The sum of cross-sectional areas of all contained conductors at any cross section of the nonmetallic wireway shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic wireway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

The ~~derating~~ adjustment factors specified in 310.15(B)(2)(a) shall be applicable to the current-carrying conductors up to and including the 20 percent fill specified above.

Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a).

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-204 Log #3075 NEC-P08 **Final Action: Accept**
(378.22)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered by the panel relative to the actions taken on Proposals 6-59, 8-155, 8-194 and 8-204.

The Technical Correlating Committee directs the Chairs of Code-Making Panels 6 and 8 to form a Task Group to correlate Proposals 6-59, 8-155, 8-194 and 8-204, and submit comments, if deemed appropriate.

This action will be considered by the panel as a public comment.

Submitter: Mike Holt, Leesburg, FL

Recommendation: Revise text as follows:

378.22 Number of Conductors.

The sum of cross-sectional areas of all contained conductors at any cross section of the nonmetallic wireway shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic wireway. ~~Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.~~
The derating factors specified in 310.15(B)(2)(a) shall be applicable to the current-carrying conductors up to and including the 20 percent fill specified above.

Substantiation: This is a companion proposal to move this code language to 310.15(B)(2)(a), where it is more appropriate. Similar proposals are made to sections 366.22(A) and 376.22(B), please correlate the proposals.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-205 Log #4483 NEC-P08 **Final Action: Accept**
(378.22)

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Revise text to read as follows:

378.22 Number of Conductors.

The sum of cross-sectional areas of all contained conductors at any cross section of the nonmetallic wireway shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic wireway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

The ~~derating~~ adjustment factors specified in 310.15(B)(2)(a) shall be applicable to the current-carrying conductors up to and including the 20 percent fill specified above.

Substantiation: Correlation issue. Also to improve *Code* readability. Table 310.15(B)(2)(a) referenced from here uses the specific term "adjustment factors", not the unspecific generalization "derating factors".

366.23(A) and 376.22(B) for the 2008 *NEC*® had been revised [Proposal 8-127/Log #2243 and Proposal 8-157/Log #2754, respectively] from the inconsistent term "correction factors" and imprecise term "derating factors", respectively, to "adjustment factors", the term specifically used in Table 310.15(B)(2)(a). Per the Substantiation of Proposal 8-157, Accepted In Principle by Code Panel 8, trade persons were being confused by the designation inconsistency with other ampacity-modifying factors used elsewhere in the *Code*.

A companion Proposal for 310.15(B)(2)(a) revises its Exceptions to use terminology consistent with its title and Table 310.15(B)(2)(a).

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-206 Log #359 NEC-P08 **Final Action: Reject**
(378.23(A))

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise text to read as follows:

"...dimensions corresponding to one wire attached to a ~~per~~ terminal in Table 312.6(A) shall apply."

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-162.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-207 Log #2604 NEC-P08 **Final Action: Reject**
(378.60)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Where an equipment grounding conductor is ~~required~~ provided ~~a separate equipment grounding conductor~~ it shall be installed in the nonmetallic raceway.
Substantiation: Edit. The provision should apply where an equipment grounding conductor is installed by choice and not "required".
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 380 — MULTIOUTLET ASSEMBLY

8-208 Log #2996 NEC-P08 **Final Action: Accept in Principle**
(380)

TCC Action: It was the action of the Technical Correlating Committee that the definition of "multioutlet assembly" remains in Article 100 according to 2.2.2.1 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Renumber Article 380 as follows, and relocate the Article 100 definition to a new 380.2 section.
ARTICLE 380 Multioutlet Assembly
380.1 Scope.
This article covers the use and installation requirements for multioutlet assemblies.
380.2 Definitions.
Multioutlet Assembly. A type of surface, flush, or freestanding raceway designed to hold conductors and receptacles, assembled in the field or at the factory.
380.10~~2~~ Uses Permitted.
~~(A) Permitted.~~ The use of a multioutlet assembly shall be permitted in dry locations.
~~380.12 Uses Not Permitted.~~
~~(B) Not Permitted.~~ A multioutlet assembly shall not be installed as follows:
(1) Where concealed, except that it shall be permissible to surround the back and sides of a metal multioutlet assembly by the building finish or recess a nonmetallic multioutlet assembly in a baseboard
(2) Where subject to severe physical damage
(3) Where the voltage is 300 volts or more between conductors unless the assembly is of metal having a thickness of not less than 1.02 mm (0.040 in.)
(4) Where subject to corrosive vapors
(5) In hoistways
(6) In any hazardous (classified) location, except as permitted by other articles in this Code
~~380.3~~380.*xxx* Metal Multioutlet Assembly Through Dry Partitions.
It shall be permissible to extend a metal multioutlet assembly through (not run within) dry partitions if arrangements are made for removing the cap or cover on all exposed portions and no outlet is located within the partitions.
Substantiation: This Code article is not consistent with the rest of the chapter three wiring method articles. This proposal is intended to assist in the parallel numbering system that has been strived for by panels 7 and 8.
Panel Meeting Action: Accept in Principle
Renumber Article 380 as follows, and relocate the Article 100 definition to a new 380.2 section.
ARTICLE 380 Multioutlet Assembly
I. General
380.1 Scope.
This article covers the use and installation requirements for multioutlet assemblies.
380.2 Definitions.
Multioutlet Assembly. A type of surface, flush, or freestanding raceway designed to hold conductors and receptacles, assembled in the field or at the factory.
II. Installation
380.10~~2~~ Uses Permitted.
~~(A) Permitted.~~ The use of a multioutlet assembly shall be permitted in dry locations.
380.12 Uses Not Permitted.
~~(B) Not Permitted.~~ A multioutlet assembly shall not be installed as follows:
(1) Where concealed, except that it shall be permissible to surround the back and sides of a metal multioutlet assembly by the building finish or recess a nonmetallic multioutlet assembly in a baseboard
(2) Where subject to severe physical damage
(3) Where the voltage is 300 volts or more between conductors unless the assembly is of metal having a thickness of not less than 1.02 mm (0.040 in.)
(4) Where subject to corrosive vapors
(5) In hoistways
(6) In any hazardous (classified) location, except as permitted by other articles in this code
~~380.3~~380.*76* Metal Multioutlet Assembly Through Dry Partitions.
It shall be permissible to extend a metal multioutlet assembly through (not run within) dry partitions if arrangements are made for removing the cap or cover on all exposed portions and no outlet is located within the partitions.
Panel Statement: The panel recognizes that the submitter struck out proposed language 380.12 Uses Not Permitted when in fact it should have been underlined. The panel assigned 380.76 for the 380.xxx. The panel also assigned part numbers in accordance with the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-209 Log #3178 NEC-P08 **Final Action: Reject**
(380(B)(6))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 380(B), delete ~~(6) In any hazardous (classified) location, except as permitted by other articles in this Code.~~
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41. The panel recognizes that the correct reference is 380.2(B)(6).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-210 Log #2607 NEC-P08 **Final Action: Reject**
(380.2(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Where likely to be subject to ~~severe~~ physical damage.
Substantiation: Edit. "Severe" is subjective and not defined. "Likely" is defined as such a nature or circumstance as to make something probable and a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-211 Log #1809 NEC-P08 **Final Action: Reject**
(380.2(B)(2)and (B)(4))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (2) Where likely to be subject to severe physical damage.
Revise: (4) Where likely to be subject to corrosive agents. ~~Vapors.~~
Substantiation: "Severe" is subjective and not defined; many sections re: damage do not use the word severe. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections. Substances other than vapors can be corrosive.
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-212 Log #2866 NEC-P08 **Final Action: Accept in Principle**
(380.23)

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Add new text to read as follows:
380.23 Insulated Conductors.
Insulated conductors installed in multi-outlet assemblies shall comply with 380.23(A) and (B).
(A) Deflected Insulated Conductors. Where insulated conductors are deflected within a multi-outlet assembly, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the multi-outlet assembly, or where the direction of the multi-outlet assembly is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in Table 312.6(A) shall apply.
(B) Multi-outlet Assemblies Used as Pull Boxes. Where insulated conductors 4 AWG or larger are pulled through a multi-outlet assembly, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required by 314.28(A)(1) for straight pulls and 314.28(A)(2) for angle pulls.

When transposing cable size into raceway size, the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.
Substantiation: With the increased use and larger sizes of multi-outlet assemblies there are no safeguards for over fill with a limitation of the number of conductors that can be installed in multi-outlet assemblies. Due to size of multi-outlet assemblies it is possible to create a temperature factor that could be greater than the conductor rating. There are no current provisions for derating as allowed in similar raceway system types (wireways). Some manufacturers provide surface raceways 2 ½ inches to 10 inches wide and 1 inch to 5 inches deep. The only limitation appears to be that raceway is identified for 600 volts or less. These raceways have dividers so that multiple line voltage and low voltage cables can be installed within the multi-outlet assembly.
Panel Meeting Action: Accept in Principle
Add new text to read as follows:
380.23 Insulated Conductors.
For field assembled multioutlet assemblies, insulated conductors shall comply with 380.23(A) and (B).
(A) Deflected Insulated Conductors. Where insulated conductors are deflected within a multioutlet assembly, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the multioutlet assembly, or where the direction of the multioutlet assembly is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in Table 312.6(A) shall apply.
(B) Multioutlet Assemblies Used as Pull Boxes. Where insulated conductors 4 AWG or larger are pulled through a multioutlet assembly, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required by 314.28(A)(1) for straight pulls and 314.28(A)(2) for angle pulls. When transposing cable size into raceway size, the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.
Panel Statement: Panel wanted to differentiate between field assembled vs listed multioutlet assemblies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 382 — NONMETALLIC EXTENSIONS

7-143 Log #2704 NEC-P07 **Final Action: Reject**
(382.2.Concealable Nonmetallic Extension)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
A listed insulated assembly of two, three, or four insulated circuit conductors and an equipment grounding conductor within a... (remainder unchanged).
Substantiation: An equipment grounding conductor should be specified since 382.10(A) relates to grounding or the lack thereof.
Panel Meeting Action: Reject
Panel Statement: The last sentence in 382.10 (A) provides the installation requirements for nonmetallic extensions from an existing non-grounding-type receptacle. Refer to the UL listing guide PZMX of the 08 White Book. The definition is written to recognize a product without a equipment grounding conductor, which is limited to replacement use only. See 382.104(C).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-144 Log #4464 NEC-P07 **Final Action: Reject**
(382.2, 382.10(C), 382.15(B), and 382.30(B))

Submitter: Richard Temblador, Southwire Company
Recommendation: Revise text to read as follows:
382.2 Definitions.
Concealable Nonmetallic Extension. A listed assembly of two, three, or four insulated circuit conductors within a nonmetallic jacket, an extruded thermoplastic covering, or a sealed nonmetallic covering. The classification includes surface extensions intended for installation under flooring materials, mounting directly on the surface of walls or ceilings, and concealed with paint, texture, joint compound, plaster, wallpaper, tile, wall paneling, or other similar materials.
382.10 Uses Permitted.
(C) Residential or Offices. For nonmetallic surface extensions mounted directly on the surface of walls or ceilings, the building shall be occupied for residential or office purposes and shall not exceed three floors abovegrade. ~~Where identified for the use, concealable nonmetallic extensions shall be permitted more than three floors abovegrade.~~
Concealable Nonmetallic Extensions, where identified for the use, shall be permitted to be used in the following:
(1) More than three floors above grade
(2) Under flooring materials when installed on hard, sound, smooth, continuous floor surfaces made of concrete, ceramic, or composition flooring, wood, and similar materials.
382.15 Exposed.
(B) Concealable Nonmetallic Extensions. One or more extensions shall be permitted to be run in any direction from an existing outlet. Where identified for the use, nonmetallic extensions may be concealed ~~with~~ under flooring materials or wall materials such as paint, texture, concealing compound, plaster, wallpaper, tile, wall paneling, or other similar materials ~~and installed per 382.15(A)~~.
382.30 Securing and Supporting.
(B) Concealable Nonmetallic Extensions. All surface-mounted concealable nonmetallic extension components shall be firmly anchored to the subfloor, wall or ceiling using an adhesive or mechanical anchoring system identified for this use.
Substantiation: This proposal seeks to revise Article 382 to recognize the use of concealable nonmetallic extensions that can be concealed under flooring materials.
The proposed expanded use of concealable nonmetallic extensions broadens its use to serve as a safe alternative to extension cords. Branch circuit wiring can be safely extended using concealable flat wire nonmetallic extension for power or lighting where needed, and as needed, to accommodate decorating schemes, placement of specific equipment or furniture to suit ever-changing lifestyles.
Panel Meeting Action: Reject
Panel Statement: The product is not listed at this time and no technical information on the installation of this product has been provided.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-145 Log #1589 NEC-P07 **Final Action: Reject**
(382.10)

Submitter: Craig D. Jennings, CDJA
Recommendation: Add 382.10(D) and revise 382.10 as indicated:
382.10 Uses Permitted. Nonmetallic extensions shall be permitted either with (A), (B), and (C), or (C), and (D).
(D) Hard Wired. Hard wired extensions specifically Listed for the intended use, shall be permitted in wet locations where run exposed, or concealed as permitted in 382.15.
Substantiation: The inclusion of hard wiring for extensions is already covered in 314.22, and hard wiring is an installation option for these systems that is safe for wet locations, providing the extension construction is suitable and Listed for this intended use. Permanently installed extensions are considerably safer than temporary wiring methods described in Article 590 when used in wet locations.
The current Code in 382.10(A) implies that nonmetallic extensions are only to be plugged in to an existing outlet, however, other sections such as 314.22, 374.11, 376.70, an 378.70 describe and allow hardwired extensions (not expressly nonmetallic) additionally used in wet locations. Adding the option (C) and (D) better supports the original (A), (B), and (C) requirements as they pertain to these other sections.
Panel Meeting Action: Reject
Panel Statement: 382.10(B) stipulates that nonmetallic extensions shall be installed in a dry location. No technical substantiation or fact finding report was provided to support the use of nonmetallic extensions in wet locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-146 Log #2705 NEC-P07 **Final Action: Reject**
(382.10(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete last sentence and substitute:
Where a concealable nonmetallic extension originates from an outlet that does not provide an equipment grounding conductor means in accordance with 250.130(C) or GFCI protection shall be provided for the outlet and the outlet shall be durable marked "GFCI protected" and "no equipment ground". No equipment ground shall be connected between two outlets or to the GFCI protective device.
FPN: See 250.130(C) and 406.3(D)(2)(3). The proposed FPN seems pertinent.
Substantiation: Edit. The first sentence states "outlet" which is not necessarily a receptacle outlet.
Panel Meeting Action: Reject
Panel Statement: The existing text provides the installation requirements for nonmetallic extensions from an existing outlet. The proposed revised text does not add clarity and adds a FPN where the existing text has the same requirements in positive code text in accordance with the NEC Style Manual. The panel assumes that the proposed FPN should have read "406.3(D)(2) and 406.3(D)(3)". The substantiation does not support the proposal. The substantiation states "outlet" is not necessarily a receptacle outlet; however, the proposal does not include the word "receptacle" and continues the use of "outlet" alone.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-147 Log #2965 NEC-P07 **Final Action: Reject**
(382.10(A))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise as follows:
382.10 Uses Permitted.
Nonmetallic extensions shall be permitted only in accordance with 382.10(A), (B), and (C).
(A) From an Existing Outlet. The extension shall be from an existing outlet on a 15- or 20-ampere branch circuit. Where a concealable nonmetallic extension originates from a non–grounding-type receptacle, <u>that non–grounding-type receptacle shall be replaced by a grounding-type receptacle and</u> the installation shall comply with 250.130(C), 406.3(D)(3)(b), or 406.3(D)(3)(c).
[remainder of 382.10(B) and 382.10(C) unchanged by this Proposal]
Substantiation: Correlation issue. Sections 250.130(C), 406.3(D)(3)(b), and 406.3(D)(3)(c), referenced by 382.10(A), provide <u>mandatory</u> protective requirements for the <u>optional</u> replacement ("… shall be permitted to be replaced …") of existing nongrounding receptacles, <u>contingent</u> on that replacement having actually occurred. By contrast, 382.10(A) invokes these requirements without also invoking the condition necessary to make them mandatory (actual replacement of the originating, existing nongrounding receptacle with a grounding-type receptacle). Therefore, a <u>new</u> installation of a concealable nonmetallic extension (CNE) branch-circuit extension having <u>new</u> receptacles mandated to be of the grounding type could leave those grounding-type CNE receptacles with neither connection to ground nor GFCI protection, UNLESS that nongrounding receptacle where the CNE originates is actually replaced.

Indirect correlation issue. Regardless of whether or not CNEs are involved, Section 406.3(D)(3) recognizes the requirements of 406.3(D)(3)(a), 406.3(D)(3)(b), and 406.3(D)(3)(c) as ALTERNATIVES for the replacement of existing nongrounding receptacles. As the 2008 *NEC*® is presently worded and structured outside of 382.10(A), the requirements of Section 250.130(C), however, appear to be IN ADDITION to the Section 406.3(D)(3) ALTERNATIVES for the replacement of existing nongrounding receptacles. As the 2008 *NEC*® is presently worded and structured outside of 382.10(A), the requirements of Section 250.130(C) AND the requirements of EITHER 406.3(D)(3)(a), 406.3(D)(3)(b), OR 406.3(D)(3)(c) appear to apply to replacement of existing nongrounding receptacles. A companion Proposal, however, revises Section 406.3(D)(3) to structure the requirements of Section 250.130(C) as another ALTERNATIVE [new 406.3(D)(3)(d)] to 406.3(D)(3)(b) and 406.3(D)(3)(c). If that companion Proposal is accepted, the 382.10(A) reference to "250.130(C)" can be changed to "406.3(D)(3)(d)", structured to reference 250.130(C) as an alternative.

Panel Member explanations of negatives to Proposal 7-98 (Log #3450) during the last *Code* cycle indicate reservations regarding protection of CNE against physical damage (driving nails through CNE conductors). The Submitter's Substantiation indicates "The cable itself is a symmetrical design providing two levels of protection on both sides of the flat wire cable via outer grounding conductor layers and inner grounded (neutral) conductor layers. This design insures that if the cable is damaged, punctured or penetrated, it will trip the over-current protection device (OCPD) and safely open the circuit." While this outer grounding conductor layer, required by 382.100 and 382.104(C), may be valid where the CNE originates from branch circuits with equipment grounding conductors, what remains inconsistent is that the CNE definition in 382.2 permits CNEs to have only TWO conductors and that when the CNE originates from an existing nongrounding receptacle, 406.3(D)(3)(b) and 406.3(D)(3)(c) cited by 382.10(A) specifically indicate that the equipment grounding conductor is NOT connected to the grounding-type CNE receptacles. If the grounding conductor of the CNE cable is left floating, how is this outer-layer protection then provided? Perhaps, CNEs originating from nongrounding-type receptacles should be limited SOLELY to the 250.130(C) method, with NO reference to 406.3(D)(3)(b) and 406.3(D)(3)(c) alternatives appropriate for wiring methods other than CNEs.
Panel Meeting Action: Reject
Panel Statement: The product is designed so that it will not energize if there is no ground available. The present requirement addresses the submitter's proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-148 Log #1555 NEC-P07 **Final Action: Reject**
(382.15 Exception No. 1 (New))

Submitter: Mark Blackford, LITE360
Recommendation: Add new text as follows:
<u>*Exception No. 1: Floor mounted runs shall be permitted if Listed for the intended use.*</u>
Substantiation: Commonly used alternatives to nonmetallic extensions, exposed (as applied to wiring methods) 100, such as cord and plug connected devices or extension cords covered in 400 do not meet the level of safety found in extensions specifically engineered for this purpose. By providing an alternative to the common practice of flexible cords and cables being run directly on the ground, this will provide a means to comply with 400.8(7).
Panel Meeting Action: Reject
Panel Statement: No technical substantiation or fact finding report was provided to support the new application of nonmetallic extensions as floor-mounted runs. The current usage is limited to walls and ceilings where the risk of physical damage is significantly lower than on floors.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-149 Log #360 NEC-P07 **Final Action: Accept**
(382.15(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
"…or other similar materials and installed <u>in accordance with</u> ~~per~~ 382.15(A).
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-150 Log #1590 NEC-P07 **Final Action: Reject**
(382.30(A) Exception (New))

Submitter: Peping Dee, LITE360
Recommendation: Add an exception No. 1 to 382.30(A) as indicated:
<u>Exception No. 1: Unless Listed for other support intervals. Shall not have more than one joint between supports. Adjoining sections shall be securely fastened together to provide a rigid joint.</u>
Substantiation: 300.11(B)(1) and (3) define systems where a raceway can be a means of support not requiring additional support. As an extension could incorporate a raceway or be constructed in a similar fashion, thus self-supporting systems do not require support intervals as described in 382.30(A) provided that mechanical continuity exists.
Panel Meeting Action: Reject
Panel Statement: Nonmetallic extensions are not raceways. There would not be any need for joints or splices in nonmetallic extensions. Also, nonmetallic extensions are limited to mounting directly on the surface of walls or ceilings.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-151 Log #361 NEC-P07 **Final Action: Accept**
(382.104(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
The ungrounded conductor shall consist of one or more ungrounded flat conductor(s) enclosed <u>in accordance with</u> ~~per~~ 382.104(B) and (C) and identified in accordance with 310.12(C).
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard. This revision will also provide consistency with the remainder of the sentence.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 384 — STRUT TYPE CHANNEL RACEWAY

8-213 Log #3179 NEC-P08 **Final Action: Reject**
(384.10(6))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 384.10, delete ~~(6) In Class I, Division 2 hazardous (classified) locations as permitted in 501.10(B)(3).~~
Renumber 384.10(7) and (8) as 384.10(6) and (7).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.

Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.

8-214 Log #481 NEC-P08 **Final Action: Reject**
(384.22)

Submitter: Carl V. Cardi, III, CVC 1 Limited LLC
Recommendation: Add new text to read as follows:

Section 384.22 Number of Conductors. The number of conductors permitted in strut-type channel raceways shall not exceed the percentage fill using Table 384.22 and applicable outside diameter (O.D.) dimensions of specific types and sizes of wire given in the tables in Chapter 9.

The derating factors of 310.15(B)(2)(a) shall not apply to conductors installed in strut-type channel raceways where all of the following conditions are met:

(1) The cross-sectional area of the raceway exceeds 2500 mm2 (4 in2).

(2) The current-carrying conductors do not exceed 30 in number.

Add new text to read as follows:

(3) The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the strut-type channel raceways, calculated in accordance with the following formula for wire fill:
$n = ca/wa$

where:

n = number of wires
ca = channel area in square inches
wa = wire area

Proposed Exception: Where the percentage fill requirements of Table 384.22 and the applicable outside diameter (O.D.) dimensions of specific types and sizes of wire given in the tables in Chapter 9 are met and where conditions (1) and (3), above, are present, but the number of conductors exceeds 30, the application of the adjustment factors set forth in Table 310.15(B)(2)(a) shall not be required for strut-type channel raceway where all of the following conditions are met:
(1) Labeled metallic devices are inserted in the strut-type channel raceway that provide elevation, separation, and spacing among the current-carrying conductors by dividing the strut-type channel raceway into channels. Not more than nine current-carrying conductors shall be placed within a channel.
(2) The metallic devices used for elevation, separation, and spacing shall enable air to flow within and between the channels in order to provide cooling of the current-carrying conductors throughout the length of the strut-type channel raceway in a manner sufficient to allow the transient and steady-state temperatures of the conductors to remain below the rated temperatures for their insulation as specified in the applicable column of Table 310.16.
(3) The metallic devices used for elevation, separation, and spacing shall provide sufficient support and separation of the current-carrying conductors so that conductors in one channel shall not come into contact with conductors in another channel, except that such conductors may come into contact with conductors in another channel upon entering or exiting the strut-type channel raceway and conductors within one channel may come into contact with other conductors in the same channel.
(4) The metallic devices used for elevation, separation, and spacing shall be secured so as to prevent movement of the devices and so as to maintain contact with the walls and floor of the strut-type channel raceway in order to conduct heat to the walls and floor of the strut-type channel raceway and shall be connected to the strut-type channel raceway in a manner consistent with the limitations of their labeling.
(5) Where contact between the current-carrying conductors and the edges of the metal devices used for elevation, separation, and spacing poses the risk of abrasion of the insulation of the conductors, the edges of the devices shall be protected so as to avoid that risk.

Substantiation: The ampacity derating factors of Section 310.15(B)(2)(a) severely limit the ampacities of conductors placed in sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways. This proposal establishes exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17 that allow for the placement of metallic devices to elevate, separate, and space the current-carrying conductors in those raceways so as to increase the number permitted by taking full advantage of the cooling capacity in the entire cross-sectional area of the raceway and the heat conducting properties of the metallic devices. The exception tendered for each of those sections contains five stringent conditions under which the devices may be used for such purpose. The report issued by INTERTEK, ETL SEMKO dated June 4, 2007, that accompanies this proposal provides test results that support the proposal.

I. Introduction:

A. Carl Cardi, III:

Mr. Cardi is presently a city electrical inspector for the city of Columbus, Ohio, a former electrical contractor, and an inventor. He is also President of CVC 1 Limited, LLC, the manufacturer of Cool Wire products.

B. Arnold E. Shaheen, Jr., Esq.:

Mr. Shaheen is counsel for CVC 1 Limited, LLC, and the author of this Proposal. Mr. Shaheen is licensed to practice law in the state of Ohio and received his Juris Doctorate Degree from Capital University in Columbus, Ohio, and a Bachelor of Science Degree in Electrical Engineering from The Ohio State University. Before, during, and after his attending college and law school, Mr. Shaheen also worked from childhood until 1985 in his family's electrical construction business, which engaged in commercial and industrial electrical construction. Between 1971 and 1985, Mr. Shaheen was licensed as an electrical contractor in Columbus, Ohio.

C. The Proposal:

Mr. Cardi has submitted this Proposal in an effort to provide suggested revisions to the National Electric Code ("NEC") that respect the intent and purpose of Section 310.15(B)(2)(a), but which allow for more flexibility in the design of electrical wiring systems that incorporate the use of sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways by allowing for new technologies that provide elevation, separation, and spacing of current-carrying conductors within those wiring systems. In so doing, it is submitted that these new technologies will provide better ambient cooling within those wiring systems by taking full advantage of all of the airspace within their cross-sectional areas as well as the heat conductive properties of the metallic devices that incorporate these new technologies and will allow for the placement of more current-carrying conductors in a raceway than would otherwise be permitted by the application of Section 310.15(B)(2)(a).

II. Heat Generated By Current-Carrying Conductors:

Well known principles of physics that govern the transfer of heat energy establish that heat energy cannot be dissipated without a thermal gradient. The principles of heat transfer are analogous to the concepts of current, resistance, and voltage embodied in Ohm's Law. Heat, like current, cannot flow unless there is a thermal gradient, as in the case of a difference in electrical potential, or voltage, in an electrical circuit. If there is no thermal gradient, or if the heat source is surrounded by insulation, the heat source will not cool or may even grow warmer if the heat source is, itself, a generator of heat energy. When current flows through a wire, the wire becomes a heat source that generates heat energy because the flow of electricity encounters resistance, the degree of which is a function of both the size of the wire and the conductivity of the material from which the wire is manufactured.

From a fire prevention perspective, the danger, of course, is that a wire will become so hot that its insulation degrades resulting in the potential for a short circuit between a bare spot on a current-carrying conductor and a bare spot on another current-carrying conductor or between a bare spot on a current-carrying conductor and the metallic enclosure in which the conductor is placed. Even where adequate overcurrent protection exists, the potential for a fire or for further degradation of the insulation of surrounding conductors exists if the temperature of current-carrying conductors is allowed to rise above the rated temperature limitation of their insulation.

Insulated, current-carrying conductors that are bundled together or which lie in contact with one another, particularly those that are totally surrounded by and in contact with other current-carrying conductors, will rise in temperature because there exists no thermal gradient through which to dissipate the heat. Section 310.10, FPN No.1, subparagraph 4, recognizes this physical phenomenon.

III. Section 310.15(B)(2)(a):

Section 310.15(B)(2)(a) requires that the ampacity derating factors of Table 310.15(B)(2)(a) shall apply to any raceway that contains more than three current-carrying conductors. On its face, Section 310.15(B)(2)(a) was meant to apply to all systems defined as raceways in Article 100. The traditional practice in the electrical industry was to readily apply this section to all forms of conduit. However, confusion arose in the enforcement and application of articles of the NEC that applied to other types of raceways because those articles contained only fill limitations and not ampacity derating requirements. The result, in many cases, was that the fill requirements of a particular article were allowed to trump the requirements of Section 310.15(B)(2)(a) and, thus, create the risk of overheated raceways because of the number of current-carrying conductors placed within them, resulting in the commensurate risk of short circuits and fire.

To resolve the confusion and to better clarify the NFPA's intent regarding the application and enforcement of Section 310.15(B)(2)(a), the 2005 edition of the NEC added ampacity derating requirements within articles pertaining to specific types of raceways. Section 374.17 pertaining to cellular metal floor raceways and Section 390.17 pertaining to underfloor raceways are but two examples.

However, underlying the application and enforcement of Section 310.15(B)(2)(a) is the assumption that the conductors in a raceway will all lie at the bottom of the raceway and in close proximity to or in contact with one another. This assumption fails to take into account the cooling effect that the surrounding ambient **within the raceway** will have when the current-carrying conductors are elevated, separated, and spaced within the raceway nor does it account for the benefit of the heat conductive properties of the metallic devices described in this Proposal.

Many sections of the NEC recognize that spacing promotes the cooling of current-carrying conductors. The requirement to provide spacing between conduits, tubing, or raceways set forth in Section 310.15(B)(2)(b) is one example. The spacing dimensions for electrical ducts depicted in Figure 310.60 of Article 310 and those depicted for single insulated conductors in nonmagnetic underground electrical ducts in FPN Figure B.310.5 of Appendix B are other examples.

However, none of the articles, in their current form, containing sections identified in this Proposal address either the potential benefit of ambient cooling that could be realized by the elevation, separation, and spacing of current-carrying conductors within a raceway or the benefit of the heat conductive properties of the metallic devices described in this Proposal. It is those benefits that this Proposal addresses, while, at the same time, honoring the intent of Section 310.15(B)(2)(a) to prevent the degradation of the insulation of current-carrying conductors due to overheating.

IV. Proposed Changes to Sections 310.15(B)(2)(a), 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17:

This Proposal sets forth exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, each containing five subparagraphs. Those five subparagraphs are discussed in sequence, below:

A. Subparagraph (1):

Metallic devices that provide elevation, separation, and spacing among current-carrying conductors would be allowed in lieu of the application of the derating factors of Table 310.15(B)(2)(a). Those devices would separate raceways into channels, however, no channel would be permitted to hold more than nine conductors, which is the upper limit for the number of conductors to which the 70 percent derating factor of Table 310.15(B)(2)(a) presently applies. This numerical limit recognizes that, even though dividing raceways into channels enables the cooling of current-carrying conductors, there are physical limits to this effect. The devices must be labeled in compliance with the definition of that term as set forth in Article 100 and the requirements of Section 110.3(A)(1) FPN.

B. Subparagraph (2):

The metallic devices that provide elevation, separation, and spacing must also permit convection within a channel and between and among channels such that the transient and steady-state temperatures of the current-carrying conductors within any channel remain below the rated temperature for their insulation as indicated in the applicable column of Table 310.16.

C. Subparagraph (3):

The metallic devices must prevent contact between current-carrying conductors in different channels within the raceway, except at points of egress and ingress. However, because the number of conductors is limited to nine within any given channel, conductors within that channel may be in contact without additional separation within that channel.

D. Subparagraph (4):

The metallic devices must be secured so as to prevent movement of the devices and to maintain contact with the walls and floor of the raceway in order to enable the device to transmit heat away from the current-carrying conductors and to the walls and floor of the raceway so that the raceway may, in turn, transmit the heat either into the air, if the raceway is an auxiliary gutter or wireway, or to concrete, if the raceway is a cellular metal raceway or an underfloor raceway.

E. Subparagraph (5):

In order to prevent abrasion of current-carrying conductors within a channel, this subparagraph provides that all edges of the metallic devices that provide elevation, separation, and spacing of the current-carrying conductors must be protected where those edges would come into contact with the conductors.

F. Section 310.15(B)(2)(a):

The words, “Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, where there is no load diversity....” have been added. This additional language makes explicit that the exceptions to the application of Section 310.15(B)(2)(a) established by this Proposal apply only to the enumerated sections and only when load diversity is not available.

G. Section 366.22(A):

The preamble to the exception for this section limits its applicability in the case of sheet metal auxiliary gutters to situations where the 20 percent fill limitation prescribed for this type of raceway is not exceeded, but where there are more than 30 current-carrying conductors placed within the raceway.

H. Section 366.23(A):

The preamble to the exception for this section mimics the preamble contained in Section 366.22(A), which also applies to sheet metal auxiliary gutters.

I. Section 374.17:

Since the language of this section contains no limitations upon the applicability of Section 310.15(B)(2)(a) to cellular metal raceways, no preamble was necessary. The exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 374.17 and to cellular metal raceways.

J. Section 376.22:

As in the case of sheet metal auxiliary gutters, the preamble to the exception for this section limits its applicability to those instances in which the 20 percent fill limitation is not exceeded, but where there are also more than 30 current-carrying conductors placed within the metal wireway.

K. Section 384.22:

In the case of strut-type channel raceways, the preamble to the exception limits its applicability to those instances in which the percentage fill requirements of Table 384.22 are not exceeded and where the outside diameter dimensions of types and sizes of wire as set forth in the tables in Chapter 9 are met, but where the cross-sectional area of the raceway exceeds 2500mm² (4in.²) and where the number of current-carrying conductors in the raceway is greater than 30, but where the cross-sectional area of all current-carrying conductors does not exceed 20 percent of the cross-sectional area of the raceway.

L. Section 386.22:

The preamble to the exception for this section mimics that of Section 384.22 and applies to surface metal raceways.

M. Section 390.17:

As in the case of cellular metal raceways, the exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 390.17 and to underfloor raceways.

V. Test Evidence Submitted In Support of Proposal:

A. Testing Protocol:

Between May 29, 2007, through June 1, 2007, electrical testing involving metallic devices described in this Proposal was performed by INTERTEK, ETL SEMKO of Cortland, New York. Two different types of raceways and two sizes of conductors, 12 AWG THHN and 10 AWG THHN were tested. Testing was performed for the purpose of: (1) measuring the heating of the conductors under the testing protocol; and, (2) to determine how many conductors could be placed within the raceways without the temperature of the conductors exceeding the 90° C limitation of their insulation. Tests for physical abrasion were not conducted.

In the first instance, a 12 in. x 3 in. x 5 ft underfloor raceway was tested under various scenarios in order to determine the conductor temperatures. Similar testing was performed for an 8 in. x 8 in. x 5 ft metallic wireway. The ends of both raceways were stuffed with styrofoam in order to trap heat so as to create a worst-case scenario. Where it was appropriate to do so, both raceways were tested in a double-blind manner, that is, they were tested under the same conditions with and without the metallic devices described in this Proposal.

Constant loading of the conductors in each instance occurred throughout the duration of each test. No unloaded conductors, or fillers, were placed within the raceways. The time period used as a benchmark in order to attain steady-state temperature conditions was three hours. Thermocouples were placed on one conductor in each channel. One thermocouple was used to measure the room ambient.

The graphs indicating the test results show the temperatures measured by the thermocouples along the Y-axis and the time periods for those temperatures along the X-axis. The temperature recording for each conductor is indicated on each graph by a different color of line. The letters, "UF," noted in the keys for the graphs for the tests denote conductors in the underfloor raceway. The letters, "WW," denote conductors in the metal wireway. The maximum temperatures that were recorded for each conductor to which a thermocouple was attached are displayed in a table at the bottom of each graph for either one or both raceways, depending upon how each test was conducted.

B. Test Nos. 1 and 10:

In Test No. 1, the underfloor raceway was wired using 81 #12 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used to elevate, separate, and space the conductors. The test load on each of the conductors was 16 amperes. Upon removal of the underfloor raceway cover it was noted that one of the supports had moved. Thus, this test was redone as Test No. 10 only as to the underfloor raceway.
In Test No. 1, the metallic wireway was wired with 90 #12 THHN conductors in 10 groupings of 9 conductors.
In Test No. 1, the temperatures for all conductors for both raceways, after more than 3 hours, remained below 90°C and in a steady-state condition. The ambient temperature remained at approximately 25°C throughout the test.
Test No.1, as to the underfloor raceway, was repeated in Test No. 10. Again, the test results were the same. After more than three hours and in steady-state condition, the temperatures of all of the conductors remained below 90°. The ambient temperature approximated 22°C throughout the test.
During neither Test No. 1 nor Test No. 10 did the temperature of any of the conductors exceed 90°C at any point in time.

C. Test No. 2:

The same test protocol were used in this test as in Test No. 1 for both raceways. However, the metallic devices described in this Proposal were not used. After 91 minutes, in the case of both raceways, the temperatures of the conductors remain in a transient state and on an upward incline towards their 90°C limitation of their insulation. At that point in time, the highest temperature reached by any conductor in the underfloor raceway was 89.24°C and in the metal wireway was 81.97°C.

D. Test No. 3:

In Test No. 3, the underfloor raceway was wired with 81 #12 THHN conductors using a vertical divider system that did not permit air to flow between the divided chambers within the raceway. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes. After only 64 minutes, the temperatures of all of the conductors in the underfloor raceway remained in a transient state and the temperature of one conductor had exceeded the 90°C limitation of its insulation.

E. Test No. 4:

In Test No. 4, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.
The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.
After more than 3 hours, the highest temperature reached in the underfloor raceway was 60.45°C and in the case of the metal wireway the highest temperature reached was 52.40°C.

F. Test No. 5.

In Test No. 5, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. For both the underfloor raceway and the metallic wireway, the metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.
This test demonstrated the upper limit of the cooling effect of the metallic devices described in this Proposal in the case of the underfloor raceway. The transient state temperatures of the underfloor conductors began to approximate 90°C after 33 minutes. At that point the cover of the underfloor raceway was removed.
However, in the case of the metal wireway, the highest temperature of the conductors was 82.03°C in steady-state condition after 190 minutes.
The ambient approximated 22°C throughout the test.

G. Test No. 6:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groups of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.
The highest temperature reached by a conductor after 203 minutes was 67.74°C in a steady-state condition. The ambient temperature for the test ranged between 22° and 28°C.

H. Test No. 7:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groupings of 9 conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.
After 157 minutes, the temperatures of the conductors remained in a transient state condition. By that time, one of the conductors had reached 89.06°C. The ambient temperature ranged between 22°C and 28°C.

I. Test No. 8:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.
The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.
After 126 minutes, the temperatures of the conductors in the underfloor raceway remained in a transient condition and were gradually rising. At that point in time the highest temperature for the underfloor conductors was 75.17°C.
After the same time period, the conductors in the wireway, for the most part, remain in a transient condition with the highest temperature recorded at 71.09°C.
The ambient temperature ranged between 22°C and 25°C.

J. Test No. 9:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.
The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.
The graph of the temperatures of the conductors in the two types of raceways demonstrates that the temperatures in both raceways were rising rapidly. Within 14 minutes after the commencement of the test, the highest temperature of a conductor in the underfloor raceway is 97.95°C and for the metal wireway is 93.43°C.
The ambient remained at approximately 22°C throughout the test.

K. Test Conclusions:

The use of the metallic devices described in this Proposal demonstrate a marked decrease in the transient and the steady-state temperatures of the conductors within the limitations of the cooling effects of the devices. This can be readily shown by comparing the test results in Test Nos. 6 and 7, the test results in Test Nos. 4 and 8, and by comparing the test results in Test Nos. 1 and 10 with Test No. 2. Within the limitations of the devices, as demonstrated in Test No. 5 as it relates to underfloor raceways, the 90°C limitations of the conductors' insulation is not exceeded during the three hour protocol for the tests where the devices were used.

VI. Conclusion:

This Proposal provides for exceptions to the applicability of Section 310.15(B)(2)(a) to sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, and underfloor raceways that impose five conditions so as to preserve the intent of that section to prevent thermal degradation of insulation, but yet allow for more current-carrying conductors to be placed within those raceways. Due to the stringent nature of those conditions, the reasons cited in the narrative, above, and the test results supplied with this Proposal, the Proposer requests that the Proposal be approved.

(384.22(3))

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text as follows:
(3) The sum of the cross-sectional area of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the strut-type channel raceways ~~calculated in accordance with the following formula for wire fill~~
~~n= ca/wa~~
~~Where~~
~~n = number of conductors ca = channel area in square inches, was = wire area~~
Substantiation: The deleted text is unnecessary and confusing. Unnecessary because there is no similar language for conductor fill in conduits, auxiliary gutters, wireways, or cellular concrete or metal floor raceways. The text is confusing because the formula sited does not give the desired result. That is, n = ca/wa does not give the number of conductors permitted at 20 percent fill. Eliminating this text will add clarity and consistency.
Panel Meeting Action: Accept
Number Eligible to Vote: 12

Submitter: Carl V. Cardi, III, CVC 1 Limited LLC
Recommendation: Add new text to read as follows:
Section 386.22 Number of Conductors or Cables. The number of conductors or cables installed in surface metal raceway shall not be greater than the number for which the raceway is designed. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles.
The derating factors of 310.15(B)(2)(a) shall not apply to conductors installed in surface metal raceways where all of the following conditions are met:
(1) The cross-sectional area of the raceway exceeds 2500 mm2 (4 in.2).
(2) The current-carrying conductors do not exceed 30 in number.
(3) The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the surface metal raceway.
<u>Proposed Exception: When the number of conductors installed in a surface metal raceway is not greater than the number for which the raceway is designed and where conditions (1) and (3), above, are present, but the number of conductors exceeds 30, the application of the adjustment factors set forth in Table 310.15(B)(2)(a) shall not be required for surface metal raceways where all of the following conditions are met:</u>
<u>(1) Labeled metallic devices are inserted in the surface metal raceways that provide elevation, separation, and spacing among the conductors by dividing the surface metal raceway into channels. Not more than nine current-carrying conductors shall be placed within a channel.</u>
<u>(2) The metallic devices used for elevation, separation, and spacing shall enable air to flow within and between the channels in order to provide cooling of the conductors throughout the length of the surface metal raceway in a manner sufficient to allow the transient and steady-state temperatures of the conductors to remain below the rated temperatures for their insulation as specified in the applicable column of Table 310.16.</u>
<u>(3) The metallic devices used for elevation, separation, and spacing shall provide sufficient support and separation of the current-carrying conductors so that conductors in one channel shall not come into contact with conductors in another channel, except that such conductors may come into contact with conductors in another channel upon entering or exiting the surface metal raceway and conductors within one channel may come into contact with other conductors in the same channel.</u>
<u>(4) The metallic devices used for elevation, separation, and spacing shall be secured so as to prevent movement of the devices and so as to maintain contact with the walls and floor of the surface metal raceway in order to conduct heat to the walls and floor of the surface metal raceway and shall be connected to the surface metal raceway in a manner consistent with the limitations of their labeling.</u>

(5) Where contact between the conductors and the edges of the metallic devices used for elevation, separation, and spacing presents the risk of abrasion of the insulation of the conductors, the edges of the devices shall be protected so as to avoid that risk.

Substantiation: The ampacity derating factors of Section 310.15(B)(2)(a) severely limit the ampacities of conductors placed in sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways. This proposal establishes exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17 that allow for the placement of metallic devices to elevate, separate, and space the current-carrying conductors in those raceways so as to increase the number permitted by taking full advantage of the cooling capacity in the entire cross-sectional area of the raceway and the heat conducting properties of the metallic devices. The exception tendered for each of those sections contains five stringent conditions under which the devices may be used for such purpose. The report issued by INTERTEK, ETL SEMKO dated June 4, 2007, that accompanies this proposal provides test results that support the proposal.

I. Introduction:

A. Carl Cardi, III:

Mr. Cardi is presently a city electrical inspector for the city of Columbus, Ohio, a former electrical contractor, and an inventor. He is also President of CVC 1 Limited, LLC, the manufacturer of Cool Wire products.

B. Arnold E. Shaheen, Jr., Esq.:

Mr. Shaheen is counsel for CVC 1 Limited, LLC, and the author of this Proposal. Mr. Shaheen is licensed to practice law in the state of Ohio and received his Juris Doctorate Degree from Capital University in Columbus, Ohio, and a Bachelor of Science Degree in Electrical Engineering from The Ohio State University. Before, during, and after his attending college and law school, Mr. Shaheen also worked from childhood until 1985 in his family's electrical construction business, which engaged in commercial and industrial electrical construction. Between 1971 and 1985, Mr. Shaheen was licensed as an electrical contractor in Columbus, Ohio.

C. The Proposal:

Mr. Cardi has submitted this Proposal in an effort to provide suggested revisions to the National Electric Code ("NEC") that respect the intent and purpose of Section 310.15(B)(2)(a), but which allow for more flexibility in the design of electrical wiring systems that incorporate the use of sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways by allowing for new technologies that provide elevation, separation, and spacing of current-carrying conductors within those wiring systems. In so doing, it is submitted that these new technologies will provide better ambient cooling within those wiring systems by taking full advantage of all of the airspace within their cross-sectional areas as well as the heat conductive properties of the metallic devices that incorporate these new technologies and will allow for the placement of more current-carrying conductors in a raceway than would otherwise be permitted by the application of Section 310.15(B)(2)(a).

II. Heat Generated By Current-Carrying Conductors:

Well known principles of physics that govern the transfer of heat energy establish that heat energy cannot be dissipated without a thermal gradient. The principles of heat transfer are analogous to the concepts of current, resistance, and voltage embodied in Ohm's Law. Heat, like current, cannot flow unless there is a thermal gradient, as in the case of a difference in electrical potential, or voltage, in an electrical circuit. If there is no thermal gradient, or if the heat source is surrounded by insulation, the heat source will not cool or may even grow warmer if the heat source is, itself, a generator of heat energy. When current flows through a wire, the wire becomes a heat source that generates heat energy because the flow of electricity encounters resistance, the degree of which is a function of both the size of the wire and the conductivity of the material from which the wire is manufactured.

From a fire prevention perspective, the danger, of course, is that a wire will become so hot that its insulation degrades resulting in the potential for a short circuit between a bare spot on a current-carrying conductor and a bare spot on another current-carrying conductor or between a bare spot on a current-carrying conductor and the metallic enclosure in which the conductor is placed. Even where adequate overcurrent protection exists, the potential for a fire or for further degradation of the insulation of surrounding conductors exists if the temperature of current-carrying conductors is allowed to rise above the rated temperature limitation of their insulation.

Insulated, current-carrying conductors that are bundled together or which lie in contact with one another, particularly those that are totally surrounded by and in contact with other current-carrying conductors, will rise in temperature because there exists no thermal gradient through which to dissipate the heat. Section 310.10, FPN No.1, subparagraph 4, recognizes this physical phenomenon.

III. Section 310.15(B)(2)(a):

Section 310.15(B)(2)(a) requires that the ampacity derating factors of Table 310.15(B)(2)(a) shall apply to any raceway that contains more than three current-carrying conductors. On its face, Section 310.15(B)(2)(a) was meant to apply to all systems defined as raceways in Article 100. The traditional practice in the electrical industry was to readily apply this section to all forms of conduit. However, confusion arose in the enforcement and application of articles of the NEC that applied to other types of raceways because those articles contained only fill limitations and not ampacity derating requirements. The result, in many cases, was that the fill requirements of a particular article were allowed to trump the requirements of Section 310.15(B)(2)(a) and, thus, create the risk of overheated raceways because of the number of current-carrying conductors placed within them, resulting in the commensurate risk of short circuits and fire.

To resolve the confusion and to better clarify the NFPA's intent regarding the application and enforcement of Section 310.15(B)(2)(a), the 2005 edition of the NEC added ampacity derating requirements within articles pertaining to specific types of raceways. Section 374.17 pertaining to cellular metal floor raceways and Section 390.17 pertaining to underfloor raceways are but two examples.

However, underlying the application and enforcement of Section 310.15(B)(2)(a) is the assumption that the conductors in a raceway will all lie at the bottom of the raceway and in close proximity to or in contact with one another. This assumption fails to take into account the cooling effect that the surrounding ambient **within the raceway** will have when the current-carrying conductors are elevated, separated, and spaced within the raceway nor does it account for the benefit of the heat conductive properties of the metallic devices described in this Proposal.

Many sections of the NEC recognize that spacing promotes the cooling of current-carrying conductors. The requirement to provide spacing between conduits, tubing, or raceways set forth in Section 310.15(B)(2)(b) is one example. The spacing dimensions for electrical ducts depicted in Figure 310.60 of Article 310 and those depicted for single insulated conductors in nonmagnetic underground electrical ducts in FPN Figure B.310.5 of Appendix B are other examples.

However, none of the articles, in their current form, containing sections identified in this Proposal address either the potential benefit of ambient cooling that could be realized by the elevation, separation, and spacing of current-carrying conductors within a raceway or the benefit of the heat conductive properties of the metallic devices described in this Proposal. It is those benefits that this Proposal addresses, while, at the same time, honoring the intent of Section 310.15(B)(2)(a) to prevent the degradation of the insulation of current-carrying conductors due to overheating.

IV. Proposed Changes to Sections 310.15(B)(2)(a), 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17:

This Proposal sets forth exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, each containing five subparagraphs. Those five subparagraphs are discussed in sequence, below:

A. Subparagraph (1):

Metallic devices that provide elevation, separation, and spacing among current-carrying conductors would be allowed in lieu of the application of the derating factors of Table 310.15(B)(2)(a). Those devices would separate raceways into channels, however, no channel would be permitted to hold more than nine conductors, which is the upper limit for the number of conductors to which the 70 percent derating factor of Table 310.15(B)(2)(a) presently applies. This numerical limit recognizes that, even though dividing raceways into channels enables the cooling of current-carrying conductors, there are physical limits to this effect. The devices must be labeled in compliance with the definition of that term as set forth in Article 100 and the requirements of Section 110.3(A)(1) FPN.

B. Subparagraph (2):

The metallic devices that provide elevation, separation, and spacing must also permit convection within a channel and between and among channels such that the transient and steady-state temperatures of the current-carrying conductors within any channel remain below the rated temperature for their insulation as indicated in the applicable column of Table 310.16.

C. Subparagraph (3):

The metallic devices must prevent contact between current-carrying conductors in different channels within the raceway, except at points of egress and ingress. However, because the number of conductors is limited to nine within any given channel, conductors within that channel may be in contact without additional separation within that channel.

D. Subparagraph (4):

The metallic devices must be secured so as to prevent movement of the devices and to maintain contact with the walls and floor of the raceway in order to enable the device to transmit heat away from the current-carrying conductors and to the walls and floor of the raceway so that the raceway may, in turn, transmit the heat either into the air, if the raceway is an auxiliary gutter or wireway, or to concrete, if the raceway is a cellular metal raceway or an underfloor raceway.

E. Subparagraph (5):

In order to prevent abrasion of current-carrying conductors within a channel, this subparagraph provides that all edges of the metallic devices that provide elevation, separation, and spacing of the current-carrying conductors must be protected where those edges would come into contact with the conductors.

F. Section 310.15(B)(2)(a):

The words, "Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, where there is no load diversity...." have been added. This additional language makes explicit that the exceptions to the application of Section 310.15(B)(2)(a) established by this Proposal apply only to the enumerated sections and only when load diversity is not available.

G. Section 366.22(A):

The preamble to the exception for this section limits its applicability in the case of sheet metal auxiliary gutters to situations where the 20 percent fill limitation prescribed for this type of raceway is not exceeded, but where there are more than 30 current-carrying conductors placed within the raceway.

H. Section 366.23(A):

The preamble to the exception for this section mimics the preamble contained in Section 366.22(A), which also applies to sheet metal auxiliary gutters.

I. Section 374.17:

Since the language of this section contains no limitations upon the applicability of Section 310.15(B)(2)(a) to cellular metal raceways, no preamble was necessary. The exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 374.17 and to cellular metal raceways.

J. Section 376.22:

As in the case of sheet metal auxiliary gutters, the preamble to the exception for this section limits its applicability to those instances in which the 20 percent fill limitation is not exceeded, but where there are also more than 30 current-carrying conductors placed within the metal wireway.

K. Section 384.22:

In the case of strut-type channel raceways, the preamble to the exception limits its applicability to those instances in which the percentage fill requirements of Table 384.22 are not exceeded and where the outside diameter dimensions of types and sizes of wire as set forth in the tables in Chapter 9 are met, but where the cross-sectional area of the raceway exceeds 2500mm² (4in.²) and where the number of current-carrying conductors in the raceway is greater than 30, but where the cross-sectional area of all current-carrying conductors does not exceed 20 percent of the cross-sectional area of the raceway.

L. Section 386.22:

The preamble to the exception for this section mimics that of Section 384.22 and applies to surface metal raceways.

M. Section 390.17:

As in the case of cellular metal raceways, the exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 390.17 and to underfloor raceways.

V. Test Evidence Submitted In Support of Proposal:

A. Testing Protocol:

Between May 29, 2007, through June 1, 2007, electrical testing involving metallic devices described in this Proposal was performed by INTERTEK, ETL SEMKO of Cortland, New York. Two different types of raceways and two sizes of conductors, 12 AWG THHN and 10 AWG THHN were tested. Testing was performed for the purpose of: (1) measuring the heating of the conductors under the testing protocol; and, (2) to determine how many conductors could be placed within the raceways without the temperature of the conductors exceeding the 90° C limitation of their insulation. Tests for physical abrasion were not conducted.

In the first instance, a 12 in. x 3 in. x 5 ft underfloor raceway was tested under various scenarios in order to determine the conductor temperatures. Similar testing was performed for an 8 in. x 8 in. x 5 ft metallic wireway. The ends of both raceways were stuffed with styrofoam in order to trap heat so as to create a worst-case scenario. Where it was appropriate to do so, both raceways were tested in a double-blind manner, that is, they were tested under the same conditions with and without the metallic devices described in this Proposal.

Constant loading of the conductors in each instance occurred throughout the duration of each test. No unloaded conductors, or fillers, were placed within the raceways. The time period used as a benchmark in order to attain steady-state temperature conditions was three hours. Thermocouples were placed on one conductor in each channel. One thermocouple was used to measure the room ambient.

The graphs indicating the test results show the temperatures measured by the thermocouples along the Y-axis and the time periods for those temperatures along the X-axis. The temperature recording for each conductor is indicated on each graph by a different color of line. The letters, "UF," noted in the keys for the graphs for the tests denote conductors in the underfloor raceway. The letters, "WW," denote conductors in the metal wireway. The maximum temperatures that were recorded for each conductor to which a thermocouple was attached are displayed in a table at the bottom of each graph for either one or both raceways, depending upon how each test was conducted.

B. Test Nos. 1 and 10:

In Test No. 1, the underfloor raceway was wired using 81 #12 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used to elevate, separate, and space the conductors. The test load on each of the conductors was 16 amperes. Upon removal of the underfloor raceway cover it was noted that one of the supports had moved. Thus, this test was redone as Test No. 10 only as to the underfloor raceway.

In Test No. 1, the metallic wireway was wired with 90 #12 THHN conductors in 10 groupings of 9 conductors.

In Test No. 1, the temperatures for all conductors for both raceways, after more than 3 hours, remained below 90°C and in a steady-state condition. The ambient temperature remained at approximately 25°C throughout the test.

Test No.1, as to the underfloor raceway, was repeated in Test No. 10. Again, the test results were the same. After more than three hours and in steady-state condition, the temperatures of all of the conductors remained below 90°. The ambient temperature approximated 22°C throughout the test.

During neither Test No. 1 nor Test No. 10 did the temperature of any of the conductors exceed 90°C at any point in time.

C. Test No. 2:

The same test protocol were used in this test as in Test No. 1 for both raceways. However, the metallic devices described in this Proposal were not used. After 91 minutes, in the case of both raceways, the temperatures of the conductors remain in a transient state and on an upward incline towards their 90°C limitation of their insulation. At that point in time, the highest temperature reached by any conductor in the underfloor raceway was 89.24°C and in the metal wireway was 81.97°C.

D. Test No. 3:

In Test No. 3, the underfloor raceway was wired with 81 #12 THHN conductors using a vertical divider system that did not permit air to flow between the divided chambers within the raceway. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes. After only 64 minutes, the temperatures of all of the conductors in the underfloor raceway remained in a transient state and the temperature of one conductor had exceeded the 90°C limitation of its insulation.

E. Test No. 4:

In Test No. 4, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

After more than 3 hours, the highest temperature reached in the underfloor raceway was 60.45°C and in the case of the metal wireway the highest temperature reached was 52.40°C.

F. Test No. 5.

In Test No. 5, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. For both the underfloor raceway and the metallic wireway, the metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

This test demonstrated the upper limit of the cooling effect of the metallic devices described in this Proposal in the case of the underfloor raceway. The transient state temperatures of the underfloor conductors began to approximate 90°C after 33 minutes. At that point the cover of the underfloor raceway was removed.

However, in the case of the metal wireway, the highest temperature of the conductors was 82.03°C in steady-state condition after 190 minutes.

The ambient approximated 22°C throughout the test.

G. Test No. 6:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groups of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

The highest temperature reached by a conductor after 203 minutes was 67.74°C in a steady-state condition. The ambient temperature for the test ranged between 22° and 28°C.

H. Test No. 7:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groupings of 9 conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

After 157 minutes, the temperatures of the conductors remained in a transient state condition. By that time, one of the conductors had reached 89.06°C. The ambient temperature ranged between 22°C and 28°C.

I. Test No. 8:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

After 126 minutes, the temperatures of the conductors in the underfloor raceway remained in a transient condition and were gradually rising. At that point in time the highest temperature for the underfloor conductors was 75.17°C.

After the same time period, the conductors in the wireway, for the most part, remain in a transient condition with the highest temperature recorded at 71.09°C.

The ambient temperature ranged between 22°C and 25°C.

J. Test No. 9:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The graph of the temperatures of the conductors in the two types of raceways demonstrates that the temperatures in both raceways were rising rapidly. Within 14 minutes after the commencement of the test, the highest temperature of a conductor in the underfloor raceway is 97.95°C and for the metal wireway is 93.43°C.

The ambient remained at approximately 22°C throughout the test.

K. Test Conclusions:

The use of the metallic devices described in this Proposal demonstrate a marked decrease in the transient and the steady-state temperatures of the conductors within the limitations of the cooling effects of the devices. This can be readily shown by comparing the test results in Test Nos. 6 and 7, the test results in Test Nos. 4 and 8, and by comparing the test results in Test Nos. 1 and 10 with Test No. 2. Within the limitations of the devices, as demonstrated in Test No. 5 as it relates to underfloor raceways, the 90°C limitations of the conductors' insulation is not exceeded during the three hour protocol for the tests where the devices were used.

VI. Conclusion:

This Proposal provides for exceptions to the applicability of Section 310.15(B)(2)(a) to sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, and underfloor raceways that impose five conditions so as to preserve the intent of that section to prevent thermal degradation of insulation, but yet allow for more current-carrying conductors to be placed within those raceways. Due to the stringent nature of those conditions, the reasons cited in the narrative, above, and the test results supplied with this Proposal, the Proposer requests that the Proposal be approved.

Recommendation: Revise text as follows:

386.22 Number of Conductors or Cables.

The number of conductors or cables installed in surface metal raceway shall not be greater than the number for which the raceway is designed. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles.

The ~~derating~~ <u>adjustment</u> factors of 310.15(B)(2)(a) shall not apply to conductors installed in surface metal raceways where all of the following conditions are met:

(1) The cross-sectional area of the raceway exceeds 2500 mm^2 (4 in.^{2}).

(2) The current-carrying conductors do not exceed 30 in number.

(3) The sum of the cross-sectional area of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the surface metal raceway.

Substantiation: The term "adjustment factor" is the term used in 310.15(B)(2)(a).

8-224 Log #3474 NEC-P08 **Final Action: Reject**

(386.22)

Submitter: David E. Watters, H. F. Lenz Company

Recommendation: Revise as follows:

~~**Number of Conductors or Cables.** The number of conductors or cables installed in surface metal raceway shall not be greater than the number for which the raceway is designed. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The derating factors of 310.15(B)(2)(a) shall not apply to conductors installed in surface metal raceways where all of the following conditions are met:~~

~~(1) The cross sectional area of the raceway exceeds 2500 mm2 (4 in.2)~~

~~(2) The current carrying conductors do not exceed 30 in number.~~

~~(3) The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the surface metal raceway.~~

<u>**Number of Conductors.** The sum of cross-sectional area of all contained conductors at any cross section of the surface metal raceway shall not exceed</u>

20 percent of the interior cross-sectional area of the surface metal raceway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

The derating factors specified in 310.15(B)(2)(a) shall be applied to the current-carrying conductors up to and including the 20 percent fill specified above.

Substantiation: Surface Metal Raceways and Metal Wireways are similar in size, construction, and performance when they are surface mounted in free air. It is assumed that conductor heating tests performed in one of these products would represent similar results in the other. Testing was performed on 2.75 in. × 1.5 in. Metal Wireway at Nationally Recognized Testing Laboratories. The ETL SEMKO Laboratory and the OnSpex Laboratory were used to test 30 active conductors at rated capacity as permitted by 376.22(B), and as listed above. In both cases, 24 amps was applied to #10 conductors which is the continuous current limit for a 30A breaker required by code. In both cases, at least one of the conductors, within the raceway, exceeded the 90°C temperature limitation of the insulation. Both tests failed according to the test reports I have provided. For these reasons, additional loading or raceway fill restrictions should be applied. In particular, the wording which allows 30 conductors to operate without de-rating should be removed. The proposed changes will make the wording of this section of the code more consistent with Articles 376 and 378. For these reasons, we recommend approval of the code changes listed above.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The first test by ETL has exceeded the maximum fill of 20 percent by 2 wires, therefore this test will not be considered. The test by OnSpex (CSA) appears to show the surface metal raceway to exceed the temperature allowed for THHN conductors. CMP-8 rejects the proposal based on only one test of a surface metal raceway.

A more complete series of tests on surface metal raceways and their various fill and current-carrying conductor adjustment factors is required for consideration of this proposal.

(386.22)

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Revise text to read as follows:

386.22 Number of Conductors.

[First paragraph of 386.22 unchanged by this Proposal]

The ~~derating~~ adjustment factors of 310.15(B)(2)(a) shall not apply to conductors installed in surface metal raceways where all of the following conditions are met:

[remainder of 386.22 unchanged by this Proposal]

Substantiation: Correlation issue. Also to improve *Code* readability. Table 310.15(B)(2)(a) referenced from here uses the specific term “adjustment factors”, not the unspecific generalization “derating factors”.

366.23(A) and 376.22(B) for the 2008 *NEC*® had been revised [Proposal 8-127/Log #2243 and Proposal 8-157/Log #2754, respectively] from the inconsistent term “correction factors” and imprecise term “derating factors”, respectively, to “adjustment factors”, the term specifically used in Table 310.15(B)(2)(a). Per the Substantiation of Proposal 8-157, Accepted In Principle by Code Panel 8, trade persons were being confused by the designation inconsistency with other ampacity-modifying factors used elsewhere in the *Code*.

A companion Proposal for 310.15(B)(2)(a) revises its Exceptions to use terminology consistent with its title and Table 310.15(B)(2)(a).

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 388 — SURFACE NONMETALLIC RACEWAYS

8-226 Log #3181 NEC-P08 **Final Action: Reject**

(388.12(5))

Submitter: A. W. Ballard, Cooper Crouse-Hinds

Recommendation: In 388.12, delete ~~(5) In any hazardous (classified) location, except as permitted by other articles in this Code.~~

Renumber 388.12(6) and (7) as 388.12(5) and (6).

Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.

Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 8-41.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-227 Log #3475 NEC-P08 **Final Action: Reject**

(388.22)

Submitter: David E. Watters, H. F. Lenz Company

Recommendation: Revise text as follows:

~~Number of Conductors or Cables. The number of conductors or cables installed in surface nonmetallic raceway shall not be greater than the number for which the raceway is designed. Cable shall be permitted to be installed where such use is not prohibited by the respective code articles.~~

Number of Conductors. The sum of cross-sectional area of all contained conductors at any cross section of the surface nonmetallic raceways shall not exceed 20 percent of the interior cross-sectional area of the surface nonmetallic raceways. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current carrying conductors.

The derating factors specified in 310.15(B)(2)(a) shall be applied to current-carrying conductors up to and including the 20 percent fill specified above.

Substantiation: Testing was performed on a 1-5/8 in. × 5-1/8 in., double compartment, surface nonmetallic raceway at the ETL SEMKO Laboratory. Each compartment was filled with sixty (60) - #10 conductors of which forty (40) were active with a continuous load of 16 amps. This condition represented a conductor fill of 34%, which complied with the manufacturer’s recommendations, and the current load complied with Table 310.15(B)(2) of the National Electrical Code. In this case, multiple conductors within the raceway compartments, exceeded the 90°C temperature limitation of the insulation. In fact, the raceway itself experienced damage due to internal cable heating. Obviously, this test failed according to the test report I have provided. For these reasons, additional loading and raceway fill restrictions should be applied. In particular, the wording which allows raceway fills to exceed 20% based on the wording “for which the raceway is designed” should be removed. The proposed changes will make the wording of this section of the code more consistent with Articles 376 and 378, and help to mitigate problems associated with excessive raceway fill. For these reasons, we recommend approval of the code changes listed above.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter provided an invalid test that did not follow manufacturer’s specifications, which is part of the listing criteria.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-228 Log #2589 NEC-P08 **Final Action: Reject**

(388.30)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Surface nonmetallic raceways shall be ~~supported~~ securely fastened to supports at intervals.... (remainder unchanged).

Substantiation: Edit. “Supported” is not necessarily the same as “fastened”. A raceway laid on the floor is supported.

Panel Meeting Action: Reject

Panel Statement: “Securely fastened” is not restricted to supports only. Securing to concrete walls, cable trays, and other approved means are acceptable.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

8-229 Log #2603 NEC-P08 **Final Action: Reject**

(388.60)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Where an equipment grounding conductor is ~~required~~ provided ~~a separate equipment grounding conductor~~ it shall be installed in the nonmetallic raceway.

Substantiation: Edit. The provision should apply where an equipment grounding conductor is installed by choice and not “required”.

Panel Meeting Action: Reject

Panel Statement: Proposed changes do not improve clarity or content of existing text.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 390 — UNDERFLOOR RACEWAYS

8-230 Log #3357 NEC-P08 **Final Action: Accept in Principle**
(390.2 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
390.XX Definition. An enclosure designed and intended for installation in floors an installation of cables and electrical conductors and which may have provisions for access to the interior at intervals of length.
Substantiation: There is no definition as is common for other raceways. A conduit may literally be an underfloor raceway.
Panel Meeting Action: Accept in Principle
Add new section 390.2 as follows and renumber remaining sections accordingly.
390.2 Definition.
Underfloor Raceway. A raceway and associated components designed and intended for installation beneath or flush with the surface of a floor for the installation of cables and electrical conductors.
Panel Statement: Panel concludes that a definition was needed for Article 390 and the revised text meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-231 Log #2706 NEC-P08 **Final Action: Reject**
(390.2(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
The installation of underfloor raceways shall only be permitted beneath the surface of concrete or other flooring material ~~in office occupancies~~ where ~~laid~~ installed flush with the ~~concrete~~ floor ~~and covered with linoleum or equivalent floor covering~~.
Substantiation: "Shall be permitted" does not impose a requirement; 90.5 (B) that term describes options or alternatives. Office occupancies or floor covering is not pertinent to the use or safety of underfloor raceways. The second word "concrete" should be deleted since the provision includes "other flooring material". "Equivalent" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: There are different rules for installation depending on occupancy type.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-232 Log #3182 NEC-P08 **Final Action: Reject**
(390.2(B))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 390.2(B), delete ~~(1) and or (2) In any hazardous (classified) locations, except as permitted by 504.20 and in Class I, Division 2 locations as permitted in 501.10(B)(3)~~
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-233 Log #2638 NEC-P08 **Final Action: Reject**
(390.15)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Connections from underfloor raceway to distribution ~~centers~~ equipment and ~~wall~~ outlets shall be made by ~~approved~~ identified fittings or by any of the identified wiring methods in Chapter 3.
Substantiation: Edit. Extensions may be made to outlets not on a wall. All wiring methods of Chapter 3 may not be suitable.
Panel Meeting Action: Reject
Panel Statement: This is not editorial. The submitter did not provide substantiation for the changes.
Approved is subject to the AHJ. Identification marks may be method of approval. Listing may be another. Simple identification creates a manufacturer's self certification that neither requires AHJ approval or listing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-234 Log #483 NEC-P08 **Final Action: Reject**
(390.17)

Submitter: Carl V. Cardi, III, CVC 1 Limited LLC
Recommendation: Add new text to read as follows:
Section 390.17 Ampacity of Conductors. The ampacity adjustment factors, in 310.15(B)(2), shall apply to conductors in underfloor raceways.
Proposed Exception: The application of the adjustment factors set forth in Table 310.15(B)(2)(a) shall not be required for underfloor raceways where all of the following conditions are met:
(1) Labeled metallic devices are inserted in the underfloor raceways that provide elevation, separation, and spacing among the conductors by dividing the underfloor raceway into channels. Not more than nine current-carrying conductors shall be placed within a channel.
(2) The metallic devices used for elevation, separation, and spacing shall enable air to flow within and between the channels in order to provide cooling of the conductors throughout the length of the underfloor raceway in a manner sufficient to allow the transient and steady-state temperatures of the conductors to remain below the rated temperatures for their insulation as specified in the applicable column of Table 310.16.
(3) The metallic devices used for elevation, separation, and spacing shall provide sufficient support and separation of the current-carrying conductors so that conductors in one channel shall not come into contact with conductors in another channel, except that such conductors may come into contact with conductors in another channel upon entering or exiting the underfloor raceway and conductors within one channel may come into contact with other conductors in the same channel.
(4) The metallic devices used for elevation, separation, and spacing shall be secured so as to prevent movement of the devices and so as to maintain contact with the walls and floor of the underfloor raceway in order to conduct heat to the walls and floor of the underfloor raceway and shall be connected to the underfloor raceway in a manner consistent with the limitations of their labeling.
(5) Where contact between the conductors and the edges of the metallic devices used for elevation, separation, and spacing presents the risk of abrasion of the insulation of the conductors, the edges of the devices shall be protected so as to avoid that risk.
Substantiation: The ampacity derating factors of Section 310.15(B)(2)(a) severely limit the ampacities of conductors placed in sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways. This proposal establishes exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17 that allow for the placement of metallic devices to elevate, separate, and space the current-carrying conductors in those raceways so as to increase the number permitted by taking full advantage of the cooling capacity in the entire cross-sectional area of the raceway and the heat conducting properties of the metallic devices. The exception tendered for each of those sections contains five stringent conditions under which the devices may be used for such purpose. The report issued by INTERTEK, ETL SEMKO dated June 4, 2007, that accompanies this proposal provides test results that support the proposal.

I. Introduction:

A. Carl Cardi, III:

Mr. Cardi is presently a city electrical inspector for the city of Columbus, Ohio, a former electrical contractor, and an inventor. He is also President of CVC 1 Limited, LLC, the manufacturer of Cool Wire products.

B. Arnold E. Shaheen, Jr., Esq.:

Mr. Shaheen is counsel for CVC 1 Limited, LLC, and the author of this Proposal. Mr. Shaheen is licensed to practice law in the state of Ohio and received his Juris Doctorate Degree from Capital University in Columbus, Ohio, and a Bachelor of Science Degree in Electrical Engineering from The Ohio State University. Before, during, and after his attending college and law school, Mr. Shaheen also worked from childhood until 1985 in his family's electrical construction business, which engaged in commercial and industrial electrical construction. Between 1971 and 1985, Mr. Shaheen was licensed as an electrical contractor in Columbus, Ohio.

C. The Proposal:

Mr. Cardi has submitted this Proposal in an effort to provide suggested revisions to the National Electric Code ("NEC") that respect the intent and purpose of Section 310.15(B)(2)(a), but which allow for more flexibility in the design of electrical wiring systems that incorporate the use of sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, surface metal raceways, and underfloor raceways by allowing for new technologies that provide elevation, separation, and spacing of current-carrying conductors within those wiring systems. In so doing, it is submitted that these new technologies will provide better ambient cooling within those wiring systems by taking full advantage of all of the airspace within their cross-sectional areas as well as the heat conductive properties of the metallic devices that incorporate these new technologies and will allow for the placement of more current-carrying conductors in a raceway than would otherwise be permitted by the application of Section 310.15(B)(2)(a).

II. Heat Generated By Current-Carrying Conductors:

Well known principles of physics that govern the transfer of heat energy establish that heat energy cannot be dissipated without a thermal gradient. The principles of heat transfer are analogous to the concepts of current, resistance, and voltage embodied in Ohm's Law. Heat, like current, cannot flow unless there is a thermal gradient, as in the case of a difference in electrical potential, or voltage, in an electrical circuit. If there is no thermal gradient, or if the heat source is surrounded by insulation, the heat source will not cool or may even grow warmer if the heat source is, itself, a generator of heat energy. When current flows through a wire, the wire becomes a heat source that generates heat energy because the flow of electricity encounters resistance, the degree of which is a function of both the size of the wire and the conductivity of the material from which the wire is manufactured.

From a fire prevention perspective, the danger, of course, is that a wire will become so hot that its insulation degrades resulting in the potential for a short circuit between a bare spot on a current-carrying conductor and a bare spot on another current-carrying conductor or between a bare spot on a current-carrying conductor and the metallic enclosure in which the conductor is placed. Even where adequate overcurrent protection exists, the potential for a fire or for further degradation of the insulation of surrounding conductors exists if the temperature of current-carrying conductors is allowed to rise above the rated temperature limitation of their insulation.

Insulated, current-carrying conductors that are bundled together or which lie in contact with one another, particularly those that are totally surrounded by and in contact with other current-carrying conductors, will rise in temperature because there exists no thermal gradient through which to dissipate the heat. Section 310.10, FPN No.1, subparagraph 4, recognizes this physical phenomenon.

III. Section 310.15(B)(2)(a):

Section 310.15(B)(2)(a) requires that the ampacity derating factors of Table 310.15(B)(2)(a) shall apply to any raceway that contains more than three current-carrying conductors. On its face, Section 310.15(B)(2)(a) was meant to apply to all systems defined as raceways in Article 100. The traditional practice in the electrical industry was to readily apply this section to all forms of conduit. However, confusion arose in the enforcement and application of articles of the NEC that applied to other types of raceways because those articles contained only fill limitations and not ampacity derating requirements. The result, in many cases, was that the fill requirements of a particular article were allowed to trump the requirements of Section 310.15(B)(2)(a) and, thus, create the risk of overheated raceways because of the number of current-carrying conductors placed within them, resulting in the commensurate risk of short circuits and fire.

To resolve the confusion and to better clarify the NFPA's intent regarding the application and enforcement of Section 310.15(B)(2)(a), the 2005 edition of the NEC added ampacity derating requirements within articles pertaining to specific types of raceways. Section 374.17 pertaining to cellular metal floor raceways and Section 390.17 pertaining to underfloor raceways are but two examples.

However, underlying the application and enforcement of Section 310.15(B)(2)(a) is the assumption that the conductors in a raceway will all lie at the bottom of the raceway and in close proximity to or in contact with one another. This assumption fails to take into account the cooling effect that the surrounding ambient **within the raceway** will have when the current-carrying conductors are elevated, separated, and spaced within the raceway nor does it account for the benefit of the heat conductive properties of the metallic devices described in this Proposal.

Many sections of the NEC recognize that spacing promotes the cooling of current-carrying conductors. The requirement to provide spacing between conduits, tubing, or raceways set forth in Section 310.15(B)(2)(b) is one example. The spacing dimensions for electrical ducts depicted in Figure 310.60 of Article 310 and those depicted for single insulated conductors in nonmagnetic underground electrical ducts in FPN Figure B.310.5 of Appendix B are other examples.

However, none of the articles, in their current form, containing sections identified in this Proposal address either the potential benefit of ambient cooling that could be realized by the elevation, separation, and spacing of current-carrying conductors within a raceway or the benefit of the heat conductive properties of the metallic devices described in this Proposal. It is those benefits that this Proposal addresses, while, at the same time, honoring the intent of Section 310.15(B)(2)(a) to prevent the degradation of the insulation of current-carrying conductors due to overheating.

IV. Proposed Changes to Sections 310.15(B)(2)(a), 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17:

This Proposal sets forth exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, each containing five subparagraphs. Those five subparagraphs are discussed in sequence, below:

A. Subparagraph (1):

Metallic devices that provide elevation, separation, and spacing among current-carrying conductors would be allowed in lieu of the application of the derating factors of Table 310.15(B)(2)(a). Those devices would separate raceways into channels, however, no channel would be permitted to hold more than nine conductors, which is the upper limit for the number of conductors to which the 70 percent derating factor of Table 310.15(B)(2)(a) presently applies. This numerical limit recognizes that, even though dividing raceways into channels enables the cooling of current-carrying conductors, there are physical limits to this effect. The devices must be labeled in compliance with the definition of that term as set forth in Article 100 and the requirements of Section 110.3(A)(1) FPN.

B. Subparagraph (2):

The metallic devices that provide elevation, separation, and spacing must also permit convection within a channel and between and among channels such that the transient and steady-state temperatures of the current-carrying conductors within any channel remain below the rated temperature for their insulation as indicated in the applicable column of Table 310.16.

C. Subparagraph (3):

The metallic devices must prevent contact between current-carrying conductors in different channels within the raceway, except at points of egress and ingress. However, because the number of conductors is limited to nine within any given channel, conductors within that channel may be in contact without additional separation within that channel.

D. Subparagraph (4):

The metallic devices must be secured so as to prevent movement of the devices and to maintain contact with the walls and floor of the raceway in order to enable the device to transmit heat away from the current-carrying conductors and to the walls and floor of the raceway so that the raceway may, in turn, transmit the heat either into the air, if the raceway is an auxiliary gutter or wireway, or to concrete, if the raceway is a cellular metal raceway or an underfloor raceway.

E. Subparagraph (5):

In order to prevent abrasion of current-carrying conductors within a channel, this subparagraph provides that all edges of the metallic devices that provide elevation, separation, and spacing of the current-carrying conductors must be protected where those edges would come into contact with the conductors.

F. Section 310.15(B)(2)(a):

The words, "Except as provided for by exceptions to Sections 366.22(A), 366.23(A), 374.17, 376.22, 384.22, 386.22, and 390.17, where there is no load diversity...." have been added. This additional language makes explicit that the exceptions to the application of Section 310.15(B)(2)(a) established by this Proposal apply only to the enumerated sections and only when load diversity is not available.

G. Section 366.22(A):

The preamble to the exception for this section limits its applicability in the case of sheet metal auxiliary gutters to situations where the 20 percent fill limitation prescribed for this type of raceway is not exceeded, but where there are more than 30 current-carrying conductors placed within the raceway.

H. Section 366.23(A):

The preamble to the exception for this section mimics the preamble contained in Section 366.22(A), which also applies to sheet metal auxiliary gutters.

I. Section 374.17:

Since the language of this section contains no limitations upon the applicability of Section 310.15(B)(2)(a) to cellular metal raceways, no preamble was necessary. The exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 374.17 and to cellular metal raceways.

J. Section 376.22:

As in the case of sheet metal auxiliary gutters, the preamble to the exception for this section limits its applicability to those instances in which the 20 percent fill limitation is not exceeded, but where there are also more than 30 current-carrying conductors placed within the metal wireway.

K. Section 384.22:

In the case of strut-type channel raceways, the preamble to the exception limits its applicability to those instances in which the percentage fill requirements of Table 384.22 are not exceeded and where the outside diameter dimensions of types and sizes of wire as set forth in the tables in Chapter 9 are met, but where the cross-sectional area of the raceway exceeds 2500mm² (4in.²) and where the number of current-carrying conductors in the raceway is greater than 30, but where the cross-sectional area of all current-carrying conductors does not exceed 20 percent of the cross-sectional area of the raceway.

L. Section 386.22:

The preamble to the exception for this section mimics that of Section 384.22 and applies to surface metal raceways.

M. Section 390.17:

As in the case of cellular metal raceways, the exception is a direct carveout to the general applicability of Section 310.15(B)(2)(a) to Section 390.17 and to underfloor raceways.

V. Test Evidence Submitted In Support of Proposal:

A. Testing Protocol:

Between May 29, 2007, through June 1, 2007, electrical testing involving metallic devices described in this Proposal was performed by INTERTEK, ETL SEMKO of Cortland, New York. Two different types of raceways and two sizes of conductors, 12 AWG THHN and 10 AWG THHN were tested. Testing was performed for the purpose of: (1) measuring the heating of the conductors under the testing protocol; and, (2) to determine how many conductors could be placed within the raceways without the temperature of the conductors exceeding the 90° C limitation of their insulation. Tests for physical abrasion were not conducted.

In the first instance, a 12 in. x 3 in. x 5 ft underfloor raceway was tested under various scenarios in order to determine the conductor temperatures. Similar testing was performed for an 8 in. x 8 in. x 5 ft metallic wireway. The ends of both raceways were stuffed with styrofoam in order to trap heat so as to create a worst-case scenario. Where it was appropriate to do so, both raceways were tested in a double-blind manner, that is, they were tested under the same conditions with and without the metallic devices described in this Proposal.

