoltaic are run inside a building or structure, they shall be contained in metal raceways, <u>Metal-Clad Cable, Armored Cable</u>, or metal enclosures, from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.14(A) through (D).

Substantiation: The present wording only permits metal raceways; the use of Metal-Clad Cable or Armored Cable would provide equivalent mechanical protection.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on proposal 4-228. Armored cable is not permitted for dc systems in accordance with the UL white book.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-230 Log #2873 NEC-P04 **Final Action: Reject**
(690.31(F))

Submitter: James M. Imlah, City of Hillsboro

Recommendation: Revise text to read as follows:

690.31 Methods Permitted.

(F) Flexible, Fine-Stranded Cables. Flexible, fine-stranded cables shall be terminated ~~only with terminals, lugs, devices, or connectors that are identified and listed for such use.~~ <u>as per 110.14(A)(1)</u>

Substantiation: Relocate this text to 110.14(A)(1) so this requirement can be applied to all installations where fine-stranded conductors and fine-stranded jacketed cables are installed, not just for solar or battery connections. This was a new item that was added in article 690.31 (F) in the 2008 NEC. The issue is that fine-stranded conductors and jacketed cables are being installed for other installation types where a wide range of flexibility is desired. With the expanded use of fine-stranded cables and conductors being used for welders, cranes, elevators, battery bank connections, computer data cables, UPS cables and many other installations, this requirements needs to be relocated to requirements for electrical installations. As this rule is applied currently within the NEC, only specific applications can require terminations to use devices and equipment rated for these conductor types. This relocated requirement will provide a procedure for identified lugs and terminations providing a safer installation without possible hot spots or cable overheating due to bad or loose lug connections when terminated with acceptable identified crimping tools.

Panel Meeting Action: Reject

Panel Statement: The submitter's section referenced does not exist.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WILLS, R.: The suggestion to have common language for fine-stranded cables is a good one. It could be in Article 110 or Article 400. The panel justification was a little trite - sure the referenced sections does not exist, but the intent of the proposal is to create such a common section.

4-231 Log #4667 NEC-P04 **Final Action: Reject**
(690.31(F))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 1-149.

This action will be considered by the panel as a public comment.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Delete this lettered paragraph.

Substantiation: This is a companion proposal to one from this submitter to relocate this material into 110.14. These requirements are hardly unique to photovoltaic installations, and should therefore apply to all installations, as the testing laboratories intend. This proposal should be provisionally accepted until CMP 1 acts on the other proposal.

Panel Meeting Action: Reject

Panel Statement: The required text does not currently exist in Section 110.14.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WILLS, R.: See My Explanation of Negative on 4-230.

4-232 Log #2505 NEC-P04 **Final Action: Accept**
(690.43)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Revise 690.43 as follows:

690.43 Equipment Grounding. <u>Equipment grounding conductors and devices shall comply with (A) through (F).</u>

<u>(A) Equipment Grounding Required</u>. Exposed non–current carrying metal parts of <u>PV</u> module frames, <u>electrical</u> equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A) regardless of voltage.

<u>(B) Equipment Grounding Conductor Required</u>. An equipment-grounding conductor between a PV array and other equipment shall be required in accordance with 250.110.

<u>(C) Structure as Equipment Grounding Conductor.</u> Devices listed and identified for grounding the metallic frames of PV modules or other equipment shall be permitted to bond the exposed ~~metallic frames of PV modules~~ metal surfaces or other equipment to mounting structures. <u>Metallic mounting structures, other than building steel, used for grounding purposes shall be identified as equipment-grounding conductors or shall have identified bonding</u>

jumpers or devices connected between the separate metallic sections and shall be bonded to the grounding system.

(D) PV Mounting Systems and Devices. Devices and systems used for mounting PV modules that are also used to provide grounding of the module frames shall be identified for the purpose of grounding PV modules.

(E) Adjacent Modules. Devices identified and listed for bonding the metallic frames of PV modules shall be permitted to bond the exposed metallic frames of PV modules to the metallic frames of adjacent PV modules.

(F) All Conductors Together. Equipment grounding conductors for the PV array and structure (where installed) shall be contained within the same raceway or cable, or otherwise run with the PV array circuit conductors when those circuit conductors leave the vicinity of the PV array.

Substantiation: The section has been rearranged to allow the inclusion of two new requirements. Making a durable connection between an aluminum PV module frame and a grounding system is difficult because aluminum and copper are dissimilar metals and aluminum is frequently clear coated and/or oxidizes very rapidly when the surface is exposed to the atmosphere. UL has clarified UL Standard 1703 with respect to the grounding requirements of PV modules, and numerous devices are being developed to quickly and effectively ground the frames of PV modules. The Code must establish installation requirements that allow these grounding devices and methods to be used in a manner that effectively provides for a durable and safe grounded PV system.

(C) Devices are being developed that bond the module frame to an aluminum mounting rack. These racks are normally designed to mechanical standards and are not designed or certified as equipment grounding conductors. They may have mechanical joints that allow for thermal expansion but do not provide electrical continuity. Unlike building steel, which is generally acknowledged as a suitable grounded structure, these aluminum racks are as difficult to make electrical connections to as the PV modules themselves. Requiring them to be identified as equipment-grounding conductors will correct this problem. Additionally, these racks, after being identified as equipment-grounding conductors must make a connection to an accepted grounding system. A copper conductor connected to ground would be acceptable.

(D) Devices are being developed that will ground the module frame through the mechanical fasteners that hold the module to the supporting structure. The difficulty in making a good, durable electrical contact with aluminum and any other materials dictates that these devices must be identified for the use.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-233 Log #2506 NEC-P04 **Final Action: Reject**
(690.46)

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Revise 690.46 as follows. Add the following second paragraph.

690.46 Array Equipment Grounding Conductors. Equipment grounding conductors for PV modules smaller than 6 AWG shall comply with 250.120(C). Solid (non-stranded) equipment-grounding conductors and grounding-electrode conductors of 6 AWG and smaller shall be permitted in raceways for PV array grounding.

Substantiation: Section 310.3 requires the use of stranded conductors of 8 AWG and larger in raceways, but the exception to 310.3 does allow the use of larger, solid conductors where permitted elsewhere in the Code. Given the problem of moisture, which is generally present at the location of the modules, and the installation requirements of 690.46/250.120(C), it would simplify PV installations if the use of solid conductors of 6 AWG in raceways were allowed. This would address not only issues of water migration into stranded grounding conductors and subsequent degradation of the conductor and/or connection, but would also allow electricians to more effectively deal with the concerns of inspectors who expect to see grounding conductors smaller than 6 AWG protected in a raceway. The allowance of 6 AWG solid conductors in raceways would allow an electrician to run an unspliced #6 (or smaller) solid conductor from the DC disconnect or combiner box to the array. This conductor could then be used to bond all of the mounting components and even connect to any auxiliary grounding electrodes installed at the location of the array without a splice.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented sufficient technical data to support this change. The requirement for stranded conductors in raceways has been in place for a long period of time based on installation limitations when larger sizes of solid conductors are used.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

WILLS, R.: I'd like to see more justification for solid conductors in this application. Why can't stranded conductors be used? Is it a cost issue? Water migration is mentioned, but this surely affects all conductors.

4-234 Log #2507 NEC-P04 **Final Action: Accept**
(690.47(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by providing more description related to the words "identified for the purpose."

This action will be considered by the panel as a public comment.

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Add the following second paragraph to 690.47(B).

A common dc grounding-electrode conductor shall be permitted to serve multiple inverters. The size of the common grounding electrode and the tap conductors shall be in accordance with 250.166. The tap conductors shall be connected to the common grounding-electrode conductor by exothermic welding or with connectors identified for the purpose.

Substantiation: PV installations using multiple small inverters are becoming more common as costs continue to decline for these products. Since each inverter and the connected modules represent individual dc systems, a common dc grounding electrode can be used to provide the necessary connection to earth for all inverters. The size of this common grounding-electrode conductor is determined by the type of grounding electrode in accordance with 250.166. Because the dc circuits for each inverter are separate and distinct, there is no requirement to make the common conductor any larger than the size of the grounding-electrode conductor required for a single inverter.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

WILLS, R.: Members of CMP-5 brought up the issue that there are some circumstances where a GEC is simply not available (for example on an upper floor of a high-rise building with no metal structure). We may need an exception to cover these situations. E.g., "Exception: Where no grounding electrode conductor is accessible, dc systems are permitted to be grounded to the building equipment grounding system."

4-235 Log #2508 NEC-P04 **Final Action: Accept in Principle**
(690.47(C))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Delete the entire existing 690.47(C) and replace it with the proposed:

~~(C) Systems with Alternating-Current and Direct-Current Grounding Requirements. Systems with alternating-current and direct-current grounding requirements shall comply with items (C)(1) through (C)(8):~~

~~(1) Where photovoltaic power systems have both alternating-current (ac) and direct-current (dc) grounding requirements, the dc grounding system shall be bonded to the ac grounding system.~~

~~(2) A bonding conductor between these systems shall be sized as the larger of the dc requirement in accordance with 690.45, the ac requirements based on the inverter alternating current overcurrent device rating and 250.122, and the system bonding requirements of 250.28.~~

~~(3) A conductor that serves as both an equipment grounding conductor and as part of the bond between ac and dc systems for an inverter incorporating dc ground-fault protection shall meet the requirements for equipment bonding jumpers in accordance with 250.102 but shall not be subject to the requirements for bonding jumpers in accordance with 250.28. A single conductor shall be permitted to be used to perform the multiple functions of dc grounding, ac grounding, and bonding between ac and dc systems.~~

~~(4) A bonding conductor or equipment grounding conductor that serves multiple inverters shall be sized based on the sum of applicable maximum currents used in item (2).~~

~~(5) A common ground bus shall be permitted to be used for both systems.~~

~~(6) A common grounding electrode shall be permitted to be used for both systems, in which case the grounding electrode conductor shall be connected to the ac ground system bonding point.~~

~~(7) Grounding electrode conductor(s) shall be sized to meet the requirements of both 250.66 (ac system) and 250.166 (dc system).~~

~~(8) For systems with utility-interactive inverters, the premises grounding system serves as the ac grounding system.~~

690.47(C) Systems with Alternating and Direct-Current Grounding Requirements. PV systems having direct current (dc) circuits and alternating current (ac) circuits with no direct connection between the dc grounded conductor and ac grounded conductor shall have a dc grounding system. The dc grounding system shall be bonded to the ac grounding system by one of the methods listed in (1), (2), or (3).

This section shall not apply to ac PV modules.

When using the methods of (2) or (3), a visual inspection shall be made to ensure that the existing ac grounding-electrode system meets the applicable requirements of Article 250, Part III.

FPN No. 1: ANSI/Underwriters Laboratory Standard 1741 for PV inverters and charge controllers requires that any inverter or charge controller that has a bonding jumper between the grounded dc conductor and the grounding system connection point have that point marked as a grounding-electrode conductor (GEC) connection point. In PV inverters, the terminals for the dc equipment-grounding conductors and the terminals for ac equipment-grounding conductors are generally connected to or electrically in common with a grounding busbar that has a marked dc GEC terminal.

FPN No.2: For utility-interactive systems, the existing premises grounding system serves as the ac grounding system.

(1) Separate DC Grounding Electrode System Bonded to the AC Grounding Electrode System. A separate dc grounding electrode or system shall be installed, and it shall be bonded directly to the ac grounding-electrode system. The size of any bonding jumper(s) between ac and dc systems shall be based on the larger size of the existing ac grounding-electrode conductor or the size of the dc grounding-electrode conductor specified by 250.166. The dc grounding-electrode system conductor(s) or the bonding jumpers to the ac grounding-electrode system shall not be used as a substitute for any required ac equipment-grounding conductors.

(2) Common DC and AC Grounding Electrode. A dc grounding-electrode conductor of the size specified by 250.166, shall be run from the marked direct-current grounding electrode connection point to the ac grounding-electrode. Where an ac grounding electrode is not accessible, the dc grounding-electrode conductor shall be connected to the ac grounding-electrode conductor in accordance with 250.64(C)(1). This dc grounding-electrode conductor shall not be used as a substitute for any required ac equipment-grounding conductors.

(3) Combined DC Grounding-Electrode Conductor and AC Equipment-Grounding Conductor. An unspliced, or irreversibly spliced, combined grounding conductor shall be run from the marked dc grounding-electrode conductor connection point along with the ac circuit conductors to the grounding bus bar in the associated ac equipment. This combined grounding conductor shall be the larger of the size specified by 250.122 or 250.166 and shall be installed in accordance with 250.64(E).

Substantiation: Section 690.47(C) was edited extensively in the Code Making Panel during the final meeting of the *2008 NEC* cycle and was not subject to public review.

This proposal takes a combination of the *2005 NEC* 690.47(C) and the *2008 NEC 690.47(C)*, clarifies that Code language and includes the requirements meeting the intent of the *2008 NEC* in a clear and understandable manner

This proposal establishes when ac and dc grounding are required, it presents the requirement for bonding the two grounding systems together, and it gives three ways of achieving that bonding. The proposal presents this information as concisely as possible without unnecessary duplication of material found elsewhere in the Code. It also provides informative material to assist installers and inspectors.

Section 690.47(C) in the *2008 NEC* did not establish the need for bonding the dc grounding system to the ac grounding system. The revised proposal does so.

This proposal clarifies the requirement and the methods of meeting the requirement.

Section 690.47(C) in the *2008 NEC* presented only one method of achieving the ac and dc bonding. This is a method that may not be applicable to all PV systems, large and small. This proposal presents three distinct methods, including the one in 690.47(C) in the *2008 NEC*. It can also be used when the listed inverter instructions require that each inverter have a dc grounding electrode installed near each inverter.

It should be noted that the combined conductor bonding method (3) requires that all entry and exit points for metal enclosures and raceways be bonded. This is important because each ferrous metal enclosure or raceway that the combined conductor passes through represents a significant increase in ground path inductance if not properly bonded. Such inductances reduce the ability of the conductor to carry surges to ground.

When using the method described in (2) or (3), it should not be presumed that the existing grounding at a building or structure is present and properly installed. Many older buildings are deficient in their grounding electrode systems. A cursory check should therefore be performed to ensure that the premises grounding electrode system exists and appears to be installed properly.

Fine Print Note (FPN) No. 1 provides information that many inspectors need to know so that they can make informed inspections of this equipment and these installations without having to search elsewhere for the information.

The Exceptions are necessary because of the increasing use of concrete encased electrodes.

Panel Meeting Action: Accept in Principle

Change FPN No. 1: to reference Underwriters Laboratories UL-1741 Standard for Inverters, Converters, and Controllers for Use in Independent Power Systems.

Revise thetitle to read: **690.47(C) Systems with Alternating-Current and Direct-Current Grounding Requirements.**

Panel Statement: Revise the wording in the proposal to correct the reference to Underwriters laboratories. Add the word current back into the title.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

DEATON, R.: The term "utility" refers to a utility supplying electrical power.

ROGERS, J.: I agree with the panel action on this proposal and with the clarified requirement as presented by the submitter. In the comment period it is my opinion that the last sentence in parts 1 and 2 should be removed as it is redundant and other code sections already mandate the installation of the AC side grounding conductor separate of the DC grounding electrode conductor.

4-236 Log #4668 NEC-P04 **Final Action: Accept in Principle**
(690.47(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Add the following wording at the end of the parent language and before item (1): "These systems shall be permitted to use both a common ground bus and a common grounding electrode for both systems. The grounding electrode conductor connected to a common grounding electrode, if used, shall be connected to the ac system ground point.

Delete 690.47(C)(5 and 6) and renumber the remaining items accordingly.

Substantiation: This section is set up based on items (1) through (8) being the subject of a mandate for compliance, and yet (5) and (6) are written as permissive rules. This proposal relocates these items to the parent text so the mandatory requirements properly fall into line.

Panel Meeting Action: Accept in Principle

Panel Statement: See the action and statement on Proposal 4-235.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-237 Log #4669 NEC-P04 **Final Action: Accept in Principle**
(690.47(C)(2) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Insert the following exception:

Exception: The bonding conductor shall not be required to be larger than the conductor required in 680.47(C)(3).

Substantiation: Consider a utility-interactive inverter with a 30A connection to a 200A service panel. The bonding conductor size per (2) is the largest of three sizes: a) the dc 690.45 requirement, or b) the ac requirement based on the inverter overcurrent device size and Table 250.122 (normally 10 AWG in this case), or c) the system bonding requirements of 250.28 (if connected at a 200 A service with the usual conductors this would be 4 AWG), so the minimum size would be 4 AWG; but, now look at (3).

In item (3), a conductor that is both an equipment grounding conductor and part of the bonding path between an ac system and a dc system that incorporates GFP, and therefore has the dc grounding connection at that location, is sized in accordance with 250.102. There are two equipment bonding conductors in 250.102, one on the load side of the service sized by 250.122, and one on the line side, sized per 250.66. Since this is on the load side, 250.122 governs the sizing and we are back to a 10 AWG conductor. This is reinforced by the statement that 250.28 does not apply, which is what drove the 4 AWG result in item 2. That said, there is no language in the parent text that provides for resolving an internal conflict, other than compliance with all 8 rules, and that could be argued as mandating the 4 AWG conductor. There is no technical merit to the larger size wire. This is purely to hold two systems at the same potential, and the worst case fault on either system is one that will be resolved through a conductor sized in accordance with 250.122.

This proposal provides the mechanism to resolve these conflicts.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and panel statement for Proposal 4-235 for 690.47(C) that covers the size of the common grounding bus and common grounding electrode case addressed in this proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-238 Log #2509 NEC-P04 **Final Action: Reject**
(690.47(D))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Delete 690.47(D)

~~(D) Additional Electrodes for Array Grounding. Grounding electrodes shall be installed in accordance with 250.52 at the location of all ground- and pole-mounted photovoltaic arrays and as close as practicable to the location of roof-mounted photovoltaic arrays. The electrodes shall be connected directly to the array frame(s) or structure. The dc grounding electrode conductor shall be sized according to 250.166. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements.~~

~~The structure of a ground- or pole-mounted photovoltaic array shall be permitted to be considered a grounding electrode if it meets the requirements of 250.52. Roof-mounted photovoltaic arrays shall be permitted to use the metal frame of a building or structure if the requirements of 250.52(A)(2) are met.~~

~~Exception No. 1: Array grounding electrode(s) shall not be required where the load served by the array is integral with the array.~~

~~Exception No. 2: Additional array grounding electrode(s) shall not be required if located within 6 ft of the premises wiring electrode.~~

Substantiation: This requirement, new to the *2008 NEC*, was added to mandate lightning protection for PV arrays. It does not replace or substitute for any other Code-required grounding systems that are designed to ensure the safety of the public.

Lightning protection is beyond the scope of the *NEC* and is covered in other NFPA documents.

Normal, equipment-grounding systems provide the necessary safety for PV systems.

A similar, optional requirement is already in the Codes as 250.54.

These lightning-protection requirements should be deleted from the Code.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided sufficient technical data to support the removal of this requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-239 Log #4670 NEC-P04 **Final Action: Reject**

(690.47(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Either:

1) Insert the following sentence after the second sentence: The electrodes shall be bonded to the grounding electrode system for the building.

Or:

2) Change the beginning of the first sentence to read “Auxiliary grounding electrodes shall be installed in accordance with 250.54 at the location...”.

Substantiation: If a separate electrode is used, whether or not it must be bonded to the power system electrodes depends on whether they are classified as “auxiliary” electrodes as covered in 250.54. The proposal for this 2008 change clearly intended that they be so classified; but the panel removed the reference and failed to substantiate its actions. This proposal seeks to force a clear stand on whether or not to bond these electrodes. The fact that they are a down payment on lightning protection suggests they are not supplemental, because NFPA 780 requires bonding to power system grounding electrode systems while retaining separate electrodes for their protective system.

Panel Meeting Action: Reject

Panel Statement: Conductors between the array and inverter is an equipment grounding conductor. Section 250.54 allows auxiliary grounding electrodes to be installed without bonding to the grounding system. Additionally, the proposal does not meet the requirements of 4.3.3(b) the Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-240 Log #4671 NEC-P04 **Final Action: Reject**

(690.48)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Insert the following sentence at the end: “A conductor meeting the terms of this requirement together with fittings suitable for creating a bonding connection shall be secured to the building surface at an easily seen location at the system connection to the grounding electrode conductor, together with instructions regarding when to install the temporary bonding jumper.”

Substantiation: The present NEC text is a maintenance procedure requirement suitable for NFPA 70E and not an installation requirement, and therefore it has no business being in the NEC as written. The rule says, in effect, that if you remove the equipment for servicing, you must install a temporary bonding conductor so as to maintain the continuity between the two equipment grounding systems that normally are bonded through the missing equipment. Now this is a very good idea, just like it is a very good idea to test electrical components for voltage before working on them. But what steps can be taken prior to the final electrical inspection by way of modifications to the electrical system to achieve the result? The rule cannot be complied with by an installing electrician.

This proposal adds actual field installation criteria that could be enforced as part of normal electrical inspections. The submitter understands that this proposal may not be suitable either. If the panel cannot develop an appropriate installation requirement, then this section should be marked for deletion.

Panel Meeting Action: Reject

Panel Statement: The proposal as submitted does not add clarity to Section 690.48. It is unclear how the submitter intends for instructions to be placarded and followed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

(690.62)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with the NEC Style Manual to provide titles for each subsection.

This action will be considered by the panel as a public comment.

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Delete the existing first paragraph and replace with the following:

~~If a single-phase, 2-wire inverter output is connected to the neutral conductor and one the ungrounded conductor (only) of a 3-wire or of a 3-phase 4-wire, wye-connected system, the maximum load connected between the neutral conductor and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity if the neutral conductor.~~

690.62 Ampacity of Neutral Conductor.

The ampacity of the neutral conductors shall comply with either A or B.

A. Where the outputs of single or multiple single-phase inverter(s) are connected between the neutral conductor and one or more of the ungrounded conductors of a 3-phase 4-wire, wye-connected system or a 120/240V single-phase system, the ampacity of the neutral conductor shall be no less than the greater of (1) or (2)

(1) 125% of the continuous load plus 100% of the non continuous load on that neutral conductor or

(2) 125% of the sum of the rated output current of all inverters considering worst-case imbalance.

Renumber second paragraph as B.