Constant loading of the conductors in each instance occurred throughout the duration of each test. No unloaded conductors, or fillers, were placed within the raceways. The time period used as a benchmark in order to attain steady-state temperature conditions was three hours. Thermocouples were placed on one conductor in each channel. One thermocouple was used to measure the room ambient.

The graphs indicating the test results show the temperatures measured by the thermocouples along the Y-axis and the time periods for those temperatures along the X-axis. The temperature recording for each conductor is indicated on each graph by a different color of line. The letters, “UF,” noted in the keys for the graphs for the tests denote conductors in the underfloor raceway. The letters, “WW,” denote conductors in the metal wireway. The maximum temperatures that were recorded for each conductor to which a thermocouple was attached are displayed in a table at the bottom of each graph for either one or both raceways, depending upon how each test was conducted.

B. Test Nos. 1 and 10:

In Test No. 1, the underfloor raceway was wired using 81 #12 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used to elevate, separate, and space the conductors. The test load on each of the conductors was 16 amperes. Upon removal of the underfloor raceway cover it was noted that one of the supports had moved. Thus, this test was redone as Test No. 10 only as to the underfloor raceway.

In Test No. 1, the metallic wireway was wired with 90 #12 THHN conductors in 10 groupings of 9 conductors.

In Test No. 1, the temperatures for all conductors for both raceways, after more than 3 hours, remained below 90°C and in a steady-state condition. The ambient temperature remained at approximately 25°C throughout the test.

Test No.1, as to the underfloor raceway, was repeated in Test No. 10. Again, the test results were the same. After more than three hours and in steady-state condition, the temperatures of all of the conductors remained below 90°. The ambient temperature approximated 22°C throughout the test.

During neither Test No. 1 nor Test No. 10 did the temperature of any of the conductors exceed 90°C at any point in time.

C. Test No. 2:

The same test protocol were used in this test as in Test No. 1 for both raceways. However, the metallic devices described in this Proposal were not used. After 91 minutes, in the case of both raceways, the temperatures of the conductors remain in a transient state and on an upward incline towards their 90°C limitation of their insulation. At that point in time, the highest temperature reached by any conductor in the underfloor raceway was 89.24°C and in the metal wireway was 81.97°C.

D. Test No. 3:

In Test No. 3, the underfloor raceway was wired with 81 #12 THHN conductors using a vertical divider system that did not permit air to flow between the divided chambers within the raceway. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes. After only 64 minutes, the temperatures of all of the conductors in the underfloor raceway remained in a transient state and the temperature of one conductor had exceeded the 90°C limitation of its insulation.

E. Test No. 4:

In Test No. 4, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded with 16 amperes.

After more than 3 hours, the highest temperature reached in the underfloor raceway was 60.45°C and in the case of the metal wireway the highest temperature reached was 52.40°C.

F. Test No. 5.

In Test No. 5, the underfloor raceway was wired with 81 #10 THHN conductors in 9 groupings of 9 conductors. The metal wireway was wired with 90 #10 THHN conductors in 10 groupings of 9 conductors. For both the underfloor raceway and the metallic wireway, the metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

This test demonstrated the upper limit of the cooling effect of the metallic devices described in this Proposal in the case of the underfloor raceway. The transient state temperatures of the underfloor conductors began to approximate 90°C after 33 minutes. At that point the cover of the underfloor raceway was removed.

However, in the case of the metal wireway, the highest temperature of the conductors was 82.03°C in steady-state condition after 190 minutes.

The ambient approximated 22°C throughout the test.

G. Test No. 6:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groups of 9 conductors. The metallic devices described in this Proposal were used. The conductors were loaded at 24 amperes.

The highest temperature reached by a conductor after 203 minutes was 67.74°C in a steady-state condition. The ambient temperature for the test ranged between 22° and 28°C.

H. Test No. 7:

The underfloor raceway was wired with 45 #10 THHN conductors in 5 groupings of 9 conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

After 157 minutes, the temperatures of the conductors remained in a transient state condition. By that time, one of the conductors had reached 89.06°C. The ambient temperature ranged between 22°C and 28°C.

I. Test No. 8:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 16 amperes.

After 126 minutes, the temperatures of the conductors in the underfloor raceway remained in a transient condition and were gradually rising. At that point in time the highest temperature for the underfloor conductors was 75.17°C.

After the same time period, the conductors in the wireway, for the most part, remain in a transient condition with the highest temperature recorded at 71.09°C.

The ambient temperature ranged between 22°C and 25°C.

J. Test No. 9:

The underfloor raceway was wired with 81 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The metal wireway was wired with 90 #10 THHN conductors. The metallic devices described in this Proposal were not used. The conductors were loaded at 24 amperes.

The graph of the temperatures of the conductors in the two types of raceways demonstrates that the temperatures in both raceways were rising rapidly. Within 14 minutes after the commencement of the test, the highest temperature of a conductor in the underfloor raceway is 97.95°C and for the metal wireway is 93.43°C.

The ambient remained at approximately 22°C throughout the test.

K. Test Conclusions:

The use of the metallic devices described in this Proposal demonstrate a marked decrease in the transient and the steady-state temperatures of the conductors within the limitations of the cooling effects of the devices. This can be readily shown by comparing the test results in Test Nos. 6 and 7, the test results in Test Nos. 4 and 8, and by comparing the test results in Test Nos. 1 and 10 with Test No. 2. Within the limitations of the devices, as demonstrated in Test No. 5 as it relates to underfloor raceways, the 90°C limitations of the conductors' insulation is not exceeded during the three hour protocol for the tests where the devices were used.

VI. Conclusion:

This Proposal provides for exceptions to the applicability of Section 310.15(B)(2)(a) to sheet metal auxiliary gutters, cellular metal floor raceways, metal wireways, strut-type channel raceways, and underfloor raceways that impose five conditions so as to preserve the intent of that section to prevent thermal degradation of insulation, but yet allow for more current-carrying conductors to be placed within those raceways. Due to the stringent nature of those conditions, the reasons cited in the narrative, above, and the test results supplied with this Proposal, the Proposer requests that the Proposal be approved.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: See panel statement on proposal 8-152.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-235 Log #2606 NEC-P08 **Final Action: Reject**
(390.17 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows:

Exception: Where more than one outlet on the same circuit is individually supplied by one set of conductors it shall be permitted to count only the current-carrying conductors of one such set of conductors for the purpose of ampacity adjustment.

Substantiation: The present derating factors discourage installation of individual sets of conductors on the same circuit which reduces voltage drop, increases efficiency and does not increase heating effect. The proposal would encourage compliance with 390.7.
Panel Meeting Action: Reject
Panel Statement: The current text is clear. It is the intent of the panel to have the adjustment factors of 310.15(B)(2) apply to underfloor raceways.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 392 — CABLE TRAYS

8-235a Log #CP804 NEC-P08 **Final Action: Accept**
(392)

Submitter: Code-Making Panel 8,
Recommendation: Accept "include" file called "Article 392 reformatted". No wording has been added or deleted from existing 392 only change is to renumber to meet the basic style manual.
ARTICLE 392

Cable Trays

I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998, *Metal Cable Tray Systems*; NEMA–VE 2-1996, *Metal Cable Tray Installation Guidelines*; and NEMA–FG-1998, *Nonmetallic Cable Tray Systems.*

392.2 Definition.

Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

II. Installation

392.10 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant. Cable trays and their associated fittings shall be identified for the intended use.

(A) Wiring Methods. The wiring methods in Table 392.10(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.10(A) Wiring Methods

Wiring Method	Article
Armored cable	320
CATV cables	820
CATV raceways	820
Class 2 and Class 3 cables	725
Communications cables	800
Communications raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Network-powered broadband communications cables	830
Nonmetallic-sheathed cable	334
Non-power-limited fire alarm cable	760
Optical fiber cables	770
Optical fiber raceways	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	
Polyvinyl chloride PVC conduit	352
Power and control tray cable	336
Power-limited fire alarm cable	760
Power-limited tray cable	725
Rigid metal conduit	344
Rigid nonmetallic conduit	352
RTRC	355
Signaling raceway	725

(B) In Industrial Establishments. The wiring methods in Table 392.10(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.10(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).

(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(b) Welding cables shall comply with the provisions of Article 630, Part IV.

(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(2) Single and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(B)(1).

(C) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

(D) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.
(E) Complete System. Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.
Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.
A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.
(F) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.
(G) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.
(H) Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.
(I) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.10(H).
(J) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.
(K) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.
For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.
For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.
(L) Cable Installation.
(1) Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.
(2) Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:
(a) The cables rated over 600 volts are Type MC.
(b) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray
(M) Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.
Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.
(N) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.
392.12 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.
392.17 Ampacity of Conductors
(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.
(1) The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22(A) shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).
(a) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.
(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.
(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).
FPN: See Table B.310.3.
(2) The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:
(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.
(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.
(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.
Exception to (2)(c): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).
(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).
FPN: See Table 310.20.
(3) Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.17(A)(1) for multiconductor cables and 392.17(A)(2) for single-conductor cables, provided that the following conditions apply:
(a) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(B), totals not more than 100 percent.
(b) Multiconductor cables are installed according to 392.22(A) and single-conductor cables are installed according to 392.22(B) and 392.10(M) and (N).
(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.
The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.
(1) The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:
(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.
(b) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.
(2) The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:
(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.
(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.67 and Table 310.68.

392.22 Number of Conductors or Cables

(A) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where the cable ampacity is determined according to 392.17(A)(1)(c), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(2) Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(4) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.22(A)(5).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22(A)(5).

Table 392.22(A)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Multiconductor Cables			
		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm^2	in.^{2}	mm^2	in.^{2}
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(6) Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.22(A)(6).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22(A)(6).

[a]The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm^2 for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

Table 392.22(A)(6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More than One Cable	
mm	in.	mm²	in.²	mm²	in.²
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

(B) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.
The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single-conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil through 900 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(B)(1) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(B)(1) for the appropriate cable tray width.

(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm², for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].
[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm² (in inches, of all 1000 kcmil) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.

(2) Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

(C) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.
The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.
The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

392.30 Securing and Supporting
(A) Securely Fastened. In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.
(B) Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.
Cable trays shall be supported at intervals in accordance with the installation instructions.
392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.
392.56 Cable Splices.
Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices shall be permitted to project above the side rails where not subject to physical damage.
392.60 Grounding and Bonding.
(A) Metallic Cable Trays. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250.
(B) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided all the following requirements are met:
(1) The cable tray sections and fittings are identified as an equipment grounding conductor.
(2) The minimum cross-sectional area of cable trays conform to the requirements in Table 392.60(A).
(3) All cable tray sections and fittings are legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction and the total cross-sectional area of both side rails for ladder or trough cable tray.
(4) Cable tray sections, fittings, and connected raceways are bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal[a] Steel Cable Trays		Aluminum Cable Trays	
	mm²	in.²	mm²	in.²
60	129	0.20	129	0.20
100	258	0.40	129	0.20
200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50[b]	258	0.40
1000	---	---	387	0.60
1200	---	---	645	1.00
1600	---	---	967.5	1.50
2000	---	---	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.
[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

III. Construction Specifications
392.100 Construction.
(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.
(B) Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.
(C) Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.
(D) Side Rails. Cable trays shall have side rails or equivalent structural members.
(E) Fittings. Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

(F) Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.

Substantiation: The rewrite includes changes in headings and numbering scheme to comply with the NEC Style Manual and for consistency with other Chapter 3 articles.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BLOM, J.: The following revisions affirm the intent of CMP-8's CP804 action. These revisions further improve usability of the Article by providing needed additional subdivision, moving some text within the Article in order to more closely correspond to the titles and editing a few sentences for improved clarity.

The outline of the Article was revised as follows:

I. General
II. Installation
392.10 Uses Permitted
392.12 Uses Not Permitted
392.18 Cable Tray Installation
392.19 Cable Installation
392.22 Number of Conductors or Cables
392.30 Securing and Supporting of Cables
392.46 Bushed Conduit and Tubing
392.56 Cable Splices
392.60 Grounding and Bonding
392.80 Ampacity of Conductors
III. Construction Specifications
392.100 Construction

Note that Subdivisions 392.18 and 392.19 are changes to clarify for the reader the distinguishing requirements of cable tray installation vs. requirements for installing cables in the cable tray. The numbering of these subdivisions was selected to correspond to the numbering system in Article 300's sections 300.18 & 300.19.

Ampacity of Conductors was re-numbered to 392.80 so that the numbering would mimic that found in the Cable Articles 320, 328, 330, 332, 334, 336, and 340.

Another change was to reinstate the subdivision titles. These title additions are consistent with the Style Manual and very helpful for readers to find desired information.

The sentence clarifications or relocations are as follows:

1. Modification to NEC 2008 392.6(A) sentence beginning "where cable trays support individual conductors and where conductors pass from one cable tray to another.......". The modified sentence is : "Where cables or conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft)."

The substantiation for this clarification is: If you take this existing language literally, you can have a single conductor tray cable extend up to 6 ft. from one tray to another (or to a piece of equipment) but you *could not have a multi-conductor cable* do so without a raceway or other supporting means. This is not likely to have been CMP-8's intent. In fact, if you look at the picture in the NEC 2008 Handbook, Exhibit 392.2, you'll see "examples of multi-conductor cables in cable trays....." not single conductors as mentioned in 392.6(A).

2. Relocated NEC 2008 392.6 Complete System subdivision (A) sentence beginning "A bonding jumper sized…" to 392.60 Grounding and Bonding. This relocation places the text with the corresponding subdivision title.

3. Relocated NEC 2008 392.6 Complete System subdivision (A) sentence beginning "The conductors shall be secured…" to 392.30(C), Securing and Supporting of Cables. This relocation places the text with the corresponding subdivision title. Additionally, clarifying text was provided to indicate that the requirement for securing cables applied to transitions.

4. Finally, the second sentence of NEC 2008 392.6 (J) which begins "For raceways terminating at the tray,…" is changed to "Raceways terminating at the tray shall be securely fastened to the cable tray system." This revised sentence appears in this comment's revised Article text as 392.18 (H). The phrase "a listed cable tray clamp or adapter" is removed. The listing requirement for conduit to cable tray clamps is relocated to 392.60 to recognize that the listing applies for grounding and bonding, not support.

ARTICLE 392

Cable Trays

I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998, *Metal Cable Tray Systems*; NEMA–VE 2-1996, *Metal Cable Tray Installation Guidelines*; and NEMA–FG-1998, *Nonmetallic Cable Tray Systems.*

392.2 Definition.

Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

II. Installation

392.10 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant. Cable trays and their associated fittings shall be identified for the intended use.

(A) Wiring Methods. The wiring methods in Table 392.10(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.10(A) Wiring Methods

Wiring Method	Article
Armored cable	320
CATV cables	820
CATV raceways	820
Class 2 and Class 3 cables	725
Communications cables	800
Communications raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Network-powered broadband communications cables	830
Nonmetallic-sheathed cable	334
Non-power-limited fire alarm cable	760
Optical fiber cables	770
Optical fiber raceways	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	
Polyvinyl chloride PVC conduit	352
Power and control tray cable	336
Power-limited fire alarm cable	760
Power-limited tray cable	725
Rigid metal conduit	344
Rigid nonmetallic conduit	352
RTRC	355
Signaling raceway	725

(B) In Industrial Establishments. The wiring methods in Table 392.10(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.10(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).

(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(b) Welding cables shall comply with the provisions of Article 630, Part IV.

(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(2) Single and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(B)(1).

(C) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

(D) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

(E) Complete System. Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.

Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

(F) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(G) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

(H) Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(I) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.10(H).

(J) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

(K) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

(L) Cable Installation.

(1) Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(2) Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(a) The cables rated over 600 volts are Type MC.

(b) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray

(M) Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(N) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.12 Uses Not Permitted.

Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

392.17 Ampacity of Conductors

(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(1) The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22(A) shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(a) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.

(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN: See Table B.310.3.

(2) The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (2)(c): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN: See Table 310.20.

(3) Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.17(A)(1) for multiconductor cables and 392.17(A)(2) for single-conductor cables, provided that the following conditions apply:

(a) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(B), totals not more than 100 percent.

(b) Multiconductor cables are installed according to 392.22(A) and single-conductor cables are installed according to 392.22(B) and 392.10(M) and (N).

(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.

(1) The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:

(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.

(b) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(2) The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.

(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.67 and Table 310.68.

392.22 Number of Conductors or Cables

(A) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where the cable ampacity is determined according to 392.17(A)(1)(c), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(2) Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

Table 392.22(A)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Multiconductor Cables: Column 1 One Cable		Column 2 MoreThan One Cable	
mm	in.	mm^2	in.^{2}	mm^2	in.^{2}
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(6) Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.22(A)(6).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22(A)(6).

Table 392.22(A)(6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More than One Cable	
mm	in.	mm^2	in.^{2}	mm^2	in.^{2}
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

(B) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.
The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

Table 392.22(A) Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

		Maximum Allowable Fill Area for Multiconductor Cables: Ladder or Ventilated Trough Cable Trays, 392.22(A)(1)				Solid Bottom Cable Trays, 392.22(A)(3)

600	24.0	18,000	28.0	18,000 – (30 Sd)	28– (1.2 Sd)	14,200	22.0	14,200–(25 Sd)	22.0–Sd
750	30.0	22,500	35.0	22,500 – (30 Sd)	35– (1.2 Sd)	17,700	27.5	17,700–(25 Sd)	27.5–Sd
900	36.0	27,000	42.0	27,000 – (30 Sd)	42– (1.2 Sd)	21,300	33.0	21,300–(25 Sd)	33.0–Sd

[a]The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm^2 for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

(4) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.22(A)(5).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22(A)(5).

(1) Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single-conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil through 900 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(B)(1) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall

not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(B)(1) for the appropriate cable tray width.
(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

Table 392.22(B)(1) Allowable Cable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays

Inside Width of Cable Tray		Column 1 Applicable for 392.22(B)(1)(b) Only		Column 2[a] Applicable for 392.22(B)(1)(c) Only	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
150	6	4,200	6.5	4,200 – (28 Sd)[b]	6.5 – (1.1 Sd)[b]
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm^2, for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].
[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm^2 (in inches, of all 1000 kcmil) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.
(2) Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.
(C) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.
The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.
The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.
392.30 Securing and Supporting
(A) Securely Fastened. In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.
(B) Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.
Cable trays shall be supported at intervals in accordance with the installation instructions.
392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.
392.56 Cable Splices.
Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices shall be permitted to project above the side rails where not subject to physical damage.
392.60 Grounding and Bonding.
(A) Metallic Cable Trays. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250.
(B) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided all the following requirements are met:
(1) The cable tray sections and fittings are identified as an equipment grounding conductor.
(2) The minimum cross-sectional area of cable trays conform to the requirements in Table 392.60(A).
(3) All cable tray sections and fittings are legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction and the total cross-sectional area of both side rails for ladder or trough cable tray.
(4) Cable tray sections, fittings, and connected raceways are bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal[a] Steel Cable Trays		Aluminum Cable Trays	
	mm^2	$in.^2$	mm^2	$in.^2$
60	129	0.20	129	0.20
100	258	0.40	129	0.20
200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50[b]	258	0.40
1000	---	---	387	0.60
1200	---	---	645	1.00
1600	---	---	967.5	1.50
2000	---	---	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.
[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.
III. Construction Specifications
392.100 Construction.
(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.
(B) Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.
(C) Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.
(D) Side Rails. Cable trays shall have side rails or equivalent structural members.
(E) Fittings. Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.
(F) Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.

8-236 Log #10 NEC-P08 **Final Action: Accept in Principle**
(392)

NOTE: This proposal appeared as Comment 8-77 on Proposal 8-180 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-180 was:
Move:
392.3 to 392.10
392.4 to 392.12
Relocate and renumber existing 392.10 and 392.12.
Submitter: Richard E. Loyd, Sun Lakes, AZ, James Imlah
Recommendation: Revise Article 392 as follows:

ARTICLE 392 Cable Tray~~s~~ Systems

I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998,Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.

392.2 Definition.
Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.
FPN. Cable trays are not raceways they are mechanical support systems. See definition of raceway in Article 100.

ll. Installation

392.~~3~~ 10 Uses Permitted.
Complete System. Cable trays shall be installed as a complete system. ~~Cable trays and their associated fittings shall be identified for the intended use.~~
(A) Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits.

(B) Cable tray installations shall not be limited to industrial establishments.

(C) Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant.

(D) Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.

(E Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

(F) In all ~~L~~ locations ~~(A) Wiring Methods. T~~the wiring methods in Table 392.~~3~~10~~(A)~~ (F) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.~~3~~10~~(A)(6)~~ (F) Wiring Methods

Wiring Method	Article	Section
Armored cable	320	
Communication raceways	800	
Electrical metallic tubing	358	
Electrical nonmetallic tubing	362	
Fire alarm cables	760	
Flexible metal conduit	348	
Flexible metallic tubing	360	
Instrumentation tray cable	727	
Intermediate metal conduit	342	
Liquidtight flexible metal conduit	350	
Liquidtight flexible nonmetallic conduit	356	
Metal-clad cable	330	
Mineral-insulated, metal-sheathed cable	332	
Multiconductor service-entrance cable	338	
Multiconductor underground feeder and branch-circuit cable	340	
Multipurpose and communications cables	800	
Nonmetallic-sheathed cable	334	
Power and control tray cable	336	
Power-limited tray cable		725.61(C) and 725.82(E)
Optical fiber cables	770	
Optical fiber raceways	770	
Rigid metal conduit	344	
Rigid nonmetallic conduit	352	
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays.		

~~B)~~ (G) In Industrial Establishments Only. The wiring methods in Table 392.~~3(A)~~ 10 (F) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system any of ~~the~~ cables in 392.~~3~~ 10(G) (1) ~~(B)(1)~~ and (G) (4) ~~(B)(2)~~ shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.
~~(1) Single Conductors. Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).~~
~~(a)~~ (1) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

~~(b)~~ (2) Welding cables shall comply with the provisions of Article 630, Part IV.

~~(c)~~ (3) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

~~(2)~~ ~~(d)~~ (4) Medium Voltage. Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.~~3(B)(1)~~10~~(5)(a).~~(G)(1)

~~(C)~~ (H) Equipment Grounding Conductors. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of 392.~~7~~ 60.

~~(D)~~ (I) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

~~(E)~~ (J) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.~~3~~ (10), nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

~~392.6 (E)~~ (K) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.
~~392.6(F)~~ (L)Cables Rated Over 600 Volts. Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:
(1) The cables rated over 600 volts are Type MC.
(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

~~392.6(G)~~ (M)Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

~~392.6(H)~~ (N) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.~~6(G)~~ 10(~~13)~~ (M).

~~392.6(I)~~ (O) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

392.~~4~~12 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

~~392.6(B)~~ 392.22 Conductors and Multiconductor Cables Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

~~392.8(D)~~ (A) Connected in Parallel.
(1) Where single conductor cables comprising each phase, neutral; or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.
(2) Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

~~392.8(E)~~ (B) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

~~392.9~~ (C) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.
The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.
(~~A~~) (1) Any Mixture of Cables. Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:
~~(1)~~ (a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.
~~(2)~~ (b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.~~9~~ 22 (C) for the appropriate cable tray width.
~~(3)~~ (c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.~~9~~ 22 (C) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

INSERT TABLE 392.22 HERE (LANDSCAPE) (Not submitted)

(~~B~~) (2) Multiconductor Control and/or Signal Cables Only.
(a) Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray.
(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).
(~~C~~) (3) Solid Bottom Cable Trays Containing Any Mixture. Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:
~~(1)~~ (a) where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.
~~(2)~~ (b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.~~9~~ 22 (C)for the appropriate cable tray width.
~~(3)~~ (c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.~~9~~ 22 (C) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.
(~~D~~) (4) Solid Bottom Cable Tray — Multiconductor Control and/or Signal Cables Only.
(a) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.
(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).
(~~E~~) (5) Ventilated Channel Cable Trays. Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:
~~(1)~~ (a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.~~9(E).~~22 (C) (5)
~~(2)~~ (b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.~~9(E).~~22 (C) (5)

Table ~~392.9(E)~~ 392.22(C)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Multiconductor Cables			
		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm2	in.2	mm2	in.2
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(~~F~~) (6) Solid Channel Cable Trays. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:
~~(1)~~ (a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.~~9(F)~~ 22 (C) (6).
~~(2)~~ (b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.~~9(F)~~ 22 (C) (6).

Table ~~392.9(F)~~392.22(C)(6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm2	in.2	mm2	in.2
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

~~392.10~~ 392.22 (D) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.
The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.
~~(A)~~ (1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:
~~(1)~~ (a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.
~~(2)~~ (b) Where all of the cables are from 250 kcmil up to 1000 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.~~10(A)~~ 22(D) for the appropriate cable tray width.
~~(3)~~ (c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table ~~392.10(A~~) 392.22(D) for the appropriate cable tray width.
~~(4)~~ d Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.
~~(B)~~ (2) Ventilated Channel Cable Trays. Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

Table ~~392.10(A)~~ 392.22 (D) Allowable Cable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays			
		Column 1 Applicable for 392.~~10(A)(2)~~ 22 (D) (1) (b) Only		Column 2a Applicable for 392.~~10(A)(3)~~ 392.22 (D) (1) (c) Only	
mm	in.	mm2	in.2	mm2	in.2
150	6	4,200	6.5	4,200 – (28 Sd)[b]	6.5 – (1.1 Sd)[b]
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm2, for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm2 (in inches, of all 1000 kcmil) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.

~~392.12~~ (E) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

(1) The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

(2) Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

~~392.6(A)~~ 392.24 Field Bends or Modifications ~~How Made.~~ Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained.

~~392.5(B)~~ 392.28 Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

~~392.6(C)~~ 392.30 Supports.

A. Cable Supports

(1)Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

~~392.8 (B)~~(2) (B) ~~Fastened Securely.~~ In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.

~~(A)~~ (B) Cable trays shall be supported at intervals in accordance with the installation instructions.

~~(B)~~ (C) ~~392.6(J)~~ Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.

(1) In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1.

~~(a)~~ (2) For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

~~(b)~~ (3) For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

~~(c)~~ (4) For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

~~392.5 (E) & 392.3~~ 392.40 ~~(D) Boxes and~~ Fittings and Covers.

~~392.5(E)~~ 392.40(A) Fittings.

(1) Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

~~392.3~~ (2) Cable trays and associated fittings shall be identified for the intended use.

~~392.6(D)~~(B) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

~~392.8(C)~~ 392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

~~392.8(A)~~ 392.56 Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails.

392.60 Grounding and Bonding.

~~392.7~~ 392.60 (A) Grounding

(A) Metallic Cable Trays. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96.

(~~B~~ 1) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided that all the following requirements are met:

~~(1)~~ a The cable tray sections and fittings shall be identified for grounding purposes.

~~(2)~~ b The minimum cross-sectional area of cable trays shall conform to the requirements in Table 392.~~7(B).~~60 (A)

~~(3)~~ c All cable tray sections and fittings shall be legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

~~(4)~~ d Cable tray sections, fittings, and connected raceways shall be bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

~~Table 392.7(B)~~ Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Minimum Cross-Sectional Area of Metal[a]

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	**Minimum Cross-Sectional Area of Metal[a]**

200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50[b]	258	0.40
1000	—	—	387	0.60
1200	—	—	645	1.00
1600	—	—	967.5	1.50
2000	—	—	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.

[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

~~292.6(A)~~ 392.60(B) Bonding. A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

~~392.11~~ 392. 80 Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.
(A) Multiconductor Cables. The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.9 shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).
(1) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.
(2) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.
(3) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).
FPN: See Table B.310.3.
(B) Single-Conductor Cables. The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:
(1) Where installed according to the requirements of 392.10, the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.
(2) Where installed according to the requirements of 392.10, the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.
(3) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (B)(3): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).
(4) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).
FPN: See Table 310.20.

~~392.13~~ ~~392.64~~(C) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.
The ampacity of cables rated 2001 volts, nominal, or over, installed according to ~~392.12~~ 392.22(E) shall not exceed the requirements of this section.
(A) Multiconductor Cables (2001 Volts or Over). The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:
(1) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.
(2) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(B) Single-Conductor Cables (2001 Volts or Over). The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:
(1) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.
(2) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(3) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in

III Construction Specifications

~~392.5 Construction Specifications~~.

~~392.5~~ 392.100 Construction

(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.

~~392.5 (D)~~ (B) Side Rails. Cable trays shall have side rails or equivalent structural members.

~~392.5(C)~~ 392.110 Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.

~~392.5(F)~~ 392.116 Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.

Revised Article 392 would show as follows:

ARTICLE 392 Cable Tray Systems

I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998,Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.

392.2 Definition.

Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

FPN. Cable trays are not raceways they are mechanical support systems. See definition of raceway in Article 100.

ll. Installation

392.10 Uses Permitted.

Complete System. Cable trays shall be installed as a complete system.

(A) Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits.

(B) Cable tray installations shall not be limited to industrial establishments.

(C) Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant.

(D) Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.

(E) Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

(F) In all locations the wiring methods in Table 392.10 (F) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections

Table 392.10-(F) Wiring Methods

Wiring Method	ArticleSection
Armored cable	320
Communication raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Multipurpose and communications cables	800
Nonmetallic-sheathed cable	334
Power and control tray cable	336
Power-limited tray cable	725.61(C) and 725.82(E)
Optical fiber cables	770
Optical fiber raceways	770
Rigid metal conduit	344
Rigid nonmetallic conduit	352

Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays.

(G) In Industrial Establishments Only. The wiring methods in Table 392.10 (F) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system any of the cables in 392.10(G) (1) and (G) (4) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(2) Welding cables shall comply with the provisions of Article 630, Part IV.

(3)Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(4) Medium Voltage. Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(G) (1)

(H) Equipment Grounding Conductors. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of 392.60.

(I) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

(J) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

(K) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(L)Cables Rated Over 600 Volts. Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(1) The cables rated over 600 volts are Type MC.

(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

(M)Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(N) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.10 (M).

(O) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

392.12 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

392.22 Conductors and Multiconductor Cables Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(A) Connected in Parallel.

(1) Where single conductor cables comprising each phase, neutral; or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

(2) Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(B) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(C) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.
The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Any Mixture of Cables. Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22 (C) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22 (C) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

INSERT TABLE 392.22(c) HERE (LANDSCAPE) (Not submitted)

(2) Multiconductor Control and/or Signal Cables Only.

(a) Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) Solid Bottom Cable Trays Containing Any Mixture. Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22 (C)for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22 (C) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(4) Solid Bottom Cable Tray — Multiconductor Control and/or Signal Cables Only.

(a) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) Ventilated Channel Cable Trays. Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.22 (C) (5)

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22 (C) (5)

Table 392.22(C)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Multiconductor Cables			
		Column 1 One Cable		Column 2 More Than One Cable	
mm	**in.**	**mm2**	**in.2**	**mm2**	**in.2**
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(6) Solid Channel Cable Trays. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.22 (C) (6).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22 (C) (6).

Table 392.22(C) (6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	**in.**	**mm2**	**in.2**	**mm2**	**in.2**
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

(D) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil up to 1000 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(D) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(D) for the appropriate cable tray width.

(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

(2) Ventilated Channel Cable Trays. Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

Table 392.22 (D) Allowable Cable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Maximum Allowable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays			
		Column 1 Applicable for 392.22 (D) (1) (b) Only		Column 1 Applicable for 392.22 (D) (1) (b) Only	Column 2a Applicable for 392.22 (D) (1) (c) Only
mm	in.	mm2	in.2	mm2	in.2
150	6	4,200	6.5	4,200 – (28 Sd)[b]	6.5 – (1.1 Sd)[b]
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm2, for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm2 (in inches, of all 1000 kcmil) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.

(E) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

(1) The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

(2) Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

392.24 Field Bends or Modifications. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained.

392.28 Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

392.30 Supports.
A. Cable Supports

(1)Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

(2) In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.

(B) Cable trays shall be supported at intervals in accordance with the installation instructions.

(C) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.

(1) In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1.

(2) For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

(3) For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

(4) For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

392.40 Fittings and Covers.

(A) Fittings.

(1) Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

(2) Cable trays and associated fittings shall be identified for the intended use.

(B) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

392.56 Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails.

392.60 Grounding and Bonding.

(A) Grounding

(1) Metallic Cable Trays. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96.

(2) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided that all the following requirements are met:

(a) The cable tray sections and fittings shall be identified for grounding purposes.

(b) The minimum cross-sectional area of cable trays shall conform to the requirements in Table 392.60 (A)

(c) All cable tray sections and fittings shall be legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

(d)Cable tray sections, fittings, and connected raceways shall be bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal[a]			
	Steel Cable Trays		Aluminum Cable Trays	
	mm2	in.2	mm2	in.2
60	129	0.20	129	0.20
100	258	0.40	129	0.20
200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50[b]	258	0.40
1000	—	—	387	0.60
1200	—	—	645	1.00
1600	—	—	967.5	1.50
2000	—	—	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.

[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

(B) Bonding. A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

392.80 Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(A) Multiconductor Cables. The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.9 shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(1) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(2) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.

(3) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN: See Table B.310.3.

(B) Single-Conductor Cables. The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(1) Where installed according to the requirements of 392.10, the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(2) Where installed according to the requirements of 392.10, the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(3) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (B)(3): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(4) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN: See Table 310.20.

(C) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays. The ampacity of cables rated 2001 volts, nominal, or over, installed according to 392.22(E) shall not exceed the requirements of this section.

(1) Multiconductor Cables (2001 Volts or Over). The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:

(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.

(b) Where multiconductor cables are installed in a single layer inuncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(2) Single-Conductor Cables (2001 Volts or Over). The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.

(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in

III Construction Specifications

392.100 Construction

(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.

(B) Side Rails. Cable trays shall have side rails or equivalent structural members.

392.110 Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.

392.116 Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.

Substantiation: As per the TCC to clarify the panel action, Article 392 was reorganized to more closely follow the suggested numbering system established in the NFPA style manual.

Substantiations for Changes to Article 392

This rewrite was completed to format it as closely as possible to the common numbering system.

- Title: add "systems" to clarify this article cover cable tray systems.
- Add Part l General
- 392.2 Definition added new FPN added for clarity definition.
- Add Part ll Installation
- 392.6 "Installation" was no longer needed so it was deleted.
- 392.3 renumbered to "392.10 and revised to style manual. The first sentence from 392.6(A) was added. "Complete System. Cable trays shall be installed as a complete system."
- Old "392.3 renumbered to 392.10 Uses Permitted" will change the numbering system from the normal 1, 2, 3… to A, B, C… to match the style manual. Additionally, the list style shown in the style manual does not provide for sub-lists within a section and the following changes:
- Old 392.3 (A) renumbered to 392.10 (A)
- Old 392.3 (A) renumbered to 392.10 (B)
- Old 392.3 (A) renumbered to 392.10 (C).
- Old 392.6 (A) renumbered to 392.10 (D)
- Old 392.6 (A) renumbered to 392.10 (E)
- Old 392.3 (A) renumbered to 392.10 (F) and changed table reference to Table 392.3(6) (A) to read Table 392.10 (F). The was an editorial change for adding "In all locations the" and removing "(A) Wiring Methods"
- Old Table 392.3 (A) (6) renumbered to Table 392.10 (F)
- Old 392.3 (B) renumbered to 392.10 (G) "In Industrial Establishments Only"
- Old 392.3 (B), first sentence table reference renumbered to 392.10 (F).
- Old 392.3 (B) second sentence to read "any of the cables in 392.10 (G) (1) to (G) (4)"
- Old 392.3 (B) (1) removed the sentence "(1) Single Conductors. Single-conductor cables shall be permitted to be installed in accordance with (B) (1) (a) through (B) (1) (c) as not needed sub heading.
- Old 392.3 (B) (1) (A renumbered to 392.10 (G) (1)
- Old 392.3 (B) (1) (B) renumbered to 392.10 (G) (2)
- Old 392.3 (B) (1) (C) renumbered to 392.10 (G) (3)
- Old 392.3 (B) (2) (d) renumbered to 392.10 (G) (4) and changed reference in article of 392.3 (B) (1) to 392.10 (G) (1)
- Old 392.3 (C) renumbered to 392.10 (H) and the grounding reference is changed from 392.7 to 392.60
- Old 392.3 (D) renumbered to 392.10 (I)
- Old 392.3 (E) renumbered to 392.10 (J)
- Old 392.6 (E) renumbered to 392.10 (K).
- Old 392.6 (F) renumbered to 392.10 (L)
- Old 392.6 (G) renumbered to 392.10 (M)
- Old 392.6 (H) renumbered to 392.10 (N) and change the reference within (N) identified as 392.6(G) renumbered to 392.10 (M)
- Old 392.6 (I) renumbered to 392.10 (O)
- Old 392.4 renumbered to 392.12.
- Old 392.6 "Installation" renumbered to 392.22 with a title of "Conductors and Cables" by adding the word "Multiconductor" that is referenced in the section due to the rewrite and numbering sequence. Change title to read "392.22 Conductors and <u>Multiconductor</u> Cables."
- Old 392.8 (D) renumbered to 392.22 (A) and the contents within this article subdivided as two separate conditions to read:

"Where single conductor cables comprising each phase, neutral; or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance."

"Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

- Old 392.8 (E) renumbered to 392.22 (B).
- Old 392.9(A) (1) renumbered to 392.22 (C) (1) (a)
- Old 392.9 that was renumbered to 392.22 (C) with subsection (1) (b) to change the existing reference of Column 1 of Table 392.9 changed to Column 1 of Table 392.22 (C).
- Old 392.9 that was renumbered to 392.22 (C) with subsection (1) (c) to change the existing reference of Column 2 of Table 392.9 changed to Column 2 of Table 392.22 (C).
- Old Table 392.9 that was renumbered to Table 392.22 (C) to change the following table references with the table to read as follows:

Ladder or Ventilated Trough Cable Trays 392.9 (A) renumbered to 392.22 (C) (1)

Solid Bottom Cable Trays 392.9 (A) renumbered to 392.22 (C) (3)

Column 1 Application for 392.9 (A) (2) renumbered to 392.22 (C) (1) (b) Only

Column 2 Application for 392.9 (A) (3) renumbered to 392.22 (C) (1) (c) Only

Column 3 Application for 392.9 (C) (2) renumbered to 392.22 (C) (2) (b) Only

Column 4 Application for 392.9 (C) (3) renumbered to 392.22 (C) (2) (c) Only

- Old 392.9 (B) changed the section content now numbered 392.22 (C) (2) into parts (a) and (b) to follow previous article format and will read as follows:

Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray.

A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

- Old 392.9 (C) renumbered to 392.22 (C) (3)
- Old 392.9 (C) (1) renumbered to 392.22 (C) (3) (a)
- Old 392.9 (C) (2) renumbered to 392.22 (C) (3) (b) to update reference Table to new title of Table 392.22 (C).
- Old 392.9 (C) (3) renumbered to 392.22 (C) (3) (c) to update reference Table to new title of Table 392.22 (C).
- Old 392.9 (D) renumbered to 392.22 (C) (4)
- Old 392.9 (D) changed the section content now numbered 392.22 (C) (4) into parts (a) and (b) to follow previous article format and will read as follows:

Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.

A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

- Old 392.9 (E) (1) renumbered to 392.22 (C) (5) (a) table reference changed to read "Column 1 of Table 392.22 (C) (5)."
- Old 392.9 (E) (2) renumbered to 392.22 (C) (5) (b) table reference changed to read "Column 2 of Table 392.22 (C) (5)."
- Old Table 392.9 (E) renumbered to Table 392.22 (C) (5)
- Old 392.9 (F) renumbered to 392.22 (C) (6)
- Old 392.9 (F) (1) renumbered to 392.22 (C) (6) (a) and table reference changed to read "Column 1 of Table 392.22 (C) (6)."
- Old 392.9 (F) (2) changed to 392.22 (C) (6) (b) and table reference changed to read "Column 2 of Table 392.22 (C) (6)."
- Old Table 392.9 (F) is renumbered to Table 392.22 (C) (6)
- Old 392.10 renumbered to 392.22 (D)
- Old 392.10 (A) renumbered to 392.22 (D) (1)
- Old 392.10 (A) (1) renumbered to 392.22 (D) (1) (a)
- Old 392.10 (A) (2) renumbered to 392.22 (D) (1) (b) for table reference to now read Column 1 of Table 392.22 (D)
- Old 392.10 (A) (3) renumbered to 392.22 (D) (1) (c) for table reference to now read Column 2 of Table 392.22 (D)
- Old 392.10 (A) (4) renumbered to 392.22 (D) (1) (d)
- Old 392.10 (B) renumbered to 392.22 (D) (2)
- Old Table 392.10 (A) renumbered to Table 392.22 (D)
- Old Table 392.10 (A) column heading reference renumbered to "Column 1 Applicable for 392.22 (D) (1) (b) Only"
- Old Table 392.10 (A) column heading reference to "Column 2a Applicable for 392.22 (D) (1) (c) Only"
- Old 392.12 renumbered to 392.22 (E)
- Old 392.12 renumbered to 392.22 (E) changed the section content into parts (1) and (2) to follow previous article format style and will read as follows:

The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

- The old 392.6 (A) has relocated this sentence to this newly number section as follows:

392.24 Field Bends or Modifications. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Words "Field" and "or Modifications" were editorial changes to provide clarity for job specific installation requirements.

- The old 392.5 (B) has relocated this sentence to the newly numbered section as follows:

392.28 Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

- The old 392.6 (C) has been renumbered to "392.30" "Supports."
- The old 392.6 has been renumbered to 392.30 "(A) Cable Supports" for multiple support requirements that will be identified as separate requirements.
- The old 392.6 (C) renumbered as 392.39 (A) (1) as one of the requirements for cable supports as follows:

Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

● The old 392.8 (A) second sentence has been relocated to 392.30 (A) (2) to read:
In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays. This relocation better fulfills the requirements for cable supports. The old title "Securely Fastened" has been removed from the 392.8 (B) when this was relocated.
● Old 392.6 (A) second sentence is renumbered as 392.30 (B).
● Old 392.6 (J) is renumbered as 392.30 (C) with a title "(C) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.
● Old 392.6 (J) now identified as 392.30 (C) was changed to a number format numbered 1 to 4 as separate requirements by the following numbering sequence:
In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1
For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.
For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.
For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.
● From the old 392.5 (E) and 392.3 (D) renumbered to a new heading and number to read as follows:"392.40 Fitting and Covers."
● Old 392.5 (E) renumbered and an identification sub (A) 392.40 (A) "Fittings."
From the old 392.5 (E) and a new designation:
Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.
● From the old 392.3 to have a new (2) for the statement relocated as follows: Cable trays and associated fittings shall be identified for the intended use.
This change was to correlate with the fitting and covers title line.
● Old 392.6 (D) renumbered to 392.40 and new designation sub (B) titled "Covers."
● Old 392.8 (C) renumbered as 392.46 "Bushed Conduit and Tubing"
● Old 392.8(A) renumbered as 392.56 "Cable Splices."
● From the old 392.7 Grounding has been renumbered to 392.60 to more closely follow the NEC numbering sequence. Additionally, the title has been changed to "Grounding and Bonding" for the title to more accurately describe the content of the article
A new sub-heading "392.60 (A) Grounding" to separate the requirements from bonding.
● Old 392.7 (A) is renumbered 392.60 (A) (1) "Metallic Cable Trays"
● Old 392.7 (B) is renumbered 392.60 (A) (2) "Steel or Aluminum Cable Tray Systems."
● Old 392.7 (B) (1) is renumbered 392.60 (A) (2) (a)
● Old 392.7 (B) (2) is renumbered 392.60 (A) (2) (b) the table reference to Table 392.7 (B) renumbered to Table 392.60 (A)
● Old 392.7 (B) (3) is renumbered 392.60 (A) (2) (c)
● Old 392.7 (B) (4) is renumbered 392.60 (A) (2) (d)
● Old Table 392.7 (B) is renumbered 392.60 (A)
● From the old 392.6 (A) has been re-identified as a sub designation "392.60 (B) Bonding" for the title to more accurately description of the article
● Old 392.11 renumbered to 392.80
● Old 392.13 renumbered to 392.80 (C) "Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays" as a sub title under ampacity
● The old 392.13 first sentence code reference should be renumbered from 392.12 to 392.22 (E)
● Old 392.13 renumbered as 392.80 (C) (1)
● Old 392.13 (A) renumbered as 392.80 (C) (1)
● Old 392.13 (A) (1) renumbered as 392.80 (C) (1) (a)
● Old 392.13 (A) (2) renumbered as 392.80 (C) (1) (b)
● Old 392.13 (B) renumbered as 392.80 (C) (2)
● Old 392.13 (B) (1) renumbered as 392.80 (C) (2) (a)
● Old 392.13 (B) (2) renumbered as 392.80 (C) (2) (b)
● Old 392.13 (B) (3) renumbered as 392.80 (C) (2) (c)
● Add Part "III Construction Specifications"
● Change the old 392.5 to 392.100 and title as "Construction" to follow the titles and location assigned to other articles.
● Old 392.5 (A) is renumbered as 392.100 (A)
● Old 392.5 (D) is renumbered as 392.100 (B)
● Old 392.5 (C) is renumbered as 392.110
● Old 392.5 (F) is renumbered as 392.116
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 8-235a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BLOM, J.: Refer to comment on Proposal 8-235a, Log No. CP804.

8-237 Log #11 NEC-P08 **Final Action: Accept in Principle**
(392)

NOTE: This proposal appeared as Comment 8-78 on Proposal 8-180 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-180 was:
Move:
392.3 to 392.10
392.4 to 392.12
Relocate and renumber existing 392.10 and 392.12.
Submitter: Michael P. Walls, American Chemistry Council
Recommendation:
ARTICLE 392 Cable Trays
GENERAL

392.1 Scope
This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.
Cable trays are mechanical support systems. Cable trays are not raceways. See the definition of raceway in Article 100.
FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998, Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.
392.2 Definition
Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.
INSTALLATION
392.~~3~~**10** Uses Permitted
Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits.
(1) Cable tray installations shall not be limited to industrial establishments.
(2) Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant.
(3) Cable trays and their associated fittings shall be identified for the intended use.
(A) Wiring Methods The wiring methods in Table 392.~~3~~10(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.~~3~~**10**(A) Wiring Methods

Wiring Method	Article Section
Armored cable	320
Communication raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Multipurpose and communications cables	800
Nonmetallic-sheathed cable	334
Power and control tray cable	336
Power-limited tray cable	725.61(C) and 725.82(E)
Optical fiber cables	770
Optical fiber raceways	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	
Rigid metal conduit	344
Rigid nonmetallic conduit	352

(B) In Industrial Establishments The wiring methods in Table 392.~~3~~**10**(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.~~3~~**10**(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single Conductors Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).

(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(b) Welding cables shall comply with the provisions of Article 630, Part IV. Cable trays used to support welding cables are required to be dedicated for welding cable installation. See 630.42 for installation details.

(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(2) Medium Voltage Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.~~3~~**10**(B)(1).

(C) Equipment Grounding Conductors Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of 392.~~7~~**60**.

(D) Hazardous (Classified) Locations Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

(E) Nonmetallic Cable Tray In addition to the uses permitted elsewhere in 392.~~3~~**10**, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

392.~~4~~**12** Uses Not Permitted

(1) Cable tray systems shall not be used in hoistways or where subject to severe physical damage.

(2) Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

392.~~9~~ **22 Cable Tray Conductor Fill (A)**Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

~~(A)~~ **(1)**Any Mixture of Cables Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

~~(1)~~**(a)** Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

~~(2)~~**(b)** Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.~~9~~ **22**for the appropriate cable tray width.

~~(3)~~ **(c)** Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.~~9~~**22** for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

~~(D)~~ **(4)**Solid Bottom Cable Tray — Multiconductor Control and/or Signal Cables Only.

(a) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.

(b)A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

~~(E)~~ **(5)**Ventilated Channel Cable Trays Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

~~(1)~~ **(a)** Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.~~9~~ **22**(E). ~~(2)~~

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.~~9~~ **22**(E).

Table 392.~~9~~ **(22)**(E) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

~~(F)~~ **(6)**Solid Channel Cable Trays Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

~~(1)~~ **(a)**Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.~~9~~ **22**(F).

~~(2)~~ **(b)**Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.~~9~~ **22**(F).

~~392.10~~ **(B)**Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays

The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

~~(A)~~ **(1)**Ladder or Ventilated Trough Cable Trays Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

~~(1)~~**(a)**Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

~~(2)~~**(b)**Where all of the cables are from 250 kcmil up to 1000 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.~~10(A)~~ **22(G)** for the appropriate cable tray width.

~~(3)~~ **(c)**Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.~~10(A)~~ **22(G)** for the appropriate cable tray width.

~~(4)~~**(d)**Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

~~(B)~~ (**2**)Ventilated Channel Cable Trays Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

(C) Number of Combination of Multiconductor Cables and Single Conductor Cables in the same Cable Tray.

392.~~6~~**24**Installation

(A) Complete System Cable trays shall be installed as a complete system.

(1) Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained.

(2) Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment.

(3) The system shall provide for the support of the cables in accordance with their corresponding articles.

(4) Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft).

(a) The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

(b)A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

(B) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(C) Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

Cable trays shall be supported at intervals in accordance with the installation instructions.

(D) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

(E) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(F) Cables Rated Over 600 Volts. Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(1) The cables rated over 600 volts are Type MC.

(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

(G) Through Partitions and Walls Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(H) Exposed and Accessible Cable trays shall be exposed and accessible except as permitted by 392.~~6~~ **(24)**(G).

I) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

(J) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.

(1) In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1.

(2) For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system.

(3) Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

~~(B)~~ **392.30** Fastened Securely. In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.

392.~~8~~ **56**Cable Installation

(A) Cable Splices Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails.

~~(C)~~ **(B)**Bushed Conduit and Tubing A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

~~(D)~~ **(C)**Connected in Parallel

(1) Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

(2) Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

~~(E)~~ **(D)**Single Conductors

(1) Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer.

(2) Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.~~7~~ **60**Grounding

(A) Metallic Cable Trays.

(1) Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96.

(2) Section 392.~~7~~**(60)**(A), together with 250.96, requires all cable tray systems that support electrical conductors (whether mechanically continuous or with isolated segments) to be electrically continuous and effectively bonded and grounded. This requirement applies whether or not the cable tray is used as an equipment grounding conductor.

(B) Steel or Aluminum Cable Tray Systems Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided that all the following requirements are met:

(1) The cable tray sections and fittings shall be identified for grounding purposes.

(2) The minimum cross-sectional area of cable trays shall conform to the requirements in Table 392.~~7~~ **60**(B).

(3) All cable tray sections and fittings shall be legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

(4) Cable tray sections, fittings, and connected raceways shall be bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

392.~~11~~ **80**Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays

(A) Multiconductor Cables The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.~~9~~ **22(A)**shall be as given in Tables 310.16 and 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(1) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(2) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Tables 310.16 and 310.18 shall be permitted for multiconductor cables.

(3) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN:See Table B.310.3.

(B) Single-Conductor Cables The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(1) Where installed according to the requirements of 392.~~10~~**22 (B)**, the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Tables 310.17 and 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Tables 310.17 and 310.19.

(2) Where installed according to the requirements of 392.103, the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Tables 310.17 and 310.19.Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Tables 310.17 and 310.19.

(3) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Tables 310.17 and 310.19.

Exception to (B)(3): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(4) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN:See Table 310.20.

392.~~12~~ **90 2001Volts or More**

(A) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays

(1) The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

(2) The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

(3) Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

~~392.13~~ **(B)**Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays

(1) The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.~~12~~ **90** shall not exceed the requirements of this section.

~~(A)~~ **(a)**Multiconductor Cables (2001 Volts or Over) The allowable ampacity of multiconductor cables shall be as given in Tables 310.75 and 310.76, subject to the following provisions:

~~(1)~~**(2)**Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Tables 310.75 and 310.76 shall be permitted for multiconductor cables.

~~(2)~~**(3)**Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Tables 310.71 and 310.72.

~~(B)~~ **(C)**Single-Conductor Cables (2001 Volts or Over) The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(1) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Tables 310.69 and 310.70.

(2) Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Tables 310.69 and 310.70.

~~(2)~~**(3)**Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Tables 310.69 and 310.70.

~~(3)~~**(4)**Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Tables 310.67 and 310.68.

392.~~5~~ **100** Construction Specifications.

(A) Strength and Rigidity Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.

(B) Smooth Edges Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

(C) Corrosion Protection Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.

(D) Side Rails Cable trays shall have side rails or equivalent structural members.

(E) Fittings Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

(F) Nonmetallic Cable Tray Nonmetallic cable trays shall be made of flame-retardant material.

Substantiation: The Panel action was to "Accept in Principle", but the only actions stated seem to be three items. One understanding from the CMP-8 meeting was that a number of formatting changes without content changes were in fact made. The attached contains what these changes were and therefore better explains why the action taken was to "Accept in Principle" rather than to just "Accept".
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 8-235a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BLOM, J.: Refer to comment on Proposal 8-235a, Log No. CP804.

8-238 Log #4729 NEC-P08 **Final Action: Accept in Principle**
(392)

TCC Action: The Technical Correlating Committee understands that the panel statement refers to Proposal 8-235a.
Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:
ARTICLE 392 Cable Tray Systems
I. General
392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.
FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998,Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.
392.2 Definition.
Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.
FPN. Cable trays are not raceways they are mechanical support systems. See definition of raceway in Article 100.
ll. Cable Tray Installation
392.6 Complete System
A. Cable trays shall be installed as a complete system before the installation of jacketed multi-conductor cables or single conductors.
392. 10 Uses Permitted.
(A) Cable trays shall be permitted as follows:
(1) Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits.
(a) ~~Exposed and Accessible.~~ Cable trays shall be exposed and accessible except as permitted by 392.10 (A)(1) (c).
(b) ~~Adequate Access.~~ Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining ~~the cables~~. wiring methods permitted in Table 392.10 (B)
(c) ~~Through Partitions and Walls.~~ Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.
(2) Cable tray installations shall not be limited to industrial establishments.
(3) Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment.
(a) The cable tray system shall provide support of the jacketed multiconductor cables or single conductors in accordance with their corresponding articles.
(4) ~~Hazardous (Classified) Locations.~~ Cable trays in hazardous (classified) locations shall contain only the cable types as permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.
(5) ~~Nonmetallic Cable Tray.~~ In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.
(B) Wiring Methods within Cable Trays. The wiring methods in Table 392.10(B) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.
(C) In Industrial Establishments. The wiring methods in Table 392.10 (B) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system.
392.12 Uses Not Permitted.
(A) Cable Trays in Hoistways. Cable tray systems shall not be used in hoistways or where subject to severe physical damage.
(B) Cable Trays in Air-Handling Spaces. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.
III. Jacketed Cables and Single Conductor Installation within Cable Trays
392.22 Jacketed Multi-conductor Cables and Single Conductor Installation.
(A) Sunlight Resistant. Where exposed to direct rays of the sun, insulated single conductors or jacketed multi-conductor cables shall be identified as being sunlight resistant.
(B) In Industrial Establishments. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system jacketed multiconductor cables or single conductors in 392.~~3~~22(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.
~~(1) Single Conductors. Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).~~
(1) Jacketed multi-conductor cables or single conductors shall be permitted as follows:
(a) 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays.
(b) Where 1/0 AWG through 4/0 AWG jacketed multi-conductor cables or single conductors are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).
(2) Welding single conductors ~~cables~~ shall comply with the provisions of Article 630, Part IV.
(C) ~~Where~~ Jacketed Multi-conductor Cable and Single Conductor Installation.
(1) Cable trays supporting a jacketed multi-conductor cable or ~~individual~~ single conductors ~~and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft)~~ shall be installed and supported to the conditions described in their respective articles and sections.
(2) Jacketed multi-conductor cables or single conductors shall be secured to the cable tray(s) at the transition and ~~they~~ shall be protected by guarding or by location from physical damage.
(3) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and ~~they~~ shall be 4 AWG or larger.
(4) Medium voltage single conductors and jacketed multiconductor ~~medium voltage~~ cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.22 (C) (1)
(5) ~~Multiconductor Cables Rated 600 Volts or Less.~~ Jacketed multiconductor cables rated 600 volts or less shall be permitted to be installed in ~~the same~~ cable tray.
(6)~~Cables Rated Over 600 Volts.~~ Jacketed cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:
(a) The jacketed multi-conductor cables rated over 600 volts are Type MC.
(b) The jacketed multi-conductor cables rated over 600 volts are separated from the jacketed multi-conductor cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.
(D) Single Conductors connected in Parallel.
(1) Where single conductors ~~cables~~ comprising each phase, neutral; or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.
(2) Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together~~, such as triplexed assemblies.~~
(E) Single Conductor Installation. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.
(F) Number of Jacketed Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.
The number of jacketed multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. ~~The conductor sizes herein apply to both aluminum and copper conductors.~~
(1) ~~Any Mixture of Cables.~~ Where ladder or ventilated trough cable trays contain jacketed multiconductor power or lighting cables, or any mixture of jacketed multiconductor power, lighting, control, and signal cables, the maximum number of jacketed multi-conductor cables shall conform to the following:
(a) Where all of the jacketed multi-conductor cables are 4/0 AWG or larger, the sum of the diameters of all jacketed multi-conductor cables shall not exceed the cable tray width, and the jacketed multi-conductor cables shall be installed in a single layer.
(b) Where the cable ampacity is determined according to 392.64 (A) (3), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables.
(c) Where all of the jacketed multi-conductor cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all jacketed multi-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22 (F) for the appropriate cable tray width.
(d) Where 4/0 AWG or larger jacketed multi-conductor cables are installed in the same cable tray with jacketed multi-conductor cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all jacketed multi-conductor cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22 (F) for the

appropriate cable tray width. The 4/0 AWG and larger jacketed multi-conductor cables shall be installed in a single layer, and no other jacketed multi-conductor cables shall be placed on them.

Table 392.22(F) Allowable Cable Fill Area for Jacketed Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

900	36.0	27,000	42.0	27,000 – (30 Sd)		42– (1.2 Sd)		21,300	33.0	21,300–(25 Sd)
	33.0–Sd									

[a] The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm2 for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].
[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger jack-eted multiconductor cables in the same cable tray with smaller cables.

(2) Jacketed Multiconductor Control and/or Signal Cables Only.

(a) Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains jacketed multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all jacketed multi-conductor cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) ~~Solid Bottom Cable Trays Containing Any Mixture.~~ Where solid bottom cable trays contain jacketed multiconductor power or lighting cables, or any mixture of jacketed multiconductor power, lighting, control, and signal cables, the maximum number of jacketed multi-conductor cables shall conform to the following:

(a) where all of the jacketed multi-conductor cables are 4/0 AWG or larger, the sum of the diameters of all jacketed multi-conductor cables shall not exceed 90 percent of the cable tray width, and the jacketed multi-conductor cables shall be installed in a single layer.

(b) where all of the jacketed multi-conductor cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all jacketed cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22 (F) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger jacketed multi-conductor cables are installed in the same cable tray with jacketed multi-conductor cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all jacketed multi-conductor cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22 (F) for the appropriate cable tray width. The 4/0 AWG and larger jacketed multi-conductor cables shall be installed in a single layer, and no other jacketed multi-conductor cables shall be placed on them.

(4) Solid Bottom Cable Tray with jacketed multiconductor control and/or signal cables only.

(a) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains jacketed multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all jacketed multi-conductor cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray.

(b) A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) Ventilated Channel Cable Trays. Where ventilated channel cable trays contain jacketed multiconductor cables of any type, the following shall apply:

(a) Where only one jacketed multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 22 (F) (5)

(b)Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22 (F) (5)

Table 392.22(F)(5) Allowable Cable Fill Area for Jacketed Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Jacketed Multiconductor Cables					
Inside Width of Cable Tray		**Column 1 One Cable**		**Column 2 More Than One Cable**	
mm	**in.**	**mm^2**	**in.^{2}**	**mm^2**	**in.^{2}**
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(6) Solid Channel Cable Trays. Where solid channel cable trays contain jacketed multiconductor cables of any type, the following shall apply:

(a) Where only one jacketed multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of
Table 392.22 (F) (6).

(b) Where more than one jacketed multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22 (F) (6).

See Table 392.22(F)(6) on page 480

(G) Number of Single-Conductors ~~Cables~~, Rated 2000 Volts or Less, in Cable Trays.

The number of single-conductors ~~cables~~, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain single-conductors ~~cables~~, the maximum number of single conductors shall conform to the following:

(a) Where all of the ~~cables~~ single-conductors are 1000 kcmil or larger, the sum of the diameters of all single conductors ~~cables~~ shall not exceed cable tray width, and the ~~cables~~ single-conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the ~~cables~~ single-conductors are from 250 kcmil up to

Table 392.22(F)(6) Allowable Cable Fill Area for Jacketed Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.0
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

900 kcmil, the sum of the cross-sectional areas of all single-conductors ~~cables~~ shall not exceed the maximum allowable cable fill area in Column 1 of Table 392. 22(G) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductors ~~cables~~ are installed in the same cable tray with single-conductors ~~cables~~ smaller than 1000 kcmil, the sum of the cross-sectional areas of all ~~cables~~ single conductors smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table ~~392.10(A~~) 392.22(G) for the appropriate cable tray width.

(d) Where any of the single conductors ~~cables~~ are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor ~~cables~~ shall not exceed the cable tray width.

(2) Ventilated Channel Cable Trays. Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductors ~~cables~~, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1.

(a) For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

(b) For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

(c) For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

B. Jacketed Multi-conductor Cables and Single Conductor Support.

1. In other than horizontal runs, the jacketed multi-conductor cables shall be fastened securely to transverse members of the cable trays.

Table 392.22(G) ~~392.10(A)~~ Allowable Cable Fill Area for Single-Conductors ~~Cables~~ in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

		Maximum Allowable Fill Area for Single-Conductors ~~Cables~~ in Ladder or Ventilated Trough Cable Trays			
Inside Width of Cable Tray		Column 1 Applicable for 392.~~10(A)(2)~~ 22(G)(1)(b) Only		Column 2[a] Applicable for ~~392.10(A)(3)~~ 392.22(G)(1)(c) Only	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
150	6	4,200	6.5	4,200 – (28 Sd)[b]	6.5 – (1.1 Sd)[b]
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 - (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm2, for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)]

[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm2 (in inches, of all 1000 kcmil) and larger single-conductors ~~cables~~ in the same ladder or ventilated trough cable tray with smaller single-conductors ~~cables.~~

392.22(H) ~~392.12~~ Number of single-conductors Type MV and Type MC Jacketed Multi-conductor Cables (2001 Volts or Over) in Cable Trays.

(1) The number of jacketed multi-conductor cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

(2) The sum of the diameters of single-conductor and jacketed multiconductor cables shall not exceed the cable tray width, and the jacketed multi-conductor cables and single-conductors shall be installed in a single layer.

(a)Where single conductors ~~cables~~ are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

392.24 Bends --- How Made. ~~392.6(A)~~ Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained.

392.28 ~~392.5(B)~~ Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

392.30 ~~392.6(C)~~ Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

A. Cable tray supports.

(1) Cable trays shall be supported at intervals in accordance with the installation instructions.

(2) ~~392.6(J) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems.~~ In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and

392.40 ~~(D)~~ Boxes and Fittings

(A) ~~392.5(E)~~Fittings. Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

(B) ~~392.6(D)~~Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

392.46 ~~392.8(C)~~Bushed Conduit and Tubing. A box shall not be required where jacketed multi-conductor cables or single conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

392.56 ~~392.8(A)~~Cable Splices.

(A) Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails.

(1) Splices shall be permitted to project above the side rails where not subject to physical damage.

IV. Grounding and Bonding.

392.60 (A) ~~392.7~~ Grounding.

(A) Metallic Cable Trays. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and part IV of Article 250.

(1) (~~B~~)Steel or Aluminum Cable Tray Systems. Steel or aluminum cable

tray systems shall be permitted to be used as equipment grounding conductors, provided that all the following requirements are met:

(a) ~~(1)~~The cable tray sections and fittings are identified as an equipment grounding conductor.

(b) ~~(2)~~ The minimum cross-sectional area of cable trays shall conform to the requirements in Table 392.~~7(B)~~ 60.

(c) ~~(3)~~ All cable tray sections and fittings are legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

(d) ~~(4)~~ Cable tray sections, fittings, and connected raceways are bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

(2) Equipment Grounding Conductors. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of 392.~~7~~ 60.

Table 392.60 ~~Table 392.7(B)~~ Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal: Steel Cable Trays		Aluminum Cable Trays	
	mm2	in.2	mm2	in.2
60	129	0.20	129	0.20
100	258	0.40	129	0.20
200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50[b]	258	0.40
1000	—	—	387	0.60
1200	—	—	645	1.00
1600	—	—	967.5	1.50
2000	—	—	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.

[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

~~292.6(A) Partial~~ (B) Bonding. A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

V. Ampacity of Jacketed Cables and Single Conductors

392.64 ~~392.11~~ Ampacity of Jacketed Cables, Rated 2000 Volts or Less, in Cable Trays.

(A) Jacketed Multiconductor Cables. The allowable ampacity of jacketed multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22 (F) shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(1) The derating factors of 310.15(B)(2)(a) shall apply only to jacketed multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the jacketed cable and not to the number of conductors in the cable tray.

(2) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.

(3) Where jacketed multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of jacketed multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN: See Table B.310.3.

(B) Single-Conductor Cables. The allowable ampacity of single-conductors ~~cables~~ shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of ~~cables~~ single conductors in cable trays. The ampacity of single-conductors ~~cables~~, or single conductors ~~cabled~~ grouped together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(1) Where installed according to the requirements of 392.~~10~~ 22 (G), the ampacities for 600 kcmil and larger single-conductors ~~cables~~ in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger ~~cables~~ single conductors shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(2) Where installed according to the requirements of 392.~~10~~ 22, the ampacities for 1/0 AWG through 500 kcmil single-conductors ~~cables~~ in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil ~~cables~~ single conductors shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(3) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one ~~cable~~ single conductor diameter between individual conductors, the ampacity of 1/0 AWG and larger ~~cables~~ single conductors shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (B)(3): For solid bottom cable trays the ampacity of single conductors ~~cables~~ shall be determined by 310.15(C).

(4) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations ~~or cables~~, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN: See Table 310.20.

(C) Combinations of Jacketed Multiconductor Cables and Single Conductors ~~Cables~~.

Where a cable tray contains a combination of jacketed multiconductor cables and single conductors ~~cables~~, the allowable ampacities shall be as given in 392.~~11 (A)~~ 64 (A) for jacketed multiconductor cables and 392.~~11~~ 64(B) for single-conductors ~~cables~~, provided the following conditions apply:

(1) The sum of the jacketed multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.~~9~~ 22 (F), ~~and~~ totals not more than 100 percent.

(2) Jacketed multiconductor cables are installed according to 392.~~9~~ 22 (F).

(3) The single conductor ~~cables~~ fill area as a percentage of the allowable fill area for the tray calculated as per 392.~~10~~ 22 (G) , totals not more than 100 percent.

(4) Single-conductor cables are installed according to 392.~~10~~ 22 (D), 392.22 (G), and 392.56 ~~392.8 (A) (D)~~.

(D) ~~392.13~~ Ampacity of Type MV single conductors and Type MC Jacketed Multi-conductor Cables (2001 Volts or Over) in Cable Trays.

The ampacity of jacketed multi-conductor cables, rated 2001 volts, nominal, or over, installed according to ~~392.12~~ 392.22(H) shall not exceed the requirements of this section.

(1) Jacketed Multiconductor Cables (2001 Volts or Over). The allowable ampacity of jacketed multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:

(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for jacketed multiconductor cables.

(b) Where jacketed multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(2) Single-Conductor Cables (2001 Volts or Over). The ampacity of single-conductors ~~cables~~, or single conductors ~~cabled~~ grouped together (triplexed, quadruplexed, etc.), shall comply with the following:

(a) The ampacities for 1/0 AWG and larger single-conductors ~~cables~~ in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductors ~~cables~~ shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.

(b) Where single-conductors ~~cables~~ are installed in a single layer in uncovered cable trays, with a maintained space of not less than one ~~cable~~ conductor diameter between individual conductors, the ampacity of 1/0 AWG and larger ~~cables~~ single conductors shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(3) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations ~~or cables~~, the ampacity of 1/0 AWG and larger ~~cables~~ single conductors shall not

exceed the allowable ampacities in Table 310.67 and Table 310.68.

VI. Construction Specifications

~~392.5 Construction Specifications~~.

392.100 Strength and Rigidity.
(A) Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.
(B) Side Rails. Cable trays shall have side rails or equivalent structural members.

392.110 Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.

392.116 ~~392.5(F)~~ Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.
Substantiation: This is a rewrite of Article 392 to more closely follow the suggested numbering and subject divisions by the NFPA style manual and NEC style manual. Any of the underlines items are new text submitted for review by CMP-8.
1. Added a new FPN under the definition and definition of raceway in article 100 new 392.2.
2. Added subsection parts with title for 6 separate parts and changed the numbering sequence.
3. Added the words “jacketed and multi-conductor” throughout for more consistency of verbiage. There are many references to cables as a stand alone, locations where “multi-conductor cables” is applied, and “jacketed cables.” A word search is showing that jacketed in even applied into Article 392 for uses permitted for cable trays. This is to attempt to have a consistency for the terms throughout this article that all cables are jacketed and multi-conductor types.
4. Added the words “single conductors” to differentiate between current references in this article that apply the word “single cables,” due to the confusion. Conductors are cables, but the change helps to clarify for installation within a cable tray how defined cable types (single conductor or jacketed multi-conductor cables) shall be installed and a more positive method for determining an ampacity of cables & conductors..
5. Added a new sentence 392.20 (A) (3) (a) that cables within a cable tray are to follow the requirements for the cables, conductors, or raceway systems that can be installed in a cable tray from their respective articles.
6. There are many new article titles as a result of the separation of the sections within this article. The titles are to more closely follow the content of a specific part of the article.
7. Be aware that the tables have not changed, but when copied over from the NEC handbook CD this is the format that it looks like when printed. The only changes to the tables is updated the numbering sequence or cable, conductor usage submitted for review by the committee.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 8-238.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BLOM, J.: Refer to comment on Proposal 8-235a, Log No. CP804.

8-239 Log #2054 NEC-P08 **Final Action: Accept**
(392.1, FPN)

Submitter: Robert Crain, Cablofil
Recommendation: FPN: For further information on cable trays, see ANSI/NEMA-VE 1~~-1998~~2002, Metal Cable Tray Systems; NECA/NEMA~~-VE 2~~105 ~~1996~~2007, *Standard for installing Metal Cable Tray Systems* ~~*Installation Guidelines*~~; and NEMA-FG 1-1998, *Nonmetallic Cable Tray Systems*.
Substantiation: Update references to the most recent titles and revisions.
Panel Meeting Action: Accept
Panel Statement: New section 392.1 of 8-235a will need to be updated per this proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-240 Log #558 NEC-P08 **Final Action: Reject**
(392.3)

Submitter: Joe Riley, City of Arlington
Recommendation: Add new text as follows:
392.3 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant and shall be installed on cable trays with ventilated covers that effectively protect the conductors and cables from direct sunlight. Cable trays, covers, and their associated fittings shall be identified for the intended use.
Substantiation: Even though the conductors and cables exposed to direct sunlight are sunlight resistant, they are still likely to be damaged over time by the extreme heat and ultra violet sun rays. Additional protection against the damaging effects of direct sunlight on cables and conductors can be achieved with the installation of ventilated cable tray covers. A General Motors automobile plant in Arlington, Texas has experienced the damaging results of direct sunlight exposure to their (MC) Metal Clad distribution cables installed on cable trays outdoors and on rooftops. The MC cable had deteriorated from the direct sunlight and environmental conditions resulting in electrical short circuits. I have included pictures of the effects of direct sunlight on sunlight resistant MC cable at the General Motors facility. At General Motors, the solution to correct the damaging effects of direct sunlight on cables and conductors was to install ventilated cable tray covers over all newly installed sunlight resistive MC cable.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: If the cables are identified as sunlight resistant, they are not required to be covered. If this is an issue, the submitter should address it with the organization responsible for the cable product listing standard.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-241 Log #1867 NEC-P08 **Final Action: Reject**
(392.3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first sentence and substitute: Cable trays shall be permitted to be used as a support system for optical fiber cables and electrical conductors including conductors in raceways and cable assemblies.
Substantiation: Proposal removes a laundry list (as in 392.1(A)), includes equipment grounding and bonding conductors and correlates with 630.42 and 770.133.
Panel Meeting Action: Reject
Panel Statement: Under uses permitted a detailed list would be expected. Panel’s experience is that this information is helpful to the user.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-242 Log #3358 NEC-P08 **Final Action: Reject**
(392.3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Cable tray shall be permitted as support system for electrical conductors and optical fiber cables. ~~Service conductors, feeders, branch circuits, communication circuits, control circuits, and signaling circuits.~~
Substantiation: Edit. “Electrical conductors and optical fiber cables” supplants an itemized list and includes welding cables, grounding electrode conductors, and grounding and bonding conductors.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on proposal 8-241. Proposal is not editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-243 Log #1927 NEC-P08 **Final Action: Reject**
(392.3(1)(c))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (1)(c): Single-conductor cable other than Type MI, Type MC, and armored ground wire shall be 1/0 AWG or larger...(remainder unchanged).
In (1)(c), “or bonding” after “equipment grounding”.
Substantiation: Type MI, Type MC, and armored ground wires may be single-conductor and excluded from the 1/0 AWG requirement. Bonding conductors should be included in (c).
Panel Meeting Action: Reject
Panel Statement: 392.3(1)(c) should be 392(B)(1)(a) Product is not available, therefore the exception is not required. MI and MC are permitted in 392.3(A). All wiring methods listed in 392.3(A) are permitted to be used in 392.3(B). No substantiation was provided for the remaining changes.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-244 Log #184 NEC-P08 **Final Action: Reject**
(Table 392.3(A))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:

Table 392.3(A) Wiring Methods

Wiring Method	Article
Armored cables	320
CATV cables	820
CATV raceways	820
Class 2 and Class 3 cables	725
Communications cables	800
Communications raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduits	348
Flexible metallic tubing	360
Instrumentation tray cables	727
Intermediate metal conduits	342
Liquidtight flexible metal conduits	350
Liquidtight flexible nonmetallic conduits	356
Metal-clad cables	330
Mineral-insulated, metal-sheathed cables	332
Multiconductor service-entrance cables	338
Multiconductor underground feeder and branch-circuit cables	340
Network-powered broadband communications cables	830
Nonmetallic-sheathed cables	334
Non-power-limited fire alarm cables	760
Optical fiber cables	770
Optical fiber raceways	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	
Polyvinyl chloride PVC conduits	352
Power and control tray cables	336
Power-limited fire alarm cables	760
Power-limited tray cables	725
Rigid metal conduits	344
Rigid nonmetallic conduits	352
RTRC	355
Signaling raceways	725

Substantiation: Section 3.3.3 of the NEC Style Manual States: "**3.3.3 Plural.** Unless referring to a single item of equipment, references to electrical components and parts shall be plural rather than singular. This results in greater consistency and makes it clear that the *NEC* provision refers to *all.*.
Panel Meeting Action: Reject
Panel Statement: The proposed change does not add clarity to the code. The singular form of these wiring methods correlates with the titles of the articles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-245 Log #3359 NEC-P08 **Final Action: Reject**
(392.3(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change the word "methods" in the heading, text, and table to "systems".
Substantiation: Edit. Some of the "methods" listed, e.g., CATV Class 1 and 3, communication, fire alarm, instrumentation tray, power and control tray, optical fiber cables, are not indicated in Chapter 3 Wiring Methods and Materials, as wiring methods.
Panel Meeting Action: Reject
Panel Statement: "Wiring method" is a type of wiring not a "system" and not limited to Chapter 3.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-246 Log #2633 NEC-P08 **Final Action: Reject**
(392.3(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Present wording limits wiring methods of Table 392.3(A) to industrial establishments. Per 392.3, cable trays are not limited to industrial establishments.
Panel Meeting Action: Reject
Panel Statement: Submitter is incorrect and present wording does not limit methods listed in 392.3(A) to industrial establishments.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-247 Log #2610 NEC-P08 **Final Action: Reject**
(392.3(B) and Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
SINGLE CONDUCTORS. Single-conductor cables shall be ~~permitted to be~~ installed in accordance with (B)(1)(a) through (B)(1)(c).
(a) No change
(b) No change
(c) No change.
Exception: Single conductors installed in raceway or as Type MC or Type MC cable.
Substantiation: "Permitted to be" does not impose a requirement, but an option or alternative per 0.5(B). Single conductors installed in a raceway or as Type MC or MI cable should be exempt. "Cable" is not specifically defined and includes Type MC and MI.
Panel Meeting Action: Reject
Panel Statement: Proposed changes do not improve clarity or content of existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-248 Log #2637 NEC-P08 **Final Action: Reject**
(392.3(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first paragraph: Single-conductor cables without a metallic covering shall be permitted... (remainder unchanged).
Substantiation: Present wording applies to Type MI, Type MC and Type AC cables which doesn't seem to be the intent.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposal limits the section requirements with no technical substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-249 Log #1926 NEC-P08 **Final Action: Accept in Principle**
(392.3(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or revise text: Cable trays in hazardous (classified) locations shall contain only the cable and raceway types permitted or required in 501.10, 502.10, 503.10, 504.20, and 505.15 in such locations.
Substantiation: Edit. Raceways are permitted in cable trays and should be included. Wiring methods are already covered in the sections noted.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on proposal 8-251.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-250 Log #1955 NEC-P08 **Final Action: Accept in Principle**
(392.3(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or revise text: Cable trays in hazardous (classified) locations shall contain only the cable and raceway types permitted or required ~~in 501.10, 502.10, 503.10, 504.20, and 505.15~~ in such locations.
Substantiation: Edit. Raceways are permitted in cable trays and should be included. Wiring methods are already specified in the sections noted which apply without a repeat requirement in this section.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on proposal 8-251.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-251 Log #2611 NEC-P08 **Final Action: Accept in Principle**
(392.3(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Cable trays in hazardous (classified) locations shall contain only the cable types and raceways permitted or required in those locations. ~~501.10, 502.10, 503.10, 504.20, and 505.15~~.
Substantiation: Edit. Raceways are permitted in cable trays. Some cables and raceways are required.
Panel Meeting Action: Accept in Principle
Revise text in 392.10(C) as follows in 8-235a:
(C) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only cable types and raceways as permitted by other articles of this code.
Panel Statement: The revised text meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-252 Log #3183 NEC-P08 **Final Action: Reject**
(392.3(D))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 392.3 delete, ~~(D) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.~~
Renumber 392.3(E) as 392.3(D).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-253 Log #2279 NEC-P08 **Final Action: Accept**
(392.4)

Submitter: David H. Kendall, Thomas & Betts Corp.
Recommendation: Revise Section to 392.4 to read as follows:
392.4 Uses Not Permitted
Cable tray systems shall not be used in hoistways or where subject to severe physical damage. ~~Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.~~
Substantiation: This section was revised to remove the statement that cable trays cannot be used in plenum since metal cable trays are permitted per 300.22.
Panel Meeting Action: Accept
Revise accepted text in 392.12 as proposed in 8-235a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HUMPHREY, D.: Removal of the last sentence of section 392.4 (Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces) may cause confusion by the user. The removal of this sentence results in the user not being directed to section 300.22 for permissible wiring methods in cable tray when the cable tray is installed in ducts, plenums or other space used for environmental air. The user may likely turn to Table 392.3(A) for a wiring method selection that may not be compatible with the requirements of section 300.22. The best solution is to leave the current language in place until this issue can be addressed by revising the uses permitted section of Article 392 to reference section 300.22.

8-254 Log #2631 NEC-P08 **Final Action: Reject**
(392.5(G) (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: 392.XX Cable trays shall be listed.
Substantiation: Cable trays are noted in Contents under Chapter 3 wiring methods and materials. Most wiring methods are required to be listed. Listing would provide for certain standards, such as grounding and bonding, and rung spacing for single conductors for which there are no Code requirements.
Panel Meeting Action: Reject
Panel Statement: Cable tray is not a raceway or wiring method. Cable trays are not considered raceways but support systems and are not required to be listed. They are, however, classified by testing agencies such as NRTLs to verify the minimum cross-sectional area requirements are met so that cable tray can be utilized as an equipment grounding conductor.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BERMAN, R.: The Panel Statement is correct, in that metallic cable trays may be classified by a testing agency as an equipment grounding conductor. However, this classification (certification) is not required by Article 392 of the NEC. Instead, Section 392.7(B)(1) requires that metallic cable tray sections and fittings only be “identified” as an equipment grounding conductor. Certification of metallic (and nonmetallic) cable trays by a nationally recognized third party certification organization would provide further evidence that the design, manufacture, and installation has been evaluated for safety and use in accordance with NEC Article 392.

8-255 Log #470 NEC-P08 **Final Action: Reject**
(392.6(I))

Submitter: Patrick G. Heater, Netsian Technologies Group
Recommendation: Revise text to read as follows:
(I) Adequate Access. Sufficient space, a minimum of 300 mm (12 in.) access headroom shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables. Care shall be taken to ensure that other building components (e.g., air conditioning ducts) do not restrict access to trays or wireways.
Substantiation: This is to correlate with ANSI/TIA/EIA — 569 — A SECTION 4.5.6.2.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel continues to maintain that access is adequately covered in 392.6(1) to maintain cables and raceways within a cable tray. Also, the panel has no authority over building components and AC ducts.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-256 Log #1546 NEC-P08 **Final Action: Reject**
(392.6(1))

Submitter: Richard Hollander, City of Tucson
Recommendation: Revise text as follows:
(1) Adequate Access. Sufficient space, a minimum of 300 mm (12 in.) access headroom shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables. Care shall be taken to ensure that other building components (e.g., air conditioning ducts) do not restrict access to trays or wireways.
Substantiation: This is to correlate with ANSI/TIA/EIA – 569 – A SECTION 4.5.6.2.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-255.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-257 Log #2632 NEC-P08 **Final Action: Accept in Part**
(392.6(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence of first paragraph: The system shall provide for the support of the cables and raceways in accordance with their corresponding articles. Securing to supports shall be in accordance with 392.8(B).
Substantiation: Edit. Raceways should be included since cable trays may be constructed with the intention of supporting only raceways and have rungs spaced accordingly. Support may be deemed as including attachment.
Panel Meeting Action: Accept in Part
Revise text in 392.10(E) as follows in 8-235a:
Accept only the phrase “and raceways.” Delete “Securing to supports shall be in accordance with 392.8(B).”
Panel Statement: Additional text “and raceways” improves the present language to clarify that both cables and raceways are permitted. The panel does not accept the addition of the reference to 392.8(B) as it is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-258 Log #3355 NEC-P08 **Final Action: Reject**
(392.6(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence:
Cable trays shall be securely fastened to supports ~~supported~~ at intervals in accordance with the installation instructions.
Substantiation: Edit. Supporting is not necessarily the same as fastened.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-259 Log #3356 NEC-P08 **Final Action: Reject**
(392.6(E) and (F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
(E) ~~Multiconductor scales~~ Conductors and cables rated 600 volts or less shall be permitted to be installed in the same cable tray with conductors or cables operating at over 600 volts.
(F) Cables and conductors ~~rated~~ operating at over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:
(1) The cables ~~rated~~ operating at over 600 volts are MC;
(2) The cables or conductors ~~rated~~ operating at over 600 volts are separated from the cables and conductors rated 600 volts or less by a solid fixed barrier of identified material compatible with the cable tray;
(3) The cables and conductors ~~rated~~ operating at over 600 volts or the cables and conductors rated at 600 volts or less are installed in a raceway or identified metal covering.
Substantiation: Edit. Present wording of (E) appears incomplete. Sometimes for one reason or another cables and conductors rated over 600 volts are used in 600 volts or less circuits; the operating voltage should be the criterion. “Cables” may be perceived as multiconductor types as it is used to designate single and multiconductor types. “Conductors” is used in 692.7(A).
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-260 Log #679 NEC-P08 **Final Action: Accept in Principle**
(392.6(F)(3))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Add new text to read as follows:
392.6(F)(3)
(3) A permanent, legible warning notice carrying the wording “DANGER — HIGH VOLTAGE” shall be placed in a readily visible position on all cable trays containing high-voltage conductors with the maximum spacing of warning notices not to exceed 3 m (10 ft).
Substantiation: This proposal is the work of the “High Voltage Task Group” appointed by the Technical Correlating Committee. The task group consisted of the following members: Alan Peterson, Paul Barnhart, Lanny Floyd, Alan Manche, Donny Cook, Vince Saporita, Roger McDaniel, Stan Folz, Eddie Guidry, and Jim Dollard.
Warning requirements currently exist throughout the NEC where qualified and unqualified persons encounter over 600 volt circuits and equipment. NEC 392.6 permits installation of cables and conductors rated over 600 volts in cable tray with and without cables and conductors rated 600 volts or less. Cable tray is permitted to be installed in locations accessible to both qualified and unqualified persons. Proposed text provides warning to protect persons in those locations.
Panel Meeting Action: Accept in Principle
Add a new section 392.120 to read asfollowing:
392.120 Marking. Cable trays containing conductors rated over 600 volts shall have a permanent, legible warning notice carrying the wording “DANGER-HIGH VOLTAGE” placed in a readily visible position on all cable trays with maximum spacing of warning notices not to exceed 3 m (10 ft).
Panel Statement: The panel supports the requirement to label cable tray when high voltage conductors are used. A new section to be added by this proposal pertaining to marking was added to incorporate the new language. The panel concludes that a new section should be used for this marking requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-261 Log #2290 NEC-P08 **Final Action: Reject**
(392.6(J))

Submitter: Baenson “Q” Cho, San Antonio, TX
Recommendation: Revise text to read as follows:
For Raceways terminating at the tray, unless a bonding jumper sized in accordance with 250.96 and 250.102 is installed, a listed cable tray grounding clamp or grounding adapter shall be used to securely fasten the raceway to the cable tray system.
Substantiation: All listed conduit to cable tray clamps available are UL listed for grounding and bonding and not for support. In industrial installations where grounding bushings with jumpers are required for conduits terminating at the cable tray and the jumpers are bonding the conduits with the ground cable running along the cable tray, the use of “listed” cable tray clamp is not necessary.
Often, it is the case where specifications require the need for providing multiple grounds to electrical equipment; 1) ground conductor with the power circuit; 2) equipment grounded to stingers from the ground grid; 3) Raceway grounded at the equipment, and; 4) Raceway grounded at tray by the use of ground bushing and tied to ground cable running the entire length of the tray system. The requirement for the use of listed cable tray clamp is redundant to 4.
If the conduit terminating at the cable tray is not touching the tray, the use of grounding bushing with jumpers is acceptable according to the current code. However, if the design of the tray system allows for the support of conduits, the supporting the conduit ends with the tray makes it a cleaner installation. The installation methods will need to be in accordance with raceway installation code sections as per the sentence following the proposed change.
The current wording does not allow conduits to be terminated at the cable tray unless a grounding bushing is used. Revised wording will allow supporting of conduit using cable tray without the use of grounding conduit clamp when grounding is provided using ground bushing.
Revision of the sentence would allow for supporting the conduit with cable tray without the use of conduit clamp listed for grounding. Such as bolting a section of strut and utilizing conduit straps for multiple conduits terminating at the tray in close vicinity. Grounding requirement would be met using grounding bushing & jumper to tray ground.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Section 392.6(J) covers supporting of raceway systems. The requirements for grounding are presently covered in 392.7(B)(4).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-262 Log #2640 NEC-P08 **Final Action: Reject**
(392.7(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Metallic cable trays that support electrical conductors, including conductors in raceways and cable assemblies, shall be grounded and bonded in accordance with applicable provisions of Table 250.66, 250.96, 250.122, and Part IV of Article 250 Exception No. 2 for 250.86 shall not apply.
Exception: Where the cable tray contains only the following types of conductors or cables:
(1) Secondary circuit welding cables;
(2) Optical fiber cables without current-carrying conductors;
(3) Class 2 circuit conductors;
(4) Communication circuit cables or wires.
Substantiation: Section 250.96 relates only to bonding, not grounding. Applicable provisions of Table 250.66 and 250.122 should be noted to provide for equipment grounding and bonding conductor sizing. Grounding does not appear to be a safety issue for cables and conductors in the proposed exceptions. Cable trays with a cover are enclosures and Exception No. 2 for 250.86 should not apply. Present text provides no specifics for grounding means.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the section, and the substantiation is not accurate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-263 Log #3622 NEC-P08 **Final Action: Accept**
(392.7(A))

Submitter: David A. Williams, Delta Township
Recommendation: Revise text to read as follows:
(A) Metallic Cable Trays. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250. Metal cable tray containing non-power conductors (communication, data, signal, etc.) shall be electrically continuous, through listed connections or the use of an insulated stranded bonding jumper not smaller than a 10 AWG.
Substantiation: The NEC presently does not require cable trays with non-power conductors to be properly bonded. The NECA/NEMA 105-2007 Standard for Installing Metal Cable Tray Systems provides bonding requirements in Section 4.7.3.2 for installations of only non-power conductors. This needs to be covered in the NEC. Most contractors do not have access to the NEIS standards.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-264 Log #362 NEC-P08 **Final Action: Reject**
(392.8(D))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
"…the conductors shall be installed in groups consisting of not more than one conductor for each ~~per~~ phase, neutral, or grounded conductor…".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The NEC style manual does not restrict the use of the word "per" in this code section. The proposed change does not add clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-265 Log #4883 NEC-P08 **Final Action: Reject**
(392.8(D))

Submitter: Charles Darnell, kVA Engineering and Forensics, LLC
Recommendation: Revise text as follows:
Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies. The restraint method employed shall protect the single conductors from damage due to the fault-current magnetic forces and be rated for the spacing between conductors and maximum available fault current.
Substantiation: Most electrical personnel (including installers and engineers) are unaware of how to achieve the single conductor performance criteria required in this code section. It is unlikely an installer or engineer could accurately quantify the conductor movement resulting from fault-current magnetic forces. Therefore, it is unreasonable to require "excessive movement" prevention unless and until electrical personnel are informed on how to meet the code requirement. There are available physics-based engineering calculations that quantify the magnitude of fault-current magnetic forces, but these would not normally be known by installers. Therefore, there is an implied code requirement for engineering force calculations whenever there are single conductors in cable tray. Also, there are several internationally recognized peer-reviewed consensus standards addressing single conductor restraint due to fault-current magnetic forces. European Standard EN 50368:2003, Cable Cleats for Electrical Installations and a forthcoming IEC standard (SC23A, PT61914, Cable Cleats for Electrical Installations) include algebraic formulas for fault-current magnetic forces and also provide manufacturer testing procedures for evaluating adequate restraint. In addition to several non-US wiring practices codes, the proposed new language for this code would be harmonized with the current revision of American Petroleum Institute RP 14F, Recommended Practice for Design, Installation, and Maintenance of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Division 1 and Division 2 Locations (see attached excerpt) and the proposed revision to IEEE Std 45, Recommended Practice for Electrical Installations on Shipboard (same wording as API RP 14F). The proposed new language for this code section introduces specific product evaluation criteria, thus providing electrical personnel with adequate information to differentiate between single conductor restraint manufacturers and models. Additionally, this new code language would be harmonized with other existing domestic and international peer-reviewed consensus standards.
Since the fault-current magnetic forces between conductors are directly proportional to the square of the peak current magnitude and indirectly proportional to the spacing between conductors, moderate short circuit levels can generate large mechanical forces. It is possible for a 3-phase 10kARMsshort circuit to generate fault-current magnetic forces above 500 pounds per foot (see attached Cable Force Calculation #1). While forces in this order of magnitude may seem considerable, large industrial electrical systems regularly encounter fault-current magnetic forces in excess of 3 tons (see attached Cable Force Calculation #2 and corresponding Event #2 Photograph). This actual incident resulted in 400 feet of 250kcmil cable expelled from the cable tray system (cables "fire-hosing" until the upstream circuit breaker cleared the fault).
Recognizing there may be self-certified cable restraint products designed to withstand fault-current magnetic forces, there are products available that are independently tested to a peer-reviewed consensus standard to withstand fault-current magnetic forces and protect the restrained cables during actual short circuit events... the cable cleat. Cable cleats may be applied in cable tray to adequately restrain and protect single conductors.
Underperforming cable restraints can result in to hazards to persons and property. In order to provide practical safeguarding of persons and property from hazards arising from the use of electricity, this code should dictate that cable restraint systems provide protection from fault-current magnetic forces. Inclusion of the proposed requirements for single conductor protection will empower the installer to make an informed decision on which restraints to use for single conductor cable restraint.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation presents compliance and enforcement problems. No method is given that will achieve compliance with the submitter's requirements and the substantiation references general instructions provided in other documents. The requirement to secure these cables, as the submitter suggests, is at best "implied," leaving great room for subjective interpretation. The present text in 392.8(D) provides sufficient direction regarding this issue. The proposed requirements are design criteria and not appropriate for the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-266 Log #4884 NEC-P08 **Final Action: Reject**
(392.8(D))

Submitter: Charles Darnell, kVA Engineering and Forensics, LLC
Recommendation: Revise text as follows:
Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces ~~unless single conductors are cabled together, such as triplexed assemblies.~~
Substantiation: By discounting the single conductor movement criteria when single conductors are cabled together, this code section suggests multiconductor cables and triplexed assemblies inherently prevent excessive movement of their included single conductors. While these cable constructions may prove adequate in systems with low available fault duties, this author's extensive forensic experience in electrical systems subject to moderate and high available fault duties proves otherwise. Electrical personnel apply cables within their thermal damage capability by selecting appropriate protective device settings (i.e. de-energizing the circuit prior to the point of thermal insulation damage). The protective device (including fuses and circuit breakers) operating times are frequently longer than the time required for single conductors to deflect outward and break free from their cable jacket and/or restraint system (if any). Such protective device applications should protect the conductor and its insulation from exceeding their design temperatures, but does not necessarily provide for adequate mechanical restraint of multi-conductor cables or triplexed assemblies. And when the single conductors are not adequately restrained, they may be damaged and cause further damage to persons and property. This author is prepared to present high-speed slow-motion video footage of multi-conductor cables undergoing short circuit testing (at magnitudes within the cable rating) that conclusively demonstrate this point.
In order to provide practical safeguarding of persons and property from hazards arising from the use of electricity, this code should dictate equal performance criteria for all cable constructions, including single conductor, multi-conductor and triplexed assemblies.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 8-265.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
GRIFFITH, M.: It is acknowledged that movement also occurs during short-circuit conditions with bundled or triplexed conductors; but the substantiation did not establish that there was a sufficient problem associated with this movement to warrant a change.

8-267 Log #2469 NEC-P08 **Final Action: Reject**
(Table 392.9 and Table 392.10(A))

Submitter: Dallas Kellerman, Cablofil
Recommendation: This proposal is a table revising (adding additional tray widths) to be similar with NEMA VE 1, 4.3 (2 in., 8 in., 16 in., and 20 in.).
Substantiation: The 2 in., 4 in., 4 in., 8 in., 16 in., and 20 in. widths are often inquired regarding fill rates which are standard widths for wire mesh tray. Since these widths are not listed, it causes confusion, etc.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposal introduced new information without any substantiation. The submitter's proposal has incorrect information in the data.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
GRIFFITH, M.: Panel should have accepted the proposal in principle by correcting the Coefficients in Table 392.9. The submitter should have used "25" in lieu of "30" as the coefficient ahead of the term "Sd" in every row of the column with the heading "mm2". This correction along with the recognition of this type tray by NEMA and it's widespread use throughout industry for more than 5 years with proven success and no reported problems/failures is sufficient substantiation for accepting the proposal.

8-268 Log #2182 NEC-P08 **Final Action: Accept in Principle**
(392.11)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
(A) Text to remain unchanged.
(1) The ~~derating~~ ampacity adjustment factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. ~~Derating~~ Ampacity adjustment shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in cable tray.
(2) Text to remain unchanged.
(3) Text to remain unchanged.
(B) Single-Conductors Cables. The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). (393 (New))

Submitter: Ray R. Keden, ERICO, Inc.
Recommendation:
ARTICLE 393 Non-Continuous Cable Supports
I. General
393.1 Scope.
This article covers the use, installation, and construction specifications for Non-Continuous Cable Supports (NC cable supports).
393.2 Definition.
NC Cable Supports. Units of support installed at intervals along a predetermined route and designed for the purpose of securely supporting and positioning cables and/or raceways.
II. Installation
393.3 Uses Permitted.
NC cable supports shall be permitted to be used as a support for multiconductor power, lighting, communications, control, and signaling circuits. NC cable support installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant.
(A) Wiring Methods. The wiring methods in Table 393.3(A) shall be permitted to be installed in NC cable supports under the conditions described in their respective articles and sections.

Table 393.3(A) Wiring Methods

Wiring Method	Article
Armored cable	320
CATV cables	820
CATV raceways	820
Class 2 and Class 3 cables	725
Communications cables	800
Communications raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Network-powered broadband communications cables	830
Nonmetallic-sheathed cable	334
Non-power-limited fire alarm cable	760
Optical fiber cables	770
Optical fiber raceways	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in NC cable supports	
Polyvinyl chloride PVC conduit	352
Power and control tray cable	336
Power-limited fire alarm cable	760
Power-limited tray cable	725
Rigid metal conduit	344
Rigid nonmetallic conduit	352
RTRC	355
Signaling raceway	725

(B) In Industrial Establishments. The wiring methods in Table 393.3(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles.
(C) Nonmetallic NC Cable Supports. In addition to the uses permitted elsewhere in 393.3, nonmetallic NC cable supports shall be permitted in corrosive areas and in areas requiring voltage isolation.
393.4 Uses Not Permitted.
Cables with conductors 4/0 AWG or larger and single conductors are not permitted to be installed in NC cable supports. NC cable supports shall not be used in hoistways or where subject to severe physical damage. NC cable supports shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces. NC cable supports shall not be used in hazardous (classified) locations.
393.5 Construction Specifications.
(A) Strength and Rigidity. NC cable supports shall have suitable strength and rigidity to provide adequate support for all contained wiring.

(B) Retaining Provisions. NC cable supports shall include provisions for retaining of all contained wiring. The provisions may be integral to the supports or other suitable means.
(C) Smooth Edges. NC cable supports shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the cables.
(D) Attachment. NC cable supports shall include provisions for attachment to structures. The provisions may be associated fittings or other suitable means.
(E) Assemblies. NC cable supports may have integral provisions or associated fittings for assembly of two or more supports either in a vertical tier, back-to-back or in back-to-back tiers.
(F) Corrosion Protection. NC cable supports shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.
(G) Listed. NC cable supports and associated fittings shall be listed.
(H) Nonmetallic NC Cable Supports. Nonmetallic NC cable supports shall be made of flame-retardant material.
393.6 Installation.
(A) Completed Before Installation. Each run of NC cable supports shall be completed before the installation of cables.
(B) Support Interval. NC cable supports shall be installed at intervals not exceeding 1.5 m (5 ft.).
(C) Exposed and Accessible. NC cable supports shall be exposed and accessible. Sufficient space shall be provided and maintained about NC cable supports to permit adequate access for installing and maintaining the cables.
393.7 Grounding.
NC cable supports are not required to be bonded to ground.
393.8 Cable Installation.
(A) Sag. The sag of the cable bundles between NC cable supports shall not exceed 300 mm (12 in.). Larger sag shall be prevented by reducing the support interval in 393.6 (B).
(B) Clearance from Surface Below. A clearance of not less than 50 mm (2 in.) shall be maintained between cables and the horizontal surface over which it passes.
(C) Clearance from Piping, Exposed Conductors, and So Forth. A clearance of not less than 50 mm (2 in.) shall be maintained between cables in NC cable support systems and other exposed conductors, piping, and so forth.
(D) Securing. Horizontal cable and raceway runs may be secured to NC cable supports. In other than horizontal runs, the cables shall be fastened securely to the NC cable supports. Securing shall be accomplished with provisions integral to the NC cable support, associated fittings or other suitable means, such as cable ties
(E) Through Partitions and Walls. Cables installed in NC cable supports shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations are made in accordance with the requirements of 300.21.
(F) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables for power and lighting rated 600 volts or less shall be permitted to be installed in the same NC cable support.
(G) Cables Rated over 600 Volts. Cables rated over 600 volts and cables for power and lighting rated 600 volts or less shall be permitted to be installed in the same NC cable support if the cables rated over 600 volts are Type MC.
393.9 Number of Multiconductor Cables, Rated 2000 Volts or Less, in NC cable Supports.
The number of multiconductor cables, rated 2000 volts or less, permitted in a single NC cable support shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.
(A) Any Mixture of Cables. Where NC cable supports contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following: The sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Columns 3 or 4 of Table 393.9 for the appropriate NC cable support width.

Table 393.9 Allowable Cable Fill Area for Multiconductor Cables in NC Cable Supports for Cables Rated 2000 Volts or Less

Inside Width of NC Cable Support		Applicable Cross-sectional Area	
mm	in.	mm^2	$in.^2$
18	0.75	540	0.84
25	1.00	750	1.16
59	2.00	1,500	2.33
75	3.00	2,250	3.50
100	4.00	3,000	4.66

(B) Multiconductor Control and/or Signal Cables Only. Where a NC cable support having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the NC cable support

393.11 Ampacity of Multiconductor Cables, Rated 2000 Volts or Less, in NC Cable Supports.

The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 393.9 shall be as given in Table 310.16 and Table 310.18, and 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the NC cable support.
Substantiation: The electrical industry has used non-continuous cable and conduit supports for many years. Standards with testing requirements exist (e.g., UL 2239). However, these parts are not codified and this proposal provides for it by formulating safety requirements. This installation method also provides for the realization of "green" aspects, a topic that supports a smarter use of our resources. Running cable in non-continuous supports saves over 80% of material compared to cable tray, yet improves the airflow and thus the heat dissipation within and around the cable bundle.
Panel Meeting Action: Reject
Panel Statement: The system consists of simply independent supports. Therefore each wiring method should be installed (supported and fastened) at intervals provided for in their own article. Realization of "green" aspects is not a consideration for requirements in the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 394 — CONCEALED KNOB-AND-TUBE WIRING

7-152 Log #3184 NEC-P07 **Final Action: Accept in Principle**
(394.12(4))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comment expressed in the voting.
This action will be considered by the panel as a public comment.
Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 394.12, delete ~~(4) Hazardous (classified) locations~~
Renumber 394.12(5) as 394.12(4).
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(4) Hazardous (classified) locations except as specifically permitted by other articles in this *Code*.
Panel Statement: Revising (4) provides the user with the information that the use of this wiring method is not currently permitted in hazardous locations but provides the information that the user should check in Chapter 5 to see if and where it is permitted. The additional added phrase preserves the responsibility for CMP-14 to authorize its use where appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
SCHUMACHER, D.: The panel should reject this as it only adds confusion to a clear article. Knob & Tube wiring is an obsolete wiring method that is only allowed by special permission in new installations. There is absolutely no need for the code users to have to go to other articles to double check this fact.

ARTICLE 396 — MESSENGER SUPPORTED WIRING

7-153 Log #2001 NEC-P07 **Final Action: Reject**
(Table 396.10(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Communication systems, Articles 800 and 830. Coaxial cables, Articles 820,. Optical fiber cables, Article 770.
Substantiation: This wiring method may be suitable for the proposed cables.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided evidence that such cables are manufactured or listed. The use of messenger-supported wiring for the articles proposed should appear in those respective articles rather than Article 396 since Chapter 3 applies generally unless modified by Chapters 5, 6, or 7. Chapter 8 stands alone unless it references other parts of the code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-154 Log #3185 NEC-P07 **Final Action: Accept in Principle**
(396.10(C))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In 396.10(C), delete ~~(C) Hazardous (Classified) Locations. Messenger supported wiring shall be permitted to be used in hazardous (classified) locations where the contained cables are permitted for such use in 501.10, 502.10, 503.10, and 504.20.~~
Substantiation: Uses permitted or not for wiring methods are typically for wet locations, direct burial, etc. There are no Articles for those locations. However, it is the responsibility of CMP 14 to determine what wiring methods are permitted in hazardous locations.
Such references to parts of Chapter 5 are not in accordance with the NEC Style Manual, 2.2.1 and 4.1.2 for instance, and the Technical Correlating Committee is requested to correlate all Articles in Chapter 3 by deleting these references altogether.
Panel Meeting Action: Accept in Principle
Revise 396.10(C) as follows:
(C) Messenger-supported wiring shall be permitted to be used in hazardous (classified) locations where the contained cables and messenger supported wiring is specifically permitted by other articles in this *Code*.
Panel Statement: Revising 396.10(C) provides the user with the information that the use of messenger-supported wiring and the attached conductors or cables is permitted in hazardous locations where specifically permitted elsewhere in the code. The user must check in Chapter 5 to see if and where it is permitted. The additional added phrase preserves the responsibility for CMP-14 to authorize its use where appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-155 Log #2643 NEC-P07 **Final Action: Reject**
(396.12)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows: Messenger supported wiring shall not be used in hoistways or where likely to be subject to physical damage.
Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-156 Log #2653 NEC-P07 **Final Action: Reject**
(396.12)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Messenger supported wiring shall not be used in hoistways or where likely to be subject to physical damage.
Substantiation: Edit. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 7-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-157 Log #4885 NEC-P07 **Final Action: Reject**
(396.13 (New))

Submitter: Charles Darnell, kVA Engineering and Forensics, LLC
Recommendation: Add new text as follows:
Messenger supported wiring shall be securely bound for protection during movement caused by fault-current magnetic forces. The restraint method employed shall protect the single conductors from damage due to the fault-current magnetic forces and be rated for the spacing between conductors and maximum available fault-current.
Substantiation: Due to the propensity for damage caused by fault-current magnetic forces, messenger supported wiring restraint should be afforded the same protection required for single conductor cables in Section 392.8 (D). Conventional methods such as rings and saddles or field-installed lashing are not able to consistently provide adequate restraint for moderate to high fault levels.
Since the fault-current magnetic force between conductors is directly proportional to the square of the peak current magnitude and indirectly proportional to the spacing between conductors, moderate short circuit levels can generate large mechanical forces. It is possible for a 3-phase 10kARMS short circuit to generate fault-current magnetic forces above 500 pounds per foot (see attached Cable Force Calculation #1). While forces in this order of magnitude may seem considerable, large industrial electrical systems regularly encounter fault-current magnetic forces in excess of 3 tons (see attached Cable Force Calculation #2).
This author's extensive forensic experience in electrical systems subject to moderate and high available fault duties proves that messenger supported wiring can be damaged from fault-current magnetic forces. Electrical personnel apply cables within their thermal damage capability by selecting appropriate protective device settings (i.e. de-energizing the circuit prior to the point of thermal insulation damage). The protective device (including fuses and circuit breakers) operating times are frequently longer than the time
required for single conductors to deflect outward and break free from their cable jacket and/or restraint system (if any). Such protective device application should protect the conductor and its insulation from exceeding their design temperatures, but does not necessarily provide for adequate mechanical restraint of multi-conductor cables or triplexed assemblies. This author is prepared to present high-speed slow-motion video footage of multi-conductor cables undergoing short circuit testing (at magnitudes within the cable rating) that conclusively demonstrate this point.
In order to provide practical safeguarding of persons and property from hazards arising from the use of electricity, this code should dictate equal performance criteria for all cable constructions. Recognizing there may be self-certified cable restraint products designed to withstand fault-current magnetic forces, there are products available that are independently tested to a peer-reviewed consensus standard to withstand fault-current magnetic forces and protect the restrained cables during actual short circuit events...
the cable cleat. Cable cleats may be applied in messenger supported wiring installations to adequately restrain and protect the wiring.
Underperforming cable restraints can result in to hazards to persons and property. Inclusion of the proposed requirements will empower the installer to make an informed decision on which restraints to use for messenger supported wiring.
Panel Meeting Action: Reject
Panel Statement: The panel is aware that movement is possible under fault conditions. The magnitude varies from location to location and is considered an engineering function to determine this. The provided language is unenforceable.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-158 Log #4621 NEC-P07 **Final Action: Reject**
(396.30(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add the following sentence: "Where messenger-supported wiring is used to supply loads wired in accordance with 250.32(B) Exception, the messenger shall be permitted to be bare and used as a neutral conductor."
Substantiation: One purpose behind proposals made in the 2008 cycle that resulted in this material entering the NEC was to correct the lack of any permission for this cable to be used for regrounded neutrals in instances (steadily decreasing) where the NEC so permitted. The final 2008 wording didn't quite get there. The 2008 wording does point to 225.4, however that reference ends up in 225.4 Exception, which allows for this practice "as specifically permitted elsewhere in this Code." This is effectively circular, because nothing in Article 396 actually permits the use. This proposal corrects the lack of correlation and makes the wording of 225.4 Exception actually point to useful information.
Panel Meeting Action: Reject
Panel Statement: The panel references the submitter to section 250.32(B) exception, which already applies and additional text is not required.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 398 — OPEN WIRING ON INSULATORS

7-159 Log #1772 NEC-P07 **Final Action: Reject**
(398.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: An exposed wiring method using cleats, knobs, nonmetallic tubes, and flexible nonmetallic tubing for the protection and support of single insulated circuit conductors and equipment grounding conductors.
Substantiation: Edit. Knobs and tubing should be specified nonmetallic. The requirement for insulated conductors should be limited to circuit conductors.
Panel Meeting Action: Reject
Panel Statement: The submitter does not provide any technical substantiation for the additional language.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-160 Log #1771 NEC-P07 **Final Action: Reject**
(398.30(B) and (C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: (B) Where not likely to be subject to physical damage ~~disturbed~~ in buildings of mill construction 8 AWG and larger...". (remainder unchanged).
(C) In industrial and agricultural establishments only...". (remainder unchanged).
Substantiation: Criteria should not be the type of building or occupancy, but the conditions of support, and maintenance and supervision. Agricultural establishments may meet those requirements.
Panel Meeting Action: Reject
Panel Statement: The general reference to industrial installations indicates conditions of maintenance by qualified individuals under direct supervision These conditions of maintenance in agricultural locations cannot be assured. In this case the use of the word "disturbed" is appropriate for this wiring method.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-161 Log #1874 NEC-P07 **Final Action: Reject**
(398.30(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "or agricultural" after "industrial".
Substantiation: The provision also appears appropriate for agricultural establishments where maintenance and supervision are provided.
Panel Meeting Action: Reject
Panel Statement: The general reference to industrial installations indicates conditions of maintenance by qualified individuals under direct supervision These conditions of maintenance in agricultural locations cannot be assured.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 399 — OUTDOOR, OVERHEAD CONDUCTORS, OVER 600 VOLTS

7-162 Log #680 NEC-P07 **Final Action: Accept**
(399)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
In addition, the Technical Correlating Committee assigns this material as Article 399.
The Technical Correlating Committee directs that the panel clarify the panel action on this proposal relative to the NEC Style Manual and statements expressed in the ballots.
This action will be considered by the panel as a public comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Add new text to read as follows:
Article 399 Outdoor, Overhead Conductors, Over 600 Volts
399.1 Scope. This article covers the use, installation and construction specifications for outdoor, overhead conductors, over 600 volts.
399.2 Definition.
Outdoor Overhead Conductors, Over 600 Volts. Single conductors, insulated, covered, or bare, installed outdoors on support structures.
399.10 Uses Permitted. Outdoor overhead conductors, over 600 volts, shall be permitted only for systems rated over 600 volts nominal as follows:
(1) Outdoors
(2) For services, feeders or branch circuits
399.12 Uses Not Permitted. Overhead conductors, over 600 volts shall not be permitted to be installed indoors.
399.30 Support.
(A) Conductors. Documentation of qualified engineered spacing design between conductors shall be available upon request of the authority having jurisdiction and shall include consideration of the following:
(1) Applied voltage
(2) Conductor size
(3) Distance between support structures
(4) Type of structure
(5) Wind/Ice loading
(B) Structures. Structures of wood, metal, concrete or combinations of those materials shall be provided for support of overhead conductors, over 600 volts. Documentation of the qualified engineered design and the installation of each support structure shall be available upon request of the authority having jurisdiction and shall include consideration of the following:
(1) Soil conditions,
(2) Foundations and structure settings,
(3) Weight of all supported conductors and equipment,
(4) Weather loading (ice, wind, temperature, etc.),
(5) Angle where change of direction occurs,
(6) Spans between adjacent structures,
(7) Effect of dead end structures,
(8) Strength of guys and guy anchors,
(9) Structure size and material(s),
(10) Hardware
(C) Insulators. Insulators used to support conductors shall be rated for all of the following:
(1) The applied phase to phase voltage
(2) Mechanical strength required for each individual installation
(3) Impulse Withstand BIL in accordance with Table 490.24
Substantiation: This proposal is the work of the "High Voltage Task Group" appointed by the Technical Correlating Committee. The task group consisted of the following members: Alan Peterson, Paul Barnhart, Lanny Floyd, Alan Manche, Donny Cook, Vince Saporita, Roger McDaniel, Stan Folz, Eddie Guidry, and Jim Dollard.
Premises wiring installations, utilizing over 600 volt systems currently exist in numerous locations and have become more common as electrical usage has increased. Many of those installations utilize overhead bare conductors on insulators as feeders and branch circuits to safely distribute power to multiple building, structure and equipment locations. NEC Chapter 3 wiring methods do not currently recognize this "wiring method" nor provide prescriptive permission or limitation for these installations. Submitted text allows and requires designers to utilize existing industry standards for the specific details of the design and provides enforcement a basis for approval of the installations.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
RAY, J.: I am balloting negative on this proposal, but do recognize that there are benefits to include medium and high voltage premises wiring installation requirements in the NEC. My reasons for negative ballot on the Panel's action are on items in this proposal that need to be addressed to improve safety and clarity. These are:
1. In 399.1 Scope, the text "construction specifications" is not covered in the purpose of the NEC according to 90.1(C).
2. In 399.2, the proposed definition does not contain information that the conductors operate over 600 Volts as the term it is to define.
3. In 399.10(2), "service" is that from a serving utility and the proper terminology should be "overhead service conductors". Uses for the conductors need to be listed as conductor types and not conductor functions.
4. In 399.12, there are instances where overhead conductors over 600 Volts are installed indoors such as in vaults and supported by insulators with electrical space separation.
5. In 399.30(A) and (B), the use of the phrase "in consideration of" results in vague and unenforceable language that is not permitted according to 3.2.1 in the NEC Style Manual. This text does not provide requirements for enforcement.
6. In 399.30(C), insulator installation needs to also consider the operational environment condition, dry and wet flashover voltages, and material composition. In addition, an Advisory Note should be included to reference ANSI C29.1 through ANSI C29.7 applicable to insulators required for line insulation.
Comment on Affirmative:
NIELSEN, D.: 1. From the panel discussion it is understood that the term "qualified engineered design" is intended to mean designed by a qualified engineer.
2. It is also understood that other factors may need to be considered such as surge protection, lightning protection, etc.

ARTICLE 400 — FLEXIBLE CORDS AND CABLES

6-140 Log #495 NEC-P06 **Final Action: Accept in Part**
(Table 400.4)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: The column number references in this proposal relate to the 2008 NEC.
Revise the column headings over columns 7 - 9 as follows:

AWG Or Kcmil	Nominal Insulation Thickness[1]	
	mm	mils

Delete the fourth column entitled "AWG or kcmil".
Relocate all Notes in column 4 to column 7.
Add "See Note 14." in existing column 8 (mm) for EV, EVJ, EVE, EVJE, EVT, and EVJT.
In column 8 for EVJT, relocate (0.51) to immediately follow 0.76.
Delete "2.41" and "95" from column 8 and 9 for HPN.
For Type S, delete 18 - 12 AWG in the third column and retain 18 - 2 in the seventh column.

Relocate the numbers (10, 1.14, 45) in the row for SJT to follow the existing numbers (18 - 12, 0.76, 30) in the row for SJ and also add the same numbers to follow the existing numbers in the row for SJTO if that portion of the table extends to more than one page.

Substantiation: This proposal will eliminate duplicate text in the same table.

The seventh column in the Table repeats the same information as the third column except in more detail. The conductor size range in the fourth column is the same as the conductor size range in the seventh column.

Relocation of the Notes from column 3 to column 7 correlates with the deletion of column 3.

The column heading "Insulation Thickness" only applies to columns 8 and 9, not column 7.

Note 14 explains the dimensions in parenthesis in the current column 8 (mm).

The dimensional relocation of 0.51 for EVJT is for consistency with the previous Table listings.

The insulation thicknesses for HPN in sizes large than 12 AWG are being deleted since no conductor size is specified and existing column 4 shows the conductor size range as 18 - 12 AWG.

The size range 18 - 12 for Type S in column 3 is incorrect and the range (18 - 2) shown in column 7 is correct.

The insulation thickness for 10 AWG should be shown following the 18 - 12 AWG dimensions since the current table is confusing, but it only applies to those types that are authorized in size 10 AWG.

Panel Meeting Action: Accept in Part

The Panel rejects the recommendation to remove the fourth column of Table 400.4. In addition, reject the recommendation to move the notes from column 4 to column 7. Accept all other recommendations.

Panel Statement: The fourth column is a quick reference to size and types. The column also contains various notes to products that may be useful to retain.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-141 Log #2394 NEC-P06 **Final Action: Reject**

(Table 400.4)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Delete the 4th column in Table 400.4 entitled "AWG or kcmil".

Substantiation: Column 4 and Column 7 essentially repeat the same information – conductor size.

Column 7 will provide all the necessary information regarding conductor size in more detail.

Panel Meeting Action: Reject

Panel Statement: The fourth column is a quick reference to size and types. The column also contains various notes to products that may be useful to retain. See panel action on Proposal 6-140.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-142 Log #1558 NEC-P06 **Final Action: Reject**

(Table 400.4, 400.5(A) and 400.6)

Submitter: Susan L. Stene, Underwriters Laboratories Inc.

Recommendation: Revise Tables 400.4 and 400.5(A) and Section 400.6 as follows:

Insert new row between type S and type SC in Table 400.4

See Table 400.4 on page 493

400.6 Markings.

(A) Standard Markings. Flexible cords and cables shall be marked by means of a printed tag attached to the coil reel or carton. The tag shall contain the information required in 310.11(A). Types S, SBST, SC, SCE, SCT, SE, SEO, SEOO, SJ, SJE, SJEO, SJEOO, SJO, SJT, SJTO, SJTOO, SO, SOO, ST, STO, STOO, SEW, SEOW, SEOOW, SJEW, SJEOW, SJEOOW, SJOW, SJTW, SJTOW, SJTOOW, SOW, SOOW, STW, STOW, and STOOW flexible cords and G, G-GC, PPE, and W flexible cables shall be durably marked on the surface at intervals not exceeding 610 mm (24 in.) with the type designation, size, and number of conductors.

Table 400.5(A) Allowable Ampacity for Flexible Cords and Cables [Based on Ambient Temperature of 30°C (86°F). See 400.13 and Table 400.4] *Only header shown*

		Thermoset Types C, E, EO, PD, S, SJ, SJO, SJOW, SJOO, SJOOW, SO, SOW, SOO, SOOW, SP-1, SP-2, SP-3, SRD, SV, SVO, SVOO	
Size (AWG)	Thermoplastic Types TPT, TST	Thermoplastic Types ET, ETLB, ETP, ETT, SBST, SE, SEW, SEO, SEOW, SEOOW, SJE, SJEW, SJEO, SJEOW, SJEOOW, SJT, SJTW, SJTO, SJTOW, SJTOO, SJTOOW, SPE-1, SPE-2, SPE-3, SPT-1, SPT-1W, SPT-2, SPT-2W, SPT-3, ST, SRDE, SRDT, STO, STOW, STOO, STOOW, SVE, SVEO, SVT, SVTO, SVTOO	Types HPD, HPN, HSJ, HSJO, HSJOO

Substantiation: UL 62, clauses 4.1.2.2 and 4.1.6.3 indicate that new materials may be used if the electrical, mechanical and physical characteristics of the construction show that the new material is comparable in performance to materials intended for the application.

UL evaluated a cord similar in construction to an SVT using a new halogen free material. The mechanical characteristics of the new material were determined and were compared to those obtained on a PVC cord. Tests used were crush, abrasion and flexing. As a result of these tests, end-of-life values were determined for an SVT cord. The data provided shows the comparison between a typical SVT cord and a cord using the new material.

As a result of this evaluation, a new cord type is being proposed. This cord type uses a halogen free material (a blend of styrenic block copolymer and polypropylene, abbreviated SPP). It is proposed to call this new cord Type SBST.

Due to the thicknesses of the construction submitted, the proposed SBST cord does not meet the construction of either SVT or SJT. Therefore, the SBST cord will have its own thickness requirements. The overall diameter of the cable falls at the high end of the range for SVT. It is therefore proposed that the overall diameter of the SBST cord shall have its own requirements.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The proposed cord size is between vacuum and junior hard service cord, and the acceptance of this proposal will require new sizes of strain relief, plug bodies etc. Therefore, the acceptance will create a substitution problems between existing cord types and connectors, and limits the material used to a halogen free material designated SPP (styrene block copolymer and polypropylene) and proposed as SBST.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Insert type **TPENH,** and **TSENH** in table 400.5 into column number 2 row 1. Insert type **SPENH-1, SPENH-2, SPENH-3, SVENH,** and **SJENH** in table 400.5 into column number 3 row 2 See table 400.5 below for location.

See Table 400.4 on pages 495 -496 and Table 400.5 on page 495
Substantiation: There is growing appliance manufacturer and consumer interest to utilize non-halogen materials for flexible wiring and cord use, including communication and low voltage power cable applications. These would provide for improved fire safety in terms of easier visibility for egress (low smoke) and better electrical safety (less potential for corrosive atmospheres that may impact sensitive equipment or circuits). It is proposed that the NEC® be revised to facilitate the anticipated use of these materials.
In particular the development of non-halogen thermoplastic elastomer materials with a good balance of performance characteristics such as flexibility and toughness and having the needed product safety performance such as meeting cable burn testing requirements, improved combustion corrosivity and good long term electrical characteristics is underway. These non-halogen materials would need to be qualified against applicable NRTL standards appropriate to the product category and intended use.
These materials would be available as alternatives to resins that are currently used. This proposal will bridge the performance interval between currently-available material classes. For example, it is anticipated that these materials will meet the 121C hot deformation and heat aging requirement for insulation and jacketing applications, matching the incumbent materials, which have proven to be fully satisfactory in this regard. Performance data demonstrating that the material can meet the proposed target will be forth coming in the future stages of the process
Panel Meeting Action: Reject
Panel Statement: There is no data provided by the submitter to support the claim of increased fire safety. There is also no evidence that the halogen free meets the safety requirements in the applicable product safety standard. 400.6(B) allows for additional markings and this allowance could be used for HF or NF cable.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-144 Log #4780 NEC-P06 **Final Action: Accept in Part**
(Table 400.4, Note 15)

Submitter: Samuel B. Friedman, General Cable Corporation
Recommendation: Add following to end of second sentence:
"and are considered sunlight resistant".
Substantiation: Although note 15 does a good job in advising that "w" suffix on cord designation indicates that the product is water resistant, it falls short of properly advising that the product is also sunlight resistant. Due to this, questions are often asked by inspectors, with less experience with cord products, as to whether a cord is sunlight resistant. The addition of the above words to note 15 should help in this regard.
Panel Meeting Action: Accept in Part
Panel rejects 'considered' from the proposed text to revise text as follows:
"...and are sunlight resistant".
Panel Statement: The rejected text, "considered" is subjective, subject to interpretation, and not in compliance with 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-145 Log #3455 NEC-P06 **Final Action: Accept**
(400.5)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal related to the action taken on Proposal 6-150.
This action will be considered by the panel as a public comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In 400.5(A), change "Table 400.5(A)" to "Table 400.5(A)(1)", "Table 400.5(B)" to "Table 400.5(A)(2)" in two places and "Table 400.5" to "Table 400.5(A)(3)".
Renumber Table 400.5(A) as Table 400.5(A)(1)
Renumber Table 400.5(B) as Table 400.5(A)(2)
Renumber Table 400.5 as Table 400.5(A)(3) and relocate the FPN to follow the Table
Relocate the first paragraph of 400.5(B) to the end of the section. The remaining paragraphs currently under (B) will now be under (A).
Delete the exception under (B) and add the following paragraph:
"(C) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated in accordance with 310.15(C).
Substantiation: Renumbering the Tables complies with 2.3.1 of the NEC Style Manual.
Except for the first paragraph under (B), all of the other paragraphs relate to the adjustment factors.
The FPN should follow the Table as it does in 310.15(B)(2)(a).
The Exception is not correct. 310.15(C) provides an equation to calculate the ampacity, not the adjustment factor.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-146 Log #1149 NEC-P06 **Final Action: Accept**
(400.5(A))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise the third sentence as follows: "Where cords are used in ambient temperatures ~~exceeding~~ other than 30° C (86°F), the temperature correction factors from Table 310.16 that correspond to the temperature rating of the cord shall be applied to the ampacity from Table 400.5(B)."
Substantiation: Currently, there is no provision in Article 400 to apply correction factors to the ampacities of flexible cables when used in ambient temperatures below 30°C.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-147 Log #1620 NEC-P06 **Final Action: Accept in Principle**
(400.5(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "Table 310.16" to "Table 310.15(B)(1)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Accept in Principle
Change "Table 310.16" to "Table 310.15(B)(16)".
Panel Statement: See panel action on Proposal 6-52.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-148 Log #1150 NEC-P06 **Final Action: Accept**
(Table 400.5(A) and Table 400.5(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Insert "copper" to size column.
Substantiation: This will clarify that the present ampacities are for copper conductors only.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

[3]All types listed in Table 400.4 shall have individual conductors twisted together except for types HPN, SP-1, SP-2, SP-3, SPE-1, SPE-2, SPE-3, **SPENH-1, SPENH-2, SPENH-3,** SPT-1, SPT-2, SPT-3, TPT, **TPENH,** NISP-1, NISP-2, NISPT-1, NISPT-2, NISPE-1, NISPE-2, **NISPENH-1, NISPENH-2** and three conductor parallel versions of SRD, SRDE, and SRDT.

[4]Types TPT, **TPENH, TSENH,** and TST should be permitted in lengths not exceeding 2.5 m (8ft) where attached directly, or by means of a special type of plug, to a portable appliance rated at 50 watts or less and of such nature that extreme flexibility of the cord is essential

[8]The third conductor in type HPN shall be used as an equivalent grounding conductor only. The insulation of the equipment grounding conductor for types SPE-1, SPE-2, SPE-3, **SPENH-1, SPENH-2, SPENH-3,** SPT-1, SPT-2, SPT-3, NISPT-1, NISPT-2, NISPE-1, **NISPENH-1, NISPENH-2** and NISPE-2 should be permitted to be thermoset polymer

6-143 (Log #4477)

6-149 Log #1642 NEC-P06 **Final Action: Accept**
(400.5(B), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change “Table B.310.11” to “Table B.310.15(B)(2)(11)”.
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables B.310.1 through B.310.11 as Tables B.310.15(B)(2)(1) through B.310.15(B)(2)(11) and the figure designations of Figures B.310.1 through B.310.5 as Figures B.310.15(B)(2)(1) through B.310.15(B)(2)(5).
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-150 Log #1644 NEC-P06 **Final Action: Accept**
(400.5(B) Exception)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise 400.5(B) Exception as shown: *”Exception: For other loading conditions, adjustment factors shall be permitted to be calculated* <u>*in accordance with*</u> ~~*under*~~ *310.15(C).”*
Substantiation: Consistent standard writing style.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-151 Log #3544 NEC-P06 **Final Action: Reject**
(400.7)

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Revise text to read as follows:
400.7 Uses Permitted.
(A) Uses. Flexible cords and cables shall be used only for the following:
(1) Pendants
(2) Wiring of luminaires<u> and electric signs, </u>
(3) Connection of portable luminaires, portable and mobile signs, or appliances
(4) Elevator cables
(5) Wiring of cranes and hoists
(6) Connection of utilization equipment to facilitate frequent interchange<u>, interconnection of electronic sign modules used in electronic message centers.</u>
(7) Prevention of the transmission of noise or vibration
(8) Appliances where the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance and repair, and the appliance is intended or identified for flexible cord connection
(9) Connection of moving parts
(10) Where specifically permitted elsewhere in this *Code.*
Substantiation: (2) To allow the use of electric signs. Flexible cords are being used as wiring in signs for a number of reasons, the least of which is that ballasts, LED power supplies, and LED modules are not able to be repaired in the field. Therefore, maintenance personnel find it necessary to quickly change out components when they no longer function. The use of flexible cords makes it possible to provide connectors that lessens the likelihood service personnel will expose themselves and the sign to an electrical fault. Cord connected signs are allowed in the code and we are adding the use of the cord. (6) Electronic message centers have removable parts and chassis and new cord and plug for maintenance. The use of cord has been prohibited in outdoor signs since the NEC does not include the same reference to signs as is made to luminaires.
Panel Meeting Action: Reject
Panel Statement: Article 600 describes methods of supplying electrical power to signs. Exception No. 2 under 600.6 refers to cord-connected signs, and in the article it is implied that only portable signs shall be permitted to be cord-connected. Lock Out Tag Out (LOTO) means is currently required for all signs.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-152 Log #4107 NEC-P06 **Final Action: Reject**
(400.7(A)(2) and (8))

Submitter: David Servine, Channelume/Let-R-Edge Co.
Recommendation: Revise text to read as follows:
(2) Wiring of luminaries <u>and signs</u>
(8) Appliances <u>and electronic sign modules</u> where the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance and repair, and the appliance <u>and electronic sign module</u> is intended or identified for flexible cord connection.
Substantiation: In many applications, the only difference between a luminaire and a sign is that the lens in front of the diffuser conveys a message. This result in two similar electrical products being constructed differently in as much as their has been a need to restrict the use of flexible cord to the supply connection of portable products, there are a number of electronic sign products that are design to be readily remove for service. Amending the text will advance a solution to the current problem associated with the restricted use of flexible cord for power and interconnection of electronic modules used in electronic signs.
Panel Meeting Action: Reject
Panel Statement: Article 600 describes methods of supplying electrical power to signs. Exception No. 2 under 600.6 refers to cord-connected signs, and in the article it is implied that only portable signs shall be permitted to be cord-connected. Lock Out Tag Out (LOTO) means is currently required for all signs. Portable signs may be cord-connected according to Article 600.6.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-153 Log #1981 NEC-P06 **Final Action: Reject**
(400.7(A)(11) (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows: (11) Wiring of traffic signals where supported by a messenger and the flexible cord is identified for the use.
Substantiation: Flexible cord is commonly used for wiring of traffic signals supported by a messenger cable and installed by contractors and municipal employees covered by 90.2(A)(1), and does not appear to be covered by 400.7(A)(1).
Panel Meeting Action: Reject
Panel Statement: A certification category (XNTL) already exists for Traffic Signal Cable Classified in Accordance with IMSA Specifications.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-154 Log #2641 NEC-P06 **Final Action: Accept in Principle**
(400.7(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: “cord connector” after “receptacle outlet”.
Substantiation: Edit. Such attachment plugs may also be energized from a cord connector body.
Panel Meeting Action: Accept in Principle
Add: “<u>or cord connector body</u>” after “receptacle outlet”.
Panel Statement: The Panel accepts the proposal in principle but has modified the submitter’s proposed text to clarify the language.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-155 Log #2333 NEC-P06 **Final Action: Reject**
(400.8)

Submitter: David Nemchik, Medina County Building Department [Ohio]
Recommendation: Revise text as follows:
(2) Where run through holes in walls, structural ceilings, suspended ceilings, or floors
<u>Exception to (2): As permitted in accordance with the provisions of 410.62(C)(1)</u>
(3) Where run through doorways, windows, or similar openings
(4) Where attached to building surfaces
Exception to (4): ~~Flexible cord and cable shall be~~ <u>As</u> permitted ~~to be attached to building surfaces~~ in accordance with the provisions of 368.56(B)
(5) Where concealed by walls, floors, or ceilings or located above suspended or dropped ceilings
<u>Exception to (5): As permitted in accordance with the provisions of 410.62(C)(1).</u>
Substantiation: In their current form, 400.8 and 410.62(C)(1) are in conflict.. This proposal eliminates that conflict without expanding the verbage that could cause the section to become needlessly drawn-out and bloated.
Panel Meeting Action: Reject
Panel Statement: There is not a conflict between 400.8(2) and (5), and 410.62(C)(1). You may not run a cord through a hole in a ceiling to power a luminaire, even if the luminaire is located directly below the outlet or busway.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-156 Log #4500 NEC-P06 **Final Action: Reject**
(400.8(4))

Submitter: Mike Flegel, Reliance Controls Corp.
Recommendation: Revise new Exception No 2 to (4) as follows:
Exception No 2: Flexible cord or cable used to supply generator power to a building or structure when connected to a device mounted on a building or structure surface that contains suitable strain relief.
Substantiation: UL has prevented the listing of the device as described in the added exception due to the wording as it exists now. I believe such an application to be safe especially since the cord is an inlet for power and not an outlet. That is to say, the cord is not live until it is plugged into a generator and the generator is running.
Panel Meeting Action: Reject
Panel Statement: No substantiation was provided to support this proposal. Properly located inlets will prevent this installation. Permanently installed flexible cord on a structure is not safe.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-157 Log #2243 NEC-P06 **Final Action: Reject**
(400.8(5))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Recommendation: Revise as follows:
(5) Where concealed by walls, floors, ~~or~~ and structural ceilings, or located above suspended or dropped ceilings except as permitted by 400.7(3).
Substantiation: I attend many inspector meetings throughout the U.S. annually. This issue continues to come up and inspectors are permitting items such as wireless routers in hotel ceilings and small cord & plug connected water heaters over office bathrooms and other similar items that are supplied with a factory cord and plug. Although I agree it is presently a violation, I have polled inspectors and have not found any problems associated with this practice. Note: This change is only intended to apply to areas above dropped and suspended ceilings.
Panel Meeting Action: Reject
Panel Statement: The proposal, as submitted, is incorrect. Its application would bypass all 400.8 uses not permitted for the 400.7 items that are listed in the proposal.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-158 Log #652 NEC-P06 **Final Action: Reject**
(400.8(5) Exception (New))

Submitter: Ron L. Janikowski, City of Wausau, Wisconsin / Rep. CMP16 Special Editorial Task Group
Recommendation: Add new Exception to read as follows:
Exception to (5). Flexible cord as part of an assembly not exceeding 6 ft in length shall be permitted above suspended or dropped ceilings, provided the space above the ceiling is not in conflict with 300.22.
Substantiation: Security cameras, fire detection and other equipment that is shipped with molded cord assemblies cannot be installed under current code rules. I think short pieces of cord, part of a listed assembly should be allowed. I think a greater problem exists when the contractor tries to hand wire the equipment.
Panel Meeting Action: Reject
Panel Statement: The substantiation states that some equipment cannot be installed under current code rules. There are currently provisions in the code that address this issue and allow installation of cords above suspended ceilings. The authority having jurisdiction could ultimately allow permission for these types of installations based on 400.7(A)(3).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-159 Log #1751 NEC-P06 **Final Action: Reject**
(400.8(7))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Where likely to be subject to physical damage.
Substantiation: Edit. “Likely” is defined as such a nature or circumstance as to make something probable and is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: The use of the term “likely” is unenforceable and vague and does not comply with 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-160 Log #1862 NEC-P06 **Final Action: Reject**
(400.8(8))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: (8) Where likely to be subject to direct sunlight unless identified as sunlight resistant.
Substantiation: Edit. Proposal correlates with other provisions that require sunlight resistance.
Panel Meeting Action: Reject
Panel Statement: The use of the term “likely” is unenforceable and vague and does not comply with 3.2.1 of the NEC Style Manual. Section 110.3(B) already states that equipment must be used within its listing/rating and labeling. Sunlight resistant cord is designated as such with a “w” on the jacket. See also Note 15 to Table 400.4 as revised by the panel in Proposal 6-144.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-161 Log #2754 NEC-P06 **Final Action: Accept**
(400.12)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Recommendation: Delete 400.12 in its entirety.
Substantiation: A companion proposal is being submitted to relocate this material to a revised 400.21 since these requirements more appropriately belong under Part I1 Construction Specifications.
Panel Meeting Action: Accept
Panel Statement: See panel actions on Proposals 6-162 and 6-169.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-162 Log #4781 NEC-P06 **Final Action: Accept**
(400.12)

Submitter: Samuel B. Friedman, General Cable Corporation
Recommendation: Remove Exception to 400.12
Substantiation: The exception to 400.12 does not apply since G-GC cables are permitted to be supplied with conductor sizes less than #10 AWG. This exception was placed in the code when the smallest conductor size permitted for G-GC cables was #8 AWG. However, this was changed in the 2004 code when the smallest size was changed to #12 AWG. The exception should have been removed at that time. Since the exception is no longer correct (#12 AWG is permitted to be used as ground-check) and not needed to clarify Section 400.12, the exception should be removed.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-163 Log #1752 NEC-P06 **Final Action: Accept in Principle in Part**
(400.13)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Flexible cords and cables, and tinsel cords shall be protected in accordance with 240.5.
Substantiation: Edit. Overcurrent devices are not described in 240.5, only circuit ampacity ratings. The requirement should include “cables” and sizes smaller than 18 AWG.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
400.13 Overcurrent Protection. Flexible cords not smaller than 18 AWG, and tinsel cords or cords having equivalent characteristics of smaller size approved for
use with specific appliances, shall be considered as protected against overcurrent ~~by the overcurrent devices described~~ in accordance with 240.5.
Panel Statement: The panel agrees with the submitter that overcurrent devices are not described in 240.5, but does not agree that cables smaller than 18 AWG should be included in the section. No technical data was supplied to indicate smaller size conductors should be included. The panel agrees that the current wording is sufficient with the proposed text changes.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-164 Log #2259 NEC-P06 **Final Action: Reject**
(400.14)

Submitter: Gus Bryan, Deputy ELectrical Inspector State of TN
Recommendation: ...In industrial (and commercial) establishments...
Substantiation: This method of installing cord drops has proven to work well. The benefits of the type installed should be extended to commercial applications.
Panel Meeting Action: Reject
Panel Statement: Industrial establishments have limited personnel access while commercial establishments would normally have much broader personnel access. The panel was not provided evidence that the conditions of qualified personnel exist in commercial establishments.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-165 Log #3513 NEC-P06 **Final Action: Accept**
(400.14)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In the last line of the second paragraph, change “Table 400.5” to “Table 400.5(A)(3)”.
Substantiation: This is a companion proposal to the revision of 400.5 and the renumbering of the tables to comply with the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-166 Log #799 NEC-P06 **Final Action: Reject**
(400.19 (New))

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new Section 400.19.
400.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.
Substantiation: 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While the equipment historically has not been listed, a basis for approval of this equipment is needed.
Panel Meeting Action: Reject
Panel Statement: Section 110.2 and 110.3 already state that electrical equipment or conductors required or permitted by the NEC must be approved, so repeating this text in 400.19 is unnecessary. Section 90.4, as well as 90.7, provides a method for the AHJ to use "listing" as a means of accepting electrical equipment, especially where the AHJ does not have access to the listing standards, does not have the qualifications, or does not have the time for evaluation of the electrical equipment. Where electrical equipment is one of a kind or not listed at time of installation, Sections 90.4 and 90.7 permit field equipment evaluation, so this text is unnecessary.
Number Eligible to Vote: 11

6-169 Log #2753 NEC-P06 **Final Action: Accept in Principle in Part**
(400.21)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Recommendation: Revise 400.21 to read as follows:
400.21 Construction.
(A) Conductors. The individual conductors of a flexible cord or cable shall be copper, have flexible stranding and shall not be smaller than the sizes in Table 400.4.
Exception: The ~~size of the~~ insulated ground-check conductor of Type G-GC cables shall ~~be~~ not be smaller than 10 A WG.
(B) Nominal Insulation Thickness. The nominal thickness of insulation for conductors of flexible cords and cables shall not be ~~less~~ smaller than specified in Table 400.4.
Exception: The nominal insulation thickness for the ground-check conductors of Type G-GC cables shall not be less than 1.14 mm (45 mils) for 8 AWG and not less than 0.76 mm (30 mils) for 10 AWG.
Substantiation: A companion proposal has been submitted to delete 400.12.
This revision will consolidate the construction requirements of flexible cords and cables into 400.21.
The addition of "copper" and "flexible stranding" provides consistency with the requirements in 400.31. The ampacity Table 400.5(A) specifies ampacities for copper conductors only and would have to be revised if other conductor materials were used. Flexible stranding is essential in flexible cords and cables, as specified in the title of Article 400.
The revisions to (A) Exception eliminates redundancy and is a grammatical correction that is consistent with the grammar used in the (B) Exception.
The rules proposed for the revised 400.21 were adopted from the existing 400.12 and 400.21. The revisions to 400.12 and 400.21 that were made to consolidate and merge them into the revised 400.21 are shown below for information.
400.12 Minimum Size.
The individual conductors of a flexible cord or cable shall be copper, have flexible stranding, and shall comply with the sizes specified ~~not be smaller than the sizes~~ in Table 400.4.
Exception: The ~~size of the~~ insulated ground-check conductor of Type G-GC cables shall ~~be~~ not be smaller than I0 AWG.
400.21 Nominal Insulation Thickness.
The nominal thickness of insulation for conductors of flexible cords and cables shall comply with ~~not be less than specified~~ in Table 400.4.
Exception: The nominal insulation thickness for the ground-check conductors of Type G-GC cables shall not be less than 1.14 mm (45 mils) for 8 AWG and not less than 0.76 mm (30 mils) for 10 AWG.
Panel Meeting Action: Accept in Principle in Part
1. Accept the proposed revision to the title of 400.21,
2. Accept the proposed addition of 400.21(A) and the relocation under the new subtitle (B) of the nominal insulation thickness.
3. Reject the change from "less" to "smaller" and the addition of the phrase "be copper".
4. Delete the exeption to 400.21(B).
Revise text as follows:
400.21 Construction.
(A) Conductors. The individual conductors of a flexible cord or cable shall have flexible stranding and shall not be smaller than the sizes specified in Table 400.4.
(B) Nominal Insulation Thickness. The nominal thickness of insulation for conductors of flexible cords and cables shall not be less than specified in Table 400.4.
~~Exception: The nominal insulation thickness for the ground-check conductors of Type G-GC cables shall not be less than 1.14 mm (45 mils) for 8 AWG and not less than 0.76 mm (30 mils) for 10 AWG.~~
Panel Statement: The term "less" is more appropriate since it refers to an insulation thickness. See panel action on proposal 6-162, which deletes the exception to part A of this section.

The exception to 400.21(B) does not apply since G-GC cables are permitted to be supplied with conductor sizes less than 10 AWG. This exception was placed in the code when the smallest conductor size permitted for G-GC cables was 8 AWG. However, this was changed in the 2004 code when the smallest size was changed to 12 AWG. The exception should have been removed at that time. Since the exception is no longer correct (12 AWG is permitted to be used as ground-check) and not needed to clarify Section 400.21(B), the exception should be removed.

Currently, there is no section in the code that specifies copper conductors, and the added text is not needed. The submitter's substantiation has not provided any data to justify the addition of the term "copper".

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-170 Log #2594 NEC-P06 **Final Action: Reject**
(400.23)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:

An insulated or covered ~~A~~ conductor intended to be used... (remainder unchanged).

Substantiation: Edit. The requirement should be limited to insulated or covered conductors.
Panel Meeting Action: Reject
Panel Statement: The existing wording for conductor is sufficient as a conductor can either be insulated or covered. The submitter's proposal does not add any additional clarification to the requirement. No technical substantiation was provided to add the proposed wording.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-171 Log #1151 NEC-P06 **Final Action: Accept**
(400.31(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Delete in its entirety: "~~(B) Shields. Cables operated at over 2000 volts shall be shielded. Shielding shall be for the purpose of confining the voltage stresses to the insulation.~~"
Substantiation: There are no cords or cables in Article 400 that are rated for use above 2000 volts.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 402 — FIXTURE WIRES

6-172 Log #4867 NEC-P06 **Final Action: Reject**
(402)

Submitter: F. Patrick Mahoney, RCDD, Cannon Design
Recommendation: The title of Article 402 "Fixture Wires" and associated text should be changed to Luminaire Cable.
Substantiation: There is a conflict in terminology in the code as Article 410 has removed all mention of "fixtures" and code now defines what used to be a fixture as a luminaire. Use of the term fixture is confusing. In addition to avoid inconsistency cable better defines the conductor than wire.
Panel Meeting Action: Reject
Panel Statement: Fixture wires are used in more applications than just luminaires.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-173 Log #1621 NEC-P06 **Final Action: Accept**
(Table 402.3)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Relocate the column heading "Thickness of Insulation" that is currently over columns 4 – 6 to only be the heading for columns 5 and 6. The heading should appear as follows:

	Thickness of Insulation	
AWG	mm	mils

Insert a vertical line in the entire table between the "AWG" column and the "mm" column".
Substantiation: The conductor size should not be under the Thickness of Insulation heading. The vertical line will provide consistency with the other columns in the Table.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-174 Log #751 NEC-P06 **Final Action: Reject**
(402.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 402.19.

402.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved.

The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:

(1) Equipment listing or labeling

(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation.

Substantiation: 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While the equipment historically has not been listed, a basis for approval of this equipment is needed.
Panel Meeting Action: Reject
Panel Statement: Section 110.2 and 110.3 already state that electrical equipment or conductors required or permitted by the NEC must be approved, so repeating this text in 402.19 is unnecessary. Section 90.4, as well as 90.7, provides a method for the AHJ to use "listing" as a means of accepting electrical equipment, especially where the AHJ does not have access to the listing standards, does not have the qualifications, or does not have the time for evaluation of the electrical equipment. Where electrical equipment is one of a kind or not listed at time of installation, Sections 90.4 and 90.7 permit field equipment evaluation, so this text is unnecessary.

ARTICLE 404 — SWITCHES

9-95 Log #1160 NEC-P09 **Final Action: Accept in Principle**
(404.2(C) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add a new subparagraph 404.2(C) and exception to read as follows:
404.2 Switch Connections.
(C) Switches Controlling Lighting Loads. Where switches control lighting loads supplied by a grounded general purpose branch circuit, a grounded circuit conductor shall be provided at the switch location.
Exception: Grounded conductors shall not be required where conductors for switches controlling lighting loads enter the device box through a raceway.
Substantiation: There are electronic lighting control devices that require a standby current to maintain the ready state and detection capability of the device. This allows immediate switching of the load to the "on" condition. These devices require standby current when they are in the "off" state, i.e., when no current is flowing to the the load. The typical design of these devices may utilize the grounding conductor for the standby current flow.

In many, if not most commercial installations, a grounded conductor is not provided in the switch box for switches controlling lighting loads. This forces the design of these control devices to utilize the grounding conductor to conduct the standby current. Occupancy sensors are permitted by UL 773A to have a current of up to 0.5 mA on the grounding conductor. In fact, a number of UL Standards permit up to a 0.5 mA ground leakage current as acknowledgment of an operational necessity.

This is allowed because the function of an occupancy sensor requires a low level standby current. The standard permits this current on the grounding conductor because in a typical installation there may be no grounded circuit conductor in the switch box which can be used as the return conductor for the standby current. The leakage current is additive and multiple devices on the same circuit could possibly create a risk. The lack of a grounded conductor in the switch box forces the use of the grounded conductor for the operation of the device. Product designers have no reasonable option but to accommodate the lack of a grounded conductor by relying on the grounding conductor. This not only promotes the risk outlined above, but limits the functionality of the device due to low current level allowed. Products can and are designed to utilize a grounded conductor. However, installers will continue to use the grounding conductor in lieu of the grounded conductor when there is no grounded conductor available in the lighting control switch box, again, promoting the same possible risk.

Sensor manufacturers could distribute the necessary supervisory current through the load for some devices, but this solution has several drawbacks. Current cannot pass through ballasts and transformers, so this method limits control to incandescent lamps, which are seldom used in commercial buildings due to requirements of the same energy codes that dictate sensor use. Leaking to load also requires sizing the device to the load, and specifying minimum loads to prevent glowing filaments. Finally, having current flowing at the load when the device is presumed to be off could create a similar risk.

Many lighting control devices are installed as a means of realizing significant energy savings associated with the control of lighting circuits. Due to escalating energy costs and the increased recognition and adoption of energy saving codes, it is expected that there will be a substantial increase in the installation of these products. It is becoming less of a design decision or personal preference and more of a legislative requirement. In order to ensure the safe use of these products, the NEC should recognize an installation practice that requires the appropriate circuit conductor to be available for the standby-operation of the control device. An occupancy sensor can be installed in any switch location. It is impractical to expect the customer or installer to anticipate all instances where an occupancy sensor will be installed.

Since revisions to the NEC often results in advances in technology with respect to electrical installations, mandating a neutral in switch boxes will encourage device manufacturers to develop products that need a power supply in order to deliver advances in the control of electricity and reduce improper wiring methods where a grounding conductor is improperly used.

Although the current design of many lighting control devices relies on the grounding conductor for conducting current, adopting this proposed requirement will ensure that future designs will take advantage of the presence of the grounded conductor in the switch box and no longer compel the design of the product or installation practice to use the grounding conductor to conduct the standby current. The availability of a grounded conductor will also promote the design of many new and improved lighting control products.

The proposal allows an exception for installations utilizing some form of raceway instead of cable. The raceway would accommodate the installation of a grounded conductor at a latter time if needed.
Panel Meeting Action: Accept in Principle
Accept the proposal as modified by revising the proposed exception to read as follows:
The grounded circuit conductor shall be permitted to be omitted from the switch enclosure where either of the conditions in (1) or (2) apply:
(1) Conductors for switches controlling lighting loads enter the device box through a raceway.
(2) Cable assemblies for switches controlling lighting enter the box through a framing cavity that is open at the top or bottom on the same floor level, or through a wall, floor, or ceiling that is unfinished on one side.
Panel Statement: This exception should only be applied in cases where compliance with the normal requirements is so difficult that covert attempts to evade the rules would be likely.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
YOUNG, R.: The Proposal should have been rejected. The proposal does not consider the fact that the vast majority of residential wiring utilizes standard light switches or electronic light dimmers. Requiring a grounded conductor at all switch boxes will significantly increase the cost of residential wiring, as all home runs (between the panel and the utilization equipment) will be required to pass through all light switches before going to the fixture box, or else switch legs would require an additional neutral conductor. Either approach would make the total length of the copper wiring required significantly longer, at zero safety benefit for most applications. Concerns about grounding conductors potentially being used as circuit conductors should be addressed in the product standards for devices that are allowed to retrofit for standard switches.
Comment on Affirmative:
HARTWELL, F.: The panel action, which may well be the best solution, still suffers from the drawback that conventional snap switches do not now and never will require a connection to a grounded circuit conductor. This may be excessive in the case of one- and two-family housing, where even if every such switch were changed to an electronic type, the cumulative load on the equipment grounding system would not be problematic. CMP 9 could avoid the "what-if" aspect of this proposal by waiving the rules in cases where the total number of switches in any current return path (branch circuit or feeder) on the load side of a main or system bonding jumper did not exceed some specified value. On the other hand, the exception presented in the panel action will be very easy to apply. Comments on this point would be appreciated.
LEMAY, T.: There are many safety and convenience benefits to the electrical system of an occupancy having a grounded circuit conductor available at all outlet control points when the control point is wired with a cabled wiring method.
There are many control devices currently on the market, and more likely to come that require the use of a grounded circuit conductor for their operation.
There are instances where the branch circuit wiring could be extended from the switch box containing a grounded circuit conductor to provide additional outlets or power to other loads near the control point at a later time.
There are also instances where the installation of a multi-level controlled luminary or appliance assembly are not contemplated at rough in and installed after the fact by the end user, requiring an additional insulated control or switch loop conductor. This provision will provide for a means to accomplish this.
Additionally, I believe that the raceway exception should be the only exception to this rule as wall finishes could be provided at any time, rendering the switch box inaccessible.

9-96 Log #318 NEC-P09 **Final Action: Reject**
(404.4)

Submitter: Thomas A. Rorro, Parsippany Bldg. Dept.
Recommendation: 404.4 Prohibits switches in "tub or shower spaces".
410.10(D) Defines "zone" 3 ft horizontally and 8 ft vertically from tub or shower rim.
I recommend that 404.4 be revised so switches are restricted in "zone".
Substantiation: The code is not clear. The code may permits a switch which can be operated while standing in a tub full of water with wet hands. Moving switches out of 3 ft "zone" will prevent this problem!
Panel Meeting Action: Reject
Panel Statement: The submitter misunderstands the objective of this rule. It is not to prevent someone in a tub or shower from touching a switch. It is to prevent the location of switches where streams of water over the cover would be routine, eventually compromising gaskets and impairing grounding continuity. A properly installed and grounded switch immediately outside the normal shower curtain location is not intended to be considered in violation of this rule.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-97 Log #450 NEC-P09 **Final Action: Reject**
(404.4)

Submitter: Vincent P. Caballero, Contra Costa County Building Inspection
Recommendation: Add new text to read as follows:
Switches shall not be installed within 900 mm (3 ft) of wet locations in tub or shower spaces...
Substantiation: I have inspected switches that have the ungrounded and grounded conductor reversed causing the metal screws on the cover plate to be energized (no doubt by an amateur). Note in the photo I have provided that if the switch was a half inch to the right, it would be illegal, as it would be "within" the shower space. This "legal" installation is not safe.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 9-96.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-98 Log #1733 NEC-P09 **Final Action: Accept in Principle**
(404.4)

Submitter: Darryl Hill, Wichita Electrical JATC / Rep. IBEW LU 271
Recommendation: Revise text to read as follows:
404.4 Damp or Wet Locations. ~~A surface mounted switch or circuit breaker in a damp or wet location...".~~
(A) Surface-mounted Switch or Circuit Breaker. Shall be enclosed in a weatherproof enclosure or cabinet that shall comply with 312.2. ~~A flush mounted switch or circuit breaker in a damp or wet location.~~
(B) Flush-mounted Switch or Circuit Breaker. Shall be equipped with a weatherproof cover. ~~Switches shall not be installed within wet location in tub or shower spaces unless installed as part of a listed tub or shower assembly.~~
(C) Tub or Shower Space Switch. Switches shall not be installed within this location unless installed as part of a listed tub or shower assembly.
Substantiation: In the original text, there is some redundant language like "damp or wet location" that is repeated a couple of times. For clarity and usability, this section already tells us in the title that we are in a "Damp or Wet location". By adding "surface-mounted" and "flush-mounted" in the 2008 NEC, this paragraph is essentially about 3 different locations or switch/breaker installations and would be much clearer if this is separated into 3 first level subdivisions as shown above.
Panel Meeting Action: Accept in Principle
Revise text as follows:
404.4 Damp or Wet Locations.
(A) Surface-Mounted Switch or Circuit Breaker. A surface-mounted switch or circuit breaker ~~in a damp or wet location~~ shall be enclosed in a weatherproof enclosure or cabinet that shall comply with 312.2.
(B) Flush-Mounted Switch or Circuit Breaker. A flush-mounted switch or circuit breaker ~~in a damp or wet location~~ shall be equipped with a weatherproof cover.
(C) Switches in Tub or Shower Spaces. Switches shall not be installed within these ~~wet~~ locations ~~in tub or shower spaces~~ unless installed as part of a listed tub or shower assembly.
Panel Statement: The panel action revises the proposed text for compliance with the NEC Style Manual and meets the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-99 Log #1873 NEC-P09 **Final Action: Reject**
(404.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "where mounted in an enclosure as described in 404.3".
Substantiation: Where switches and circuit breakers are not mounted in enclosures, as permitted by Exception No. 2 for 404.3(A), the on and off position should be indicated.
Panel Meeting Action: Reject
Panel Statement: The open switches described in 110.27, as cited in the submitter's substantiation, need not be indicating if their position is obvious upon inspection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-100 Log #1896 NEC-P09 **Final Action: Reject**
(404.8(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "used as switches" in the first sentence.
Substantiation: Article 100 defines a circuit breaker as a device to open and close a circuit by nonautomatic (manual) means. Present wording infers there are instances where a circuit breaker is not a switch. Even if deemed not a switch, ready access to manually operated circuit breakers should be required.
Panel Meeting Action: Reject
Panel Statement: There are instances where circuit breakers are not being used as a switching means. Additionally, requirements for the accessibility of overcurrent devices are included in 240.24.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-101 Log #1158 NEC-P09 **Final Action: Accept in Principle**
(404.8(A) Exception No. 4 (New))

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action with the following revision:
"404.1 Scope. The provisions of this article apply to all switches, switching devices, and circuit breakers used as switches, operating at 600 volts, nominal, or less, unless specifically referenced elsewhere in the Code for higher voltages."
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add the following:
Exception No. 4: For equipment operating above 600V, location of switches shall be in accordance with 490.41.
Substantiation: 490.41(B) allows handles for infrequently operated devices over 600V to be located above the 2.0 m maximum elevation as long as they are safely operable and serviceable from a portable platform. There is some confusion among the AHJs as to whether the requirements of 490.41 supersede those of 404.8(A) for switches over 600V. Adding Exception No. 4 to 404.8(A) provides clarification.
Note: See companion proposal to 490.41(B).
Panel Meeting Action: Accept in Principle
Revise 404.1 to read as follows:
"The provisions of this article apply to all switches, switching devices, and circuit breakers used as switches, operating at 600 volts and below, unless specifically referenced elsewhere in the *Code* for higher voltages."
Panel Statement: CMP-9 agrees with the submitter that the switch height requirement for medium voltage systems should be covered in Article 490. When medium voltage applications were covered in Chapter 7, the provisions of 90.3 automatically resolved the sort of problem that arose in this case. Now that these rules have been moved to Chapter 4, inadvertent conflicts such as this may continue to crop up, and the suggested change in scope should restore the independence of Article 490 in these cases. CMP-9 recognizes that article scope statements are the province of the TCC and recommends this change. As part of this action, CMP-9 is reviewing the content of Article 404 and making correlating changes accordingly.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HARTWELL, F.: A preliminary review of provisions in Article 490 during the panel meeting did not raise any specific areas where additional correlating actions would be necessary. Comment is invited on this point.