Substantiation: These two currents ((1) and (2)) are not additive in this requirement because they may exist separately at different times. The existing requirement, as written, is incorrect in requiring the sum of these two currents to be used. Since the currents (power) will generally flow in opposite directions, the sum may be near zero at times.

If the inverters are not operating, the neutral must be able to carry any connected load currents. The operation of the inverters in the presence of load currents will tend to decrease currents in the neutral. If there are no loads, then the circuit must carry the full rated output of the inverter(s). Where multiple inverters are installed and connected phase-to-neutral, consideration must be given to situations where one or more inverters could fail, be turned off, or the connected array shaded thus eliminating any balance between the phases and increasing the neutral currents. The 125% of rated output is needed to ensure that the neutral conductor ampacity is consistent with the ampacity calculated elsewhere in the Code.

Example:

480/277V, 3-phase, 4-wire, wye system: Existing maximum, connected, unbalanced load current in the neutral is 40 amps. Two 7 kW inverters are connected between each phase and neutral. A total of six inverters are connected. Rated output current of each inverter is 27.3 amps. When all six inverters are producing rated current, the neutral currents from the inverters are near zero. In a worst-case situation, only two inverters connected on one phase are working at rated output and the others are shut off or have failed. The currents in the neutral from these two inverters would total 2 x 27.3 amps or 54.6 amps, and this should be used to calculate the required ampacity for the neutral, since it is larger than the 40 amps of load current.

Recommendation: Delete all of Section 690.64.

~~The output of a utility-interactive inverter shall be connected as specified in 690.64(A) or (B).~~

~~(A) Supply Side. The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).~~

~~(B) Load Side. The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Where distribution equipment, including switchboards and panelboards, is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders, or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (B)(1) through (B)(7).~~

~~(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.~~

~~(2) Bus or Conductor Rating. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor. In systems with panelboards connected in series, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors.~~

~~(3) Ground-Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.~~

~~Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.~~

~~(4) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.~~

~~(5) Suitable for Backfeed. Circuit breakers, if backfed, shall be suitable for such operation.~~

~~FPN: Circuit breakers that are marked "Line" and "Load" have been evaluated only in the direction marked. Circuit breakers without "Line" and "Load" have been evaluated in both directions.~~

~~(6) Fastening. Listed plug-in-type circuit breakers backfed from utility-interactive inverters complying with 690.60 shall be permitted to omit the additional fastener normally required by 408.36(D) for such applications.~~

~~(7) Inverter Output Connection. Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall be sized for the loads connected in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent marking:~~

~~**WARNING**~~
~~**INVERTER OUTPUT CONNECTION**~~
~~**DO NOT RELOCATE THIS OVERCURRENT DEVICE**~~

Substantiation: The requirements of 690.64 were moved to 705.12 during the *2008 NEC* Code making cycle and are no longer needed in Article 690.

A permanent warning label shall be applied to the distribution equipment with the following or equivalent marking:~~

~~WARNING~~
~~INVERTER OUTPUT CONNECTION~~
~~DO NOT RELOCATE~~
~~THIS OVERCURRENT DEVICE~~

Substantiation: Photovoltaic systems operating in parallel with another electric supply to a premise electrical system are considered Interconnected Electric Power Production Systems and fall within the scope of Article 705. The point of connection requirements in 690.64 duplicate the text Section 705.12. Repeating the requirements, to interconnect a photovoltaic utility-interactive inverter in Article 690 is redundant. The requirements in Section 690.64 are not specific to photovoltaic installations. Many types of interconnected electric production systems use utility-interactive inverters, such as wind, photovoltaic, fuel cells, and micro-turbines, to mention a few. Section 705.12(A) and (D) provides uniform interconnection requirements for this inverter technology, regardless of the primary energy source.

The requirements in Section 690.64 duplicate the text in 705.12 as listed below:

- 690.64(A) is duplicated text from 705.12(A)
- 690.64(B), B(1) through B(7) is duplicated by 705.12(D), (D)(1) through (D)(7)

This proposal removes the duplicated text in Article 690 and references Article 705 sections that state the utility-interactive inverter point of connection requirements.

Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 4-246.

4-247 Log #4144 NEC-P04 **Final Action: Reject**
(690.71)

Submitter: Robert H. Wills, Intergrid, LLC / Rep. American Wind Energy Association
Recommendation: Revise text to read as follows:

VIII. Storage Batteries

690.71 Installation.

(A) General. Storage batteries in a solar photovoltaic system shall be installed in accordance with the provisions of Article 480. The interconnected battery cells shall be considered grounded where the photovoltaic power source is installed in accordance with 690.41.

Batteries in PV power systems are usually grounded when the PV power system is grounded in accordance with Article 690, Part VI.

~~(B) Dwellings.~~

~~(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).~~

~~Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 690.7 shall be permitted.~~

~~(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.~~

~~FPN: Batteries in solar photovoltaic systems are subject to extensive charge–discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.~~

~~At any voltage, a primary safety concern in battery systems is that a fault (e.g., a metal tool dropped onto a terminal) might cause a fire or an explosion. Guarded, as defined in Article 100, describes the best method to reduce this hazard.~~

~~(C) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 690.16.~~

~~Large banks of storage batteries can deliver significant amounts of short-circuit current. Current-limiting overcurrent devices should be used if necessary.~~

~~(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.~~

~~This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel cases for proper operation.~~

~~Grounded metal trays and cases or containers (as normally required by 250.110) in flooded, lead-acid battery systems operating over 48 volts, nominal, have been shown to be a contributing factor in ground faults. Nonconductive racks, trays, and cases minimize this problem.~~

~~(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, where more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.~~

~~(F) Battery Maintenance Disconnecting Means. Battery installations, where there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the photovoltaic electrical system. A non–load-break-rated switch shall be permitted to be used as the disconnecting means.~~

(G) Battery Systems of More Than 48 Volts. On photovoltaic systems where the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided that the photovoltaic array source and output circuits comply with 690.41.

~~(2) The dc and ac load circuits shall be solidly grounded.~~

~~(3) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.~~

~~(4) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.~~

Insert into Article 480, Storage Batteries

480.xx Installation.

(A) Dwellings.

(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 690.7 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in systems subject to extensive charge–discharge cycles typically require frequent maintenance, such as checking electrolyte and cleaning connections.

At any voltage, a primary safety concern in battery systems is that a fault (e.g., a metal tool dropped onto a terminal) might cause a fire or an explosion. Guarded, as defined in Article 100, describes the best method to reduce this hazard.

(B) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 690.16.

Large banks of storage batteries can deliver significant amounts of short-circuit current. Current-limiting overcurrent devices should be used if necessary.

(C) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel cases for proper operation.

Grounded metal trays and cases or containers (as normally required by 250.110) in flooded, lead-acid battery systems operating over 48 volts, nominal, have been shown to be a contributing factor in ground faults. Nonconductive racks, trays, and cases minimize this problem.

(D) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, where more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.

(E) Battery Maintenance Disconnecting Means. Battery installations, where there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the electrical system. A non–load-break-rated switch shall be permitted to be used as the disconnecting means.

(F) Battery Systems of More Than 48 Volts. On systems where the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The dc and ac load circuits shall be solidly grounded.

(2) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(3) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

Substantiation: The section on the installation of storage batteries in residences in Article 690 makes a lot of sense for systems other than photovoltaics. In writing the new proposed article for Small Wind Electric Systems, we copied this language, changing PV to Small Wind Electric. These requirements should apply to any substantial battery storage system, and thus should be moved to a general section of the code.

The problem – language duplicated in several articles, and not being applied for other situations where it is relevant – e.g. small wind, hydro, etc.

The solution – move it to Article 480, perhaps

Panel Meeting Action: Reject

Panel Statement: The proposal is incomplete as written. The panel suggests that the submitter comments on the proposal with technical data to substantiate the comment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

WILLS, R.: The committee rejected this proposal more due to lack of time than lack of substantiation. The issue of moving common language to a suitable common article should be addressed at the ROC meeting, and by the TCC. I am the author of this proposal. Communication with others on CMP4 at Hilton Head brought me to a different conclusion to that proposed here. The common sections covering storage batteries in 690, 692 and 694(new) are also relevant to other forms of energy storage including ultra-capacitors, flywheels etc.

We believe that a better solution is to create a new Article in Chapter 6 (Special Equipment) entitled “Energy Storage Systems”, and that that this be location for this common text. There are two reasons for this:

1/ Energy storage systems are now encompassing more than just storage batteries

2/ The relevant aspects of energy storage systems to PV, fuel cells and wind should stay in the same CMP as 690-694. It seemed that things were more coordinated when 690, 692 & 705 were in CMP 13 with 445 (generators) and 480 (storage batteries). I will prepare a comment that is a complete draft of a new Article, 69x, Energy Storage Systems.

(One other issue to address is that plug-in hybrid and pure electric vehicles are now interacting with the electric grid - both charging and discharging. These “mobile” energy storage systems need to be addressed).

4-248 Log #4300 NEC-P04 **Final Action: Reject**
(690.71)

Submitter: Robert H. Wills, Intergrid, LLC

Recommendation: Revise as follows:

VIII. Storage Batteries

690.71 Installation.

(A) General. Storage batteries in a solar photovoltaic system shall be installed in accordance with the provisions of Article 480. The interconnected battery cells shall be considered grounded where the photovoltaic power source is installed in accordance with 690.41.

Batteries in PV power systems are usually grounded when the PV power system is grounded in accordance with Article 690, Part VI.

~~(B) Dwellings.~~

~~(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).~~

~~Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 690.7 shall be permitted.~~

~~(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.~~

Insert into Article 480, Storage Batteries

480.xx Installation.

(A) Dwellings.

(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 690.7 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in systems subject to extensive charge–discharge cycles typically require frequent maintenance, such as checking electrolyte and cleaning connections.

At any voltage, a primary safety concern in battery systems is that a fault (e.g., a metal tool dropped onto a terminal) might cause a fire or an explosion. Guarded, as defined in Article 100, describes the best method to reduce this hazard.

(B) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 690.16.

Large banks of storage batteries can deliver significant amounts of short-circuit current. Current-limiting overcurrent devices should be used if necessary.

(C) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel cases for proper operation.

Grounded metal trays and cases or containers (as normally required by 250.110) in flooded, lead-acid battery systems operating over 48 volts, nominal, have been shown to be a contributing factor in ground faults. Nonconductive racks, trays, and cases minimize this problem.

(D) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, where more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.

(E) Battery Maintenance Disconnecting Means. Battery installations, where there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the electrical system. A non–load-break-rated switch shall be permitted to be used as the disconnecting means.

(F) Battery Systems of More Than 48 Volts. On systems where the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The dc and ac load circuits shall be solidly grounded.

(2) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(3) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

Substantiation: The section on the installation of storage batteries in residences in Article 690 makes a lot of sense for systems other than photovoltaics. In writing the new proposed article for Small Wind Electric Systems, we copied this language, changing PV to Small Wind Electric. These requirements should apply to any substantial battery storage system, and thus should be moved to a general section of the code.

The problem – language duplicated in several articles, and not being applied for other situations where it is relevant – e.g. small wind, hydro, etc.

The solution – move it to Article 480, perhaps

Panel Meeting Action: Reject

Panel Statement: The proposal is incomplete as written. The panel suggests that the submitter comments on the proposal with technical data to substantiate the comment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-249 Log #2512 NEC-P04 **Final Action: Reject**
(690.71(H))

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Add the following section H to 690.71

(H) Disconnects and Overcurrent Protection. Where battery bank input and output terminals are more than 1.5 meters (5 feet) from connected equipment, or where the circuits from these terminals pass through a wall or partition, a switched disconnecting means and overcurrent protection shall be provided at the battery end of the circuit. Fused disconnecting means or circuit breakers are acceptable. Where fused disconnecting means are used, the "Line" terminals of the disconnecting means shall be connected toward the battery terminals. Overcurrent devices or disconnecting means shall not be installed in battery enclosures where explosive atmospheres can exist.

Substantiation: Batteries represent significant sources of short-circuit current, and circuits connected to these sources must be protected with overcurrent devices. A switched disconnecting means is required to allow rapid disconnection of the batteries from the circuit under connected equipment failure and during maintenance. It is difficult to install this equipment when the cable lengths are shorter than about five feet, and this is the distance that Underwriters Laboratories (UL) generally allows for unprotected cable lengths when testing PV power centers. Any penetration of a wall or partition necessitates the installation of a disconnecting means and overcurrent protection at the battery end of the circuit to protect the circuit as it passes through the wall and to allow the battery to be disconnected at the source.

Panel Meeting Action: Reject

Panel Statement: The submitter's proposed new section and requirements are addressed in other sections of the code. See 240.21(H) and Section 480.5. The 5 ft rule is not substantiated as a UL requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-250 Log #2513 NEC-P04 **Final Action: Accept in Principle**
(690.72(C))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal and comply with the NEC Style Manual 3.1 regarding the use of the wording "must be met" and use mandatory language.

This action will be considered by the panel as a public comment.

Submitter: John Wiles, Southwest Technology Development Inst/New Mexico State Univ. / Rep. PV Industry Forum

Recommendation: Add the new section as follows:

690.72(C) Buck/Boost DC Converters. Buck/boost charge controllers and other dc power converters that increase or decrease the output current or output voltage with respect to the input current or input voltage shall be installed in compliance with (1) and (2).

(1) The ampacity of the conductors in output circuits shall be based on the maximum rated continuous, output current of the charge controller or converter for the selected output voltage range.

(2) The voltage rating of the output circuits shall be based on the maximum voltage output of the charge controller or converter for the selected output voltage range.

Substantiation: Many new charge controllers and other power converters (aka linear current boosters) are of the buck/boost type that can accept high input voltages at low current and deliver lower output voltages at considerably higher currents to a load. For example: A PV array producing 150 volts at 12 amps would be processed through the charge controller to 24 volts at 60 amps for battery charging. These controllers usually have several different nominal output operating voltage ranges that are selected by the installer to match the nominal battery voltage. Nominal voltages such as 12, 24, and 48 are common, and the maximum output current may vary with each voltage range. The proposal requires that these variations in output voltage and current be addressed when determining the rating of over current protective devices and the ampacity of conductors in the output circuits.

Panel Meeting Action: Accept in Principle

Revise the wording as follows:

690.72(C) Buck/Boost DC Converters. When buck/boost charge controllers and other dc power converters that increase or decrease the output current or output voltage with respect to the input current or input voltage are installed, the following requirements must be met:

(1) The ampacity of the conductors in output circuits shall be based on the maximum rated continuous, output current of the charge controller or converter for the selected output voltage range.

(2) The voltage rating of the output circuits shall be based on the maximum voltage output of the charge controller or converter for the selected output voltage range.

Panel Statement: The panel revised the language to clarify that installation of buck-boost converters is not mandatory, however, when installed the requirements must be met.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ROGERS, J.: I vote in favor of this proposal, however, it is my opinion that the language that the submitter proposed is more suitable for this requirement than the language presented by the Panel. It is my recommendation that the submitter submit a comment on this during the comment period.

4-251 Log #2872 NEC-P04 **Final Action: Reject**
(690.74)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 1-149.

This action will be considered by the panel as a public comment.

Submitter: James M. Imlah, City of Hillsboro

Recommendation: Revise text to read as follows:

690.74 Battery Interconnections.

Flexible cables, as identified in Article 400, in sizes 2/0 AWG and larger shall be permitted within the battery enclosure from battery terminals to a nearby junction box where they shall be connected to an approved wiring method. Flexible battery cables shall also be permitted between batteries and cells within the battery enclosure. Such cables shall be listed for hard-service use and identified as moisture resistant.

Flexible, fine-stranded cables shall ~~only~~ be ~~used with terminals, lugs, devices, and connectors that are listed and marked for such use.~~ terminated as per 110.14(A)(1).

Substantiation: Relocate this text to 110.14 (A) (1) so this requirement can be applied to all installations where fine-stranded This was a new item that was added in article 690.31 (F) in the 2008 NEC. The issue is that fine-stranded conductors and jacketed cables are being installed for other installation types where a wide range of flexibility is desired. With the expanded use of fine-stranded cables and conductors being used for welders, cranes, elevators, battery bank connections, computer data cables, UPS cables and many other installations, this requirements needs to be relocated to requirements for electrical installations. As this rule is applied currently within the NEC, only specific applications can require terminations to use devices and equipment rated for these conductor types. This relocated requirement will provide a procedure for identified lugs and terminations providing a safer installation without possible hot spots or cable overheating due to bad or loose lug connections when terminated with acceptable identified crimping tools. Conductors and fine-stranded jacketed cables are installed, not just for solar or battery connections.

Panel Meeting Action: Reject

Panel Statement: The required text does not currently exist in Section 110.14.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 692 — FUEL CELL SYSTEMS

4-252 Log #3663 NEC-P04 **Final Action: Reject**
(692.4(C))

Submitter: Keith W. Brand, Baton Rouge Area Electrical JATC

Recommendation: Add the following new text:

692.4(C) System Installation. Fuel Cell Systems shall be installed by qualified persons with documented training and experience in the installation of and NEC requirements applicable to such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation. Records of qualified persons must be furnished upon request to the local authority having jurisdiction.

Substantiation: Electrical power sources that operate in parallel to utility power sources, or operate alone, provide the same voltage thresholds that were previously determined to be within a cautious working environment. It follows that training and qualifications should be required before work is allowed on such systems. To prevent the unsafe conditions that have been exposed in the Photovoltaics industry and to be consistent within the area of parallel energy sources, the above proposed added text does provide a method to ensure increased adherence to the National Electrical Code. The Code Making Panel has the opportunity to help prevent unsafe conditions by being proactive within this emerging industry.

Additionally, The inclusion of the wording "qualified persons" does have precedence in the NEC.

See: 685.1 Scope.

This article covers integrated electrical systems, other than unit equipment, in which orderly shutdown is necessary to ensure safe operation. An integrated electrical system as used in this article is a unitized segment of an industrial wiring system where all of the following conditions are met:

(1) An orderly shutdown is required to minimize personnel hazard and electrical damage.

(2) The conditions of maintenance and supervision ensure that qualified persons service the system. **The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation.**

A person designated as a qualified person shall possess the skills and knowledge related to the construction and operation of the electrical equipment and installation and shall have received documented safety training on the hazards involved. **Documentation of their qualifications shall be on file with the office of the establishment in charge of the completed installation.**

(3) Effective safeguards acceptable to the authority having jurisdiction are established and maintained.

Also:

215.2(B)(3) Supervised Installations. For supervised installations, feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where all of the following conditions are met:

(1) Conditions of design and installation are provided under engineering supervision.

(2) **Qualified persons with documented training and experience** in over 600-volt systems provide maintenance, monitoring, and servicing of the system. 215.2

Panel Meeting Action: Reject

Panel Statement: The panel supports installation of these systems by qualified persons. However, the NEC cannot contain requirements relative to the qualifications of installers for any electrical system, these requirements need to be handled by local or state qualification committees or licensing boards. See Annex H of the NEC for recommendations on establishing such bodies.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

STAFFORD, T.: This Panel Member has determined that extensive training is required for emerging technologies. A large percentage of installers have no electrical background and/or training and there is no license requirement in place to mandate this requirement. The panel statement "The NEC cannot contain requirements relative to the qualifications of the installers for any electrical system, these requirements need to be handled by local state qualification committees or licensing boards" is ineffective for the following reasons.

First, the NEC does contain requirements for qualifications of installers and maintaining documentation thereof, see Article 685 and Article 215.2B)(3) and substantiation provided in the original proposal by submitter. Article 685 describes industrial wiring system and details the importance of necessary training for the personnel involved. The same concerns are present for parallel energy sources. Specifically, an orderly shutdown of the system is required upon certain conditions, service of equipment requires someone knowledgeable in the functions and electrical characteristic thereof, and effective safeguards should be in place acceptable to the AHJ. The original proposal attempts to provide the safeguards that are critically needed by a growing industry. The panel may decide that article 685 is not relevant when determining if like requirements should be in place for article 690, but the panel cannot claim the affects are as critical to personnel and equipment.

Second, local license boards are not addressing the issue at a pace to insure safety for the consumer/users of parallel energy sources and for the personnel involved.

TOOMER, R.: See Proposal 4-186.

Comment on Affirmative:

ROGERS, J.: I agree with the panel action on this proposal, however, the submitter is correct in his concern relative to requiring "qualified persons" to install these systems. This is extremely important for these systems to assure the safety or persons and property where these systems are utilized. Unfortunately the NEC is an installation document and not a qualification document. Any areas of the country that utilize any type of electrical licensing laws should be sure that their laws extend to these installations. Any areas of the country that do not have electrical licensing laws should refer to Annex H of the NEC and consider adopting it as a guide for qualified personnel performing electrical installations.

4-253 Log #3664 NEC-P04 **Final Action: Reject**
(692.4(C) (New))

Submitter: Keith W. Brand, Baton Rouge Area Electrical JATC
Recommendation: Add the following new text:
69X.4(C) Equipment Installation. Equipment shall be installed by qualified persons with documented training and experience in the installation of and NEC requirements applicable to such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation. (3) Effective safeguards acceptable to the authority having jurisdiction are established and maintained.
Also:
215.2(B)(3) Supervised Installations. For supervised installations, feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where all of the following conditions are met:
(1) Conditions of design and installation are provided under engineering supervision.
(2) **Qualified persons with documented training and experience** in over 600-volt systems provide maintenance, monitoring, and servicing of the system. 215.2
Panel Meeting Action: Reject
Panel Statement: The panel supports installation of these systems by qualified persons. However, the NEC cannot contain requirements relative to the qualifications of installers for any electrical system. These requirements need to be handled by local or state qualification committees or licensing boards. See Annex H of the NEC for recommendations on establishing such bodies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
STAFFORD, T.: This Panel Member has determined that extensive training is required for emerging technologies. As another emerging technology provides renewable resources, wind power will be another exponentially growing resource for electric power generation. As there are no provisions outlined in the electrical safety standards, this is an opportunity to ensure safe, reliable growth of an emerging technology and prevent the failures of the past related to other parallel energy sources. A large percentage of installers have no electrical background and/or training and there is no license requirement in place to mandate this requirement. The panel statement “The NEC cannot contain requirements relative to the qualifications of the installers for any electrical system, these requirements need to be handled by local state qualification committees or licensing boards” is ineffective for the following reasons.
First, the NEC does contain requirements for qualifications of installers and maintaining documentation thereof, see Article 685 and Article 215.2B)(3) and substantiation provided in the original proposal by submitter. Article 685 describes industrial wiring system and details the importance of necessary training for the personnel involved. The same concerns are present for parallel energy sources. Specifically, an orderly shutdown of the system is required upon certain conditions, service of equipment requires someone knowledgeable in the functions and electrical characteristic thereof, and effective safeguards should be in place acceptable to the AHJ. The original proposal attempts to provide the safeguards that are critically needed by a growing industry. The panel may decide that article 685 is not relevant when determining if like requirements should be in place for article 690, but the panel cannot claim the affects are as critical to personnel and equipment.
Second, local license boards are not addressing the issue at a pace to insure safety for the consumer/users of parallel energy sources and for the personnel involved.
TOOMER, R.: See Proposal 4-186.
Comment on Affirmative:
ROGERS, J.: I agree with the panel action on this proposal, however, the submitter is correct in his concern relative to requiring “qualified persons” to install these systems. This is extremely important for these systems to assure the safety or persons and property where these systems are utilized. Unfortunately the NEC is an installation document and not a qualification document. Any areas of the country that utilize any type of electrical licensing laws should be sure that their laws extend to these installations. Any areas of the country that do not have electrical licensing laws should refer to Annex H of the NEC and consider adopting it as a guide for qualified personnel performing electrical installations.