9-102 Log #3242 NEC-P09 **Final Action: Reject**
(404.8(A) Exception No. 4 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows:
Exception No. 4: Switching devices identified for only automatic operation by temperature. Pressure, flow, movement, proximity, magnetism, light, and the like, shall not be required to be readily accessible.
Substantiation: Since 404.1 includes switching devices but no section except 404.15(B) specifically addresses them the requirement for switches must be assumed to apply.
Panel Meeting Action: Reject
Panel Statement: Although the devices cited in the substantiation have a switching function, they are not switches of the type defined in Article 100, and therefore not covered by the provisions of this article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-103 Log #1905 NEC-P09 **Final Action: Reject**
(404.8(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: A snap switch, dimmer, receptacle, pilot light, or other device, with exposed terminals, shall not be grouped or ganged in enclosures with other ~~snap switches, receptacles, or similar such~~ devices unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless the voltage between ~~adjacent devices~~ a device and the one next to it does not exceed 300 volts, or unless they are installed in enclosures equipped with identified securely installed barriers between such devices.
Substantiation: Edit. The provision should apply to devices other than snap switches with exposed terminals, which present the same hazard. “Adjacent” is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: There are devices that are equipped with wire leads without exposed terminals that are intended to be covered by this rule and that would be exempt under the terms of this proposal. In addition, the word “adjacent” is not vague and means exactly the same thing as the one next to it, so this does not improve the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-104 Log #2582 NEC-P09 **Final Action: Reject**
(404.8(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
A snap switch, receptacle, pilot light, push button and other such devices shall not be grouped.... (remainder unchanged.)
Substantiation: Edit. This provision should apply to other devices which may present a hazard.
Panel Meeting Action: Reject
Panel Statement: This proposal is not within the scope of Article 404. The section as worded is correct, because it states the requirement in terms of snap switches (which Article 404 does control) being located adjacent to other equipment. Note that 406.4(G) now contains the reciprocal requirements for receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-105 Log #3764 NEC-P09 **Final Action: Reject**
(404.8(B))

Submitter: Richard Shackelford, Clinton, OH
Recommendation: Revise text to read as follows:
404.8(B) Voltage Between Adjacent Devices. A snap switch shall not be grouped or ganged in enclosures with other snap switches, receptacles, or similar devices, unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts ~~or~~ unless they are installed in enclosures equipped with identified, securely installed barriers between adjacent devices or by other listed means.
Substantiation: The current language in 404.8(B) limits the method of providing a barrier to dividers designed for use in boxes to provide separation between devices. These dividers are normally field installed by being inserted in a slot or other means to form a separate compartment for a device. This proposal will recognize other listed methods that provide the equivalent level of protection. Additionally, if field conditions warrant the installation of a barrier and a box is not designed to have barriers installed, recognizing a listed means as an alternative, could be achieved with this proposal.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP-9 is not convinced that the product described in the illustrations that accompany this proposal is a satisfactory equivalent to a conventional barrier. The current code language does not limit the barrier to a divider inserted into a box. It does require that the barrier be “secure”, which means it must remain in place throughout its useful life.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-106 Log #3650 NEC-P09 **Final Action: Accept in Principle**
(404.8(C), FPN (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Add new text to read as follows:
FPN: See 210.7(B) for disconnect requirements when more than one circuit supplies a switch.
Substantiation: Listed or not, if you supply the switch with more than one circuit a means to simultaneously disconnect the ungrounded conductors must be provided on the line side of the switch per 210.7(B). Without this FPN many code users will miss this critical safety requirement.
Panel Meeting Action: Accept in Principle
Accept the proposal as written, but change “when” to “where”.
Panel Statement: The qualifying language is a condition of place and not time. CMP-9 agrees that the note is appropriate in this context.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-107 Log #4538 NEC-P09 **Final Action: Reject**
(404.9(B))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing text of the 2008 NEC as follows:
(**B) Provision for Grounding.** Snap switches, including dimmer and similar control switches, shall ~~be connected to an equipment grounding conductor and shall~~ provide a means to connect metal faceplates to the equipment grounding conductor, whether or not a metal faceplate is installed. ~~Snap switches shall be considered to be part of an effective ground-fault current path if either of the following conditions is met:~~
~~(1) The switch is mounted with metal screws to a metal box or metal cover that is connected to an equipment grounding conductor or to a nonmetallic box with integral means for connecting to an equipment grounding conductor.~~
~~(2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.~~
~~Exception to (B): Where no means exists within the snap-switch enclosure for connecting to the equipment grounding conductor or where the wiring method does not include or provide an equipment grounding conductor, a snap switch without a connection to an equipment grounding conductor shall be permitted for replacement purposes only. A snap switch wired under the provisions of this exception and located within reach of earth, grade, conducting floors, or other conducting surfaces shall be provided with a faceplate of nonconducting, noncombustible material or shall be protected by a ground-fault circuit interrupter.~~
Substantiation: This proposal intends to move the installation requirements for grounding switches to Article 250 under the jurisdiction of CMP-5. The construction requirements are appropriate to remain in Article 410.
Panel Meeting Action: Reject
Panel Statement: The grounding provisions for snap switches should remain in Article 404. These devices are self-contained and, unlike receptacles, they do not provide a portal for a quasi branch-circuit extension beyond the device in the form of a cord. These requirements have been in this location for many code cycles, and users are accustomed to finding them in their current location. Note also the discussion and panel actions in this cycle regarding Proposals 9-110 and 9-111 for examples of where grounding rules become complicated by the design of some current styles of snap switches with novel internal constructions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-108 Log #2581 NEC-P09 **Final Action: Accept in Principle**
(404.9(B) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
A snap switch wired under this provisions of this exception and located within ~~reach~~ 2.5 m (8 ft) vertically or 1.5 m (5 ft) horizontally of ground or exposed grounded metal shall be provided with a faceplate of nonconducting noncombustible material with nonmetallic attachment screws unless the switch mounting strap or yoke is nonmetallic or ~~shall be~~ the circuit is protected by a ground-fault circuit interrupter.
Substantiation: “Within reach” is subjective. Nonmetallic attachment screws (nylon for example) for the faceplate should be required for metallic switch straps.
Panel Meeting Action: Accept in Principle
Accept the proposal as written but add the word “objects” after the words “or exposed grounded metal”.
Panel Statement: CMP-9 wishes to keep the construction of this provision parallel to the wording in 250.110(1).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-109 Log #499 NEC-P09 **Final Action: Reject**
(404.9(B) Exception to (B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Insert a hyphen between "circuit" and "interrupter" in the second sentence.
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: The lack of a hyphen is consistent with Article 100 and the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-110 Log #245 NEC-P09 **Final Action: Accept in Principle**
(404.9(B) Exception No. 2 (New))

Submitter: Douglas R. Burrell, Cheetah USA Corp.
Recommendation: Add new text to read as follows:
<u>Exception No. 2: Where a listed snap switch comprised of a non-metallic, non-conductive plastic yoke exists, with no means of fastening a metal faceplate and provisions of 250.148 are met, the equipment grounding conductor shall not be required to be terminated at the snap switch.</u>
Substantiation: It is clear that the entire intent and assumptions of 404.9 are in relation to a metal yoke and the potential assembly of a metal faceplate that could become energized and introduce a safety hazard to consumers. Every inspector and electrician we have talked with acknowledges this interpretation and rationale for grounding the snap switch (due to metal yokes). Metal yokes have been the norm for 40+ years.
With the introduction of a plastic yoke, with its inherit safety features (plastic cannot become energized), we request a provisional consideration that would allow properly listed (UL 20 Standards Approved through a Recognized NRTL) snap switches that have a plastic yoke and that do not provide any means of fastening a standard screw-based wall plate (thus not allowing a metal wall plate to be fastened) be considered safe for installation without use of the grounding connector. This provision does not recommend and/or suggest that the grounding means required in 250.148 be eliminated, but that the termination of such grounding means not be required for this unique plastic yoke snap switch. The grounding means should always be available and accessible in the outlet box and properly grounded for replacement purposes or installation of metal yoke devices. Our request is only in consideration of a specifically listed and marked device where the assumptions set forth for metal yoked snap switches do not apply.
We would present the following evidences for your consideration:
1. The plastic yoke snap switches have no holes/means to attach a standard screw wall plate.
2. The plastic yoke is clearly marked, "for use with Cheetah non-metallic faceplates only" as per the NRTL laboratory (ETL) specification (UL20) documentation. (See Listing Report).
3. The provided Dielectric Test Report conducted by Intertek (ETL) Laboratory where 5000 Volts were applied directly to the plastic yoke snap switch with no dielectric breakdown.
4. The plastic yoke snap switch has been approved and installed in over 35 states with full local jurisdiction and state-wide approval. Most jurisdictions approve immediately when presented samples and documentation - due to the self-evident aspects of the plastic yoke with the statement, "how do you ground plastic?".
5. Every electrical board that has allowed us to properly present our products with substantive evidences of our safety features have approved the installation of the non-grounded snap switches. See samples of some of the electrical board approval documents.
6. The plastic yoke snap switches have been installed across the nation for over 4 years without any incident of safety or hazard concerns to consumer.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
The present exception becomes "Exception No. 1 to (B)." Reword the exception as follows: "Exception No. 2 to (B): Listed snap switches equipped with nonmetallic yokes and faceplates, where the plate cannot be installed on any other type of snap switch, shall not be required to be connected to an equipment grounding conductor."
Panel Statement: This wording is more economical. Section 250.148 applies whether or not this exception is used. The limitation on other types of faceplates is taken from the recommendation that is part of Proposal 9-111.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HARTWELL, F.: This exception may require further tightening at the December meetings. The submitting manufacturer offers an accessory that "Converts Cheetah Box to Standard Screw Box." Subtle changes in wording, or even wholesale reconsideration, may be required to assure that a metal faceplate will not be used at a future time to replace the nonmetallic faceplate that was in place at the time of inspection. No jurisdiction known to this panel member requires permits and inspections in connection with changing a faceplate, which is the reason for the present rule. This product was turned down for listing by a major testing laboratory for this reason, however, the manufacturer then went to another testing laboratory and got a different result, leading, apparently, to this proposal that has the effect of legitimizing the end result. Comment on the part of those who actually install this product and the accessories thereto is invited.
OSBORNE, R.: While continuing to "accept in principle", the panel should consider modifications to the panel action to address the following concerns: (1) The proposal is specific to snap switches, consideration should be given to whether the exception should apply to all devices identified in the parent rule (including dimmers and similar control switches), (2) Require the device and cover plate to be listed as a kit or assembly - this mirrors the requirement in 406.4(D) for receptacle/faceplate combinations and is consistent with the panels intent that the yoke be designed to interface with a unique faceplate, (3) Include additional verbiage to ensure the yoke does not have mounting means to mount faceplates not provided as part of the listed assembly (i.e. the yoke should not be provided with threads to accept 6-32 screws for the mounting of traditional faceplates), (4) Limit the exception to those devices with all parts accessible after installation to be manufactured of nonmetallic materials (i.e., the switch operator should not be metallic), and (5) Revision to 404.12 to address the renumbering of the existing exception. These changes are incorporated in the following alternative text:
<u>"404.9(B) - Exception No. 2: Listed kits or listed assemblies shall not be required to be connected to an equipment grounding conductor if all of the following conditions are met:</u>
<u>(1) The device is provided with a nonmetallic faceplate that cannot be installed on any other type of device,</u>
<u>(2) The device does not have mounting means to accept other configurations of faceplates,</u>
<u>(3) The device is equipped with a nonmetallic yoke, and</u>
<u>(4) All parts of the device that are accessible after installation of the faceplate are manufactured of nonmetallic materials."</u>
404.12, last sentence, should read as follows: "Except as covered in 404.9(B), Exception <u>No. 1</u>, nonmetallic boxes for switches shall be installed with a wiring method that provides or includes an equipment grounding conductor."

9-111 Log #725 NEC-P09 **Final Action: Accept in Principle**
(404.9(B) Exception No. 2 and 3 (New))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise numbering of existing Exception to (B) and add new text to read as follows:
404.9 Provisions for General-Use Snap Switches.
(A) Faceplates. *[unchanged by this Proposal]*
(B) Grounding. Snap switches, including dimmer and similar control switches, shall be connected to an equipment grounding conductor and shall provide a means to connect metal faceplates to the equipment grounding conductor, whether or not a metal faceplate is installed. Snap switches shall be considered to be part of an effective ground-fault current path if either of the following conditions is met:
(1) The switch is mounted with metal screws to a metal box or metal cover that is connected to an equipment grounding conductor or to a nonmetallic box with integral means for connecting to an equipment grounding conductor.
(2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.
Exception <u>No. 1</u> to (B): Where no means exists within the snap-switch enclosure for connecting to the equipment grounding conductor or where the wiring method does not include or provide an equipment grounding conductor, a snap switch without a connection to an equipment grounding conductor shall be permitted for replacement purposes only. A snap switch wired under the provisions of this exception and located within reach of earth, grade, conducting floors, or other conducting surfaces shall be provided with a faceplate of nonconducting, noncombustible material or shall be protected by a ground-fault circuit interrupter.
<u>Exception No. 2 to (B): A snap switch with integral enclosure complying with 300.15(E) shall be permitted.</u>
<u>Exception No. 3 to (B): Listed kits or assemblies encompassing a snap switch without a connection to an equipment grounding conductor and nonmetallic faceplates that cover the snap switch, where the plate cannot be installed on any other snap switch, shall be permitted.</u>
Substantiation: Proposed *Exception No. 2* is necessary to reconcile correlation issues. In accordance with 300.15(E), 334.30(C), 545.10, 550.15(I) *Exception*, 551.47(E) *Exception No. 1*, and 552.48(E) *Exception No. 1*, receptacles AND SWITCHES of the boxless type are Listed and can be used in installations. These switches incorporate integral nonconductive (nonmetallic) faceplates and inherently cannot interchange faceplates, metal or otherwise. Contrary to this requirement, there is absolutely no point in providing a means to connect a metal faceplate to the equipment grounding conductor, or even to connect the switch itself where there is no feed-through to switched equipment having no need to be grounded.
Similarly, there are Listed switches that are restricted by design to accepting proprietary faceplates of a mounting configuration available only in nonconductive, nonmetallic materials, and, vice versa, these faceplates are only

capable of being mounted to this switch. The wording for *Exception No. 3* parallels that of *NEC*® 406.4(D) *Exception* for receptacles, adapted for snap switches.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Accept the first proposed exception worded as follows: "Exception No. 3 to (B): A snap switch with integral nonmetallic enclosure complying with 300.15(E) shall be permitted without a connection to an equipment grounding conductor." Take no action on the second proposed exception.

Panel Statement: The substance of the second proposed exception has been incorporated in principle, relying on the wording developed in the panel action in Proposal 9-110 as a new Exception No. 2. The first proposed exception (which becomes Exception No. 3) has been reworded to clarify exactly what is being permitted.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

OSBORNE, R.: See comment on Proposal 9-110.

9-112 Log #3604 NEC-P09 **Final Action: Accept**

(404.9(C))

Submitter: Brian E. Rock, Hubbell Inc.

Recommendation: Revise text to read as follows:

404.9 Provisions for General-Use Snap Switches.

[404.9(A) and 404.9(B) unchanged by this Proposal]

(C) Construction. Metal faceplates shall be of ferrous metal not less than 0.76 mm (0.030 in.) in thickness or of nonferrous metal not less than 1.02 mm (0.040 in.) in thickness. Faceplates of insulating material shall be noncombustible and not less than 2.54 mm (~~0.010~~ 0.100 in.) in thickness, but they shall be permitted to be less than 2.54 mm (~~0.010~~ 0.100 in.) in thickness if formed or reinforced to provide adequate mechanical strength.

Substantiation: Errata (multi-Edition).

These values were last balanced during the Clinton administration [1999 *NEC*®, 380-9(c)]. These US units of measure have been running a deficit, however, throughout the Bush administration [2002, 2005, 2008 *NEC*®, 404.9(C)].

0.10 in. = 2.54 mm, as indicated in 1999 *NEC*®.

380-9(c) in 1999 *NEC*® = 404.9(C) in 2002, 2005, 2008 *NEC*®

However, 2.54 mm ≠0.010 in., as indicated in 2002, 2005, 2008 *NEC*®. A 90% shortfall!!

Restoring the balance of values is the Change We Need!

CAN/CSA C22.2 No 42.1 • ANSI/UL514D, Cover Plates for Flush-Mounted Wiring Devices, 4.3.2.2 Exception No 2, 4.3.2.3 Exception No 2, 4.3.2.6 Exception, 4.3.2.7 Exception, 4.3.2.8.1 Exception, and 4.3.2.9.1 Exception already reflect the corrected value.

Panel Meeting Action: Accept

Panel Statement: Although the panel action is to accept the proposal to correct a typographical error, it does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-113 Log #4470 NEC-P09 **Final Action: Accept in Principle**

(404.9(N))

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Revise text to read as follows:

[404.9] **(B) Grounding. "**Where constructed with exposed conductive surfaces, s~~S~~nap switches, including dimmer and similar control switches, shall be connected to an equipment grounding conductor and shall provide a means to connect metal faceplates to an equipment grounding conductor, whether or not a metal faceplate is installed...".

Substantiation: Switches are currently available that are manufactured using plastic mounting straps, and there is no practical reason to connect these devices to the equipment grounding conductor as there is no exposed conductive surface that is likely to become energized in an insulation or equipment failure event. This has confused some AHJs regarding the enforcement of this section of the code. By accepting this proposed change, clarity of code intent and enforceability will both be enhanced.

Panel Meeting Action: Accept in Principle

See the panel actions on Proposals 9-110 and 9-111.

Panel Statement: See the panel statements on Proposals 9-110 and 9-111.

Number Eligible to Vote: 12

9-114 Log #3890 NEC-P09 **Final Action: Reject**

(404.10(C))

Submitter: Ted "Smitty" Smith, Electrical Experts Consulting

Recommendation: Add new text as follows:

404.10(C) Exposed Terminals. Switches shall be enclosed so that energized wiring terminals are not exposed to contact.

Substantiation: This was proposal 9-97 Log #2778 for the 2008 NEC and the panel rejected the proposal and in their comments made wording suggestions which may be more acceptable and accomplish the intent of the proposal. I have made those wording changes. I believe this change will help keep electricians and other safer from electrical shock, especially in those circumstances where covers are removed for painting or other things and the circuits have not be de-energerized.

Panel Meeting Action: Reject

Panel Statement: CMP-9 rejected this in the 2008 cycle with the following statement: "All exposed terminals are required to be in an enclosure with covers and plates installed. This is a design option that can be addressed in the field where necessary. There is no technical substantiation to support the need for requirements to anticipate the level of misuse anticipated by the submitter." CMP-9 reaffirms this statement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-115 Log #3294 NEC-P09 **Final Action: Reject**

(404.11)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete: "in the event of a power failure".

Substantiation: Manual operation capability should not be limited to occasions of power failure.

Panel Meeting Action: Reject

Panel Statement: Although such switches will normally be operable with or without power available, the minimum requirement for safety, which is the purpose of this rule, is that these switches be additionally operable with the power off.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-116 Log #2555 NEC-P09 **Final Action: Reject**

(404.11, FPN)

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481 IBEW

Recommendation: Revise as follows:

404.11 FPN...240.83(D)

Substantiation: Only 240.83(D) applies to switched circuit breakers.

Panel Meeting Action: Reject

Panel Statement: A circuit breaker used as a switch needs to comply with all of 240.83, not only 240.83(D).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-117 Log #2297 NEC-P09 **Final Action: Accept in Principle**

(404.14(A)(1))

Submitter: John Marshall, Underwriters Laboratories Inc.

Recommendation: Article 404.14(A)(1) – Revised to

A form of general-use snap switch suitable only for use on ac circuits for controlling the following:

"(1) Resistive and inductive loads, including electric-discharge lamp~~s~~ ballasts, along with electronic ballasts and LED drivers for luminaires, not exceeding the ampere rating of the switch and at the voltage involved".

Substantiation: Current ratings of electronic ballasts and LED drivers are also to be used in determining the load for snap switches. "LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ.

Panel Meeting Action: Accept in Principle

Instead of accepting the proposed language, in the existing Code text, delete the phrase "including electric discharge lamps".

Panel Statement: CMP-9 agrees that the loads identified in the proposal are permissible. This rule was never intended to include a list of permitted applications, which are far more extensive than the ones covered in this proposal. Elimination of this phrase removes the implication that this rule limits its applicability in this way.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-118 Log #726 NEC-P09 **Final Action: Accept in Principle**
(404.14(F) (New))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text and a new Fine Print Note and revise the numbering cross-reference correspondingly to read as follows:
404.14 Rating and Use of Snap Switches.
Snap switches shall be used within their ratings and as indicated in 404.14(A) through ~~(E)~~(F).
FPN No. 1: For switches on signs and outline lighting, see 600.6.
FPN No. 2: For switches controlling motors, see 430.83, 430.109, and 430.110.
(F) Cord-and-Plug-Connected Loads. Where a snap switch is used to control cord-and-plug-connected equipment on a general-purpose branch circuit, each snap switch controlling receptacle outlets or cord connectors that are supplied by permanently connected cord pendants shall be rated at not less than the rating of the maximum permitted ampere rating or setting of the overcurrent device protecting the receptacles or cord connectors, as provided in Article 210.
FPN: See 210.50(A) and 400.7(A)(1) for equivalency to a receptacle outlet of a cord connector that is supplied by a permanently connected cord pendant.
Exception: Where a snap switch is used to control not more than one single receptacle outlet on a branch circuit, the switch shall be permitted to be rated at not less than the rating of the receptacle.
[remainder of 404.14 unchanged by this Proposal]
Substantiation: Many ASSUME that the circuit rating defines the switch's rating, but 404.14 says only that the switch shall be used within *its* rating. That works when the load is known and hard-wired. 404.14(A), 404.14(B) and 404.14(D) adequately define the switch current rating when that ONE, NONINTERCHANGEABLE load is hard-wired to the branch circuit. When the load is plug-and-cord-connected through a receptacle or cord connector on a cord pendant (i.e., INTERCHANGEABLE), however, the current rating requirements of that switch are incompletely defined by existing 404.14.
210.3 establishes that the branch circuit's current rating is based upon the "maximum permitted ampere rating or setting of the overcurrent device". 210.21(B) requires that the receptacle's rating is based on the circuit rating. Article 404 (404.14 in particular) is silent, however, on the current rating of the switch controlling a receptacle outlet and Article 210 offers no coordination of the switch rating with anything else.
Once the switch is installed, the USER canNOT see the current rating of the switch behind a cover plate, only the receptacle's configuration or the marked current rating of the overcurrent device at the panelboard, and could exceed the switch's current rating with another plug-and-cord-connected load, resistive, inductive or tungsten filament, by the USER.
You can't go by the plug configuration of the interchangeable, cord-and-plug-connected load to determine the ampere rating of the branch circuit. Some receptacle configurations accept either an attachment plug of the same current rating or of a LOWER current rating. 406.3(F) mandates noninterchangeability of receptacle outlet and plug configurations based on different voltages, frequencies, or services (ac versus dc) on the same premises, but NOT based on amperage or horsepower current rating. The most common examples are that non-locking-type 20-ampere, 125-volt (NEMA 5—20R) and 250-volt (NEMA 6—20R) receptacles will accept either non-locking-type 15- or 20-ampere, 125-volt (NEMA 5—15P or NEMA 5—20P) and 250-volt (NEMA 6—15P or NEMA 6—20P) plugs, respectively.
For a multioutlet branch circuit, you cannot establish the ampere rating of the circuit [210.19(A)(2)] based on the ampere rating (or the associated outlet configuration) of an INDIVIDUAL receptacle. For example per 210.21(B), 15-ampere receptacles (NEMA 5—15R) could be on either 15-ampere or 20-ampere branch circuits. Per 220.14(I), a switch controlling a multioutlet branch circuit could be controlling 13 outlets on a 20-ampere branch circuit rather than 10 outlets on a 15-ampere branch circuit. Consequently, the switch's rating must be based on the rating of the branch circuit rather than rating of the receptacle.
The one exception would be where the snap switch is "downstream" of any other receptacles on the multioutlet branch circuit and controls only one outlet of known ampere rating. This scenario includes a switch controlling one single receptacle, a switch controlling one outlet face of a split-wired duplex receptacle, or the outlet of a combination receptacle with integral switch [UL product category RUSZ, CSA International product class 6233-84], where there are no further feed-through termination to supply other receptacles.
Here's a real-world example cited to us by Electrical Inspector Bill DeVoe with the City of Aurora, Colorado:
Some electricians in his jurisdiction have started to install individual branch circuits for plug-and-cord-connected kitchen garbage disposals (single-phase, motor-driven load rated ½ horsepower, 120 V ac, having a NEMA 5—15P plug) using a 20 A single receptacle (NEMA 5—20R), 12 AWG wire and a 20 A circuit breaker.
These electricians want to know if a 15 A, 120 V ac switch is permissible on this branch circuit. These electricians assert that the enclosed undersink cabinet interior is a dedicated space with a single receptacle on an individual branch circuit and intended only for connection of the garbage disposal.
If you go by the garbage disposal's motor rating of ½ horsepower (120 V ac), *NEC*® Table 430.248 gives you a full load current of 9.8 A. For an ac-only snap switch controlling a motor load, 404.14(A)(3), 430.83(C)(2), and 430.109(C)(2) all indicate that 80% of a 15 A switch rating is 12 A. So the full load current of 9.8 A for this garbage disposal's motor load can be controlled by a 15 A switch. IF the garbage disposal were a HARD-WIRED load!
But if the garbage disposal is NOT hard-wired and instead is plug-and-cord-connected, then per 430.42(C) this is an Article 210 general-purpose branch circuit. The last sentence of NEC® 430.42(C) indicates that the 20 A receptacle determines the circuit rating (12 AWG wire and a 20 A circuit breaker).
The receptacle, nonetheless, IS accessible, the plug of the garbage disposal CAN be disconnected from the receptacle outlet, and the plug (15 A NEMA 5—15P or 20 A NEMA 5—20P) of another plug-and-cord-connected equipment (non-motor load or higher horsepower motor loads) COULD be connected to this receptacle outlet, even if on only a temporary basis. So, a 1900 W space heater (resistive load) could be plugged into the 20 A single receptacle on an individual branch circuit, drawing 16 A through that 15 A snap switch supposedly "dedicated" to that garbage disposal. Article 404 does NOT address what rating the switch must have, only that the INTERCHANGEABLE plug-in loads, like a hard-wired load, cannot exceed the UNVIEWABLE rating of the snap switch behind its cover plate.
NOTE: Although the above EXAMPLE uses a motor-driven appliance, this example could have been for any other type of load and equipment. This needs to be handled under Article 404, NOT under Article 422.
Panel Meeting Action: Accept in Principle
Accept the proposal as written; however, in the exception change "one single receptacle outlet" to "one receptacle".
Panel Statement: The words "One single receptacle outlet", as in the sense of a solitary receptacle outlet, could literally encompass a ten-gang box filled with receptacles, because that ten-gang box is a single point on the wiring system and meets the definition of receptacle outlet in Article 100. This was surely not the intent of this proposal as indicated in the substantiation. A receptacle is a single contact point, and therefore the correct wording to meet the submitter's intent is "one receptacle." For example, a duplex receptacle is two receptacles and exceeds the permission granted by this panel action.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-119 Log #886 NEC-P09 **Final Action: Reject**
(404.15 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add 404.XX
LOCATION. Switches shall not be installed in a face-up position in any countertop or horizontal surface.
Substantiation: A requirement similar to 550.13(F) is warranted.
Panel Meeting Action: Reject
Panel Statement: The referenced section in the substantiation, presumably intended to be stated as 550.13(F)(2), mirrors 406.4(E) and only applies to receptacles in countertops. More substantiation would be required to support a blanket prohibition on face-up mounting for all switches of any description in all locations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-120 Log #1042 NEC-P09 **Final Action: Reject**
(404.15 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
404.XX Switches and circuit breakers shall be listed and marked with the manufacturers name or identification and, voltage rating, and ampere or horsepower rating.
Substantiation: There does not appear to be such a general requirement for switches and circuit breakers except for switches covered by 404.14(C) and (D). Section 406.2 requires listing for receptacles, and switches are no less a critical part of wiring systems.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been presented that current industry practices are causing problems in the field. The proposed requirements for circuit breakers are beyond the scope of Article 404.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-121 Log #1144 NEC-P09 **Final Action: Reject**
(404.15 (New))

Submitter: Steven G. Waldman, Waldman Bros. Electric Inc.
Recommendation: Add text to read as follows:
Motion Activated On/Timed off Switches shall not be permitted in public places if they control area lighting.
Substantiation: The problem is that if you enter a public setting where these devices are used and you are out of range of the motion activated switch the lights will shut off, leaving you in the dark. This is unsafe if a person does not know his surroundings and could cause injury.
The specific reason for this proposal is that the above situation happened in a locker room of a YMCA where patrons have to find their way to get to the switches motion area to turn the lights back on.
Panel Meeting Action: Reject
Panel Statement: The proposal addresses a design consideration and not a code issue. No change in the NEC is required to address the issue.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-122 Log #1184 NEC-P09 **Final Action: Reject**
(404.15 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows:
404.XX Listing. Switches, circuit breakers and switching devices shall be listed.
Substantiation: Items critical to safety, including limit switches, pressure and similar switches should provide indication that listing protocols have determined a level of safety. Listing should be a general requirement not limited to 404.14 (D)(E).
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 9-120.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-123 Log #979 NEC-P09 **Final Action: Reject**
(404.15(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Switches shall be marked with the current type (ac or dc) maximum voltage and current rating, and if horsepower rated, the maximum, rating(s) at the applied voltage(s) ~~for which they are designed.~~
Substantiation: Edit. The type of current should be specified, also the maximum voltage and current, and the horsepower at the voltage employed.
Panel Meeting Action: Reject
Panel Statement: The present language, by referencing “current,” reaches both the amount of current and its type. The word “voltage” covers the voltage information requested in this proposal. Finally, the provision for horsepower is qualified by the statement “the maximum rating”, which covers the testing provisions encompassed in this proposal. No change in the NEC is required. The requested information is routinely available on presently available switch designs, and this is further evidence that no changes in the NEC need to be made.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-124 Log #3243 NEC-P09 **Final Action: Reject**
(404.19 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add new text as follows:
404.XX Switching devices identified only for automatic operation by temperature, pressure, flow, movement, light, proximity, magnetism, and the like shall not be required to be externally manually operable.
Substantiation: Since 404.1 includes switching devices but no section (except 404.15(B)) specifically addresses them the requirement for switches must be assumed to apply.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 9-102.

Ballot Results: Affirmative: 12

9-125 Log #4195 NEC-P09 **Final Action: Reject**
(404.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
404.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer’s self-evaluation or an owner’s engineering judgment.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, not time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: In the 2005 NEC cycle, CMP-9 considered a serious, official proposal from electrical equipment manufacturers to require all pull boxes to be listed. That proposal was rejected on the grounds that it was excessive to require a listing, especially on pull boxes that may be made in local sheet metal shops to meet specific dimensional requirements. This is the second time over the past few code cycles that CMP-9 has refused to require listings on this equipment. Another good example is 314.40(B), which does not require listings in contradistinction to 314.40(B) Exception No. 2 that does require listings. These distinctions were very carefully drawn by CMP-9 at the time they were made. Although these examples do not occur in the article under consideration, they illustrate an appropriate decision-making process.
The NEC process is a transparent, open process, fully subject to opportunities for public participation and comment. Proposals such as this have the effect of making thousands of amendments throughout the NEC, in this case removing “approved” and “identified” and substituting “listed,” all without going through the consensus process on the merits of the specific equipment applications involved. CMP-9 recommends that interested parties submit proposals for listing requirements for specific equipment as they deem necessary. The fact that this proposal allows for field evaluations by testing laboratories as a second method of product acceptance and delays the effective date until 2017 does not address these issues and is still excessive in many cases.
Number Eligible to Vote: 12

9-129 Log #4919 NEC-P09 **Final Action: Reject**
(404.19)

Submitter: Donald R. Cook, Shelby County Building Inspections
Recommendation: Add a new section 404.19 as follows:
404.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this options would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered Professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While Item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

Panel Meeting Action: Reject
Panel Statement: Because the terminology "such as" is open ended, item 3 of this proposal is tantamount to recognizing an AHJ's approval under 110.2 of equipment that could simply be approved or could be identified as defined in Article 100 or listed as defined in Article 100 and therefore does not add anything to the code.

Substantiation: Clarify wording as not to limit the use of exception.
Panel Meeting Action: Reject
Panel Statement: CMP-18 believes the proposal concerns 406(8)(B) Exception.
The submitter has given no reasoning to expand the limits of the exception. The existing wording is as intended. The submitter is encouraged to look at 4.3.3(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-10 Log #1191 NEC-P18 **Final Action: Reject**
(406.1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Scope. This article covers the rating(s), type(s) and installation of receptacles, cord connectors, ~~and~~ attachment plugs (cord caps) <u>and flanged surface devices</u>.
Substantiation: Edit. Flanged surface devices are also covered.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been given for adding "flanged surface devices." See panel action and statement on Proposals 18-3 and 18-4.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-11 Log #2427 NEC-P18 **Final Action: Reject**
(406.1(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
DEFINITION: <u>Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify when there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.</u>
Substantiation: If Power Safe Protector is accepted in 406 only, a definition will be needed. There is a proposal for Article 100 also.
Panel Meeting Action: Reject
Panel Statement: There is nothing in the current edition of the NEC that prohibits such a receptacle. The substantiation raises questions as to its specific applicability to the proposal.
A thorough study of overheating terminations and wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code.
Over the past several code cycles, much of the same incident data has been used to support AFCI proposals indicating that the incidents are the result of arcing faults on the interior wiring. In the last code cycle, this data was used to support a thermally protected receptacle indicating that the incidents resulted from overheated receptacle contacts or terminals. Now the claim is that the incidents are resulting from thermal overload.
Furthermore, PSPs do not contain downstream (feed through) power connection.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-12 Log #675 NEC-P18 **Final Action: Reject**
(406.2)

Submitter: Wendell Whistler, Whistler Consulting & Technical Services
Recommendation: Add new text to read as follows:
<u>Child-Care facilities.</u>
(i) "Child day care center" means a facility providing regularly scheduled care for a group of children one month of age through twelve years of age for periods less than twenty-four hours.
(ii) "School-age child care center" means a program operating in a facility other than a private residence accountable for school-age children when is not in session.
(iii) "Family child day care home" means the same as "family child care home" and "a child day care facility" located in the family abode of the person or persons under whose direct care and supervision the child is placed, for the care of twelve or fewer children, including children who reside at the home.
Substantiation: Due to the concentration of children in these facilities and the ratio of supervision adults/children this would provide the same level of protection as is being accomplished in dwelling units.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
It is not clear what the proposal is intended to accomplish.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Attachment plugs, ~~and~~ cord connectors, and flanged surface devices shall be... (remainder unchanged).
Substantiation: Flanged surface devices should be included.
Panel Meeting Action: Reject
Panel Statement: The proposal provides no technical data supporting substantiation for adding flanged surface devices. See panel action and statement on Proposal 18-10.
This section applies to receptacles and other female contact devices and does not apply to attachment plugs or flanged surface devices.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-18 Log #1901 NEC-P18 **Final Action: Reject**
(406.2(B) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: Exception: Where a lower rating is permitted by 410.30(C)(2).
Substantiation: Edit. The lower rating permitted by 410.30(C)(2) (125%) of luminaire current) may be less than 15 amperes.
Panel Meeting Action: Reject
Panel Statement: The proposal provides no technical data supporting the substantiation. The panel believes the reference 410.30(C)(2) in the proposal is to a section in the 2005 edition of the NEC. The reference in the 2008 NEC would be 410.62(C)(2).
In either case, receptacles are not permitted to be rated less than that shown in 406.2(B). They may be a lower rating than the branch circuit; but they cannot be lower than required by 406.2(B).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-19 Log #2428 NEC-P18 **Final Action: Reject**
(406.3(D)(2))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
(D) Replacements.
(2) ~~Ground-Fault Circuit-Interrupters~~ Power Safe Protector. ~~Ground-fault circuit-interrupter~~ Power safe protector ~~protected~~ receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this Code.
Substantiation: A person can receive a serious shock when coming into contact with the blades of a partially inserted plug, or when plugging in faulty equipment or wiring, even with GFCI protection. Fires start as faulty appliances are not detected. Additional fires start when loose receptacle supply connections overheat and ignite nearby flammable material. These fires represent a leading cause of electrical fires in homes.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
There are several proposals made to require Power Safe Protectors throughout the code. Their approval would make it a needed change here.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-11.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-20 Log #500 NEC-P18 **Final Action: Reject**
(406.3(D)(3))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Insert a hyphen between “circuit” and “interrupter” in the first sentence in (b) and in two places in (c).
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: The panel believes the reference is incorrect and should be 406.3(D)(3)(c).
In this instance, the use of “ground-fault circuit-Interrupter” is a noun and therefore the lack of a hyphen is correct according to the NEC Style Manual. See Annex B of the NEC Style Manual.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-21 Log #2384 NEC-P18 **Final Action: Reject**
(406.3(D)(3))

Submitter: David G. Humphrey, Midlothian, VA
Recommendation: Add text to read as follows:
406.3(D)(3) Non-Grounding Type Receptacles. Where attachment to an equipment grounding conductor does not exist in the receptacle enclosure, <u>and cord and plug connected equipment required to be connected to an equipment grounding conductor is not intended to be used,</u> the installation shall comply with (D)(3)(a), (D)(3)(b), or (D)(34)(c).
Substantiation: The addition of the statement <u>*and cord and plug connected equipment required to be connected to an equipment grounding conductor is not intended to be used*</u> makes clear that the replacement methods described in 406.3(D)(3)(a), (b), and (c) do not provide a grounding means required by 250.114 for specific equipment and appliances. The current language may induce the user to conclude that the permissions given in 406.3 are absolute, especially with regard to protecting a circuit by the use of a ground-fault circuit interrupter. The marking of “No Equipment Ground” is often negated by the false perception that the shock hazard protection provided by a ground-fault circuit interrupter meets the requirement of 250.114. Placement of a GFCI type receptacle with no connected equipment grounding conductor per 406.3(B) or (C) at the intended location of the laundry equipment for example, invites the use of such equipment with a result of the appliance not being grounded. Adaptors and the like may prove to be unreliable especially with the expanded use of non-conductive water pipe in recent years.
The current provisions would allow a non-grounding type receptacle to be replaced with a gfci-protected receptacle at the obvious location of a refrigerator with no violation occurring until the appliance is plugged in. Adding the wording suggested, directs the installer to the installation of an equipment grounding conductor as detailed in 250.130(C) and provides the Inspector with a method of determining that the requirements of 250.114 are met when these non-grounding type receptacles are replaced in locations where appliances and equipment requiring grounding are intended to be used.
Panel Meeting Action: Reject
Panel Statement: The current code indeed anticipates supplying cord and plug-connected equipment (with a grounding plug cap) from a GFCI receptacle that is not connected to earth ground as allowed by the present text. A GFCI receptacle without a connection to earth ground is a safer alternative than a grounding receptacle without connection to earth ground when used as a replacement for a two-wire receptacle. CMP-18 notes that when a GFCI is installed as permitted by this section, a special label is required noting that there is no connection to earth ground.
This change would require the installer and AHJ to determine intent. This is impossible and impractical. See 3.2.1 of the NEC Style Manual.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-22 Log #2429 NEC-P18 **Final Action: Reject**
(406.3(D)(3))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
(3) Non-Grounding-Type Receptacles. Where attachment to an equipment grounding conductor does not exist in the receptacle enclosure, the installation shall comply with (D)(3)(a), (D)(3)(b), or (D)(3)(c).
(a) A non-grounding-type receptacle(s) shall be permitted to be replaced with another non-grounding-type receptacle(s).
(b) A non-grounding-type receptacle(s) shall be permitted to be replaced with a ~~ground-fault-circuit-interrupter~~ <u>power safe protector</u> type of receptacle(s). These receptacles shall be marked “No Equipment Ground.” ~~An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter receptacle to any outlet supplied form the ground-fault circuit-interrupter.~~
(c) ~~A non-grounding type receptacle(s) shall be permitted to be replaced with a grounding type receptacle(s) where supplied through a ground-fault circuit-interrupter. Grounding type receptacles supplied through the ground-fault circuit-interrupter shall be marked “GFCI Protected” and “No Equipment Ground.” An equipment grounding conductor shall not be connected between the grounding type receptacles.~~
Substantiation: A person can receive a serious shock when coming into contact with the blades of a partially inserted plug, or when plugging in faulty equipment or wiring, even with GFCI protection. Fires start as faulty appliances are not detected. Additional fires start when loose receptacle supply connections overheat and ignite nearby flammable material. These fires represent a leading cause of electrical fires in homes.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a “Power Off” safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.

Ballot Results: Affirmative: 11

18-23 Log #2966 NEC-P18 **Final Action: Reject**
(406.3(D)(3))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise as follows:
406.3 General Installation Requirements.
Receptacle outlets shall be located in branch circuits in accordance with Part III of Article 210. General installation requirements shall be in accordance with 406.3(A) through (F).
[406.3(A) through 406.3(C) unchanged by this Proposal]
(D) Replacements. Replacement of receptacles shall comply with 406.3(D)(1), (D)(2), and (D)(3) as applicable.
[406.3(D)(1) and 406.3(D)(2) unchanged by this Proposal]
(3) Non–Grounding-Type Receptacles. Where attachment to an equipment grounding conductor does not exist in the receptacle enclosure, the installation shall comply with (D)(3)(a), (D)(3)(b), ~~or~~ (D)(3)(c)<u>, or (D)(3)(d)</u>.
(a) A non–grounding-type receptacle(s) shall be permitted to be replaced with another non–grounding-type receptacle(s).
(b) A non–grounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s). These receptacles shall be marked “No Equipment Ground.” An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.
(c) A non–grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Grounding-type receptacles supplied through the ground-fault circuit interrupter shall be marked “GFCI Protected” and “No Equipment Ground.” An equipment grounding conductor shall not be connected between the grounding-type receptacles.
<u>(d) A non–grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where connections shall be as indicated in 250.130(C).</u>
[remainder of 406.3 unchanged by this Proposal]
Substantiation: Correlation issue and usability of the *Code*. Section 406.3(D)(3) recognizes the requirements of 406.3(D)(3)(a), 406.3(D)(3)(b), and 406.3(D)(3)(c) as ALTERNATIVES for the replacement of existing nongrounding receptacles, but NOT the requirements of Section 250.130(C) as another equally viable ALTERNATIVE. As the 2008 *NEC*® is presently structured, if a nongrounding receptacle is replaced by a grounding receptacle, the requirements of BOTH Section 250.130(C) AND Section 406.3(D)(3)(c) appear to apply to the grounding replacement, rather than EITHER 250.130(C) OR 406.3(D)(3)(c). By contrast, 382.10(A) more correctly recognizes the requirements of Section 250.130(C) as another ALTERNATIVE to the requirements of 406.3(D)(3)(b) and 406.3(D)(3)(c). [The requirements of 406.3(D)(3)(a) are not applicable to Article 382’s CNE wiring method.]
Panel Meeting Action: Reject
Panel Statement: This is already addressed in 406.3(D)(1).

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-24 Log #3467 NEC-P18 **Final Action: Accept in Principle**
(406.3(D)(3) (New))

Submitter: John I. Williamson, Maple Grove, MN
Recommendation: Add text to read as follows:

Create a new section 406.3(D)(3). Renumber existing 2005 NEC section 406.3(D)(3) to 406.3(D)(4) and so on for all subsequent existing sections.

(3) Tamper-Resistant Receptacles. Listed tamper-resistant receptacles shall be provided where replacements are made at receptacle outlets that are required to be tamper-resistant elsewhere in this Code.

Substantiation: Unless otherwise required in 406.3(D), it is presumed that tamper-resistant receptacles are only required to be installed at new receptacle outlet locations in existing occupancies where a receptacle outlet previously was not installed. For existing occupancies with existing receptacles, if it was the intent of the NEC to require the existing non-tamper-resistant receptacles to be replaced with tamper-resistant receptacles, the NEC needs to be properly correlated to reflect that requirement.

Panel Meeting Action: Accept in Principle

406.3(D)(3) to read as follows:

(3) Tamper-Resistant Receptacles. Listed tamper-resistant receptacles shall be provided where replacements are made at receptacle outlets that are required to be tamper-resistant elsewhere in the code.

Renumber subsequent sections.

Panel Statement: The submitter mistakenly asked for this change to the 2005 NEC code text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-25 Log #4539 NEC-P18 **Final Action: Reject**
(406.3(D)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the text of the 2008 NEC to read as follows:

(3) Non–Grounding-Type Receptacles. If ~~Where attachment to~~ an equipment grounding conductor does not exist in the receptacle enclosure, and the manufacturers' installation instructions for utilization equipment or appliances to be supplied from the receptacle do not require the equipment to be connected to an equipment grounding conductor, the installation shall be permitted to comply with (D)(3)(a), or (D)(3)(b)~~, or (D)(3)(c)~~.

(a) A non–grounding-type receptacle(s) shall be permitted to be replaced with another non–grounding-type receptacle(s).

(b) A non–grounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s) of the non-grounding type. These receptacles shall be marked "No Equipment Ground." An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.

~~(c) A non–grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Grounding-type receptacles supplied through the ground-fault circuit interrupter shall be marked "GFCI Protected" and "No Equipment Ground." An equipment grounding conductor shall not be connected between the grounding-type receptacles~~.

Substantiation: This section, as written, creates a conflict with 110.3(B) in that many small appliance manufacturers require their equipment be connected to an equipment grounding conductor. Section 110.3(B) requires that equipment be installed and used in compliance with instructions included in the listing. Installing a receptacle without an equipment grounding conductor connection violates that section and manufacturer's instructions. In addition, this section is in conflict with 250.4(A)(5) as a low-impedance ground-fault return path is not being provided. Section 250.114 requires many cord-and-plug appliances to have an equipment grounding conductor connected. The existing language in 406.3(D)(3) violates those rules.

In addition, the present language in 406.3(D)(3)(c) creates a possibly hazardous condition as the user of the grounding type receptacle has a reasonable expectation that an equipment grounding path is provided when a grounding type receptacle is installed. In essence, the practice of installing a grounding type GFCI without an equipment grounding conductor connected creates a "trap" of sorts. Since a ground-fault return path is not provided, a ground-fault in an appliance will simply energize the metal frame of the appliance waiting for the unsuspecting user (often a homeowner) to complete the fault return path by contacting the faulted appliance and a grounded appliance or ground-fault return path. The owner provides the test path for the GFCI device! This hardly seems appropriate!

If that isn't bad enough, recent published data from UL indicates nearly 10 percent of the existing GFCI devices tested as a part of the Aging Wiring Study would not operate properly. IAEI published an article several years ago that showed a significant number of GFCI devices tested by home inspectors would not function properly. Hardly the sort of reports needed to instill confidence in the technology!

The proposal suggests a non-grounding type GFCI could be used for replacement purposes but not serve in place of an equipment grounding conductor. An non-grounding GFCI would provide GFCI protection but without the indication of a grounding path being provided when in fact the grounding terminal is not connected at all.

These receptacles often supply electronic equipment that relies on the connection to the equipment grounding conductor for safety. These receptacles are often referred to as having a "phantom ground." The NEC should not allow this unsafe practice and should remove the conflict with other sections.

Present Section 250.130 provides a practical means of installing an equipment grounding conductor if one does not exist at the receptacle outlet. Granted, this may not be as convenient as installing a GFCI device but should provide a safe installation.

Panel Meeting Action: Reject
Panel Statement: There is no GFCI receptacle of the non-grounding configuration. Reference to aging wiring statistics of GFCIs not operating properly is being taken out of context. The non-operating GFCI statistics includes miswiring and other incorrect installation details.

The requirement of the label stating "No Equipment Ground" is intended to warn the user of the fact that a grounding connection does not exist in the circuit and to take proper precautions.

The proposal introduces a concept that is totally unenforceable. The AHJ would be required to know what equipment may be supplied by a receptacle and the manufacturer's installation instructions for the equipment.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-26 Log #599 NEC-P18 **Final Action: Accept in Principle**
(406.3(D)(4))

Submitter: Teri Dwyer, Wyoming, MN
Recommendation: Add new text as follows:

(4) Tamper Resistant Receptacles. Where replacements are made at receptacle outlets located in dwelling units, Tamper Resistant Receptacles shall be provided as required by 406.11.

Substantiation: The statistics used for the 2008 NEC requirement of 406.11 came from existing dwellings by majority. The cost difference between a standard residential receptacle and a Tamper Resistant Receptacle is minimal, less than one dollar. This requirement will reduce the risk of children being injured in existing dwellings.

18-29 Log #3148 NEC-P18 **Final Action: Reject**
(406.3(D)(4) (New))

Submitter: Steven R. Montgomery, 2D2C Inc.
Recommendation: Add new text to read as follows:
Electrical-Fault Circuit-Interrupter.
Electrical Fault Circuit Interrupter protected receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this *Code*.
Substantiation: Resistive heating and arcing faults ignite most of the major residential electrical fires. Resistive heating faults ignite 59% of the fires, in spite of branch circuit over-current protection (see "Electrical Ignition Causes of Fires in Ontario 2002-2007," Electrical Safety Authority (ESA) report, 2008). The latest code enhancements, including Arc Fault Circuit Interrupters (per UL Std. 1699), are not designed to protect against resistive heating from current flowing through poor branch circuit connections (high resistance points), overloaded appliances and open neutral conditions. New homes may have aged and potentially faulty appliances, extension cords and lighting fixtures brought in by homeowners. The 2006 NFPA report titled "Selected Residential Electrical Fires" indicates these faults have resulted in numerous fire fatalities.
Electrical Fault Circuit Interrupter (EFCI) technology is designed to provide primary protection against resistive heating ignition mechanisms including high resistance points in branch circuit wiring (cause of 23% of residential electrical fires, per the attached ESA 2008 report), appliance overloads (cause of 17% of the electrical fires), and open neutral conditions (cause of 2% of the electrical fires). EFCI also provides supplementary protection against overloaded circuits (cause of 7% of the electrical fires) and insulation damage that leads to arc tracking (cause of 7% of the electrical fires). A large portion of residential electrical ignitions are caused by resistive heating that cannot be protected by branch circuit overcurrent devices but can be protected by EFCI.
EFCI protection must be located at the junction between the load and branch circuit wiring to detect these faults and cannot be located at the panelboard. EFCI technology is a superior approach compared all relevant alternatives. (see "Alternatives to Electrical Fault Circuit Interrupter (EFCI) Technology", Wayne Hartill, 2D2C Inc., 2008.)
The complete protection of EFCI technology has been previously referred to as the combination of Overload Fault Circuit Interrupter (OFCI) and Power Fault Circuit Interrupter (PFCI) technologies. For simplicity, OFCI and PFCI technologies have been renamed Electrical Fault Circuit Interrupter (EFCI). Some previous documentation refers to the old nomenclature.
Two Fact Finding Reports from independent NRTL's substantiate the performance of EFCI technology. (see "Descriptive Report and Test Results", Todd Hamden, CSA International, Feb 2006 & "Descriptive Report and Test Results", Intertek Testing Services NA Ltd., Jan 2006). A third NRTL Fact Finding Report has been request from Underwriters Laboratories (UL).
Products containing EFCI technology have NRTL certification against UL 498 and UL 498A standards and have been available for sale in the marketplace since 2006. Multiple producers of EFCI technology exist in the marketplace. With a mandate more producers will likely enter the marketplace.
A mandate of EFCI technology is required because the net safety benefit to society is far greater than that of voluntary sales alone.
Please review submitted letters of support from the following fire forensics experts including:
● Vytenis Babrauskas, Ph.D., President of Fire Science and Technology Inc. and author of the "Ignition Handbook".
● John S. Robison, President of Robison Forensic Consulting, previously Alabama State Fire Marshal, and previous President of International Fire Marshals Association.
● Chris W Korinek, P.E., President of Synergy Technologies and author of Chapter 10 of "Kirks Fire Investigation" book.
● Doug Crawford, Deputy Fire Marshal of the Ontario Office of the Fire Marshal.
Note that multiple sister proposals have been submitted as a new 100, 210.50(C), 406.3(D)(4) and 550.13(A)(4).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The substantiation is insufficient in several respects. The several Fact Finding Reports submitted by CSA and Intertek confirm the performance characteristics of the product. No information or data has been presented to define the specific characteristics of the various hazards claimed to be mitigated by this product. No product standard has been offered against which a product can be evaluated to ensure that it safely mitigates the identified hazards and does so without adverse interaction with other products within the wiring system. Further, while incident data was presented and discussed, it is unclear exactly what incremental increase this product could offer without duplicating protective measures already required by this code. The NEC does not currently prohibit installation of these devices.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-30 Log #3561 NEC-P18 **Final Action: Accept in Principle**
(406.3(D)(4) (New))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Add a new list item to 406.3(D) as follows:
406.3(D)
(4) Arc-Fault Circuit Interrupters. Arc-Fault circuit-interrupter protected receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this *Code*.
Substantiation: The NEC presently addresses receptacle replacement in 406.3(D). This proposal seeks to expand the present receptacle replacement requirements to include arc fault protected receptacles where required elsewhere in the NEC. The existing requirement in 406.3(D)(2) requires GFCI protected receptacles where replacements are made at receptacle outlets that are required to be so protected elsewhere in the NEC. There is no practical reason to limit the level of safety provided by AFCI's to new homes only.
The benefits of 210.12 have been well substantiated over the last few NEC cycles, but it is highly unlikely that the fire-reducing provisions of 210.12 will ever result in AFCI protection for existing dwelling units unless branch-circuit circuit breakers are replaced or the service is upgraded. There is no practical reason to limit the level of safety provided by an AFCI to new homes only. This proposal will provide that extra protection for older homes by requiring the gradual replacement, over time, of non-AFCI-protected receptacles with new AFCI-protected ones.
Panel Meeting Action: Accept in Principle
Add a new (4) to 406.3(D) as follows:
406.3(D)
(4) Arc-Fault Circuit-Interrupters. Listed combination arc-fault circuit-interrupter receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this code.
Exception: Unless the receptacle is protected by an upstream AFCI.
Panel Statement: CMP-18 edited the proposed text for clarity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
LOWRANCE, JR., A.: The panel in accepting this proposal has not taken into account the magnitude of this new requirement. In requiring the replacement receptacle, in areas required to be Arc Fault Circuit Interrupter protected, to be an AFCI receptacle type the panel is, in a large amount of the cases, requiring the circuit to be completely rewired. Many older houses have circuits with shared neutrals, multi wire branch circuits, loose connections, and degraded insulation. In all of these cases the wiring would have to be replaced for the AFCI receptacle to function. Additionally the homeowner would be tempted to do the replacement his or her self thus bypassing the electrical installation professional who is acquainted with the hazards inherent in such installations.
Enforceability is an additional issue in this change as again the homeowner would be tempted to do the work his or her self without taking advantage of the benefits that an inspection can provide.
We need more experience to be obtained regarding the installation of combination type AFCIs in new dwellings before requiring the installation of AFCIs in wide variety of existing dwellings that will have numerous different wiring configurations."
TODD, S.: The replacement of the receptacle on a circuit with the Combo AFCI receptacle will only protect the circuit down stream from the AFCI from parallel and series arcs and upstream from series arcs. The Submitter's substantiation is to make a requirement similar to the receptacle replacement where GFCI receptacles are required elsewhere in the code. The justification did not include any documented problems in the field of a safety concern. Many receptacles are replaced by homeowners who may or may not replace the receptacle with and AFCI type receptacle. This proposed requirement is

unenforceable. The committee discussed the operational issues of combining the AFCI technology with old construction. In addition, if the circuit is protected by an AFCI type circuit breaker then a standard receptacle is acceptable.

Comment on Affirmative:

COSTELLO, P.: The new requirement will now provide AFCI protection to those receptacles in older homes where it would be required today. This is a proactive approach to providing extra protection to a homes aging wiring system.

WELLS, J.: I am voting affirmatively because I believe the submitter has appropriately endeavored to address the problem of electrical fires in existing dwellings. Data indicates that a very significant portion of electrical fires, in fact, occur is such older homes.

During the comment period, I encourage the submitter and others to address what I consider flaws in the wording as Accepted in the panel action. First, the wording should allow AFCIs of either the circuit breaker or outlet branch circuit type to be used in a non discriminatory way for compliance. Second, I am not certain that replacement of an individual receptacle should serve as the trigger for requiring AFCI protection in existing buildings. Alternative triggers should be considered and proposed during the comment period.

18-31 Log #3857 NEC-P18 **Final Action: Accept in Principle**
(406.3(D)(4))

Submitter: Bill McGovern, City of Plano

Recommendation: Add new text as follows:

<u>(4) Tamper-Resistant Receptacles. Tamper-resistant receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in the *Code.*</u>

Substantiation: Substantiation brought forth by CPSC (ROP 18-40) for the 2008 NEC revealed the high number of injuries to small children from inserting metal objects into receptacle outlets. Many first time home buyers are younger individuals moving into existing dwellings that have or will have young children in the future. As a minimum existing dwelling being either bought or sold usually receive a fresh coat of paint, along with new device outlets and luminaires. Requiring tamper-resistant outlets at the time of replacement will insure child safety for many more years to come.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-24.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-32 Log #4715 NEC-P18 **Final Action: Accept in Principle**
(406.3(D)(4) (New))

Submitter: Robert P. McGann, City of Cambridge

Recommendation: (D)(4) to be added and referenced in first paragraph:

<u>(D)(4) Receptacles in dwelling units must be tamper resistant as referenced in 406.11.</u>

Substantiation: It is obvious that this is the next logical safety step in the expansion of tamper resistant receptacle requirements. This is in light of the documentation that brought 406.11 into the Code.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-24.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-33 Log #3847 NEC-P18 **Final Action: Accept**
(406.3(D)(5))

Submitter: Bill McGovern, City of Plano

Recommendation: Add new text as follows:

<u>(4) Weather-Resistant Receptacles. Weather-resistant receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in the *Code*.</u>

Substantiation: Without the requirement for weather-resistant receptacles to be installed at the time of replacement, ordinary receptacles will be installed and subjected to the same failures as the receptacles they were replacing in the first place.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-34 Log #4912 NEC-P18 **Final Action: Accept in Principle**
(406.3(D)(5))

Submitter: James T. Dollard, Jr., IBEW Local 98

Recommendation: Add a new list item to 406.3(D) as follows:

406.3(D)

<u>**(5) Tamper Resistant.** Tamper resistant receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this *Code.*</u>

Substantiation: The NEC presently addresses receptacle replacement in 406.3(D). This proposal seeks to expand the present receptacle replacement requirements to include tamper resistant receptacles where required elsewhere in the NEC. The existing requirement in 406.3(D)(2) requires GFCI protected receptacles where replacements are made at receptacle outlets that are required to be so protected elsewhere in the NEC. There is no practical reason to limit the level of safety provided by tamper resistant receptacles to new homes only.

The inclusion of 406.11 in the 2008 NEC was well substantiated.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-24.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-35 Log #3889 NEC-P18 **Final Action: Reject**
(406.3(G))

Submitter: Ted “Smitty” Smith, Electrical Experts Consulting

Recommendation: Add new text as follows:

<u>Safeguarding of Termination Screws. Receptacles shall be installed in a manner that protects the termination screws, break of tabs, or other leads that are welded to the receptacle from accidental contact with persons and tools after installation.</u>

Substantiation: This was proposal 18-17 Log #2779 for the 2008 NEC and the panel rejected the proposal based primarily on three factors. 1. There was not listed device that could accomplish this, 2. Break off tabs and other areas of exposure were not addressed and 3. There was some fear that this cold encourage persons to work on devices while energized. A listed device is now available. Shockguard. I have addressed the break off tabs and other termination points. The intent of this change was not encourage persons to work on devices while energized. Circuits should be de-energized prior to working on them. This proposal is intended to address the situations when non-qualified personnel removed device covers to paint for example. This is often done even though it should not be done. When we know that something is done regularly and this action creates a safety hazard should we make corrections to the installation practices to minimize this hazard. The CMP originally believed that it should not be left up to the AHJ to determine what was suitable. I believe that is is within in the responsibility of the AHJ to make just those types of judgment calls when enforcing the NEC.

Panel Meeting Action: Reject

Panel Statement: There is nothing in the code that would prohibit the use of this product.

The product should not be required since it validates improper installation (i.e., cover plate removed) and endorses an unsafe practice of working on a receptacle when energized. Additionally, Article 590, temporary installations during construction, remodeling, maintenance, repair, or similar activates requires GFCI for personnel protection. This product should not be used as a substitute for GFCI protection.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-36 Log #3897 NEC-P18 **Final Action: Reject**
(406.4(B))

Submitter: Ronald Standley, E Light Electric Services

Recommendation: Add new text as follows:

<u>Exception No. 1: Where metal cover plates are installed, receptacles shall be mounted such that the ground pin opening is above the hot and neutral openings.</u>

Substantiation: If multiple failing conditions are encountered (i.e., plug not fully inserted, metal cover loosens, etc.) it is possible that the metal cover could contact the hot conductor creating a short circuit and a fire hazard.

Panel Meeting Action: Reject

Panel Statement: This proposal is not substantiated with incident data indicating burn or electrocution exposure or the circumstances surrounding such incidents.

Additionally, the proposal only addresses receptacles installed in a vertical plane. How does one insure in a receptacle mounted on a horizontal surface that the ground pin opening is above the hot and neutral openings?

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-37 Log #556 NEC-P18 **Final Action: Reject**
(406.4(E))

Submitter: Joe Riley, City of Arlington
Recommendation: Revise text as follows:
(E) Receptacles in Countertops and Similar Work Surfaces ~~in Dwelling Units~~ **or Floor Surfaces.** Receptacles shall not be installed in a face-up position in countertops ~~or~~ and similar work surfaces~~.~~ or floor surfaces.
Exception: Receptacles mounted in or on floor surfaces that are designed and listed as an assembly for the purpose.
Substantiation: The change helps to clarify the requirements for receptacle installations in or on floor surfaces in a face-up position. Obvious hazards are present when loose debris can fall into open blades of a receptacle and which can create a short circuit from use regardless of whether the receptacle is in a dwelling or other than dwelling countertop or floor surface.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide sufficient technical substantiation to support expanding this requirement to other than dwelling units and does not provide technical substantiation to support the recommendation as is required by 4-3.3(d) of the NFPA Regulations Governing Committee Projects.
CMP-18 also refers the submitter to 314.27(C).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-38 Log #2230 NEC-P18 **Final Action: Reject**
(406.4(E))

Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Revise text to read as follows:
Receptacles shall not be installed in face up position in countertops or similar work surfaces or under cabinets.
Substantiation: Receptacles installed face up under a kitchen sink cabinet, for a disposal or instant hot, have the potential of cleaners or other chemicals normally stored under a sink leaking or being spilled into a receptacle that could be a potential fire hazard.
Panel Meeting Action: Reject
Panel Statement: No data or incident evidence was provided to substantiate the need for this proposal.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-39 Log #2387 NEC-P18 **Final Action: Reject**
(406.4(E))

Submitter: Jamie McNamara, Hastings, MN
Recommendation: I put a strike through deleted text.
406.4(E) Receptacles in Countertops and Similar Work Surfaces ~~in Dwelling Units~~.
Substantiation: This requirement should not be limited to dwellings.
Panel Meeting Action: Reject
Panel Statement: No data or incident evidence was provided to substantiate the need for this proposal.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-40 Log #305 NEC-P18 **Final Action: Reject**
(406.4(F) (New))

Submitter: Eldon E. Jewson, Stantec Consulting
Recommendation: Add new Section 406.4(F) and move existing (F) to (G), move (G) to new Section (H).
406.4(F) Receptacles. Receptacles shall not be concealed above a dropped or suspended ceiling.
Substantiation: See National Electrical Code Section 400.8(5).
If flexible cords cannot be installed above a dropped or suspended ceiling, it then follows that receptacles should not be permitted above a dropped or suspended ceiling as well. Receptacles are specified on plans to be mounted above dropped t-bar or suspended ceilings on countless plans submitted to the AHJ for approval. This practice violates 400.8(5).
Panel Meeting Action: Reject
Panel Statement: The receptacle located above a dropped or suspended ceiling serves as a convenience outlet for a repairman to plug in tools while working in the drop or suspected ceiling. Extension cords are not a permanent wiring method.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-41 Log #1166 NEC-P18 **Final Action: Accept**
(406.5)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add a second paragraph as follows:
Receptacle faceplates mounted inside a box having a recess-mounted receptacle, shall effectively close the opening and seat against the mounting surface.
Substantiation: Boxes are provided with recess-access to receptacles mounted therein. The faceplates/cover plates for these receptacles necessarily must fit the inside dimensions of the box. A small tolerance is required, maximum 1/32 inch, to facilitate installation of the cover plate. The recessed design and the very small opening provide the necessary degree of safety against access to live parts. The term “effectively closed” is used in 110.12(A) to express the intent of the requirement, but to recognize the need for some tolerance in application of the requirement. The language in the existing text in 406.5 is absolute and does not afford listing standards any tolerance in applying the requirement. I don’t believe that the present text envisioned recess-mounted receptacles.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-42 Log #1895 NEC-P18 **Final Action: Reject**
(406.6(A), (B), and (D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A), delete “and cord connectors”.
Revise texts: (B): Attachment plugs shall be installed so that their prongs, blades, or pins are not energized unless inserted into an energized receptacle, cord connector, or flanged surface outlet. (remainder unchanged).
(D) A flanged surface inlet shall be installed such that the prongs, blades or pins are not energized unless inserted into an energized cord connector. ~~Is inserted into it.~~
Substantiation: In (A), cord connectors do not have exposed prongs, blades, or pins.
In (B), attachment plugs may be used with cord connectors and flanged surface outlets.
In (D), it is more accurate to indicate the prongs, blades, or pins are inserted into the cord connector.
Panel Meeting Action: Reject
Panel Statement: The substantiation of (A) is correct but misses the intent of prohibiting any exposed current carrying part other than the prongs, blades, or pins. Surely the submitter is not advocating having energized contacts or terminals of connectors exposed.
For the the substantiation of (B), see panel action and statement on Proposal 18-3.
Regarding (D), flanged surface inlets are affixed and are unable to physically move. An energized cord connector can be moved and inserted into a flanged surface inlet.
Additionally, the proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-43 Log #1408 NEC-P18 **Final Action: Reject**
(406.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Receptacles, cord connectors and ~~attachment plugs~~ flanged surface outlets shall be so constructed that they ~~receptacles or cord connectors do not accept~~ are not compatible with an attachment plug with a ~~different~~ higher voltage or current rating from that for which the ~~device is~~ they are rated.
Delete the last sentence.
Substantiation: Flanged surface outlets should be included. The word “different” should be changed to “higher” and makes the penultimate sentence superfluous. The last sentence is superfluous, as nongrounding type receptacles inherently do not accept grounding type attachment plugs with a fixed grounding member.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-44 Log #2688 NEC-P18 **Final Action: Reject**
(406.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:

Receptacles, cord connectors ~~and~~ attachment plugs, <u>and flanged surface devices</u> shall be constructed such that <u>these devices</u> ~~receptacles or cord connectors~~ will not accept <u>other such devices</u> ~~an attachment plug~~ with a <u>higher</u> ~~different~~ voltage or current rating from that for which the device is <u>rated</u> ~~intended~~. ~~However a T slot receptacle or cord connector shall be permitted to accept a 15-ampere attachment plug of the same voltage rating.~~ Non-grounding type receptacles, <u>cord connectors, and flanged surface outlets</u> shall not accept grounding type attachment plugs.

<u>*Exception: Non-grounding type receptacles, cord connectors, and flanged surface outlets shall be permitted to accept a grounding type attachment plug with a movable self-restoring grounding pole on circuits operating at 150 volts, or less.*</u>

Substantiation: Flanged surface devices should be included. "Different" should be changed to "higher" since plugs and receptacles may be used on circuits of lower rating than the devices and there is no hazard. Proposed exception correlates with 406.9 and makes the reference to a T-slot receptacle unnecessary.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-45 Log #2068 NEC-P18 **Final Action: Reject**
(406.8)

Submitter: Robert D. Osborne, Underwriters Laboratories Inc.
Recommendation: 406.8 Receptacles in Damp or Wet Locations.

(A) Damp Locations. A receptacle installed outdoors in a location protected from the weather or in other damp locations shall have an enclosure for the receptacle that is weatherproof when the receptacle is covered (attachment plug cap not inserted and receptacle covers closed).

An installation suitable for wet locations shall also be considered suitable for damp locations.

A receptacle shall be considered to be in a location protected from the weather where located under roofed open porches, canopies, marquees, and the like, and will not be subjected to a beating rain or water runoff. All 15- and 20-ampere, 125- and 250-volt nonlocking receptacles shall be a listed weather-resistant type <u>unless they are part of a listed assembly that has an environmental rating suitable for outdoor applications</u>.

FPN: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15, and 6-20 in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles.

(B) Wet Locations.
(1) 15- and 20-Ampere Receptacles in a Wet Location. 15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted. All 15- and 20-ampere, 125- and 250-volt nonlocking receptacles shall be listed weather-resistant type <u>unless they are part of a listed assembly that has an environmental rating suitable for outdoor applications</u>.

FPN: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15, and 6-20 in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles.

Exception: 15- and 20-ampere, 125- through 250-volt receptacles installed in a wet location and subject to routine high-pressure spray washing shall be permitted to have an enclosure that is weatherproof when the attachment plug is removed.

Substantiation: Current wording of Section 406.8 is appropriate for installation of receptacles in damp or wet locations that are not part of listed assemblies. Listed products with integral receptacles, such as power outlets, have an overall assembly environmental rating that is based off product Standard requirements intended to protect receptacles from the environmental conditions. Reliance on the listed product Standard is appropriate to verify acceptability for such use.
Panel Meeting Action: Reject
Panel Statement: Even as part of a listed assembly the receptacles must be listed and identified weather resistant type if used in a damp or wet location. The inclusion here makes the standard for the products include this requirement.

The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

HEWITT, L.: Discussions at the panel meeting indicated a concern with what constituted a "listed assembly", since a factory assembly of an outlet box, receptacle, and cover plate could be considered a "listed assembly", and considered suitable without weather-resistant type receptacles. The submitter identifies listed products such as power outlets. Applying the weather resistant requirement to receptacles to power outlets or similar types of devices may not be supported by the original substantiation, and could form the basis for a modified proposal and additional substantiation during the comment period. The submitter should consider revised wording and additional substantiation to be submitted during the comment period.

18-46 Log #2885 NEC-P18 **Final Action: Reject**
(406.8)

Submitter: James Steven Bryan, Bryan Electrical Inspector PC
Recommendation: Revise text to read as follows:

Exception 15- and 20-ampere, 125- through 250-volt receptacles installed in a wet location and subject to routine high pressure spray washing shall be permitted to have an enclosure that is weatherproof when the attachment plug is removed, disconnected, and closed <u>prior to washing</u>.

Substantiation: The exception gives permission to routine spray wash with equipment plugged in and the enclosure is weatherpoof only when the attachment plug is removed. The revised exception requires the equipment to be disconnected before spray wash.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The exception does not deal with the act of spray washing. It only specifies what type of enclosure is permitted to be installed in a location where spray washing routinely takes place.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-47 Log #4718 NEC-P18 **Final Action: Reject**
(406.8(A))

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Revise text as follows:

All 15 and 20 ampere, 125 and 250 volt ~~non-locking~~ receptacles shall be listed weather resistant

Substantiation: These receptacles are susceptable to the same corrosive atmospheres.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-48 Log #4858 NEC-P18 **Final Action: Reject**
(406.8(A) and (B))

Submitter: John Steinke, Amish Electric
Recommendation: Delete this sentence from both sections:

"All 15- and 20-ampere 125- and 250-volt, nonlocking receptacles shall be a listed weather-resistant type."

Substantiation: These requirements either address an issue already addressed by the NEC, or are better served in other forums.

Section 110.11 of the NEC already requires requires that all equipment be suitable for the environment. Testing agencies already have sundry tests and requirements for equipment to be used in wet locations. Unlike 406.8, this section applies to ALL equipment, not just a few types of receptacles.

406.8 (A), by including the 'weather resistant' language, has the effect of requiring damp locations to be treated as though they were wet locations. This reverses decades of treating damp locations as though they were dry locations.

Nor does the language address other devices and enclosures in these damp, or wet, locations.

If we are already required to use 'wet location' receptacles in wet locations, and the materials are not standing up, then we need to address the testing of equipment for wet locations. Manufactures' standards, or testing agency protocols, are where this issue ought to be addressed - not in the NEC.

If improper equipment is being installed in wet locations, than we are not enforcing an existing requirement.
Panel Meeting Action: Reject
Panel Statement: These sections of the NEC provide the basis for new requirements in the product standard for more robust resistance to corrosion for receptacles intended for use in these locations.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-49 Log #4722 NEC-P18 **Final Action: Reject**
(406.8(A) and 406.8(B)(1))

Submitter: Matthew A. Piantedosi, B.A. Piantedosi, Jr., Master Electrician
Recommendation: Revise to read as follows: All 15- and 20-ampere, 125- and 250-volt nonlocking receptacles shall be a listed weather-resistant type.
Substantiation: The UL standard for weather-resistant GFCI receptacles does not recognize the damage of the internal circuit board due to humidity and condensation. I am proposing that the standard be revised to include circuit board protection against condensation. This type of protection is currently being used in ECM motors.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided a proposed change.
The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-50 Log #3616 NEC-P18 **Final Action: Reject**
(406.8(B))

Submitter: Jeffrey A. Duehlmeyer, City of Des Moines
Recommendation: Add new text to read as follows:
All enclosures that are weatherproof whether or not the attachment plug cap is inserted shall be metal hinged.
Substantiation: I'm an electrical inspector for the City of Des Moines. A common product problem we encounter is the weatherproof enclosures we require for receptacles located in wet locations are either broken or partially missing leaving the receptacle exposed to the weather. This only occurs when plastic covers are being used. Metal covers have never been a problem.
Panel Meeting Action: Reject
Panel Statement: CMP-18 recommends that the problem stated should be addressed in the product standard, not the installation standard.
Also, see the panel action and statement on Proposal 18-54 as well as the substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-51 Log #4717 NEC-P18 **Final Action: Reject**
(406.8(B))

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Revise text as follows:
All 15 and 20 ampere, 125 and 250 volt ~~nonlocking~~ receptacles shall be listed weather-resistant.
Substantiation: These receptacles are susceptible to the same corrosive atmospheres.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-52 Log #1198 NEC-P18 **Final Action: Reject**
(406.8(B)(3) (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add (3) as follows:
(3) Cord Connectors. A cord connector or flanged surface device shall be identified for the use.
Substantiation: These devices in wet locations should be identified for the use.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-53 Log #1298 NEC-P18 **Final Action: Reject**
(406.8(B)(3) (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add (3):
<u>Cord connectors and flanged surface devices installed in a wet location shall be identified for the use.</u>
Substantiation: Edit. Reliance should not be solely on 110.2, 110.3, and 110.11.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
The proposed revision is not considered editorial.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-54 Log #3732 NEC-P18 **Final Action: Accept in Principle**
(406.8(B)(1))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 406.8(B)(1) as follows:
(1) 15- 20-Ampere Receptacles in a Wet Location.
15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug is inserted. <u>For other than one or two family dwellings,</u> <u>an outlet box hood when installed for this purpose shall be listed and where installed on an enclosure supported from grade as described in Section 314.23(B) or as described in Section 314.23(F), shall be identified as "extra-duty".</u> All 15- and 20-ampere, 125- and 250-volt non-locking receptacles shall be listed weather-resistant type.
<u>FPN: Requirements for extra-duty outlet box hoods are found in ANSI/UL 514D, *Cover Plates for Flush-Mounted Wiring Devices*.</u>
Substantiation: The purpose of this proposal is to require outlet box hoods that are part of a weatherproof enclosure to have "extra duty" durability when the enclosure is mounted on an independent free standing post, stanchion, pillar, conduit, metal, polymeric, wood brace, or other rigid support.
The durability of presently listed outlet box hoods provided for compliance with the requirements in Section 406.8(B)(1) has been called into question by an increasing number of inspection authorities. NEMA manufacturers of these outlet box hoods have proposed more rigorous performance requirements in UL 514D to improve the general durability of all listed hoods. However, the inspection authorities that have been consulted during NEMA's investigation have indicated that outlet box hoods in particular installations are more susceptible to damage. Among these are temporary installations in wet locations such as construction jobsites. With enclosures supported from grade as described in Section 314.23 (B) and enclosures with enclosed devices supported as described in Section 314.23 (F). 15 and 20 ampere, 125 and 250 volt receptacles installed in such "free standing" enclosures in a wet location are presently required to comply with the requirements in Section 406.5 (B) but are often subject to greater physical abuse.
This proposal, and the companion proposal in Section 590.4(D) recognize that more durable products already exist that will help ensure that the degree of protection for receptacles envisioned by the requirement in 406.8(B) will be retained in these harsher use environments. Requirements for listed "extra-duty" outlet box hoods are under development in UL 514D.
Panel Meeting Action: Accept in Principle
Revise 406.8(B)(1) as follows:
(1) 15- 20-Ampere Receptacles in a Wet Location.
15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug is inserted. <u>For other than one- or two-family dwellings,</u> <u>an outlet box hood when installed for this purpose shall be listed and where installed on an enclosure supported from grade as described in 314.23(B) or as described in 314.23(F) shall be identified as "extra-duty".</u> All 15- and 20-ampere, 125- and 250-volt non-locking receptacles shall be listed weather-resistant type.
<u>FPN: Requirements for extra-duty outlet box hoods are found in ANSI/UL 514D, *Cover Plates for Flush-Mounted Wiring Devices*.</u>
Retain existing FPN and Exception.
Panel Statement: CMP-18 agrees with the submitter's text and clarifies that the existing FPN and exception are to be retained.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-55 Log #176 NEC-P18 **Final Action: Reject**
(406.8(B)(2)(a))

Submitter: Tommy Young, Commonwealth of Kentucky
Recommendation: Add:
For commercial and industrial shall use aluminum die-cast in use cover.
Substantiation: Due to heavy usage.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-56 Log #1299 NEC-P18 **Final Action: Reject**
(406.8(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Receptacles, cord connectors, and flanged surface devices shall not be within or directly over a bathtub, hot tub, spa, or shower stall.
Substantiation: Edit. Cord connectors and flanged surface devices should be included; "tub" should include hot tubs and spas, not just bathtubs.
Panel Meeting Action: Reject
Panel Statement: The proposed revision is not considered editorial; cord connectors and flanged devices are not part of the installed premise wiring. Rules concerning receptacles with respect to hot tubs and spas are covered by other articles in this code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-57 Log #2254 NEC-P18 **Final Action: Reject**
(406.8(C))

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector
Recommendation: Add new and delete text to read as follows:
(C) Bathtub and Shower ~~Space~~ Areas. No receptacles shall be located within a zone measured 900 mm (3 ft) horizontally and 2.5 m (8 ft) vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the space directly over the tub or shower stall.
Substantiation: The intention for this new text is to clarify the hazard that a receptacle could bring to these areas. 410.10(D) does not allow the use of certain types of luminaries and paddle fans near these areas. By extending the requirement to receptacles, the AHJ would ease the interpretation regarding "bathtub and shower area" instead of "bathtub and shower space". I have provided pictures of certain examples that I have encountered in the field.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: All bathroom receptacles are required to be grounded and protected by a GFCI. This is the primary protection from shock hazards. Were the proposed text to be accepted, a number of bathrooms would not be able to have any receptacles installed because even those adjacent to the sink would be within 3 feet of the tub.
This would create a conflict with 210.52(D) and would lead to the use of extension cords from adjacent rooms where GFCI protection is not present and result in a greater hazard.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-58 Log #1894 NEC-P18 **Final Action: Reject**
(406.9(A), (B), and (D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise texts: (A) Grounding type receptacles, cord connectors, ~~and~~ attachment plugs, adapters, and, flanged surface devices shall be provided with...(remainder unchanged).
(B) Grounding type receptacles, cord connectors, ~~connections and~~ attachment plugs, and flanged surface devices shall have a mean...(remainder unchanged).
Revise (D): Grounding type attachment plugs, and flanged surface inlets ~~and cord connectors and receptacles~~ shall be designed such that the grounding connection is made before the current-carrying connections. Grounding type devices shall be so designed that grounding poles of attachment plugs and flanged surface inlets cannot be brought into contact with current-carrying parts of receptacles or cord connectors.
Substantiation: Flanged surface devices should be included. The design of the grounding pole or plugs and surface inlets determines that the grounding connection is made first, not the design of the receptacle, cord connector, or flanged surface outlet.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-59 Log #236 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Sprague Owings, Nassau County, FL
Recommendation: Add new text to read:
406.11 Daycare and Kindergarten Receptacles. Receptacles located within the rooms, bathrooms, playrooms, activity rooms and play yards of daycare centers and kindergarten classrooms shall be listed tamper resistant or shall employ a listed tamper resistant cover.
Substantiation: This is already required in pediatric locations in health care facilities and will be required in residences as of 2008.
Panel Meeting Action: Reject
Panel Statement: The proposal as written would eliminate the requirement for tamper-resistant receptacles in Dwelling units. No substantiation was provided to support this proposal.
The proposal would also introduce listed tamper-resistant covers. CMP-18 is not aware of such a product. See panel action and statement on Proposal 18-90 for daycare facilities.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-60 Log #554 NEC-P18 **Final Action: Accept in Principle in Part**
(406.11)

Submitter: Joe Riley, City of Arlington
Recommendation: Add new text as follows:
406.11 Tamper-Resistant Receptacles ~~in Dwelling Units~~
(A) Dwelling Units. In all areas specified in 210.52, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper resistant receptacles.
(B) Other Than Dwelling Units. In all public areas where children are predominately present, such as daycares, classrooms, churches, restaurants, restrooms, bathrooms, playrooms, activity rooms, playgrounds, swimming pools, and as described in 517.18 (C), all 125-volt, 15- and 20-ampere receptacles shall be listed tamper resistant receptacles.
Substantiation: Extending the areas required for the installation of tamper resistant receptacles to other than dwelling units where children are predominately present will prevent electrical shock hazards and help to safeguard children.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: CMP-18 accepts the recommendation concerning "daycares." CMP-18 considers daycare to be a subset of childcare facilities. See panel action and substantiation on Proposal 18-90.
CMP-18 rejects the balance of the proposal for lack of definition and substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-61 Log #674 NEC-P18 **Final Action: Accept in Principle**
(406.11)

Submitter: Wendell Whistler, Whistler Consulting & Technical Services
Recommendation: Revise text to read as follows:
406.11 Tamper-resistant Receptacles in Dwelling Units and Child-Care Facilities. In all areas specified in 210.52, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles in day-care facilities.
Substantiation: Due to the concentration of children in these facilities and the ratio of supervision adults/children, this would provide the same level of protection as is being accomplished in dwelling units.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and substantiation on Proposal 18-90.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-62 Log #727 NEC-P18 **Final Action: Accept in Principle**
(406.11)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
406.11 Tamper-Resistant Receptacles in Dwelling Units.
In all areas specified in 210.52, all 125-volt, 15- and 20-ampere nonlocking receptacles shall be listed tamper-resistant receptacles.
Substantiation: "In all areas specified in 210.52" addresses not only the receptacle outlet REQUIRED to be present but also ANY additional, optional receptacles also located in those same areas. Based on the injury data cited in Proposal 18—40 for the 2008 *NEC*®, the requirement is warranted for any and all 125-volt, 15- and 20-ampere NONLOCKING receptacles. The requirement, however, is not limited to all 125-volt, 15- and 20-ampere NONLOCKING receptacles. In some AREAS specified in 210.52, some of the receptacles are mandated to be of the LOCKING type; these may be rated 125-volt, 15- and 20-ampere. There are no known 125-volt, 15- or 20-ampere LOCKING receptacles Listed as tamper-resistant receptacles.
Permanently installed pools and their associated water-pumps can be located inside or outside of dwellings. 210.52(A) identifies areas such as sunrooms, recreation rooms, etc. 210.52(E) identifies outdoor outlets. 210.52(G) identifies basement and garage areas. 680.22(A)(1)(1) requires that receptacles supplying cord-and-plug-connected water pumps for permanently installed pools be of the LOCKING-type configuration. These LOCKING receptacles are frequently rated 125-volt, 15- or 20-amperes. Often, these pool-pump receptacles are located in the outdoor areas adjacent to dwellings. For some dwellings, these pool-pump receptacles are within the dwelling's interior.
Events such as wedding receptions and fund-raisers held at residences (large ones, outside my pay grade) may fall under Article 525. 525.23(B) requires use of locking receptacles for quick disconnection and reconnection of electrical equipment not required to be provided with GFCI protection for personnel.

This could include electrical equipment rated 125-volt, 15- or 20-amperes.

Proposal 18—40 did not specifically identify that LOCKING receptacles were amongst the injuries in the cited NEISS and CHIRPP reports and it is unlikely these were.

Panel Meeting Action: Accept in Principle

Add text to read as follows:

406.11 Tamper-Resistant Receptacles in Dwelling Units.

In all areas specified in 210.52, all nonlocking type 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

Panel Statement: CMP-18 clarified that nonlocking applies to both 15- and 20-ampere receptacles and added "type" for clarity.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-63 Log #1734 NEC-P18 **Final Action: Accept in Principle**
(406.11)

Submitter: Bryan Walter, Wichita Electrical JATC

Recommendation: Revise text to read as follows:

406.11 Tamper-Resistant Receptacles. ~~in Dwelling Units.~~

<u>(A) In Dwelling Units.</u> In all areas specified in 210.52, all 125-volt, 15 and 20-ampere receptacles shall be listed tamper-resistant receptacles.

<u>(B) Other Than Dwelling Units. In all areas designated for children or similar areas, all 125-volt, 15 and 20-ampere receptacles that are accessible to children shall be listed tamper-resistant receptacles.</u>

<u>FPN: Examples of these areas would be daycare, preschool, indoor play areas or areas designated for children.</u>

Substantiation: This proposal is the work of a task group formed by the 2nd Year Apprenticeship Class 2C of 2008. Kenneth Bascombe, Pedro Diaz, Josh Hershey, Philip King, Dan Mruk, Matt Rader, Austin Snook, Bryson Stanhope, Paul Underwood, Bryan Walter and Darryl Hill. This task group has concluded the following substantiation:

Shock hazards exist at day cares, pre-schools, and similar areas for children, where child to adult ratios can be high. It can only take seconds for children to come in contact and be exposed to a potential shock hazard. If the concern for children exists in a dwelling unit, shouldn't we have the same concern in other areas where children can come in contact with receptacles? We must not forget that 90.1(A) says this code is for the *Practical* safeguarding of persons and property from hazards arising from the use of electricity. We feel as a task group that tamper-resistant receptacles are a very practical way of safeguarding our children regardless of where their location may be, in a dwelling or in a day care/pre-school setting.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and substantiation on Proposal 18-90.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-64 Log #2255 NEC-P18 **Final Action: Accept in Principle**
(406.11)

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector

Recommendation: Add text to read as follows:

406.11 Tamper-Resistant Receptacles in Dwelling Units<u>, Educational Occupancies, and Day Cares</u>.

Substantiation: Since the majority of accidents happen with children, therefore extending the protection to educational and day care occupancies (see NFPA 5000, 2006 edition) will enhance the safety of the children. Thus reducing the statistics already set by NEMA. This protection would extend only to the assembly areas of such occupancies (example: classrooms, bathrooms, halls, playrooms, etc.). NEC has already included it for pediatric locations in 517.18(C).

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and substantiation on Proposal 18-90.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-65 Log #2431 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Michael Baxter, Energy Safe Technologies Inc.

Recommendation: Revise text to read as follows:

406.11 ~~Tamper Resistant~~ <u>Power Safe Protector</u> Receptacles in Dwelling Units. In all areas specified in 210.52, all 125 volt, 15- and 20-ampere receptacles shall be listed <u>power safe protector</u> ~~tamper resistant~~ receptacles.

Substantiation: Tamper resistant receptacles can deter the novice toddler; an older child can easily defeat them rending the protection ineffective. The Power Safe Protector (PSP) device uses a new "Power Off" safety paradigm that keeps the electrical power off until it is actually needed. This eliminates the shock and electrocution hazard. In contrast, today's devices leave the power on continuously and respond only after a problem has occurred. The new Power Off paradigm allows several important safety checks to be performed before unsafe fault conditions can cause injury or cause a fire. These include checks for short circuits, line-to-ground faults, neutral-to-ground faults. The power is turned on only when it is safe to do so. When power is no longer needed the PSP receptacle turns the power off. Thus, the default condition is for the receptacle to be unenergized. Additionally, while the PSP receptacle is energized, it monitors for over-temperature conditions that can lead to fires.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Note: Supporting material is available for review at NFPA Headquarters.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-66 Log #2550 NEC-P18 **Final Action: Accept in Principle**
(406.11)

Submitter: John Chernock, Hazle Township Bldg. Dept.

Recommendation: Change present 406.11 to 406.11(A) and add a new 406.11(B) Child Day Care Centers.

Substantiation: In the NEC code section 406.11 states that the tamper proof receptacles are required in all dwelling units as specified in 210.52. For many years, they were also required in pediatric wards. See 517.18(C). The use of the tamper proof receptacles should now be required in child day care centers and other buildings where children are placed for long hours where the possibility of coming in contact with a hazardous condition is possible.

The children at day care centers range in age from one (1) year and up. The total number of children at daycare is far greater than in dwellings, and the possibility of the children tampering with the electrical devices is far greater. At times, these centers are understaffed which makes it more likely for some children to be at risk for an accident. Requiring tamper proof receptacles would greatly reduce the risk of shocks, burns and possible fatalities.

Also see section 10.1.17 of the (U.S. General Services, Administration Child Care Center Design Guide) that I have provided. This requires tamper proof receptacles. Reference publication PBS-100 March 2003.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Ballot Results: Affirmative: 11

18-67 Log #2573 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Charles Palmieri, Palmieri Assoc.

Recommendation: Add the following sections to existing text requiring the use of tamper resistant receptacles.

406.11 Tamper-Resistant Receptacles in Dwelling Units. In all areas specified in 210.52, <u>and those units described in 210.60 with permanent provisions for cooking,</u> all 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

Substantiation: In 210.60, titled Guest Rooms, Guest Suites, Dormitories, and Similar Occupancies. Sub-part (A) General, requires "for those units provided with permanent provisions for cooking" that they shall have receptacle outlets installed in accordance with all of the applicable rules in 210.52. There are no rules in 210.52 proper requiring tamper resistant receptacles. One must refer to 406.11, and at present that section does not include mandatory language for tamper resistant receptacles in 210.60 occupancies. This panel agreed during the 2008 code process to require tamper resistant receptacles in dwelling units. That new language was adopted to reduce injury or death to children. If the panel deemed a danger of shock or electrocution to children in all dwelling units, then logic should apply that 210.60 occupancies (with permanent provisions for cooking) likewise present a real hazard to children.

Panel Meeting Action: Reject

Panel Statement: Current code already requires tamper-resistant receptacles where such facilities meet the Article 100 definition of dwelling unit, which states where such units provide complete and independent living facilities for one or more person(s), including permanent provisions for living, sleeping, cooking, and sanitation.

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise the title of 406.11 as shown:

406.11 Tamper-Resistant ~~in~~ <u>for</u> Dwelling Units.

Substantiation: The title is proposed to be revised to reflect the fact that the actual requirement applies to receptacles that are not only "in" the dwelling unit, but other locations as well (such as outside, etc.).

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-69 Log #2954 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Fred W. Brown, HI Electron
Recommendation: Change the wording to read: 406.11 **Tamper-Resistant** <u>**or Electrical-Fault Circuit-Interrupter (EFCI)**</u> **Receptacles in Dwelling Units**. In all areas specified in 210.52, all receptacles on 120-volt, single phase, 15- and 20-ampere branch circuits shall be listed tamper-resistant <u>or Electrical-Fault Circuit-Interrupter (EFCI)</u> receptacles.
Substantiation: U.S. Consumer Product Safety Commission (CPSC) conducted a 10 year study (1991 – 2001) of National Electronic Injury Surveillance Systems (NEISS). The data shows 24,000+ children less than 10 years old were treated in Emergency Rooms for incidents related to electrical receptacles. A similar study done by Canadian Hospitals Injury Reporting and Prevention Program (CHIRPP) 8 Year Study (1996-2003) from 14 CHIRPP Hospitals 465 children less than 9 years old were treated in Emergency Rooms for incidents related to electrical receptacles. The National Electrical Code, NFPA 70 2005 & 2008, has added requirements for tamper resistant receptacles in dwellings and Health Care pediatric areas. Electrical-Fault Circuit-Interrupter (EFCI) type receptacles give an additional type of protection to children and persons.

GFCI outlets and breakers are designed and tested to prevent death for most adults from line to ground leakage, but do not protect against death from line to neutral contact. Young adults, older adults, and children have a lower resistance to electrical current affects and are more vulnerable to injury. Tamper Resistance Receptacles are not tamperproof. These receptacles provide a reasonable means of protection against shock but are not child or foolproof.

Protection from line-to-neutral shocks is needed around children, since they do not all recognize the shock hazards and risks. Tamper Resistance outlets use a mechanical insulating shutter system to shield children from accessing live voltages on electrical receptacle sockets. Electrical-Fault Circuit-Interrupter (EFCI) uses a relay to normally disconnect electricity at the receptacle sockets. EFCI only turns electricity on at the socket when it detects the insertion of an electrical plug. The detection mechanism is an RFID tag embedded in a device plug or attached to the face of a device plug that complies with the Right Plug standard. Both Tamper Resistance and EFCI outlets provide a reasonable means of preventing line-to-neutral shocks. If proper receptacle installation is not accomplished then it may lead to more children injuries.

In the 2008 National Electrical Code Arc-Fault Circuit-Interrupter (AFCI) has been expanded to protect most 120 volt, single phase, 15 and 20 ampere branch circuits in dwelling units. AFCI technology senses parallel arcing faults in the range of 70 amperes, series arcing faults in the range of 5 amperes, and de-energize the branch circuit. Electrical-Fault Circuit-Interrupter (EFCI) would greatly improve the protection of persons and property from the use of electricity. This type of protection would help to minimize the risk of fires in dwelling units. Their sensitivity to some electrical fault conditions would be to isolate the dangerous causes of electrical fires.

During the 1999 National Electrical Code cycle there were extensive documentation presented that pointed out that most of the electrical fires that occurred in dwelling units were in wiring and equipment beyond the branch circuit overcurrent protection device. Overcurrent protection devices are to protect conductors and equipment if currents reach a value that will cause an excessive or dangerous temperature in conductors or conductor insulation. This protection is for large currents caused by short circuit, ground faults, or overloads. Article 210.19(A)(4) in the National Electrical Code (NEC) recognizes the use of ‘tap conductors’ connected to branch circuits. Tap conductors have overcurrent protection ahead of its point of supply that exceeds the value permitted for branch circuit conductors that are protected according their calculated load and allowable ampacity. Article 210.19(A)(4) Exception No. 2 allows small than 14 AWG cords where approved for and used with a specific listed appliance or luminaire. Article 310.5 in the NEC requires the minimum size conductor to be 14 AWG copper except as permitted elsewhere in the Code. The article “How Electricity Ignites Fires by John S. Robison” points out that currents far less than the design limits of branch circuit overcurrent protection devices and AFCIs are some of the causes for fires in electrical equipment, wiring, appliance cords, and other cords.

Electrical-Fault Circuit-Interrupter (EFCI) sense a lower level of fault and overload current conditions than branch circuit protection devices and AFCIs. The article “Stop Fires Before They Start by Steve Montgomery” points out that EFCI provide protection against over and under voltage, open neutral conductors, high resistance connections, damage wiring, overloading of small appliance cords, etc. that branch circuit overcurrent protection devices and AFCIs might not protect against. Even with the increased sensitive the EFCI they will not be a cause of nuisance tripping. EFCI detect a potential cause of electrical fires and safely segregate it.

A proposal similar to this was submitted to the State of Wisconsin Electrical Committee during the adoption of the 2008 National Electrical Code and to National Fire Protection Health Care (NFPA 99-82 Log #197 HEA-ELS, 4.3.2.2.6.2(D) **Receptacles for Special Area**) 2010. Both of these committees were supportive of this new technology but felt that this requirements belonged elsewhere. The State of Wisconsin Department of Commerce felt that the EFCI requirement should best be adopted at the National Fire Protection was more appropriate for NFPA 70.

18-70 Log #3844 NEC-P18 **Final Action: Accept in Principle**
(406.11)

Submitter: Ted “Smitty” Smith, Electrical Experts Consulting
Recommendation: Revise text to read as follows:

Tamper resistant receptacles in Dwelling units. In ~~all areas specified in 210.52,~~ <u>dwelling units,</u> all 125-volt, 15- and 20-ampere receptacles located below 2 m (6-1/2) from the finished floor shall be listed tamper resistant receptacles.
Substantiation: The current wording leads to interpretation and confusion. In all areas specified in 210.52, 210.52 does not really specify areas, it specifies receptacle placement requirements. The current wording could be interpreted that this tamper proof listing is only required on receptacles required by 210.52. In a bedroom for example, I am required to have a receptacle within 6 of any space along the wall. If I put in more receptacles that required, do they need to be tamper resistant? I am not required to put a receptacle in for a garbage disposal which is located under the kitchen sink. Under kitchen sink is not an area specified in 210.52, so it does not need to be tamper resistant I believe the intent of the code was to require tamper resistant receptacles everywhere in the home. Therefore the revised wording will make that clear. The addition of the height requirement to the language will allow receptacles installed in the ceiling for garage door openers and the like to be accepted from this requirement. After all, the intent is to protect small children from accidental shock, a receptacle mounted above 2 meters should be safe from small children.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and substantiation on Proposal 18-71.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-71 Log #3848 NEC-P18 **Final Action: Accept in Principle**
(406.11)

Submitter: Bill McGovern, City of Plano
Recommendation: Revise text as follows:

Tamper-Resistant Receptacles in Dwelling Units. In all areas specified in 210.52, all 125-volts, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

<u>Exception No. 1: Receptacles located more than 1.7 m (5 1/2 ft.) above the floor.</u>

<u>Exception No. 2: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that in normal use is not easily moved from one place to another and that is cord-and-plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).</u>
Substantiation: Required spacing of receptacles in 210.52 must be installed at a height below 1.7 m (5 1/2 ft.) to be considered as meeting the requirements for wall spacing. Receptacles installed above 1.7 m (5 1/2 ft.) are not accessible and well out of reach of small children. By allowing the exception for a single receptacle or duplex receptacle located within dedicated space will eliminate the need for tamper-resistant receptacles to be installed behind dishwashers, refrigerators, washing machines and the like.
Panel Meeting Action: Accept in Principle

Revise 406.11 to read as follows:

406.11 Tamper-Resistant Receptacles for Dwelling Units. In all areas specified in 210.52, all nonlocking type 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

Exception No. 1: Receptacles located more than 1.7 m (5 ½ ft) above the floor.

Exception No. 2: Receptacles that are part of a luminaire or appliance.

Exception No. 3: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that in normal use is not easily moved from one place to another and that is cord-and-plug connected in accordance with 400.7(A)(6), (A)(7), or (A)(8).
Panel Statement: The text was revised for clarity. The submitter’s No. 2 exception was renumbered as No. 3. CMP-18 added Exception No. 2 for clarity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-72 Log #4329 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Steven Orlowski, National Association of Home Builders
Recommendation: Delete Section 406.11
~~406.11 Tamper-Resistant Receptacles in Dwelling Units.~~
~~In all areas specified in 210.52, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.~~
Substantiation: During the previous code cycle, there was no scientific research presented which showed that tamper-resistant receptacles are more effective than other listed safety devices that are currently available. Specifically, the listed plastic outlet covers have been proven to be safe and reliable in preventing electrical injury to young children. The fact sheet produced by the National Fire Protection Association, states that tamper resistant receptacles are preferred over plastic safety caps, but lacks scientific data dispute that these listed plastic safety caps provide a practical safeguarding to young children. The committee failed to provide a compelling argument or any substantial justification that these devices be required in all new dwellings, when the fact remains that less than 2% of all existing dwellings are occupied by families with children under the age of 6 (2006 US Consensus data). Furthermore the NEISS report which the committee reviewed to base their decision, did not provide any supporting information that the majority of the reported injuries occurred in a dwelling unit or whether there was a listed safety device was present at the time of the injury.
Panel Meeting Action: Reject
Panel Statement: Contrary to the statement in the substantiation that no scientific research was presented supporting the current requirement, the panel reviewed substantiation of the proposal including a study by the Temple University Biokinetics Research Laboratory documenting the ability of 2 to 4 year old children to remove plastic caps within seconds. The panel further reviewed a Consumer Union Report on plastic out caps indicating the possibility of a choking hazard. Finally, the substantiation of the proposal for this requirement clearly indicated that 71% of the reported incidents (the NEISS data) occurred in the home.

In addition to making a blatantly incorrect and misleading statement concerning this panel's diligence in accepting this requirement during the last code cycle, the submitter suggests that children under the age of 6 will never, ever, under any circumstances enter and be exposed to this hazard in 98% of all new homes constructed.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-73 Log #4330 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Steven Orlowski, National Association of Home Builders
Recommendation: Revise Text:

406.11 Tamper-Resistant Receptacles in Dwelling Units.

In all areas specified in ~~210.52~~ <u>210.8</u>, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

Add New Section:

<u>210.8 Tamper Resistant Receptacles Protection for Children.</u>
<u>(A) Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles shall be tamper-resistant where the receptacle is located within 44 inches of the finished floor in the habitable rooms of the dwelling unit. Tamper resistant receptacles shall no be required in the following locations specified in (1) through (7).</u>
<u>(1) Bathrooms</u>
<u>(2) Garages, and also accessory buildings that have a floor located at or below grade level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use</u>
<u>(3) Outdoors</u>
<u>(4) Crawl spaces — at or below grade level</u>
<u>(5) Unfinished basements — for purposes of this section, unfinished basements are defined as portions or areas of the basement not intended as habitable rooms and limited to storage areas, work areas, and the like</u>
<u>(6) Kitchens where the receptacles are installed to serve the countertop surfaces or appliances</u>
<u>(7) Laundry, utility, and wet bar sinks</u>
(Renumber subsequent sections)

A companion proposal has been sent to CMP-2 for action on the 210.8 portion of this proposal.
Substantiation: Currently the code requirement for tamper-resistant receptacles is too broad in scope and requires tamper-resistant receptacles in areas of the home that should not pose a threat to, or are inaccessible to, young children. This proposal lists several locations within the dwelling where there is no need to provide safeguarding for unattended children. Receptacles that are not readily accessible or that are dedicated for equipment should not be required to be tamper resistant. Examples of these areas that tamper-resistant receptacles should not be required are those found in attics, crawlspaces, mechanical rooms, behind equipment such as dishwasher, stoves, refrigerators, countertops, etc. To require tamper-resistant receptacles in these and other areas, not accessible to children under the age 5, shows a lack of forethought for this code requirement. Regarding last cycle, there were some members of the committee who felt it was best to require all the receptacles within the dwelling to be protected so the installer would not mistakenly miss a location. This belief is unfounded and may reflect a misunderstanding on the abilities of the electrician. For years now, along with all of the other NEC requirements one needs understand, installers have the knowledge to know which circuits are required to be connected to AFCI and which receptacles require GFCI protection. With proper training and clearly identifying the required locations for tamper resistant receptacles within the NEC, the installer will not be confused.
Panel Meeting Action: Reject
Panel Statement: CMP-18 agrees in principle with a height requirement. See panel action and statement on Proposal 18-71.

CMP-18 rejects the remaining portions for lack of substantiation that children of greatest risk (2 to 6 years) cannot contact the receptacles proposed for exclusion given their curious nature and propensity to explore.

CMP-18 does not agree with the submitter that these requirements belong in 210.8.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-74 Log #4390 NEC-P18 **Final Action: Accept in Principle**
(406.11)

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:

406.11 Tamper-Resistant Receptacles in Dwelling Units.
In all areas <u>required</u> ~~specified~~ in 210.52, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.
Substantiation: The revised text clarifies that only receptacles "required" by 210.52 shall be tamper-resistant. Although 210.52 has requirements for the location of dwelling unit receptacles, there are additional receptacles described in this section which are considered to be dwelling unit receptacles such as those that are part of a luminaire or appliance. Those would not be "required" receptacles.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-71, specifically Exception No. 2.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-75 Log #4409 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Dean Hunter, Hunter Electric
Recommendation: Revise text as follows:

406.11 Tamper Resistant Receptacles in Dwelling Units. In all areas specified in 210.52, a All 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.
Substantiation: This small change clarifies the intent of this section.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) and (d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-76 Log #4622 NEC-P18 **Final Action: Reject**
(406.11)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows:

Receptacles rated 125-volt, 15- and 20 amperes and installed in dwelling units to comply with 210.52, or of comparable accessibility to children, shall be listed tamper-resistant receptacles.
Substantiation: The 2008 language is subject to some interpretation, because some believe that since 210.52 applies to dwelling units, the requirement reaches every such receptacle installed in a dwelling unit. Others point out that the panel could have said all receptacles in a dwelling unit and chose not to. Further, 210.52 itself leads off with a list of applications for which an installed receptacle must not be interpreted as complying with 210.52 requirements. This could certainly be interpreted that those areas are not included in the new requirement. In some cases that makes sense and in others it doesn't. For example, a receptacle in an appliance or luminaire doesn't count, and this makes practical sense since those little single receptacles are unlikely to be available with tamper-resistant features. Receptacles in a cabinet or cupboard, or over 1.7 m (5½ ft above the floor) probably aren't too accessible to toddlers anyway. On the other hand, the switched receptacle is normally at toddler height and should be included, although the literal text makes this one questionable as well. Another area for interpretation involves receptacles installed to meet 210.50(B) even though no placement rule in 210.52 is involved. For example, a receptacle behind a refrigerator or a gas-fired stove for its igniter almost certainly could be exempted without disturbing the purposes for this section.

This proposal reaches all receptacles qualifying as 210.52 receptacles, and others in the same relative position installed for other reasons (such as attempts to say that a receptacle is in addition to the required 210.52 outlets). It does this through an express reference (accessibility to children) that squarely addresses the purpose for the rule in the first place. What a concept: say what you really mean, and mean what you say you mean.

Panel Meeting Action: Reject

Panel Statement: The resulting language would be vague and ambiguous. The panel has said what it means and means what it says.

See panel action and statement on Proposal 18-71.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-77 Log #4716 NEC-P18 **Final Action: Accept in Principle**

(406.11)

Submitter: Robert P. McGann, City of Cambridge

Recommendation: Revise text as follows:

406.11 Tamper-Resistant Receptacles in Dwelling Units. In all areas <u>readily accessible within 5 1/2 ft of floor</u> ~~Specified in 210.52~~. All 125 volt, 15 and 20 amp receptacles shall be listed tamper resistant receptacles.

Substantiation: There are too many holes with existing wording. It allows the dedicated outlet for the window AC unit in the habitable room not to be tamper resistant but requires the outlet behind the refrigeration to be TR. This is only one of many scenarios the contractor and inspectors are up against daily. This also correlates with the 5 1/2 ft rule in 210.52.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-71.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-78 Log #4856 NEC-P18 **Final Action: Reject**

(406.11)

Submitter: John Steinke, Amish Electric

Recommendation: Delete entire section.

Substantiation: "If it saves but one life" has been used as justification for this section. Such a though may sound nice, but it exceeds the mandate of the NEC. It is also overly broad, to the point of being illogical.

Article 90.1 defines the scope of the NEC. 90.1(A) states that the purpose is the practical safeguarding; 90.1(B) claims that the provisions are considered mandatory for safety. 90.1(C) bluntly states that the code is not a design manual.

In short, the code is a minimum (as all laws should be), and is not intended to be an ideal. By trying to 'raise the bar,' one begins to enter into design issues.

The requirement of tamper resistant receptacles is clearly a design issue. There are already numerous codes that require their use in day care centers, etc... on the theory that the insertion of foreign objects is a danger unique to young children. Oddly enough, many of these rules will allow the continued use of ordinary receptacles, provided GFCI protection is provided.

The NEC has gone considerably beyond these existing regulations.

This is where the section begins to be illogical. There is no distinction between an unprotected receptacle in a childs' room, a GFCI protected receptacle above the kitchen counter, and essentially inaccessible receptacles (such as those behind refrigerators and the one for the garage door operator).

Another argument that has been advanced is that such receptacles are required in other countries. While it may sound trite, we are not 'other countries.' Perhaps they ought to imitate us - not the other way around. More importantly, these other countries have entirely different approaches to electricity. For example, Great Britain requires tamper-resistant receptacles, but also essentially bans receptacles from bathrooms at all - while we not only require them, but require them to be 20 amp circuits. Also, ironically, they justify their position by arguing 'safety.'

Finally, there is the detail of testing a receptacle. OSHA requires us to test that the power is off before we work on receptacles; yet it is impossible to test them with a 'ticker,' and even inserting meter probes is a challenge with 'ordinary' receptacles.

Testing agencies have absolutely no problem imposing their own requirements on the products they endorse. If this is truly a necessary 'safety' feature, it ought to be integral to their standards. Alternatively, if this is what manufacturers desire, they have their standards to address. The NEC is not the place for this decision to be made.

Panel Meeting Action: Reject

Panel Statement: CMP-18 upholds the requirement for tamper-resistant receptacles based on over 10 years of electrical shock and burn incident data. This proposal is to delete the requirement based on 90.1, when, in fact, the previous incident data completely supports the requirement as one that is "the practical safeguarding" contained in 90.1.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-79 Log #4874 NEC-P18 **Final Action: Reject**

(406.11)

Submitter: David Zinck, Wiring Inspector / Rep. Newburyport, MA

Recommendation: Add text to read as follows:

In all areas specified in 210.52, all 125 volt, 15 and 20 ampere receptacles shall be listed tamper-resistant receptacles. <u>This requirement shall apply to new or completely renovated dwelling units only.</u>

Substantiation: When this requirement was sold to the panel for the 2007 NEC, it was supposed to be for new construction only (see the panel statements in the ROP). Sometime between the time when they passed it to the time when it went into the NEC, the new construction only part was removed. If Best Buy had pulled a "bait-and-switch" like that with flat screen TV's, there would be rioting in the streets.

Here is the great injustice to this requirement. A couple does a complete kitchen renovation. Maybe they do not have any kids. Maybe their kids are grown and gone. They have to use tamper resistant receptacles behind the stove, on the counter, for the microwave hood outlet, the trash compactor outlet, and the dishwasher outlet, even though they are not accessible to small children. All this in a house that has 200 readily accessible plugs that are not tamper-resistant.

Adding the second sentence clears up this problem.

Panel Meeting Action: Reject

Panel Statement: It was never the intent of CMP-18 to limit this requirement as described in the substantiation. Note that CMP-18 has accepted adding a requirement that replacement receptacles be tamper-resistant. See panel action and statement on Proposal 18-24.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-80 Log #2348 NEC-P18 **Final Action: Accept in Principle**

(406.11, Exceptions No. 1 and 2)

Submitter: Julian R. Burns, Quality Power Solutions, Inc.

Recommendation: Add new text as follows:

<u>*Exception No. 1: Receptacles installed at or above 1.5 m (5 ft) above the finished floor shall not be required to be listed tamper-resistant receptacles.*</u>

<u>*Exception No. 2: Receptacles installed for appliances occupying dedicated space shall not be required to be listed tamper-resistant receptacles.*</u>

Substantiation: The requirement for tamper-resistant receptacles was to protect children. The receptacles installed above 5 ft. are out of reach for children. Some examples of these receptacle locations are; wall mounted TVs, audio visual equipment, central vacuums and garage door operators.

Where appliances occupy dedicated space, children do not have access to. Some examples of these receptacles would include; refrigerators, dishwashers, disposals, freezers, microwaves, hydromassage bathtubs, gas cooktops and gas dryers.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-71.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-81 Log #252 NEC-P18 **Final Action: Accept in Principle**

(406.11 Exception)

Submitter: Mario L. Mumfrey, Cincinnati, OH

Recommendation: Add text to read as follows:

Exception: Excludes receptacles installed at a height exceeding 24 in. from the floor level to the bottom of the receptacle yoke and behind appliances that are fixed in place.

Note: This exception is for the use of TR (tamper-resistant) receptacles.

Substantiation: This addition to the 2008 NEC gave little explanation for the change other then to say that it safeguards small, unsupervised children from inserting small metallic objects into accessible electrical receptacles. I agree that safety should be priority and especially child safety wherever possible. However, by requiring TR receptacles basically everywhere in dwelling units it now becomes more adult competence then child safety. Article 90.1(C) states that this code is not a training manual for untrained persons. 406.3(D) covers replacement receptacle(s) and does not refer to 406.11 as requiring TR type. By limiting the use of TR receptacles, safety can still be achieved.

Panel Meeting Action: Accept in Principle

Panel Statement: CMP-18 accepts in principle the intent of "behind appliances" see panel action and statement on Proposal 18-71.

CMP-18 rejects the 24 in. limitation from the floor as such receptacles are well within access of children. The panel further rejects the substantiation relating to "adult competence" or "untrained persons". The panel heard child safety experts from the American Burn Association advise that supervision is not a viable solution and that "a safer environment provides better injury prevention than behavior modification."

(406.12 (New))

Submitter: Joe Penachio, Peabody, MA
Recommendation: Add new text to read as follows:
406.12 Tamper Resistant Receptacles in Other Than Dwelling Units.
In areas such as child care, day care, kindergarten, play school, preschool, nursery school, and similar locations, where the possibility of tampering exists, all 125 volt, 15- and 20-ampere receptacles shall be listed tamper proof receptacles.
Substantiation: This requirement would be consistent with the codes intent to protect young children from inserting paper clips and similar objects into the receptacles in these areas. This would also correlate with 406.11 for dwelling units and 517.18(C), Pediatric Locations. I'm not sure of how many of the 24,000 children reported injured by inserting objects into receptacles from the NEISS (National Electronic Injury Surveillance System) were in these areas, but I'd venture that there were many.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and substantiation on Proposal 18-90.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-86 Log #688 NEC-P18 **Final Action: Reject**
(406.12)

Submitter: Joseph E. Rossi, Township of Clinton
Recommendation: Add new text to read as follows:
Receptacles installed in all areas shall have a minimum branch circuit of 20 amperes.
Substantiation: It is time we take a look at field inspections vs. codes written on paper. During rough, final and after certificate of occupancy are issued there are not additional appliances other then that which are required in place. Many times a builder will sell a house that is completely empty of furniture, appliances and electronic devices.
As an electrical inspector, I enter people's houses and see many receptacles overloaded, mainly in the bedrooms of children. They each have their own computer systems along with fish tank, hair dryers, etc. all in one room. Worst over are the efficiency apartments and one bedroom townhouses. These places are totally over packed. It will be a small price to pay for the safety and integrity of branch circuits.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
CMP-18 requests the TCC to redirect this proposal to CMP-2, which has jurisdiction over branch circuits.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-87 Log #1167 NEC-P18 **Final Action: Accept in Principle in Part**
(406.12)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add a new subparagraph 406.12 to read as follows:
406.12 Tamper-Resistant Receptacles in Guest Rooms, Guest Suites, Dormitories, and Similar Occupancies.
In all areas specified in 210.60, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.
Substantiation: 406.11 Requires listed tamper resistant receptacles in all areas specified in 210.52 for dwelling units to increase the level of safety for children. 210.60 requires guest rooms or guest suites in hotels, motels, sleeping rooms in dormitories, and similar occupancies to have receptacle outlets installed in accordance with 210.52. These locations are also likely to be occupied by children and should require the same level of protection. People will come to expect this level of safety for their children when occupying these facilities.
Panel Meeting Action: Accept in Principle in Part
Add a new subparagraph 406.12 to read as follows:
406.12 Tamper-Resistant Receptacles in Guest Rooms and Guest Suites.
All nonlocking type 125-volt, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.
Panel Statement: Current code already requires tamper-resistant receptacles where such facilities meet the Article 100 definition of dwelling unit, which states where such units provide complete and independent living facilities for one or more person(s) including permanent provisions for living, sleeping, cooking, and sanitation.
There is insufficient substantiation for additional expansion of the requirement.

(406.12 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text to read as follows:
406.XX Location. Receptacles, cord connectors, attachment plugs (caps), and flanged surface devices shall be installed in accessible locations.
Substantiation: Edit. Section 422.16 (B)(2) and (B)(4) require a receptacle to be accessible, which implies other receptacles may be inaccessible.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-89 Log #2955 NEC-P18 **Final Action: Reject**
(406.12)

Submitter: Fred W. Brown, HI Electron
Recommendation: Add a new text as follows:
406.12 **Electrical-Fault Circuit-Interrupter (EFCI) Receptacles in Dwelling Units**. In all areas of dwelling units, all receptacles on 120-volt, single phase, 15- and 20-ampere branch circuits shall be Electrical-Fault Circuit-Interrupter (EFCI) receptacles.
Substantiation: U.S. Consumer Product Safety Commission (CPSC) conducted a 10 year study (1991 – 2001) of National Electronic Injury Surveillance Systems (NEISS). The data shows 24,000+ children less than 10 years old were treated in Emergency Rooms for incidents related to electrical receptacles. A similar study done by Canadian Hospitals Injury Reporting and Prevention Program (CHIRPP) 8 Year Study (1996-2003) from 14 CHIRPP Hospitals 465 children less than 9 years old were treated in Emergency Rooms for incidents related to electrical receptacles. The National Electrical Code, NFPA 70 2005 & 2008, has added requirements for tamper resistant receptacles in dwellings and Health Care pediatric areas. Electrical-Fault Circuit-Interrupter (EFCI) type receptacles give an additional type of protection to children and persons.

GFCI outlets and breakers are designed and tested to prevent death for most adults from line to ground leakage, but do not protect against death from line to neutral contact. Young adults, older adults, and children have a lower resistance to electrical current affects and are more vulnerable to injury. Tamper Resistance Receptacles are not tamperproof. These receptacles provide a reasonable means of protection against shock but are not child or foolproof.

Protection from line-to-neutral shocks is needed around children, since they do not all recognize the shock hazards and risks. Tamper Resistance outlets use a mechanical insulating shutter system to shield children from accessing live voltages on electrical receptacle sockets. Electrical-Fault Circuit-Interrupter (EFCI) uses a relay to normally disconnect electricity at the receptacle sockets. EFCI only turns electricity on at the socket when it detects the insertion of an electrical plug. The detection mechanism is an RFID tag embedded in a device plug or attached to the face of a device plug that complies with the Right Plug standard. Both Tamper Resistance and EFCI outlets provide a reasonable means of preventing line-to-neutral shocks. If proper receptacle installation is not accomplished then it may lead to more children injuries.

In the 2008 National Electrical Code Arc-Fault Circuit-Interrupter (AFCI) has been expanded to protect most 120 volt, single phase, 15 and 20 ampere branch circuits in dwelling units. AFCI technology senses parallel arcing faults in the range of 70 amperes, series arcing faults in the range of 5 amperes, and de-energize the branch circuit. Electrical-Fault Circuit-Interrupter (EFCI) would greatly improve the protection of persons and property from the use of electricity. This type of protection would help to minimize the risk of fires in dwelling units. Their sensitivity to some electrical fault conditions would be to isolate the dangerous causes of electrical fires.

During the 1999 National Electrical Code cycle there were extensive documentation presented that pointed out that most of the electrical fires that occurred in dwelling units were in wiring and equipment beyond the branch circuit overcurrent protection device. Overcurrent protection devices are to protect conductors and equipment if currents reach a value that will cause an excessive or dangerous temperature in conductors or conductor insulation. This protection is for large currents caused by short circuit, ground faults, or overloads. Article 210.19(A)(4) in the National Electrical Code (NEC) recognizes the use of ‘tap conductors’ connected to branch circuits. Tap conductors have overcurrent protection ahead of its point of supply that exceeds the value permitted for branch circuit conductors that are protected according their calculated load and allowable ampacity. Article 210.19(A)(4) Exception No. 2 allows small than 14 AWG cords where approved for and used with a specific listed appliance or luminaire. Article 310.5 in the NEC requires the minimum size conductor to be 14 AWG copper except as permitted elsewhere in the Code. The article “How Electricity Ignites Fires by John S. Robison” points out that currents far less than the design limits of branch circuit overcurrent protection devices and AFCIs are some of the causes for fires in electrical equipment, wiring, appliance cords, and other cords.

Electrical-Fault Circuit-Interrupter (EFCI) senses a lower level of fault and overload current conditions than branch circuit protection devices and AFCIs. The article “Stop Fires Before They Start by Steve Montgomery” points out that EFCI provide protection against over and under voltage, open neutral conductors, high resistance connections, damage wiring, overloading of small appliance cords, etc. that branch circuit overcurrent protection devices and AFCIs might not protect against. Even with the increased sensitive the EFCI they will not be a cause of nuisance tripping. EFCI detect a potential cause of electrical fires and safely segregate it.

A proposal similar to this was submitted to the State of Wisconsin Electrical Committee during the adoption of the 2008 National Electrical Code and to National Fire Protection Health Care (NFPA 99-82 Log #197 HEA-ELS, 4.3.2.2.6.2(D) **Receptacles for Special Area**) 2010. Both of these committees were supportive of this new technology but felt that this requirements belonged elsewhere. The State of Wisconsin Department of Commerce felt that the EFCI requirement should best be adopted at the National Fire Protection was more appropriate for NFPA 70.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-29.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-90 Log #1168 NEC-P18 **Final Action: Accept in Principle**
(406.14 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add text to read as follows:
406.14 Child Care Facilities.
(A) Definition: Child Care Facility. A building or structure, or portion thereof, for educational, supervision or personal care services for more than four children 7 years or less of age.
(B) Tamper Resistant Receptacles. In all child care facilities, all 125-volt, 15- and 20-ampere receptacles shall be listed tamper resistant receptacles.
Substantiation: Sections 406.11 and 517.18(C) require tamper resistant receptacles to prevent incidents of electrical burns and shock that result when children insert conductive objects into receptacles. Both of these sections recognize that listed tamper resistant receptacles provide the most effective means of preventing children from inserting foreign objects into receptacles. The use of tamper resistant receptacles is also recognized in the US General Services Administration Child Care Center Design Guide as a critical design feature for child care areas. This Guide contains the criteria for planning and designing child care centers. Section 10.1.17 : “The following safety issues shall be incorporated into the design of the center:

● Outlets in areas accessible to children must be tamper resistant as defined by NEC Article 517.18(C). The intent is to “child proof” outlets that are within children’s reach to avoid any possibility of electrocution. Where practical locate them out of the child’s reach (at least 1380 mm above floor level).”

(The GSA design guide is available at:
http://www.gsa.gov/gsa/cm _attachments/GSA_DOCUMENT/Design%20 Guide_R2FD38_0Z5RDZ-i34K-pR.pdf)

For purposes of this code section, a child care facility has been defined as the use of a building or structure for educational, supervision or personal care services for more than four children 7 years of age or less. This definition takes into consideration various aspects of the current definitions for such facilities that appear in the International Building Code, Sections 305 and 308 as well as the definition in the US General Services Administration Child Care Center Design Guide.

The statistics provided with the 2005 NEC proposal for tamper resistant receptacles required by Section 406.11 indicated that approximately 89% of the electrical burn and shock incidents occurred to children 6 years of age or less. The current code requirements for tamper resistant receptacles ensure that children will be protected in closely supervised areas such as pediatric care locations and in less structured residential environments. However, there is no code requirement for tamper resistant receptacles in child care areas where young children are normally present for extended periods. Children in child care facilities have ready access to electrical receptacles and the same potential hazard for electrical burns and shock exists if a child inserts a foreign object into a receptacle. The same level of protection required by the code in pediatric care areas and in dwellings should be provided for children in child care facilities.
Panel Meeting Action: Accept in Principle
Add new section 406.2 to read as follows:
406.2 Definitions
Child Care Facility. A building or structure, or portion thereof, for educational, supervision, or personal care services for more than four children 7 years or less of age.
Renumber current 406.2 to 406.3 and renumber remainder of Article 406.
Add new 406.15 to read as follows:
406.15 Child Care Facilities. In all child care facilities, all nonlocking type 125-volt, 15- and 20- ampere receptacles shall be listed tamper-resistant receptacles.
Panel Statement: CMP-18 moved the new definition to section 410.2 in accordance with 2.2.2.2 of the NEC Style Manual. Additionally, the panel added “nonlocking type”. See panel action and statement on Proposal 18-62.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 408 — SWITCHBOARDS AND PANELBOARDS

9-130a Log #CP901 NEC-P09 **Final Action: Accept**
(408.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the panel action with the following revisions:

"408.1 Scope. This article covers switchboards and panelboards operating at 600 volts, nominal, or less, except as specifically referenced elsewhere in the Code."

The Technical Correlating Committee recognizes that Code-Making Panel 1 deleted the wording "Distribution Boards" in 110.26(F).

Submitter: Code-Making Panel 9,

Recommendation: I. Revise 408.1 to read as follows:

This article covers switchboards and panelboards. It does not apply to equipment operating at over 600 volts except as specifically referenced elsewhere in the Code.

II. Revise 408.2 by changing "used on switchboards, panelboards, and distribution boards" to "used on switchboards and panelboards."

III. Revise 110.26(F) to read "All switchboards, panelboards, and motor control centers shall be located in dedicated spaces and protected from damage."

Substantiation: This proposal removes the terminology "distribution boards" and "battery-charging panels" from the scope of this article, and also clarifies that it normally does not apply to equipment operating over 600 volts unless some specific provision is cited elsewhere. Over the last four code cycles CMP 9 has been reluctant to remove the obsolete terminology on distribution boards because of concerns regarding inadvertent effects on installed equipment, even though contemporary product standards do not use this wording. No instances have come to light, and CMP 9 is prepared to remove it at this time. The deletion of the language on battery-charging panels follows from the deletion of the phrase "light and power circuits". Any panelboard or switchboard that meets the applicable definition in Article 100 should be and now will be covered in this article, regardless of the specific loads it supplies.

To correlate with this change the second part of this proposal removes the "distribution boards" terminology from 110.26(F). This terminology is only in 110.26(F) because that provision used to be part of former Article 384, which is now Article 408. When these rules were moved to Article 110, the scope of 110.26(F) had to agree with the scope of the article from which it came (now Article 408). It follows that if the "distribution boards" terminology is now removed, it should be removed from Article 110 as well.

The exclusion of systems operating over 600 volts reserves the coverage of this equipment to Article 490. When medium voltage applications were covered in Chapter 7 (former Article 710), the provisions of 90.3 automatically resolved inadvertent conflicts between this article and specific rules for equipment operating at higher voltages. Now that these rules have been moved to Chapter 4, inadvertent conflicts such as the one addressed in Proposal 9-101 may crop up, and the suggested change in scope agrees with the relevant product standards and should restore the independence of Article 490 in these cases. As part of this action, CMP 9 is reviewing the content of both Articles 490 and 408 and making correlating changes accordingly.

CMP 9 solicits specific public comment on the removal of the terminology "distribution boards" and will revisit this issue should inadvertent consequences be identified from this change. In addition CMP 9 also recognizes that CMP 1 now has jurisdiction over 110.26(F) and requests that the TCC place this change on the agenda of CMP 1 for action in the comment period. Finally, CMP 9 recognizes that final authority for revisions to article scope provisions rest with the TCC and makes this recommendation accordingly.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

HARTWELL, F.: A preliminary review of provisions in Article 490 during the panel meeting did not raise any specific areas where additional correlating actions would be necessary. Comment is invited on this point.

9-131 Log #3790 NEC-P09 **Final Action: Accept in Principle**
(408.1)

Submitter: James Grant, Rochester, NH

Recommendation: Revise text to read as follows:

408.1 Scope.

This article covers the following:

(1) All switchboards, panelboards, ~~and distribution boards~~ installed for the control of light and power circuits

(2) Battery-charging panels supplied from light or power circuits

Substantiation: The scope of the article mentions distribution boards, however, there is no mention of them in the rest of the article.

Panel Meeting Action: Accept in Principle

Refer to the action on panel proposal 9-130a that addresses the concerns in this proposal.

Panel Statement: The terminology has been removed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-132 Log #2047 NEC-P09 **Final Action: Accept in Principle**
(408.1(1) Scope)

Submitter: Larry T. Smith, National Electrical Seminars, Inc.

Recommendation: Revise text to read as follows:

408.1 Scope. This article covers the following:

(1) All switchboards, <u>and</u> panelboard~~s, and distribution boards~~ installed for the control of light and power circuits

(2) Battery-charging panels supplied from light or power circuits.

Substantiation: The 1937 NEC makes this statement, "**3841. Scope.** The requirements of this article shall apply to all switchboards, panelboards, and *distribution boards* used for the control of light and power circuits...".

But what is a distribution board? No one seems to know. The title of Article 408 is Switchboards and Panelboards and we have clear definitions of both in Article 100, but *distribution boards* are not defined in Article 408 or Article 100. In 1937, everyone in the electrical industry probably knew what a *distribution board* was, but not today. At least one AHJ in a major city considers a UPS a distribution board and is requiring dedicated space (110.26(F)) above all UPS equipment. In the opinion of another AHJ, separate safety switches mounted on a 2 ft x 4 ft sheet of plywood constitutes a distribution board.

Distribution board appears to be an archaic term that should be deleted. If not deleted, it should be defined because distribution boards are listed in 110.26(F) as equipment requiring dedicated space. Isn't the title of Article 408 Switchboards and Panelboards?

Panel Meeting Action: Accept in Principle

Refer to the action on panel proposal 9-130a that addresses the concerns in this proposal.

Panel Statement: The terminology has been removed.

Number Eligible to Vote: 12

9-133 Log #2048 NEC-P09 **Final Action: Accept in Principle**
(408.1(2) Scope)

Submitter: Larry T. Smith, National Electrical Seminars, Inc.

Recommendation: Revise text to read as follows:

408.1 Scope. This article covers the following:

~~(2) Battery charging panels supplied from light or power circuits.~~

Substantiation: The 1937 NEC makes this statement, "**3841. Scope**... The requirements of this article shall apply to battery-charging panels if current is taken from light or power circuits."

Is there anyone alive today who knows what that statement was intended to cover? What is a *battery-charging panel*? No one seems to know, but a lot of people are willing to offer various opinions. Some people believe that it was intended to exclude old Delco systems, but who knows? Others believe that it was meant to cover UPS equipment, but UPS equipment hadn't even been developed yet. In 1937, everyone in the electrical industry probably knew what was intended, but not today.

Battery charging panel appears to be an archaic term that should be deleted and if not deleted, defined. Isn't the title of Article 408 Switchboards and Panelboards?

Panel Meeting Action: Accept in Principle

Refer to the action on panel proposal 9-130a that addresses the concerns in this proposal.

Panel Statement: The terminology has been removed.

Number Eligible to Vote: 12

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-135 Log #3293 NEC-P09 **Final Action: Accept in Part**
(408.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Switchboards, panelboards, <u>control panels, and motor control centers</u> in hazardous (classified) locations shall comply with <u>applicable</u> ~~requirements~~ <u>provisions</u> of Articles 500 through 517.
Substantiation: Edit. This provision should not be limited to switchboards and panelboards or requirements; any applicable exceptions and provisions that are permissive should be included.
Panel Meeting Action: Accept in Part
Accept the change to "applicable provisions"; reject the addition of control panels and motor control centers.
Panel Statement: The rejected material is out of the scope of this article. Hazardous (classified) location requirements for control panels are covered in 409.3, and for motor control centers the coverage occurs in 430.5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-136 Log #3651 NEC-P09 **Final Action: Reject**
(408.3(A)(2))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
(2) Service Switchboards <u>and Panelboards</u>. Barriers shall be placed in all service switchboards <u>and panelboards</u> such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations. <u>The barrier shall provide shock and arc flash protection equivalent to that provided by the switchboard or panelboard enclosure.</u>
Substantiation: With the current design of panelboards used as service equipment, it is not possible to comply with the electrical safe work rules required by OSHA and NFPA 70E, unless the utility disconnects the line side power any time the service equipment enclosure cover is opened or removed. This code change will make it possible to do work in the service equipment without having the utility disconnect the line side power, by removing the (unacceptable) exposure to the unprotected line side connections. This requirement has been in place for Canadian service equipment for many years. There is no reason why we can't have the same protection for the electrical workers here in the US.
Canadian Standards Association Standard C22.2 No. 29, Clause 7.4.1.2 states: "The main switch or circuit breaker shall be located in a separate section of the enclosure with a sheet-metal barrier or the equivalent, of the same thickness as the walls of the enclosure, having bushed holes or the equivalent, for the necessary wiring between compartments". The major manufacturers of switchboards and panelboards currently make products that are in compliance with the CSA Standard so it will not be a hardship on them to comply with this safety rule. Please review the included pictures of a panel design that complies with the CSA Standard.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Canadian and US requirements are different in many ways including the US allowance for six service disconnects, which is not allowed in Canada. Alternative methods exist to provide shock and arc flash protection equivalent to that provided by an enclosure. No substantiation of field issues has been provided.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-137 Log #3410 NEC-P09 **Final Action: Accept**
(408.3(C))

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
408.3(C) Used as Service Equipment. Each switchboard or panelboard, if used as service equipment, shall be provided with a main bonding jumper sized in accordance with 250.28(D) or the equivalent placed within the panelboard or one of the sections of the switchboard for connecting the grounded service<u>-entrance</u> conductor on its supply side to the switchboard or panelboard frame. (The remaining text to be unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service<u>-Entrance</u> Cable. Service<u>-entrance</u> conductors made up in the form of a cable.
Service<u>-Entrance</u> Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service<u>-entrance</u> conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-<u>entrance</u> conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and "Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-138 Log #764 NEC-P09 **Final Action: Reject**
(408.3(E))

Submitter: Robert Sogla, Coon Rapids, MN
Recommendation: Revise text to read as follows:
408.3(E) Phase Arrangement. The phase arrangement on 3-phase buses shall be A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the switchboard or panelboard. The ~~B~~ C phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems.
Substantiation: Over the years since this was changed from C phase to B phase, the metering was never changed. As such, there are many installations where C phase in the meter is not C phase in the panel. I think we should go back to C phase so that C phase is the same throughout the building. If it becomes C phase and orange then there will be no more confusion with the common practice of using brown, orange, and yellow on 480v systems since orange here is also B phase. Also, there is no good reason to change phase orientation between the meter and the panel.
Panel Meeting Action: Reject
Panel Statement: When metering is involved, the Exception allows C phase high leg construction. Color coding is an industry practice and not a Code requirement. No substantiation has been provided to indicate that this practice has caused confusion.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-139 Log #3652 NEC-P09 **Final Action: Reject**
(408.3(E))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
(E) Phase Arrangement. The phase arrangement on 3-phase buses shall be so that when the leads of a phase rotation meter are connected A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the switchboard or panelboard that the phase rotation meter shall indicate a clockwise rotation. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.
Substantiation: As this section is currently written it has no meaning. It appears that the intent is to require a clockwise rotation. If this is not the intent, then the section does not accomplish anything as the terms A, B and C are only arbitrary terms and the section should be deleted from the code.
Panel Meeting Action: Reject
Panel Statement: 408.3(E) is intended to be a construction requirement for panelboards and switchboards as a matter of consistency. The proposal is a design consideration for connected equipment which is not the purpose of this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-140 Log #2764 NEC-P09 **Final Action: Accept in Principle**
(408.3(F))

Submitter: Donald R. Offerdahl, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
(F) Switchboard or Panelboard Identification
1. High-Leg Identification. A switchboard or panelboard containing a 4-wire, delta-connected system where the midpoint of one phase winding is grounded shall he legibly and permanently field marked as follows:
"Caution ______ Phase Has ______ Volts to Ground"
2. Ungrounded electrical systems as permitted in 250.21(1), (2) and (3) and for general power distribution systems in accordance with 250.21(4). 1 shall be legibly and permanently field marked as follows:
"Caution Ungrounded electrical system ________ Volts"
Substantiation: Ungrounded electrical systems are permitted but need to be identified. If the equipment bonding conductor are not marked correctly (white rather than green) it leaves the impression than this is a grounded system, which it is not. The power supplier has no requirement to label the transformer when the system is changed from grounded to an ungrounded system. This situation has happen in several occasions. The disadvantage of operating systems ungrounded is increased susceptibility to high transient voltages that can hasten insulation deterioration.
Panel Meeting Action: Accept in Principle
Revise proposed item (2) to read as follows:
(2) Ungrounded Systems. A switchboard or panelboard containing an ungrounded electrical system as permitted in 250.21 shall be legibly and permanently field marked as follows:
"Caution Ungrounded System Operating _____ Volts Between Conductors"
Panel Statement: CMP-9 agrees with the submitter but has made editorial changes that make the new wording parallel to that for high-leg systems. Since all numbered parts of 250.21 potentially are covered (and are included in this proposal) the cross reference has been simplified accordingly.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
RUPP, B.: This proposal should be rejected. Switchboards and panelboards have been used in ungrounded electrical systems for decades without issue. The substantiation provided does not indicate the safety issue or hazard that the proposed marking will address. Normal operation of an ungrounded electrical system will provide balanced voltages between phases and phases to ground, unlike the high-leg system for which the marking in 408.3(F) is justified.

9-141 Log #1297 NEC-P09 **Final Action: Accept in Principle**
(408.4)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
"and circuit breaker" after "switch" in the penultimate sentence.
Substantiation: To clarify the identification is required at circuit breakers whether or not used as switches.
Panel Meeting Action: Accept in Principle
Revise 408.4 as follows:
Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. Spare positions that contain unused overcurrent devices or switches shall be described accordingly. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch or circuit breaker ~~on~~ in a switchboard. No circuit shall be described in a manner that depends on transient conditions of occupancy.
Panel Statement: At any specified location covered in this section, either a switch or a circuit breaker, but not both, will be found. For contemporary switchboard construction, the preposition "in" is preferred to "on" with regard to the location of switches and circuit breakers.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-142 Log #1494 NEC-P09 **Final Action: Accept in Principle**
(408.4)

Submitter: Robert G. Fahey, City of Janesville
Recommendation: Add new text as follows:
408.4 Signage
(A) Circuit Directory or Circuit Identification
Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. Spare positions that contain unused overcurrent devices or switches shall be described accordingly. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch on a switchboard. No circuit shall be described in a manner that depends on transient conditions of occupancy.
(B) Switchboards and Panelboards. All switchboards and panelboards shall be identified as to where the power supply originates for each switchboard and panelboard.
Exception No. 1. Dwelling units and associated residential buildings panelboards.
Exception No. 2. Service equipment.
Substantiation: In many commercial and industrial occupancies, where there are many panelboards and switchboards located throughout the building and/or premises, making it difficult at times to locate the circuit breaker, main distribution panel, or fused disconnect which supplies the individual panelboard or switchboard. In many engineered jobs, this type of labeling already takes place through the specifications the electrical engineer has written up for the electrical contractor to follow. This practice enhances safety for the people who service the equipment, it will save time locating the circuit breaker in the case of an emergency and when normal maintenance is performed. I believe this small change will benefit the facility owner, facility staff, electricians and others who will work on the equipment in the future. I am currently inspecting a high school where this labeling is being applied to all equipment, panelboards, transformers and main distribution panels and the cost is very minimal to the facility.
Panel Meeting Action: Accept in Principle
Change the proposed section title from "Signage" to "Field Identification Required." Revise (B) to read as follows: "Source of Supply. All switchboards and panelboards supplied by a feeder in other than one- or two-family dwellings shall be marked as to where the power supply originates."
Panel Statement: CMP-9 has made editorial changes but agrees that such sources should be identified. The identifying marking will not be an actual sign, and the wording of (B) needs a title. The exceptions have been included in the restatement of the rule. Panelboards in multifamily housing present similar concerns and CMP-9 has broadened the wording accordingly. The panel action does not intend to affect the action on Proposal 9-141.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-143 Log #1893 NEC-P09 **Final Action: Accept in Part**
(408.4)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: The identification shall be included in a circuit directory that is located on the face or inside of the panel door of a panelboard and located at each switch or circuit breaker on a switchboard or motor control center.
Substantiation: Edit. Circuit breakers and motor control centers should be included in the provision.
Panel Meeting Action: Accept in Part
Accept the addition of "or circuit breaker."
Reject the addition of "or motor control center."
Panel Statement: Motor control centers are not within the scope of Article 408. The requirement is covered by 110.22(A). CMP-9 does not intend to disturb its action on Proposal 9-141.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-144 Log #1601 NEC-P09 **Final Action: Reject**
(408.8)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 1 for Action in Article 110.
This action will be considered by the Code-Making Panel 1 as a public comment.
Submitter: Russell LeBlanc, The Peterson School of Engineering
Recommendation: Add new section as follows:
Switchboards and panelboards shall be field marked with a sign or plaque to warn qualified and unqualified persons of the work spaces required to be kept clear by 110.26(A)(1), (2), (3) or 110.32 as applicable. The sign or plaque shall be located so as to be clearly visible to persons in the workspace and shall be permitted to be on or adjacent to the equipment. The marking shall include the words:

WARNING!
AREA IN FRONT OF ELECTRICAL PANEL MUST BE KEPT CLEAR FOR ________________________

The marking shall also include the dimensions of the depth, width, and height required to be kept clear for the workspace.
Substantiation: I am continually being forced to work on panelboards and switchboards that were originally installed with plenty of work space, but over time have had the work space encroached upon by other trades or unknowing individuals who install shelves, pipes, ductwork, walls, and all kinds of other obstructions too close to the electrical equipment. This places me and every other electrical worker in peril if I need to work on the equipment while energized. I have surveyed HUNDREDS of students that attend my classes and seminars and they all agree that they have also been put into this dangerous situation. Members of the Code Making Panel themselves may have worked in these situations. This is NOT just an enforcement issue, but also rather immediately DANGEROUS situation if the equipment is unreachable in an emergency, such as firefighters, or other emergency personnel (or anyone else for that matter) needing to turn the power off because of an emergency!!!!! They certainly cannot wait for the wire inspector to show up and "enforce" the code. It will be too late by that time. But maybe, just maybe the plumber won't put the pipe in the way, or the carpenter won't build the wall too close, or the shop owner won't install shelves right in front of the panel if there were a sign to warn them! It's certainly not a guarantee, but if the warning sign were to prevent ONE tragedy, then making this a requirement will certainly be worth it. These signs are already available for just a few dollars. Well worth the minimal cost. The wording in my proposal also allows for the sign to be placed on a wall or perhaps on the door to the electrical room, as long as the sign is clearly visible to anyone standing in the workspace thinking of putting an obstruction in front of the electrical panel.
Signs and plaques are required in several sections of the Code such as 110.15, 110.27(C), 110.31(B)(1), 225.37, 230.2, 426.13, 427.13, 450.8(D), 460.22(B)(2), 516.10(B)(3), 690.14(D)(4), 690.56(A), 690.56(B), 692.4(B), and 705.10. The sign or plaque that I am proposing is at least equal in importance to any of the other signs required by Code and perhaps MORE important than others.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP-9 recommends to the TCC that this proposal be forwarded to CMP-1 during the public comment period for action in Article 110. The subject matter is directly related to the dedicated workspace requirements and should be addressed in Chapter 1.

Ballot Results: Affirmative: 12

9-145 Log #4275 NEC-P09 **Final Action: Reject**
(408.9)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 408.9.
408.9 Equipment Approval. The equipment required or permitted by this Article after December 31, 2016 shall be acceptable only if listed.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, the proposed text requires listing of all equipment covered by this Article by a qualified testing agency as defined in Article 100. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation and listing of that equipment.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 9-128.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BREITKREUTZ, B.: The AHJ should approve equipment unless he inspects and identifies a specific non-compliance with the NEC.

9-146 Log #4276 NEC-P09 **Final Action: Reject**
(408.9)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 408.9.
408.9 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if listed.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See the statement on Proposal 9-126.

Ballot Results: Affirmative: 12
Comment on Affirmative:
BREITKREUTZ, B.: See my Comment on Affirmative on Proposal 9-125 (Log #4195).

9-147 Log #4277 NEC-P09 **Final Action: Reject**
(408.9)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 408.9.
408.9 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment

construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 9-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BREITKREUTZ, B.: See my Comment on Affirmative on Proposal 9-125 (Log #4195).

9-148 Log #4278 NEC-P09 **Final Action: Reject**
(408.9)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 408.9.
408.9 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

(408.30)

Submitter: Mike Theisen, St. Cloud, MN
Recommendation: Revise the text of 408.30 as follows:
408.30 General. All panelboards shall have a rating not less than the minimum feeder capacity required for the load calculated in accordance with Parts ~~II~~, III, IV, or V of Article 220 as applicable.
Substantiation: By deleting Part II from the list of Article 220 sections referenced in 408.30, this revision will clarify that the rating in question is the feeder or service, not a branch circuit. Part II is referenced in Part III of Article 220, so no requirements are lost.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-153 Log #2765 NEC-P09 **Final Action: Reject**
(408.36 Exception No. 1)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 4 for comment.
Submitter: Donald R. Offerdahl, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
Exception No. 1: Individual protection shall not be required for a panelboard used as service equipment ~~with~~ when multiple disconnecting means are installed in accordance with 230.71(A). For the purposes of determining a disconnecting means, a disconnecting means is an circuit breaker that serves a single load. A single pole 120 volt single phase breaker feeding a single phase 120 volt load is considered as one disconnecting means. A two pole 240 volt single phase breaker feeding a single phase 240 volt load is considered as one disconnecting. A three pole 208 volt three phase breaker feeding a three phase 208 volt load is considered as one disconnecting means, respectively. In panelboards protected by three or more main circuit breakers or sets of fuses, the circuit breakers or sets of fuses shall not supply a second bus structure within the same panelboard assembly.
Substantiation: The language in 230.72(B) is vague which states “Single-Pole Units. Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with identified handle ties or a master handle to disconnect all conductors of the service with no more than six operations of the hand.” Changing the reference to 230.72(A) clarifies the 6 disconnect rule. The added language of determining the number of disconnecting means better explains that the exception are limited to 6 disconnecting means feeding 6 loads. The language in 230.72(B) could be interpreted that the 3 single pole breakers could have a master tie and 18 single pole breakers could be operated by 6 master tie or handles. I don’t believe it was the objective of the code panel to allow this.
Panel Meeting Action: Reject
Panel Statement: The intent of this rule is to correlate this requirement, as simply as possible, with requirements in Article 230. The reference to 230.71 means that CMP-4 governs what constitutes appropriate disconnecting means for services, and CMP-9 does not want to second-guess those requirements. The panelboards covered in this proposal will function safely regardless of the number of disconnects within them. CMP-9 requests that the TCC send this proposal to CMP-4 for comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-154 Log #4865a NEC-P09 **Final Action: Reject**
(408.36(C))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 2 for information.
Submitter: John Steinke, Amish Electric
Recommendation: Add: Where, in a single phase system, a device has both a two-pole and a single-pole outlet on the same yoke, a three-pole disconnect will be used.
A companion proposal has been submitted to 210.7(B).
Substantiation: There exist combination devices that, for example, have a 240v receptacle and a 120v receptacle mounted on the same yoke. One ought to have these both become disconnected at the same time, as with a multi-wire branch circuit.
Yet, 408.36(C) would seem to prohibit this practice. I do not believe that was the intent of 408,36 as that section addresses an obsolete device that was used to ‘create’ limited three phase power from a single phase source.
210.4(C) appears to address this issue, and even to allow one ‘leg’ of the two-pole circuit to also supply the single-pole device, but I believe the NEC needs to be more specific.
Panel Meeting Action: Reject
Panel Statement: A three-pole breaker is not a delta breaker unless it actually supplies three-phase power through a third pole that is not connected to the panelboard bus structure. Therefore 408.36(C) does not prohibit the practice identified in the proposal. The technical merit of this proposal must be evaluated by CMP-2 and covered in Article 210, as the submitter has apparently recognized in his companion proposal. CMP-9 requests the TCC forward this proposal to CMP-2 for information.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-155 Log #2960 NEC-P09 **Final Action: Reject**
(408.40)

Submitter: Paul A. Keleher, Paul Keleher Electrical Services
Recommendation: 408.40 Grounding of Panelboards. Panelboard cabinets and panelboard frames, if of metal, shall be in physical contact with each other and shall be connected to an equipment grounding conductor. Where the panelboard is used with nonmetallic raceway or cable or where separate equipment grounding conductors are provided, the requirements of 250.130(A) or (B) shall apply. ~~A terminal bar for the equipment grounding conductors shall be secured inside the cabinet. The terminal bas shall be bonded to the cabinet and panelboard frame, if of metal; otherwise it shall be connected to the equipment grounding conductor that is run with the conductors feeding the panelboard.~~ …~~Equipment grounding conductors shall not be connected to a terminal bar provided for grounded conductors or neutral conductors unless the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted by Article 250.~~
Substantiation: This language in 408.40, is confusing without a specific reference to 250.130(A) or (B), and appears to be (although it on close scrutiny may actually not be) in conflict with 250.130(A) and (B). As a consequence of this confusion, installers are confused as to which requirement applies to the connection of equipment grounding conductors in non-metallic raceway or cable, often installing an equipment grounding bus in violation of 250.130(A) or (B). The text will be clearer by simply deferring to 250.130(A) or (B) when terminating equipment grounding conductors in non-metallic raceway or cable at a panelboard. The last paragraph of the section should be deleted as it creates confusion.
Panel Meeting Action: Reject
Panel Statement: This section (408.40) is written to correlate with 250.24(A)(5) or 250.30(A) as applicable. It then includes some installation requirements that are specific to panelboard enclosures that follow from the general rules here and in Article 250. CMP-9 does not agree with the submitter that the text is confusing or inconsistent with any provision in Article 250.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-156 Log #2540 NEC-P09 **Final Action: Reject**
(408.42)

Submitter: Lowell Bradbury, Vergas, MN
Recommendation: Add new text as follows:
408.42 Location. Panelboards back shall be located no less than 1 1/4 in. from the nearest framing member.
Substantiation: Siding installers with power nailers are shooting nails into load centers and panelboards that are flush mounted on exterior walls. We have seen numerous installations where the pneumatic staples or nails penetrate the back of flush-mounted panelboards, often directly contacting energized conductors or bus.
Panel Meeting Action: Reject
Panel Statement: Similar issues exist with many types of electrical components, including outlet boxes and conductors in wall cavities. No level of protection can always protect against poor workmanship by other trades on the jobsite. The examples cited in the submitter’s substantiation are anecdotal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-157 Log #4540 NEC-P09 **Final Action: Accept in Principle**
(408.51)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the negative comments expressed in the voting and that this proposal be referred to Code-Making Panel 5 for comment.
Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing text of the 2008 NEC by adding a new sentence as follows:
408.51 Busbars. Insulated or bare busbars shall be rigidly mounted. Busbars for the equipment grounding conductor in switchboards listed for use as service equipment shall be sized in compliance with 250.102(C).
Substantiation: The new sentence will ensure that the equipment grounding busbar in service equipment is sized properly for termination of bonding jumpers and main bonding jumpers. It is very common to terminate bonding jumpers for raceways containing service-entrance conductors on the equipment bonding busbar. The bonding jumpers are required to be sized in accordance with 250.102(C). The bonding jumpers for main and system bonding jumpers are required to be sized according to 250.28(D) which is identical to the requirement in 250.102(C).
Panel Meeting Action: Accept in Principle

Accept the proposal as modified by adding the words "or the busbar location shall be labeled to prohibit bonding connections associated with service-entrance conductors" at the end of the proposed requirement.
Panel Statement: CMP-9 agrees with the technical concerns of the submitter but chooses to allow current busbar designs to continue where the manufacturer chooses to apply the appropriate warning label.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
OSBORNE, R.: The Panel should reject this proposal. The example used in the substantiation is a Code violation, as 250.80 requires service raceways and enclosures to be bonded to the grounded system conductor, with the method of bonding detailed in 250.92(B). Identifying Section 250-102(C) as the source of requirements for the equipment grounding conductor is incorrect, as this applies to the sizing of supply side enclosure bonding jumpers.
RUPP, B.: The requirements of 250-102(C) apply to the sizing of supply side enclosure bonding jumpers and do not pertain to equipment grounding conductors. Service raceways and enclosures are required to be bonded to the grounded system conductor per 250.80 with one of the methods specified in 250.92(B). Section 250.86 provides the requirements for other than service with 250.94 providing the methods permitted and 250.102(D) the bonding jumper sizing. The substantiation example of connecting bonding jumpers for service conductor raceways to the equipment grounding busbar is a violation of 250.80 and 250.92(B).

9-158 Log #2563 NEC-P09 **Final Action: Accept**
(408.55)

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text as follows:
408.55 Wire-Bending Space ~~in Panelboards~~ <u>within an Enclosure Containing a Panelboard.</u>
Substantiation: The current wording is not accurate, as the section pertains to the wire bending space about the panelboard within an enclosure. The proposed wording will enhance clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-159 Log #243 NEC-P09 **Final Action: Reject**
(408.57)

Submitter: Robert Losaw, Ridge Electric, Inc.
Recommendation: Add new text to read as follows:
<u>**408.57** Each panel board shall be manufactured to contain a number of separate connection places for ground wires and for neutral wires, that number to meet or exceed the maximum number of circuits the panel may contain. This applies without concern for the intended use for the panel board as a main panel, sub-panel, or disconnect box.</u>
Substantiation: Many manufactured panels do not contain sufficient lugs or connection points for circuit's ground wires. For example, a Square D 200-amp QO panel allows 40 circuits, but has only 30 ground wire connection points. This requires installing an additional lug or combining multiple ground wires under one lug bolt, both producing unnecessary ground error possibilities.
Panel Meeting Action: Reject
Panel Statement: The submitter has substantiated a need to pay attention to detail when ordering electrical equipment but no safety issue. Many panels are used with wiring methods that do not require separate equipment grounding conductors. Many equipment grounding terminals, including those in the panel cited in the substantiation, are listed for more than one equipment grounding termination at a single terminal. This proposal is not necessary. Additional terminals are readily available in kit form.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 409 — INDUSTRIAL CONTROL PANELS

11-4 Log #4270 NEC-P11 **Final Action: Reject**
(409.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 409.5 in Part I.
<u>409.5 Equipment Approval. The equipment required or permitted by this Article after December 31, 2016 shall be acceptable only if listed.</u>
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, the proposed text requires listing of all equipment covered by this Article by a qualified testing agency as defined in Article 100. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation and listing of that equipment.

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 409.5 in Part I.
<u>409.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if listed.</u>
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: The proposal limits the ability of installing and constructing electrical equipment. The authority having jurisdiction already has the authority to require listing of electrical equipment through NEC Sections 90.4, 90.7, and 110.2. Information is provided for the basis of approval in Section 409.1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-6 Log #4272 NEC-P11 **Final Action: Reject**
(409.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 409.5 in Part I.
<u>409.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:</u>
<u>(1) Equipment listing or labeling</u>
<u>(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation</u>
<u>(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment</u>
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-5
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-7 Log #4273 NEC-P11 **Final Action: Reject**
(409.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 409.5 in Part I.
409.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-8 Log #4274 NEC-P11 **Final Action: Reject**
(409.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 409.5 in Part I.
409.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-9 Log #4404 NEC-P11 **Final Action: Reject**
(409.22)

Submitter: Jay Tamblingson, Rockwell Automation
Recommendation: Add new paragraph 409.22 as follows:
409.22 Short-Circuit Current Rating. An industrial control panel shall not be installed at a point on the electrical system where the available fault current is in excess of its short-circuit current rating as marked per 409.110(3).
Substantiation: The present language in 409.110 includes requirements for short-circuit current rating (SCCR) markings on industrial control panels. In many cases, the SCCR rating for the panel may be less than the interrupting rating(s) of the branch circuit protective devices and SCCR's of other components in the panel, which can lead to confusion to the suitability for the available fault current. The added paragraph provides clear language that the overall SCCR rating on the panel as determined by 409.110(3) is to be used to evaluate suitability.
Similar language can be found in Article 285.6 for TVSS devices and in Paragraph 4.8 of the 2007 NFPA 79.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are addressed in Sections 110.3(B) and 110.10.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-10 Log #985 NEC-P11 **Final Action: Reject**
(409.60)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Multisectional industry control panels shall be bonded together with ~~an equipment grounding~~ conductor in the form of a wire or ~~an equivalent grounding~~ bus sized in accordance with Table 250.122 for the largest overcurrent device protecting the control panel. Equipment grounding conductors shall terminate on this ~~grounding~~ bus or to a grounding termination point provided in a single section industrial control panel.
Substantiation: Edit. Conductors that provide bonding are not generally designated as equipment grounding conductors. Bonding in itself does not necessarily provide grounding.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-11.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-11 Log #1305 NEC-P11 **Final Action: Reject**
(409.60)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:
BONDING. Multisection industrial control panels shall be bonded together with a conductor in the form of a wire sized in accordance with Table 250.122 or a bus of equal or greater ampacity. Wire-type equipment grounding and bonding conductors shall be connected to the bus (if provided) or to equipment grounding terminals in the industrial control panel(s).
Substantiation: "Bonded together" involves bonding conductors, not equipment grounding conductors. Bonding conductors should be specified to be connected to the bus (if provided). The word "provided" implies, but does not require a grounding termination point.
Panel Meeting Action: Reject
Panel Statement: The present language is consistent with the definition of equipment grounding conductors as defined in Article 100. It is recognized that the equipment grounding conductor also performs bonding. Section 250.118 specifies the types of equipment grounding conductors permitted. The submitter's proposed reference to using the largest overcurrent device for sizing the equipment grounding conductor is presently required by 250.122 and is not needed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-12 Log #3883 NEC-P11 **Final Action: Reject**
(409.102(A))

Submitter: Thomas Hull, E Light Electric Services
Recommendation: Revise text as follows:
Busbars shall be protected from physical damage and ~~be held firmly in place~~ be installed according to manufacturers torque ratings
Substantiation: The word "family" is listed in the NEC Style manual as a word not to be used in the NEC because it is potentially unenforceable. The revised wording is more specific and enforceable.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposal changes the meaning and intent of the section. "Held firmly in place" addresses bracing, whereas torqueing primarily addresses connection integrity. There are situations where bus bars are field fabricated and installed in industrial control panels and do not have manufacturers' recommendations. The submitter's intent is unclear.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-13 Log #3886 NEC-P11 **Final Action: Reject**
(409.102(A))

Submitter: Kathy Garcia, E Light Electric Services
Recommendation: Revise text as follows:
Busbars shall be protected from physical damage and ~~be held firmly~~ shall be installed firmly in place.
Substantiation: The wording of the paragraph above needs to be changed from a busbar being held firmly in place to be installed firmly in place so that the reader of text and installer of equipment are not mislead or confessed about information provided. The text needs to be clear so that no mistakes are made installing busbar properly.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add any clarity to the section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-14 Log #884 NEC-P11 **Final Action: Accept in Principle**
(409.102(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
Other busbar arrangements for additions to existing installations and the phases shall be effectively identified marked.
Substantiation: Edit. Present wording does not indicate what is to be marked or the purpose of marking.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 11-15.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-15 Log #989 NEC-P11 **Final Action: Accept in Principle in Part**
(409.102(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Other busbar arrangements shall be permitted for additions to existing installations and the phases shall be effectively identified ~~marked~~.
Substantiation: Edit. Present wording does not indicate what is to be marked or the purpose of marking.
Panel Meeting Action: Accept in Principle in Part
Revise the last sentence of 409.102(B) to read:
Other busbar arrangements shall be permitted for additions to existing installations, and the phases shall be permanently ~~effectively identified~~ marked.
Panel Statement: The term "identified" is defined in Article 100 and relates to listings by testing agencies. The present language more accurately describes the identification requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-16 Log #3653 NEC-P11 **Final Action: Reject**
(409.102(B))

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Revise text to read as follows:
(B) Phase Arrangement. The phase arrangement on 3-phase horizontal common power and vertical buses shall be so that when the leads of a phase rotation meter are connected A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the industrial control panel that the phase rotation meter shall indicate a clockwise rotation. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.
Substantiation: As this section is currently written it has no meaning. It appears that the intent is to require a clockwise rotation. If this is not the intent, then the section does not accomplish anything as the terms A, B and C are only arbitrary terms and the section should be deleted from the code.
Panel Meeting Action: Reject
Panel Statement: The added language does not enhance the safety to the installation. The NEC is not a design manual in accordance with 90.1(C).
This is consistent with Sections 408.3(E) on panelboards and switchboards and 430.97(B) on motor control centers.
This section, as written, does provide a benefit. For example, it requires that the middle phase, the B-phase, be the phase with the higher voltage to ground, if such a situation exists.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-17 Log #333 NEC-P11 **Final Action: Accept**
(409.104)

Submitter: Paul J. Cormier, Worcester Electrician School
Recommendation: Revise as follows:
409.104 Wiring space ~~in Industrial Control Panels~~.
Substantiation: "In Industrial Control Panels" is redundant to the article's heading.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-18 Log #334 NEC-P11 **Final Action: Reject**
(409.104(A))

Submitter: Paul J. Cormier, Worcester Electrician School
Recommendation: Revise as follows:
Industrial control panel enclosures shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches or overcurrent devices, unless associated with the control panel and adequate space for this purpose is provided.
Substantiation: Too often you can shut down the power to a control panel with switches or overcurrent devices to comply with NFPA 70E only to find live wiring not associated with said control panel occupying the same space.
Panel Meeting Action: Reject
Panel Statement: The proposal conflicts with other provisions in the code and is too limiting in scope. Section 312.8 specifically allows what the submitter is proposing to prohibit.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-19 Log #335 NEC-P11 **Final Action: Reject**
(409.104(A))

Submitter: Paul J. Cormier, Worcester Electrician School
Recommendation: Revise as follows:
(A) ~~General.~~ Conductors, splices, and taps within industrial control panel enclosures for switches or overcurrent devices.
Substantiation: The existing heading does not effectively describe the content of the article.
Panel Meeting Action: Reject
Panel Statement: The present heading more accurately describes the contents of the section and gives general requirements for wiring within an industrial control panel. The proposed language does not include all of the requirements of the section as stated in the substantiation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-20 Log #1429 NEC-P11 **Final Action: Accept in Principle in Part**
(409.104(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Industrial control panel enclosures shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches, or overcurrent devices, or other equipment unless adequate space for this purpose is provided and the conductors shall not fill the wiring space to more than 40 percent of the cross sectional area at any cross section and taps shall not fill the cross sectional area wiring space at any cross section to more than 75 percent . ~~of the cross sectional area of that space.~~
Substantiation: Edit. Conductors feeding through or tapping off to equipment other than switches or overcurrent devices should be included. "Adequate" is a term to be avoided per the Style Manual, and is effectively covered by the fill requirements.
Panel Meeting Action: Accept in Principle in Part
Revise (A) to read as follows:
(A) General. Industrial control panel enclosures shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches or overcurrent devices or other equipment unless the conductors fill less than 40 percent of the of the cross-sectional area of the wiring space. In addition, the conductors, splices, and taps shall not fill the wiring space at any cross section to more than 75 percent of the cross-sectional

area of that space.
Panel Statement: The addition of the text "or other equipment" improves clarity as these conductors may supply other components, such as contactors or relays. The last part of the last sentence will remain as is. It specifies where the 75% applies and adds to clarity of the intent of this requirement.
The panel editorially changed the first and second sentences for more clarity and usability.
In addition, substantiation was not provided for the removal of the last phrase.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
DESJARLAIS, J.: The first sentence of (A) should be revised as follows "... conductors feeding through or tapping off to other switches, ~~or~~ overcurrent devices or other equipment....". Delete "or" and add comma.

11-21 Log #1161 NEC-P11 **Final Action: Accept in Principle in Part**
(409.106)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Replace existing text and add new table as follows:
~~409.106 Spacing. Spacings between live bare metal parts in feeder circuits shall not be less than specified in Table 430.97.~~
<u>409.106 Spacings. Spacings in feeder circuits between uninsulated live parts of adjacent components, between uninsulated live parts of components and grounded or accessible dead metal parts, between uninsulated live parts of components and the enclosure, and at field wiring terminals, shall be maintained as shown in Table 409.106.</u>
Exception: Spacings shall be permitted to be less than those specified in Table ~~430.97~~ <u>409.106</u> at circuit breakers and switches and in listed components installed in industrial control panels.

Table 409.106 Minimum Spacing Between Bare Metal Parts in Feeder Circuits

	Opposite Polarity Over Surface		Opposite Polarity Through Air		Live Parts to Ground	
	mm	**in.**	**mm**	**in.**	**mm**	**in.**
Nominal Voltage						
Not over 125 volts, nominal	19.1	3/4	12.7	½	12.7	1/2
Not over 250 volts, nominal	31.8	1 ¼	19.1	¾	12.7	½
Not over 600 volts, nominal	50.8	2	25.4	1	25.4	1

Substantiation: The existing text and the reference to Table 430.97 is unclear as to whether it is addressing spacing within components or spacings between components, between components and ground, and at field wiring terminals. The new text and table is based on UL 508A and clarifies that the spacings only apply between components, between components and ground, and at field wiring terminals.
Panel Meeting Action: Accept in Principle in Part
Revise existing 409.106 to read as follows:
409.106 Spacings. Spacings in feeder circuits between uninsulated live parts of adjacent components, between uninsulated live parts of components and grounded or accessible non-current-carrying metal parts, between uninsulated live parts of components and the enclosure, and at field wiring terminals shall be as shown in Table 430.97.
Exception: Spacings shall be permitted to be less than those specified in Table 430.97 at circuit breakers and switches and in listed components installed in industrial control panels.
Panel Statement: The panel revisions to the proposal replaces the term "dead" with "non-current-carrying." The language improves the usability and satisfies the submitter's concern. The panel rejects the insertion of the proposed table. The present reference to Table 430.97 adequately addresses the submitter's intent; accepting the proposed table is redundant. In addition, the word "maintained" was removed because maintenance is beyond the scope of the NEC.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-22 Log #987 NEC-P11 **Final Action: Reject**
(409.108)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence: Where used as service equipment each industrial control panel shall be of the type that is <u>identified</u> ~~suitable~~ for use as service equipment.
Substantiation: Edit. "Suitable" is a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The use of the word "suitable" is appropriate in this context. The proposal is, in fact, not simply editorial but would make a change in the requirement.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-23 Log #4465 NEC-P11 **Final Action: Accept in Principle**
(409.110(3))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal concerning the use of the word "when" since the NEC Style Manual considers "when" as a condition of time.
This action will be considered by the panel as a public comment.
Submitter: Robert G. Fahey, City of Janesville
Recommendation: Revise text to read as follows:
409.110 <u>(3) When an industrial control panel is provided with more than one power source such that more than one disconnect switch is required to disconnect all power within the control panel shall be marked: "CAUTION²: Industrial Control Panel is supplied by more than 1 power source.</u>
Renumber existing subsection (3) to (4) and renumber subsequent subsections to follow.
Substantiation: Without the text included in NEC Article 409, the person servicing the industrial control panel may not realize there is more than power supply to the industrial control panel, with this required labeling the personnel servicing the equipment will be better protected from shock hazards or possibly electrocution. This same requirement is found in UL 508A, section 55.4, the Standard which is used for "listed" industrial control panels. I would propose the new wording be the new paragraph (3) so as to follow the wording in paragraph (2) which relates to the incoming supply circuit(s) and renumber the present (3) as (4) and renumber the remaining paragraphs accordingly.