4-254 Log #4673 NEC-P04 **Final Action: Accept**
(692.14)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this section.
Substantiation: This is a very strange requirement because none of these rules have anything to do with fuel cells in particular. If a fuel cell system is in a building fed with a feeder, it will be an additional power source at that location, the rules in Chap. 2 will apply to it because nothing in Art. 692 amends those rules. After reviewing the substantiation when this article went into the NEC, it appears that the panel was trying to make sure not that the remote building was protected from the fuel cell source, but rather that the fuel cell source could be disconnected from the building. However, the present wording in 692.13 does the whole job, and much more simply.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-255 Log #4674 NEC-P04 **Final Action: Reject**
(692.59)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Rewrite the final sentence to read as follows: “Transfer switches with one side connected to a service conductors shall be listed as being suitable for use as service equipment.”
Substantiation: If the fuel cell is used in a noninteractive system that also has a service connection as a backup supply, the fuel cell system is to be connected to the premises system through one side of a transfer switch that keeps the two supply sources separated. This simply requires what 702.6 already requires anyway. However, the last sentence is apparently incorrect because it requires that “when” (condition of time) the transfer switch is connected on the utility side, the switch must comply with a part of Art. 230 that is about the manufactured characteristics of service equipment, specifically, its energized parts must be enclosed or guarded, and the equipment is to have been marked by the manufacturer to identify it as suitable for use as service equipment. These are not conditions of time. The only practical way to address this for now is to make certain that the transfer switch has been listed as “suitable for use as service equipment.”
Panel Meeting Action: Reject
Panel Statement: The requirements are covered in Article 230 and 702.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-256 Log #4675 NEC-P04 **Final Action: Accept**
(692.60)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change “listed and identified” to “listed and marked.”
Substantiation: The definition of “identified” in Article 100 does not mean marked, and this section pretty clearly expects this equipment to be marked so interested parties know what they are dealing with. Identified means recognizable as suitable, and since the requirement is for a listing, that will necessitate the use of equipment that meets the lesser standard of being identified.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-257 Log #4733 NEC-P04 **Final Action: Accept**

(692.65)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:

692.65 Utility-Interactive Point of Connection. The output of a utility-interactive inverter shall be connected as specified in ~~692.65 (A) or (B)~~ <u>705.12(A) or (D).</u>

~~**(A) Supply Side.** The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).~~

~~**(B) Load Side**. The output of a utility interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Where distribution equipment, including switchboards and panelboards, is fed simultaneously by a primary source(s) of electricity and one or more utility interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeder, or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (B)(1) through (B)(7).~~

~~**(1) Dedicated Overcurrent and Disconnect.** Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.~~

~~**(2) Bus or Conductor Rating**. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor. In systems with panelboards connected in series, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors.~~

~~(3) **Ground-Fault Protection**. The interconnection point shall be on the line side of all ground-fault protection equipment.~~

~~*Exception:* Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground fault current sources. Ground fault protection devices used with supplies connected to the load side terminals shall be identified and listed as suitable for backfeeding.~~

~~**(4) Marking**. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.~~

~~**(5) Suitable for Backfeed.** Circuit breakers, if backfed, shall be suitable for such operation.~~

~~FPN: Circuit breakers that are marked "Line" and "Load" have been evaluated only in the direction marked. Circuit breakers without "Line" and "Load" have been evaluated in both directions.~~

~~**(6) Fastening.** Listed plug-in-type circuit breakers backfed from utility-interactive-inverters complying with 690.60 shall be permitted to omit the additional fastener normally required by 408.36(D) for such applications.~~

~~**(7) Inverter Output Connection.** Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices ;supplying it, a connection in a panel-board shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall be sized for the loads connected in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent marking:~~

~~WARNING~~
~~INVERTER OUTPUT CONNECTION~~
~~DO NOT RELOCATE~~
~~THIS OVERCURRENT DEVICE~~

Substantiation: Fuel Cell systems operating in parallel with another electric supply to a premise electrical system are considered Interconnected Electric Power Production Systems and fall within the scope of Article 705. The point of connection requirements in 692.65 duplicate the text Section 705.12. Repeating the requirements, to interconnect a fuel cell utility-interactive inverter in Article 692 is redundant. The requirements in Section 692.65 are not specific to fuel cell installations. Many types of interconnected electric production systems use utility-interactive inverters, such as wind, solar, fuel cells, and micro-turbines, to mention a few. Section 705.12(A) and (D) provides uniform interconnection requirements for this inverter technology, regardless of the primary energy source. The requirements in Section 692.65 duplicate the text in 705.12 as listed below:

- 692.65 (A) is duplicated text from 705.12(A)
- 692.65(B), B(1) through B(7) is duplicated by 705.12(D), (D)(1) through (D)(7)

This proposal removes the duplicated text in Article 692 and references Article 705 sections that state the utility-interactive inverter point of connection requirements.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 4-260.

Ballot Results: Affirmative: 12

4-261 Log #1412 NEC-P04 **Final Action: Reject**
(692.65(B)(5) and Exception)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text as follows:

Circuit breakers, if backfed, shall be ~~suitable~~ <u>identified</u> for such operation

FPN: Circuit breakers that are marked "Line" and "Load" have been evaluated only for such connections <u>and shall only be so connected</u>. Circuit breakers without such markings have been evaluated <u>for backfeed connections</u> ~~in both directions~~ <u>and shall be permitted to be so connected.</u>

Substantiation: Edit. "Suitable" is a term to be avoided per the Style Manual. Proposal is more specific than "in both directions".

Panel Meeting Action: Reject

Panel Statement: The circuit breakers are not "identified". The FPN is written in the form of a requirement. An FPN is not a requirement. The submitter has not presented sufficient technical data to support the change stated in the proposal. The proposal attempts to place mandatory requirements into a fine print note. The proposal does not meet the requirements of 4.3.3(b) of the Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 694 — SMALL WIND ELECTRIC SYSTEMS

4-262 Log #3818 NEC-P04 **Final Action: Accept in Principle**
(694 (New))

Submitter: Thomas J. Baker, Puget Sound Electrical Training

Recommendation: Add new text to read as follows:

Create new article <u>694 WIND TURBINES</u>

<u>Wind driven generator equipment. This equipment includes alternators or generators that produce electrical current through the conversion of wind energy into electrical energy. Wind driven generation equipment must demonstrate conformance to applicable safety standards.</u>

<u>Installation</u>

<u>(1) A wind driven generator system design review must be submitted at the time of the inspection request. permit holders must submit a copy of the wind driven generator equipment manufacturer's installation information and a legible one-line diagram of the wind driven generator design and calculations used to determine voltage and current within the generation system to the electrical inspector. This diagram must show the wind driven generator equipment, devices, overcurrent protection, conductor sizing, grounding, ground fault protection if required, and any system interconnection points.</u>

<u>(2) For utility interactive systems, any person making interconnections between the generator system and the utility distribution network must consult the serving utility and is required to meet all additional utility standards.</u>

<u>(3) All wind driven generator equipment and disconnecting means must be permanently identified as to their purpose, maximum voltages and type of current within the system with an identification plate.</u>

Substantiation: There are no rules in the NEC for Wind turbines. This proposal would create a new article to address scope, circuit requirements, disconnecting means, wiring methods, grounding, marking and other requirements for users to safely install this equipment.

The proposed rules are taken from the Washington State Electrical Rules that are to be adopted late in 2008.

While most wind turbines are installed by electric utilities and are not under the scope of the NEC, there are some installations done under the scope of the NEC. In Washington State, there have been several of the small wind turbines installed, creating difficulties for electrical approval, as there are no product standards or NEC rules.

Several companies market wind turbines that are targeted toward the residential market. The American Wind Turbine Association (AWEA) designation is small wind, defined as 100 Kw and below.

The payback for a small wind turbine can be better that a photovoltaic system, as it can operate more hours per day. According to the AWEA, A 3 kW, 15 ft rotor, on a 23 ft tower can produce about 5,000 kWh/yr, if wind conditions allow.

There is a significant market for wind turbines. The Mayor of San Francisco announced in July 2008 that the city would "expedite permitting and minimize costs for the installation of residential, commercial and municipal wind generation in the city".

The U.S. Department of Energy, in its 2007 edition of the annual report on U.S. wind power installation, noted that wind power capacity increased 46%.

It is expected that the new article would be created with input from stakeholders, manufacturers and trade associations.

Panel Meeting Action: Accept in Principle

See Panel Action on Proposal 4-263.

Panel Statement: This proposal is addressed in general by panel action on Proposal 4-263 which, as the proposer suggests, should "create a new article to address scope, circuit requirements, disconnecting means, wiring methods, grounding, marking, and other requirements for users to safely install this equipment."

The proposed text "Wind driven generation equipment must demonstrate conformance to applicable safety standards" is addressed in part by the panel action on Proposal 4-263, in 690.4(B) "Inverters used in small wind electric systems shall be identified and either listed or recognized for the application". A general requirement for all equipment to be listed or recognized would create a problem for this new industry as applicable safety standards are currently under development, and not yet published. The panel will revisit this issue in the future.

Section (1) and (2) of the proposal (referenced from Washington State Electrical Rules) regarding details of a design review by the AHJ and additional utility requirements are not directly related to the installation of electrical conductors, equipment, and raceways, and so fall outside the scope of the NEC. See also NEC Annex H, Administration and Enforcement.

Section (3) of the proposal has been addressed by the panel action on Proposal 4-263 in Article 694, Part VI, Marking.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-263 Log #4499 NEC-P04 **Final Action: Accept in Principle**
(694 (New))

TCC Action: The Technical Correlating Committee directs that the panel reconsider the proposal relative to technical inconsistencies and NEC Style Manual issues.

The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee directs that the new Article Scope be modified to read as follows:

"694.1 Scope. The provisions of this article apply to small wind (turbine) electric systems that consisting of one or more wind electric generators with individual systems up to and including 100 kW. These systems can include generators, alternators, inverters, and controllers.

FPN: See FPN Figure 694.1 No. 1 and FPN Figure 694.1 No. 2

FPN: These systems can be interactive with other electrical power production sources or may be stand-alone systems. These systems can have ac or dc output, with or without electrical energy storage, such as batteries.

FPN Figure 694.1 No. 1 Identification of Small Wind Electric System Components – Interactive System.

FPN Figure 694.1 No. 2 Identification of Small Wind Electric System Components – Stand-Alone System."

This action shall be considered by the panel as a public comment.

Submitter: Robert H. Wills, Intergrid, LLC

Recommendation: Add new text as follows:

Note: this is a proposed new article. All text is new. For clarity, the text is not underscored.

Notes in square brackets [...] are informational and not intended to be part of the final article.

ARTICLE 69x Small Wind Electric Systems

I. General

69X.1 Scope

The provisions of this article apply to small wind electric systems (also known as small wind turbine systems), including generators, alternators, inverter(s), and controller(s) for such systems. [See Figures 69X.1(A) and 69X.1(B).]

This article applies to small wind electric systems consisting of one or more wind electric generators with individual systems up to and including 100KW rated power output.

Systems covered by this article may be interactive with other electrical power production sources or stand-alone, with or without electrical energy storage such as batteries. These systems may have ac or dc output for utilization.

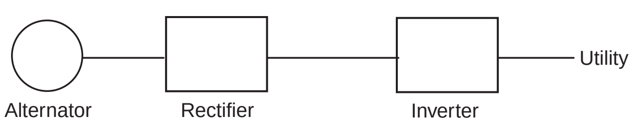

Figure 69x.1(A) Identification of Small Wind Electric System Components – Interactive System.

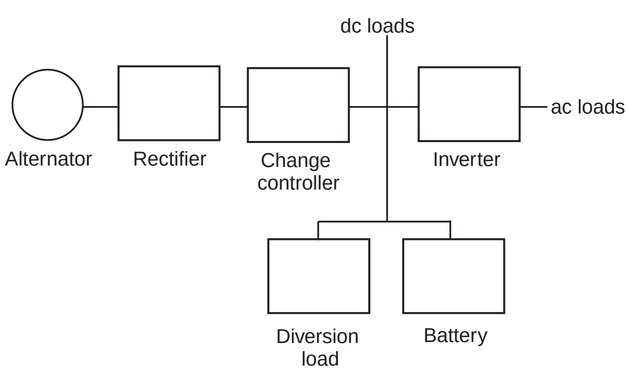

Figure 69x.1(B) Identification of Small Wind Electric System Components – Stand-Alone System.

69x.2 Definitions

Wind Turbine. A mechanical device that converts wind energy to electrical energy.

Wind Turbine System. A small wind electric generating system.

Tower. A pole or other structure that supports a wind turbine.

Guy. A cable that mechanically supports a wind turbine tower.

Nacelle. An enclosure housing the alternator and other parts of a wind turbine.

Rated Power: The wind turbine's power output at 11.0 m/s (24.6 mph) when measured in accordance with IEC 61400-12-1, *Power Performance Measurements of Electricity Producing Wind Turbines.*

Maximum Output Power . The maximum one-minute average power output a wind turbine will produce in normal steady-state operation (peak instantaneous power output can be higher).

Maximum Voltage . The maximum voltage the wind turbine will produce in operation including open circuit conditions.

Wind Turbine Output Circuit. Circuit conductors between the internal components of a small wind turbine (which may include an alternator, integrated rectifier, controller and/or inverter), and other equipment.

Inverter Output Circuit. Conductors between the inverter and an ac panelboard for stand-alone systems or the conductors between the and inverter and service equipment or another electric power production source, such as a utility, for an electrical production and distribution network.

Charge Controller. Equipment that controls dc voltage or dc current, or both, used to charge a battery.

Diversion Charge Controller. Equipment that regulates the charging process of a battery by diverting power from energy storage to direct-current or alternating-current loads or to an interconnected utility service.

Diversion Load Controller. Equipment that regulates the output of a wind generator by diverting power from the generator to direct-current or alternating-current loads or to an interconnected utility service.

Diversion Load. A load connected to a diversion charge controller or diversion load controller. Also known as a Dump Load.

FPN: See also definitions for Interconnected Systems in Article 705 [or Article 100 if they are moved there].

[Note: Other definitions from Article 69x may need to be included, but hopefully common language will be moved to Article 705 or Article 100].

69x.3 Other Articles

Wherever the requirements of other articles of this Code and Article 69x differ, the requirements of Article 69x shall apply and, if the system is operated in parallel with a primary source(s) of electricity, the requirements in 705 shall apply.

Exception: Small wind electric systems, equipment, or wiring installed in a hazardous (classified) location shall also comply with the applicable portions of Articles 500 through 516.

69x.4 Installation

(A) Small Wind Electric System. A small wind electric system shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).

(B) Equipment. Inverters or motor generators intended for use in small wind electric systems shall be identified and either listed or recognized for the application.

[Note: Justification for other than the PV listing requirements – the industry group developing this article plans to include requirements that all electrical components in small wind electric systems be listed or recognized in a future edition of the NEC, but currently there are no UL standards for listing wind turbines, although a standard is planned. This language ensures safety for parallel operation with the grid, while giving the industry time to develop standards and to test equipment to these standards].

(C) Diversion Load Controllers. A small wind electric system employing a diversion load controller as the sole means of regulating the speed of a wind turbine rotor shall be equipped with two reliable independent means to prevent over-speed operation. An interconnected utility service shall not be considered to be a reliable diversion load.

(D) Surge Protective Devices. A surge protective device shall be installed between a small wind electric system and any loads served by the premises electrical system. The surge protective device is permitted to be a Type 3 device located on a dedicated branch circuit serving a small wind electric system, or a Type 2 device anywhere on the load side of the service disconnect. Surge protective devices shall be installed in accordance with Article 285.

(E) Receptacles. A receptacle is permitted to be attached to a small wind electric system branch or feeder circuit for maintenance or data acquisition use. Receptacles shall be protected with an overcurrent device that is rated at no greater than the current rating of the receptacle.

II. Circuit Requirements

69x.7 Maximum Voltage.

(A) Turbine Output Circuits. For wind turbines connected to one- and two-family dwellings, turbine output circuits shall be permitted to have a maximum voltage up to 600 volts. Other installations with a maximum voltage over 600 volts shall comply with Article 69x, Part IX.

(B) Direct-Current Utilization Circuits. The voltage of dc utilization circuits shall conform to 210.6.

(C) Circuits over 150 Volts to Ground. In one- and two-family dwellings, live parts in circuits over 150 volts to ground shall not be accessible to other than qualified persons while energized.

FPN: See 110.27 for guarding of live parts, and 210.6 for voltage to ground and between conductors.

69x.8 Circuit Sizing and Current.

(A) Calculation of Maximum Circuit Current. The maximum current for the specific circuit shall be calculated in accordance with 69x.8(A)(1) through (A)(3).

(1) Turbine Output Circuit Currents. The maximum current shall be the circuit current when the wind turbine is operating at Maximum Output Power.

(2) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.

(3) Stand-Alone Inverter Input Circuit Current. The maximum current shall be the stand-alone continuous inverter input current rating when the inverter is producing rated power at the lowest input voltage.

(B) Ampacity and Overcurrent Device Ratings. Small wind electric system currents shall be considered to be continuous.

(1) Sizing of Conductors and Overcurrent Devices. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 69x.8(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and (C).

Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

69x.9 Overcurrent Protection.

(A) Circuits and Equipment. Turbine output circuits, inverter output circuits, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.

Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 69x.8(B) and located where one of the following apply:

(a) There are no external sources such as batteries or backfeed from inverters.

(b) The maximum currents from all sources do not exceed the ampacity of the conductors.

FPN: Possible backfeed of current from any source of supply, including a supply through an inverter into the alternator output circuit, is a consideration in determining whether adequate overcurrent protection from all sources is provided for conductors and modules. Some small wind electric systems rely on the turbine output circuit to regulate turbine speed. In systems of this type, manufacturers instructions should be followed.

(B) Power Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer with a current rating on the side connected toward the small wind electric power source, not less than the short-circuit output current rating of the inverter, shall be permitted without overcurrent protection from that source.

(C) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a small wind electric system shall be listed for use in dc circuits and shall have the appropriate voltage, current, and interrupting ratings.

[Note: The following common language to 69x, 692 and 69x should move to a common Article – perhaps a new one near 705, but focused on stand-alone rather than interconnected systems.

A separate proposal has been submitted to this effect. If this proposal is accepted, 69x.10 could be deleted]

69x.10 Stand-Alone Systems.

The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this Code except as modified by 69x.10(A) through (D).

(A) Inverter Output. The ac output from a stand-alone inverter(s) shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of an alternate energy source shall be equal to or greater than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.

(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(C) Single 120-Volt Supply. The inverter output of a stand-alone small wind electric system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING

SINGLE 120-VOLT SUPPLY. DO NOT CONNECT
MULTIWIRE BRANCH CIRCUITS!

(D) Energy Storage or Backup Power System Requirements. Energy storage or backup power supplies are not required.

==

III. Disconnecting Means

69X.13 All Conductors.

Means shall be provided to disconnect all current-carrying conductors of a small wind electric power source from all other conductors in a building or other structure. A switch, circuit breaker, or other device, either ac or dc, shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.

Exception: A wind turbine that uses the turbine output circuit for regulating turbine speed does not require a turbine output circuit disconnecting means.

69X.14 Additional Provisions.

Disconnecting means shall comply with 69X.14(A) through (D).

(A) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment and shall comply with the following:

The disconnecting means for ungrounded conductors shall consist of a manually operable switch(es) or circuit breaker(s) complying with all of the following requirements:

(1) Located where readily accessible

(2) Externally operable without exposing the operator to contact with live parts

(3) Plainly indicating whether in the open or closed position

(4) Having an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment

Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and have the following words or equivalent:

WARNING

ELECTRIC SHOCK HAZARD. DO NOT TOUCH TERMINALS.
TERMINALS ON BOTH THE LINE AND LOAD SIDES MAY BE
ENERGIZED
IN THE OPEN POSITION.

(B) Equipment. Equipment such as rectifiers, controllers, output circuit isolating and shorting switches and overcurrent devices shall be permitted on the wind turbine side of the disconnecting means.

(C) Requirements for Disconnecting Means

(1) Location. The small wind electric system disconnecting means shall be installed at a readily accessible location either on or adjacent to the turbine tower, on the outside of a building or structure or inside nearest the point of entrance of the system conductors.

Exception: Installations that comply with 69X.31(E) shall be permitted to have the disconnecting means located remotely from the point of entry of the system conductors.

The disconnecting means shall not be installed in bathrooms.

(2) Marking. Each turbine disconnecting means shall be permanently marked to identify it as a small wind electric system disconnect. A plaque shall be installed in accordance with 705.10.

(3) Suitable for Use. Each turbine system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.

(4) Maximum Number of Disconnects. The turbine disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.

(5) Grouping. The turbine disconnecting means shall be grouped with other disconnecting means for the system to comply with 69X.14(C)(4). A turbine disconnecting means shall not be required at the nacelle or tower location.