Panel Meeting Action: Accept in Principle
Revise text to read as follows:
409.110 (3) When an industrial control panel is supplied by more than one power source such that more than one disconnecting means is required to disconnect all power within the control panel, it shall be marked to indicate that more than one disconnecting means is required to de-energize the equipment. Renumber existing subsection (3) to (4) and renumber subsequent subsections to follow.
Panel Statement: The action meets the intent of the submitter while improving the clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 410 — LUMINAIRES (LIGHTING FIXTURES), LAMPHOLDERS, AND LAMPS

18-91 Log #2296 NEC-P18 **Final Action: Reject**
(410.1)

Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Article 410.1 – Revised to
"This article covers luminaires, portable luminaires, lampholders, pendants, incandescent filament lamps, electric-discharge lamps and ballasts, LED drivers, decorative lighting…".
Substantiation: Article also covers ballasts for discharge lamp and LED drivers. The components are specially called out, as there are references to the direct installation of these components, not that they are usually components for luminaires. "LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ.
Panel Meeting Action: Reject
Panel Statement: Ballasts and LED drivers are included in the scope of this article because they are included as part of a luminaire.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-92 Log #2861 NEC-P18 **Final Action: Reject**
(410.2, Exception No. 1 to (2))

Submitter: Randall Clacys, Lone Pine Lake Electric
Recommendation: Add to 410.2:
Lighting in closet storage space shall not be required if the space is not considered habitable.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-93 Log #994 NEC-P18 **Final Action: Reject**
(410.5 Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "floor" to "standing surface".
Substantiation: Edit. There may not be a "floor" per se; standing surface may be earth, platforms, walkways, etc.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-94.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-94 Log #1196 NEC-P18 **Final Action: Reject**
(410.5 Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Exception No. 1: Cleat type lampholders located at least 2.5m (8ft) above the floor or standing surface shall be permitted to have exposed terminals. Add: Exception No. 2: Exposed live parts of lighting systems shall be permitted in accordance with 411.5 (C) and (D).
Substantiation: Cleat type lampholders may be installed with open wiring on insulators in agricultural establishments (barns) where there is no "floor", and in lighting systems of 30 volts or less outdoors where there is no floor.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation. See 4.3.3 of the NFPA Regulations Governing Committee Projects. Standing space may include the treads on a stair. Present wording is acceptable, and the proposed changes would only cause confusion as to its intent.
Further, the submitter is requested to review the definition of "floor" in the dictionary, which would include the surfaces in his proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-95 Log #3076 NEC-P18 **Final Action: Reject**
(410.6)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Delete the following text:
~~410.6 Listing Required.~~
~~All luminaires and lampholders shall be listed.~~
Substantiation: This requirement is overly restrictive and should be deleted. There was very inadequate technical substantiation in adding it to the 2008 NEC.
Panel Meeting Action: Reject
Panel Statement: There is no information to support the submitter's statement that there was insufficient technical substantiation to require luminaires and lampholders to be listed.
The submitter does not provide sufficient substantiation. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-96 Log #833 NEC-P18 **Final Action: Reject**
(410.8(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revisit: LUMINAIRE TYPES Only listed luminaries of the following types shall be permitted to be installed in a closet.
Substantiation: Edit. "Permitted" per 90.3(B) does not constitute a requirement.
Panel Meeting Action: Reject
Panel Statement: See 4.3.3 of the NFPA Regulations Governing Committee Projects. The submitter has failed to reference a proper section in the 2008 NEC. The submitter does not seem to be using the 2008 edition of the NEC.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-97 Log #993 NEC-P18 **Final Action: Reject**
(410.10(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Wiring methods and materials supplying the luminaire(s) shall not be ~~exposed within~~ installed on the exposed surface of the cooking hood.
Substantiation: Edit. The definition of exposed applies to wiring methods behind panels which allow access which includes wiring methods so installed which are not subject to vapors or grease.
Panel Meeting Action: Reject
Panel Statement: CMP-18 finds the phrase "installed on the exposed surface" to be vague, confusing, and potentially subject to misinterpretation. Since there is no indication that the present wording has resulted in misinterpretations, CMP-18 finds the current wording acceptable.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-98 Log #4623 NEC-P18 **Final Action: Reject**
(410.10(C)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change the word "identified" to "marked".
Substantiation: Since all luminaires installed pursuant to the current version of Article 410 must be listed, they must also meet the definition of "identified" in Article 100 (recognizable as suitable, etc.). Therefore, this requirement means nothing as worded. Almost surely, what is intended is a marking requirement showing the appropriate use. Identified as defined in Article 100 does not mean marked, and care must be taken to avoid misusing the term.
Panel Meeting Action: Reject
Panel Statement: The term "identified" in Article 100 states "Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular Code requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-99 Log #2767 NEC-P18 **Final Action: Reject**
(410.10(D))

Submitter: Greg Schmidt, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
(D) Bathtub and Shower Areas. No parts of cord-connected luminaires, chain-, cable-, or cord-suspended luminaires, lighting track, pendants, or ceiling-suspended (paddle) fans shall be located within a zone measured 900 mm (3 ft) horizontally and 2.5 m (8 ft) vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the space directly over the tub or shower stall. Luminaires located within the actual outside dimension of the bathtub or shower to a height of 2.5 m (8 ft) vertically from the top of the bathtub rim or shower threshold shall be marked for damp locations, or marked for wet locations where subject to shower spray, and shall be GFCI protected.
Substantiation: 680.22(C)(4) and 680.43(B)(1)(a-c) requires GFCI protection for luminaires installed in zones surrounding pool and hot tub areas. The same shock hazard exists in bathrooms where Luminaires are installed above shower stalls, bathtubs and hydro-massage tubs. People could come in contact with the luminaire when in the bathtub, shower stall, or hydro-massage tub. In situations when a person may have to re-lamp the luminaire, the area may still be wet. For example: While a person was taking a shower the bulb burns out. The individual, (still in their bathrobe) stands in a wet shower when changing the bulb. The Authority Having Jurisdiction should not have to rely upon the installation instructions of the luminaire to specify GFCI protection and 410.10(D) should cover this requirement.
Panel Meeting Action: Reject
Panel Statement: The submitter has documented no hazard.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-100 Log #1918 NEC-P18 **Final Action: Reject**
(410.11)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Luminaires and lampholders that operate with a surface temperature higher than 90°C (194°F) shall be clearly marked to indicate a separation distance from combustible material and constructed, installed or equipped with identified means to minimize the likelihood of igniting combustible material.
Substantiation: Lampholders should be included. Unless there is a marking, the installer and AHJ are not likely to be aware of operating temperature.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-101 Log #4624 NEC-P18 **Final Action: Accept in Principle in Part**
(410.11)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change "Luminaires" in the title and in the beginning of the text to read "luminaires and lampholders".
Substantiation: This section fails to include lampholders, even though an incandescent lampholder, particularly one with a large lamp, is probably the most potent heat source available. This proposal corrects this oversight.
Panel Meeting Action: Accept in Principle in Part
Add 410.97(New) to Part VIII to read as follows:
410.97 Lampholders Near Combustible Material. Lampholders shall be constructed, installed, or equipped with shades or guards so that combustible material is not subjected to temperatures in excess of 90°C (194°F).
Panel Statement: CMP-18 agrees with the submitter that lampholders need to be addressed.
CMP-18 disagrees that 410.11 is the correct location to change the text. As such, a new section 410.97 is created.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
CARPENTER, F.: The Panel Action text is likely to result in issues concerning enforceability since in most cases the AHJ will not be able to determine if an installation will result in material operating in excess of 90 C. Additionally, the submitter has not provided any data to support a conclusion that a problem exists with current installation practices.

18-102 Log #1917 NEC-P18 **Final Action: Reject**
(410.11(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Edit. Already covered by 410.11 which includes flush and recessed types.
Panel Meeting Action: Reject
Panel Statement: The submitter does not reference a legitimate section of the Code. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-103 Log #992 NEC-P18 **Final Action: Reject**
(410.12)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "floor" in the last sentence to "standing surface" or "finished grade".
Substantiation: Edit. There may be no "floor" per se; the standing surface may be earth, walkways, platforms, etc.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-94.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-104 Log #747 NEC-P18 **Final Action: Reject**
(410.16)

Submitter: Phillip Hyche, City of Hoover
Recommendation: Revise text to read as follows:
Luminaires in clothes closets (and storage areas).
Substantiation: ● To help with the new definition of clothes closet.
● 2 Fires caused by open bulbs in storage spaces with clothes.
● Clarity between Insp. and Contractor where clothes may be located and cause fire hazard.
Panel Meeting Action: Reject
Panel Statement: No details in the substantiation support the expansion of the requirements to other types of storage areas that are completely undefined.
The submitter is encouraged to write in complete sentences and to elaborate so the panel does not have to guess at what the submitter is trying to convey.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-105 Log #4463 NEC-P18 **Final Action: Accept**
(410.16)

Submitter: Frederick L. Carpenter, Lithonia Lighting
Recommendation: Revise 410.16 as shown below:
410.16 Luminaires in Clothes Closets
(A) Luminaire Types Permitted. Listed luminaires of the following types shall be permitted to be installed in a closet:
(1) ~~A surface-mounted~~ Surface-mounted or recessed incandescent or LED luminaires with ~~a~~ completely enclosed ~~lamp~~ light sources
(2) ~~A surface-mounted~~ Surface-mounted or recessed fluorescent luminaires
(3) Surface-mounted fluorescent or LED luminaires identified as suitable for installation within the closet storage ~~area~~ space
(B) Luminaire Types Not Permitted. Incandescent luminaires with open or partially enclosed lamps and pendant luminaires or lampholders shall not be permitted.
(C) Location. The minimum clearance between luminaires installed in clothes closets and the nearest point of a closet storage space shall be as follows:
(1) 300 mm (12 in.) for surface-mounted incandescent or LED luminaires with a completely enclosed light source installed on the wall above the door or on the ceiling
(2) 150 mm (6 in.) for surface-mounted fluorescent luminaires installed on the wall above the door or on the ceiling
(3) 150 mm (6 in.) for recessed incandescent or LED luminaires with a completely enclosed light source installed in the wall or ceiling
(4) 150 mm (6 in.) for recessed fluorescent luminaires installed in the wall or ceiling
(5) Surface-mounted fluorescent or LED luminaires shall be permitted to be installed within the closet storage space where identified for this use.
Substantiation: 1. The 2008 NEC moved the definition for "Storage Space" from this section to Section 410.2 and renamed the definition "Closet Storage Space". The remaining uses of the terms "storage space" and "storage area" in 410.16 need to be updated to "closet storage space" to be consistent with the definition in 410.2.

2. The 2008 NEC added provisions for the use of LED luminaires in 410.16(C)(1), 410.16(C)(3), and 410.16(C)(5); however, 410.16(A) implies that LED luminaires are only permitted when “identified as suitable for installation within the storage area”. This was only the intent when an installation complies with 410.16(C)(5). This can be rectified by adding the provision for LED luminaires in 410.16(A)(1).

3. 410.16(A)(1) and 410.16(A)(2) should be changed to the plural tense to be consistent with the rest of the section.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-106 Log #1383 NEC-P18 **Final Action: Reject**
(410.16(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise texts:
(A) ~~Listed~~ Only luminaires of the following types shall ~~be permitted to~~ be installed in a closet:
(B) Lampholders and incandescent luminaires with open or partially enclosed lamps and pendant luminaires and lampholders shall not be permitted.
Substantiation: Edit. Luminaires and lampholders are already required to be listed by 410.6. “Permitted” does not entail any requirement per 90.5(B).
Panel Meeting Action: Reject
Panel Statement: Without the words “be permitted to,” the installation of luminaires becomes mandatory in a clothes closet. See 3.1.2 for permissive Rules in the NEC Style Manual.
The substantiation is incorrect in implying that the proposal is editorial, nowhere in the NEC are luminaires required in clothes closets. Therefore, the present wording “permitting” certain types (and not others) is correct.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-107 Log #1921 NEC-P18 **Final Action: Reject**
(410.18)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Luminaires, lampholders, and other equipment installed in coves and which are likely to require inspection or maintenance shall be accessible.
Substantiation: Edit. “Adequately” and “properly” are subjective and terms to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The proposed revision is not considered editorial. Further, it opens the requirement to permit lampholders, which are not permitted in the current wording.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-108 Log #665 NEC-P18 **Final Action: Reject**
(410.19 (New))

Submitter: Michael L. Savage, Sr., Middle Department Inspection Agency, Inc.
Recommendation: Add new Section 410.19 to read as follows:
410.19 Space for Luminaires. A space of not less than 6 in. above a recessed suspended ceiling luminaire shall be maintained clear of all building systems for maintenance and replacement of the luminaire.
Substantiation: It has been my experience while conducting hundreds of electrical inspections on new and old buildings that systems foreign to the luminaires are installed directly over the luminaires, thereby effectively preventing or adversely affecting maintenance and replacements of said luminaires.
Panel Meeting Action: Reject
Panel Statement: The submitter has not indicated that the proposal will eliminate any hazard. It is not the purpose of the code to ensure installations are efficient, convenient, or adequate for good service or future expansion of electrical use. See 90.1(B).
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-109 Log #983 NEC-P18 **Final Action: Accept in Principle in Part**
(410.20)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Canopies and outlet boxes and fittings taken together shall provide ~~adequate~~ free space for conductors in accordance with 314.16.
Substantiation: Edit. Fittings such as conduit bodies should be included. “Properly” is subjective and a term to be avoided per the Style Manual. Reference to 314.16 is specific.
Panel Meeting Action: Accept in Principle in Part
Revise 410.20 to read as follows:
Canopies and outlet boxes taken together shall provide enough space so that luminaire conductors and their connecting devices shall be installed in accordance with the provisions of 314.16.
Panel Statement: CMP-18 does not accept inclusion of fittings.
The submitter has provided no substantiation for the inclusion of a conduit body in the calculation of volume for a fixture mounted to a box. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-110 Log #1382 NEC-P18 **Final Action: Accept in Principle**
(410.20)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Canopies and outlet boxes taken together shall comply with 314.16(A) ~~provide adequate space so that luminaires and their connecting devices can be properly installed~~.
Alternatively, delete this section.
Substantiation: Already more comprehensively covered in 314.16(A) which applies. “Adequate” and “properly” are terms to be avoided per the Style Manual.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-109.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-111 Log #2539 NEC-P18 **Final Action: Reject**
(410.20)

Submitter: Edward B. Vogt, Ed Trains
Recommendation: Delete text as follows:
~~410.20. Space for Conductors. Canopies and outlet boxes taken together shall provide adequate space so that luminaire conductors and their connecting devices can be properly installed.~~ (Delete the whole rule)
Substantiation: This rule directly contradicts 314.16 which states: “In no case shall the volume of the box...be less than the fill calculation... “Application of 410.20 for a small box installation could potentially cause ignition of combustible material under the canopy.
Panel Meeting Action: Reject
Panel Statement: The submitter has failed to provide sufficient substantiation for removal of this section. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
The submitter is also requested to look at 314.16(A) where it states “The volume of a wiring enclosure (box) shall be the total volume of the assembled sections and, where used, the space provided by plaster rings, domed covers, extension rings, and so forth, that are marked with their volume or are made from boxes the dimensions of which are listed in Table 314.16(A).”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-112 Log #2309 NEC-P18 **Final Action: Accept in Part**
(410.24)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with respect to subdivision titles.
This action will be considered by the panel as a public comment.
Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Article 410.24 Revise heading to
Connection of Electric-Discharge and LED Type Luminaires
Article 410.24(A) “Electric-discharge and LED type luminaires supported independently…”
Article 410.24(B) “Electric-discharge and LED type luminaires surface mounted…”.
Substantiation: Luminaires employing LED lamp technology will be replacing similar shaped products that have employed fluorescent lamp technology.
Panel Meeting Action: Accept in Part
Revise the heading of 410.24 to read as follows:
Connection of Electric-Discharge and LED Luminaires.
Revise the heading of 410.24(A) to read as follows: Electric-discharge and LED luminaires supported independently…
Revise the heading of 410.24(B) to read as follows: Electric-discharge and LED luminaires surface mounted…
Panel Statement: CMP-18 removed the word “type” from the submitter’s proposed text for consistency.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-113 Log #1095 NEC-P18 **Final Action: Reject**
(410.24(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Electric-discharge lumunaires, where not installed over outlet boxes and where supported independently of ~~the~~ an outlet box or conduit body shall be connected to the branch circuit ~~through metal raceway, nonmetallic raceway, Type MC cable, Type AC cable, Type MI cable, nonmetallic sheathed cable~~ by an identified raceway or cable, or flexible cord as permitted in 410.62(B) or 410.62(C).
Substantiation: Some recessed fixtures are mounted to yokes which incorporate an attached outlet box over the opening required by (B), but the box does not support the fixtures. It is not practical and not designed for connection to these boxes with raceways or cables. Proposal eliminates a laundry list of raceways and cables, requires the raceways and cables to be identified for the purpose, and provides for wiring methods of Articles 394 and 398.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no substantiation to allow the inclusion of UF cable or TC cable to be used in this installation. In his substantiation the submitter refers to sub-part (B), but the proposal deals with the requirements of sub-part (A) only and makes no provisions for access to the conductors in the outlet box.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-114 Log #991 NEC-P18 **Final Action: Reject**
(410.24(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Electric discharge luminaries ~~surface~~ mounted over ~~concealed~~ outlet, pull, or junction boxes ~~and designed to be supported solely by the outlet box~~ shall be provided with ~~suitable~~ openings in the back of the luminaire to provide access to the wiring in the box.
Substantiation: Access should also be required to boxes where luminaries are flush mounted or where surface mounted over surface mounted boxes. Outlet boxes are not permitted to be concealed (rendered inaccessible) per 314.29 and 314.72(D).
Panel Meeting Action: Reject
Panel Statement: Stating that something “should” be done does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects in that there is no statement of the problem or why the proposal solves the problem.
It appears the submitter does not realize that the luminaire in (B) is designed not to be supported solely by the box. This cannot be readily accomplished with a surface mounted box.
314.29 requires that the wiring in the box be accessible. This section accomplishes this by requiring a suitable opening in the back of the box for access to the wiring.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-115 Log #1381 NEC-P18 **Final Action: Reject**
(410.24(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete: “concealed”.
Substantiation: Concealed outlet boxes (per definition for concealed) are inaccessible and openings in the luminaire will not provide access to inaccessible boxes. 314.29 requires wiring in boxes to be accessible which can’t be accomplished if the boxes are concealed (inaccessible).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-114.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-116 Log #1994 NEC-P18 **Final Action: Reject**
(410.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first paragraph and substitute: metal or nonmetal poles identified for the use shall be permitted to support luminaires, lampholders, loudspeakers, cameres, and other equipment and to enclose conductors, coaxial cables, or fiber optic cables, and to be used as a raceway mast provided the following conditions are met; Add: (7) Coaxial cables and fiber optic cables shall be supported at the top by identified means if the vertical rise exceeds _____m (_____ft). Identified means shall be provided to prevent strain on termination.
Substantiation: Poles may support more than luminaires and should be permitted to support aerial spans and used as a raceway mast. Coaxial and fiber optic cables should be included. If proposal is accepted, the panel can determine support intervals for vertical rise of coaxial and fiber optic cables.
Panel Meeting Action: Reject
Panel Statement: The submitter has given no substantiation to support the mixing of line voltage and coaxial cables, fiber optic cables, or service conductors in the same raceway or enclosure. There is no data included to support the aerial spans the submitter has suggested. The proposal is in violation of sections 230.7, 725.48(B), and 820.47.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-117 Log #1386 NEC-P18 **Final Action: Reject**
(410.30(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change “suitable” to “identified”.
Substantiation: Suitable is subjective and a term to be avoided per the Style Manual; “identified” is defined.
Panel Meeting Action: Reject
Panel Statement: The submitter provides no information to substantiate the requirement for listing of poles. This would suggest that materials such as wood need to be listed. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-118 Log #3320 NEC-P18 **Final Action: Reject**
(410.30(C)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: and not less than specified in 406.2(B).
Substantiation: Edit. Correlation with 406.2 (B).
Panel Meeting Action: Reject
Panel Statement: See 4.3.3 of the NFPA Regulations Governing Committee Projects. The submitter has failed to reference a proper section in the 2008 NEC. The submitter does not seem to be using the 2008 edition of the NEC.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-119 Log #1041 NEC-P18 **Final Action: Reject**
(410.30(C)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
and not less than 15 amperes.
Substantiation: This section appears to conflict with 406.2(B) which requires a minimum ampere rating of 15 amperes since 125 percent of a luminaire load current may be substantially less than 15 amperes.
Panel Meeting Action: Reject
Panel Statement: See 4.3.3 of the NFPA Regulations Governing Committee Projects. The submitter has failed to reference a proper section in the 2008 NEC. The submitter does not seem to be using the 2008 edition of the NEC.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-120 Log #3319 NEC-P18 **Final Action: Reject**
(410.31)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Except as permitted in 410.32 luminaires (fixtures) shall not be used as a raceway ~~for circuit conductors~~ unless listed and marked for use as a raceway.
Substantiation: Edit. Correlation with 410.32. “Circuit conductors” may be deemed not to include grounding and bonding conductors and optical fiber cables.
Panel Meeting Action: Reject
Panel Statement: See 4.3.3 of the NFPA Regulations Governing Committee Projects. The submitter has failed to reference a proper section in the 2008 NEC. The submitter does not seem to be using the 2008 edition of the NEC.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-121 Log #1421 NEC-P18 **Final Action: Reject**
(410.40)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
General. Metal luminaires and lampholders shall be grounded ~~as required in Article 250~~ and comply with Part V of this article.
Substantiation: Article 250 has exceptions and alternatives to grounding which conflict with (A) and 410.46 which have no such provisions.
Panel Meeting Action: Reject
Panel Statement: The substantiation does not specify where any conflict exists with Article 250.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-122 Log #4541 NEC-P18 **Final Action: Reject**
(410.40 and 410.42)

Submitter: Phil Simmons, Simmons Electrical Services
Recommendation: Revise the existing text of the 2008 NEC as follows:
410.40 General.
Luminaires and lighting equipment shall be grounded as required in 250.112(J) ~~Article 250 and Part V of this article~~.
410.42 ~~**Exposed Luminaire.**~~
~~**(A) Exposed Conductive Parts.** Exposed metal parts shall be connected to an equipment grounding conductor or insulated from the equipment grounding conductor and other conducting surfaces or be inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 38 mm (1½ in.) from lamp terminals shall not be required to be grounded.~~
~~**(B) Made of Insulating Material.** Luminaires directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding attachment to an equipment grounding conductor shall be made of insulating material and shall have no exposed conductive parts.~~
~~*Exception No. 1: Replacement luminaires shall be permitted to connect an equipment grounding conductor from the outlet in compliance with 250.130(C). The luminaire shall then comply with 410.42(A).*~~
~~*Exception No. 2: Where no equipment grounding conductor exists at the outlet, replacement luminaires that are GFCI protected shall not be required to be connected to an equipment grounding conductor.*~~
~~**410.44**~~ **Equipment Grounding Conductor Attachment.**
Luminaires with exposed metal parts shall be provided with a means for connecting an equipment grounding conductor for such luminaires.
~~**410.46 Methods of Grounding.**~~
~~Luminaires and equipment shall be mechanically connected to an equipment grounding conductor as specified in 250.118 and sized in accordance with 250.122.~~
Substantiation: This proposal intends to move the installation requirements for luminaires to 250.112(J) under the jurisdiction of CMP-5. The construction requirements are appropriate to remain in Article 410.
Panel Meeting Action: Reject
Panel Statement: 250.112(J) contains no requirements for grounding luminaires other than a reference to part V of this article, which would be removed by this proposal.
CMP-18 objects to moving these installation requirements to Article 250.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-123 Log #982 NEC-P18 **Final Action: Reject**
(410.40(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
~~A~~ An identified means shall be provided in each metal box and cabinet for the connection of ~~an~~ a wire-type equipment grounding or bonding conductor. The means shall be permitted to be a tapped hole with at least two machine screw threads or a nut and bolt connection.
Substantiation: This provision appears related to wire type conductors. The means should be identified for the use. Nut and bolt connections are usually one identified means.
Panel Meeting Action: Reject
Panel Statement: The submitter does not reference a legitimate section of the code. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-124 Log #1420 NEC-P18 **Final Action: Reject**
(410.42(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
(A) Exposed ~~Conductive~~ Parts Luminaires. Exposed metal parts of luminaires and lampholders shall be...". (remainder unchanged)
(B) Made of Insulating Materials. Luminaires and lampholders directly wired or attached to outlets...". (remainder unchanged).
Exception No. 1: Replacement luminaires and lampholders shall be permitted...". (remainder unchanged).
Exception No. 2: Where no equipment grounding conductor exists at the outlet, replacement luminaires and lampholders that are GFCI protected...". (remainder unchanged).
Substantiation: This article covers lampholders such as for floodlights, which should be included in the provisions.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been given for adding lampholders to the requirements. Additionally, CMP-18 notes that floodlights are luminaires, not lampholders.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-125 Log #1303 NEC-P18 **Final Action: Reject**
(410.42(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Replacement luminaires and lampholders directly wired or attached to outlets supplied by an existing wiring method that does not provide a ~~ready~~ means for grounding ~~attachment to an equipment grounding conductor~~ shall have enclosures made of ~~insulating~~ nonconductive material and shall have no exposed conductive parts.
Substantiation: Since practically all wiring methods are required to provide an equipment grounding conductor, this provision should apply to existing installations as does 250.130(C) and replacement fixtures. Present wording can be construed as a retroactive requirement.
Panel Meeting Action: Reject
Panel Statement: Lampholders are not luminaires. Product standards for them do not require a ground.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-126 Log #1419 NEC-P18 **Final Action: Reject**
(410.44)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add "lampholders" after "luminaries".
Substantiation: This provision should also apply to lampholders.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-127 Log #1954 NEC-P18 **Final Action: Reject**
(410.45)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Lamps shall not be located where ~~normally~~ likely to be subject ~~exposed~~ to physical damage.
Substantiation: Edit. "Normally" is a term to be avoided per the Style Manual. "Likely" is defined as a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The submitter does not reference a legitimate section of the code. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-128 Log #1418 NEC-P18 **Final Action: Reject**
(410.46)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Metal luminaires and lampholders shall be..." (remainder unchanged).
Alternatively, delete this section.
Substantiation: Metal should be specified and lampholders included. This section is superfluous; already covered by Article 250 which applies.
Panel Meeting Action: Reject
Panel Statement: Lampholders are not luminaires. Product standards for them do not require a ground.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-129 Log #1304 NEC-P18 **Final Action: Reject**
(410.52)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Change "suitable" to "identified".
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: "Suitable" is an appropriate term. A conductor current is not identified.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-130 Log #3122 NEC-P18 **Final Action: Reject**
(410.53 (New))

TCC Action: The Technical Correlating Committee directs that the chairs of Code-Making Panels 9 and 18 establish a Task Group to review Proposal 9-75 and 18-130 with regard to application within their respective articles.
Submitter: Patricia Barron, Safety Quick Light
Recommendation: Add the following new text:
Luminaires shall be designed with a power plug for mating with receptacle in accordance with 314.27(A).
Substantiation: Statement Of Problem – There are many cases of electrocutions and accidents that occur during installations of luminaires, that result in a significant amount of **injuries, including death**.
Substantiation for Proposal - There is a receptacle and plug system available designed for **safe** installation of luminaires that enables luminaires to be simply plugged "in" or "out" **without touching any wires.** This type of system will **save lives** and substantially **reduce or eliminate electrocutions or accidents** caused during installation of light fixtures or even when replacing light bulbs. If the outlet box is supplied with the safety receptacle, luminaires for ceiling or wall become plug "in" to install and "out" to remove **safely and simply** without touching wires. Luminaires can be unplugged from the branch circuit when changing bulbs or maintenance and plugged in safely when done. **There are cases of death and severe injury even** when changing light bulbs. This type of luminaire receptacle and plug system will **save lives and prevent injuries** and **needs** to be implemented into the code. Please refer to attached report outlining cases of electrocution
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Installation of this device has the same level of risk as installing a luminaire. There is no compelling reason to believe that a user would remove the luminaire before relamping and if they did they would be exposed to conductors and splices in the outlet box, which should be avoided by untrained individuals.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-131 Log #1417 NEC-P18 **Final Action: Reject**
(410.62(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add "and lampholders" after "luminaires".
Substantiation: The provision should also apply to lampholders such as for floodlights.
Panel Meeting Action: Reject
Panel Statement: Stating that something "should" be done does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects in that there is no statement of the problem or why the proposal solves the problem.
The submitter has failed to provide sufficient substantiation for this change. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-132 Log #2712 NEC-P18 **Final Action: Reject**
(410.62(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
Adjustable luminaires and lampholders that are secured in place shall be permitted to be connected by identified flexible wiring methods. Where connected by flexible cord, the cord shall be hard-usage or extra-hard usage type identified for the use and contain an equipment grounding conductor. The wiring method shall not be longer than necessary for maximum adjustment and shall not be subject to strain at terminations. A flexible cord shall be permitted to be permanently connected or shall be provided with a grounding-type attachment plug.
Substantiation: The provision should apply to fixed equipment and include lampholders such as for floodlights and spotlights. Flexible wiring methods other than cords should be included. Cords should be identified for the purpose, e.g., wet locations, sunlight resistance, etc. All hard usage and extra hard usage cords are not suitable such as electric vehicle cables. Physical damage is covered by 400.8(7) as are other wiring methods.
Panel Meeting Action: Reject
Panel Statement: Stating that something "should" be done does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects in that there is no statement of the problem or why the proposal solves the problem.
Certain other flexible wiring methods are acceptable for connection of adjustable luminaries, but they should not be included in 410.62(B) since the title of the section is "Cord-Connected Lampholders and Luminaires". Lampholders are covered in 410.62(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-133 Log #2308 NEC-P18 **Final Action: Accept in Part**
(410.62(C))

Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Article 410.62(C) Revise heading to
Electric-Discharge and LED Type Luminaires.
Substantiation: The rules written for a fluorescent type "shop lights" would also be appropriate for the same luminaire type, but which employs LED lamp technology.
Panel Meeting Action: Accept in Part
Article 410.62(C) Revise heading to read as follows:
Electric-Discharge and LED Luminaires.
Panel Statement: CMP-18 removed "type" from the submitter's proposal for consistency.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-134 Log #4625 NEC-P18 **Final Action: Reject**
(410.62(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Editorially revise this material as follows:
(C) Electric-Discharge Luminaires. Electric discharge luminaires shall comply with (1) unless either (2) or (3) specifically apply to the application.
(1) Cord-Connected Installations. Luminaires in compliance with any of the conditions in (a) through (c) shall be permitted to be cord connected provided the luminaire is located directly below the outlet or busway and the cord is not be subject to strain or physical damage.
(a) Plug-Connected. A luminaire shall be permitted to be connected with a cord terminating in a grounding-type attachment plug or busway plug.
(b) Strain Relief and Canopy Provided. A luminaire assembly equipped with a strain relief and canopy shall be permitted to use a cord connection between the luminaire assembly and the canopy. The canopy shall be permitted to include a section of raceway not over 150 mm (6 in.) in length and intended to facilitate the connection to an outlet box mounted above a suspended ceiling.
(c) Manufactured Wiring Systems. Listed assemblies incorporating manufactured wiring system connectors in accordance with 604.6(C), shall be permitted to be cord connected.
[No changes to (2) or (3).]
Substantiation: This proposal begins by setting a relationship between (1), and (2) and (3) which necessary because all three numbered items address cord-connected luminaires. The first topic is restructured to put the requirements that apply to the entire number (1) in the parent text and then listing the three remaining conditions in a rule rather than a list format. This allows for parallel construction and the use of complete sentences. The overall effect is to break up a 62-word run-on sentence that is almost impossible to read. The soft conversion on the length of the nipple is converted to a hard conversion in accordance with 90.9(B).
Panel Meeting Action: Reject
Panel Statement: The submitter in his rewording of 410.62(C) left out several key components of the existing section. For instance, he did not include the requirement of cord visibility and the requirements that the luminaire be directly below the outlet or busway.
The submitter does not understand the relationship of (1), (2), and (3) of 410.62(C). An installation must comply with (1) even if it complies with (2), or (3).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-135 Log #2579 NEC-P18 **Final Action: Reject**
(410.62(C)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
Receptacles. Cord connectors, flanged surface devices, and attachment plugs shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire or lampholder ~~full-load~~ rated current and not less than specified in 406.2(B).
Substantiation: Edit. The provision should include cord connectors and flanged surface devices and a minimum rating specified in 406.2(B) for correlation.
Panel Meeting Action: Reject
Panel Statement: Flanged surface devices and cord connectors are covered in 410.62(C)(3). The submitter has given no substantiation as to why they should be moved into 410.62(C)(2).
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-136 Log #1328 NEC-P18 **Final Action: Reject**
(410.62(C)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Electric discharge luminaires equipped with a flanged surface inlet shall ~~be permitted to~~ be supplied by flexible cord pendants equipped with a cord connector.
Substantiation: Edit. "Permitted" per 90.5(B) does not impose any requirement for a cord or connector.
Panel Meeting Action: Reject
Panel Statement: The flanged surface inlet may be also supplied by a metallic raceway. The submitter has given no substantiation for removal of other wiring methods from this section. See 3.1.2 of the NEC Style Manual for permissive rules.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-136a Log #CP1803 NEC-P18 **Final Action: Accept**
(410.64)

Submitter: Code-Making Panel 18,
Recommendation: Revise 410.64 to read as follows:
410.64 Luminaires as Raceways. Luminaires shall not be used as a raceway for circuit conductors unless they comply with 410.64(A), 410.64(B), or 410.64(C).
(A) Listed. Luminaires listed and marked for use as a raceway shall be permitted to be used as a raceway.
(B) Through-Wiring. Luminaires identified for through-wiring, as permitted by 410.21, shall be permitted to be used as a raceway.
(C) Luminaires Connected Together. Luminaires designed for end-to-end connection to form a continuous assembly, or luminaires connected together by recognized wiring methods, shall be permitted to contain the conductors of a 2-wire branch circuit, or one multiwire branch circuit, supplying the connected luminaires and need not be listed as a raceway. One additional 2-wire branch circuit separately supplying one or more of the connected luminaires shall also be permitted.
FPN: See Article 100 for the definition of Multiwire Branch Circuit.
Delete 410.65 and its FPN.
In 410.21, change the FPN to read as follows:
FPN: See 410.64(C) for wiring supplying power to fixtures connected together.
Substantiation: To address the concerns expressed by the submitters of proposals 18-138 and 18-139, 410.64 was rewritten to include the requirements of 410.65. Additionally, a reference to 410.21 was added for clarity. This rewrite improves the usability of the code; it does not make any changes to the requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-137 Log #877 NEC-P18 **Final Action: Reject**
(410.64)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Luminaires shall not be used as a raceway for circuit conductors or junction point for conductors supplying other equipment unless listed and ~~marked~~ identified for such use ~~as a raceway~~ except as permitted in 410.65.
Substantiation: Electric — discharge luminaires should not be used as junction boxes. 410.65 doesn't require listing as a raceway.
Panel Meeting Action: Reject
Panel Statement: The submitter has given no substantiation for this change. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Without a junction point, there is no way an installer could make electrical connections to the ballast.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-138 Log #1416 NEC-P18 **Final Action: Accept in Principle**
(410.64)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
"Except as permitted in 410.65 luminaires shall not be used as a raceway..." (remainder unchanged)
Substantiation: Present requirement conflicts with 410.65.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-136a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-139 Log #3654 NEC-P18 **Final Action: Accept in Principle**
(410.64 and 410.65)

Submitter: Donald A. Ganiere, Ottawa, IL
Recommendation: Delete 410.65 and make that deleted wording an exception to 410.64.
Substantiation: This is an example of where the policy of writing everything in positive text is not user friendly and actually makes the coder harder, not easier to use. If you are installing luminaires and are thinking about running the circuit(s) through the luminaire, you would go to the code book and find your answer in section 410.64. At this point, because there are no exceptions to 410.64 the user has no reason to read additional code sections. If the text that is now found in 410.65 were to be an exception, then the user would have reason to read that text and find out that there are, in fact, cases where you are permitted to use the luminaire as a raceway.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-136a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-140 Log #876 NEC-P18 **Final Action: Reject**
(410.65)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Luminaires not listed and marked for use as a raceway and ~~designed~~ identified as suitable for end-to-end connections to form a continuous assembly, or luminaires connected together by ~~recognized~~ approved wiring methods, shall be permitted to contain the conductors of a 2-wire branch circuit or one multiwire branch circuit supplying the connected luminaires ~~and need not be marked as a raceway~~.
Substantiation: "Recognized" is not defined; many wiring methods recognized by the Code may not be suitable. "Need not be listed" doesn't prohibit listing and if listed this section doesn't correlate with 410.64.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
See panel action and statement on Proposal 18-136a.
Number Eligible to Vote: 12

18-141 Log #1415 NEC-P18 **Final Action: Reject**
(410.65)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "recognized" to "identified".
Substantiation: Edit. All wiring methods in this Code are "recognized" but not necessarily suitable for use (identified).
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects for the substantiation does not contain a statement of the problem.
The proposed change is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-142 Log #1414 NEC-P18 **Final Action: Reject**
(410.68)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Feeder and branch circuit conductors within 75 mm (3 in.) of a ballast shall have an insulation temperature rating not lower than 90°C (194°F) ~~unless supplying a luminaire marked as suitable for a different insulation temperature rating~~ and not less than the insulation temperature rating marked on the luminaire or ballast.
Substantiation: Edit. Present wording permits 90°C rating if the luminaire is marked with a "different" rating, which includes one with a higher than 90°C. A luminaire or ballast marked for lower than 90°C conductors may be replaced with one not so marked. The 90°C rating should be a minimum.
Panel Meeting Action: Reject
Panel Statement: The proposed revision is not considered editorial.
The submitter has provided no substantiation of a problem to support this change. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Ballasts are not required to be marked with a temperature rating.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-143 Log #1925 NEC-P18 **Final Action: Reject**
(410.68)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: ~~BRANCH CIRCUIT~~ CONDUCTORS and BALLASTS. ~~Branch circuit~~ Insulated conductors within 75 mm (3 in.) of a ballast shall have an insulation temperature rating not less than 90°C (194°F) unless supplying a luminaire (fixture) ~~marked as suitable for a different temperature~~ and not lower than the temperature marked on the ballast or luminaire.
Substantiation: Conductors other than branch circuit conductors (if insulated) should be included; 410.64 permits feeder conductors in fixtures used as raceways. The 90°C rating should be the minimum since a ballast with a lower marked rating may be replaced. The phrase "suitable for a different insulation temperature" includes a lower than 90°C rating which permits a 60°C or 75°C conductor insulation. "Different" doesn't necessarily mean higher.
Panel Meeting Action: Reject
Panel Statement: Stating that something "should" be done does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects in that there is no statement of the problem or why the proposal solves the problem.
The submitter has provided no substantiation of a problem to support this change. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Ballasts are not required to be marked with their temperature rating.
It appears that the wording in the proposal is not the text in the 2008 NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-144 Log #2307 NEC-P18 **Final Action: Accept in Principle in Part**
(410.68)

Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Article 410.68 Revise to
"Feeder and branch-circuit ~~conductors~~ wires within 75 mm (3 inch) of a ballast or LED driver shall have an insulation temperature rating not lower than 90 °C …".
Substantiation: LED drivers that UL lists (even the Class 2 output type) are limited to either 75 °C or 90 °C, depending on which standard was used to evaluate the device. In many ways, the installation rules established for discharge lighting ballasts over years will carry over to LED drivers. "LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ.
Also "wire" rather than "conductor" would be more appropriate here since the context is about the spacing of an insulated wire, not the spacing to the internal conductor.
Panel Meeting Action: Accept in Principle in Part
Revise recommended text to read as follows:
410.68 Feeder and branch-circuit conductors within 75 mm (3 in.) of a ballast, LED driver, power supply, or transformer shall have an insulation temperature rating not lower than 90°C (194°F) unless supplying a luminaire marked as suitable for a different insulation temperature.
Panel Statement: CMP-18 does not accept the change from conductors to wires. The term "conductors" is used throughout this code.
Power supplies and transformers were added to create a more inclusive list.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-155 Log #980 NEC-P18 **Final Action: Reject**
(410.82(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Where used with Edison base lampholders the grounded conductor shall be ~~identified and~~ attached to the screw shell and the ~~identified blade~~ grounded conductor terminal of the attachment plug.
Substantiation: Edit. Grounded conductors are already required to be identified. Some plugs may have prongs. “Identified blade” is not specific; ungrounded blades and grounding blades are also identified.
Panel Meeting Action: Reject
Panel Statement: The submitter failed to provide sufficient substantiation for the removal of the requirement for identification of the grounded conductor. He also failed to provide sufficient substantiation for the change to grounded conductor terminal instead of identified blade.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-156 Log #2161 NEC-P18 **Final Action: Accept**
(410.85)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete text as follows:
~~410.85 Tests.~~
~~All wiring shall be free from short circuits and ground faults as defined in 250.2 and shall be tested for these defects prior to being connected to the circuit.~~
Substantiation: The addition of 410.6 in the 2008 NEC requiring that all luminaires must be listed brings in all of the construction and safety requirements of the appropriate standards for safety. 410.85 is material that is better covered by the appropriate standard for safety and, therefore, should be deleted from the NEC.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-157 Log #2739 NEC-P18 **Final Action: Accept**
(410.85)

Submitter: Timothy S. Owens, City of Santa Clara
Recommendation: Delete text as follows:
~~410.85 Tests.~~
~~All wiring shall be free from short circuits and ground faults as defined in 250.2 and shall be tested for these defects prior to being connected to the circuit.~~
Substantiation: The addition of 410.6 in the 2008 NEC requiring that all luminaires must be listed brings in all of the construction and safety requirements of the appropriate standards for safety. 410.85 is material that is better covered by the appropriate standard for safety and, therefore, should be deleted from the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-158 Log #1385 NEC-P18 **Final Action: Reject**
(410.86)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
~~Exposed~~ Live parts within porcelain luminaires shall be ~~suitably~~ recessed ~~and located so as to make it improbable that wires can come in contact with them~~.
Substantiation: Edit. Listed luminaires (410.6) are unlikely to have exposed (see definition) live parts. Live parts (terminals) must have live wires in contact with them or they cannot be energized. “Suitable” is a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The submitter failed to submit sufficient substantiation for this change. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
See panel action and statement on Proposal 18-159.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-159 Log #1775 NEC-P18 **Final Action: Accept in Part**
(410.86)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete, or substitute: Live terminals within luminaires shall be insulated, recessed, or located to provide a spacing not less than 13 mm (1/2 in.) between live parts and the mounting plane of the luminaire or lampholder and between live terminals and noncurrent-carrying metal parts of the luminaire or lampholder.
Substantiation: It is not clear whether this provision is intended for a porcelain or plastic lampholder intended for mounting on an outlet box. Live parts of luminairies and lampholders necessarily have to be in contact with wires in order to be “live”. This provision appears superfluous since listing is required and not likely to include exposed live parts. If retained, it should apply whether the material is porcelain, plastic, or metal.
Panel Meeting Action: Accept in Part
Delete 410.86.
Panel Statement: CMP-18 chose to delete this section but not to substitute text.
CMP-18 is baffled by the submitter’s statement that “It is not clear whether this provision is intended for a porcelain or plastic lampholder intended for mounting on an outlet box” since the requirement specifically addresses “Exposed live parts within porcelain luminaires”. The proposal would expand the requirement to all luminaires and lampholders. The submitter has provided no substantiation for expanding the requirement to all luminaires and lampholders.
The submitter has failed to submit sufficient substantiation for this change. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
However, CMP-18 concludes that these are product standard requirements and no longer needed since the inclusion of 410.6 of the 2008 NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-160 Log #2642 NEC-P18 **Final Action: Accept in Part**
(410.86)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or revise as follows: ~~Exposed~~ Uninsulated live parts within porcelain luminaries and lampholders shall be ~~suitable~~ recessed ~~so as to make it improbable that wires come into contact with them~~ with a spacing of ~~at least~~ not less than 13 mm (1/2 in.) between uninsulated live parts and grounded metal parts and the mounting plane of the luminaire or lampholder.
Substantiation: This section can be deleted as 410.6 requires listing whereby such provisions, if applicable, would be addressed. It is unlikely that listed luminaires and lampholders have exposed live parts. (see definition). Parts within fixtures cannot be live unless in contact with a wire. it appears this rule may have been originally intended to apply to porcelain lampholders designed for installation on an outlet box. If within a fixture, live parts are not exposed, per definition.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action and statement on Proposal 18-159.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-161 Log #1384 NEC-P18 **Final Action: Reject**
(410.96)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Lampholders installed in wet or damp locations shall be ~~of the weatherproof~~ identified for the location.
Substantiation: Porcelain and plastic lampholders are commonly installed in basements, crawl spaces, etc., which may be considered damp at times. Boxes on which they are mounted are not required to be weatherproof nor is the NM cable by which they are commonly wired (normally dry locations).
Panel Meeting Action: Reject
Panel Statement: The substantiation notes that NM cable may be used to wire these boxes, yet the code in section 334.12(B)(4) specifically prohibits the use of NM cable in wet or damp locations. The section specifically references wet or damp locations.
The submitter has failed to provide sufficient substantiation to support his proposal. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
Installations that are in violation to the current requirement are insufficient substantiation for changing the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-162 Log #2162 NEC-P18 **Final Action: Accept**
(410.100)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Delete text as follows:
~~410.100 Insulation.~~
~~The outer metal shall and the cap shall be lined with insulating material that prevents the shell and cap from becoming a part of the circuit. The lining shall not extend beyond the metal shell more than 3 mm (1/8 in.) but shall prevent any current carrying part of the lamp base from being exposed when a lamp is in the lampholding device.~~
Substantiation: The addition of 410.6 in the 2008 NEC requiring that all luminaires must be listed brings in all of the construction and safety requirements of the appropriate standards for safety. 410.100 is material that is better covered by the appropriate standard for safety and, therefore, should be deleted from the NEC.

(410.110)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
410.110 General.
Luminaires installed in recessed cavities in walls or ceilings, including suspended ceilings, shall comply with 410.115 through 410.122.
Substantiation: This proposal is made in an effort to assist the panel in complying with section 6.6 of the regulations governing committee projects. There has been a long standing formal interpretation addressing this issue, and this proposal eliminates the need for it.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-167 Log #3273 NEC-P18 **Final Action: Accept in Principle**
(410.116(A)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence:
The points of support and the trim finish ~~off the opening in the ceiling or wall surface~~ shall be permitted to be in contact with combustible materials.
Substantiation: Editorial. The proposed deletion is unnecessary for application of this section Recessed luminaries may be installed in other than ceilings or walls, e.g., in bottoms of cabinets.
Panel Meeting Action: Accept in Principle
Change 410.116(A)(1) to read as follows:
The points of support and the trim finishing off the openings in the ceiling, wall, or other finished surface shall be permitted to be in contact with combustible materials.
Panel Statement: The change to the second sentence accomplishes the intent of the submitter.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-168 Log #2305 NEC-P18 **Final Action: Accept in Principle**
(410.116(B))

Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Article 410.116(B) Revise to
Thermal insulation shall not be installed above a recessed luminaire or within 75 mm (3 inch) of the recessed luminaire's enclosure, wiring compartment, ~~or~~ ballast, or LED driver, unless ~~it~~ the luminaire is identified "Type IC", for insulation contact. ~~for contact with insulation, Type IC.~~
Substantiation: LED drivers could also be applicable here. This article is in regard to recessed installations, compared to Article 410.136, which is in regard to surface mounted installations, or Article 410.137(B), which is in regard to remotely mounted installations. Articles 410.136 and 410.137(B) are companion proposals. "LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ.
Also, clarification by of what "it" is and "Type IC" which is defined in UL 1598, Standard for Luminaires.
Panel Meeting Action: Accept in Principle
410.116(B) to read as follows:
(B) Installation. Thermal insulation shall not be installed above a recessed luminaire or within 75 mm (3 in.) of the recessed luminaire's enclosure, wiring compartment, ballast, transformer, LED driver, or power supply unless the luminaire is identified "Type IC," for insulation contact.
Panel Statement: CMP-18 added transformer and power supply to create a more inclusive list.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-169 Log #2578 NEC-P18 **Final Action: Reject**
(410.117(A), (B) and (C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
(A) Conductors that have insulation ~~suitable~~ identified for the temperature encountered shall be used.
Delete (B).
Revise (C): Where the branch circuit conductors are not identified for the temperature encountered, tap conductors ~~suitable~~ identified for the temperature shall be ~~permitted to~~ run from the luminaire or lampholder terminal connections to an outlet box or conduit body placed ~~at least~~ not less than 300 mm (1 ft)) from the luminaire or lampholder. (remainder unchanged).
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual. (B) is already covered by (A). Lampholders and conduit bodies should be included in (C). "Permitted to be run" does not impose a requirement per 90.5.
Panel Meeting Action: Reject
Panel Statement: CMP-18 does not accept that (B) should be deleted. (B) is not covered by (A) as the submitter suggests. (B) specifically permits branch-circuit conductors to enter the luminaire that (A) does not address. The submitter mistakenly believes that the purpose of tap conductors is to address temperature limitations of branch circuit conductors. This is not the intent, so CMP-18 rejects the proposed changes to (C).
The submitter has provided no substantiation for adding conduit bodies and lampholders.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-170 Log #3318 NEC-P18 **Final Action: Accept in Principle**
(410.121)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change “box” to “enclosure” or “housing”.
Substantiation: Edit. It is unclear if “box” is intended to apply to the fixture housing or a terminal connection box that may be a part of the fixture.
Panel Meeting Action: Accept in Principle
In 410.121, change the word “box” to “recessed housing”.
Panel Statement: “Recessed housing” is the proper term as defined in the product standard, UL 1598.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-171 Log #1774 NEC-P18 **Final Action: Accept in Part**
(410.122)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete, or revise last sentence: Where used, cements shall be of the high heat type identified for the use.
Substantiation: Edit. This provision seems unnecessary since listing protocols include evaluation of cements, if used. The AHJ cannot reasonably determine quality of cements, whether high heat (?) or heat resistant types.
Panel Meeting Action: Accept in Part
410.122 to read as follows:
Lampholders of the screw shell type shall be of porcelain or other suitable insulating materials.
Panel Statement: CMP-18 chose to delete the last sentence but not to substitute text.
The proposed revision is not considered editorial.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-172 Log #3324 NEC-P18 **Final Action: Accept in Part**
(410.122)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete last sentence or revise:
Where used, cements and other adhesives shall be ~~of the high heat type~~ <u>identified for the temperature encountered</u>.
Substantiation: Edit. This seems to be a requirement better covered by product standards. “High heat type” is not defined.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action and statement on Proposal 18-171.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-173 Log #2690 NEC-P18 **Final Action: Reject**
(410.130(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text :
Thermal protection shall not be required in a recessed high-intensity discharge luminaire (fixture) identified for the use ~~installed~~ <u>encased</u> in poured concrete, <u>brick, or masonry or tile construction units</u>.
Substantiation: The provision should apply where installation is in other noncombustible construction.
Panel Meeting Action: Reject
Panel Statement: Thermal protection is required in brick, masonry, and tile construction units. The submitter did not provide any substantiation for why thermal protection should not be required in brick, masonry, or tile construction units. CMP-18 notes that this proposal is similar in content to two proposals submitted by the same submitter in the 2008 code cycle (2008 ROP proposals 18-89 and 18-90). CMP-18 rejected those proposals because no substantiation was provided. CMP-18 requests that the submitter refrain from wasting its time by repeatedly submitting the same proposal without substantiation. CMP-18 welcomes proposals with substantiation.
Also, the submitter references the incorrect section, and the wording is not consistent with present code language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-174 Log #3323 NEC-P18 **Final Action: Reject**
(410.130(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: This “definition” is at variance with the Article 100 definition of “energized” which does not specify a voltage level.
Panel Meeting Action: Reject
Panel Statement: Delete what?
The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-174a Log #CP1802 NEC-P18 **Final Action: Accept**
(410.130(E)(3) and 410.21 FPN)

Submitter: Code-Making Panel 18,
Recommendation: Change 410.130(E)(3) title from “Exit Fixtures” to “Exit Luminaires.”
410.21 FPN to read as follows:
FPN: See 410.65 for wiring supplying power to luminaires connected together.
Substantiation: This change is to correct an oversight in the previous code cycle.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-175 Log #12 NEC-P18 **Final Action: Accept in Principle in Part**
(410.130(G))

NOTE: This proposal appeared as Comment 18-90 on Proposal 18-90b in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 18-90b was:
Modify Section 410.73(G) to read as follows:
(G) Disconnecting Means. In indoor locations, other than dwellings and assorted accessory structures, fluorescent luminaires that utilize double ended lamps and contain ballast that can be serviced in place, shall have a disconnecting means either internal or external to each luminaire. When connected to multiwire branch circuits, the disconnect shall simultaneously break all the supply conductors of the ballast, including the grounded conductor. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire it shall be a single device, located in sight of the luminaire.
The existing five exceptions are to remain as written in the 2005 NEC.
Submitter: Gregory J. Steinman, Thomas & Betts Corporation
Recommendation: Revise as follows:
(G) Disconnecting Means. In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires that utilize double-ended lamps and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire. <u>For existing installed luminaires without disconnecting means, at the time a ballast is replaced, a disconnecting means shall be installed</u>. When connected to multiwire branch circuits, the disconnect shall simultaneously break all the supply conductors of the ballast, including the grounded conductor. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire, it shall be a single device, ~~located in sight of~~ <u>adjacent to</u> the luminaire.
Substantiation: Disconnecting means provide a safe working environment for the electrician. It can be added easily at the time a ballast is replaced and will provide a safer installation of the next ballast replacement. There are several ballast disconnecting components available that can be easily installed during ballast replacement. Per Article 100, the words “in sight of” mean within 50 feet. This is too far for a safe replacement. The disconnecting means shall be easily accessible to the electrician.
Panel Meeting Action: Accept in Principle in Part
410.130(G) to read as follows:
(G) Disconnecting Means.
(1) General. In indoor locations other than dwellings and associated accessory structures, fluorescent luminaires that utilize double-ended lamps and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire. For existing installed luminaires without disconnecting means, at the time a ballast is replaced a disconnecting means shall be installed. The line side terminals of the disconnecting means shall be guarded.
Remainder of 410.130(G) unchanged.
Panel Statement: The submitter’s language has been modified to comply with the current code.
CMP-18 accepts the proposal but not changing “location in sight of” with “adjacent to.”
Insufficient substantiation is given for replacing “location in sight of” with “adjacent to”.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-176 Log #303 NEC-P18 **Final Action: Reject**
(410.130(G))

Submitter: Mark Ptashkin, City of Glendale
Recommendation: Revise 410.130(G) by adding a new Exception 3, revising Exception 6 and renumbering the remaining exceptions and providing new text for Subsection 3:
(G) Disconnecting Means
(1) General. In indoor locations other than dwellings and associated accessory structures, fluorescent luminaires that utilize double-ended lamps and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire. The line side terminals of the disconnecting means shall be guarded.
Exception No. 1: A disconnecting means shall not be required for luminaires installed in hazardous (classified) location(s).
Exception No. 2: A disconnecting means shall not be required for emergency illumination required in 700.16.
Exception No. 3: A disconnecting means shall not be required for legally required illumination as required in 701.11.
Exception No. ~~(3)~~4: For cord-and-plug connected luminaires, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means.
Exception No. ~~(4)~~5: A disconnecting means shall not be required in industrial establishments with restricted public access where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedures.
Exception No. ~~(5)~~6: Where more than one luminaire installed and supplied by other than a multiwire branch circuit, a disconnecting means shall not be required for every luminaire when the design of the installation includes disconnecting means, such that the illuminate space cannot be left in total darkness while the building is occupied.
(2) Multiwire Branch Circuits. When connected to multiwire branch circuits, the disconnecting means shall simultaneously break all the supply conductors to the ballast, including the grounded conductor.
~~**(3) Location.** The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire, it shall be a single device, and shall be attached to the luminaire or the luminaries shall be located with sight of the disconnecting means.~~
(3) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the luminaires or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted. Where multiwire branch circuits are used, a multi-pole disconnect or circuit breaker shall be used as the disconnecting means.
Substantiation: New Exception 3. Legally required standby systems, for the purposes of this article, should omit the disconnecting means for the same reasons they are omitted from the emergency systems. Failure of the lighting systems in these areas could create a life safety hazard. Thus, the requirement for the additional stand-by system for lighting units in at least one model building code.
Revised Exception 6. The requirement for maintaining the areas illumination should only be required while the building is open for business or as defined by the building codes as occupied. Egress lighting is only required while a building is open for business. The current requirement appears to require the additional level of lighting anytime equipment is serviced. This appears to place an unnecessary and potentially costly requirement that would require this lighting for not only service work but work done after hours or even remodeling or renovation. This would also have the effect of eliminating this disconnecting means for “temporary” lighting used on construction sites or shell buildings that are not legally able to be occupied.
Revised Subsection 3. This is, for the most part, the same verbiage used in 410.141(B) with the additional sentence addressing multiwire circuits. That section allows the use of a remote lockable disconnect for voltages of over 1000 volts while this section, under 1000 volts, does not. It would seem that the higher voltage would be a more hazardous installation to service and yet it is permissible to utilize a remote disconnect when it can be locked in the open position. By providing a remote lockable disconnect for systems under 1000 volts, this section would still retain the desired ability to de-energize equipment combined with the new ability to lock it out, thus, increasing the safety to the public. Additionally, other articles of the NEC allow the use of a remote lockable disconnecting means. By revising this section, it would more closely resemble other sections of the Code.
Panel Meeting Action: Reject
Panel Statement: CMP-18 does not agree with the submitter’s substantiation that a disconnect should not be required for legally required illumination.
The use of a lock on a circuit breaker is not allowed because then the entire circuit would have to be off instead of just the individual luminaire.
CMP-18 does not agree with the necessity of whether the building is occupied or not.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-177 Log #1284 NEC-P18 **Final Action: Reject**
(410.130(G))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(1) In indoor locations other than dwellings and associated accessory structures, fluorescent luminaires that utilize double-ended lamps and contain ballasts that can be serviced in place shall have ~~a~~ an accessible disconnecting means either internal or immediately adjacent to each luminaire. The line side terminals of the disconnecting means shall be guarded.
Exception No. 1: ~~A~~ The disconnecting means specified in (1) SHALL NOT BE REQUIRED FOR LUMINAIRES INSTALLED IN HAZARDOUS (CLASSIFIED) LOCATIONS.
EXCEPTION No. 2: ~~a~~ THE DISCONNECTING MEanS SPECIFIED in (1) shall not be required for emergency illumination covered ~~required~~ in 700.16.
Exception No. 3: For cord-and-plug connected luminaires an accessible separable connector and flanged surface inlet or an accessible attachment plug ~~and receptacle~~ shall be permitted to serve as the disconnecting means.
Exception No. 4: The disconnecting means specified in (1) shall not be required in ~~industrial~~ establishments with restricted pubic access where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedures.
Exception No. 5: Where more than one luminaire is installed and supplied by *~~other than~~ a ~~multiwire~~ 2-wire circuit ~~a~~ the disconnecting means specified in (1) shall not be required for every luminaire when the ~~design of the~~ installation includes disconnecting means for the luminaires whereby no single disconnecting means in the branch circuit(s) other than the branch circuit disconnecting means can deenergize all the luminaires. ~~Such that the illuminated space cannot be left in total darkness.~~*
In (G)(2), change “break” to “open”.
Substantiation: The disconnecting means should be accessible, and if external, adjacent to the luminaire. Present wording does not specify location if external. Exceptions should clearly indicate they apply to disconnecting means of the rule. Section 700.16, covers but does not require emergency illumination. In exception No. 3, superfluous wording is eliminated; proposal requires the disconnecting means to be accessible; present wording does not include attachment plug and lighting busway. In exception No. 5, design cannot ensure spaces will not be in darkness if there is a power failure or an overcurrent device operates.
Panel Meeting Action: Reject
Panel Statement: Direction as to the location of an external disconnect is provided in 410.130(G)(3). The changes in verbiage are superfluous and not sufficiently substantiated to necessitate such a change. The flanged surface inlet is covered in “accessible separable connector.”
Since the disconnecting means can be internal to the luminaire, the Article 100 definition of “accessible” would not apply in all cases. It is intuitively obvious that an exception to 410.130(G)(1) applies to 410.130(G)(1), so stating this explicitly is not necessary. The location for an external disconnect is specified in 410.130(G)(3), so the panel rejects the proposal to add the words “immediately adjacent” to 410.130(G)(1). The submitter is reminded that “immediately adjacent” is vague terminology that should be avoided in accordance with the NEC Style Manual.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-178 Log #2240 NEC-P18 **Final Action: Accept in Principle**
(410.130(G))

Submitter: Gregory J. Steinman, Thomas & Betts Corporation
Recommendation: Revise text to read as follows:
(G) Disconnecting Means.
(1) General. In indoor locations other than dwellings and associated accessory structures, fluorescent luminaires that utilize double-ended lamps and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire. If not already present, a disconnecting means shall be installed during ballast replacement. The line side terminals of the disconnecting means shall be guarded.
(remainder of article unchanged).
Substantiation: The disconnecting means provides a safety function for the electrician. There are millions of luminaires presently installed that will never have the level of safety provided with new installations. This is an easy method to improve the safety of the existing installed products. As new luminaires are installed using a disconnecting means, electricians will expect that disconnect to be available.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-175.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-179 Log #4814 NEC-P18 **Final Action: Reject**
(410.130(G))

Submitter: Charles M. Williams, Stealth Electric
Recommendation: A sentence should be added to the general paragraph: Existing luminaires in which ballast replacements, or retrofitting take place shall be provided this capability at the time of service or retrofit. This applies to these luminaries without external means of disconnect.
Substantiation: Existing luminaires will require replacement of ballast to include incorporation of electron ballasts at the time of ballast replacement. Also, there is an increasing retrofit effort on behalf of energy conservation. The existing circuits will not be upgraded, and old circuits are usually left in place. In the case of retrofits, these usually occur in very old installations.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
See panel action and statement on Proposal 18-175.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-180 Log #2542 NEC-P18 **Final Action: Reject**
(410.130(G)(1))

Submitter: Brian J. Coll, Tri-State Safety Inspections
Recommendation: Add new text as follows:
Effective January 1st, 2014, in all outdoor locations other than one and two family dwelling units and associated accessory structures, high-intensity discharge luminaires that contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire. All ungrounded terminals of the disconnecting means shall be guarded to prevent accidental contact. The disconnecting means shall simultaneously disconnect all of the supply conductors to the ballast, including the grounded conductor. The disconnecting means shall be located before any fuses integral to the luminaire.
Exception No. 1: Where high-intensity discharge luminaires are installed grouped on lighting standards or other structures, a single disconnecting means shall be permitted. The disconnecting means must be installed within sight of the luminaires which it serves. The disconnecting means must have provisions for being locked in the open position permanently installed. The disconnecting means shall be permitted to open only the ungrounded conductors and only the line side terminals shall be required to be guarded.
Exception No. 2: High-intensity discharge luminaires which contain an integral twist-lock type photocell or shorting cap which opens all ungrounded conductors when removed shall be accepted as meeting the disconnecting requirement of this section.
Substantiation: HID luminaires are commonly used for site lighting on the outside of buildings, both wall mounted and pole mounted. They are often automatically controlled by lighting controls and contactors from inside the building far from the luminaires location. The larger the site, the harder it becomes to locate and properly lock-out the disconnecting means. The luminaires are also commonly supplied by up to 480 volts nominal.
When servicing site lighting, it is common to have the power turned on to the luminaires so the nonworking luminaires can be identified. Due to the long restrike time of the HID luminaires it is impractical to have the power turned off and on during servicing, especially on large sites.
Since the controller and disconnecting means can be difficult to locate and is often far away from the luminaire being serviced, it is common to disconnect the power supply conductors within the luminaire while the circuit is energized in order to replace ballasts and other internal components. Having a mandatory safe means within or near the luminaire to disconnect all supply power would eliminate shock and arc flash hazards. Hazards include injury or deaths caused directly by an electrical shock or arc flash or by a resulting fall as these luminaires are almost always serviced from ladders, scaffolding, aerial work platforms and bucket trucks.
Many manufactures currently include such disconnecting means within the luminaires which they make. This would simply make the feature mandatory while also providing options to meet most installation situations.
Including this requirement in the 2011 NEC and setting an effective date of January 1st 2014, will provide manufactures enough time to modify their products to meet the new disconnecting requirements.
Panel Meeting Action: Reject
Panel Statement: The submitter's conclusion that the disconnecting means that he describes would eliminate shock or arc flash hazards is incorrect. The fluorescent luminaires that are currently covered by 410.130(G)(1) contain insulated components within their electrical enclosures. Unlike those fluorescent luminaires, outdoor HID luminaires are constructed using numerous components that have accessible live parts within the luminaire's electrical enclosure. The HID ballasts used in most outdoor luminaires have open coils. Many of these ballasts also have accessible live spade terminals. In addition to the ballast, oil filled capacitors, photoelectric receptacles, quartz standby relays, dual-level dimming relays, fuseholders, and dimming system surge coils can all contain accessible live terminals or open coils. This proposal would allow the opening of electrical enclosures that contain live components to access a disconnecting means; however, once the electrical enclosure is opened, contact with hazardous voltages could occur before the disconnect device is located and disconnected. Therefore, the panel concludes that accepting the proposal could result in exposing workers to greater risk.
The connectors that the submitter references in existing outdoor HID luminaires are not listed or rated for making and breaking under load. These connectors are supplied as a matter of convenience by some manufacturers for ease of installation and maintenance, but they should never be connected or disconnected while the circuit is energized.
When servicing outdoor HID luminaires the circuit should be disconnected at the panel and locked-out, and the appropriate personal protective equipment should be used.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-181 Log #4709 NEC-P18 **Final Action: Reject**
(410.130(G)(1))

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Add the following text as the last sentence of paragraph 410.130(G)(1): "Lighting retrofit jobs must adhere to 410.130(G)(1), (2) and (3)".
Substantiation: This is the purpose of this requirement so it will be safe when servicing these luminaires. What better time could there be to install the service disconnecting means.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
See panel action and statement on Proposal 18-175.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-182 Log #619 NEC-P18 **Final Action: Reject**
(410.130(H))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text to read as follows:
<u>The ballasts of fluorescent luminaires and high intensity discharge luminaires shall be protected against fault currents in accordance with their limited short-circuit withstand ratings.</u>
Substantiation: These ballasts have a limited short-circuit withstand rating, typically 200 amperes, when tested on a 20 amp circuit. Supplementary overcurrent protection may often be necessary due to higher fault currents available on these circuits. Equipment withstand ratings are basically addressed in 110.10, but specifically should be addressed here as well.
Panel Meeting Action: Reject
Panel Statement: The submitter has failed to provide sufficient substantiation to support this change. See 4.3.3 of the NFPA Regulations Governing Committee Projects.
The requirements contained in 110.10 are sufficient.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-183 Log #4626 NEC-P18 **Final Action: Reject**
(410.135)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this section.
Substantiation: This rule, limiting luminaires in dwelling occupancies with open circuit voltages above 300 unless special construction features are in place, appears to be obsolete. The only dwelling-unit location limitation markings in the current UL Luminaire Marking Guide are those that prohibit open circuit voltages over 1000 [and thereby enforce 410.140(B)] and those that prohibit luminaires marked for supply wiring rated over 90°C
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
The statement that the product type appears to be obsolete indicates that uncertainty exists regarding the submitter's substantiation. Equipment that meets these requirements may still be listed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-184 Log #2304 NEC-P18 **Final Action: Accept in Principle**
(410.136(A) and (B))

Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Article 410.136(A) Revise to
Luminaires that have exposed ballasts, ~~or~~ transformers, or LED drivers, shall be installed such that ballasts, ~~or~~ transformers, or LED drivers, shall not be in contact with combustible material.
Article 410.136(B) Revise to
Where a surface-mounted luminaire containing a ballast or LED driver is to be installed on combustible low-density cellulose fiberboard…
Substantiation: LED drivers could also be applicable here. "LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ. See companion proposal to 410.116(B).
Panel Meeting Action: Accept in Principle
410.136 (A) and (B) to read as follows:
(A) Exposed Components. Luminaires that have exposed ballasts, transformers, LED drivers or power supplies shall be installed such that ballasts, transformers, LED drivers, or power supplies shall not be in contact with combustible material unless listed for this condition.
(B) Combustible Low-Density Cellulose Fiberboard. Where a surface-mounted luminaire containing a ballast, transformer, LED driver, or power supply is to be installed on combustible low-density cellulose fiberboard, it shall be marked for this condition or shall be spaced not less than 38 mm (1 1/2 in.) from the surface of the fiberboard.
Retain the FPN.
Panel Statement: CMP-18 added LED driver and power supply to create a more inclusive list.
The heading of (A) was changed to be more inclusive.
(A) was edited to consider Type IC luminaires.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-185 Log #4627 NEC-P18 **Final Action: Reject**
(410.136(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows:
(B) Combustible Surfaces. Luminaires marked by their manufacturer as for mounting on noncombustible surfaces only shall not be mounted within 38 mm (1½ in.) of a combustible surface.
Delete the last sentence of the rule and delete the fine print note.
Substantiation: The relevant UL marking category for these luminaires, "Fluorescent Surface-Mounted Luminaires, (IUEZ)," deleted the specific references to this condition as of the 2001 edition of the *Green and White Books*. In its place (presumably) is a generic permission for all ceiling and wall-mounted luminaires in the IUEZ category to be mounted in either of those locations and even with thermal insulation behind the ceiling or wall surface. This permission is subject to two exceptions, the second of which presumably corresponds to this topic. The first exception is a mandatory orientation exception and, based on the reading of the general permission as allowing ceiling luminaires to be mounted on walls and vice-versa, disallows luminaires that are "obviously not designed for ceiling use or if marked WALL MOUNT ONLY" from being mounted on ceilings. This topic is not relevant to this discussion, but the conditions mentioned are enforceable per 110.3(B).
The second exception effectively prohibits luminaires marked "NONCOMBUSTIBLE SURFACE ONLY" from being mounted on noncombustible surfaces. From all this it would appear that unless so marked, any fluorescent luminaire can be mounted on combustible surfaces, including low-density cellulose fiberboard, even with thermal insulation behind it. And from the current language of 410.136(B) it would appear that a 38 mm (1½ in.) spacing is sufficient to address a noncombustible mounting limitation if one appears on a luminaire, unless some other dimension is in the installation directions.
Therefore this proposal updates this section so it applies to combustible surfaces and limits the mounting of luminaires with a combustible surface limitation from being mounted within the traditional 1½ in. spacing unless a listing restriction requires a greater distance. CMP 18 may have additional information to fine-tune this update, but it is clear that the existing wording, essentially unchanged for over 50 years, is functionally obsolete in terms of its specific information. The last sentence was removed because all recessed luminaires must necessarily comply with Part XI of the article, so it added nothing.
Panel Meeting Action: Reject
Panel Statement: No definitive substantiation has been provided to show that there is a problem with the present text.
The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-186 Log #2303 NEC-P18 **Final Action: Accept in Principle**
(410.137(B))

Submitter: John Marshall, Underwriters Laboratories Inc.
Recommendation: Article 410.137(B) Revise to
Separately mounted, or independent, ballasts or LED drivers that are intended for direct connection to a wiring system shall not be required to be additionally ~~separately~~ enclosed.
Substantiation: LED drivers could so be applicable here. "LED driver" is a common industry term referring to the power supply for the LED. Drivers for Light-emitting Diode (LED) Arrays, Modules, and Controllers are covered under UL CCN: FKSZ. See companion proposal to 410.116(B).
There is growing usage of the term "independent ballast" to mean a ballast that can be remotely located from the luminaire.
"Additionally" rather than "separately" would be better here because the context is in regard to the need of an additional enclosure (although that would not be needed since the enclosure for an independent ballast is already sufficient).
Panel Meeting Action: Accept in Principle
410.137(B) to read as follows:
(B) Separate Mounting. Separately mounted ballasts, transformers, LED drivers, or power supplies that are listed for direct connection to a wiring system shall not be required to be additionally enclosed.
Panel Statement: CMP-18 added transformer, LED driver, and power supply to create a more inclusive list.
CMP-18 removed "or independent" as it is redundant.
The term "listed" was added to ensure that the equipment is listed or provided with an enclosure.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-187 Log #2380 NEC-P18 **Final Action: Reject**
(410.140(A))

Submitter: Jimmie Evanisko, National Cathode Corporation / Rep. UL Listed "IFAY" Manufacturers
Recommendation: Revise text to read as follows:
(A) Listing. Electric-discharge lighting systems with an open-circuit voltage exceeding 1000 volts shall be listed and installed in conformance with ~~that~~ their IFAY listing.
Substantiation: It is to my understanding that there is a proposal to insert the verbiage "cold cathode" into "eight " locations into Article 600 of the NEC for the 2011 edition. And I do not understand how it relates to any safety and installation issues with regards to Article 410.
What do I understand is that presently there are "9" independent cold cathode manufacturers listed under UL IFAY that comply with Article 410, they also comply with UL DUEC2 and DUEC8 for General Illumination that do not require secondary-circuit ground fault protection.
On the other hand there is another listing that pertains to "Field Installed Neon Outline Lighting Systems" govern under UL UYAM, UL DUEC and UL DUEC7 with only "1" manufacturer listed that does require SGFP.
Looking at UL UXYT and UL UZBL there are over 2,500 manufacturer that must comply with Article 600 that requires SGFP.
Adding the verbiage of cold cathode to NEC Article 600 will only cause more confusion to the AHJ's, has absolutely no relevance to any safety issues and will cause a huge burden on the "9" IFAY manufacturers with regards to the AHJ's queries.
Other than the items stated above, the UL General Information for Electrical Equipment Directory clearly states under "IFAY" provides "general illumination " in accordance with Article 410 of the NEC and absolutely no relationship in categories UXYT, UZBL, UYAM or UXYT in the neon industry and UL 2161 #20 SGFP exception No. 5: A cold cathode supply marked in accordance with 42.5 is not required to be provided with secondary ground fault production.
While speaking to Diana Pappas Jordan at UL Northbrook, we agreed that any gas filled lamp (CCFL, cold cathode, fluorescent, neon and others) with electrodes/filaments are the same but the main difference is the "application".
During the STP meeting at UL Northbrook in 2006 which I attended, a member suggested that luminaires listed under UL IFAY should be covered by the scope of the standard for luminaires, UL 1598 rather UL 48 and the straw poll of the voting members voted ten to two to add it directly into UL 1598. I also remember the AHJ's at the STP meeting from Phoenix (Lanny McMahill) stating that he understood luminaires for general illumination and saw no problem with a transformer less SGFP. I believe that instead of forcing ground fault devices to be included in our "General Illumination Systems" that the proposal should be addressing and clarifying it within the scope of NEC 410 XIV or moving it to UL 1598 as per our last UL 48 meeting.
Ironically, today I contacted C.S.A. to concur which CSA Standard National Cathode Corporation is listed under and they stated C22.2 NO255 and 250.0-04 which is the equivalent to UL 1598.
Basically, trying to fix something that isn't broken with regards to safety does not apply to the IFAY industry.
I have spoken to dozens of listed members in UL UXYT and very rarely do they use power sources exceeding 120MA because they have no need to.

If there are other reasons that I am not aware of other than safety issues to insert the verbiage of "cold cathode" into NEC Article 600 due to politics or our present economy then it is only appropriate to insert "<u>their</u> <u>IFAY</u>" into Article 410 per my proposal.

Panel Meeting Action: Reject

Panel Statement: CMP-18 refers the submitter to 110.3(B).

This addition would be redundant; this requirement already addresses products listed under the UL category IFAY. Other NRTLs may have different terms for this category.

4.2 of the NEC Style Manual prohibits references to other standards. 3.2.1 of the Style Manual prohibits vague references.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-188 Log #1773 NEC-P18 **Final Action: Reject**
(410.140(C))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: Literal wording requires the terminal of a lamp to be considered a live part whether in the shipping container, removed from a luminaire, or disconnected from the circuit. Other rules and regulations of management, OSHA, and 490.22 should be sufficient.

Panel Meeting Action: Reject

Panel Statement: Delete what?

The proposal does not comply with 4.3.3(c) of the NFPA Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-189 Log #4628 NEC-P18 **Final Action: Reject**
(410.140(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Change "as a live part" to "as an uninsulated live part".

Substantiation: See Article 100. Any energized part is live; presumably this sentence is classifying the lamp terminals as uninsulated and live, which would be useful information.

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with 4.3.3(d) of the NFPA Regulations Governing Committee Projects because the substantiation does not contain a statement of the problem.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-190 Log #1561 NEC-P18 **Final Action: Accept in Part**
(410.141(B))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered by Code-Making Panel 18 based upon the action of Code-Making Panel 1 taken on Proposal 1-63.

This action will be considered by the panel as a public comment.

Submitter: Stanley J. Folz, Henderson, NV

Recommendation: Revise text to read as follows:

(B) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the luminaires or lamps, or it shall be permitted elsewhere if it is provided with a <u>**lockable disconnecting means.**</u> ~~for locking in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.~~

Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.

A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."

Panel Meeting Action: Accept in Part

410.141(B) to read as follows:

(B) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the luminaires or lamps, or it shall be permitted elsewhere if it is provided with a <u>lockable disconnecting means</u>. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Panel Statement: CMP-18 choose to retain the last sentence of 410.141(B). Leaving the last sentence in does not detract from the submitter's proposal.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

CARPENTER, F.: Since the proposal (1-63) which would have added an Article 100 definition for "Disconnecting Means, Lockable" was rejected by CMP-1, this terminology should not be used in this section of the code.

18-191 Log #2577 NEC-P18 **Final Action: Reject**
(410.141(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete second sentence and substitute:

The provisions for locking shall be an identified permanent integral component of the disconnecting means.

Substantiation: Edit. The locking means should be identified for the use. Proposal eliminates makeshift methods.

Panel Meeting Action: Reject

Panel Statement: See panel action on Proposal 18-190.

The submitter failed to consider that sometimes makeshift means are just as effective and a lot safer than a lockable permanent component.

Recommendation: Add new section 422.5 in Part I.
<u>422.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if listed.</u>
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement to Proposal 17-5.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-5 Log #4266 NEC-P17 **Final Action: Reject**
(422.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 422.5 in Part I.
<u>422.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:</u>
<u>(1) Equipment listing or labeling</u>
<u>(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation</u>
<u>(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer’s self-evaluation or an owner’s engineering judgment</u>
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: Section 110.2 already states that electrical equipment or conductors required or permitted by the NEC must be approved, so repeating this text in this section is unnecessary. Section 90.4, as well as 90.7, provides a method for the AHJ to use “listing” as a means of accepting electrical equipment. Where electrical equipment is not listed at the time of installation, Sections 90.4 and 90.7 permit field equipment evaluation.
Any proposed additional requirements should be addressed by a change to Section 110.2.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
CRIVELL, P.: The proposed requirement for listing or labeling of equipment for acceptance and approval by the Authority Having Jurisdiction is not limited to electrical distribution equipment with established standards to which it is to be tested to compared to or used to or evaluated by a Nationally Recognized Testing Laboratory (e.g., a machine used to package Microsoft software or a machine used to control the manufacture of carbon fiber for the Boeing 787 airplane). Requiring that evidence from a “qualified testing laboratory” or “inspection agency” would necessitate that the code define “qualified testing laboratory”, “inspection agency”, and “owner’s engineers judgment”. Otherwise, the Authority Having Jurisdiction would have no basis for their approval and acceptance of the qualifications of the “qualified testing laboratory”, the appropriateness of the training and certification of the “inspection agency” inspector, or the owner and the soundness of their “engineering judgment”. There will be electrical distribution equipment and utilization equipment which will be installed, which will not be listed, but which the Authority Having Jurisdiction or local ordinances may require be labeling to be acceptable to them and ultimately approved by them. In summary, the role of the Authority Having Jurisdiction is to use their authority, professional judgment, and local ordinances, including the National Electrical Code, to make the decision on what is acceptable, what is not acceptable, and what is needed in the way of labeling or documentation from a manufacturer, engineer, or other professional to obtain their acceptance and approval.