(D) Equipment Mounted in Not-Readily-Accessible Locations. Rectifiers, controllers, and inverters shall be permitted to be mounted in nacelles or other exterior areas that are not readily accessible.

69X.15 Disconnection of Small Wind Electric System Equipment.

Means shall be provided to disconnect equipment, such as inverters, batteries, charge controllers, and the like, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified. A single disconnecting means in accordance with 69X.17 shall be permitted for the combined ac output of one or more inverters in an interactive system.

Exception: Equipment housed in a turbine nacelle is not required to have a disconnecting means.

69X.16 Fuses.

Means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than qualified persons. Switches, pullouts, or similar devices that have suitable ratings may serve as means to disconnect fuses from all sources of supply. A shorting plug shall be permitted to be used as an alternative to a disconnect in systems that regulate turbine speed using the turbine output circuit.

69X.18 Installation and Service of a Wind Turbine.

Open circuiting, short circuiting, or mechanical brakes shall be used to disable a turbine for installation and service.

FPN: Some wind turbines rely on the connection from the alternator to a remote controller for speed regulation. Opening turbine output circuit conductors may cause mechanical damage to a turbine and create excessive voltages that could damage equipment or expose persons to electric shock.

69X.20 Disconnection of Wind Turbine Alternators.

IV. Wiring Methods

69x.31 Methods Permitted

(A) Wiring Systems. All raceway and cable wiring methods included in this *Code* and other wiring systems and fittings specifically intended for use on wind turbines shall be permitted. Where turbine output circuits operating at maximum voltages greater than 30 volts are installed in readily accessible locations, circuit conductors shall be installed in raceway.

(B) Flexible Cords and Cables. Flexible cords and cables, where used to connect the moving parts of turbines, shall comply with Article 400 and shall be of a type identified as a hard service cord or portable power cable; they shall be suitable for extra-hard usage, listed for outdoor use, and water resistant. Cables exposed to sunlight shall be sunlight resistant.

V. Grounding

69X.43 Equipment Grounding.

(A) General. Exposed non–current-carrying metal parts of towers, turbine nacelles, other equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A) regardless of voltage. Attached metal parts such as turbine blades and tails that have no source of electrical energization are not required to be grounded.

(B) Guy Wires. Guy wires used to support turbine towers shall not be required to be grounded.

[FPN] Guy wires supporting towers that are adequately grounded are not likely to become energized and so are not subject to the requirements of 250.110. Grounding of metallic guy wires may be required by lighting codes.

(C) Tower Grounding.

(1) Auxiliary Electrode(s). A wind turbine tower shall be grounded with auxiliary electrode(s) to limit voltages imposed by lightning. Auxiliary electrodes are permitted to be installed in accordance with 250.54. Electrodes that are part of the tower foundation and that meet the requirements for concrete encased electrodes (250.52(A)(3)) are acceptable. A grounded metal tower support is acceptable if it meets the requirements of 250.136(A).

(2) Equipment Grounding Conductor. An equipment grounding conductor shall be required between a turbine and the system grounded conductor in accordance with 250.110.

(3) Tower Grounding Connections. The equipment grounding conductor, and grounding electrode conductors (if used), shall be shall be connected to a metallic tower by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Devices such as connectors and lugs shall be suitable for the material of the conductor and the structure to which they connect. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action and corrosion. All mechanical elements used to terminate these conductors shall be accessible.

(4) Lightning Protection Systems. Auxiliary electrodes and grounding electrode conductors shall be permitted to act as lightning protection system components if they meet the requirements of NFPA 780. If separate, the tower lightning protection system grounding electrodes shall be bonded to the tower auxiliary grounding electrode system. Guy lightning protection system ground electrodes shall not be required to be bonded to the tower auxiliary grounding electrode system.

FPN: See NFPA 780-2008, *Standard for the Installation of Lightning Protection Systems, Annex N, Wind Turbine Generator Systems*, for information on lightning protection of wind turbines.

VI. Marking

69x.54 Interactive System Point of Interconnection.

All interactive system(s) points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source and with the rated ac output current and the nominal operating ac voltage.

69x.55 Power Systems Employing Energy Storage.

Small wind electric systems employing energy storage shall be marked with the maximum operating voltage, including any equalization voltage and the polarity of the grounded circuit conductor.

69x.56 Identification of Power Sources.

(A) Facilities with Stand-Alone Systems. Any structure or building with a power system that is not connected to a utility service source and is a stand-alone system shall have a permanent plaque or directory installed on the exterior of the building or structure at a readily visible location. The plaque or directory shall indicate the location of system disconnecting means and that the structure contains a stand-alone electrical power system.

(B) Facilities with Utility Services and Small Wind Electric Systems. Buildings or structures with both utility service and a small wind electric system shall have a permanent plaque or directory providing the location of the service disconnecting means and the small wind electric system disconnecting means if not located at the same location.

VII. Connection to Other Sources

[This section should be coordinated with similar language in 69x and 692 that indicates that the requirements of Article 705 apply.]

69x.60 Identified Interactive Equipment. Only inverters listed or recognized, and identified as interactive shall be permitted in interactive systems.

69x.62 Installation. Small wind electric systems, when connected to other electric sources, shall comply with the requirements of article 705.

69x.62 Ampacity of Neutral Conductor.

If a single-phase, 2-wire inverter output is connected to the neutral conductor and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum load connected between the neutral conductor and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

A conductor used solely for instrumentation, voltage detection, or phase detection, and connected to a single-phase or 3-phase utility-interactive inverter, shall be permitted to be sized at less than the ampacity of the other current-carrying conductors and shall be sized equal to or larger than the equipment grounding conductor.

69x.63 Operating Voltage Range. Systems operating on dedicated branch or feeder circuits may exceed normal voltage operating ranges provided that the voltage at any general distribution equipment remains within these ranges.

[Justification - This provision is added in recognition that wind turbines may use the electric grid to dump energy from short-term wind gusts. This may result in the voltage at the turbine exceeding the limits set out in ANSI C84.1-2006, Voltage Ratings for Electric Power Systems and Equipment (60 Hz), however the voltage at the distribution equipment must stay within the C84.1 range.].

69x.64 Point of Connection.

[Note – this section may be deleted if Article 705 has equivalent language]

The output of a utility-interactive inverter shall be connected as specified in 69x.64(A) or (B).

(A) Supply Side. The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(B) Load Side. The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Where distribution equipment, including switchboards and panelboards, is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders, or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (B)(1) through (B)(7).

(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) Bus or Conductor Rating. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor. In systems with panelboards connected in series, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors.

(3) Ground-Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

(4) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.

(5) Suitable for Backfeed. Circuit breakers, if backfed, shall be suitable for such operation.

FPN: Circuit breakers that are marked “Line” and “Load” have been evaluated only in the direction marked. Circuit breakers without “Line” and “Load” have been evaluated in both directions.

(6) Fastening. Listed plug-in-type circuit breakers backfed from utility-interactive inverters complying with 69x.60 shall be permitted to omit the additional fastener normally required by 408.36(D) for such applications.

(7) Inverter Output Connection. Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall be sized for the loads connected in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent marking:

WARNING

INVERTER OUTPUT CONNECTION

DO NOT RELOCATE THIS OVERCURRENT DEVICE

VIII. Storage Batteries

[This common language should move to 480 or another common article]

69X.71 Installation.

(A) General. Storage batteries in small wind electric systems shall be installed in accordance with the provisions of Article 480.

(B) Dwellings.

(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 69X.7 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in small wind electric systems are subject to extensive charge–discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.

(C) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 69X.16.

(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel cases for proper operation.

(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, where more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.

(F) Battery Maintenance Disconnecting Means. Battery installations, where there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the small wind electric system. A non–load-break-rated switch shall be permitted to be used as the disconnecting means.

(G) Battery Systems of More Than 48 Volts. On small wind electric systems where the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The turbine output circuits shall comply with 69X.41.

(2) The dc and ac load circuits shall be solidly grounded.

(3) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(4) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

69X.72 Charge Control.

(A) General. Equipment shall be provided to control the charging process of the battery. Charge control shall not be required where the design of the small wind electric source is matched to the voltage rating and charge current requirements of the interconnected battery cells and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer. All adjusting means for control of the charging process shall be accessible only to qualified persons.

FPN: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged.

(B) Diversion Charge Controller.

(1) Sole Means of Regulating Charging. A small wind electric system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with two reliable independent means to prevent overcharging of the battery. An interconnected utility service shall not be considered to be a reliable diversion load.

(2) Circuits with Direct-Current Diversion Charge Controller and Diversion Load. Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:

(1) The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum battery voltage. The power rating of the diversion load shall be at least 150 percent of the maximum power rating of the turbine.

(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

IX. Systems over 600 Volts

69x.80 General

Small wind electric systems with a maximum system voltage over 600 volts dc shall comply with Article 490 and other requirements applicable to installations rated over 600 volts.

69x.85 Definitions

For the purposes of Part IX of this article, the voltages used to determine cable and equipment ratings are as follows.

Battery Circuits. In battery circuits, the highest voltage experienced under charging or equalizing conditions.

Other Circuits. In other circuits, the maximum voltage experienced in normal operation.

Substantiation: This proposal was generating by a working group from the small wind electric industry comprising over 50 members, and is supported by the American Wind Energy Association.

The problem: Hundreds of small wind turbines are being installed in the USA every month and there is no specific article to address the particular characteristics of their electrical systems. While many installations are stand-alone applications, most nowadays are utility interactive, and so requirements similar to Article 690, Photovoltaic Systems, apply.

Substantiation: Small wind electric systems are being installed at rural, and now increasingly, in urban locations. The electrical safety of these installations can be improved by clear requirements for grounding and other aspects the electrical installation. As wind turbine towers are typically tall structures, they are subject to lightning strikes and as such deserve special attention when connected to a premises electrical system.

The proposed text follows the structure, and in many cases the language of Articles 690 and 692. It will be a welcome addition to the 2011 NEC for all installers of small wind electric systems.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

ARTICLE 694 Small Wind Electric Systems

I. General

694.1 Scope. The provisions of this article apply to small wind electric systems (also known as small wind turbine systems), including generators, alternators, inverters, and controllers for such systems. [See Figures 694.1(A) and 694.1(B).]

This article applies to small wind electric systems consisting of one or more wind electric generators with individual systems up to and including 100 kW rated power output.

Systems covered by this article may be interactive with other electrical power production sources or stand-alone, with or without electrical energy storage such as batteries. These systems may have ac or dc output for utilization.

Figure 694.1(A) Identification of Small Wind Electric System Components – Interactive System.

Figure 694.1(B) Identification of Small Wind Electric System Components – Stand-Alone System.

694.2 Definitions

Charge Controller. Equipment that controls dc voltage or dc current, or both, and that is used to charge a battery or other energy storage device.

Diversion Charge Controller. Equipment that regulates the charging process of a battery or other energy storage device by diverting power from energy storage to direct-current or alternating-current loads or to an interconnected utility service.

Diversion Load Controller. Equipment that regulates the output of a wind generator by diverting power from the generator to direct-current or alternating-current loads or to an interconnected utility service.

Diversion Load. A load connected to a diversion charge controller or diversion load controller. Also known as a Dump Load.

Guy. A cable that mechanically supports a wind turbine tower.

Inverter Output Circuit. Conductors between an inverter and an ac panelboard for stand-alone systems or the conductors between an inverter and service equipment or another electric power production source, such as a utility, for an electrical production and distribution network.

Maximum Output Power. The maximum one-minute average power output a wind turbine will produce in normal steady-state operation (instantaneous power output can be higher).

Maximum Voltage. The maximum voltage the wind turbine will produce in operation including open circuit conditions.

Nacelle. An enclosure housing the alternator and other parts of a wind turbine.

Rated Power. The wind turbine's power output at a wind speed of 11.0 m/s (24.6 mph). If a turbine produces more power at lower wind speeds, the rated power shall be measured at a wind speed less than 11 m/s that produces the greatest output power.

FPN: The method for measuring wind turbine power output is specified IEC 61400-12-1, Power Performance Measurements of Electricity Producing Wind Turbines.

Tower. A pole or other structure that supports a wind turbine.

Wind Turbine. A mechanical device that converts wind energy to electrical energy.

Wind Turbine Output Circuit. Circuit conductors between the internal components of a small wind turbine (which may include an alternator, integrated rectifier, controller, and/or inverter), and other equipment.

Wind Turbine System. A small wind electric generating system.

FPN: See also definitions for interconnected systems in Article 705.

694.3 Other Articles. Whenever the requirements of other articles of the *Code* and Article 694 differ, the requirements of Article 694 shall apply. If the system is operated in parallel with primary sources of electricity, the requirements in Article 705 shall apply.

Exception: Small wind electric systems, equipment, or wiring installed in a hazardous (classified) location shall also comply with the applicable portions of Articles 500 through 516.

694.4 Installation.

(A) Small Wind Electric System. Small wind electric system(s) shall be permitted to supply a building or other structure in addition to any services of another electricity supply system.

(B) Equipment. Inverters used in small wind electric systems shall be identified and either listed or recognized for the application.

(C) Diversion Load Controllers. A small wind electric system employing a diversion load controller as the primary means of regulating the speed of a wind turbine rotor shall be equipped with an additional, independent, reliable means to prevent over-speed operation. An interconnected utility service shall not be considered to be a reliable diversion load.

(D) Surge Protective Devices. A surge protective device shall be installed between a small wind electric system and any loads served by the premises electrical system. The surge protective device is permitted to be a Type 3 device located on a dedicated branch circuit serving a small wind electric system, or a Type 2 device anywhere on the load side of the service disconnect.

Surge protective devices shall be installed in accordance with Article 285. Part II.

(E) Receptacles. A receptacle is permitted to be attached to a small wind electric system branch or feeder circuit for maintenance or data acquisition use. Receptacles shall be protected with an overcurrent device that is rated at no greater than the current rating of the receptacle.

II. Circuit Requirements

694.7 Maximum Voltage.

(A) Turbine Output Circuits. For wind turbines connected to one- and two-family dwellings, turbine output circuits shall be permitted to have a maximum voltage up to 600 volts. Other installations with a maximum voltage over 600 volts shall comply with Article 694, Part IX.

(B) Direct-Current Utilization Circuits. The voltage of dc utilization circuits shall conform to 210.6.

(C) Circuits over 150 Volts to Ground. In one- and two-family dwellings, live parts in circuits over 150 volts to ground shall not be accessible to other than qualified persons while energized.

FPN: See 110.27 for guarding of live parts and 210.6 for branch circuit voltage limitations.

694.8 Circuit Sizing and Current.

(A) Calculation of Maximum Circuit Current. The maximum current for a circuit shall be calculated in accordance with 694.8(A)(1) through (A)(3).

(1) Turbine Output Circuit Currents. The maximum current shall be the circuit current when the wind turbine is operating at Maximum Output Power.

(2) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.

(3) Stand-Alone Inverter Input Circuit Current. The maximum current shall be the stand-alone continuous inverter input current rating when the inverter is producing rated power at the lowest input voltage.

(B) Ampacity and Overcurrent Device Ratings. Small wind electric system currents shall be considered to be continuous.

(1) Sizing of Conductors and Overcurrent Devices. Circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 694.8(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and (C).

Exception: Circuits containing an assembly, together with its overcurrent devices, that is listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.

694.9 Overcurrent Protection.

(A) Circuits and Equipment. Turbine output circuits, inverter output circuits, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.

Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 694.8(B) and when the maximum currents from all sources do not exceed the ampacity of the conductors.

FPN: Possible backfeed of current from any source of supply, including a supply through an inverter to the wind turbine output circuit, is a consideration in determining whether adequate overcurrent protection from all sources is provided. Some small wind electric systems rely on the turbine output circuit to regulate turbine speed. Inverters may also operate in reverse to for turbine startup or speed control. In systems of these types, manufacturers instructions should be followed.

(B) Power Transformers. Overcurrent protection for a transformer with sources on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer with a current rating on the side connected to the inverter output, which is not less than the rated continuous output current rating of the inverter, shall be permitted without overcurrent protection from the inverter.

(C) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a small wind electric system shall be listed for use in dc circuits and shall have appropriate voltage, current, and interrupting ratings.

694.10 Stand-Alone Systems.

The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this Code except as modified by 694.10(A) through (D).

(A) Inverter Output. The ac output from stand-alone inverters shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of a wind energy source shall be equal to or greater than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.

(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(C) Single 120-Volt Supply. The inverter output of a stand-alone small wind electric system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING
SINGLE 120-VOLT SUPPLY. DO NOT CONNECT
MULTIWIRE BRANCH CIRCUITS!

(D) Energy Storage or Backup Power System Requirements. Energy storage or backup power supplies are not required.

III. Disconnecting Means

694.13 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a small wind electric power source from all other conductors in a building or other structure. A switch, circuit breaker, or other device, either ac or dc, shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.

Exception: A wind turbine that uses the turbine output circuit for regulating turbine speed shall not require a turbine output circuit disconnecting means.

694.14 Additional Provisions. Disconnecting means shall comply with 694.14(A) through (D).

(A) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment and shall comply with the following:

The disconnecting means for ungrounded conductors shall consist of manually operable switches or circuit breakers complying with all of the following requirements:

(1) Located where readily accessible
(2) Externally operable without exposing the operator to contact with live parts
(3) Plainly indicating whether in the open or closed position
(4) Having an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment

When all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and have the following words or equivalent:

WARNING
ELECTRIC SHOCK HAZARD. DO NOT TOUCH TERMINALS.
TERMINALS ON BOTH THE LINE AND LOAD SIDES MAY BE
ENERGIZEDIN THE OPEN POSITION.

(B) Equipment. Equipment such as rectifiers, controllers, output circuit isolating and shorting switches and overcurrent devices shall be permitted on the wind turbine side of the disconnecting means.

(C) Requirements for Disconnecting Means.

(1) Location. The small wind electric system disconnecting means shall be installed at a readily accessible location either on or adjacent to the turbine tower, on the outside of a building or structure or inside nearest the point of entrance of the system conductors.

Exception: Installations that comply with 694.31(C) shall be permitted to have the disconnecting means located remotely from the point of entry of the system conductors.

A turbine disconnecting means shall not be required to be located at the nacelle or tower.

The disconnecting means shall not be installed in bathrooms.

(2) Marking. Each turbine system disconnecting means shall be permanently marked to identify it as a small wind electric system disconnect. A plaque shall be installed in accordance with 705.10.

(3) Suitable for Use. Turbine system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.

(4) Maximum Number of Disconnects. The turbine disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.

(5) Grouping. The turbine disconnecting means shall be grouped with other disconnecting means for the system to comply with 694.14(C)(4).

(D) Equipment Mounted in Not-Readily-Accessible Locations. Rectifiers, controllers, and inverters shall be permitted to be mounted in nacelles or other exterior areas that are not readily accessible.

694.15 Disconnection of Small Wind Electric System Equipment. Means shall be provided to disconnect equipment, such as inverters, batteries, charge controllers, and the like, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified. A single disconnecting means in accordance with 694.14 shall be permitted for the combined ac output of one or more inverters in an interactive system.

A shorting switch or plug shall be permitted to be used as an alternative to a disconnect in systems that regulate turbine speed using the turbine output circuit.

Exception: Equipment housed in a turbine nacelle is not required to have a disconnecting means.

694.16 Fuses. Means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than qualified persons. Switches, pullouts, or similar devices that have suitable ratings shall be permitted to serve as means to disconnect fuses from all sources of supply.

694.18 Installation and Service of a Wind Turbine. Open circuiting, short circuiting, or mechanical brakes shall be used to disable a turbine for installation and service.

FPN: Some wind turbines rely on the connection from the alternator to a remote controller for speed regulation. Opening turbine output circuit conductors may cause mechanical damage to a turbine and create excessive voltages that could damage equipment or expose persons to electric shock.

IV. Wiring Methods

694.31 Methods Permitted.

(A) Wiring Systems. All raceway and cable wiring methods included in this Code and other wiring systems and fittings specifically intended for use on wind turbines shall be permitted. When turbine output circuits operating at maximum voltages greater than 30 volts are installed in readily accessible locations, circuit conductors shall be installed in raceways.

(B) Flexible Cords and Cables. Flexible cords and cables, when used to connect the moving parts of turbines or used to permit ready removal for maintenance and repair, shall comply with Article 400 and shall be of a type identified as a hard service cord or portable power cable; they shall be suitable for extra-hard usage, listed for outdoor use, and water resistant. Cables exposed to sunlight shall be sunlight resistant.

(C) Direct-Current Turbine Output Circuits Inside a Building. When direct-current turbine output circuits are run inside a building or structure, they shall be contained in metal raceways or metal enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means.

V. Grounding

694.43 Equipment Grounding.

(A) General. Exposed non–current-carrying metal parts of towers, turbine nacelles, other equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A) regardless of voltage. Attached metal parts such as turbine blades and tails that have no source of electrical energization are not required to be grounded.

(B) Guy Wires. Guy wires used to support turbine towers shall not be required to be grounded.

[FPN] Guy wires supporting towers that are adequately grounded are not likely to become energized and so are not subject to the requirements of 250.110. Grounding of metallic guy wires may be required by lightning codes.

(C) Tower Grounding.

(1) Auxiliary Electrodes. A wind turbine tower shall be grounded with one or more auxiliary electrodes to limit voltages imposed by lightning. Auxiliary electrodes are permitted to be installed in accordance with 250.54. Electrodes that are part of the tower foundation and that meet the requirements for concrete encased electrodes (250.52(A)(3)) are acceptable. A grounded metal tower support is acceptable if it meets the requirements of 250.136(A).

(2) Equipment Grounding Conductor. An equipment grounding conductor shall be required between a turbine and the system grounded conductor in accordance with 250.110.

(3) Tower Grounding Connections. The equipment grounding conductor and grounding electrode conductors, if used, shall be connected to a metallic tower by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Devices such as connectors and lugs shall be suitable for the material of the conductor and the structure to which they connect. When practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action and corrosion. All mechanical elements used to terminate these conductors shall be accessible.

(4) Lightning Protection Systems. Auxiliary electrodes and grounding electrode conductors shall be permitted to act as lightning protection system components if they meet applicable requirements. If separate, the tower lightning protection system grounding electrodes shall be bonded to the tower auxiliary grounding electrode system. Guy lightning protection system ground electrodes shall not be required to be bonded to the tower auxiliary grounding electrode system.

FPN: See NFPA 780-2008, *Standard for the Installation of Lightning Protection Systems*, Annex N, Wind Turbine Generator Systems, for information on lightning protection of wind turbines.

VI. Marking

694.54 Interactive System Point of Interconnection.

All interactive system points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source and with the rated ac output current and the nominal operating ac voltage.

694.55 Power Systems Employing Energy Storage.

Small wind electric systems employing energy storage shall be marked with the maximum operating voltage, including any equalization voltage and the polarity of the grounded circuit conductor.

694.56 Identification of Power Sources.

(A) Facilities with Stand-Alone Systems. Any structure or building with a power system that is not connected to a utility service source and is a stand-alone system shall have a permanent plaque or directory installed on the exterior of the building or structure at a readily visible location. The plaque or directory shall indicate the location of system disconnecting means and that the structure contains a stand-alone electrical power system.

(B) Facilities with Utility Services and Small Wind Electric Systems. Buildings or structures with both utility service and small wind electric systems shall have a permanent plaque or directory providing the location of the service disconnecting means and the small wind electric system disconnecting means.

694.57 Instructions for Disabling Turbine. A plaque shall be installed at or adjacent to a turbine location providing basic instructions for disabling the turbine.

VII. Connection to Other Sources

694.60 Identified Interactive Equipment. Only inverters listed or recognized, and identified as interactive shall be permitted in interactive systems.

694.61 Installation. Small wind electric systems, when connected to other electric sources, shall comply with the requirements of article 705.

694.62 Ampacity of Neutral Conductor.

If a single-phase, 2-wire inverter output is connected to the neutral conductor and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum load connected between the neutral conductor and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

A conductor used solely for instrumentation, voltage detection, or phase detection and connected to a single-phase or 3-phase utility-interactive inverter, shall be permitted to be sized at less than the ampacity of the other current-carrying conductors and shall be sized equal to or larger than the equipment grounding conductor.

694.63 Operating Voltage Range. Small wind electric systems operating on dedicated branch or feeder circuits shall be permitted to exceed normal voltage operating ranges at the end of these circuits provided that the voltage at any distribution equipment supplying other loads remains within normal ranges.

FPN: Wind turbines may use the electric grid to dump energy from short-term wind gusts. Normal operating voltages are defined in ANSI C84.1-2006, Voltage Ratings for Electric Power Systems and Equipment (60 Hz).

694.64 Point of Connection.

See 705.12 Point of Connection.

VIII. Storage Batteries

[This common language should move to 480 or another common article]

694.71 Installation.

(A) General. Storage batteries in small wind electric systems shall be installed in accordance with the provisions of Article 480.

(B) Dwellings.

(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: When live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 694.7 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in small wind electric systems are subject to extensive charge–discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.

(C) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries when the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 694.16.

(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted when no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that require steel or other conductive material cases for proper operation.

(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, when more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.

(F) Battery Maintenance Disconnecting Means. Battery installations, when there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductors in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductors for the remainder of the small wind electric system. A non–load-break-rated switch shall be permitted to be used as the disconnecting means.

(G) Battery Systems of More Than 48 Volts. On small wind electric systems when the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The dc and ac load circuits shall be solidly grounded.

(2) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(3) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

694.72 Charge Control.

(A) General. Equipment shall be provided to control the charging process of the battery. Charge control shall not be required when the design of the small wind electric source is matched to the voltage rating and charge current requirements of the interconnected battery cells and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer.
All adjusting means for control of the charging process shall be accessible only to qualified persons.
FPN: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged.
(B) Diversion Charge Controller.
(1) Sole Means of Regulating Charging. A small wind electric system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with two reliable independent means to prevent overcharging of the battery. An interconnected utility service shall not be considered to be a reliable diversion load.
(2) Circuits with Direct-Current Diversion Charge Controller and Diversion Load. Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:
(1) The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum battery voltage. The power rating of the diversion load shall be at least 150 percent of the maximum power output rating of the small wind electric system.
(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.
IX. Systems over 600 Volts
694.80 General.
Small wind electric systems with a maximum system voltage over 600 volts dc shall comply with Article 490 and other requirements applicable to installations rated over 600 volts.
694.85 Definitions.
For the purposes of Part IX of this article, the voltages used to determine cable and equipment ratings are as follows.
Battery Circuits. In battery circuits, the highest voltage experienced under charging or equalizing conditions.
Other Circuits. In other circuits, the maximum voltage experienced in normal operation.
Panel Statement:
Revise text to read as follows:
ARTICLE 694 Small Wind Electric Systems
I. General
694.1 Scope. The provisions of this article apply to small wind electric systems (also known as small wind turbine systems), including generators, alternators, inverters, and controllers for such systems. [See Figures 694.1(A) and 694.1(B).]
This article applies to small wind electric systems consisting of one or more wind electric generators with individual systems up to and including 100 kW rated power output.
Systems covered by this article may be interactive with other electrical power production sources or stand-alone, with or without electrical energy storage such as batteries. These systems may have ac or dc output for utilization.
Figure 694.1(A) Identification of Small Wind Electric System Components – Interactive System.
Figure 694.1(B) Identification of Small Wind Electric System Components – Stand-Alone System.
694.2 Definitions
Charge Controller. Equipment that controls dc voltage or dc current, or both, and that is used to charge a battery or other energy storage device.
Diversion Charge Controller. Equipment that regulates the charging process of a battery or other energy storage device by diverting power from energy storage to direct-current or alternating-current loads or to an interconnected utility service.
Diversion Load Controller. Equipment that regulates the output of a wind generator by diverting power from the generator to direct-current or alternating-current loads or to an interconnected utility service.
Diversion Load. A load connected to a diversion charge controller or diversion load controller. Also known as a Dump Load.
Guy. A cable that mechanically supports a wind turbine tower.
Inverter Output Circuit. Conductors between an inverter and an ac panelboard for stand-alone systems or the conductors between an inverter and service equipment or another electric power production source, such as a utility, for an electrical production and distribution network.
Maximum Output Power. The maximum one-minute average power output a wind turbine will produce in normal steady-state operation (instantaneous power output can be higher).
Maximum Voltage. The maximum voltage the wind turbine will produce in operation including open circuit conditions.
Nacelle. An enclosure housing the alternator and other parts of a wind turbine.
Rated Power. The wind turbine's power output at a wind speed of 11.0 m/s (24.6 mph). If a turbine produces more power at lower wind speeds, the rated power shall be measured at a wind speed less than 11 m/s that produces the greatest output power.
FPN: The method for measuring wind turbine power output is specified IEC 61400-12-1, Power Performance Measurements of Electricity Producing Wind Turbines.
Tower. A pole or other structure that supports a wind turbine.
Wind Turbine. A mechanical device that converts wind energy to electrical energy.
Wind Turbine Output Circuit. Circuit conductors between the internal components of a small wind turbine (which may include an alternator, integrated rectifier, controller, and/or inverter), and other equipment.
Wind Turbine System. A small wind electric generating system.
FPN: See also definitions for interconnected systems in Article 705.
694.3 Other Articles. Whenever the requirements of other articles of the *Code* and Article 694 differ, the requirements of Article 694 shall apply. If the system is operated in parallel with primary sources of electricity, the requirements in Article 705 shall apply.
Exception: Small wind electric systems, equipment, or wiring installed in a hazardous (classified) location shall also comply with the applicable portions of Articles 500 through 516.
694.4 Installation.
(A) Small Wind Electric System. Small wind electric system(s) shall be permitted to supply a building or other structure in addition to any services of another electricity supply system.
(B) Equipment. Inverters used in small wind electric systems shall be identified and either listed or recognized for the application.
(C) Diversion Load Controllers. A small wind electric system employing a diversion load controller as the primary means of regulating the speed of a wind turbine rotor shall be equipped with an additional, independent, reliable means to prevent over-speed operation. An interconnected utility service shall not be considered to be a reliable diversion load.
(D) Surge Protective Devices. A surge protective device shall be installed between a small wind electric system and any loads served by the premises electrical system. The surge protective device is permitted to be a Type 3 device located on a dedicated branch circuit serving a small wind electric system, or a Type 2 device anywhere on the load side of the service disconnect. Surge protective devices shall be installed in accordance with Article 285. Part II.
(E) Receptacles. A receptacle is permitted to be attached to a small wind electric system branch or feeder circuit for maintenance or data acquisition use. Receptacles shall be protected with an overcurrent device that is rated at no greater than the current rating of the receptacle.
II. Circuit Requirements
694.7 Maximum Voltage.
(A) Turbine Output Circuits. For wind turbines connected to one- and two-family dwellings, turbine output circuits shall be permitted to have a maximum voltage up to 600 volts. Other installations with a maximum voltage over 600 volts shall comply with Article 694, Part IX.
(B) Direct-Current Utilization Circuits. The voltage of dc utilization circuits shall conform to 210.6.
(C) Circuits over 150 Volts to Ground. In one- and two-family dwellings, live parts in circuits over 150 volts to ground shall not be accessible to other than qualified persons while energized.
FPN: See 110.27 for guarding of live parts and 210.6 for branch circuit voltage limitations.
694.8 Circuit Sizing and Current.
(A) Calculation of Maximum Circuit Current. The maximum current for a circuit shall be calculated in accordance with 694.8(A)(1) through (A)(3).
(1) Turbine Output Circuit Currents. The maximum current shall be the circuit current when the wind turbine is operating at Maximum Output Power.
(2) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.
(3) Stand-Alone Inverter Input Circuit Current. The maximum current shall be the stand-alone continuous inverter input current rating when the inverter is producing rated power at the lowest input voltage.
(B) Ampacity and Overcurrent Device Ratings. Small wind electric system currents shall be considered to be continuous.
(1) Sizing of Conductors and Overcurrent Devices. Circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 694.8(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and (C).
Exception: Circuits containing an assembly, together with its overcurrent devices, that is listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.
694.9 Overcurrent Protection.
(A) Circuits and Equipment. Turbine output circuits, inverter output circuits, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.
Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 694.8(B) and when the maximum currents from all sources do not exceed the ampacity of the conductors.

FPN: Possible backfeed of current from any source of supply, including a supply through an inverter to the wind turbine output circuit, is a consideration in determining whether adequate overcurrent protection from all sources is provided. Some small wind electric systems rely on the turbine output circuit to regulate turbine speed. Inverters may also operate in reverse to for turbine startup or speed control. In systems of these types, manufacturers instructions should be followed.

(B) Power Transformers. Overcurrent protection for a transformer with sources on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer with a current rating on the side connected to the inverter output, which is not less than the rated continuous output current rating of the inverter, shall be permitted without overcurrent protection from the inverter.

(C) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a small wind electric system shall be listed for use in dc circuits and shall have appropriate voltage, current, and interrupting ratings.

694.10 Stand-Alone Systems.

The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this Code except as modified by 694.10(A) through (D).

(A) Inverter Output. The ac output from stand-alone inverters shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of a wind energy source shall be equal to or greater than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.

(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(C) Single 120-Volt Supply. The inverter output of a stand-alone small wind electric system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING

SINGLE 120-VOLT SUPPLY. DO NOT CONNECT
MULTIWIRE BRANCH CIRCUITS!

(D) Energy Storage or Backup Power System Requirements. Energy storage or backup power supplies are not required.

III. Disconnecting Means

694.13 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a small wind electric power source from all other conductors in a building or other structure. A switch, circuit breaker, or other device, either ac or dc, shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.

Exception: A wind turbine that uses the turbine output circuit for regulating turbine speed shall not require a turbine output circuit disconnecting means.

694.14 Additional Provisions. Disconnecting means shall comply with 694.14(A) through (D).

(A) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment and shall comply with the following:

The disconnecting means for ungrounded conductors shall consist of manually operable switches or circuit breakers complying with all of the following requirements:

(1) Located where readily accessible
(2) Externally operable without exposing the operator to contact with live parts
(3) Plainly indicating whether in the open or closed position
(4) Having an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment

When all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and have the following words or equivalent:

WARNING

ELECTRIC SHOCK HAZARD. DO NOT TOUCH TERMINALS.
TERMINALS ON BOTH THE LINE AND LOAD SIDES MAY BE
ENERGIZEDIN THE OPEN POSITION.

(B) Equipment. Equipment such as rectifiers, controllers, output circuit isolating and shorting switches and overcurrent devices shall be permitted on the wind turbine side of the disconnecting means.

(C) Requirements for Disconnecting Means.

(1) Location. The small wind electric system disconnecting means shall be installed at a readily accessible location either on or adjacent to the turbine tower, on the outside of a building or structure or inside nearest the point of entrance of the system conductors.

Exception: Installations that comply with 694.31(C) shall be permitted to have the disconnecting means located remotely from the point of entry of the system conductors.

A turbine disconnecting means shall not be required to be located at the nacelle or tower.

The disconnecting means shall not be installed in bathrooms.

(2) Marking. Each turbine system disconnecting means shall be permanently marked to identify it as a small wind electric system disconnect. A plaque shall be installed in accordance with 705.10.

(3) Suitable for Use. Turbine system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.

(4) Maximum Number of Disconnects. The turbine disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.

(5) Grouping. The turbine disconnecting means shall be grouped with other disconnecting means for the system to comply with 694.14(C)(4).

(D) Equipment Mounted in Not-Readily-Accessible Locations. Rectifiers, controllers, and inverters shall be permitted to be mounted in nacelles or other exterior areas that are not readily accessible.

694.15 Disconnection of Small Wind Electric System Equipment. Means shall be provided to disconnect equipment, such as inverters, batteries, charge controllers, and the like, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified. A single disconnecting means in accordance with 694.14 shall be permitted for the combined ac output of one or more inverters in an interactive system.

A shorting switch or plug shall be permitted to be used as an alternative to a disconnect in systems that regulate turbine speed using the turbine output circuit.

Exception: Equipment housed in a turbine nacelle is not required to have a disconnecting means.

694.16 Fuses. Means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than qualified persons. Switches, pullouts, or similar devices that have suitable ratings shall be permitted to serve as means to disconnect fuses from all sources of supply.

694.18 Installation and Service of a Wind Turbine. Open circuiting, short circuiting, or mechanical brakes shall be used to disable a turbine for installation and service.

FPN: Some wind turbines rely on the connection from the alternator to a remote controller for speed regulation. Opening turbine output circuit conductors may cause mechanical damage to a turbine and create excessive voltages that could damage equipment or expose persons to electric shock.

IV. Wiring Methods

694.31 Methods Permitted.

(A) Wiring Systems. All raceway and cable wiring methods included in this Code and other wiring systems and fittings specifically intended for use on wind turbines shall be permitted. When turbine output circuits operating at maximum voltages greater than 30 volts are installed in readily accessible locations, circuit conductors shall be installed in raceways.

(B) Flexible Cords and Cables. Flexible cords and cables, when used to connect the moving parts of turbines or used to permit ready removal for maintenance and repair, shall comply with Article 400 and shall be of a type identified as a hard service cord or portable power cable; they shall be suitable for extra-hard usage, listed for outdoor use, and water resistant. Cables exposed to sunlight shall be sunlight resistant.

(C) Direct-Current Turbine Output Circuits Inside a Building. When direct-current turbine output circuits are run inside a building or structure, they shall be contained in metal raceways or metal enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means.

V. Grounding

694.43 Equipment Grounding.

(A) General. Exposed non–current-carrying metal parts of towers, turbine nacelles, other equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A) regardless of voltage. Attached metal parts such as turbine blades and tails that have no source of electrical energization are not required to be grounded.

(B) Guy Wires. Guy wires used to support turbine towers shall not be required to be grounded.

[FPN] Guy wires supporting towers that are adequately grounded are not likely to become energized and so are not subject to the requirements of 250.110. Grounding of metallic guy wires may be required by lightning codes.

(C) Tower Grounding.

(1) Auxiliary Electrodes. A wind turbine tower shall be grounded with one or more auxiliary electrodes to limit voltages imposed by lightning. Auxiliary electrodes are permitted to be installed in accordance with 250.54. Electrodes that are part of the tower foundation and that meet the requirements for concrete encased electrodes (250.52(A)(3)) are acceptable. A grounded metal tower support is acceptable if it meets the requirements of 250.136(A).

(2) Equipment Grounding Conductor. An equipment grounding conductor shall be required between a turbine and the system grounded conductor in accordance with 250.110.

(3) Tower Grounding Connections. The equipment grounding conductor and grounding electrode conductors, if used, shall be connected to a metallic tower by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Devices such as connectors and lugs shall be suitable for the material of the conductor and the structure to which they connect. When practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action and corrosion. All mechanical elements used to terminate these conductors shall be accessible.

(4) Lightning Protection Systems. Auxiliary electrodes and grounding electrode conductors shall be permitted to act as lightning protection system components if they meet applicable requirements. If separate, the tower lightning protection system grounding electrodes shall be bonded to the tower auxiliary grounding electrode system. Guy lightning protection system ground electrodes shall not be required to be bonded to the tower auxiliary grounding electrode system.

FPN: See NFPA 780-2008, *Standard for the Installation of Lightning Protection Systems*, Annex N, Wind Turbine Generator Systems, for information on lightning protection of wind turbines.

VI. Marking

694.54 Interactive System Point of Interconnection.

All interactive system points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source and with the rated ac output current and the nominal operating ac voltage.

694.55 Power Systems Employing Energy Storage.

Small wind electric systems employing energy storage shall be marked with the maximum operating voltage, including any equalization voltage and the polarity of the grounded circuit conductor.

694.56 Identification of Power Sources.

(A) Facilities with Stand-Alone Systems. Any structure or building with a power system that is not connected to a utility service source and is a stand-alone system shall have a permanent plaque or directory installed on the exterior of the building or structure at a readily visible location. The plaque or directory shall indicate the location of system disconnecting means and that the structure contains a stand-alone electrical power system.

(B) Facilities with Utility Services and Small Wind Electric Systems. Buildings or structures with both utility service and small wind electric systems shall have a permanent plaque or directory providing the location of the service disconnecting means and the small wind electric system disconnecting means.

694.57 Instructions for Disabling Turbine. A plaque shall be installed at or adjacent to a turbine location providing basic instructions for disabling the turbine.

VII. Connection to Other Sources

694.60 Identified Interactive Equipment. Only inverters listed or recognized, and identified as interactive shall be permitted in interactive systems.

694.61 Installation. Small wind electric systems, when connected to other electric sources, shall comply with the requirements of article 705.

694.62 Ampacity of Neutral Conductor.

If a single-phase, 2-wire inverter output is connected to the neutral conductor and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum load connected between the neutral conductor and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

A conductor used solely for instrumentation, voltage detection, or phase detection and connected to a single-phase or 3-phase utility-interactive inverter, shall be permitted to be sized at less than the ampacity of the other current-carrying conductors and shall be sized equal to or larger than the equipment grounding conductor.

694.63 Operating Voltage Range. Small wind electric systems operating on dedicated branch or feeder circuits shall be permitted to exceed normal voltage operating ranges at the end of these circuits provided that the voltage at any distribution equipment supplying other loads remains within normal ranges.

FPN: Wind turbines may use the electric grid to dump energy from short-term wind gusts. Normal operating voltages are defined in ANSI C84.1-2006, Voltage Ratings for Electric Power Systems and Equipment (60 Hz).

694.64 Point of Connection.

See 705.12 Point of Connection.

VIII. Storage Batteries

[This common language should move to 480 or another common article]

694.71 Installation.

(A) General. Storage batteries in small wind electric systems shall be installed in accordance with the provisions of Article 480.

(B) Dwellings.

(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: When live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 694.7 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in small wind electric systems are subject to extensive charge–discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.

(C) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries when the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 694.16.

(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted when no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that require steel or other conductive material cases for proper operation.

(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, when more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.

(F) Battery Maintenance Disconnecting Means. Battery installations, when there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductors in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductors for the remainder of the small wind electric system. A non–load-break-rated switch shall be permitted to be used as the disconnecting means.

(G) Battery Systems of More Than 48 Volts. On small wind electric systems when the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The dc and ac load circuits shall be solidly grounded.

(2) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(3) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

694.72 Charge Control.

(A) General. Equipment shall be provided to control the charging process of the battery. Charge control shall not be required when the design of the small wind electric source is matched to the voltage rating and charge current requirements of the interconnected battery cells and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer.

All adjusting means for control of the charging process shall be accessible only to qualified persons.

FPN: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged.

(B) Diversion Charge Controller.

(1) Sole Means of Regulating Charging. A small wind electric system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with two reliable independent means to prevent overcharging of the battery. An interconnected utility service shall not be considered to be a reliable diversion load.

(2) Circuits with Direct-Current Diversion Charge Controller and Diversion Load. Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:

(1) The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum battery voltage. The power rating of the diversion load shall be at least 150 percent of the maximum power output rating of the small wind electric system.

(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

IX. Systems over 600 Volts

694.80 General.

Small wind electric systems with a maximum system voltage over 600 volts dc shall comply with Article 490 and other requirements applicable to installations rated over 600 volts.

694.85 Definitions.

For the purposes of Part IX of this article, the voltages used to determine cable and equipment ratings are as follows.

Battery Circuits. In battery circuits, the highest voltage experienced under charging or equalizing conditions.

Other Circuits. In other circuits, the maximum voltage experienced in normal operation.