17-7 Log #4268 NEC-P17 **Final Action: Reject**
(422.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 422.5 in Part I.

422.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:

(1) Equipment listing or labeling

(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation

(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment

Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

Ballot Results: Affirmative: 13

17-9 Log #2700 NEC-P17 **Final Action: Reject**
(422.13)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:

A fixed storage type water heater that has a capacity of 450 L (120 gal) or less shall be considered a continuous load for the purpose of sizing branch circuits, feeders, and service conductors.

Substantiation: While wording after the word "load" may be superfluous since it is covered by 210.20(A), the rule should include feeder and service conductors since the reason for the 125 percent requirement is valid for feeder and service conductor connections and overcurrent devices. Continuous load is applied to feeders and service conductors in Examples D(3)and D(3)(a).
Panel Meeting Action: Reject
Panel Statement: The requirement of 422.13 specifies a continuous load is to be used to size the branch circuit only. If storage-type water heaters are to be considered a continuous load when calculating feeders and services, substantiation needs to be submitted to show that the current method used to size feeders and services is not adequate. For example, feeders and services are calculated under Article 220.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-10 Log #3907 NEC-P17 **Final Action: Reject**
(422.13(A) (New))

Submitter: Eugene F. Swisher, City of Tampa / Rep. IBEW Local 915
Recommendation: Insert the following new text:

Instantaneous or tankless type water heaters shall be considered a continuous load for the purposes of sizing branch circuit conductors.

Substantiation: Tankless water heaters are not currently addressed in the Code. This results in difficulty properly sizing branch circuit conductors.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate substantiation for considering all instantaneous or tankless water heaters as continuous loads.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:

BLEWITT, T.: The submitter has not provided adequate substantiation that all instantaneous (tankless) water heaters shall be considered as continuous loads. There are many such water heaters that are intended for point of use hot water dispensing and which are used only for short periods of time.

17-11 Log #1559 NEC-P17 **Final Action: Accept in Principle**
(422.15(C) (New))

Submitter: Ralph C. Guinn, Canplas Industries Ltd.
Recommendation: Add new text as follows:

(C) An equipment grounding conductor shall be used where the central vacuum outlet assembly has accessible noncurrent-carrying metal parts, likely to be energized.

Substantiation: Confusion during revisions to UL standard 1017 resulted in the UL/CSA joint committee requesting a revision to section 422.15C to add clarity.
Panel Meeting Action: Accept in Principle

Revise 422.15(C) to read as follows:

(C) Accessible non–current-carrying metal parts of the central vacuum outlet assembly shall be grounded in accordance with 250.110.
Panel Statement: CMP-17 edited the submitter's text,and the change meets the submitter's intent.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4
Explanation of Negative:

BLEWITT, T.: The Panel sought to leverage existing Code content rather than add criteria that could be deemed vague ("likely to become energized"). In doing so, the prepared text did not provide inspectors with clarity on whether the small parts of the vacuum outlet assemblies required grounding. What the Panel was essentially trying to do is to say a few isolated fasteners, springs and (other?) non-electrical parts do not need to be grounded because the insulation (air / plastic) interposed between them and current-carrying parts suffices. Suggested language will be provided during the Comment phase.

MORRIS, W.: CMP-17 made a change to the original proposal. The AHAM Central Vacuum Cleaner member companies do not believe that this change will correct the issue at-hand. The Central Vacuum outlet cover is composed of a plastic cover, a metal spring assembly, and two metal screws which affix the cover to a plastic backing plate. Per NEC 2008, some local inspectors have viewed the requirements of 422.15 (c) as requiring the metal screws and spring to be grounded. We suggest instead, "C. Grounding, if needed, shall be in compliance with 250.110" which uses the term, "...likely to be energized."

PANNOCK, J.: After review of the comments, I agree that the language needs to be further clarified and as such, the proposal in it's current form is not acceptable.

SCHAPP, R.: The phrase"likely to become energized" is a common phrase used throughout the code. It is desirable to avoid its use but the panel is attempting to micromanage a situation that is practically impossible to do with code language. Another option is to change the panel statement to "in accordance with 250" and drop the reference to.110. When the inspection is made, Installation and Operating Instructions will be available, and the AHJ can make a decision based on installed components and applicable sections of Article 250.

Comment on Affirmative:

CRIVELL, P.: The word "grounded", as in "…shall be grounded in accordance with…" should be replaced with the words "connected to the equipment grounding conductor" to comply with the correct language as used in 250-10. This vote was directed by IEEE.

17-12 Log #2867 NEC-P17 **Final Action: Reject**
(422.16(A))

Submitter: James M. Imlah, City of Hillsboro
Recommendation: Revise text to read as follows:

422.16 Flexible Cords.

(A) General. Flexible cord shall be permitted to facilitate all of the following:

(1) for the connection of appliances to facilitate their frequent interchange or to prevent the transmission of noise or vibration ~~or~~

(2) the removal or disconnection of appliances that are fastened in place

(3) ~~where~~ the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance or repair ~~and~~

(4) the appliance is intended or identified for flexible cord connection.

Substantiation: Reorganize the section "A" to better follow the NEC style manual and clarify the intent of this section by making this a list as the rest of section 422.16.

Panel Meeting Action: Reject

Panel Statement: This revision not only reorganizes the text of this section, but with this reorganization, the requirements of the current section would be substantially changed without providing substantiation.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

17-13 Log #4832 NEC-P17 **Final Action: Reject**
(422.16(B)(1))

Submitter: Bachir Karam, Las Vegas, NV
Recommendation: Add text to read as follows:

(5) The switch operating the disposer receptacle may not be installed adjacent to the switch operating the kitchen sink light.

Exception: The switch operating the sink light is readily identifiable with a pilot light.

Substantiation: It is common practice in our city to install both the disposer receptacle switch and the kitchen sink light switch in the same double gang box, with no way to identify which is which. It happened to me a few times in both my house and my parents house. Even though there were no dishes in the sink, the fact that you get the disposer running when you are intending on turning the light can be quite startling. I believe it can be quite dangerous when you reach in the dark to turn the light on, but accidentally start the sink disposer, which may have metal utensils with glass dishes around them.

Thank you for considering my request to add a section (5) to 422.16(B)(1).

Panel Meeting Action: Reject

Panel Statement: The panel rejects the substantiation as inadequate to require a revision to the NEC to add this requirement. No reports of injury or loss has been provided to justify this revision.

The NEC is not a design specification; see 90.1(C).

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

17-14 Log #1194 NEC-P17 **Final Action: Reject**
(422.16(B)(3)(5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

(3): The cord is not likely to be subject to physical damage~~Receptacles are located to avoid physical damage to the flexible cord.~~

~~(5) The receptacle is supplied by an individual branch circuit.~~

Substantiation: Location of the receptacle cannot avoid damage to the length of the cord. The individual circuit requirement is apparently based on the assumption of a future replacement or expansion of future electrical use which is not the purpose of the Code per 90.1(B). If direct-connected (hard wired) an individual circuit is not required even though such equipment can also be replaced, so there is no consistency. Dishwashers, waste disposers and trash compactors may be replaced but are not required to be cord-connected. The definition of Branch Circuit, Appliance does not limit the circuit to one appliance.

Panel Meeting Action: Reject

Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.

This proposal is not for 422.16(B)(3)(5), it is probably for 422.16(B)(4)(5). The proposed wording to item #3 does not add clarity to this requirement. 422.16(B)(1)(3) and 422.16(B)(2)(3) have the same wording as the current wording of 422.16(B)(4)(3) and has had no problem with interpretation. The proposal for requiring an individual branch circuit was because of the fact that homeowners are replacing their range hoods with microwaves and are not rewiring the circuit to the correct size to feed these appliances. If they are hardwired, then a permit will be required to install the unit or receptacle and this will allow for the inspector to verify the circuit size for the new microwave.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

17-15 Log #251 NEC-P17 **Final Action: Reject**
(422.16(B)(4)(5))

Submitter: Dennis J. Cox, Elkhart County Building Dept. / Rep. IAEI
Recommendation: Revise text to read as follows:

422.16(B)(4)(5) The receptacle is supplied by a individual (20 ampere) branch circuit.

Substantiation: Today's microwave/vent hoods are higher wattage units. Say for example you have a unit rated at 1,850 watts, this will overload a 15 ampere circuit. Simple math clearly states 120V ÷ 1,850W = 15.41666 ampere. Rounded up this is .42 ampere over the maximum overcurrent device rating. Other sections in the code also state 210.52(B)(1) small appliances (in short) states 20 ampere small appliance branch circuits required by 210.11(C)(1) shall serve all wall and floor receptacle outlets covered by 210.52(A), all counter top outlets covered by 210.52(C) and receptacle outlets for refrigeration equipment.

Panel Meeting Action: Reject

Panel Statement: CMP-17 does not agree with the submitter's substantiation as equipment is required to be installed per 110.3(B).

422.16(B)(4)(5) mandates ONE receptacle on an INDIVIDUAL branch circuit in accordance with 210.21(B)(1).

Since an individual branch circuit is inherently limited to ONE receptacle, the mandated plug-and-cord-connected derating for two or more receptacles per 210.21(B)(2) does not apply. The receptacle and plug may be used at their full ratings per 406.2(A) and 406.6, respectively. Per 422.33(C), the receptacle shall not be rated less than the connected load.

The highest rated microwave oven bearing a 15-ampere, 120-volt plug is rated 1800W. 1800W ÷ 120V = 15.0A. Most microwave residential ovens, built-in or portable, are rated significantly below 1800W; many tend to be 900W to 1100W.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

BLEWITT, T.: Microwave ovens for over-the-range installation with convection or halogen heating are typically rated 1600 - 1800 watts. Their supply cords are mostly fitted with a 15 A attachment plug, although at least one manufacturer specifies a 20 A attachment plug for models rated 1800 watts. There are models rated greater than 1800 watts that are rated 208 or 240 V and fitted with 30 A attachment plugs. Ovens rated 120 V and greater-than-1800 watts are required by the product standard to be fitted with a 20 A (or larger) attachment plug.

17-16 Log #3001 NEC-P17 **Final Action: Reject**
(422.16(B)(4)(5))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as the proposal does comply with the NFPA Regulations Governing Committee Projects.

This action will be considered by the panel as a public comment.

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:

(4) Range Hoods. Range hoods shall be permitted to be cord-and-plug-connected with a flexible cord identified as suitable for use on range hoods in the installation instructions of the appliance manufacturer, where all of the following conditions are met:

(1) The flexible cord is terminated with a grounding-type attachment plug.

Exception to (1): A listed range hood distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be terminated with a grounding-type attachment plug.

(2) The length of the cord is not less than 450 mm (18 in.) and not over 900 mm (36 in.).

(3) Receptacles are located to avoid physical damage to the flexible cord.

(4) The receptacle is accessible.

(5) The receptacle is supplied by an individual branch circuit.

Exception to (5):

Receptacles installed to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units shall be permitted to be on the same circuit as the range hood.

Substantiation: It is very common for electricians to install the igniter on the same circuit as the range hood. Considering the incredibly low amount of power consumed by this, it should not be a violation. The language of the proposal is the same language found in 210.52(B)(2) Ex No. 2.

Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
CMP-17 refers the submitter to 210.52(B)(2) Exception No. 2.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-17 Log #2699 NEC-P17 **Final Action: Reject**
(422.16(B)(4) and (5))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as the proposal does comply with the NFPA Regulations Governing Committee Projects.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete (5) The receptacle is supplied by an individual branch circuit.
Substantiation: Range hoods that are permanently connected "hard wired" are not required to be on an individual circuit. The definition of branch circuit, appliance, permits more than one appliance. A cord/plug in itself does not warrant an individual circuit. Possible replacement by a different type hood can also apply to permanently connected hoods. This provision is not in harmony with 90.1(B) re: future expansion.
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the Regulations Governing Committee Projects in that it does not contain proposed text, including the wording to be added, revised (and how revised), or deleted.
CMP-17 cannot establish the reference the submitter intends to delete.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
HIRSCH, B.: CMP 17 received many proposals with confusing pointers during this cycle. This one, however, is obviously a proposal to eliminate the "future build" requirement in 422.16(B)(5). The substantiation submitted is correct in that the Code specifically stated in 90.1(B) that the provisions of the Code are not necessarily adequate for good service or the future expansion of electrical use. To require "future build" on every installation puts an unnecessary burden on most of the customers affected by the requirement and does not improve the safety of the installation.

17-18 Log #4866 NEC-P17 **Final Action: Reject**
(422.18)

Submitter: John Steinke, Amish Electric
Recommendation: Add a fine print note:
FPN: This section is not intended to require the use of specially made products, in lieu of traditional methods, such as the mounting of a steel box and mud ring assembly directly to a structural support.
Substantiation: A piece of dimensional lumber, secured to a pair of ceiling joists, and in turn supporting a "four square" steel box and mud ring is a traditional mounting method, that has proven itself more than adequate. Yet, the code, as worded, would seem to prohibit this practice.
This is ironic, as the fancy new boxes were compared to the traditional methods at the time of their evaluation. They were designed to match the traditional methods, and, perhaps, provide the installer with some more flexibility in fan location. (For example, a 1/2 in. "pancake" box is a listed fan box, but provides little wiring space. The new designs attempt to address this issue). In a like manner, it is unlikely that any 'turn and twist" bracket can be more secure than a piece of lumber screwed directly to the framing members.
Panel Meeting Action: Reject
Panel Statement: The code does not require or imply that specially made products are required to support suspended ceiling fans (paddle).
The NEC is not a design specification or installation manual; see 90.1(C).
Also, the submitter provides unenforceable language.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-19 Log #1830 NEC-P17 **Final Action: Reject**
(422.21 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: XX INSTALLATION REQUIREMENTS. Where a range, clothes dryer, dishwasher, trash compactor, or other appliance is directly connected by a cable or flexible conduit, an unsupported length of not less than 900 mm (3 ft) but not longer than necessary shall be provided to permit access to terminations. The cable or conduit shall be secured at the point where the unsupported length begins. Nonmetallic sheathed cable, Type SE, Type UF, Type MI cable, flexible metallic tubing, and electrical nonmetallic tubing shall not be used for this purpose.
Substantiation: A provision similar to 550.15(E) seems warranted.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation for this change.
Additional methods of securing conduits or cables other than flexible cords as allowed under 422.16 need to comply with their specific requirements for the particular wiring methods to be used. The term proposed in the first sentence of the proposal "but not longer than necessary" is ambiguous and subjective. There are specific limitations for securing cords and cables within their specific code sections.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-20 Log #1825 NEC-P17 **Final Action: Accept in Part**
(422.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: ~~A means~~ An identified means shall be provided to simultaneously disconnect all ungrounded conductors of each branch circuit supplying an appliance in accordance with the following sections of Part III.
Substantiation: The disconnecting means should be suitable for the purpose and simultaneously disconnect all ungrounded conductors of the branch circuit.
Panel Meeting Action: Accept in Part
422.30 to read as follows:
422.30 General. A means shall be provided to simultaneously disconnect each appliance from all ungrounded conductors in accordance with the following sections of Part III. If an appliance is supplied by more than one source, the disconnecting means shall be grouped and identified.
Panel Statement: CMP-17 accepts the submitter's addition of the word "simultaneously."
CMP-17 does not accept the remainder of the submitter's proposal. No substantiation has been provided to show the current wording is inadequate.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-21 Log #463 NEC-P17 **Final Action: Accept**
(422.31 and 422.32)

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Add, revise, and delete text to read as follows:
422.31 Disconnection of Permanently Connected Appliances.
(A) Rated at Not over 300 Volt-Amperes or $^{1}/_{8}$ Horsepower. For permanently connected appliances rated at not over 300 voltamperes or $^{1}/_{8}$ hp, the branch-circuit overcurrent device shall be permitted to serve as the disconnecting means.
(B) Appliances Rated over 300 Volt-Amperes ~~or 1/8 Horsepower~~. For permanently connected appliances rated over 300 volt-amperes ~~or 1/8 hp~~, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance or is capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
FPN: For appliances employing unit switches, see 422.34.
(C) Appliances Rated over $^{1}/_{8}$ Horsepower. For permanently connected appliances rated over $^{1}/_{8}$ hp, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance. The disconnecting means shall comply with Sections 430.109 and 430.110.
~~422.32 Disconnecting Means for Motor-Driven Appliance. If a switch or circuit breaker serves as the connecting means for a permanently connected motor-driven appliance of more than 1/8 hp, it shall be located within sight from the motor controller and shall comply with Part IX of Article 430.~~
Exception: If an ~~motor-driven~~ appliance of more than 1/8 hp is provided with a unit switch that complies with 422.34(A), (B), (C), or (D), the switch or circuit breaker serving as the other disconnecting means shall be permitted to be out of sight from the ~~motor controller~~ appliance.
Substantiation: This change is intended to clarify the requirements of these sections. As presently worded, there is conflict and confusion with the requirements of Section 422.31(B) and those of section 422.32. Section 422.31(B) allows the branch-circuit switch or circuit breaker disconnecting means for an appliance rated over $^{1}/_{8}$ horsepower to be locked in the open position. However, section 422.32 requires that for a motor driven appliance the disconnecting means must be within sight from the motor controller. As such, this section prohibits the "capable of being locked in the open position." To clarify the intent, the over $^{1}/_{8}$ Horsepower has been removed from section 422.31(B) and a new section 422.31(C) has been created to addresses appliances rated over $^{1}/_{8}$ horsepower. This should make it easier for users of the NEC to understand that for appliances with a motor rated over $^{1}/_{8}$ horsepower, the disconnecting means requirements are more restrictive (as presently worded in section 422.32). Incorporating the requirements of section 422.32 into new section 422.31(C) makes sense. With this change, existing section 422.32 can be deleted. Since the code requirements reference an appliances horsepower rating, a motor driven appliance is implied; therefore, there is no need to reference motor driven appliance. The reference to motor controller is unnecessary too, as the controller is part of the appliance. If not, then the equipment should be subject to the installation requirements of Article 430. The Exception was modified by deleting the reference to "motor driven" and "motor controller" to correlate with new section 422.31(C). Again, the intent of this change is to remove the conflicting and confusing code language!

Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:

MORRIS, W.: 1. Motor size should not be a limiting factor for a more restrictive disconnect means on appliances. Apparent power seems like a more applicable criteria and is already covered in Section 422.31 (B) which allows the circuit breaker to serve as the disconnect.

2. having a circuit box in sight of every appliance is impractical in most cases

3. a circuit switch (wall switch) for the appliance creates confusion since occupants do not understand its purpose and it does provide complete disconnection at the unit since only one conductor is being switched

4. a circuit breaker should be adequate disconnect means and protection to the service person whether the appliance is over 300VA or the appliance contains a motor rated higher than 1/8hp since it eliminates the 115V potential to the unit.

5. 300 Volt-ampere and 1/8 horsepower were originally intended to refer to the same appliance with two different units. Hence, they should not be separated and treated as different appliances as the intend would be altered.

PANNOCK, J.: The change eliminates the ability to lock out the disconnect means if it is not within sight of the appliance for appliances rated over 1/8 horsepower.

According to the way we read this proposal, if you add the new "(C)" it causes confusion. A 1/8 HP appliance would be about 100 VA. Thus, if you say in (B) that anything over 300 VA the branch circuit breaker can serve as the disconnecting means if it is within sight of the appliance or capable of being locked in open position. Then, if you add what is proposed in (C), for anything over 1/8 HP (which would be 100 VA), you allow that the circuit breaker can be used as the disconnecting means where the breaker is within sight. This does not seem to make sense. Why would you allow the breaker to serve as the disconnecting means if it could be locked in open position on a over 300VA appliance but not for a 100VA appliance? Isn't the real safety issue with the amount of power available in the circuit, not in the appliance?

The other problem that we have is that appliances are not rated in both VA and HP. HP is outdated and not used. It is also not an international unit of electrical power, and therefore appliances are rated in only Amps or VA or Watts on a nameplate. Motorized appliances are either rated in Amps or VA.

UL requirements for appliances typically state (dishwashers, MWO, but not washers and dryers): "The rating of an appliance having provision for permanent connection of the electrical supply and incorporating a motor load of more than 1/8 horsepower shall include either: a) The motor load of the largest motor in amperes and volts, and also the non-motor load in amperes and volts (or watts and volts); or b) The minimum supply circuit conductor ampacity and the maximum rating of the circuit overcurrent protective device in amperes."

Therefore, the appliances **<u>may not be marked</u>** with a horsepower rating. Horsepower is not an internationally recognized unit, but volt-amps and watts are. The requirements in 430 are clear for motor driven appliances, but 422 covers combination appliances so the different rule is appropriate. Dishwashers are the clearest example.

17-22 Log #1562 NEC-P17 **Final Action: Reject**
(422.31(B))

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:

(B) Appliances Rated over 300 Volt-Amperes or Horsepower. For permanently connected appliances rated over 300 volt-amperes or hp, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance or **<u>the disconnecting means shall be lockable.</u>** ~~is capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.~~

Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.

A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."

Panel Meeting Action: Reject
Panel Statement: CMP-17 rejects this proposal because there is no definition for the term "disconnecting means, lockable" in Article 100 that meets the current requirements of this section.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-23 Log #1799 NEC-P17 **Final Action: Reject**
(422.31(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: For permanently connected appliances rated over 300 volt-amperes or 1/8 hp, the branch circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker <u>if</u> within sight from the appliance or ~~is capable of~~ h<u>as identified integral permanent provisions for</u> being locked in the open <u>(off)</u> position.

Delete remainder.

Substantiation: Proposal provides specific requirements for locking and prohibits makeshift methods. "Capable" is not specific as to means and doesn't specifically require actual means for locking.
Panel Meeting Action: Reject
Panel Statement: The current wording is the same wording used in many other sections throughout the code and requires provisions for locking to remain in place with or without the lock installed. There was no substantiation provided showing that the current wording is being misapplied or misunderstood.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-24 Log #1804 NEC-P17 **Final Action: Reject**
(422.31(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete present text and substitute:

For permanently connected appliances rated over 300 volt-amperes or 1/8 hp, the branch circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance or is provided with an identified integral and permanent means for locking in the open (off) position, capable of being locked in the open position.

Delete remainder.

Substantiation: Proposal provides specific requirements and prohibits makeshift methods.
Panel Meeting Action: Reject
Panel Statement: See action and statement on Proposal 17-23.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-25 Log #1860 NEC-P17 **Final Action: Reject**
(422.31(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: For permanently connected appliances rated over 300 volt-amperes or 1/8 horsepower the branch circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance <u>or has identified permanent integral means for being locked in the open (off) position</u>.

Delete the last sentence.

Substantiation: Edit. "Capable" is subjective and not specific, proposal does not allow for makeshift methods. "Open" should clearly mean "off" position, not the cover or enclosure of the disconnecting means.
Panel Meeting Action: Reject
Panel Statement: See action and statement on Proposal 17-23.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-26 Log #3623 NEC-P17 **Final Action: Reject**
(422.31(B), FPN)

Submitter: David A. Williams, Delta Township
Recommendation: Delete the FPN for this Section 422.31(B).
Substantiation: This fine print note should be deleted since the UL product standard does not require an appliance unit switch to switch the ungrounded conductor. The manufacturer is permitted to switch the grounded conductor.
Panel Meeting Action: Reject
Panel Statement: Deleting the FPN will not change the requirements of 422.34 or 422.31(B). The FPN is only to remind code users that Section 422.34 exists and is applicable. The substantiation is technically incorrect and in conflict with 404.2(B).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-27 Log #1800 NEC-P17 **Final Action: Reject**
(422.33(A) and (C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence of (A): Where the separable cord connector, plug and receptacle or flanged surface device are not readily accessible, cord and plug connected appliances shall be provided with disconnecting means in accordance with 422.31.
Revise (C): The rating of an attachment plug, a receptacle, or a separable cord connector or flanged surface device shall not be less than the rating of any appliance connected thereto.
Substantiation: "Accessible" as used in (A) appears to apply to equipment. Receptacles are required to be accessible and the disconnecting means of 422.31 are required to be accessible.
(C) should include attachment plugs and flanged surface services.
Panel Meeting Action: Reject
Panel Statement: CMP-17 does not accept the changes to the wording as there is no improved clarity with respect to the word "accessible" applying to the separable connector, plug, and receptacle.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-28 Log #3624 NEC-P17 **Final Action: Reject**
(422.34)

Submitter: David A. Williams, Delta Township
Recommendation: Delete Section 422.34.
Substantiation: This section should be deleted since the UL product standard does not require an appliance unit switch to switch the ungrounded conductor. The manufacturer is permitted to switch the grounded conductor.
Panel Meeting Action: Reject
Panel Statement: See action and statement on Proposal 17-26.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-29 Log #501 NEC-P17 **Final Action: Reject**
(422.49)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Add a hyphen between "circuit" and "interrupter" in the second sentence.
Substantiation: The addition of the hyphen will provide consistency throughout the Code.
Additional proposals are being submitted to make similar corrections throughout the Code.
Panel Meeting Action: Reject
Panel Statement: CMP-17 notes that the proposal does not follow the NEC Style Manual, Annex B, Standard Terms.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-30 Log #4796 NEC-P17 **Final Action: Reject**
(422.49)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
High-Pressure Spray Washers.
(A) 120 Volt Systems. All single-phase cord-and-plug-connected high-pressure spray washing machines rated at 120 volts or less shall be provided with factory-installed power safe protector protection for personnel. The power safe protector shall be an integral part of the attachment plug or shall be located in the supply cord within 300 mm (12 in.) of the attachment.
(B) 240 Volt Systems. All single-phase cord-and-plug-connected high-pressure spray washing machines rated at 250 volts or less shall be provided with factory-installed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the supply cord within 300 mm (12 in.) of the attachment.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:
1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle is actively supplying power to an appliance, it provides traditional GFCI protection.
2. PSP receptacles monitor the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.
Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The use of a trademarked name is not allowed in code language. As far as we know, there has been no release of the patent.
There are no product safety requirements for this product.
CMP-17 does not agree that the submitter's technical substantiation demonstrates that the device mitigates the hazards described.

ARTICLE 424 — FIXED ELECTRIC SPACE-HEATING EQUIPMENT

17-35 Log #1609 NEC-P17 **Final Action: Reject**
(424.3)

Submitter: Adam Horsky, GR Noto Electrical Construction / Rep. IBEW Local 81
Recommendation: Revise text to read as follows:
424.3 Branch Circuits.
(A) Branch-Circuit Requirements. Individual branch circuits shall be permitted to supply any size fixed electric space-heating equipment.
(1) Branch circuits supplying two or more outlets. ~~For~~ Fixed electric space-heating equipment shall be rated 15, 20, 25, or 30 amperes.
(2) Branch circuits in nondwelling occupancies. Fixed infrared heating equipment shall be permitted to be supplied from branch circuits rated not over 50 amperes.
Substantiation: Section 424.3(A) in its current form creates confusion as to what is actually meant by the text. The division of 424.3(A) into 424.3(A)(1) and 424.3(A)(2) helps to alleviate much confusion by separating the two codes into their purpose.
Panel Meeting Action: Reject
Panel Statement: CMP-17 rejects the submitter's reorganization as it does not add clarity to the article. The submitter has provided no definitive substantiation to show that there has been confusion resulting from the existing text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-36 Log #2695 NEC-P17 **Final Action: Accept**
(424.3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Individual branch circuits shall be permitted to supply any ~~size~~ volt-ampere or wattage rating of fixed electric space heating equipment for which it is rated.
Substantiation: Edit. "Size" is apparently intended to apply to power rating; not physical size; the branch circuit should be specified to be rated for the load.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-37 Log #2164 NEC-P17 **Final Action: Accept**
(424.3(A))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise text as follows:
424.3 Branch Circuits.
(A) Branch-Circuit Requirements.
Individual branch circuits shall be permitted to supply any size fixed electric space-heating equipment.
Branch circuits supplying two or more outlets for fixed electric space-heating equipment shall be rated 15, 20, 25, or 30 amperes. In ~~nondwelling occupancies~~ other than a dwelling unit, fixed infrared heating equipment shall be permitted to be supplied from branch circuits rated not over 50 amperes.
Substantiation: The change is in keeping with the NEC Style Manual on the use of "nondwelling" terminology. The change will also provide better clarity for the user by plainly stating the correct usage of the rule.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 10 Negative: 3
Explanation of Negative:
ROCK, B.: The revision was substantiated by unreferenced citation of the NEC® Style Manual on the use of "nondwelling" terminology. However Annex B, "Standard Terms", of the NEC® Style Manual indicates on Page 28 explicitly indicates for "other than a dwelling unit" to avoid and to use "nondwelling" that is listed on the same page as being a sanctioned standard term. The existing wording is in fact in accordance with the NEC® Style Manual and the proposed wording is not.
SCHAPP, R.: I agree with the comments on vote submitted by Mr. Rock and Mr. Yasenchak.
YASENCHAK, R.: The term "other than a dwelling unit" does not meet the Style Manual requirements.

17-38 Log #2742 NEC-P17 **Final Action: Accept in Principle**
(424.3(A))

Submitter: Timothy S. Owens, City of Santa Clara
Recommendation: Revise text to read as follows:
424.3 Branch Circuits.
(A) Branch-Circuit Requirements.
Individual branch circuits shall be permitted to supply any size fixed electric space-heating equipment.
Branch circuits supplying two or more outlets for fixed electric space-heating equipment shall be rated 15, 20, 25, or 30 amperes. In ~~nondwelling occupancies~~ other than a dwelling unit, fixed infrared heating equipment shall be permitted to be supplied from branch circuits rated not over 50 amperes.
Substantiation: This change is in keeping with the NEC Style Manual on the use of "nondwelling" terminology. The change will also provide better clarity for the user by plainly stating the correct usage of the rule.

Recommendation: Revise text:
Where likely to be subject to physical damage... (remainder unchanged)
Substantiation: Edit. 'Likely" is defined as such a nature or circumstance as to make something probable and provides a basis for judgment. It is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: The submitter's text does not meet the requirements of the NEC Style Manual, 3.2.1.
This phrase adds no clarity to the text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-41 Log #1033 NEC-P17 **Final Action: Reject**
(424.19)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first paragraph and substitute:
DISCONNECTING MEANS. An identified switch or circuit breaker shall be provided to simultaneously disconnect each branch circuit supplying fixed electric space heating equipment. Where the heating equipment is supplied by more than one branch circuit the disconnecting means shall be grouped and each identified as to the equipment controlled by a permanently affixed and durable label. Each disconnecting means shall have an ampere rating not less than 125 percent of the total load it controls. An identified integral permanent means for locking in the open (off) position shall be provided for each disconnecting means.
Substantiation: The type of disconnecting means should be suitable for the use; the locking provision suggests it is a switch or circuit breaker. "All" ungrounded conductors includes feeder and service conductors. "Grouped and marked" does not specify what kind of marking nor durability or attachment. The proposal for locking is specific as to the portion of the disconnection means, not the cover or door, and prohibits makeshift methods.
Panel Meeting Action: Reject
Panel Statement: CMP-17 does not accept that the proposed revised wording is necessary or adds clarity to the existing code requirement.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-42 Log #1563 NEC-P17 **Final Action: Reject**
(424.19)

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
424.19 Disconnecting Means.
Means shall be provided to simultaneously disconnect the heater, motor controller(s), and supplementary overcurrent protective device(s) of all fixed electric space-heating equipment from all ungrounded conductors. Where heating equipment is supplied by more than one source, the disconnecting means shall be grouped and marked. The disconnecting means specified in 424.19(A) and (B) shall have an ampere rating not less than 125 percent of the total load of the motors and the heaters **and be lockable.** ~~The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.~~
(A) Heating Equipment with Supplementary Overcurrent Protection. The disconnecting means for fixed electric space-heating equipment with supplementary overcurrent protection shall be within sight from the supplementary overcurrent protective device(s), on the supply side of these devices, if fuses, and, in addition, shall comply with either 424.19(A)(1) or (A)(2).
(1) Heater Containing No Motor Rated over Horsepower. The above disconnecting means or unit switches complying with 424.19(C) shall be permitted to serve as the required disconnecting means for both the motor controller(s) and heater under either of the following conditions:
(1) The disconnecting means provided is also within sight from the motor controller(s) and the heater.
(2) The disconnecting means **is lockable.** ~~provided is capable of being locked in the open position.~~
(2) Heater Containing a Motor(s) Rated over Horsepower. The above disconnecting means shall be permitted to serve as the required disconnecting means for both the motor controller(s) and heater **under the following conditions.** ~~by one of the following means:~~
(1) ~~Where~~ the disconnecting means **or unit switch compying with 424.19(C)** is ~~also~~ in sight from the motor controller(s) and the heater **or,**
(2) **The heater disconnecting means is lockable where not located within sight from the heater and,** ~~Where the disconnecting means is not within sight from the heater, a separate disconnecting means shall be installed, or the disconnecting means shall be capable of being locked in the open position, or unit switches complying with 424.19(C) shall be permitted.~~
(3) **The motor controller(s) disconnecting means complies with 430.102(A) and,** ~~Where the disconnecting means is not within sight from the motor controller location, a disconnecting means complying with 430.102 shall be provided.~~
(4) **The motor disconnect complies with 430.102(B).** ~~Where the motor is not in sight from the motor controller location, 430.102(B) shall apply.~~
(B) Heating Equipment Without Supplementary Overcurrent Protection.
(1) Without Motor or with Motor Not over Horsepower. For fixed electric space-heating equipment without a motor rated over hp, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the heater or **the disconnecting means is lockable.** ~~is capable of being locked in the open position.~~
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: See action and statement on Proposal 17-22.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-43 Log #2679 NEC-P17 **Final Action: Reject**
(424.19)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:
An identified disconnecting means shall be provided to simultaneously disconnect all ungrounded conductors of each branch circuit supplying fixed electric space heating equipment. Where the equipment is supplied by more than one circuit the disconnecting means shall be grouped and durably marked to indicate the equipment controlled. The disconnecting means specified in 424.19(A) and (B) shall have an ampere rating not less than the total load of the motors and the heaters plus 25 percent of the motor or heater load, whichever is largest. An identified integral and permanent means shall be provided for locking the disconnecting means in the open (off) position.
Substantiation: Present wording literally requires simultaneous disconnection of ALL ungrounded conductors even where supplied by different disconnecting means. "More than one branch circuit" is proposed since more than one "source" may be deemed to mean service, power supply, or panelboard. An ampere rating for the disconnecting means of 125 percent of the largest motor or heater load will allow for temporary motor overcurrent and the heating effect of continuous load on terminals and overcurrent devices. There is no need to apply the factor to both motor and heating load. Proposal for locking is specific and doesn't allow makeshift methods. Present wording does not REQUIRE locking means.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-41.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-44 Log #2156 NEC-P17 **Final Action: Accept**
(424.19(A)(2))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Replace entire section 424,19(A)(2) to read as follows.
Heater Containing A Motor(s) Rated over 1/8 Horsepower. The above disconnecting means shall be permitted to serve as the required disconnecting means for both the motor controller(s) and the heater by one of the following means:
(1) Where the disconnecting means is in sight from the motor controller(s) and the heater, and complies with Part IX of Article 430.
(2) Where the motor(s) of more than 1/8 horsepower and the heater are provided with a single unit switch that complies with 422.34(A), (B), (C), or (D), the disconnecting means shall be permitted to be out of sight from the motor controller.
Substantiation: 422.32 requires that the disconnecting means comply with Part IX of Article 430. This same motor-driven appliance with an additional fixed space heater is not presently required to comply with Part IX of Article 430. There should be uniformity in the location requirement for a motor(s) over 1/8 horsepower, whether it is a motor-driven appliance or part of fixed space-heating equipment.
For example, a fan coil unit with no auxiliary heat would fall within the scope of 422.32. This same unit, with integral heat would fall within the scope of 424.19(A)(2). This change would provide uniformity for a motor(s) over 1/8 horsepower.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-45 Log #903 NEC-P17 **Final Action: Reject**
(424.19(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
"...or is ~~capable of being~~ has permanent integral identified provisions for being locked in the open (off) position.
Substantiation: "Capable of being locked" is not specific and does not exclude makeshift or temporary methods, and does not actually require locking provisions.
Panel Meeting Action: Reject
Panel Statement: CMP-17 rejects the need for this rewording, and there is no substantiation provided to show that the current section is inadequate or is being misinterpreted.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-46 Log #904 NEC-P17 **Final Action: Reject**
(424.19(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
"...or is ~~capable of being~~ has permanent integral identified provisions for being locked in the open (off) position.
Substantiation: "Capable of being locked" is not specific, does not actually require locking provisions and does not exclude makeshift methods.
Panel Meeting Action: Reject
Panel Statement: See panel action and substantiation on Proposal 17-45.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-47 Log #2693 NEC-P17 **Final Action: Reject**
(424.21)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Switches and circuit breakers used as disconnecting means ~~shall be of the indicating type~~ shall be clearly and permanently marked to indicate the open (off) and closed (on) position. Exception; 3-way and 4-way snap switches.
Substantiation: "Indicating" is not defined or specific; a pilot light can be an indicator. Indication could be the normal up or down position of the operating handle as covered in Exception No. 1 for 404.7. This provision should track the wording of 404.7.
Panel Meeting Action: Reject
Panel Statement: CMP-17 rejects the use of the words "clearly and permanently marked" as there are other means besides marking that could serve as an indicator. 404.7 requires units to "clearly indicate," rather than be "clearly and permanently marked."
3-way and 4-way switches are not approved as disconnects as they are able to be operated at multiple locations.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
MALDONADO, J.: The Action should have been to Accept in Part. The use of the term "indicating type", which is not clearly defined in this Article or in Article 100, does not give clear direction as to what is expected of the installer and becomes a point of contention in the field. The proposed Exception should be rejected. There are disconnect switches being approved as part of Listed equipment that does not Clearly show the "off" or "on" position of a disconnect switch. Article 110.22(A) already addresses that the disconnect "indicate its purpose".
Recommendation: Switches and circuit breakers used as disconnecting means ~~shall be of the indicating type~~ shall be clearly and permanently marked to indicate the open (off) and closed (on) position.
Comment on Affirmative:
BLEWITT, T.: The submitter sought to have similar wording in 424.21 as appears in 404.7. However, the proposal would result in a marking that is not prescribed in 404.7 and would prohibit switches with integral lamps or other effective means of indication as currently permitted by both cited articles.

17-48 Log #2692 NEC-P17 **Final Action: Reject**
(424.22)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part:
... shall be ~~permitted~~ considered to be protected against overcurrent where supplied by one of the branch circuits described in 210.3 and 210.23 that is rated for the load.
Substantiation: "One of the branch circuits in Article 210 is vague and not specific. and includes circuits over 600 volts.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-50.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-49 Log #1092 NEC-P17 **Final Action: Reject**
(424.22(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part:...Shall be permitted to be protected against overcurrent by the branch circuit overcurrent protective device. ~~Where supplied by one of the branch circuits in Article 210.~~
Substantiation: "One of the branch circuits in Article 210" is not specific and covers many branch circuits including those over 600 volts. A branch circuit larger than 50 amperes (210.23(D)) may not provide protection for equipment rated 10 amperes.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the code.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-50 Log #3353 NEC-P17 **Final Action: Reject**
(424.22(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part:
... shall be permitted to be protected against overcurrent where supplied by one of the branch circuits covered in ~~Article 210~~ 210.3 and 210.23 provided the branch circuit does not exceed the maximum protective device rating marked on the equipment.
Substantiation: "One of the branch circuits in Article 210" is broad, includes circuits over 600 volts. The branch circuits should comply with any equipment marking.
Panel Meeting Action: Reject
Panel Statement: CMP-17 rejects the text that would limit the requirements to 210.3 and 210.23.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-51 Log #1091 NEC-P17 **Final Action: Accept in Principle**
(424.28(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence of second paragraph:
Electric space heating equipment intended for use on alternative current only. Or direct current only, or both shall be marked to so indicate such use.
Substantiation: Some heating elements may be suitable for use on ac and dc circuits.
Panel Meeting Action: Accept in Principle
Second paragraph of 424.28(A) to read as follows:
Electric space-heating equipment intended for use on alternating current only, ~~or~~ direct current only, or both, shall be marked to so indicate. The marking of equipment consisting of motors over 1/8 hp and other loads shall specify the rating of the motor in volts, amperes, and frequency, and the heating load in volts and watts or in volts and amperes.
Panel Statement: CMP-17 edited the submitter's text to clarify that "alternative current" was not the intended wording.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(Note: Sequence 17-52 was not used)

17-53 Log #1090 NEC-P17 **Final Action: Accept**
(424.39)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
~~Sufficient area shall be provided to ensure that~~ No heating cable ~~is~~ shall be covered by any surface mounted ~~unit~~ equipment.
Substantiation: Edit. "Sufficient" is a term to be avoided per the Style Manual. "Unit" is not defined.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-54 Log #2691 NEC-P17 **Final Action: Reject**
(424.40)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Splices in embedded cables shall be ~~spliced only where necessary; and only~~ made by ~~approved~~ identified means,... (remainder unchanged)
Substantiation: Edit. It is normal practice to splice only where necessary. What constitutes necessary? "Approved" is not necessarily the same as "identified".
Panel Meeting Action: Reject
Panel Statement: No substantiation was provided to show that the current wording has caused a misapplication of the code.
The intent of the code is to require "approved" rather than "identified."
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-55 Log #2698 NEC-P17 **Final Action: Reject**
(424.43)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
Such installations shall be permitted to be ~~single~~ individual conductors in ~~approved~~ identified raceways, single or multiconductor Type UF, Type NMC or other ~~approved~~ identified conductors.
Substantiation: Edit. "Single" implies one conductor, as indicated by "single Type UF". "Approved" is not necessarily the same as "identified".
Panel Meeting Action: Reject
Panel Statement: CMP-17 assumes the submitter was referring to 424.43(A).
The intent of CMP-17 is to require "approved" rather than "identified" as "approved" is appropriate.
"Single conductors" is commonly used throughout the code.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-56 Log #2593 NEC-P17 **Final Action: Reject**
(424.43(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Free nonheating leads from cables shall be installed in accordance with ~~approved~~ identified wiring methods from t~~he junction~~ a box, thermostate, or control switch to a location within the ceiling. Such installations shall be ~~permitted to be~~ in ~~approved~~ raceways, ~~single or~~ multiconductor Type UF cable, Type NMC or other ~~approved~~ identified conductors or cables.
Substantiation: "Approved" is not necessarily the same as "identified". The leads may be installed from a switch or thermostat which may not be deemed a "junction" box. The present last sentence has no specific requirements; 90.5 states "shall be permitted" identifies actions allowed but not required. Type UF cable should be multiconductor type covered by rules of Article 334. Is single conductor Type UF to be installed per Article 394 or 398?
Panel Meeting Action: Reject
Panel Statement: The intent of CMP-17 is to require "approved" rather than "identified" as "approved" is appropriate.
"Single conductor Type UF" is an approved wiring method.
The addition of "thermostate, or control switch" does not add clarity to the code. Other items such as relays could also be used.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-57 Log #364 NEC-P17 **Final Action: Accept**
(424.44(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise title as shown:
(A) ~~Watts per Linear~~ Watts/Linear Meter (Foot).
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard. This revision will also provide consistency with the other text.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-58 Log #3670 NEC-P17 **Final Action: Accept**
(424.44(G))

Submitter: Mark Smythe, Smythe Electric Inc.
Recommendation: Revise text as follows:
424.44(G) Ground-Fault Circuit-Interrupter Protection. Ground-fault circuit interrupter protection for personnel shall be provided for cables installed in electrically heated floors of bathrooms, kitchens, and in hydromassage bathtub locations.
Substantiation: Including GFCI protection of electrical heating cables in kitchen masonry floors, would provide the same protection provided in bathrooms and hydromassage tub locations, for personnel while washing dishes or while in the vicinity of a wet floor in the instance of a plumbing leak at the dishwasher.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
HIRSCH, B.: This proposal adds the requirement to provide GFCI protection for cables installed in electrically heated floors in kitchens to the existing requirement for GFCI protection on cables installed in electrically heated floors for bathrooms and hydro-massage bathtub locations. The submitter offered no substantiation that any incidents have ever occurred and based the proposal on the "possibility" that water could be on the floor of a kitchen if the dishwasher ever leaked.
MORRIS, W.: I do not accept the premise that kitchen floors should be automatically considered to be a wet surface location. The word, "kitchens" should not be used in this revision.

17-59 Log #1223 NEC-P17 **Final Action: Reject**
(424.60)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change first word "elevated" to "heated".
Substantiation: Edit. "Elevated" is not defined or quantified.
Panel Meeting Action: Reject
Panel Statement: CMP-17 chooses to retain the existing verbiage. "Elevated" is technically correct.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-60 Log #1089 NEC-P17 **Final Action: Reject**
(424.92(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Each unit shall be listed and identified as suitable for the installation.
Substantiation: Installers and AHJs generally do not have the wherewithall to evaluate the safety of such products such as nonheating leads. Many equipments are required to be listed which have much less potential for hazards. Manufacturers' instructions per 424.93(A)(1) may not be equal to provisions required by a NRTL. 424.93(A)(3) suggests some panels are listed.
Panel Meeting Action: Reject
Panel Statement: 424.6 already requires listing. Repeating the requirement here would be redundant.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-61 Log #1088 NEC-P17 **Final Action: Reject**
(424.94)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
Wiring located above heated ceilings shall be spaced not less than 50 mm (2 in.) above the heated ceiling and shall be considered as operating in an ambient of 50°C (122°F) unless installed at least 300 mm (12 in.) above the heated ceiling.
Substantiation: Wiring installed far enough above the ceiling should be exempted. If this proposal has merit, the panel may establish the distance.
Panel Meeting Action: Reject
Panel Statement: No substantiation was provided to allow for this reduction. The submitter is requested to provide test data to show this reduction is justified in concealed non-ventilated spaces.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 426 — FIXED OUTDOOR ELECTRIC DEICING AND SNOW-MELTING EQUIPMENT

17-62 Log #1087 NEC-P17 **Final Action: Accept**
(426.2.Impedance Heating System)

Submitter: Dan Leaf, Seneca, SC
Recommendation: IMPEDENCE HEATING SYSTEM. Change "dual winding" to "isolating".
Substantiation: Dual means two; there is no apparent reason not to permit transformers with multiple primary and secondary windings. Two winding transformers can be connected as autotransformers.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-63 Log #1224 NEC-P17 **Final Action: Reject**
(426.2, FPN)

Submitter: Dan Leaf, Seneca, SC
Recommendation: In the FPN, change "dual-winding" to "multiple winding" an add after transformer "with the primary and secondary windings physically separated".
Substantiation: Edit. Dual-winding means two windings and does not prohibit autotransformer connections, and literally prohibits isolating type transformers with more than two windings.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-64.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-64 Log #3245 NEC-P17 **Final Action: Accept in Principle**
(426.2, FPN)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change:
dual winding: to “isolating” or “isolation type”.
Substantiation: “Dual” means two; many transformers have more than two windings. Dual doesn’t necessarily mean isolated windings; dual (two) windings can be connected as an autotransformer.
Panel Meeting Action: Accept in Principle
Change FPN for Skin-Effect Heating System to read as follows:
FPN: Typically, an electrically insulated conductor is routed through and connected to the envelope at the other end. The envelope and the electrically insulated conductor are connected to an ac voltage source from an isolating transformer.
Panel Statement: CMP-17 believes the submitter is referring to the second FPN.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-65 Log #4260 NEC-P17 **Final Action: Reject**
(426.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 426.5 in Part I.
426.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer’s self-evaluation or an owner’s engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV’s, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of “other” options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be “approved”, it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement to Proposal 17-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-66 Log #4261 NEC-P17 **Final Action: Reject**
(426.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 426.5 in Part I.
426.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if listed.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject

17-67 Log #4262 NEC-P17 **Final Action: Reject**
(426.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 426.5 in Part I.
426.5 Equipment Approval. The equipment required or permitted by this Article after December 31, 2016 shall be acceptable only if listed.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, the proposed text requires listing of all equipment covered by this Article by a qualified testing agency as defined in Article 100. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation and listing of that equipment.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement to Proposal 17-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-68 Log #4263 NEC-P17 **Final Action: Reject**
(426.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 426.5 in Part I.
426.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer’s self-evaluation or an owner’s engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.

(426.11)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:

Fixed outdoor deicing and snow-melting equipment shall be protected by identified means where likely to be subject to physical damage.

Substantiation: Sections 426.10, 426.12, 426.13, 426.14 use the full description of the equipment covered by this article. Present wording literally requires protection whether or not there is a likelihood of damage. "Likely" is defined as such a nature or circumstance as to make something probable and a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: There was no substantiation provided to show that the current wording has caused a misinterpretation or an unsafe installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-71 Log #1086 NEC-P17 **Final Action: Reject**
(426.20(C)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:

Equipment that has been ~~specially investigated~~ listed for other forms of installation shall be installed only in the manner for which it has been listed ~~investigated~~.

Substantiation: Text does not indicate who is to investigate or what qualifications they have; is it the AHJ, installer or manufacturer?
Panel Meeting Action: Reject
Panel Statement: According to 110.3, instructions supplied with the equipment provide installation requirements.

CMP-17 has determined that "listed" is too restrictive. The submitter is requested to provide additional substantiation.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

MALDONADO, J.: The Panels action should have been "Accept". The current text uses an undefined term that is ambiguous. There are terms that could be used that are clearly identified, such as "Approved", "Identified", "Listed" or "Labeled". Since this term is being used as an exception to the general rule, the term "Listed" would be the most appropriate, since "special investigations" would be more closely related to the listing process.

Comment on Affirmative:

CRIVELL, P.: The proposal should be accepted in part and principle for the following reasons:

The word "investigated" is not defined and is therefore subjective and not enforceable. The purpose of 426 (C) (3) is to allow embedded deicing and snow-melting resistance heating elements to be installed with different cover than prescribed in 426(C)(1) and 426(C)(2). It is not too restrictive to require that the heating elements be listed and for the listing to identify alternate installation requirements if the installation does not comply with that prescribed in 426(C)(1) or 426(C)(2).

The heating elements are not necessarily "listed" for a manner of installation, but more accurately its listing cold "identify" a manner of installation other than that prescribed in 426(C)(1) or 426(C)(2).

The following panel statement could be used to Accept in Part and Principle:
The heating elements are not necessarily "listed" for a manner of installation, but more accurately its listing could "identify" a manner of installation other than that prescribed in 426(C)(1) or 426(C)(2).
426 (C) (3) revised as follows:
Equipment that has been ~~specially investigated~~ listed for other forms of installation shall be installed only in the manner for which it has been identified ~~investigated.~~

17-72 Log #1226 NEC-P17 **Final Action: Accept in Part**
(426.22(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action and statement of this proposal to identify what was not accepted and the reason it was not accepted.

This action will be considered by the panel as a public comment.

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

All but 25 mm to 150 mm (1 in. to 6 in.) of nonheating leads of conductors ~~Type TW and other approved types~~ not having a grounded sheath shall be enclosed in a rigid metal conduit, electrical metallic tubing, intermediate metal conduit or other ~~approved~~ identified raceways...(remainder unchanged).

Substantiation: Edit. A reference to Type TW and other approved types is superfluous. "Rigid" conduit is assumed to be metal not PVC; "other raceways should be identified for the use, which is not the same as "approved".
Panel Meeting Action: Accept in Part

426.22(B) to read as follows:

(B) Raceways. All but 25 mm to 150 mm (1 in. to 6 in.) of nonheating leads ~~of Type TW and other approved types~~ not having a grounding sheath shall be enclosed in a rigid metal conduit, electrical metallic tubing, intermediate metal conduit, or other raceways within asphalt or masonry; and the distance from the factory splice to raceway shall not be less than 25 mm (1 in.) or more than 150 mm (6 in.).
Panel Statement: CMP-17 accepts "metal" and deletes "Type TW and other approved types."

CMP-17 does not accept the remainder of submitter's proposal.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-73 Log #1085 NEC-P17 **Final Action: Accept**
(426.23(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "suitable" to "identified".
Substantiation: Edit. Suitable is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

SCHAPP, R.: Replacing "suitable" with "identified" is inconsistent with panel action taken on proposal 17-72.Clarification is needed to avoid confusion between articles 426.22(B) and 426.23(A).

17-74 Log #1225 NEC-P17 **Final Action: Reject**
(426.23(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

Nonheating power supply leads shall be enclosed in a rigid metal conduit, intermediate metal conduit, electrical metallic tubing, or other identified raceways ~~approved means~~.

Substantiation: Edit. "Rigid" is assumed to be metal; "approved" is not the same as "identified".
Panel Meeting Action: Reject
Panel Statement: The existing code text provides for adequate mechanical protection. The wording "rigid conduit" does not exclude PVC or other similar adequate protection methods.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

SCHAPP, R.: To be consistent with panel action on proposal 17-72, panel action should be APA so it reads "rigid metal conduit"

17-75 Log #729 NEC-P17 **Final Action: Accept**
(426.28)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise the title to read as follows:
426.28 Ground-Fault Protection of Equipment ~~Protection~~.
Ground-fault protection of equipment shall be provided for fixed outdoor electric deicing and snow-melting equipment, except for equipment that employs mineral-insulated, metal-sheathed cable embedded in a noncombustible medium.
Substantiation: Revise Section title to match the subject content of the Section. This revision would be consistent with the definition in Article 100 and the title used for 230.95 for similar subject matter and would improve readability of the *Code*. The vague title "Equipment Protection" of 426.28 lead Code-Making Panel No 2 for the 2005 *NEC®* to accept a change of the reference in 210.8(A)(3) *Exception to (3)* (addressing GFCI Protection for Personnel) to 426.28 from Article 426 (in its entirety) in an effort to comply with 4.1.1 of the *NEC® Manual of Style*.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-76 Log #2732 NEC-P17 **Final Action: Accept**
(426.28)

Submitter: James S. Conrad, Tyco Thermal Controls
Recommendation: Revise text to read as follows:
426.28 Equipment Protection. Ground-fault protection of equipment shall be provided for fixed outdoor electric deicing and snow-melting equipment~~, except for equipment that employs mineral-insulated, metal-sheathed cable embedded in a noncombustible medium~~.
Substantiation: Mineral insulated cables employ different types of metal sheaths, not all of which are suitable as ground fault returns. This revision would eliminate the only exception in the NEC to the requirement that all electrical heating cables be ground-fault protected. It would also harmonize with the Canadian Electrical Code which requires ground-fault protection, not only for embedded electric deicing and snow-melting cables in particular, but for all electric heating cables, regardless of their application.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-77 Log #3305 NEC-P17 **Final Action: Accept in Principle**
(426.31)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete present text and substitute: A transformer of the multiple winding type, with the primary and secondary windings physically separated, with a grounded shield between the primary and secondary windings, and ungrounded secondary, shall be used to supply the heating system.
Substantiation: "Dual" means "two" many transformers have more than two windings. The secondary should be specified as ungrounded to avoid ground fault currents. While intent may be perceived, "distribution system" literally includes all conductors supplying the system, including the service. Stating the purpose is unnecessary and not done for most Code rules.
Panel Meeting Action: Accept in Principle
426.31 to read as follows:
426.31 Isolation Transformer. An isolation transformer with a grounded shield between the primary and secondary windings shall be used to isolate the distribution system from the heating system.
Panel Statement: CMP-17 changes the term "dual-winding" to "isolation." The change satisfies the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-78 Log #3461 NEC-P17 **Final Action: Reject**
(426.32)

Submitter: Neal Fenster, Thermo Systems Technology, Inc.
Recommendation: Revise text to read as follows:
"Unless protected by ~~a ground fault circuit interrupter protection for personnel~~ ground fault protection the secondary winding of the isolation transformer connected to the impedance heating elements shall not have an output voltage greater than 30 volts ac.
Where ~~ground fault circuit interrupter protection for personnel~~ ground fault protection is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.
Substantiation: 1) These metallic piping systems are thermally insulated and mechanically protected against physical damage.
2) The higher operating current levels of electrical impedance heating systems are not compatible with a Class A type protection system.
Panel Meeting Action: Reject
Panel Statement: Ground-fault protection is not equivalent to ground-fault-circuit interrupter protection for personnel. There was no substantiation provided to show why the operating current level is not compatible with a Class A type GFCI.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-79 Log #3230 NEC-P17 **Final Action: Reject**
(426.50(B))

Submitter: Ralph E. Russell, Jr., New Durham, NH
Recommendation: Revise text as follows:
The factory installed attachment plug of cord-and-plug-connected equipment rated 20 amperes or less and 150 volts or less to ground shall not serve as the disconnecting means. The disconnecting means described in 426.50(A) shall apply also for 426.50(B)
Substantiation: Receptacles for de-icing equipment are too often accessible only after removal of excess snow, ice build ups and are reached by ladder or long handled equipment. This disconnecting method compounded with environmental conditions warrants a safer, more practical method.
Panel Meeting Action: Reject
Panel Statement: CMP-17 believes the current text is appropriate. Subsection (B) is a permissive allowance for a cord and plug to be used as a disconnect.
No substantiation was provided to show that this is an unsafe installation allowance.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 427 — FIXED ELECTRIC HEATING EQUIPMENT

17-80 Log #4255 NEC-P17 **Final Action: Reject**
(427.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 427.5 in Part I.
427.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement to Proposal 17-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-81 Log #4256 NEC-P17 **Final Action: Reject**
(427.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 427.5 in Part I.
427.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement to Proposal 17-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-82 Log #4257 NEC-P17 **Final Action: Reject**
(427.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 427.5 in Part I.
427.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

17-85 Log #730 NEC-P17 **Final Action: Accept**
(427.22)

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise the title to read as follows:
427.22 Ground-Fault Protection of Equipment ~~Protection~~.
Ground-fault protection of equipment shall be provided for electric heat tracing and heating panels. This requirement shall not apply in industrial establishments where there is alarm indication of ground faults and the following conditions apply:
(1) Conditions of maintenance and supervision ensure that only qualified persons service the installed system
(2) Continued circuit operation is necessary for safe operation of equipment or processes.
Substantiation: Revise Section title to match the subject content of the Section. This revision would be consistent with the definition in Article 100 and the title used for 230.95 for similar subject matter and would improve readability of the *Code*.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-86 Log #3462 NEC-P17 **Final Action: Reject**
(427.27)

Submitter: Neal Fenster, Thermo Systems Technology, Inc.
Recommendation: Revise text to read as follows:
"Unless protected by ~~a ground fault circuit interrupter protection for personnel~~ ground fault protection, the secondary winding of the isolation transformer connected to the pipeline or vessel being heated shall not have an output voltage greater than 30 volts ac.
Where ~~ground fault circuit interrupter protection for personnel~~ ground fault protection is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.
Substantiation: 1) These metallic piping systems are thermally insulated and mechanically protected against physical damage.
2) The higher operating current levels of electrical impedance heating systems are not compatible with a Class A type protection system.
Panel Meeting Action: Reject
Panel Statement: Ground fault protection is not equivalent to ground fault circuit interrupter protection for personnel. There was no substantiation provided to show why the operating current level is not compatible with a Class A type GFCI.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-87 Log #1564 NEC-P17 **Final Action: Reject**
(427.56)

Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
427.56 Controls
(A) Temperature Control with ``Off'' Position**. Temperature controlled switching devices that indicate an ``off'' position and that interrupt line current shall open all ungrounded conductors when the control device is in this ``off'' position. These devices shall not be permitted to serve as the disconnecting means unless **the disconnecting means is lockable. ~~capable of being locked in the open position~~.
**(B) Temperature Control Without ``Off'' Position**. Temperature controlled switching devices that do not have an ``off'' position shall not be required to open all ungrounded conductors and shall not be permitted to serve as the disconnecting means.
(C) Remote Temperature Controller. Remote controlled temperature-actuated devices shall not be required to meet the requirements of 427.56(A) and 427.56(B). These devices shall not be permitted to serve as the disconnecting means.
(D) Combined Switching Devices. Switching devices consisting of combined temperature-actuated devices and manually controlled switches that serve both as the controllers and the disconnecting means shall comply with all the following conditions:
(1) Open all ungrounded conductors when manually placed in the ``off'' position.
(2) Be designed so that the circuit cannot be energized automatically if the device has been manually placed in the ``off'' position.
(3) Be **a lockable disconnecting means**. ~~capable of being locked in the open position.~~
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Reject
Panel Statement: See action and statement on Proposal 17-22.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-88 Log #1112 NEC-P17 **Final Action: Reject**
(427.56(C) and (D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of (C): ~~Remote controlled~~ Temperature actuated control devices in remote-control circuits shall not be required to meet the requirements of...(remainder unchanged).
Revise (D)(3):
Be ~~capable of being locked~~ provided with an identified integral and permanent means for locking in the open (off) position.
Substantiation: Temperature control devices are not remotely controlled. Proposal for locking is specific and doesn't allow for makeshift methods.
Panel Meeting Action: Reject
Panel Statement: In regards to 427.56(C), the submitter's text does not add any clarity to the code.
In regards to 427.56(D)(3), the current wording is the same wording used in many other sections throughout the code. There was no substantiation provided showing that the current wording is being misapplied or misunderstood.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-89 Log #3306 NEC-P17 **Final Action: Reject**
(427.57)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: which does not exceed a maximum rating marked on the equipment.
Substantiation: Per 210.23(D), a 200 ampere branch circuit which supplies a 10 ampere load is considered suitable overcurrent protection.
Panel Meeting Action: Reject
Panel Statement: The circuit overcurrent protection device protects the branch circuit conductors, not the equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 430 — MOTORS, MOTOR CIRCUITS, AND CONTROLLERS

11-24 Log #3783 NEC-P11 **Final Action: Reject**
(Figure 430.1)

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Add new text to read as follows:
Motor Control Centers (Part VIII) and Adjustable Speed Drive Systems (Part X) are not represented in the motor feeder and branch circuit single line drawing illustrated in Figure 430.1.
Substantiation: Figure 430.1 is meant to illustrate Part I through Part X of the Motor Sections. Part VIII and Part X are not represented.
Panel Meeting Action: Reject
Panel Statement: Figure 430.1 is intended to allow the user of the code to more effectively interpret Article 430. Not every component or specific device is intended to be represented in the graphic. All parts of Article 430 are represented above the graphic for reference. Items in the proposal are included in the text above the graphic and therefore included in Figure 430.1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

1-263 Log #13 NEC-P01 **Final Action: Reject**
(430.2.Engineering Supervision)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
NOTE: This proposal appeared as Comment 1-109 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:
Add a new definition in 430.2 to read as follows:
Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.
Submitter: Code-Making Panel 3,
Recommendation: CMP-3 recommends adding the proposed definition of "Engineering Supervision" to Article 100.
Substantiation: There are approximately 28 references to engineering supervision in various locations throughout the NEC. Although none of these references occur within Articles under the jurisdiction of CMP-3, this definition, inserted into Article 100 and placed under the jurisdiction of CMP-1 should be adequately defined, and placing it within Article 100 would provide a convenient location for this general definition.
This comment has been balloted through CMP-3 with the following results:
13 Eligible to Vote
9 Affirmative
3 Negative
1 Not Returned (J. sleights)
Mr. L. Easter voted negatively stating: "This proposal should be Rejected. The phrase "engineering supervision" is found 58 times in various articles of the NEC. As such, a definition does not belong in Article 430, where it would apply to only Article 430. If it were to be included as a definition in the NEC, it would more appropriately be placed in Article 100. However, the development of a definition of "Engineering Supervision" in Article 100 must consider the context and use of this term in each of the 58 locations of this term in the NEC."
Mr. D. Pace voted negatively stating: "A definition of the term "Engineering Supervision" should not be added to Article 100. the term needs to be defined specifically for the intended need. One definition cannot accurately cover all of the uses that are currently in the NEC. Also, the definition, as written, does not provide criteria for determining qualifications "supervision" and specifying an "Electrical Engineer" is too restrictive and is not feasible or necessary in some cases."

Mr. M. Sanders voted negatively stating: "The basis for Proposal 11-16a and Proposals 11-34 and 11-45 which did not receive the necessary consensus, and, therefore have been rejected by the Technical Correlating Committee. The negative comments on proposals by Mr. Hamer and Mr. Wright should have been taken into account, along with the comment of the Code-Making Panel 3 Task Group in Item 5.

The proposed text considered for inclusion into Article 100 is specific to Article 430 applications, and the apparent text has been adapted from the present 240.86(A), which is specific to field selected and installed series component overcurrent protection assemblies and is restricted to existing, not new, installations. The Code-Making Panel 3 Task Group states there are 28 instances where variations on this proposed text is employed. In order for this definition to be considered for inclusion into Article 100, each of those instances should be reviewed for the proposed text applicability.

This proposed text should be held for further review by all the affected Code-Making Panels and report back to the 2011 NEC cycle. This is too important to handle within the limited time of a Comment period."

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action Proposal 1-71.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 7 Negative: 5

Explanation of Negative:

FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).

HICKMAN, P.: We conclude that the recommendation is much too broad for Article 100 and is vague and unenforceable.

HITTINGER, D.: I do not agree with the Code Making Panel 3 recommendation to add a general definition in Article 100 that is too broad and unenforceable. I am not in agreement with the Panel 1 statement referencing their action on proposal 1-71.

See my comments on proposal 1-71.

MONIZ, G.: See NEMA's statement on Proposal 1-149.

SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. The term should be defines as an action or activity that includes certain measurable criteria or concepts that would demonstrate that the applicable installation or system is under specific and controlled conditions that warrant lessening the general rules when these conditions are met. What constitutes engineering supervision should be described as specific controls or conditions that are established and maintained continuously by qualified persons, which is already defined and fairly well understood.

Comment on Affirmative:

LABRAKE, JR., N.: I am voting with the Panel Action to locate the definition in Article 100. However, I disagree with the use of the definition in Proposal 1-71. See my ballot statement on Proposal 1-69a.

1-264 Log #14 NEC-P01 **Final Action: Reject**
(430.2.Engineering Supervision)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

NOTE: This proposal appeared as Comment 1-110 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:

Add a new definition in 430.2 to read as follows:

Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.

Submitter: Code-Making Panel 14,

Recommendation: a) Not support Technical Correlating Committee action to include a general definition as the issue is not applicable to CMP-14 texts.

A) Delete the word "engineering" from sections 501.140 and 505.17.

B) CMP-14 does not support the inclusion of the proposed definition of "engineering supervision" in Article 100.

Substantiation: A) This action makes these sections consistent with terms used in some 13 other places within CMP-14 texts and ensures that any action taken by CMP-1 on Proposal 11-16a will not impact installations under the responsibility of CMP-14.

B) Adding the proposed definition of "engineering supervision" within Article 100 would be too restrictive. Some engineering functions within the responsibility of CMP-14 could be better accomplished by persons with chemical, mechanical, process engineering backgrounds. The responsibility to determine specific qualifications for specific functions required in various areas within the NEC should remain with the Code-Making Panel that includes those qualifications. A general term cannot adequately cover all applications.

This comment was balloted through CMP-14 with the following ballot results:

14 Eligible to Vote
13 Affirmative
1 Negative (J. Kuczka)

Mr. Kuczka voted negatively stating: "NEMA agrees with not including a definition of engineering supervision, but does not agree with sending a comment to CMP-1 to delete wording in articles outside their jurisdiction. Furthermore, the deletion of the word "engineering" in 501 and 505 would be considered new material."

Mr. D. Cook voted affirmatively stating: "While I agree the engineering judgment required for electrical installations in hazardous (classified) locations may, and in some cases should, be addressed by engineers with other than an electrical background, I believe a definition in Article 100 would be useful for the general requirements in the NEC, providing the proposed definition in Article 100 would require the Code-Making Panel's responsible for Chapters 5, 6, and 7 to review the use of the term and determine if those "special" occupancies, equipment, and conditions require the use of a different term. At this point in the 2008 NEC Cycle, that does not seem possible."

Mr. M. O'Meara voted affirmatively stating: "Adding a definition of "Engineering Supervision" clarifies the level of responsibility the phrase is intended to require and will be helpful throughout the code in determining the proper level of supervision necessary."

Panel Meeting Action: Reject

Panel Statement: The panel concludes that a definition for "Engineering Supervision" is needed in Article 100.

See the panel action on Proposal 1-71.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 7 Negative: 5

Explanation of Negative:

FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).

HICKMAN, P.: We agree with Panel 14 that an Article 100 definition of engineering supervision is not warranted.

HITTINGER, D.: I agree with the recommendation by Code Making Panel 14 that a general definition in Article 100 is not warranted. I am not in agreement with the Panel 1 statement that a general definition is needed in Article 100 or the reference to their action on proposal 1-71.

See my comments on proposal 1-71.

MONIZ, G.: See NEMA's statement on Proposal 1-71.

SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. The term should be defines as an action or activity that includes certain measurable criteria or concepts that would demonstrate that the applicable installation or system is under specific and controlled conditions that warrant lessening the general rules when these conditions are met. What constitutes engineering supervision should be described as specific controls or conditions that are established and maintained continuously by qualified persons, which is already defined and fairly well understood.

Comment on Affirmative:

LABRAKE, JR., N.: See my Comment on Affirmative on Proposal 1-263 (Log #13).

1-265 Log #15 NEC-P01 **Final Action: Reject**
(430.2.Engineering Supervision)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
NOTE: This proposal appeared as Comment 1-111 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:
Add a new definition in 430.2 to read as follows:
Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.
Submitter: Code-Making Panel 6,
Recommendation: This definition should not be incorporated in Article 100.
Substantiation: The application of specific formulas does not necessarily require the general expertise of an electrical engineer. For instance, a mathematical proof of conditions under application of 310.15(C) might be judged by the AHJ (who may be an electrical engineer doing plan checking) as acceptable although not done by an electrical engineer. Other engineers and other trained personnel may be fully qualified.
"Engineering supervision" alone provides a definition as clear as required.
This comment was balloted through CMP-6 with the following ballot results:
11 Eligible to Vote
11 Affirmative
Panel Meeting Action: Reject
Panel Statement: The panel concludes that a definition for "Engineering Supervision" is needed in Article 100.
See the panel action on Proposal 1-71.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 5
Explanation of Negative:
FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).
HICKMAN, P.: We agree with Panel 6 that the proposed Article 100 definition of engineering supervision is not appropriate for inclusion in Article 100 and conclude that the recommendation is much too broad for Article 100 and is vague and unenforceable.
HITTINGER, D.: I agree with the recommendation by Code Making Panel 6 that a general definition in Article 100 is not warranted. I am not in agreement with the Panel 1 statement that a general definition is needed in Article 100 or the reference to their action on proposal 1-71.
See my comments on proposal 1-71.
MONIZ, G.: See NEMA's statement on Proposal 1-71.
SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. (430.2.Engineering Supervision)

NOTE: This proposal appeared as Comment 1-112 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:
Add a new definition in 430.2 to read as follows:
Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.
Submitter: Code-Making Panel 2,
Recommendation: Reject the proposal.
Substantiation: The Task Group recommends to reject this proposal. The Task Group agrees that this definition is under the scope of CMP-1. The extent that "engineering supervision" is used throughout the code may have many different implications. The term given in the proposal of "electrical engineer" may conflict with other terms in the code using licensed professional engineers under engineering supervision. It appears that anytime the term "engineering supervision" or "maintenance and supervision" are used, they are always used in the connotation of relaxing the requirements of the code. The CMP-2 Task Group recommends that this be covered by a multi-panel Task Group during the next code cycle.
This comment was balloted through CMP-2 with the following ballot results:
12 Eligible to Vote
11 Affirmative
1 Not returned (B. Nenninger)
Mr. J. Pauley voted affirmatively stating: "For clarity, item 3 of the comment form should have the "deleted text" box checked and should state "CMP-2 recommends that CMP-1 Reject the proposal."
Panel Meeting Action: Accept
Panel Statement: See the panel action on Proposal 1-71.

1-267 Log #17 NEC-P01 **Final Action: Accept**
(430.2.Engineering Supervision)

NOTE: This proposal appeared as Comment 1-113 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:
Add a new definition in 430.2 to read as follows:
Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.
Submitter: Code-Making Panel 10,
Recommendation: Reject this proposal.
Substantiation: This comment was developed by a Task Group comprised of the following members of CMP-10: James Dollard, Chair; Charles Blizzard; Dennis Darling; Charles Eldridge; Carl Fredericks; Clive Kimblin; John Kovacik; Frank Ladonne; George Ockuly; Gerald Williams; Alan Manche and Vince Saporita.
The phrase "engineering supervision" is found 58 times in various articles of the NEC. As such, it does not belong in Article 430, where it would apply to only Article 430. If it were to be included as a definition in the NEC, it would more appropriately be placed in Article 100. However, the development of a definition of "Engineering Supervision" in Article 100 must consider the context and use of this term in each of the 58 locations of this term in the NEC.
This comment was balloted through CMP-10 with the following ballot results:

(430.2.Engineering Supervision)

Note: This Proposal appeared as Comment 1-108 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:
Add a new definition in 430.2 to read as follows:
Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: The Technical Correlating Committee Rejects the panel action to add a new definition for "Engineering Supervision" to Article 430. The term is used throughout the NEC and if a definition is needed it should be under the purview of Code-Making Panel 1. The Technical Correlating Committee directs that this proposal be sent to Code-Making Panel 1 for consideration of action in Article 100 during the comment phase. This action will be considered by Code-Making Panel 1 as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel agrees with the Technical Correlating Committee that a new definition of "Engineering Supervision" is not to be added to 430.2.
See the panel action on Proposal 1-71.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).
HICKMAN, P.: We agree with Panel 1 that the proposed definition of engineering supervision recommended in proposal 11-16a for the 2008 NEC should not be located in 430.2.
HITTINGER, D.: I agree with the part of Code Making Panel 1 statement that the proposed definition of engineering supervision recommended in proposal 11-16 for the 2008 Code should not be located in 430.2. I do not agree with the part of the Panel 1 statement referring to their action on proposal 1-71.
See my comments on proposal 1-71.
LABRAKE, JR., N.: See my Comment on Affirmative on Proposal 1-263 (Log #13).
MONIZ, G.: See NEMA's statement on Proposal 1-71.
SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. (430.2.Engineering Supervision)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Note: This Proposal appeared as Comment 1-109 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:
Add a new definition in 430.2 to read as follows:
Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.
Submitter: Code-Making Panel 3,
Recommendation: CMP-3 recommends adding the proposed definition of "Engineering Supervision" to Article 100.
Substantiation: There are approximately 28 references to engineering supervision in various locations throughout the NEC. Although none of these references occur within Articles under the jurisdiction of CMP-3, this definition, inserted into Article 100 and placed under the jurisdiction of CMP-1 should be adequately defined, and placing it within Article 100 would provide a convenient location for this general definition.
This comment has been balloted through CMP-3 with the following results:
13 Eligible to Vote
9 Affirmative
3 Negative
1 Not Returned (J. sleights)
Mr. L. Easter voted negatively stating: "This proposal should be Rejected. The phrase "engineering supervision" is found 58 times in various articles of the NEC. As such, a definition does not belong in Article 430, where it would apply to only Article 430. If it were to be included as a definition in the NEC, it would more appropriately be placed in Article 100. However, the development of a definition of "Engineering Supervision" in Article 100 must consider the context and use of this term in each of the 58 locations of this term in the NEC."
Mr. D. Pace voted negatively stating: "A definition of the term "Engineering Supervision" should not be added to Article 100. the term needs to be defined specifically for the intended need. One definition cannot accurately cover all of the uses that are currently in the NEC. Also, the definition, as written, does not provide criteria for determining qualifications "supervision" and specifying an "Electrical Engineer" is too restrictive and is not feasible or necessary in some cases."
Mr. M. Sanders voted negatively stating: "The basis for Proposal 11-16a and Proposals 11-34 and 11-45 which did not receive the necessary consensus, and, therefore have been rejected by the Technical Correlating Committee. The negative comments on proposals by Mr. Hamer and Mr. Wright should have been taken into account, along with the comment of the Code-Making Panel 3 Task Group in Item 5.
The proposed text considered for inclusion into Article 100 is specific to Article 430 applications, and the apparent text has been adapted from the present 240.86(A), which is specific to field selected and installed series component overcurrent protection assemblies and is restricted to existing, not new, installations. The Code-Making Panel 3 Task Group states there are 28 instances where variations on this proposed text is employed. In order for this definition to be considered for inclusion into Article 100, each of those instances should be reviewed for the proposed text applicability.
This proposed text should be held for further review by all the affected Code-Making Panels and report back to the 2011 NEC cycle. This is too important to handle within the limited time of a Comment period."
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action Proposal 1-71.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 5
Explanation of Negative:
FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).
HICKMAN, P.: We conclude that the recommendation is much too broad for Article 100 and is vague and unenforceable.
HITTINGER, D.: I do not agree with the Code Making Panel 3 recommendation to add a general definition in Article 100 that is too broad and unenforceable. I am not in agreement with the Panel 1 statement referencing their action on proposal 1-71.

See my comments on proposal 1-71.
MONIZ, G.: See NEMA's statement on Proposal 1-71.
SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. The term should be defines as an action or activity that includes certain measurable criteria or concepts that would demonstrate that the applicable installation or system is under specific and controlled conditions that warrant lessening the general rules when these conditions are met. LABRAKE, JR., N.: See my Comment on Affirmative on Proposal 1-263 (Log #13).

1-270 Log #61 NEC-P01 **Final Action: Reject**
(430.2.Engineering Supervision)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Note: This Proposal appeared as Comment 1-110 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:
Add a new definition in 430.2 to read as follows:
Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.
Submitter: Code-Making Panel 14,
Recommendation: a) Not support Technical Correlating Committee action to include a general definition as the issue is not applicable to CMP-14 texts.
A) Delete the word "engineering" from sections 501.140 and 505.17.
B) CMP-14 does not support the inclusion of the proposed definition of "engineering supervision" in Article 100.
Substantiation: A) This action makes these sections consistent with terms used in some 13 other places within CMP-14 texts and ensures that any action taken by CMP-1 on Proposal 11-16a will not impact installations under the responsibility of CMP-14.
B) Adding the proposed definition of "engineering supervision" within Article 100 would be too restrictive. Some engineering functions within the responsibility of CMP-14 could be better accomplished by persons with chemical, mechanical, process engineering backgrounds. The responsibility to determine specific qualifications for specific functions required in various areas within the NEC should remain with the Code-Making Panel that includes those qualifications. A general term cannot adequately cover all applications.
This comment was balloted through CMP-14 with the following ballot results:
14 Eligible to Vote
13 Affirmative
1 Negative (J. Kuczka)
Mr. Kuczka voted negatively stating: "NEMA agrees with not including a definition of engineering supervision, but does not agree with sending a comment to CMP-1 to delete wording in articles outside their jurisdiction. Furthermore, the deletion of the word "engineering" in 501 and 505 would be considered new material."
Mr. D. Cook voted affirmatively stating: "While I agree the engineering judgment required for electrical installations in hazardous (classified) locations may, and in some cases should, be addressed by engineers with other than an electrical background, I believe a definition in Article 100 would be useful for the general requirements in the NEC, providing the proposed definition in Article 100 would require the Code-Making Panel's responsible for Chapters 5, 6, and 7 to review the use of the term and determine if those "special" occupancies, equipment, and conditions require the use of a different term. At this point in the 2008 NEC Cycle, that does not seem possible."
Mr. M. O'Meara voted affirmatively stating: "Adding a definition of "Engineering Supervision" clarifies the level of responsibility the phrase is intended to require and will be helpful throughout the code in determining the proper level of supervision necessary."

Note: This Proposal appeared as Comment 1-112 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:

Add a new definition in 430.2 to read as follows:

Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.

Submitter: Code-Making Panel 2,

Recommendation: Reject the proposal.

Substantiation: The Task Group recommends to reject this proposal. The Task Group agrees that this definition is under the scope of CMP-1. The extent that "engineering supervision" is used throughout the code may have many different implications. The term given in the proposal of "electrical engineer" may conflict with other terms in the code using licensed professional engineers under engineering supervision. It appears that anytime the term "engineering supervision" or "maintenance and supervision" are used, they are always used in the connotation of relaxing the requirements of the code. The CMP-2 Task Group recommends that this be covered by a multi-panel Task Group during the next code cycle.

This comment was balloted through CMP-2 with the following ballot results:

12 Eligible to Vote

11 Affirmative

1 Not returned (B. Nenninger)

Mr. J. Pauley voted affirmatively stating: "For clarity, item 3 of the comment form should have the "deleted text" box checked and should state "CMP-2 recommends that CMP-1 Reject the proposal."

Panel Meeting Action: Accept

Panel Statement: See the panel action on Proposal 1-71.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

FISKE, W.: See my Explanation of Negative on Proposal 1-69a (Log #3443).

HICKMAN, P.: We agree with Panel 2 that the proposed definition of engineering supervision recommended in proposal 11-16a for the 2008 NEC should not be located in 430.2.

HITTINGER, D.: I agree with Code Making Panel 2 that the proposed definition of engineering supervision recommended in proposal 11-16 for the 2008 Code should not be located in 430.2. I do not agree with the Panel 1 statement referring to their action on proposal 1-71.

See my comments on proposal 1-71.