ARTICLE 695 — FIRE PUMPS

13-47 Log #70 NEC-P13 **Final Action: Reject**
(695)

Note: This Proposal appeared as Comment 13-103 on Proposal 13-77 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-77 was:
Revise extracted text from NFPA 20 to reflect 2006 edition revisions. Following is the NFPA 20 - Chapter 9 text as it has been voted on by the NFPA 20 Committee to date.
NFPA 20 - DRAFT
Chapter 9 Electric Drive for Pumps
9.1 General.
9.1.1 This chapter covers the minimum performance and testing requirements of the sources and transmission of electrical power to motors driving fire pumps.
9.1.2 Also covered are the minimum performance requirements of all intermediate equipment between the source(s) and the pump, including the motor(s) but excepting the electric fire pump controller, transfer switch, and accessories (see Chapter 10).
9.1.3 All electrical equipment and installation methods shall comply with NFPA 70, National Electrical Code, Article 695, and other applicable articles.
9.1.4* All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.
9.1.5 All power supplies shall have the capacity to run the fire pump on a continuous basis.
9.1.6 All power supplies shall comply with the voltage drop requirements of Section 9.7.
9.2 Normal Power.
9.2.1 An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.
9.2.2 The normal source of power required in 9.2.1 and its routing shall be arranged in accordance with one of the following:
(1) Service connection dedicated to the fire pump installation.
(2) On-site power production facility connection dedicated to the fire pump installation.
(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.
(4) As a feeder connection where all of the following conditions are met:
a. The protected facility is part of a multi-building campus style arrangement.
b. A back-up source of power is provided from a source independent of the normal source of power.
c. It is impractical to supply the normal source of power through arrangement 9.2.2(1), 9.2.2(2), 9.2.2(3) or 9.2.2(5).
d. The arrangement is acceptable to the authority having jurisdiction.
e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).
(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695 of NFPA 70.
9.2.3 For fire pump installations using the arrangement of 9.2.2(1), 9.2.2(2),9.2.2(3), 9.2.2(5) for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.
9.2.3.1 Where the disconnecting means permitted by 9.2.3 is installed, the disconnecting means shall meet all of the following:
(1) Identified as being suitable for use as service equipment.
(2) Lockable in the closed position.
(3) * Located remote from other building disconnecting means.
(4) * Located remote from other fire pump source disconnecting means.
(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers.
9.2.3.2 Where the disconnecting means permitted by 9.2.3 is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.
9.2.3.3 Where the disconnecting means permitted by 9.2.3 is installed, the disconnect shall be supervised in the closed position by one of the following methods:
(1) Central station, proprietary or remote station signal device
(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location
(3) Locking the disconnecting means in the closed position
(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner
9.2.3.4 Where the overcurrent protection permitted by 9.2.3 is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment.
9.3 Alternate power.
9.3.1 Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus.
9.3.2* Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided where the normal source is not reliable.
9.3.3 An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.
9.3.4 When provided, the alternate source of power shall be supplied from one of the following sources:
(1) A generator installed in accordance with Section 9.8.
(2) One of the sources identified in 9.2.2(1); 9.2.2(2); 9.2.2(3); or 9.2.2(5) when the power is provided independent of the normal source of power.
9.3.5 When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations.
9.4 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.
9.4.1 The junction box shall be securely mounted.
9.4.2* Mounting and installing of a junction box shall not violate the enclosure Type (NEMA) rating of the fire pump controller(s).
9.4.3* Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the Short Circuit Rating of the controller(s).
9.4.4 As a minimum, a National Electrical Manufacturers Association (NEMA) Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed f or the subject to match the fire pump controller enclosure Type rating.
9.4.5 Terminals, junction blocks, splices, and the like, when used, shall be listed.
9.5* Listed Electrical Circuit Protective System to Controller Wiring.
9.5.1* Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with NFPA 70.
9.5.2 Single (individual conductors) shall not enter the fire pump enclosure separately.
9.5.3* Where required by the manufacturer of a listed Electrical Circuit Protective System or by NFPA 70 or by the Listing agency, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.
9.5.4 Standard wiring between junction box and controller is acceptable.
9.6* Raceway Terminations.
9.6.1 Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.
9.6.2 The NEMA Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.
9.6.3 The installation instructions of the manufacturer of the fire pump controller shall be followed.
9.6.4 No alterations to the fire pump controller, other than conduit entry as allowed by NFPA 70, shall be approved by the authority having jurisdiction.
9.7* Voltage Drop.
9.7.1 Unless the requirements of 9.4.2 are met, the voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor-starting conditions.
9.7.2 The requirements of 9.7.1 shall not apply to emergency run mechanical starting. (See 10.5.3.2.)
9.7.3 The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.
9.8 Motors.
9.8.1 General.
9.8.1.1 All motors shall comply with NEMA MG-1, Motors and Generators, shall be marked as complying with NEMADesign B standards, and shall be specifically listed for fire pump service. (See Table 9.8.1.1.)
Table 9.8.1.1 Horsepower and Locked Rotor Current Motor Designation for NEMA Design B Motors
9.8.1.2 The requirements of 9.8.1.1 shall not apply to direct-current, high-voltage (over 600 V), large-horsepower [over 373 kW (500 hp)], single-phase, universal-type, or wound-rotor motors, which shall be permitted to be used where approved.
9.8.1.3 Motors used with variable speed controllers shall additionally meet the applicable requirements of NEMA MG1, Part 31 and shall be marked for inverter duty.

9.8.1.4* The corresponding values of locked rotor current for motors rated at other voltages shall be determined by multiplying the values shown by the ratio of 460 V to the rated voltage in Table 9.8.1.1.

9.8.1.5 Code letters of motors for all other voltages shall conform with those shown for 460 V in Table 9.8.1.1.

9.8.1.6 All motors shall be rated for continuous duty.

9.8.1.7 Electric motor–induced transients shall be coordinated with the provisions of 10.4.3.3 to prevent nuisance tripping of motor controller protective devices.

9.8.1.8 Motors for Vertical Shaft Turbine–Type Pumps.

9.8.1.8.1 Motors for vertical shaft turbine–type pumps shall be dripproof, squirrel-cage induction type.

9.8.1.8.2 The motor shall be equipped with a nonreverse ratchet.

9.8.2 Current Limits.

9.8.2.1 The motor capacity in horsepower shall be such that the maximum motor current in any phase under any condition of pump load and voltage unbalance shall not exceed the motor-rated full-load current multiplied by the service factor.

9.8.2.2 Where the motor is used with a variable speed pressure limiting controller, the service factor shall not be used.

9.8.2.3 The maximum service factor at which a motor shall be used is 1.15.

9.8.2.4 These service factors shall be in accordance with NEMA MG-1, Motors and Generators.

9.8.2.5 General-purpose (open and dripproof) motors, totally enclosed fan-cooled (TEFC) motors, and totally enclosed nonventilated (TENV) motors shall not have a service factor larger than 1.15.

9.8.2.6 Motors used at altitudes above 1000 m (3300 ft) shall be operated or derated according to NEMA MG-1, Motors and Generators, Part 14.

9.8.3 Marking.

9.8.3.1 Marking of motor terminals shall be in accordance with NEMA MG-1, Motors and Generators, Part 2.

9.8.3.2 A motor terminal connecting diagram for multiple lead motors shall be furnished by the motor manufacturer.

9.9 On-Site Standby Generator Systems.

9.9.1 Capacity.

9.9.1.1 Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 9.3.2, they shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of Section 9.7.

9.9.1.2 A tap ahead of the on-site generator disconnecting means shall not be required.

9.9.2* Power Sources.

9.9.2.1 These power sources shall comply with Section 9.7 and shall meet the requirements of Level 1, Type 10, Class X systems of NFPA 110, Standard for Emergency and Standby Power Systems.

9.9.2.2 The fuel supply capacity shall be sufficient to provide 8 hours of fire pump operation at 100 percent of the rated pump capacity in addition to the supply required for other demands.

9.9.3 Sequencing. Automatic sequencing of the fire pumps shall be permitted in accordance with 10.5.2.5.

9.9.4 Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.

9.9.5* Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump.

Submitter: James S. Nasby, Master Control Systems, Inc.

Recommendation: Revise the text of the TCC write-up in the A2007 ROP to read as follows.

ARTICLE 695 Fire Pumps

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 20-2006, Standard for the Installation of Stationary Pumps for Fire Protection. Only editorial changes were made to the extracted text to make it consistent with this Code.

695.1 Scope.

(A) Covered. This article covers the installation of the following:

(1) Electric power sources and interconnecting circuits

(2) Switching and control equipment dedicated to fire pump drivers

(3) Associated fire pump accessory equipment

(B) Not Covered. This article does not cover the performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system.

FPN: See NFPA 20-2006, Standard for the Installation of Stationary Pumps for Fire Protection, for further information.

695.2 Definitions.

Fault Tolerant External Control Circuit. Those control circuits entering or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump from all other internal or external means and may cause the controller to start the pump under these conditions.

On-Site Power Production Facility. The normal supply of electric power for the site that is expected to be constantly producing power.

On-Site Standby Generator. A facility producing electric power on site as the alternate supply of electric power. It differs from an on-site power production facility, in that it is not constantly producing power.

695.3 Power Source(s) for Electric Motor-Driven Fire Pumps.

Electric motor-driven fire pumps shall have a reliable source of power.

FPN: NFPA 20-2006, *Standard for the Installation of Stationary Pumps for Fire Protection,* covers characteristics of reliable of reliable sources. Also see the cross-reference in Annex J.

(A) Scope. This section covers the minimum performance and testing requirements of the sources and transmission of electrical power to motors driving fire pumps.

(B) Equipment. Also covered are the minimum performance requirements of all intermediate equipment between the source(s) and the pump, including the motor(s) but excepting the electric fire pump controller, transfer switch, and accessories

FPN: See Chapter 10 of NFPA 20.

(C) General. All electrical equipment and installation methods shall comply with this Code except as modified by Article 695.

(D) Hazards. All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.

FPN: Where the power supply involves an on-site power production facility, the protection is required for the facility in addition to the wiring and equipment.

(E) Continuous Duty. All power supplies shall have the capacity to run the fire pump on a continuous basis.

(F) Voltage Drop. All power supplies shall comply with the voltage drop requirements of Section 695.8

(G) Phase Converters. Phase converters shall not be permitted to be used for fire pump service.

695.4 Continuity of Power.

(A) Continuously Available. An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.

(B) Arrangement. The normal source of power required in 695.4(A) and its routing shall be arranged in accordance with one of the following:

(1) Service connection dedicated to the fire pump installation.

(2) On-site power production facility connection dedicated to the fire pump installation.

(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.

(4) As a feeder connection where all of the following conditions are met:

a. The protected facility is part of a multi-building campus style arrangement.

b. A back-up source of power is provided from a source independent of the normal source of power

c. It is impractical to supply the normal source of power through arrangement 695.4(B)(1), 695.4(B)(2), 695.4(B)(3) or ~~695.4(B)(4)~~ 695.4(B)(5)

d. The arrangement is acceptable to the authority having jurisdiction.

e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).

(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695.6.

(C) Connections. For fire pump installations using the arrangement of 695.4(B)(1), 695.4(B)(2), 695.4(B)(3), 695.4(B)(5) for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.

(D) Disconnecting Means. Where the disconnecting means permitted by ~~695.4(A)~~ 695.4(C) is installed, the disconnecting means shall meet all of the following:

(1) Identified as being suitable for use as service equipment.

(2) Lockable in the closed position.

(3) Located remote from other building disconnecting means.

FPN: ~~The disconnecting means should be located such that inadvertent simultaneous operation is not likely.~~ This is to avoid the inadvertent simultaneous operation of the building and fire pump disconnect switches.

(4) Located remote from other fire pump source disconnecting means.

FPN: ~~The disconnecting means should be located such that inadvertent simultaneous operation is not likely.~~ This is to avoid the inadvertent simultaneous operation of the disconnect switches of other fire pumps.

(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers.

(E) Placard. Where the disconnecting means permitted by 695.4(C) is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.

(F) Supervision. Where the disconnecting means permitted by 695.4(C) is installed, the disconnect shall be supervised in the closed position by one of the following methods:

(1) Central station, proprietary or remote station signal device

(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location

(3) Locking the disconnecting means in the closed position

(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner

(G) Overcurrent Protection Where the overcurrent protection permitted by 695.4(C) is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment. The next standard overcurrent device shall be used in accordance with 240.6. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

695.5 Alternate Power.

(A) When Required. Except for an arrangement described in 695.5(C), at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department <u>or when required by the AHJ. The alternate source shall, as a minimum, comply with the requirements of this section.</u>

FPN: <u>Local codes and/or AHJ often require alternate power for certain occupancies, such as high rise buildings, places of assembly and etc. These alternate power sources are considered to be the Emergency Source of Power for a motor driven fire pump as opposed to the Normal Source of Power.</u>

(B) Unreliable Source. Except for an arrangement described in 695.5(C), at least one alternate source of power shall be provided where the normal source is not reliable.

FPN: ~~The conditions identified are conditions that would make the normal source of power be considered not reliable.~~ See Alternate Power. Other Sources in NFPA-20, *Standard for the Installation of Stationary Pumps for Fire Protection*, for specifics.

~~(1) NFPA 25 begins to require special undertakings (i.e., fire watches) when a water based fire protection system is taken out of service for longer than 4 hours. If the normal source power plant has been intentionally shut down for longer than 4 hours in the past, it is reasonable to require a back-up source of power.~~

~~(2) The standard does not require that the normal source of power is infallible. NFPA 20 does not intend to require a back-up source of power for every installation using an electric motor driven fire pump. Should the normal source of power fail due to a natural disaster (hurricane) or due to a problem with electric grid management (regional blackout), the fire protection system could be supplied through the fire department connection. However, if the power grid is known to have had problems in the past (i.e., switch failures or animals shorting a substation), it is reasonable to require a back-up source of power.~~

~~(3) Fire departments responding to an incident at the protected facility will not operate aerial apparatus near live overhead power lines, without exception. A back-up source of power is required in case this scenario occurs and the normal source of power must be shut off. Additionally, many utility providers will remove power to the protected facility by physically cutting the overhead conductors. If the normal source of power is provided by overhead conductors, which will not be identified, the utility provider could mistakenly cut the overhead conductor supplying the fire pump.~~

~~(4) Power disconnection and activated overcurrent protection should only occur in the fire pump controller. The provisions of 9.2.2 for the disconnect switch and overcurrent protection essentially require disconnection and overcurrent protection to occur in the fire pump controller. If unanticipated disconnect switches or overcurrent protection devices are installed in the normal source of power that do not meet the requirements of 9.2.2, the normal source of power must be considered not reliable and a back-up source of power is necessary.~~

(C) Back-up Pump. An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.

<u>FPN: See NFPA-20 for requirements of engine driven or steam turbine fire pumps. In either case, operation of the pump is intended to be independent of the source of electrical power.</u>

(D) Alternate Source. When provided, the alternate source of power shall be supplied from one of the following sources:

(1) A generator installed in accordance with 695.9.

(2) One of the sources identified in 695.4(B)(1); 695.4(B)(2); 695.4(B)(3); or 695.4(B)(5) when the power is provided independent of the normal source of power.

(E) Overhead Lines. When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations.

695.6 Transformers. Where the service or system voltage is different from the utilization voltage of the fire pump motor, transformer(s) protected by disconnecting means and overcurrent protective devices shall be permitted to be installed between the system supply and the fire pump controller in accordance with 695.6(A) and (B), or (C). Only transformers covered in 695.6(C) shall be permitted to supply loads not directly associated with the fire pump system.

<u>FPN: This may apply to low voltage and medium voltage installations as well as when the service is high voltage.</u>

(A) Size. Where a transformer supplies an electric motor-driven fire pump, it shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the associated fire pump accessory equipment supplied by the transformer.

(B) Overcurrent Protection. The primary overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. Secondary overcurrent protection shall not be permitted. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

(C) Feeder Source. Where a feeder source is provided in accordance with 695.4(B)(4), transformers supplying the fire pump system shall be permitted to supply other loads. All other loads shall be calculated in accordance with Article 220, including demand factors as applicable.

(1) Size. Transformers shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the remaining load supplied by the transformer.

(2) Overcurrent Protection. The transformer size, the feeder size, and the overcurrent protective device(s) shall be coordinated such that overcurrent protection is provided for the transformer in accordance with 450.3 and for the feeder in accordance with 215.3, and such that the overcurrent protective device(s) is selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s), the pressure maintenance pump motor(s), the full-load current of the associated fire pump accessory equipment, and 100 percent of the remaining loads supplied by the transformer. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

695.7 Power Wiring. Power circuits and wiring methods shall comply with the requirements in 695.7(A) through (H), and as permitted in 230.90(A), Exception No. 4; 230.94, Exception No. 4; 230.95, Exception No. 2; 240.13; 230.208; 240.4(A); and 430.31.

(A) ~~Supply~~ <u>Supply</u> Conductors.

(1) Services and On-Site Power Production ~~Facility~~ <u>Facility</u>. Service conductors and conductors supplied by an on-site power production facility shall be physically routed outside a building(s) and shall be installed as service conductors in accordance with Part III and Part IV of Article 230. Where supply conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).

(2) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.4(B)(4), all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).

Exception to (A) (2): Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement for routing outside of the building(s) shall apply only to those conductors on the load side of that point automatic connection between sources.

(3) Supervised or On-Site Standby Generator Connections. Fire pump supply conductors on the load side of the final disconnecting means and ~~overcurent~~ <u>overcurrent</u> device(s) permitted by 695.4(C) or conductors that connect directly to an on-site generator shall comply with all of the following:

a. Independent Routing. The conductors shall be kept entirely independent of all other wiring.

b. Associated Fire Pump Loads. The conductors shall supply only loads that are directly associated with the fire pump system.

c. Protection from Potential Damage. The conductors shall be protected to resist potential damage by fire, structural failure, or operational accident.

d. Inside a Building. When routed through a building, the conductors shall be installed using one of the following methods;

(1) Be encased in a minimum 50 mm (2 in.) of concrete

(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2-hour and dedicated to the fire pump circuit(s).

(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating

FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain fire rating.

Exception to (3)(d): The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 700. 9(D) of this Code.

(B) Conductor Size.

(1) Fire Pump Motors and Other Equipment. Conductors supplying a fire pump motor(s), pressure maintenance pumps, and associated fire pump accessory equipment shall have a rating not less than 125 percent of the sum of the fire pump motor(s) and pressure maintenance motor(s) full-load current(s), and 100 percent of the associated fire pump accessory equipment.

(2) Fire Pump Motors Only. Conductors supplying only a fire pump motor shall have a minimum ampacity in accordance with 430.22 and shall comply with the voltage drop requirements in 695.8.

(C) Overload Protection. Power circuits shall not have automatic protection against overloads. Except for protection of transformer primaries provided in 695.6(C)(2), branch-circuit and feeder conductors shall be protected against short circuit only. Where a tap is made to supply a fire pump, the wiring shall be treated as service conductors in accordance with 230.6. The applicable distance and size restrictions in 240.21 shall not apply.

Exception No. 1: Conductors between storage batteries and the engine shall not require overcurrent protection or disconnecting means.

Exception No. 2: For on-site standby generator(s) rated to produce continuous current in excess of 225 percent of the full-load amperes of the fire pump motor, the conductors between the on-site generator(s) and the combination fire pump transfer switch controller or separately mounted transfer switch shall be installed in accordance with 695.7(A)(3)d.

The protection provided shall be in accordance with the short-circuit current rating of the combination fire pump transfer switch controller or separately mounted transfer switch.

(D) Pump Wiring. All wiring from the controllers to the pump motors shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit Type LFNC-B, listed Type MC cable with an impervious covering, or Type MI cable.

(E) Junction Points. Where wire connectors are used in the fire pump circuit, the connectors shall be listed. A fire pump controller or fire pump power transfer switch, where provided, shall not be used as a junction box to supply other equipment, including a pressure maintenance (jockey) pump(s). A fire pump controller and fire pump power transfer switch, where provided, shall not serve any load other than the fire pump for which it is intended.

(F) Mechanical Protection. All wiring from engine controllers and batteries shall be protected against physical damage and shall be installed in accordance with the controller and engine manufacturer's instructions.

(G) Ground Fault Protection of Equipment. Ground fault protection of equipment shall not be permitted for fire pumps.

(H) Onsite Standby Generator Disconnecting Means. Where the power source is supplied by on-site generator(s), the supply conductors shall connect to a generator disconnecting means dedicated for the purpose of serving the fire pump. The disconnecting means shall be located in a separate enclosure from other generator disconnecting means.

695.8 Voltage Drop.

(A) Starting Voltage Drop. The voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor starting conditions.

(B) Mechanical Operator. The requirements of 695.8(A) shall not apply to emergency- run mechanical starting.

(C) Running Voltage Drop. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.

695.9 On-Site Standby Generator Systems.

(A) Capacity.

(1) Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 695.5(B), they shall be of sufficient capacity to allow normal starting and rung of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of 695.8

(2) A tap ahead of the on-site generator disconnecting means shall not be required.

(B) Power Sources.

~~(1)~~ These power sources shall comply with 695.8 and shall meet the requirements of Level 1, Type 10 emergency power systems. ~~, Class X systems of NFPA 110, Standard for Emergency and Standby Power Systems.~~

~~(2) The fuel supply capacity shall be sufficient to provide 8 hours of fire pump operation at 100 percent of the rated pump capacity in addition to the supply required for other demands.~~

FPN: Type 10 systems are required to make emergency power available in 10 or less seconds. See NFPA -110 *Standard for Emergency and Standby Power Systems* for definition of Level 1 Emergency Power System. See NFPA-20 for fuel capacity requirements.

(C) Sequencing. Automatic sequencing of the fire pumps shall be permitted as a means of meeting the voltage drop requirements of 695.8.

(D) Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.

(E) Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load (See NFPA 20, 9.6.5)

FPN: This is to prevent any Generator Protective Devices from tripping when the fire pump load is transferred to the generator. The subject protective device(s), where used, need to be sized to allow the The generator to allow will instantaneous pickup of the full pump room load. ~~This includes~~ , including the staring any and all connected fire pumps in the across-the-line (direct on line) full voltage staring mode. This is always the case when the fire pump(s) is running by use of the Emergency Mechanical Operator of the fire pump controller(s). (See NFPA-20 9.6, On-Site Standby Generator Systems.). ~~(Not applicable here. (Emergency Run Mechanical Control at Controller).~~

695.10 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.

(A) Mounting. The junction box shall be securely mounted.

(B) Controller Enclosure Integrity. Mounting and installing of a junction box shall not violate the enclosure type (NEMA) rating of the fire pump controller(s).

(C) Controller Short Circuit Rating Integrity. Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the short-circuit rating of the controller(s).

(D) Type Rating. As a minimum, a ~~*National Electrical Manufacturer's Association*~~ (NEMA) Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed for the subject to match the fire pump controller enclosure Type rating.

(E) Terminals. Terminals, junction blocks, splices, and the like, when used, shall be listed.

695.11 Listed Electrical Circuit Protective System to Controller Wiring.

(A) Single Conductors. Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with this code.

FPN: This is to avoid ~~Cutting slots or rectangular cutouts in a fire pump controller will violate the manufacturer's~~ violating the enclosure type rating, ~~and~~ and/or the ~~controller's~~ controller short-circuit (withstand) rating ~~and will void the manufacturer's warrantee.~~ See also 300.20 and Article 322.

(B) Single conductors (individual conductors) shall not enter the fire pump enclosure separately.

(C) Smoke Seal. Where required by the listing of the electrical circuit protective system, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.

FPN When so required, this seal is to prevent flammable gases from entering into the fire pump controller.

(D) Standard wiring between junction box and controller is acceptable.

695.12 Raceway Terminations.

(A) Hubs. Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.

(B) Type Rating. The NEMA Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

(C) Installation. The installation instructions of the manufacturer of the fire pump controller shall be followed.

(D) Controller Alterations. No alterations to the fire pump controller, other than conduit entry as allowed by this code, shall be made without the approval of ~~approved by~~ the authority having jurisdiction.

695.13 Listed Equipment. Diesel engine fire pump controllers, electric fire pump controllers, electric motors, fire pump power transfer switches, foam pump controllers, and limited service controllers shall be listed for fire pump service. [NFPA 20:9.5.1.1, 10.1.2.1, 12.1.3.1]

695.14 Equipment Location.

(A) Controllers and Transfer Switches. Electric motor-driven fire pump controllers and power transfer switches shall be located as close as practicable to, and within sight of, the motors that they control.

(B) Engine-Drive Controllers. Engine-drive fire pump controllers shall be located as close as is practical to, and within sight of, the engines that they control.

(C) Storage Batteries. Storage batteries for fire pump engine drives shall be supported above the floor, secured against displacement, and located where they are not subject to physical damage, flooding with water, excessive temperature, or excessive vibration.

(D) Energized Equipment. All energized equipment parts shall be located at least 300 mm (12 in.) above the floor level.

(E) Protection Against Pump Water. Fire pump controllers and power transfer switches shall be located or protected so that they are not damaged by water escaping from pumps or pump connections.

(F) Mounting. All fire pump control equipment shall be mounted in a substantial manner on noncombustible supporting structures.

695.15 Control Wiring.

(A) Control Circuit Failures. External control circuits that extend outside the fire pump room shall be arranged so that failure of any external circuit (open or short circuit) shall not prevent the operation of a pump(s) from all other internal or external means. Breakage, disconnecting, shorting of the wires, or loss of power to these circuits could cause continuous running of the fire pump but shall not prevent the controller(s) from starting the fire pump(s) due to causes other than these external control circuits. All control conductors within the fire pump room that are not fault tolerant shall be protected against physical damage. [NFPA 20:10.5.2.6, 12.5.2.5]

(B) Sensor Functioning. No undervoltage, phase-loss, frequency-sensitive, or other sensor(s) shall be installed that automatically or manually prohibit actuation of the motor contactor. [NFPA 20:10.4.5.6]

Exception: A phase loss sensor(s) shall be permitted only as a part of a listed fire pump controller.

(C) Remote Device(s). No remote device(s) shall be installed that will prevent automatic operation of the transfer switch. [NFPA 20:10.8.1.3]

(D) Engine-Drive Control Wiring. All wiring between the controller and the diesel engine shall be stranded and sized to continuously carry the charging or control currents as required by the controller manufacturer. Such wiring shall be protected against physical damage. Controller manufacturer's specifications for distance and wire size shall be followed. [NFPA 20:12.3.5.1]

(E) Electric Fire Pump Control Wiring Methods. All electric motor-driven fire pump control wiring shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit Type B (LFNC-B), listed Type MC cable with an impervious covering, or Type MI cable.

(F) Generator Control Wiring Methods. Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) encased in 50 mm (2 in.) of concrete or within enclosed construction dedicated to the fire pump circuits and having a minimum 1-hour fire resistance rating, or circuit protective systems with a minimum of 1-hour fire resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.

Substantiation: The recommended text is based upon the TCC write-up in the A2007 ROP.

Revisions are also per the NEMA Explanation of Negative Vote Comments printed in the NEC ROP.

Revisions are also per R. Swayne's Explanation as follows:

Revisions to the ROP Version of

Article 695 for the
2008 Edition of NFPA-70

ARTICLE 695 Fire Pumps

Responses to Explanations of Negative Vote Comments

NEMA C & S Rejection Text:

NASBY, J.: NEMA disagrees with the rewrite outlined in this proposal. The arrangement of the material introduces new confusion to an Article that was already not clear in its intent. In addition, the revision adds material that is in NFPA 20 and should remain in NFPA 20. The responsibility of the NEC is for the installation requirements for the fire pump. Design requirements related to performance should not be moved to the NEC. An example of this problem is in proposed 695.5(A) to require an alternate source when the pumping capacity is beyond that of fire department apparatus. This is not an installation requirement, but is information that should remain in NFPA 20 only. – Text of 695.5(A) revised. Also, Fine Print Note (FPN) added to 695.5(A) and 695.5(C). Also corrected some missed spelling and typo. errors.

In addition, the revisions add a number of Fine Print Notes that are unacceptable and in violation of the NEC Style Manual. Examples of these notes include:

1. 695.4(D)(3) FPN – Contains a recommendation -- Done.
2. 695.4(D)(4) FPN – Contains a recommendation -- Done.
3. 695.5(B) FPN – Contains recommendations as well as an attempted interpretation of the requirement --Done .
4. 695.9(E) FPN – contains recommendations -- Done.
5. 695.11(E) FPN – deals with warranty issues and is inappropriate in the NEC and in a FPN -- Done.

Other technical issues include (but are not limited to):

1. 695.6(I) – does not recognize installations where large generator sets are paralleled and supply switchboards or switchgear that then serves the various connected loads. -- There is no clause "695.6(I)".
2. 695.4(C) – limits the installation to one disconnect between the source and the controller. Should a transfer switch be installed ahead of the controller, another disconnect would not be permitted. This is contrary to typical installation where a remote disconnect is applied at the normal source of supply and then supplies the transfer switch. – Correct. Only a single disconnect and OCPD is allowed ahead of the Normal Source and the fire pump controller. This is illustrated in NFPA-20 FIGURE A.9.3.2 "Typical Power Supply Arrangements from Source to Motor" "Arrangement B" and in FIGURE A.10.8 "Typical Fire Pump Controller and Transfer Switch Arrangements" "ARRANGEMENT II". A single disconnect (with or without OCPD) is allowed ahead of an upstream transfer switch.
3. 695.4(D) – it would appear that the requirement to not locate the disconnecting means in with other equipment has been lost in the revision without any substantiation. – Noted. The only four connections allowed are (#1) Direct Connection via: Dedicated Service (695.4(B)(1), On-Site Power Plant (695.4(B)(2), Dedicated Fire Pump Feeder (695.4(B)(3)); #2 Campus style feeder (695.4(B)(4); #3 Supervised Connection (695.4(D)); and Transformer Connection (695.4(B)(5)). Made editorial correction to incorrect reference to 695.4(A) which should be 695.4(C). Done.
4. 695.4(B)(4)(e) – the requirement for selective coordination creates significant technical concern. It may be impossible to design a system where the overcurrent protection for the fire pump circuit (size very large to carry locked rotor current) could be selectively coordinated with an upstream device that is part of the normal distribution system protection. It may also end up causing the other parts of the distribution system equipment to be oversized to simply accomplish the selectivity requirement. This is not justified or substantiated and decreases safety because of the increase in arc flash hazard. This is part of the requirements for multi-building campus style connection where allowed. Fire pump equipment is considered expendable while fighting a fire. The equipment is designed to and intended to run to destruction. No other loads are allowed to pose a hazard to the power supply for a fire pump or pumps. Arc-flash protection is part of NFPA-70E. Fire pump controllers very often have high short circuit current rating with 100,000 Amp Symmetrical be the most common. This is due to their use in large buildings or facilities. **[Thru buildings clause missing?]**

Other requirements that are inappropriate for the NEC include:

1. 695.9(A)(1) – a direct mandatory reference to NFPA 110, which is prohibited by the NEC Style Manual -- Done. Moved reference to new FPN.
2. 695.9(B)(2) – requirements for fuel supply capacity for a generator which is not an NEC installation issue – Done. Deleted. Moved reference to NFPA-20 to new FPN.
3. 695.10(D) – A mandatory reference to NEMA Type 2 – which is reference to another standard that is prohibited by the NEC Style Manual. – Done. Moved to new FPN.
4. 695.12(D) – is in conflict with the provisions of 90.4 – Done. Wording was incorrect.
5. 5.695.3(C) – this material is redundant with 90.3 – Clause isn't redundant with 90.3. This clause is for inspection and enforcement agencies to prevent installation materials and equipment not complying with this standard. This is important for both low voltage and medium voltage installations since auxiliary and ancillary equipment is often installed in the power path or signal paths. Said equipment varies widely.

The complete concept of this revision needs to be addressed in the comment phase with the objective of keeping Article 695 limited to installation requirements necessary for the application of the NEC. – Done.

Swane Rejection Text:

SWAYNE, R.: This proposal should be rejected for many reasons. NFPA 20 has its place and Article 695 has its place, the two should not become one. The Scope of Article 695 covers the installation of power sources and interconnecting units and the installation of switching and control equipment dedicated to fire pump drives. It does not cover performance, maintenance, and testing of the fire pump system. The Scope of NFPA 20 covers minimum performance and testing requirements of the sources and transmission of electric power to motors driving fire pumps. The two scopes are not the same and each is necessary. – Noted. Note that these installations are usually reviewed by at least two plan approval agencies and two inspection groups, namely electrical and fire prevention. This section (695) has carried the power supply extracted text from NFPA-20 since the NFPA-70 (NEC) has wider circulation than NFPA-20, the extracted text helps prevent rejections and delays and unreliable installations. The wholesale replacement of one standard by another will leave electricians and Authorities Having Jurisdiction without the guidance necessary to provide safe installations of fire pumps. If it is felt that Article 695 is lacking in some of the requirements that NFPA 20 indicates as being important, then a paragraph by paragraph review should be performed. In this way, there will not be any danger in deleting any of the safe practices that exist today. – Also noted. This is the purpose of Article 695. The purpose is not to replicate NFPA-20; but, to carry over only those clauses pertinent to plan approval agencies, installers, and inspectors.

As examples of where the proposed action is deficient:

1) Section 695.3(G) prohibits phase converters which was not accepted by NFPA 20 as documented in the substantiation to Proposal 13-81. See Negative Comment on Proposal 13-81. – See the somewhat confusing history of this topic in NFPA-20 copied below. At this time, Phase Converters are not allowed by the NFPA-20 Technical Committee.

20-71 Log #59 **Final Action: Reject**
(9.2.1.1)

SUBMITTER: Kevin J. Kelly, National Fire Sprinkler Association

RECOMMENDATION: State whether or not phase converters are allowed where a 3-phase motor is being used for the fire pump, but three-phase electricity isn't available.

SUBSTANTIATION: The users of NFPA 20 need guidance on whether or not the use of phase converters constitutes "a reliable source" of power. The situation occurs frequently where three-phase power is not available. How is this problem intended to be addressed?

Is there a need to list phase converters for fire pump service? Is there a need to regulate how phase reversal will be monitored and annunciated?

Users of the standard need answers to these questions.

COMMITTEE MEETING ACTION: Reject

COMMITTEE STATEMENT: Performance of this equipment is not suitable for this service.

NUMBER ELIGIBLE TO VOTE: 27

BALLOT RESULTS: Affirmative: 24 Negative: 1

BALLOT NOT RETURNED: 2 LEICHT, MEZSICK

EXPLANATION OF NEGATIVE:

HAAGENSEN: If the Committee strongly considers that phase converters are not suitable for this purpose, then the provisions of NFPA 20 should clearly state that sentiment.

20- 8 Log #38 **Final Action: Accept in Principle**
(9.2.1)

Submitter: Jon Nisja, Northcentral Regional Fire Code Development Committee
Comment on Proposal No: 20-71
Recommendation: Add a new section to read:
9.2.x Phase converters shall not be permitted to be used for fire pump service.
Substantiation: Based on the committee statement to the proposal and the negative comment of Mr. Haagensen we have submitted a comment to include the prohibition of the converters to clarify the issue.
Committee Meeting Action: Accept in Principle
See Committee Action and Statement on 20-42 (Log #37).
Committee Statement: See Committee Action and Statement on 20-42 (Log #37).
Number Eligible to Vote: 27
Ballot Results: Affirmative: 26
Ballot Not Returned: Mezsick, S.

20-42 Log #37 **Final Action: Accept**
(A.9.2.1.1)

Submitter: Kenneth E. Isman, National Fire Sprinkler Association
Comment on Proposal No: 20-71
Recommendation: Add an annex note to 9.2. . as follows:
A.9.2 Phase converters that take single phase power and convert it to three phase power for the use of fire pump motors are not recommended because of the imbalance in the voltage between the phases when there is no load on the equipment. If the power utility installs a phase converters in their own power transmission lines, such phase converters are outside the scope of this standard and need to be evaluated by the AHJ to determine the reliability of the electric supply.
Substantiation: This was our understanding from the discussion at the ROP meeting as to the reason for the rejection of our proposal. If this information is true, it should be recorded in the annex.
Committee Meeting Action: Accept
Number Eligible to Vote: 27
Ballot Results: Affirmative: 26
Ballot Not Returned: Mezsick, S.

2) Section 695.4(B)(4)(c) refers to itself as being impractical. – Done. Clause corrected. This is a numbering error carried forward.

3) Section 695.4(B)(5) refers to "service" whereas the facility does not have to be a campus to have a primary service with a low voltage supply feeding the building or structure. – Although place last, this clause, 695.4(B)(5) does not relate to the campus style method of 695.4(B)(4). It also applies service at low voltage, medium voltage or high voltage. For example: 480 Vac to 208 Vac, 7,000 Vac to 480 Vac or 13.8 KVac to 240 Vac.

4) Section 695.4(F)(4) refers to weekly recorded inspections which are proper for NFPA 20, but not for NFPA 70 which is an installation code. – Although periodic inspections and maintenance are generally covered in NFPA-25 for sprinkler systems, this clause is separate and does not fall in the realm of normal inspection of fire pumps or sprinkler systems. It applies directly to the assurance of power being available for the fire pump. This is important to plan approval agencies, installers and inspectors to know of this provision along with the other electrical requirements so that provisions can be made.

5) Section 695.5(A) is a new requirement that may be enforced by the Fire Marshal, but not by the electrical AHJ. Noted. Clause revised.

6) Section 695.5(B) requires an alternate source when the normal source is not reliable without defining "reliable". "Reliable" is not defined in Article 100 and the attempt to define it by the unenforceable FPN is confusing. Noted. Clause modified.

7) Section 695.5(B), FPN No. 4 refers to conditions that are not permitted. This may signal the installer that it may not be permitted, but you can do it anyway if you provide an alternate source. This sends the wrong signal. Noted. FPN deleted.

8) Editorially, "when" should be replaced by "where" in several locations to meet the Style Manual – Noted. I'm asking for direction from NFPA staff I'm trying to minimize differences in extracted text compared to the source document.

9) It is not apparent what is included in Section 695.7(A) and what is in Section 695.7(B). – Corrected spelling error and missing text in title of 695.7 and sub-clause (A). Proposed 695.7 [Power Wiring] (A) [Supply Conductors] is essentially similar to extant [2005] 695.6 [Power Wiring] sub-clauses (A) [Service Conductors] and (B) [Circuit Conductors]. 695.7(B) [Conductor Sizes] is essentially similar to extant 695.6(C) [Conductor Size].

10) Section 695.7(A)(B)(3) refers to load side of the "service" disconnecting means. A multi-building campus or a facility with a primary service generally does not have a "service" to each of its buildings. – Acknowledge. The term "service" here means the campus service equipment, such as double ended switchgear (main-tie-main). A FPN may be in order to help clarify since the campus distribution, while typically medium voltage, is also typically down stream of transformers, and where the primary side, the secondary side, or both may be arranged as double ended.

11) Section 695.7(A)(B)(3) refers to disconnecting means and overcurrent devices permitted by Section 695.4(B). Section 695.4(B) does not cover these items. Correct. Corrected reference to read "695.4(C)".

This proposal is premature and should be rejected. The Proposer should come back with a detailed comparison for consideration. Noted. Revisions made accordingly with appreciation for these observations and corrections.

Panel Meeting Action: Reject
Panel Statement: The panel has looked at this proposed revision of Article 695 as a collective body of work and determined that there are too many correlation, style, and technical issues that cannot be resolved within the time frame of the ROP meeting. This proposal is similar in nature to Proposal 13-77 for the 2008 NEC, which also proved too cumbersome for the panel to act on and ensure proper technical correlation with NFPA 20. To that end, CMP-13 has acted on Proposals 13-60a, 13-77a, and 13-95a to provide correlation between important sections of NFPA 20 and Article 695. These actions are based on the recommended changes for the 2010 edition of NFPA 20 as accepted by the NFPA 20 technical committee in their ROP and ROC actions.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-48 Log #71 NEC-P13 **Final Action: Accept**
(695)

Note: This Proposal appeared as Comment 13-105 on Proposal 13-77 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-77 was:
Revise extracted text from NFPA 20 to reflect 2006 edition revisions. Following is the NFPA 20 - Chapter 9 text as it has been voted on by the NFPA 20 Committee to date.
NFPA 20 - DRAFT
Chapter 9 Electric Drive for Pumps
9.1 General.
9.1.1 This chapter covers the minimum performance and testing requirements of the sources and transmission of electrical power to motors driving fire pumps.
9.1.2 Also covered are the minimum performance requirements of all intermediate equipment between the source(s) and the pump, including the motor(s) but excepting the electric fire pump controller, transfer switch, and accessories (see Chapter 10).
9.1.3 All electrical equipment and installation methods shall comply with NFPA 70, National Electrical Code, Article 695, and other applicable articles.
9.1.4* All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.
9.1.5 All power supplies shall have the capacity to run the fire pump on a continuous basis.
9.1.6 All power supplies shall comply with the voltage drop requirements of Section 9.7.
9.2 Normal Power.
9.2.1 An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.
9.2.2 The normal source of power required in 9.2.1 and its routing shall be arranged in accordance with one of the following:
(1) Service connection dedicated to the fire pump installation.
(2) On-site power production facility connection dedicated to the fire pump installation.
(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.

(4) As a feeder connection where all of the following conditions are met:
a. The protected facility is part of a multi-building campus style arrangement.
b. A back-up source of power is provided from a source independent of the normal source of power.
c. It is impractical to supply the normal source of power through arrangement 9.2.2(1), 9.2.2(2), 9.2.2(3) or 9.2.2(5).
d. The arrangement is acceptable to the authority having jurisdiction.
e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).
(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695 of NFPA 70.
9.2.3 For fire pump installations using the arrangement of 9.2.2(1), 9.2.2(2),9.2.2(3), 9.2.2(5) for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.
9.2.3.1 Where the disconnecting means permitted by 9.2.3 is installed, the disconnecting means shall meet all of the following:
(1) Identified as being suitable for use as service equipment.
(2) Lockable in the closed position.
(3) * Located remote from other building disconnecting means.
(4) * Located remote from other fire pump source disconnecting means.
(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers.
9.2.3.2 Where the disconnecting means permitted by 9.2.3 is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.
9.2.3.3 Where the disconnecting means permitted by 9.2.3 is installed, the disconnect shall be supervised in the closed position by one of the following methods:
(1) Central station, proprietary or remote station signal device
(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location
(3) Locking the disconnecting means in the closed position
(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner
9.2.3.4 Where the overcurrent protection permitted by 9.2.3 is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment.
9.3 Alternate power.
9.3.1 Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus.
9.3.2* Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided where the normal source is not reliable.
9.3.3 An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.
9.3.4 When provided, the alternate source of power shall be supplied from one of the following sources:
(1) A generator installed in accordance with Section 9.8.
(2) One of the sources identified in 9.2.2(1); 9.2.2(2); 9.2.2(3); or 9.2.2(5) when the power is provided independent of the normal source of power.
9.3.5 When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations.
9.4 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.
9.4.1 The junction box shall be securely mounted.
9.4.2* Mounting and installing of a junction box shall not violate the enclosure Type (NEMA) rating of the fire pump controller(s).
9.4.3* Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the Short Circuit Rating of the controller(s).
9.4.4 As a minimum, a National Electrical Manufacturers Association (NEMA) Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed f or the subject to match the fire pump controller enclosure Type rating.
9.4.5 Terminals, junction blocks, splices, and the like, when used, shall be listed.
9.5* Listed Electrical Circuit Protective System to Controller Wiring.
9.5.1* Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with NFPA 70.
9.5.2 Single (individual conductors) shall not enter the fire pump enclosure separately.
9.5.3* Where required by the manufacturer of a listed Electrical Circuit Protective System or by NFPA 70 or by the Listing agency, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.
9.5.4 Standard wiring between junction box and controller is acceptable.
9.6* Raceway Terminations.
9.6.1 Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.
9.6.2 The NEMA Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.
9.6.3 The installation instructions of the manufacturer of the fire pump controller shall be followed.
9.6.4 No alterations to the fire pump controller, other than conduit entry as allowed by NFPA 70, shall be approved by the authority having jurisdiction.
9.7* Voltage Drop.
9.7.1 Unless the requirements of 9.4.2 are met, the voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor-starting conditions.
9.7.2 The requirements of 9.7.1 shall not apply to emergency run mechanical starting. (See 10.5.3.2.)
9.7.3 The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.
9.8 Motors.
9.8.1 General.
9.8.1.1 All motors shall comply with NEMA MG-1, Motors and Generators, shall be marked as complying with NEMADesign B standards, and shall be specifically listed for fire pump service. (See Table 9.8.1.1.)
Table 9.8.1.1 Horsepower and Locked Rotor Current Motor Designation for NEMA Design B Motors
9.8.1.2 The requirements of 9.8.1.1 shall not apply to direct-current, high-voltage (over 600 V), large-horsepower [over 373 kW (500 hp)], single-phase, universal-type, or wound-rotor motors, which shall be permitted to be used where approved.
9.8.1.3 Motors used with variable speed controllers shall additionally meet the applicable requirements of NEMA MG1, Part 31 and shall be marked for inverter duty.
9.8.1.4* The corresponding values of locked rotor current for motors rated at other voltages shall be determined by multiplying the values shown by the ratio of 460 V to the rated voltage in Table 9.8.1.1.
9.8.1.5 Code letters of motors for all other voltages shall conform with those shown for 460 V in Table 9.8.1.1.
9.8.1.6 All motors shall be rated for continuous duty.
9.8.1.7 Electric motor–induced transients shall be coordinated with the provisions of 10.4.3.3 to prevent nuisance tripping of motor controller protective devices.
9.8.1.8 Motors for Vertical Shaft Turbine–Type Pumps.
9.8.1.8.1 Motors for vertical shaft turbine–type pumps shall be dripproof, squirrel-cage induction type.
9.8.1.8.2 The motor shall be equipped with a nonreverse ratchet.
9.8.2 Current Limits.
9.8.2.1 The motor capacity in horsepower shall be such that the maximum motor current in any phase under any condition of pump load and voltage unbalance shall not exceed the motor-rated full-load current multiplied by the service factor.
9.8.2.2 Where the motor is used with a variable speed pressure limiting controller, the service factor shall not be used.
9.8.2.3 The maximum service factor at which a motor shall be used is 1.15.
9.8.2.4 These service factors shall be in accordance with NEMA MG-1, Motors and Generators.
9.8.2.5 General-purpose (open and dripproof) motors, totally enclosed fan-cooled (TEFC) motors, and totally enclosed nonventilated (TENV) motors shall not have a service factor larger than 1.15.
9.8.2.6 Motors used at altitudes above 1000 m (3300 ft) shall be operated or derated according to NEMA MG-1, Motors and Generators, Part 14.
9.8.3 Marking.
9.8.3.1 Marking of motor terminals shall be in accordance with NEMA MG-1, Motors and Generators, Part 2.
9.8.3.2 A motor terminal connecting diagram for multiple lead motors shall be furnished by the motor manufacturer.
9.9 On-Site Standby Generator Systems.
9.9.1 Capacity.
9.9.1.1 Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 9.3.2, they shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of Section 9.7.
9.9.1.2 A tap ahead of the on-site generator disconnecting means shall not be required.
9.9.2* Power Sources.

9.9.2.1 These power sources shall comply with Section 9.7 and shall meet the requirements of Level 1, Type 10, Class X systems of NFPA 110, Standard for Emergency and Standby Power Systems.

9.9.2.2 The fuel supply capacity shall be sufficient to provide 8 hours of fire pump operation at 100 percent of the rated pump capacity in addition to the supply required for other demands.

9.9.3 Sequencing. Automatic sequencing of the fire pumps shall be permitted in accordance with 10.5.2.5.

9.9.4 Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.

9.9.5* Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump.

Submitter: Jim Pauley, Square D Company

Recommendation: This Proposal should remain Rejected.

Substantiation: The TCC was correct to return this proposal back to the panel. It has so many problems introduced by the revision that the panel should not try to salvage any type of significant rewrite during the comment phase. The panel should revisit the individual proposals for Article 695 and review each one based on its merit for inclusion in Article 695. The revision proposed by Proposal 13-77 is completely unacceptable for the NEC.

Panel Meeting Action: Accept

Panel Statement: See the panel action and statement on Proposal 13-47.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Note: This Proposal appeared as Comment 13-107 on Proposal 13-77 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-77 was:

Revise extracted text from NFPA 20 to reflect 2006 edition revisions. Following is the NFPA 20 - Chapter 9 text as it has been voted on by the NFPA 20 Committee to date.

NFPA 20 - DRAFT

Chapter 9 Electric Drive for Pumps

9.1 General.

9.1.1 This chapter covers the minimum performance and testing requirements of the sources and transmission of electrical power to motors driving fire pumps.

9.1.2 Also covered are the minimum performance requirements of all intermediate equipment between the source(s) and the pump, including the motor(s) but excepting the electric fire pump controller, transfer switch, and accessories (see Chapter 10).

9.1.3 All electrical equipment and installation methods shall comply with NFPA 70, National Electrical Code, Article 695, and other applicable articles.

9.1.4* All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.

9.1.5 All power supplies shall have the capacity to run the fire pump on a continuous basis.

9.1.6 All power supplies shall comply with the voltage drop requirements of Section 9.7.

9.2 Normal Power.

9.2.1 An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.

9.2.2 The normal source of power required in 9.2.1 and its routing shall be arranged in accordance with one of the following:

(1) Service connection dedicated to the fire pump installation.

(2) On-site power production facility connection dedicated to the fire pump installation.

(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.

(4) As a feeder connection where all of the following conditions are met:

a. The protected facility is part of a multi-building campus style arrangement.

b. A back-up source of power is provided from a source independent of the normal source of power.

c. It is impractical to supply the normal source of power through arrangement 9.2.2(1), 9.2.2(2), 9.2.2(3) or 9.2.2(5).

d. The arrangement is acceptable to the authority having jurisdiction.

e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).

(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695 of NFPA 70.

9.2.3 For fire pump installations using the arrangement of 9.2.2(1), 9.2.2(2),9.2.2(3), 9.2.2(5) for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.

9.2.3.1 Where the disconnecting means permitted by 9.2.3 is installed, the disconnecting means shall meet all of the following:

(1) Identified as being suitable for use as service equipment.

(2) Lockable in the closed position.

(3) * Located remote from other building disconnecting means.

(4) * Located remote from other fire pump source disconnecting means.

(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers.

9.2.3.2 Where the disconnecting means permitted by 9.2.3 is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.

9.2.3.3 Where the disconnecting means permitted by 9.2.3 is installed, the disconnect shall be supervised in the closed position by one of the following methods:

(1) Central station, proprietary or remote station signal device

(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location

(3) Locking the disconnecting means in the closed position

(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner

9.2.3.4 Where the overcurrent protection permitted by 9.2.3 is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment.

9.3 Alternate power.

9.3.1 Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus.

9.3.2* Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided where the normal source is not reliable.

9.3.3 An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.

9.3.4 When provided, the alternate source of power shall be supplied from one of the following sources:

(1) A generator installed in accordance with Section 9.8.

(2) One of the sources identified in 9.2.2(1); 9.2.2(2); 9.2.2(3); or 9.2.2(5) when the power is provided independent of the normal source of power.

9.3.5 When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations.

9.4 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.

9.4.1 The junction box shall be securely mounted.

9.4.2* Mounting and installing of a junction box shall not violate the enclosure Type (NEMA) rating of the fire pump controller(s).

9.4.3* Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the Short Circuit Rating of the controller(s).

9.4.4 As a minimum, a National Electrical Manufacturers Association (NEMA) Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed f or the subject to match the fire pump controller enclosure Type rating.

9.4.5 Terminals, junction blocks, splices, and the like, when used, shall be listed.

9.5* Listed Electrical Circuit Protective System to Controller Wiring.

9.5.1* Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with NFPA 70.

9.5.2 Single (individual conductors) shall not enter the fire pump enclosure separately.

9.5.3* Where required by the manufacturer of a listed Electrical Circuit Protective System or by NFPA 70 or by the Listing agency, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.

9.5.4 Standard wiring between junction box and controller is acceptable.

9.6* Raceway Terminations.

9.6.1 Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.

9.6.2 The NEMA Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

9.6.3 The installation instructions of the manufacturer of the fire pump controller shall be followed.

9.6.4 No alterations to the fire pump controller, other than conduit entry as allowed by NFPA 70, shall be approved by the authority having jurisdiction.

9.7* Voltage Drop.

9.7.1 Unless the requirements of 9.4.2 are met, the voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor-starting conditions.

9.7.2 The requirements of 9.7.1 shall not apply to emergency run mechanical starting. (See 10.5.3.2.)

9.7.3 The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.

9.8 Motors.

9.8.1 General.

9.8.1.1 All motors shall comply with NEMA MG-1, Motors and Generators, shall be marked as complying with NEMADesign B standards, and shall be specifically listed for fire pump service. (See Table 9.8.1.1.)

Table 9.8.1.1 Horsepower and Locked Rotor Current Motor Designation for NEMA Design B Motors

9.8.1.2 The requirements of 9.8.1.1 shall not apply to direct-current, high-voltage (over 600 V), large-horsepower [over 373 kW (500 hp)], single-phase, universal-type, or wound-rotor motors, which shall be permitted to be used where approved.

9.8.1.3 Motors used with variable speed controllers shall additionally meet the applicable requirements of NEMA MG1, Part 31 and shall be marked for inverter duty.

9.8.1.4* The corresponding values of locked rotor current for motors rated at other voltages shall be determined by multiplying the values shown by the ratio of 460 V to the rated voltage in Table 9.8.1.1.

9.8.1.5 Code letters of motors for all other voltages shall conform with those shown for 460 V in Table 9.8.1.1.

9.8.1.6 All motors shall be rated for continuous duty.

9.8.1.7 Electric motor–induced transients shall be coordinated with the provisions of 10.4.3.3 to prevent nuisance tripping of motor controller protective devices.

9.8.1.8 Motors for Vertical Shaft Turbine–Type Pumps.

9.8.1.8.1 Motors for vertical shaft turbine–type pumps shall be dripproof, squirrel-cage induction type.

9.8.1.8.2 The motor shall be equipped with a nonreverse ratchet.

9.8.2 Current Limits.

9.8.2.1 The motor capacity in horsepower shall be such that the maximum motor current in any phase under any condition of pump load and voltage unbalance shall not exceed the motor-rated full-load current multiplied by the service factor.

9.8.2.2 Where the motor is used with a variable speed pressure limiting controller, the service factor shall not be used.

9.8.2.3 The maximum service factor at which a motor shall be used is 1.15.

9.8.2.4 These service factors shall be in accordance with NEMA MG-1, Motors and Generators.

9.8.2.5 General-purpose (open and dripproof) motors, totally enclosed fan-cooled (TEFC) motors, and totally enclosed nonventilated (TENV) motors shall not have a service factor larger than 1.15.

9.8.2.6 Motors used at altitudes above 1000 m (3300 ft) shall be operated or derated according to NEMA MG-1, Motors and Generators, Part 14.

9.8.3 Marking.

9.8.3.1 Marking of motor terminals shall be in accordance with NEMA MG-1, Motors and Generators, Part 2.

9.8.3.2 A motor terminal connecting diagram for multiple lead motors shall be furnished by the motor manufacturer.

9.9 On-Site Standby Generator Systems.

9.9.1 Capacity.

9.9.1.1 Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 9.3.2, they shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of Section 9.7.

9.9.1.2 A tap ahead of the on-site generator disconnecting means shall not be required.

9.9.2* Power Sources.

9.9.2.1 These power sources shall comply with Section 9.7 and shall meet the requirements of Level 1, Type 10, Class X systems of NFPA 110, Standard for Emergency and Standby Power Systems.

9.9.2.2 The fuel supply capacity shall be sufficient to provide 8 hours of fire pump operation at 100 percent of the rated pump capacity in addition to the supply required for other demands.

9.9.3 Sequencing. Automatic sequencing of the fire pumps shall be permitted in accordance with 10.5.2.5.

9.9.4 Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.

9.9.5* Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump.

Submitter: Barry F. O'Connell, Tyco Thermal Controls
Recommendation: Continue to Reject.
Substantiation: The material introduces new confusion to an Article that was already confusing, as pointed out in the NEMA negative comment.
Panel Meeting Action: Accept
Panel Statement: See the panel action and statement on Proposal 13-47.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-50 Log #3826 NEC-P13 **Final Action: Reject**
(695)

Submitter: James S. Nasby, Skokie, IL
Recommendation: If the extracted text relating to power supplies cannot be made to agree with the 2007 Edition of NFPA-20 it should be deleted, leaving only the text relating to Installation that is native to NFPA-70 (the NEC).
Substantiation: 1) The Extant Article 695 extracted text is from the 2003 Edition of NFPA-20 which has been extensively rewritten in the 2007 Edition.

2) 90.9(C)(2), although related to Units of Measure requires that extracted text not be compromised.

3) Since I don't know the status of the work by the NFPA-20 – NEC task group on this topic, I'm submitting this Public Proposal as a contingency proposal.

4) The statement in the Scope that the text is extracted from NFPA 20-2007 is not correct. It's still at the 2003 version.

Note that I'm also submitting another Public Proposal to synchronize (update) the extracted text. This is an important life safety issue. There is significant confusion in the field due to the substantial difference between the two documents.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided specific text. This proposal does not meet the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects.

Submitter: James S. Nasby, Skokie, IL
Recommendation: Synchronize (update) the extract text from 2007 Edition of NFPA-20 Chapter 9 in accordance with CMP-13 Panel Meeting Action on my Public Comment # 13-103, Log, # 1037 of the A2007 Report on Comments.

Revise text as shown below with updated NFPA-20 Reference clause numbering:

ARTICLE 695 Fire Pumps

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 20-2007 ~~3~~, *Standard for the Installation of Stationary Pumps for Fire Protection*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

695.1 Scope.

(A) Covered. This article covers the installation of the following:

(1) Electric power sources and interconnecting circuits

(2) Switching and control equipment dedicated to fire pump drivers

(3) Associated fire pump accessory equipment which includes wiring and overcurrent protection of other loads connected to the power supply.

(B) Not Covered. This article does not cover the following:

(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system

(2) Pressure maintenance (jockey or makeup) pumps

FPN: See NFPA 20-~~2003~~ 2007, *Standard for the Installation of Stationary Pumps for Fire Protection,* for further information.

695.2 Definitions.

Fault Tolerant External Control Circuits. Those control circuits either entering or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump from all other internal or external means and may cause the controller to start the pump under these conditions. [NFPA 20:3.3.7.2]

On-Site Power Production Facility. The normal supply of electric power for the site that is expected to be constantly producing power. [NFPA 20:3.3.34]

On-Site Standby Generator. A facility producing electric power on site as the alternate supply of electric power. It differs from an on-site power production facility, in that it is not constantly producing power. [NFPA 20:3.3.35]

695.3 Power Source(s) for Electric Motor-Driven Fire Pumps.
Electric motor-driven fire pumps shall have a reliable source of power. [NFPA 20:9.2.1]

FPN: NFPA 20-2007, *Standard for the Installation of Stationary Pumps for Fire Protection*, covers characteristics of reliable of reliable sources. Also see the cross-reference in Annex J.

(A) Individual Sources. Where reliable, and where capable of carrying indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply, the power source for an electric motor-driven fire pump shall be one or more of the following.

(1) Electric Utility Service Connection. A fire pump shall be permitted to be supplied by a separate service, or from a connection located ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with 230.82(5). The service equipment shall comply with the labeling requirements in 230.2 and the location requirements in 230.72(B). ~~[NFPA 20:9.2.2]~~

(2) On-Site Power Production Facility. A fire pump shall be permitted to be supplied by an on-site power production facility. The source facility shall be located and protected to minimize the possibility of damage by fire. ~~[NFPA 20:9.2.3]~~

(3) Dedicated Feeder. A dedicated feeder shall be permitted where it is derived from a service connection as described in 695.3(A)(1).

(B) Multiple Sources. Where reliable power cannot be obtained from a source described in 695.3(A), power shall be supplied one of the following:

(1) Two Individual Sources. ~~from a~~ An approved combination of two or more of ~~either of such sources~~ the sources from 695.3(A).

(2) Individual Source and Generator. An approved combination of one or more of the sources in 695.3(A) and an on-site generator complying with 695.3(D). ~~or from an approved combination of feeders constituting two or more power sources as covered in 695.3(B)(2), or from an approved combination of one or more of such power sources in combination with an on-site standby generator complying with 695.3(B)(1) and (B)(3).~~

(C) Multibuilding Campus-Style Complexes. Where the sources in 695.3(A) are not practicable and the installation is part of a multibuilding campus style complex, feeder sources shall be permitted where approved by the authority having jurisdiction and installed in accordance with (1) or (2).

(1) Two Feeder Sources. Two feeders shall be permitted as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).

(2) Feeder and Alternate Source. A feeder shall be permitted as a normal source of power when an alternate source of power independent from the feeder is provided. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B).

~~**(1) Generator Capacity.** An on-site generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the on-site generator disconnecting means shall not be required. The requirements of 430.113 shall not apply. [NFPA 20:9.6.1]~~

~~**(2) Feeder Sources.** This section applies to multibuilding campus-style complexes with fire pumps at one or more buildings. Where sources in 695.3(A) are not practicable, and with the approval of the authority having jurisdiction, two or more feeder sources shall be permitted as one power source or as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 695.4(B). [NFPA 20:9.2.5.3]~~

~~**(3) Arrangement.** The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:9.2.5.1]~~

(~~1~~D) Generator ~~Capacity~~ as Alternate Source. ~~An~~ Where an on-site generator(s) is used ~~to comply with this section~~ as an alternate source of power. The following shall apply:

(1) Capacity. The generator shall have ~~shall be of~~ sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. [NFPA 20:9.6.1.1]

(2) Connection. A tap ahead of the on-site generator disconnecting means shall not be required. [NFPA 20:9.6.1.2]

(3) Adjacent Disconnects. The requirements of 430.113 shall not apply.

(4) Phase Converters. Phase converters shall not be permitted to be used in the fire pump circuit. [NFPA 20:A.9.9.2] {Note that 695.3(D)(4) as 695.19 should be renumber as 695.19 (or 695.8, or 695.9 or 695.13. Phase Converters are not related to gen-set alternate power. I've used 695.19 in the cross reference} [NFPA 20:A.9.9.2]

~~**(3)**~~ **(E) Arrangement.** ~~The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:9.2.5.1]~~

The normal source of power required in 695.4(A) and its routing shall be arranged in accordance with one of the following:

(1) Service connection dedicated to the fire pump installation.

(2) On-site power production facility connection dedicated to the fire pump installation.

(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.

(4) As a feeder connection where all of the following conditions are met:

a. The protected facility is part of a multi-building campus style arrangement.

b. A back-up source of power is provided from a source independent of the normal source of power.

c. It is impractical to supply the normal source of power through arrangement 695.3(E)(4)(a), 695.3(E)(4)(b), 695.3(C)(4)(c) or 695.3(E)(4)(e).

d. The arrangement is acceptable to the authority having jurisdiction.

e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).

(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695.5. [NFPA 20:9.2.2]

695.4 Continuity of Power.

Circuits that supply electric motor-driven fire pumps shall be supervised from inadvertent disconnection as covered in 695.4(A) or 695.4(B).

~~(A) Direct Connection. The supply conductors shall directly connect the power source to either a listed fire pump controller or listed combination fire pump controller and power transfer switch. [NFPA 20:9.3.2.2.2]~~

(A) Continuously Available. An electric motor driven fire pump shall be provided with a normal source of power as a continually available source. [NFPA 20:9.2.1]

(B) Supervised Connection. A single disconnecting means and associated overcurrent protective device(s) shall be permitted to be installed between a remote power source and one of the following:

(1) A listed fire pump controller

(2) A listed fire pump power transfer switch

(3) A listed combination fire pump controller and power transfer switch

For systems installed under the provisions of 695.3(B)(2) only, such additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this *Code*. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized according to 430.62 to provide short-circuit protection only. All disconnecting devices and overcurrent protective devices that are unique to the fire pump loads shall comply with 695.4(B)(1) and 695.4(B)(2). ~~through (B)(5).~~ [NFPA 20:9.2.3]

(1) Overcurrent Device Selection. The overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s). [NFPA 20:9.2.3.4]

~~**(2)** Disconnecting Means. The disconnecting means shall comply with all the following:~~

~~**(1)** Be identified as suitable for use as service equipment~~

~~**(2)** Be lockable in the closed position~~

~~**(3)** Not be located within equipment that feeds loads other then the fire pump~~

~~**(4)** Be located sufficiently remote from other building or other fire pump source disconnecting means such that inadvertent contemporaneous operation would be unlikely~~

~~**(3)** Disconnect Marking. The disconnecting means shall be marked "Fire Pump Disconnecting Means." The letters shall be at least 25 mm (1 in.) in height, and they shall be visible without opening enclosure doors or covers.~~

~~**(4)** Controller Marking. A placard shall be placed adjacent o the fire pump controller, stating the location of this disconnecting means and the location of the key (if the disconnecting means is locked).~~

(2) ~~**(5)**~~ **Supervision.** The disconnecting means shall be supervised in the closed position by one of the following methods:

(1) Central station, proprietary, or remote station signal device

(2) Local signaling service that causes the sounding of an audible signal at a constantly attended point [NFPA 20:9.2.3.3]

(3) Locking the disconnecting means in the closed position

(4) Sealing of disconnecting means and approved weekly recorded inspections when the disconnecting means are located within fenced enclosures or in buildings under the control of the owner. [NFPA 20:9.3.2.2.3]

(C) Connections. For fire pump installations using the arrangement of 695.3(E)(4)(a), 695.3(E)(4)(b), 695.3(E)(4)(c), 695.3(E)(4)(e), for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller. [NFPA 20:9.2.3]

(D) Disconnecting Means. Where the disconnecting means permitted by 695.4(C) is installed, the disconnecting means shall meet all of the following:

(1) Identified as being suitable for use as service equipment.

(2) Lockable in the closed position.

(3) Located remote from other building disconnecting means.

FPN: This is to avoid the inadvertent simultaneous operation of the building and fire pump disconnect switches.

(4) Located remote from other fire pump source disconnecting means.

FPN: This is to avoid the inadvertent simultaneous operation of the disconnect switches of other fire pumps.

(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers. [NFPA 20:9.2.3.1]

(E) Placard. Where the disconnecting means permitted by 695.4(C) is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.

(F) Supervision. Where the disconnecting means permitted by 695.4(C) is installed, the disconnect shall be supervised in the closed position by one of the following methods:
(1) Central station, proprietary or remote station signal device
(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location
(3) Locking the disconnecting means in the closed position
(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner. [NFPA 20:9.2.3.3]
(G) Overcurrent Protection. Where the overcurrent protection permitted by 695.4(C) is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment. The next standard overcurrent device shall be used in accordance with 240.6. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s). [NFPA 20:9.2.3.4]
695.5 Transformers.
Where the service or system voltage is different from the utilization voltage of the fire pump motor, transformer(s) protected by disconnecting means and overcurrent protective devices shall be permitted to be installed between the system supply and the fire pump controller in accordance with 695.5(A) and (B), or (C). Only transformers covered in 695.5(C) shall be permitted to supply loads not directly associated with the fire pump system.
(A) Size. Where a transformer supplies an electric motor-driven fire pump, it shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the associated fire pump accessory equipment supplied by the transformer.
(B) Overcurrent Protection. The primary overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. Secondary overcurrent protection shall not be permitted. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).