LABRAKE, JR., N.: See my Comment on Affirmative on Proposal 1-263 (Log #13).

MONIZ, G.: See NEMA's statement on Proposal 1-71.

SASSAMAN, H.: NECA generally supports the concept of defining the term "engineering supervision" to provide consistent and clear direction what constitutes engineering supervision where it appears in various provisions of the NEC. However, NECA does not support the definition text currently proposed. The proposed text for this new definition is related to an individual's qualifications or engineering firm's qualifications and therefore, requires judgment by the AHJ or other governing body as to the qualifications of an individual or firm. This will no doubt lead to more inconsistent enforcement and application of the rules where the term appears throughout the NEC. Engineering supervision is an action not a description of one's qualifications or capabilities. The term should be defines as an action or activity that includes certain measurable criteria or concepts that would demonstrate that the applicable installation or system is under specific and controlled conditions that warrant lessening the general rules when these conditions are met. What constitutes engineering supervision should be described as specific controls or conditions that are established and maintained continuously by qualified persons, which is already defined and fairly well understood.

1-273 Log #64 NEC-P01 **Final Action: Accept**
(430.2.Engineering Supervision)

Note: This Proposal appeared as Comment 1-113 on Proposal 11-16a in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-16a was:

Add a new definition in 430.2 to read as follows:

Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.

Submitter: Code-Making Panel 10,

Recommendation: Reject this proposal.

Substantiation: This comment was developed by a Task Group comprised of the following members of CMP-10: James Dollard, Chair; Charles Blizzard; Dennis Darling; Charles Eldridge; Carl Fredericks; Clive Kimblin; John Kovacik; Frank Ladonne; George Ockuly; Gerald Williams; Alan Manche and Vince Saporita.

The phrase "engineering supervision" is found 58 times in various articles of the NEC. As such, it does not belong in Article 430, where it would apply to only Article 430. If it were to be included as a definition in the NEC, it would more appropriately be placed in Article 100. However, the development of a definition of "Engineering Supervision" in Article 100 must consider the context and use of this term in each of the 58 locations of this term in the NEC.

This comment was balloted through CMP-10 with the following ballot results:

11-25 Log #2082 NEC-P11 **Final Action: Reject**
(430.2.Valve Actuator Motor (VAM) Assemblies)

Submitter: Jeff Goldsmith, GE Water & Process Technologies
Recommendation: Revise text to read as follows:
Valve Actuator Motor (VAM) Assemblies. A manufactured assembly, used to operate a valve, consisting of an actuator motor and other components such as controllers, torque switches, limit switches, and overload protection. If the full load current is not more than 2 amperes and the supply is not more than 240 volts, VAMs shall be permitted to be classified as control circuit components that comply with Article 725 and not Article 430.
Substantiation: The Water & Wastewater industry uses many small motorized actuators (typically less than 2A at 120V) for valves up to about 10". There can be hundreds of these in a treatment facility. Paragraph 46.1.1(b) of UL standard 508A has always allowed these VAMs to be classified as control circuit loads. Accordingly, a common industry practice is to control these actuators using control relays and supplementary overcurrent protection in industrial control panels. Article 430 compliance is onerous and unnecessary for these VAMs.
The VAM definition that was new in the 2008 NEC valuably classifies 480V VAMs for large pipelines as motors to be covered by Article 430. This proposal fixes the unintended prohibition of a safe practice, by unambiguously permitting some VAMs to be covered by Article 725.
Almost all of the VAMs for this intended use will fall within the 2 ampere limit, which is the maximum current for 14 AWG wire to meet the requirements of 725.51(A) for no derating.
Panel Meeting Action: Reject
Panel Statement: A definition cannot contain a requirement per 2.2.2 of the NEC Style Manual. Article 725 does not apply to motor branch circuits. The reference to UL 508A to electrically operated valves is incorrect. VAMs are not classified as control circuit loads.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
GUIDRY, P.: While I agree with the panel action, I encourage the submitter to provide more information about the small motor operated valves mentioned in his proposal during the comment stage so the panel can have a better understanding about the equipment that was described. Manufacturer's cut sheets, data sheets, etc. would help our understanding of what the issue is.

11-26 Log #2216 NEC-P11 **Final Action: Accept in Principle**
(430.6)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Add reference to new part (D) in 430.6 main text to read:
430.6 Ampacity and Motor Rating Determination.
The size of conductors supplying equipment covered by Article 430 shall be selected from the allowable ampacity tables in accordance with 310.15(B) or shall be calculated in accordance with 310.15(C). Where flexible cord is used, the size of the conductor shall be selected in accordance with 400.5. The required ampacity and motor ratings shall be determined as specified in 430.6(A), (B), (C) and (D).
Add new part (D) to existing 430.6 to read:
430.6(D) Valve Actuator Motor Assemblies. For VAMs, the rated current shall be the full load current and this current shall be used to determine the maximum rating or setting of the motor branch-circuit short-circuit and ground-fault protective device and the ampacity of the conductors.
Substantiation: For VAMs, typically there is a rated current or full load current given in addition to the locked rotor current. Part B for torque motors uses the locked rotor current to determine wire sizes and fuse/breaker sizes. Since confusion still exists among Code users as to whether a VAM is a torque motor (which it is not), the addition of part (D) would help clarify what current rating should be used in determining the fuse/breaker and wire size.
Panel Meeting Action: Accept in Principle
Add new text to read as follows:
430.6(D) Valve Actuator Motor Assemblies. For VAMs, the rated current shall be the nameplate full load current, and this current shall be used to determine the maximum rating or setting of the motor branch-circuit short-circuit and ground-fault protective device and the ampacity of the conductors.
Panel Statement: The word "nameplate" clarifies that the tables are not to be used to determine the full load current.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-27 Log #2564 NEC-P11 **Final Action: Reject**
(430.6(A)(1))

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text as follows:
Table Values. Other than for motors built for low speeds (less than 1200 RPM) or high torques, and for multispeed motors, the values given in Table 430.247, Table 430.248, Table 430.249, and Table 430.250 shall be used to determine the required ampacity of conductors...
Substantiation: As written, the text is not as concise as it could be; conductor ampacities are determined in Article 310. The addition of the word "required" would be consistent with other code sections, such as 440.6.
Panel Meeting Action: Reject
Panel Statement: The word "required" does not add additional clarity when the whole sentence is taken into consideration.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-28 Log #3784 NEC-P11 **Final Action: Accept in Principle**
(430.6(A)(1) Exception No. 1)

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Revise text to read as follows:
"Exception No. 1: Multispeed motors shall be in accordance with 430.22~~(A)~~ (B) and 430.52."
Substantiation: Article 430.22(B) addresses multispeed motors, not Article 430.22(A).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and substantiation on Proposal 11-48a.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-29 Log #3785 NEC-P11 **Final Action: Reject**
(430.7(A)(16))

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Add new text to read as follows:
(16) Rated power factor at full load.
Substantiation: European made motors include a power factor listed as: COSθ or COSΦ. Knowing the power factor of a motor at full load is helpful to engineers performing motor calculations and analysis.
Panel Meeting Action: Reject
Panel Statement: The proposal mandates design criteria that is not required for a safe and code-compliant installation. The manufacturers have the option to include power factor values on the nameplate if desired for design criteria; engineers may also consult with motor manufacturers to obtain this information. NEMA standard MG1 does not require power factor values as a nameplate marking.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-30 Log #3786 NEC-P11 **Final Action: Reject**
(430.7(A)(17))

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Add new text to read as follows:
(17) Rated efficiency at full load.
Substantiation: European made motors are rated in KW instead of Horsepower. In order for an engineer to convert Horsepower to KW, the motor efficiency at full load must be known.

$$\text{Motor KW Rating} = \frac{(\text{Horsepower Rating})\,(0.746\,\frac{\text{KW}}{\text{HP}})}{[\%\ \text{Efficiency}/100\%]}$$

Panel Meeting Action: Reject
Panel Statement: 430.7(A)(7) requires motors to be rated and marked with the horsepower rating. The proposed language is not necessary as the rated efficiency markings are a design criteria and an option for the manufacturer. NEMA standard MG1 does not require efficiency ratings as a nameplate marking.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-31 Log #365 NEC-P11 **Final Action: Accept**
(430.7(B))

TCC Action: The Technical Correlating Committee directs that the panel reconsider its action with reference to (kilovolt-amperes (kVA)/horsepower, since this would result in the kVA divided by the horsepower rather than multiplied.

This action will be considered by the panel as a public comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
In seven places in (1) through (5) revise from "…kilovolt-ampere (kVA) per horsepower…" to "…kilovolt-amperes (kVA)/horsepower…".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-32 Log #434 NEC-P11 **Final Action: Accept**
(Table 430.7(B))

TCC Action: The Technical Correlating Committee directs that the panel reconsider its action with reference to (kilovolt-amperes (kVA)/horsepower, since this would result in the kVA divided by the horsepower rather than multiplied.

This action will be considered by the panel as a public comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Revise column heading from "Kilovolt-Amperes per Horsepower…" to "Kilovolt-Amperes/Horsepower…".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-33 Log #242 NEC-P11 **Final Action: Reject**
(430.7(B) and Table 430.7(B), FPN (New))

Submitter: Paul Schwartz, FLUOR
Recommendation: Add a FPN below Table 430.7(B) as follows:
To convert the Table 430.7(B) values to the ratio of locked rotor amps to full load amps (LRA/FLA), multiply the Code Letter values (kVA per HP with locked rotor) by (Rated Power Factor x Rated Efficiency/0.746).
Substantiation: NEMA MG-1 and the NEC require all induction motors to have a locked rotor code Letter stamped on the motor nameplate. This Code Letter provides a range of values for kVA_{LR} per HP from which the starting current under locked rotor condition can be calculated for a given motor. Some power system analysis programs use this Code Letter as input data for motor models for motor starting and short circuit calculations. However, other programs use LRA and FLA as input data. The purpose of this FPN addition to Table 430.7(B) is to clarify the relationship between the Code Letter value and the ratio of LRA/FLA.
CONVERSION OF THE MOTOR CODE LETTER VALUE TO THE RATIO OF LRA/FLA
Motor HP = kVA_R * PF_R * EFF_R/0.746, where the subscript R stands for the rated)
The Motor code Letter = kVA_{LR}/HP = kVA_{LR}/(kVA_R*PF_R*EFF_R/0.746)
The Motor Starting Current in per unit of full load current = kVA_{LR}/ kVA_R = = (sqrt 3 * V_R*LRA)/(sqrt 3*V_R * FLA) = LRA/FLA
The Motor Code Letter = kVA_{LR}/HP = (LRA/FLA) * (0.746/PF_R * EFF_R)
Therefore, the ratio of LRA/FLA = (kVA_{LR}/HP) * (PF_R * EFF_R /0.746)
(Note when PF_R * EFF_R = 0.746, the Code Letter Value equals the ratio of LRA/FLA)
MEDIUM VOLTAGE INDUCTION MOTOR EXAMPLE
HP = 13,500 HP
kV_R = 13,200 V
PF_R = 89%
EFF_R = 96.5%
FLA = 512.9 A
LRA = 2718.4 A
The LRA/FLA = 2718/512.9 = 5.3
The kVA_{LR}/HP = (LRA/FLA) * (0.746/PF_R * EFF_R) = (5.3 * 0.746)/(0.89*0.965) = 4.6
(Note the 530% motor inrush current is much greater than the 460% motor kVA_{LR}/HP.)
CODE LETTER APPLICATION SUMMARY
It can be seen from the above that there can be a significant difference in the numerical per unit values of kVA_{LR}/HP and LRA/FLA for a given motor. Thus, in modeling motors in a computer program, it is important to determine exactly what the program needs and to validate that the program uses the required data (either kVA_{LR}/HP or LRA/FLA) correctly to get the correct motor model in terms of 1 /LRA or the motor per unit subtransient reactance.
Note that not all of the US motor standards require the Code Letter to be included on the motor nameplate. For example, API-541-2004 and API-546-1997 require the locked rotor amps to be included on the motor nameplate. NEMA C50.41-2000 requires the locked rotor amps to be included on the motor nameplate but notes that, when agreed to between the user and the manufacturer, the locked rotor Code letter may be used.
Based on the above, it is recommended that the above FPN be added below Table 430.7(B).
Panel Meeting Action: Reject
Panel Statement: The NEC is not to be used as a design manual. All of the submitter's FPN information can be found in many engineering manuals.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-34 Log #3682 NEC-P11 **Final Action: Reject**
(430.9(C))

Submitter: Richard F. VanWert, Middle Department Inspection Agency
Recommendation: Revise text as follows:
A minimum of ~~(7 lb-in.)~~ (7 in.-lb)
Substantiation: The correct term should be in.-lb similar to the term ft-lb.
Panel Meeting Action: Reject
Panel Statement: The existing units are technically correct as stated.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-35 Log #435 NEC-P11 **Final Action: Accept**
(Table 430.10(B))

TCC Action: The Technical Correlating Committee directs that the panel reconsider its action with reference to "Wires/Terminal*", since this would result in a division of the wires by the number of terminals.

This action will be considered by the panel as a public comment.
Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Revise column heading from "Wires per Terminal*" to "Wires/Terminal*"
In Note following the Table, change "wires per terminal" to "wires to be connected to a terminal"
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-36 Log #1106 NEC-P11 **Final Action: Reject**
(430.11)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "may" to "is likely to".
Substantiation: May is a term to be avoided per the Style Manual and includes installations where it is possible, but unlikely that dripping or spraying of oil, water, or other liquid will occur. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: Both "may" and "likely to" have a probability of occurring associated with them. According to the NEC Style Manual the word "likely" should be avoided. A definition of "likely" means a high probability, which in this case is not the same as "may". "May" as used in this context is correct and meets the requirements of 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-37 Log #1104 NEC-P11 **Final Action: Accept**
(430.12)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "nonburning" to "noncombustible".
Substantiation: Edit. Nonburning is not the same as noncombustible; it can apply to combustible material which is not presently burning.
Panel Meeting Action: Accept
Panel Statement: The panel notes that this change will be in the exception to 430.12(A).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-38 Log #436 NEC-P11 **Final Action: Accept**
(Table 430.12(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
In the second and third paragraph of the footnotes to the Table, change “per” to “for each”.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-39 Log #437 NEC-P11 **Final Action: Accept**
(Table 430.12(C)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
Revise the column heading from “per” to “for Each” so it reads “Minimum Usable Volume for Each Power Supply Conductor”.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-40 Log #1882 NEC-P11 **Final Action: Reject**
(430.12(E) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Where a motor is installed as part of factory-wired equipment and effectively bonded to the equipment which is grounded in accordance with this Code, a separate equipment grounding conductor shall not be required to be run to the motor.
Substantiation: Edit. If the equipment itself is grounded, the grounding means should clearly comply with requirements that are based on the overcurrent devices for the equipment and motor.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation for the revised wording. The present exception accurately addresses when an equipment grounding conductor is not required.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-41 Log #1105 NEC-P11 **Final Action: Reject**
(430.14(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Open motors that have commutators or collector rings shall be located or protected so that sparks <u>are not likely to</u> reach ~~adjacent~~ combustible material.
Substantiation: Adjacent is not defined and is a term to be avoided per the Style Manual. Sparks from a motor mounted 10 ft over combustible material could ignite such material. “Likely” is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: Section 3.2.1 of the NEC Style Manual lists both terms as ones to be avoided. The proposed text does not improve the clarity of this exception. The submitter has provided no substantiation that this section is unclear or causing problems in the field.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-42 Log #1107 NEC-P11 **Final Action: Reject**
(430.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change “suitable” to “identified”.
Substantiation: Edit. Suitable is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The term “identified” is defined in Article 100 and relates to listings by testing agencies. The term “suitable” is not unenforceable or vague as used in this context.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-43 Log #3333 NEC-P11 **Final Action: Reject**
(430.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
In locations or flying material is <u>likely to be</u> collected on <u>or in</u> a motor<u>(s)</u> in such quantities as to ~~seriously~~ interfere with the ventilation or cooling of the motor<u>(s)</u> and cause <u>elevated</u> ~~dangerous~~ temperatures <u>for which the motor(s) not rated</u>, ~~suitable~~ <u>an identified type of enclosed motor(s) that does not overheat under the prevailing conditions shall be used or an identified</u> enclosure for the motor<u>(s)</u> shall be <u>provided which minimizes the entrance of dust and flying material and does not cause elevated motor temperatures</u>.
Substantiation: Motors identified as suitable for the use should not require other enclosures. If other enclosures are provided they should be identified for the use and not in themselves cause elevated temperatures. “Seriously” and “dangerous” are subjective and not defined. “Suitable” is a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any substantiation to indicate that the section is unclear or is causing problems in the field. “Seriously” and “dangerous” are defined in Webster’s 11th Collegiate Dictionary, the official dictionary for NFPA.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-44 Log #4250 NEC-P11 **Final Action: Reject**
(430.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 430.19 in Part I.
<u>430.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:</u>
<u>(1) Equipment listing or labeling</u>
<u>(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation</u>
<u>(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer’s self-evaluation or an owner’s engineering judgment</u>
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV’s, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of “other” options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be “approved”, it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-46.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-45 Log #4251 NEC-P11 **Final Action: Reject**
(430.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 430.19 in Part I.
430.19 Equipment Approval. The equipment required or permitted by this Article after December 31, 2016 shall be acceptable only if listed.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, the proposed text requires listing of all equipment covered by this Article by a qualified testing agency as defined in Article 100. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation and listing of that equipment.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-46.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-46 Log #4252 NEC-P11 **Final Action: Reject**
(430.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 430.19 in Part I.
430.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if listed.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: The proposal limits the ability of installing and constructing electrical equipment. The authority having jurisdiction already has the authority to require listing of electrical equipment through NEC Sections 90.4, 90.7, and 110.2.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
FAHEY, R.: The action on this proposal requiring motors to be listed should have been accept. The acceptance of this proposal would improve electrical safety and assure motors are manufactured properly and safely. As of this date, the majority of motors utilized in residential, commercial and industrial applications are listed. The concern was regarding larger specialty motors used in large industrial applications. Although present Code sections 90.7, 110.2 and 110.3(A) do allow the AHJ to require a product be listed, the proposed language would directly allow and greatly enhance the ability of the AHJ to require these products to be listed. Panel members had a concern with larger motors where the motors are specifically manufactured for a particular application process; these motors are typically installed in large industrial facilities where the product could be field evaluated by a recognized testing agency for these special and limited situations. Overall, the proposal will add safety to the electrical system and assure the AHJ, the end user and the manufacturers of motors, that all motors manufactured worldwide, would comply with the same standard of safety.

11-47 Log #4253 NEC-P11 **Final Action: Reject**
(430.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add a new section 430.19 in Part I.
430.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-46.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-48 Log #4254 NEC-P11 **Final Action: Reject**
(430.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 430.19 in Part I.
430.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

Ballot Results: Affirmative: 15

11-48a Log #CP1100 NEC-P11 **Final Action: Accept**
(430.22)

Submitter: Code-Making Panel 11,
Recommendation: Delete 430.22 in its entirety and replace with:
430.22 Single Motor.
Conductors that supply a single motor used in a continuous duty application shall have an ampacity of not less than 125 percent of the motor full load current rating as determined by 430.6(A)(1), or not less than the following:
(A) DC Motors-Rectifier Supplied. For dc motors operating from a rectified power supply, the conductor ampacity on the input of the rectifier shall not be less than 125 percent of the rated input current to the rectifier. For dc motors operating from a rectified single-phase power supply, the conductors between the field wiring output terminals of the rectifier and the motor shall have an ampacity of not less than the following percentage of the motor full-load current rating:
(a) Where a rectifier bridge of the single-phase half-wave type is used, 190 percent.
(b) Where a rectifier bridge of the single-phase full-wave type is used, 150 percent.
(B) Multispeed Motor. For a multispeed motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the highest of the full-load current ratings shown on the motor nameplate. The ampacity of the branch-circuit conductors between the controller and the motor shall not be less than 125 percent of the current rating of the winding(s) that the conductors

energize.

(C) Wye-Start, Delta-Run Motor. For a wye-start, delta-run connected motor, the ampacity of the branch-circuit conductors on the line side of the controller shall not be less than 125 percent of the motor full-load current as determined by 430.6(A)(1). The ampacity of the conductors between the controller and the motor shall not be less than 72 percent of the motor full-load current rating as determined by 430.6(A)(1).

FPN: The individual motor circuit conductors of a wye-start, delta-run connected motor carry 58 percent of the rated load current. The multiplier of 72 percent is obtained by multiplying 58 percent by 1.25.

(D) Part-Winding Motor. For a part-winding connected motor, the ampacity of the branch-circuit conductors on the line side of the controller shall not be less than 125 percent of the motor full-load current as determined by 430.6(A)(1). The ampacity of the conductors between the controller and the motor shall not be less than 62.5 percent of the motor full-load current rating as determined by 430.6(A)(1).

FPN: The multiplier of 62.5 percent is obtained by multiplying 50 percent by 1.25.

(E) Other Than Continuous Duty. Conductors for a motor used in a short-time, intermittent, periodic, or varying duty application shall have an ampacity of not less than the percentage of the motor nameplate current rating shown in Table 430.22(E), unless the authority having jurisdiction grants special permission for conductors of lower ampacity.

****Insert Table 430.22(E) Duty-Cycle Service (Existing Not Shown)***

Note: Any motor application shall be considered as continuous duty unless the nature of the apparatus it drives is such that the motor will not operate continuously with load under any condition of use.

(F) Separate Terminal Enclosure. The conductors between a stationary motor rated 1 hp or less and the separate terminal enclosure permitted in 430.245(B) shall be permitted to be smaller than 14 AWG but not smaller than 18 AWG, provided they have an ampacity as specified in 430.22.

Substantiation: The panel has rewritten the section to provide more clarity, to correlate the wye-start, delta-run motors with other sections and to provide some additional information for dc motors.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-49 Log #2311 NEC-P11 **Final Action: Accept in Principle**

(430.22(C))

TCC Action: The Technical Correlating Committee understands that the proposal referenced in the panel statement should be 11-48a.

Submitter: John Clay, North Idaho College

Recommendation: Change last sentence of 430.22(C) to say 72% in lieu of 58%.

Substantiation: 440.32 clearly definite conductor sizing between a controller & motor; vis a vis 430.22(C) does not. A revision for – to clarify reduced voltage starting conductor sizing is needed.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and substantiation on Proposal 11-107a.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

DESJARLAIS, J.: Panel statement should read: "See panel action and substantiation on proposal 11-48a."

It currently refers to proposal 107a which does not address 430.22.

11-50 Log #4794 NEC-P11 **Final Action: Accept**

(430.22(G))

Submitter: David Drennan, Thyssen Krupp Krause, Inc.

Recommendation: Add a new 430.22(G)

(G) Conductors for Small Motors. Conductors for small motors shall not be smaller than 14 AWG unless otherwise permitted in 430.22(G)(1) or 430.22(G)(2).

(1) 18 AWG Copper. 18 AWG Copper shall be permitted if part of a jacketed multiconductor cable assembly or flexible cord, or individual conductors used in a cabinet or enclosure, under the following conditions:

(a) Motor circuits with a full-load ampacity of 5 amperes or less provided all the following conditions are met:

(i) Circuit is protected in accordance with 430.52.

(ii) Circuit is provided with Class 10 overload protection in accordance with 430.32.

(iii) Overcurrent protection is provided in accordance with 240.4(D)(1)(2)

(b) Motor circuits with a full-load ampacity of 3.5 amperes or less provided all the following are met:

(i) Circuit is protected in accordance with 430.52.

(ii) Circuit is provided with Class 20 overload protection in accordance with 430.32.

(iii) Overcurrent protection is provided in accordance with 240.4(D)(1)(2).

(2) 16 AWG Copper. 16 AWG Copper shall be permitted if part of a jacketed multiconductor cable assembly or flexible cord, or individual conductors used in a cabinet or enclosure, under the following conditions:

(a) Motor circuits with a full-load ampacity of 8 amperes or less provided all the following conditions are met:

(i) Circuit is protected in accordance with 430.52.

(ii) Circuit is provided with Class 10 overload protection in accordance with 430.32.

(iii) Overcurrent protection is provided in accordance with 240.4(D)(2)(2).

(b) Motor circuits with a full-load ampacity of 5.5 amperes or less provided all the following are met:

(i) Circuit is protected in accordance with 430.52.

(ii) Circuit is provided with Class 20 overload protection in accordance with 430.32.

(iii) Overcurrent protection is provided in accordance with 240.4(D)(2)(2).

Substantiation: This proposal correlates the detailed requirements for applying small motor circuit conductors in Article 430 with those found in NFPA 79. It specifically limits the type of conductors that can be utilized or limits their location to a "protected" area such as a cabinet or enclosure. It then specifies the classes of overload relays and the sizes of overcurrent protective devices, based upon the motor full load amperes. The changes were introduced into NFPA 79 in order to help US machinery manufacturers compete in the international market, where the allowable minimum IEC motor circuit conductors are smaller than the minimum 14 AWG conductors allowed in NFPA 79 and the NEC®.

Panel Meeting Action: Accept

Add a new 430.22(G)

(G) Conductors for Small Motors. Conductors for small motors shall not be smaller than 14 AWG unless otherwise permitted in 430.22(G)(1) or 430.22(G)(2).

(1) 18 AWG Copper. [18 AWG Copper shall be permitted if part of a jacketed multiconductor cable assembly or flexible cord or individual conductors used in a cabinet or enclosure, under the following conditions:]

(1) Motor circuits with a full-load ampacity of 5 amperes or less provided all the following conditions are met:

(a) Circuit is protected in accordance with 430.52

(b) Circuit is provided with Class 10 overload protection in accordance with 430.32

(c) Overcurrent protection is provided in accordance with 240.4(D)(1)(2).

(2) Motor circuits with a full-load ampacity of 3.5 amperes or less provided all the following are met:

(a) Circuit is protected in accordance with 430.52

(b) Circuit is provided with Class 20 overload protection in accordance with 430.32

(c) Overcurrent protection is provided in accordance with 240.4(D)(1)(2).

(2) 16 AWG Copper. 16 AWG copper shall be permitted if part of a jacketed multiconductor cable assembly or flexible cord, or individual conductors used in a cabinet or enclosure, under the following conditions:]

(1) Motor circuits with a full-load ampacity of 8 amperes or less provided all the following conditions are met:

(a) Circuit is protected in accordance with 430.52

(b) Circuit is provided with Class 10 overload protection in accordance with 430.32

(c) Overcurrent protection is provided in accordance with 240.4(D)(2)(2).

(2) Motor circuits with a full-load ampacity of 5.5 amperes or less provided all the following are met:

(a) Circuit is protected in accordance with 430.52

(b) Circuit is provided with Class 20 overload protection in accordance with 430.32

(c) Overcurrent protection is provided in accordance with 240.4(D)(2)(2).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

DESJARLAIS, J.: An exception should be made for certified motor operated equipment employing wires sizes smaller than specified in this proposal. The following should be added after (G) and before (1):

Exception - Smaller wire sizes may be employed where part of a listed motor operated equipment.

11-50a Log #CP1101 NEC-P11 **Final Action: Accept**

(430.24)

Submitter: Code-Making Panel 11,

Recommendation: Delete section 430.24 in its entirety and replace with the following:

430.24 Several Motors or a Motor(s) and Other Load(s). Conductors supplying several motors, or a motor(s) and other load(s), shall have an ampacity not less than the sum of each of the following:

1. 125 percent of the full-load current rating of the highest rated motor as determined by 430.6(A)
2. the sum of the full-load current ratings of all the other motors in the group, as determined by 430.6(A)
3. 100 percent of the non-continuous non-motor load
4. 125 percent of the continuous non-motor load.

The FPN and the exceptions remain unchanged.

Substantiation: The modified text clarifies the meaning of "required for the other loads".
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DESJARLAIS, J.: Add to item 2. 100 percent of the sum of the full-load......
Revise item 4. 100 percent of the continuous non-motor load
Substantiation: Revise item 2 as shown to clarify the percent of additional motor load for calculation. Revise item 4 as shown. The remaining non-motor loads should be calculated in a manner no different than the remaining motor-loads. Motor loads are more apt to incur running overloads than non-motor loads. Clause 430.53(C)(4) sizes loads for branch circuit protection similarly.

11-51 Log #1084 NEC-P11 **Final Action: Reject**
(430.24 Exception No. 3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
Where the circuitry is interlocked so as to prevent simultaneous operation of selected motors or other loads ~~at the same time~~, the conductor ampacity shall be permitted to be based on the summation of 125 percent of the largest motor or continuous load, whichever is larger, and the currents of the other motors and other loads to be operated simultaneously ~~at the same time~~ that results in the highest current.
Substantiation: Edit. Proposal clarifies that the 125 percent factor is to be applied.
Panel Meeting Action: Reject
Panel Statement: It is the panel's intent to require 125 percent of the largest motor, plus 125 percent of the continuous load for those loads operating simultaneously. No technical substantiation has been provided to the panel for only requiring 125 percent for the largest of the motor or the continuous load. See panel action and statement on 11-48a.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BUNCH, R.: This proposal deals with exception 3 in 430.34. Panel action 11-48a only reworded 430.22 rules for a single motor. This is several motors and other loads, not a single motor so the panel action for 11-48a does not apply. The exception cited is still allowed in 430.24. This proposal was only to clarify for circuit with interlocks and should be accepted.
Comment on Affirmative:
FAHEY, R.: The panel statement referring to proposal 11-48a was incorrectly referenced; the correct panel action and statement should have been 11-50a.
SAUNDERS, L.: Panel statement improperly refers to "see panel action and comment on 11-~~48a~~" and should refer to 11-50a.

11-52 Log #1083 NEC-P11 **Final Action: Reject**
(430.26)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part...provided the conductor have ~~sufficient~~ an ampacity ~~for~~ not less than the maximum load determined in accordance with...(remainder unchanged).
Substantiation: Edit. "Sufficient" is subjective, undefined, and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The use of the word "sufficient" is a quantitative term that can be enforceable because it is a calculated load. If a word is enforceable, 3.2.1 of the NEC Style Manual, allows its use.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-53 Log #3452 NEC-P11 **Final Action: Reject**
(430.26)

Submitter: James G. Lally, IBEW/NECA Technical Institute
Recommendation: 430.26 add new paragraph:
For feeder or service calculations for single family dwellings omit the additional 25 percent for the largest motor.
Substantiation: 220.50 refers us to 430.24.
The amount of VA that it adds in determining the size of the conductors is insignificant.
Panel Meeting Action: Reject
Panel Statement: The panel rejects this proposal, as the submitter has not provided technical substantiation to support the omission of the 25 percent for the largest motor. Many larger homes have large equipment such as mechanical equipment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-54 Log #255 NEC-P11 **Final Action: Reject**
(430.28(1))

Submitter: Timothy Trewyn, Garrison Engineering Services
Recommendation: Revise text to read as follows:
(1)...shall not exceed 100 ~~1000~~ percent of the tap conductor ampacity
Substantiation: Selection of overcurrent device at 1000 percent of the ampacity of a conductor protected by the device is unsafe. This appears to be a typographical error.
Panel Meeting Action: Reject
Panel Statement: This is not a typographical error. The panel rejects this proposal as the present 1000 percent language is correct for the 10 ft tap rule. If the multiplier was changed to 100 percent, the tap conductor would be required to be the same size as the conductor that it is tapped from; therefore, it would not be defined as a tap conductor. The substantiation does not indicate how the existing requirement is unsafe.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-55 Log #3713 NEC-P11 **Final Action: Reject**
(430.28(1))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Add additional text to 430.28 (1) as follows:
430.28 Feeder Taps. Feeder tap conductors shall have an ampacity not less than that required by Part II, shall terminate
in a branch-circuit protective device, and, in addition, shall meet one of the following requirements:
(1) Be enclosed either by an enclosed controller or by a raceway, be not more than 3.0 m (10 ft) in length, and,
for field installation, be protected by an overcurrent device on the line side of the tap conductor, the rating
or setting of which shall not exceed 1000 percent of the tap conductor ampacity. Feeder tap conductors shall be permitted to terminate in multiple branch-circuit protective devices that have a common line side connection either by:
a) Use of bus-bar wiring accessories identified for such use, or
b) Use of conductors to interconnect between terminals where the total length of the tap and all interconnecting conductors to any of the branch-circuit protective devices does not exceed 3m (10 ft).
Substantiation: The current language states that a tap conductor must terminate in a branch-protective device, and is not clear in its permission of termination onto multiple branch circuit devices in parallel. This proposal clarifies the use of readily available bus bar wiring accessories or daisy chaining using conductors when the motor branch-circuit short-circuit protective device terminals are designed for such use.
Panel Meeting Action: Reject
Panel Statement: The present code language provides clear indication a single overcurrent device is required. The proposed text allows an installation with an unlimited number of overcurrent protective devices. This new language allows the possibility of overloading the tap conductors. The proposal also adds language as to the method of connecting the tap conductors, which is ambiguous and difficult for the AHJ to enforce.
For purposes of arc-flash reduction, if an arc-flash were to occur on the line side of one of the multiple branch-circuit protective devices, it is better to have a single overcurrent protective device, rated at the ampacity of the feeder tap, at the end of the tap. This proposal would eliminate the single device at the end of the tap, meaning that the arc-flash would be determined by the feeder overcurrent device, which could be 10 times the rating of the device that is now required.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
DESJARLAIS, J.: The same requirements applicable to branch circuit conductors should be applicable to tap conductors as the hazards are the same. The present requirements in clauses 430.53 and 430.53 are sufficient for determining the size, type and number of branch circuit protection requirements.
WRIGHT, J.: The wording of the Panel statement "it is better to have a single overcurrent protective device, rated at the ampacity of the feeder tap, at the end of the tap" is incorrect, as related to Article 430. The present rules for feeder taps in Section 430.28 require that the tap end in a branch circuit protective device; the rating of that branch circuit protective device is not specified, relative to the tap conductor. Instead, overcurrent protection for the feeder tap is provided by the overload protection provided in accordance with Part III of Article 430.
The rating of the branch-circuit protective device at the end of the feeder tap is determined by the load, in accordance with Section 430.52 or 430.53. This results in the branch-circuit protective device at the end of the feeder tap having a rating considerably higher than the ampacity of the feeder tap conductor; that is necessary in order to get motors started.

The Panel statement that the proposed change allows the possibility of overloading tap conductors is also incorrect. Section 430.24 contains specific requirements for sizing the tap conductors supplying multiple loads. The total of all loads connected to the multiple branch-circuit protective devices attached to the bus-bar wiring system of proposed 430.28(1)(a) or interconnected as in proposed 430.28(1)(b) would be used to calculate the required ampacity of the tap conductor to these connections.

The Panel statement regarding arc-flash reduction is also incorrect, in that, as noted above, the feeder tap is not required to terminate in a branch-circuit protective device rated at the ampacity of the feeder tap. Under the proposed wording, the maximum rating of any branch-circuit protective device connected to the bus-bar system or interconnected system would be no higher than that currently permitted by the Code.

Making connections at the line-side of one of the multiple branch-circuit protective devices would be no different than making connections at the line-side of a single branch-circuit protective device. In both cases, the fault would be limited by the feeder overcurrent device. For circumstances involving multiple loads on a feeder circuit, the present wording of the Code requires the use of multiple feeder taps, which presents multiple opportunities for wiring errors.

11-56 Log #1082 NEC-P11 **Final Action: Reject**
(430.31)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second paragraph:

These provisions shall not be interpreted as requiring overload protection where ~~it might introduce~~ <u>opening of the overload device(s)</u> introduces possible additional or increased hazard(s), as in the case of fire pumps.

Substantiation: Edit. “Might” is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation that there are problems with this section as written. The term “might” is appropriate in the context of this section and is in accordance with section 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

COLE, T.: Table 3.2.1 in the Style Manual lists the word “might” as a word that is possibly unenforceable. The use of the word “might” in this context is a perfect example of this. While the author is correct in saying the word “might is a confusing word he then interjects another word “possible” which would have the same affect. Substituting the word “if” in place of the words “it might introduce” and eliminating the word “possible” would eliminate any vague wording and add clarity. The proposal should have been accepted in principal.

11-57 Log #1272 NEC-P11 **Final Action: Reject**
(430.32(A)(1))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:

430.32(A)(1) Continuous-Duty Motors.

(1) Separate Overload Device. A separate overload device that is responsive to motor current. <u>This device is permitted to be a Dual Element (Time-Delay) fuse, sized in accordance with Part III of Article 430.</u> This device shall be selected to trip or shall be rated at no more than the following percent of the motor nameplate full-load current rating:

Substantiation: Many questions and comments have come up concerning whether a fuse can be used for overload protection, in our classroom and phone calls to James R. Weimer. I believe that this simple change would clarify this. Reviewing 430.36 implies that a fuse is acceptable.
Panel Meeting Action: Reject
Panel Statement: Dual element (time-delay) fuses are presently permitted in 430.36 to be utilized for overload protection when sized in accordance with Part III of Article 430. The proposed language would be redundant.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-58 Log #2352 NEC-P11 **Final Action: Reject**
(430.32(A)(1))

Submitter: Kevin M. Weigman, Northeast Wisconsin Technical College
Recommendation: Revise text to read as follows:

Separate Overload Device. A separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated at no more than the following percent of motor nameplate full-load ~~current~~ <u>ampere</u> rating.

Substantiation: The nameplate of a motor lists the current for said motor in Full Load Amperes whereas the Code lists it as Full Load Current from the tables. Changing the language will serve to clarify the intent of the code section that the nameplate value is the desired value.
Panel Meeting Action: Reject
Panel Statement: The NEC Style Manual lists “full load current” as a standard term. The panel does not agree using the term “amperes” will add clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-59 Log #625 NEC-P11 **Final Action: Reject**
(430.32(A)(1), FPN No. 2)

Submitter: Gregory P. Bierals, Samaritan’s Purse World Medical Mission
Recommendation: Add new text to read as follows:

FPN No. 2: Using the actual measured running current of the motor, increased to no more than the percentages identified in this section, instead of using the motor nameplate full-load current rating, may provide better overload protection.

Substantiation: Where the actual running current of the motor, under normal conditions, is less than the motor nameplate current rating, the use of this lower value would be a prudent choice.
Panel Meeting Action: Reject
Panel Statement: In accordance with Section 3.1.3 of the NEC Style Manual the proposed new FPN does not contain explanatory information only. Furthermore, a FPN should not contain recommendations.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-60 Log #438 NEC-P11 **Final Action: Accept**
(Table 430.37)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:

In the seventh and eight rows of the Table, change “per” to “for each”.

In the seventh row of the Table, change “con- ductors” to “conductors”.

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.

The correction for conductors is editorial.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(Note: Sequence 11-61 was not used)

11-62 Log #731 NEC-P11 **Final Action: Reject**
(430.42(C))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Delete text to read as follows:
430.42 Motors on General-Purpose Branch Circuits.
Overload protection for motors used on general-purpose branch circuits as permitted in Article 210 shall be provided as specified in 430.42(A), (B), (C), or (D).
(C) Cord-and-Plug-Connected. Where a motor is connected to a branch circuit by means of an attachment plug and receptacle and individual overload protection is omitted as provided in 430.42(A), the rating of the attachment plug and receptacle shall not exceed 15 amperes at 125 volts or 250 volts. Where individual overload protection is required as provided in 430.42(B) for a motor or motor-operated appliance that is attached to the branch circuit through an attachment plug and receptacle, the overload device shall be an integral part of the motor or of the appliance. The rating of the ~~attachment plug and~~ receptacle shall determine the rating of the circuit to which the motor may be connected, as provided in Article 210.
[remainder of 430.42 unchanged by this Proposal]
Substantiation: NOTE: This proposal is separate from another proposal I submitted for 430.42(C) involving cord pendants.

The rating of the circuit should be based on the rating of the receptacle alone, not on EITHER the receptacle OR the attachment plug. Some receptacle configurations accept either an attachment plug of the same current rating or of a lower current rating. 406.3(F) mandates noninterchangeability based on different voltages, frequencies, or services (ac versus dc) on the same premises, but NOT based on amperage or horsepower current rating. The most common examples are that non-locking-type 20-ampere, 125-volt (NEMA 5—20R) and 250-volt (NEMA 6—20R) receptacles will accept either non-locking-type 15- or 20-ampere, 125-volt (NEMA 5—15P or NEMA 5—20P) and 250-volt (NEMA 6—15P or NEMA 6—20P), respectively.

Also as a matter of enforcement by the AHJ at the time of inspection, the receptacle as part of the permanent wiring is there, but the attachment plug (and equipment) may not be.

Panel Meeting Action: Reject
Panel Statement: The present language requires the installer to size the branch circuit based on both the attachment plug and the receptacle for the load to be served; this is consistent with 210.21(B). See panel action and statement on Proposal 11-63.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-63 Log #732 NEC-P11 **Final Action: Accept in Part**
(430.42(C))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Revise text and add a new Fine Print Note to read as follows:
430.42 Motors on General-Purpose Branch Circuits.
Overload protection for motors used on general-purpose branch circuits as permitted in Article 210 shall be provided as specified in 430.42(A), (B), (C), or (D).
(C) Cord-and-Plug-Connected. Where a motor is connected to a branch circuit by means of an attachment plug and a receptacle or a cord connector that is supplied by a permanently connected cord pendant and individual overload protection is omitted as provided in 430.42(A), the rating of the attachment plug and receptacle shall not exceed 15 amperes at 125 volts or 250 volts. Where individual overload protection is required as provided in 430.42(B) for a motor or motor-operated appliance that is attached to the branch circuit through an attachment plug and a receptacle or a cord connector that is supplied by a permanently connected cord pendant, the overload device shall be an integral part of the motor or of the appliance. The rating of the ~~attachment plug and~~ receptacle or the cord connector shall determine the rating of the circuit to which the motor may be connected, as provided in Article 210.
FPN: See 210.50(A) and 400.7(A)(1) for equivalency to a receptacle outlet of a cord connector that is supplied by a permanently connected cord pendant.
[remainder of 430.42 unchanged by this Proposal]
Substantiation: NOTE: This proposal is separate from another proposal I submitted for 430.42(C) NOT involving addition of cord pendants.
Regarding the deletion of "attachment plug or" in the last sentence of 430.42(C), the rating of the circuit should be based on the rating of the receptacle alone, not on EITHER the receptacle OR the attachment plug. Some receptacle configurations accept either an attachment plug of the same current rating or of a lower current rating. 406.3(F) mandates noninterchangeability based on different voltages, frequencies, or services (ac versus dc) on the same premises, but NOT based on amperage or horsepower current rating. The most common examples are that non-locking-type 20-ampere, 125-volt (NEMA 5—20R) and 250-volt (NEMA 6—20R) receptacles will accept either non-locking-type 15- or 20-ampere, 125-volt (NEMA 5—15P or NEMA 5—20P) and 250-volt (NEMA 6—15P or NEMA 6—20P), respectively.
Also as a matter of enforcement by the AHJ at the time of inspection, the receptacle as part of the permanent wiring is there, but the attachment plug (and equipment) may not be.
The added wording and Fine Print Note for cord pendants and cord connectors are provided for correlation to 210.50(A) and 400.7(A)(1) and the practices they already permit, commonly employed in commercial and industrial applications.
Panel Meeting Action: Accept in Part
Revise text of **430.42(C)** to read as follows:
(C) Cord-and-Plug-Connected. Where a motor is connected to a branch circuit by means of an attachment plug and a receptacle or a cord connector and individual overload protection is omitted as provided in 430.42(A), the rating of the attachment plug and receptacle shall not exceed 15 amperes at 125 volts or 250 volts. Where individual overload protection is required as provided in 430.42(B) for a motor or motor-operated appliance that is attached to the branch circuit through an attachment plug and a receptacle or a cord connector the overload device shall be an integral part of the motor or of the appliance. The rating of the attachment plug and receptacle or the cord connector shall determine the rating of the circuit to which the motor may be connected, as provided in Article 210.
[remainder of 430.42 unchanged by this Proposal]
Add a new fine print note to read as follows:
FPN: See 210.50(A) and 400.7(A)(1) for equivalency to a receptacle outlet of a cord connector that is supplied by a permanently connected cord pendant.
Panel Statement: The panel accepts the additional language as related to cord connectors and the FPN. The panel rejects the remainder of the proposal. The present language requires the installer to size the branch circuit based on both the attachment plug and the receptacle for the load to be served. This is consistent with 210.21(B).
The additional code language related to permanently connected cord pendants is not necessary because they are presently permitted in 210.50(A) and 400.7(A)(1), therefore the additional language is redundant.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
DESJARLAIS, J.: Re-word the 5th line of the proposal to state: "...circuit through an attachment plug and a receptacle or a cord connector, the overload device shall..." Add a comma after "cord connector".

11-64 Log #1081 NEC-P11 **Final Action: Accept**
(430.42(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
"or cord connector" after "receptacle" in four places.
Substantiation: Edit. Cord connectors should be included; they are required if a motor has a flanged surface inlet.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-65 Log #1080 NEC-P11 **Final Action: Reject**
(430.43)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
A motor overload device that can restart a motor automatically shall not be installed if automatic restarting of the motor ~~can~~ is likely to result in injury to persons.
Substantiation: Edit. Any automatic (or manual) restarting of a motor can result in injury, dependent on circumstances. "Likely" is defined as a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: 3.2.1 of the NEC Style Manual lists "likely" as a possible unenforceable term. The present text uses the term "can" as a verb and denotes possibility. The present text contains clear language and is more specific than the proposed language. The definition of "can" is "capable of".
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-66 Log #1108 NEC-P11 **Final Action: Reject**
(430.44)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
If immediate automatic shut-down of a motor by a motor overload protective device(s) ~~would~~ is likely to introduce addition or increased hazard(s)... (remainder unchanged).
Substantiation: It can be difficult to determine with certainty if an increased hazard will result due to variable conditions and circumstances. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The true definition of likely is "a high probability". The use of the word "would" indicates that something "will" take place. The use of "likely" interjects some uncertainty and changes the intent of the text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-67 Log #2215 NEC-P11 **Final Action: Accept in Principle**
(430.52(C)(7))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Add new FPN to existing 430.52(C)(7) to read:
FPN: A Motor Short-Circuit Protector as used in this Section is a fused device and is not a motor circuit protector (MCP) instantaneous circuit breaker.
Substantiation: There remains much confusion in the industry as to what a Motor Short-Circuit Protector is. This FPN will clarify that a Motor Short-Circuit Protector is not the same as an MCP circuit breaker.
Panel Meeting Action: Accept in Principle
Add new FPN to existing 430.52(C)(7) to read:
FPN: A motor short-circuit protector as used in this section is a fused device and is not an instantaneous trip circuit breaker.
Panel Statement: The panel accepts the concept and changed wording to use the proper term, which is "instantaneous trip circuit breaker".
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-68 Log #3714 NEC-P11 **Final Action: Accept**
(430.53)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Modify 430.53, with the following added wording:
430.53 Several Motors or Loads on One Branch Circuit. Two or more motors or one or more motors and other loads shall be permitted to be connected to the same branch circuit under conditions specified in 430.53(D) and in 430.53(A), (B), or (C). The branch circuit protective device shall be fuses or inverse time circuit breakers.
Substantiation: This clarifies that inverse time circuit breakers and fuses are the only permitted means for providing group motor branch short-circuit and ground fault protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-69 Log #3715 NEC-P11 **Final Action: Accept**
(430.53(C)(1) and (2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Change the text under (C)(1) as follows:
(1) Each motor overload device is either (a) listed for group installation with a specified maximum rating of fuse, circuit breaker, or both, or (b) selected such that the ampere rating of the motor branch short-circuit and ground fault protective device does not exceed that allowed by 430.52 for that individual motor overload device and corresponding motor load.
Change the text under (C)(2) as follows:
(1) Each motor controller is either (a) listed for group installation with a specified maximum rating of fuse, circuit breaker, or both, or (b) selected such that the ampere rating of the motor branch short-circuit and ground fault protective device does not exceed that allowed by 430.52 for that individual controller and corresponding motor load.
Substantiation: The language in 430.53(C)(1) and (2) requires all motor controllers and overloads devices to be listed for group installation. Any motor controller or overload device applied within a group installation where the branch circuit protection for the group is sized within what would be permitted for a single motor installation of that device need not be marked for group motor as it is protected within its listing requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-70 Log #4402 NEC-P11 **Final Action: Accept in Principle in Part**
(430.53(D)(2), FPN)

Submitter: Jay Tamblingson, Rockwell Automation
Recommendation: Add the following at the end of subsection 430.53.(D).(2):
FPN: Protection against physical damage can include use of raceways, enclosures, and other wiring methods such as that referenced in 336.10.(7).
Substantiation: The proposed FPN helps to clarify the possible means of protection from physical damage, particularly for the now very common distributed power and control applications on machines.
Panel Meeting Action: Accept in Principle in Part
Instead of adding this text in a FPN, the panel has revised 430.52(D)(2) to read:
No conductor to the motor shall have an ampacity less than one-third that of the branch-circuit conductors, with a minimum in accordance with 430.22, the conductors to the motor overload device being not more than 7.5 m (25 ft) long and being protected from physical damage by being enclosed in an approved raceway or other approved means.
Panel Statement: The panel has added language to be consistent with present language for physical protection of tap conductors in other sections of the NEC, such as 430.53(D)(3), 430.28 and 240.21. The additional language satisfies the submitter's concerns with the type of physical protection required for these tap conductors. This addresses the submitter's concerns in regard to referencing other wiring methods by adding the language "other approved means".
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-71 Log #3716 NEC-P11 **Final Action: Accept in Part**
(430.53(D)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Modify 430.53(D)(3) with the following added wording:
Conductors from the branch-circuit short-circuit and ground-fault protective device to a listed manual motor controller additionally marked "Suitable for Tap Conductor Protection in Group Installations" or to a branch-circuit protective device shall be permitted to have an ampacity not less than 1/10 the rating or setting of the branch-circuit short-circuit and ground-fault protective device. The conductors from the controller to the motor shall have an ampacity in accordance with 430.22. The conductors from the branch-circuit short-circuit and ground-fault protective device to the controller shall (1) be ~~suitably protected from physical damage and~~ enclosed either by an enclosed controller or by a raceway and be not more than 3 m (10 ft) long or (2) have an ampacity not less than that of the branch-circuit conductors.
Substantiation: This is a clarification of existing requirements. Additional Branch Circuit Protective Devices (such as fuses, inverse time circuit breakers and listed Self-Protected Combination Motor Controllers) may be used in the same location in the circuit of a Group Installation as a manual motor controller additionally marked "Suitable for Tap Conductor Protection in Group Installations". Further, this clarifies that the concepts in 430.28 are also applicable in group applications.
In addition, the phrase "suitably protected from physical damage" is redundant and confusing in light of the requirement for enclosing in an enclosed controller or a raceway.
Panel Meeting Action: Accept in Part
Modify 430.53(D)(3) with the following added wording:
Conductors from the branch-circuit short-circuit and ground-fault protective device to a listed manual motor controller additionally marked "suitable for tap conductor protection in group installations" or to a branch-circuit protective device shall be permitted to have an ampacity not less than 1/10 the rating or setting of the branch-circuit short-circuit and ground-fault protective device. The conductors from the controller to the motor shall have an ampacity in accordance with 430.22. The conductors from the branch-circuit short-circuit and ground-fault protective device to the controller shall (1) be suitably protected from physical damage and enclosed either by an enclosed controller or by a raceway and be not more than 3 m (10 ft) long or (2) have an ampacity not less than that of the branch-circuit conductors.
Panel Statement: The panel does not agree with deleting the text. This text provides necessary clarity for the raceway or enclosed controller.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DESJARLAIS, J.: The purpose of 430.53(D)(3) is that the tap conductors terminate as a manual motor control additionally marked suitable for tap conductor protection in group installations. The intent is not for one BCP device to follow another. Note that the first sentence of 430.53(D) specifically excludes the need for another BCP device when the conditions in (1), (2) or (3) are met.

11-72 Log #1111 NEC-P11 **Final Action: Reject**
(430.61)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Part V specifies protection devices intended to protect feeder and service conductors supplying motors against overcurrent due to short circuits or grounds.
Substantiation: The provision should apply to service conductors especially those supplying only a motor branch circuit or only a motor feeder(s).
Panel Meeting Action: Reject
Panel Statement: Article 430 Part V relates to motor feeder short-circuit and ground-fault protection. As defined in Article 100 service conductors are the conductors from the service point to the service disconnecting means. See part VII of Article 230 for the protection of service equipment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-73 Log #1110 NEC-P11 **Final Action: Reject**
(430.62(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
"and service conductors" after "feeder" in three places.
Substantiation: The provision should apply to service conductors, especially those supplying only a motor branch circuit or only a motor feeder(s).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 11-72.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-74 Log #1109 NEC-P11 **Final Action: Reject**
(430.63)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
"or service conductors" after "feeder" in two places.
Add:
FPN: Where service conductors supply a motor control center. See 430.94.
Substantiation: The provision should apply to service conductors, especially those supplying only a motor branch circuit or a motor feeder(s).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 11-72. The FPN does not add any clarity or usability to the code. In addition, the reference to 430.94 is incorrect.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-75 Log #2016 NEC-P11 **Final Action: Accept in Principle in Part**
(430.63)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Where a feeder supplies a motor load and, in addition, ~~a lighting or a lighting and appliance~~ other types of load(s) the feeder overcurrent protective device(s) shall have a rating ~~sufficient to carry the lighting and appliance~~ not less than the other types of load(s) plus the following: (remainder unchanged)
Add: FPN: For continuous loads see 215.2 (A).
Substantiation: "Sufficient" is subjective and a term to be avoided per the Style Manual. Section 215.2 (A) applies to continuous load, and can be complied with by an overcurrent device rated not less than 125 percent of the largest motor or 125 percent of the continuous load, whichever is greater. A 125 percent rating for the largest load (motor or continuous) complies with the requirement for motor and continuous load since it serves the purpose for both.
Panel Meeting Action: Accept in Principle in Part
Revise 430.63 as follows:
430.63 Rating or Setting – ~~Power~~ Motor and ~~lighting~~ Other Loads.
Where a feeder supplies a motor load and other load(s), ~~in addition, a lighting or a lighting and appliance load~~ the feeder protective device shall have a rating ~~sufficient to carry the lighting or lighting and appliance load~~ not less than that required for the other load(s), plus the following:
(1) For a single motor, the rating permitted by 430.52
(2) For a single hermetic refrigerant motor-compressor, the rating permitted by 440.22
(3) For two or more motors, the rating permitted by 430.62
The exception is unchanged.
Panel Statement: The wording provided by the panel more clearly states the requirement and meets the intent of the submitter. The panel rejects the new FPN. Continuous loads are typically not a factor in feeder short-circuit and ground-fault protection as used in 430 Part V. The explanatory reference to 215.2(A) is not necessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-76 Log #1622 NEC-P11 **Final Action: Accept**
(Table 430.72(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: In Note 2, change "Table 310.17" to "Table 310.15(B)(2)".
In Note 3, change "Table 310.16" to "Table 310.15(B)(1)".
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Accept
Panel Statement: The panel accepts this proposal based on the action of Panel 6 to change the numbering of the Tables in Article 310.
The panel refers this action to the Technical Correlating Committee for correlation based on Panel 6 action.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-77 Log #1103 NEC-P11 **Final Action: Reject**
(430.72(B) Exception No. 1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
Where the opening of the control circuit ~~would~~ is likely to create a hazard... (remainder unchanged).
Substantiation: It can be difficult to determine with certainty if a hazard is created. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The true definition of likely is "a high probability". The use of the word "would" indicates that something "will" take place. The use of "likely" interjects some uncertainty and changes the intent of the text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-78 Log #3710 NEC-P11 **Final Action: Accept**
(430.72(C))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise (C) **Control Circuit Transformer as follows:**
(C) Control Circuit Transformer. Where a motor control circuit transformer is provided, the transformer shall be protected in accordance with 430.72(C) (1), (C)(2), (C)(3), (C)(4), ~~or~~ (C)(5), or (C)(6).
Renumber 430.72(C)(5) to 430.72 (C)(6), and add a new (C)(5) as follows:
(5) Manual motor controller suitable for tap conductor protection. The primary of a control circuit transformer shall be permitted to be protected by a listed manual motor controller marked "Suitable for Tap Conductor Protection in Group Installation" when installed under all of the following conditions:
(a) The current adjustment of the manual motor controller is set at not more than the rated input current of the control transformer;
(b) A wiring diagram specifying the proper connections for using the manual motor controller as a control transformer overcurrent protection device is provided with the device by the manufacturer, and
(c) The manual motor controller is rated for use on the supply voltage system as marked on the device.
(~~5~~6) Other Means. Protection shall be permitted to be provided by other approved means.
Substantiation: The UL Standard for Safety for Industrial Control Equipment UL508 revision September 11, 2005 added provisions for manual motor controllers suitable for tap conductor protection to be used to protect control transformers. The revisions above reflect the application and marking requirements as stated in the section 73.1.3 and 75.7 of UL508.
See Companion proposal NEC 450.3(B).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
SAPORITA, V.: I vote negative on Panel action
The text of 430.72 (A) General specifically states that the motor control circuit shall be permitted to be protected by either a supplementary or branch-circuit overcurrent protective device(s). Part (C) provides protection requirements for the control circuit transformer. Note well that the text of 430.72(C) (1),(2),(3),(4), and (5) is application specific referring to other NEC Sections or to performance requirements. 430.72 (C) (1) (2) (3) (4) and (5) are not product specific. If a manual motor protector is suitable for control circuit transformer protection then its use is already covered in 430.72 (C)(5), Other Means. The use of a manual motor protector for control circuit transformer protection is in fact a product standard issue and would be part of the product safety standard UL508 and verified by product listing after appropriate testing. Inclusion of product specific requirements in 430.72 (C) will lead to field misapplication.

11-79 Log #3711 NEC-P11 **Final Action: Accept**
(430.72(C))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise (C) **Control Circuit Transformer as follows:**
(C) Control Circuit Transformer. Where a motor control circuit transformer is provided, the transformer shall be protected in accordance with 430.72(C) (1), (C)(2), (C)(3), (C)(4), ~~or~~ (C)(5), or (C)(6).
Renumber 430.72(C)(5) to 430.72 (C)(6), and add a new (C)(5) as follows:
(5) Manual motor controller suitable for tap conductor protection. The primary of a control circuit transformer shall be permitted to be protected by a listed manual motor controller marked "Suitable for Tap Conductor Protection in Group Installation" when installed under all of the following conditions:
(a) The current adjustment of the manual motor controller is set at not more than the rated input current of the control transformer;
(b) A wiring diagram specifying the proper connections for using the manual motor controller as a control transformer overcurrent protection device is provided with the device by the manufacturer, and
(c) The manual motor controller is rated for use on the supply voltage system as marked on the device.
(~~5~~6) Other Means. Protection shall be permitted to be provided by other approved means.
Substantiation: The UL Standard for Safety for Industrial Control Equipment UL508 revision September 11, 2005 added provisions for manual motor controllers suitable for tap conductor protection to be used to protect control transformers. The revisions above reflect the application and marking requirements as stated in the section 73.1.3 and 75.7 of UL508.

Panel Statement: The true definition of likely is “a high probability”. The use of the word “would” indicates that something “will” take place. The use of “likely” interjects some uncertainty and changes the intent of the text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-82 Log #2612 NEC-P11 **Final Action: Accept in Part**
(430.73)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
PROTECTION of CONDUCTORS ~~from PHYSICAL DAMAGE~~ Where damage to a motor control circuit ~~would~~ is likely to constitute a hazard, all conductors of such a remote control the circuit that are outside of the control device itself or the controlled equipment enclosure shall be installed in an identified raceway or cable or be otherwise ~~suitably~~ protected from physical damage by identified means.
Substantiation: “Damage” should include all forms such as chemical. Cables identified for the use such as Type MI or AC should be permitted. “Suitable” is a term to be avoided per the Style Manual. “Likely” is defined as such a nature or circumstance as to make something probable and a term used in many sections.
Panel Meeting Action: Accept in Part
Revise 430.73 to read as follows:
430.73 Protection of Conductors from Physical Damage.
Where damage to a motor control circuit would constitute a hazard, all conductors of such a remote motor control circuit that are outside the control device itself shall be installed in a raceway or be otherwise protected from physical damage.
Panel Statement: The panel accepts the deletion of the word “suitably” and the addition of “s” to “conductor,” making it plural in the title. All other proposed changes are rejected.
The term “physical damage” is used in many sections of the code. This term needs to remain in this section title to provide descriptive information to the installer on what type of damage the code section is concerned with and furthermore complies with Section 3.2.5.5 of the NEC Style Manual.
NEC Style Manual section 3.2.1 lists “likely” as a possible unenforceable or vague term. The present text uses the term “would” as a verb, and as such is used to express probability and is not used in the definitive context. The present text provides more clear language and is more specific than the proposed language.
No substantiation is provided as to why the proposed language “or the controlled equipment enclosure” or the addition of cable as a wiring method should be accepted.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-83 Log #2617 NEC-P11 **Final Action: Reject**
(430.73)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Where a motor control circuit is likely to be subject to damage, the conductors shall be installed in an identified raceway, cable, or enclosure, or otherwise protected by identified means.
Substantiation: “Hazard” is not defined; is control circuit damage which prevents a sump pump operation a hazard? A hazard is irrelevant to the provision of 110.27(B) which applies generally and uses the term “likely to be” which is used in numerous sections. Raceways, cables, and enclosures should be identified for the use whether damage is physical or chemical. “Suitable” is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The term “hazard” is defined in Webster’s Dictionary as “ a source of danger” and is used as such in the present text, thus making the intent of this section more user friendly and enforceable.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-84 Log #1079 NEC-P11 **Final Action: Accept**
(430.74)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change “one side” to “one conductor”.
Substantiation: Edit.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DESJARLAIS, J.: Revision does not add clarity. The intent of the clause is to distinguish between grounded control circuit conductors and ungrounded control circuit conductors. Changing “one side” to “conductor” does not promote this intent. The term “one side” is the more correct term since multiple conductors can be used in one side of a circuit.

11-85 Log #2613 NEC-P11 **Final Action: Accept**
(430.74)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change “side” to “conductor”.
Substantiation: Edit. “Side” is vernacular, “conductor” is more appropriate.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DESJARLAIS, J.: Revision does not add clarity. The intent of the clause is to distinguish between grounded control circuit conductors and ungrounded control circuit conductors. Changing “one side” to “conductor” does not promote this intent. The term “one side” is the more correct term since multiple conductors can be used in one side of a circuit.

11-86 Log #3077 NEC-P11 **Final Action: Accept**
(430.74)

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
430.74 Electrical Arrangement of Control Circuits.
Where one side of the motor control circuit is grounded, the motor control circuit shall be arranged so that an ~~accidental ground~~ ground-fault in the control circuit remote from the motor controller will (1) not start the motor and (2) not bypass manually operated shutdown devices or automatic safety shutdown devices.
Substantiation: This proposal simply removes an undefined term and replaces with a term that is defined. This is consistent with work done in the 2008 cycle to clarify the use of grounding related terms.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-87 Log #1078 NEC-P11 **Final Action: Reject**
(430.75 Exception No. 2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "may" to "is likely to".
Substantiation: Edit. May is a term to be avoided per the Style Manual. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: Both "may" and "likely to" have a probability of occurring associated with them. According to the NEC Style Manual the word "likely" should be avoided. A definition of "likely" means a high probability, which in this case is not the same as "may". "May" as used in this context is correct and meets the requirements of 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-88 Log #1077 NEC-P11 **Final Action: Accept**
(430.81(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
"or cord connector" after "receptacle".
Substantiation: Portable motors may be supplied through a cord connector, and will be if equipped with a flanged surface inlet.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

11-89 Log #3341 NEC-P11 **Final Action: Reject**
(430.82(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Each controller shall be ~~capable of~~ identified for starting and stopping the motor(s) it controls and ~~shall be capable of~~ interrupting the locked-rotor current of the motor(s).
Substantiation: Edit. "Capable" is subjective. The provision should include multiple motors permitted to be controlled by one controller.
Panel Meeting Action: Reject
Panel Statement: The term "capable" is used many times throughout the code. When used in the context as an adverb it is defined as "having general efficiency and ability." The present text contains clear language and is more specific than the proposed language. The term "identified" is defined in Article 100 and relates to listings by testing agencies. The panel does not intend for a controller to control more than one motor unless the conditions of the applicable exceptions in 430.87 are met.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-90 Log #3340 NEC-P11 **Final Action: Reject**
(430.83(A)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
Where two or more motors are controlled by one controller the horsepower rating shall be determined in accordance with the provisions of 430.110(C).
FPN; See 610.51 for cranes and hoists.
Substantiation: Horsepower ratings determined by 430.110(C) generally result in a rating greater than the arithmetical addition of horsepowers. The same provisions for disconnecting means should apply to controllers are a type of disconnecting means and may be employed where overload protection is shunted or not provided. 610.51(B) modifies this provision.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are presently addressed by 430.87 Exception No. 1. The panel rejects the proposed new FPN. Section 90.3 addresses the submitters concerns as Chapter 6 supplements or modifies the general rules of Chapters 1 through 4.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-91 Log #601 NEC-P11 **Final Action: Reject**
(430.83(E), FPN)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add a new Fine Print Note as follows:
FPN: Motor controllers marked with a slash voltage rating are not intended for use on corner grounded delta, ungrounded or impedance grounded systems.
Substantiation: Where it is possible for full phase-to-phase voltage to be present across only one pole, such as may occur if phase "A" develops a fault-to-ground on a 480 volt, B-phase, corner grounded delta system, the ground-fault current may exceed the interrupting rating of the motor controller.
Panel Meeting Action: Reject
Panel Statement: The present code language in the second sentence presently addresses the submitter's concerns and the proposal would be redundant. In addition, the FPN contains mandatory language, which is not allowed by the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-92 Log #2391 NEC-P11 **Final Action: Accept**
(430.94)

Submitter: Thomas F. Mueller, Southern Company
Recommendation: In Article 430.94, change IX to VIII as follows:
430.94 Overcurrent Protection. Motor control centers shall be provided with overcurrent protection in accordance with Parts I, II and VIII of Article 240. "The ampere rating...".
Substantiation: Reference Comment 11-33 in the May, 2001 ROC and the appended Technical Correlating Committee Note. "In the 1999 NEC, Article 240 was written with Parts A, B, C...". During the code change process, Panel 11 adopted a change to 430.94 and incorrectly placed Part I of Article 240 as part of the new 430.94. The Technical Correlating Committee recognized that Part I was incorrect and stated that the correct Part should be Part H. Part H was changed to Part VIII in the 2002 NEC but the editors failed to pick up on that and thus replaced Part H with Part IX. Part IX of Article 240 deals with protection of over 600 volt equipment and, thus, should not be included in 430.94 as this equipment is detailed in 430.221ff. On the other hand, Part VIII of Article 240 deals with supervised industrial installations where the overwhelming majority of MCCs are properly found.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-93 Log #3407 NEC-P11 **Final Action: Accept in Principle**
(430.95)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
430.95 Service Equipment. Where used as service equipment, each motor control center shall be provided with a single main disconnecting means to disconnect all ungrounded service-entrance conductors. (The remaining text to be unchanged.)
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of "service drops" and "service laterals". Those, too, are utility installed extensions of the services. What comes after the "point of delivery" or "the point of connection" are "service-entrance conductors," either underground or overhead.
It is recognized, however, that the definitions of "service entrance conductors" (either overhead and/or underground) need to have the concept of "service point" added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of "Service Drop" and

"Service Lateral" are "by current definitions and code requirements, not limited to the 'utility company side of the service point'." These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as "Service Drop" and "Service Lateral") will clarify the application of NEC requirements.

By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

430.95 Service Equipment. Where used as service equipment, each motor control center shall be provided with a single main disconnecting means to disconnect all ungrounded service-entrance conductors. (The remaining text to be unchanged.)

Panel Statement: The panel accepts the proposed revision to insert the term "entrance" after "service" contingent upon Panel 4 acceptance of Proposal 4-10. This action based on the proposal and not the merits of the substantiation. This action is to be referred to the NEC Correlating Committee for review.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

COLE, T.: This is an attempt to redefine the point at which a service begins. The demarkation point of where the utility ends and the service begins is already well defined. Panel 1 rejected a similar proposal to 90.2 prior to Panel 11 voting on this proposal. Other panels also rejected similar proposals. This is now a correlation issue and should be rejected.

DESJARLAIS, J.: The proposed change does not add any clarity to the interpretation or readability of the NEC regarding the use of the term "Service." The submitter has not substantiated what value has been added by inserting the word "entrance".

11-94 Log #3655 NEC-P11 **Final Action: Reject**
(430.97(B))

Submitter: Donald A. Ganiere, Ottawa, IL

Recommendation: Revise text to read as follows:

(B) Phase Arrangement. The phase arrangement on 3-phase horizontal common power and vertical buses shall be so that when the leads of a phase rotation meter are connected A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the motor control center that the phase rotation meter shall indicate a clockwise rotation. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.

Substantiation: As this section is currently written it has no meaning. It appears that the intent is to require a clockwise rotation. If this is not the intent, then the section has no meaning as the terms A, B and C are only arbitrary terms and it should be deleted from the code.

Panel Meeting Action: Reject

Panel Statement: The added language does not enhance the safety to the installation. The NEC is not a design manual in accordance with 90.1(C).
This is consistent with sections 408.3(E) on panelboards and switchboards and 430.97(B) on motor control centers.
This section, as written, does provide a benefit. For example, it requires that the middle phase, the B-phase, be the phase with the higher voltage to ground, if such a situation exists.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-95 Log #1565 NEC-P11 **Final Action: Accept in Principle**
(430.102)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal and correlate with the action taken on Proposal 1-63.

This action will be considered by the panel as a public comment.

Submitter: Stanley J. Folz, Henderson, NV

Recommendation: Revise text to read as follows:

430.102 Location.

(A) Controller. An individual disconnecting means shall be provided for each controller and shall disconnect the controller. The disconnecting means shall be located in sight from the controller location.

Exception No. 1: For motor circuits over 600 volts, nominal, a controller disconnecting means ~~capable of being locked in the open position~~ shall be permitted to be out of sight of the controller, provided **the disconnecting means is lockable and the** controller is marked with a warning label **identifying** ~~giving~~ the location of the disconnecting means.

Exception No. 2: A single disconnecting means shall be permitted for a group of coordinated controllers that drive several parts of a single machine or piece of apparatus. The disconnecting means shall be located in sight from the controllers, and both the disconnecting means and the controllers shall be located in sight from the machine or apparatus.

Exception No. 3: The disconnecting means shall not be required to be in sight from valve actuator motor (VAM) assemblies containing the controller where such a location introduces additional or increased hazards to persons or property and conditions (a) and (b) are met.

(a) The valve actuator motor assembly is marked with a warning label giving the location of the disconnecting means.

(b) **The disconnecting means is lockable.** ~~The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.~~

(B) Motor. A disconnecting means shall be provided for a motor in accordance with (B)(1) or (B)(2).

(1) Separate Motor Disconnect. A disconnecting means for the motor shall be located in sight from the motor location and the driven machinery location.

(2) Controller Disconnect. The controller disconnecting means required in accordance with 430.102(A) shall be permitted to serve as the disconnecting means for the motor if it is in sight from the motor location and the driven machinery location.

Exception to (1) and (2): The disconnecting means for the motor shall not be required under either condition (a) or condition (b), provided the controller disconnecting means required in accordance with 430.102(A) is **a lockable disconnecting means.** ~~individually capable of being locked in the open position. The provision for locking or adding a lock to the controller disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.~~

Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.

A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(1) The valve actuator motor assembly is marked with a warning label identifying ~~giving~~ the location of the disconnecting means.

Panel Statement: The panel accepts the proposed revision contingent upon CMP 1's acceptance of proposed definition of "lockable". This action is to be referred to the Correlating Committee for review. In addition, the panel changed "giving" to "identifying" to correlate with other accepted changes in this section.

Number Eligible to Vote: 15

(430.102(B)(2)(b))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
In industrial <u>or commercial</u> installations...(remainder unchanged).
Substantiation: The provisions should be the determining factor, not the type of occupancy.
Panel Meeting Action: Reject
Panel Statement: Expanding this exception to commercial installations would decrease the level of safety intended to be provided by the main requirement of this section for disconnecting means. It is not the intent of Panel 11 to reduce the level of safety by expanding the exception for other than industrial installations.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-99 Log #1074 NEC-P11 **Final Action: Reject**
(430.103)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence:
The disconnecting means shall simultaneously open all ungrounded conductor of the ~~supply~~ branch circuit ~~and shall be designed so that no pole can be operated independently~~.
Substantiation: Edit. "All" supply conductors include feeder and service conductors.
Panel Meeting Action: Reject
Panel Statement: The panel intends that all supply conductors regardless of whether they are service, feeder, or branch circuit conductors be designed so that no pole can be operated independently. The proposal deletes language that provides clarity as to the operation of the disconnecting means.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-100 Log #1072 NEC-P11 **Final Action: Reject**
(430.104)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
The disconnecting means shall ~~plainly indicate~~ <u>be permanently and durable marked to indicate</u> whether in the open (off) or closed (on) position.
Substantiation: Marking should be required; an up or down position should not be an acceptable indication.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation that there are any field problems indicating that a change is needed. In many installations this is, in fact, an indication rather than a marking on the disconnecting means.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-101 Log #733 NEC-P11 **Final Action: Accept**
(430.109(F))

Submitter: Brian E. Rock, Hubbell Inc.
Recommendation: Add text to read as follows:
430.109 Type.
The disconnecting means shall be a type specified in 430.109(A), unless otherwise permitted in 430.109(B) through (G), under the conditions specified.
(F) Cord-and-Plug-Connected Motors. For a cord-and-plug-connected motor, a horsepower-rated attachment plug <u>or flanged surface inlet</u> and receptacle <u>or cord connector</u> having ratings no less than the motor ratings shall be permitted to serve as the disconnecting means. A horsepower-rated attachment plug <u>or flanged surface inlet</u> and receptacle <u>or cord connector</u> shall not be required for a cord-and-plug-connected appliance in accordance with 422.33, a room air conditioner in accordance with 440.63, or a portable motor rated 1/3 hp or less.
[remainder of 430.109 unchanged by this Proposal]
Substantiation: To eliminate confusion and uneven enforcement regarding cord connectors and flanged surface inlets (also known as motor caps) as an alternative to plugs and receptacles. Some draw a distinction between a cord connector and a receptacle or between an attachment plug and a flanged surface inlet, but many manufacturers' cord connectors employ the same contact carrier subassemblies as their flanged receptacles, and many manufacturers' flanged surface inlets employ the same plug blade carrier subassemblies as their attachment plugs. Some manufacturers eliminate commercially the terminology distinctions present in the NEC®: they identify cord connectors as female attachment plugs and the flanged surface inlets as male receptacles. As a consequence, where one manufacturer's cord connector is disallowed as a motor disconnect, another manufacturer's completely substitutable female attachment plug is permitted as a motor disconnect. 210.50(A) indicates that "a cord connector that is supplied by a permanently connected cord pendant shall be considered a receptacle outlet."
Panel Meeting Action: Accept

(430.109(F))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
"or cord connector" after "receptacle" in two places.
Substantiation: Cord connectors should be included in the provisions.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 11-101.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-103 Log #1861 NEC-P11 **Final Action: Reject**
(430.110(A) and Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: GENERAL. The disconnecting means for motor circuits rated 600 volts, nominal, or less, shall have an ampere rating not less than 115 percent of the <u>nameplate</u> full-load current rating of the motor, <u>and for motors rated more than one horsepower a current rating not less than the percentage specified in 430.32(A) for overload devices</u> Delete exception:...
Substantiation: Where overload devices permit a substantial current in excess of full load current such as for large motors, the disconnecting means should be rated for that current. Full load current should be derived from the nameplate rating since they may vary from the tables in Part XIV. To allow for temporary overload, 115 percent should be a minimum. "Less than 115 percent" does not establish a lower limit; 50 percent is lower.
Panel Meeting Action: Reject
Panel Statement: The present language requires the values in the tables be used to size the disconnecting means. This requirement and value consistently guarantees the disconnect is properly and safely sized for the present motor and future replacement motors. No technical information is provided as required by 4.3.3(d) of the Regulations Governing Committee Projects to substantiate deleting the exception.
Only overload protection is based upon nameplate current. Everything else is based upon table values. The intent of the submitter is not clear as "not less than 115 percent" is certainly greater than "50 percent".
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-104 Log #1071 NEC-P11 **Final Action: Reject**
(430.110(C)(2) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter portion...shall be permitted to have an ampere rating <u>not</u> less than <u>100</u> ~~115~~ percent...(remainder unchanged).
Add: FPN: See 430.128 for adjustable speed drive systems.
Substantiation: Edit. Present wording implies any value less than 115 percent is acceptable.
Panel Meeting Action: Reject
Panel Statement: The exception allows less than 115% for listed unfused motor circuit switches only when calculated in accordance with 430.110(C)(1). This calculation along with the listing of the motor circuit switch assures the sizing is adequate for the loads to be served.
The proposal and substantiation indicate that the submitter does not understand the meaning of "not less than". "Not less than 115 percent" has the same meaning as "115 percent or greater".
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-105 Log #2034 NEC-P11 **Final Action: Reject**
(430.110(C)(2) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
A listed motor-circuit switch having a horsepower rating ~~equal to or greater~~ <u>not less</u> than the equivalent horsepower of the combined loads, determined in accordance with 430.110(C)(1), <u>or a molded case switch</u> shall be permitted to have an ampere rating less than 115 percent <u>but not less than 100 percent</u> of the sum of all currents at the full-load condition.
Substantiation: A molded case switch is suitable for this exception. Less than 115 percent should have a lower limit of 100 percent.
Panel Meeting Action: Reject
Panel Statement: The exception does not apply to molded case switches, as these switches are not rated in horsepower. The listed motor circuit switches are applicable under the exception and are rated in horsepower.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-106 Log #2033 NEC-P11 **Final Action: Reject**
(430.113 and Exception No. 1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: MORE THAN ONE SUPPLY CIRCUIT. Motors and motor-operated equipment supplied by more than one circuit shall be provided with an identified disconnecting means for each supply circuit on or immediately adjacent to the motor or equipment. A permanent durable sign shall be provided on or immediately adjacent to multiple disconnecting means indicating the presence of other disconnecting means.

Exception No. 1: The disconnecting means shall not be required to be on or immediately adjacent to the motor or equipment if an identified disconnecting means is provided to disconnect the controller for the motor or equipment and has identified integral and permanent means for locking in the open (off) position.

Substantiation: “Source” is not defined; is it different circuits, panelboards, generators, services? Disconnecting means should be identified for the use (ratings, simultaneous disconnection of ungrounded conductors, etc.) “capable of being locked” does not impose specific requirements; proposal is specific and doesn’t allow for makeshift methods.
Panel Meeting Action: Reject
Panel Statement: No substantiation was provided that a field problem exists with the existing language. The proposal does not add clarity or improve readability.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-107 Log #3717 NEC-P11 **Final Action: Accept**
(430.122)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text and add FPN as follows:

430.122 Conductors — Minimum Size and Ampacity.

(A) Branch/Feeder Circuit Conductors. Circuit conductors supplying power conversion equipment included as part of an adjustable-speed drive system shall have an ampacity not less than 125 percent of the rated input current to the power conversion equipment.

FPN: Power conversion equipment can have multiple power ratings and corresponding input currents.

(B) Bypass Device. For an adjustable speed drive system that utilizes a bypass device, the conductor ampacity shall not be less than required by 430.6. The ampacity of circuit conductors supplying power conversion equipment included as part of an adjustable-speed drive system that utilizes a bypass device shall be the larger of either of the following:

(1) 125 percent of the rated input current to the power conversion equipment
(2) 125 percent of the motor full-load current rating as determined by 430.6.

Substantiation: Addition of current is for editorial purposes and to be consistent with 430-128.

This proposal clarifies current practice in that power conversion equipment may have multiple input ratings.

Equipment might have only one rating on the name plate. Additional ratings can be provided in the manufacturers instructions for use.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-107a Log #CP1102 NEC-P11 **Final Action: Accept**
(430.123)

Submitter: Code-Making Panel 11,
Recommendation: Revise text to read as follows:

430.123 Branch Circuit Short-Circuit and Ground Fault Protection.
(A) Drive Protection and Markings. The branch circuit short-circuit and ground-fault protection for a circuit supplying power conversion equipment shall be of the type and size specified by the manufacturer’s instructions provided with the power conversion equipment. When the instructions do not specify the type and size, a branch-circuit fuse or inverse-time circuit breaker shall be used and shall be sized based upon the input current rating of the power conversion equipment multiplied by the percentage from Table 430.52.

Exception No. 1: Additional branch circuit short-circuit and ground-fault protection is not required for power conversion equipment where provided with integral branch circuit rated protection such as: an inverse-time circuit breaker, branch-circuit fuses or semiconductor fuses, as provided in section 430.52(C)(5), in all ungrounded input conductors.

Exception No. 2: Unless specified in the manufacturer’s instructions supplied with the power conversion equipment, ”common dc bus” power conversion equipment is not required to have individual branch circuit protective devices installed in the dc input conductors.

(B) Drive and Bypass Protection. Where a branch circuit short-circuit and ground-fault protective device provides protection for both the adjustable speed drive system and a bypass circuit, the specific branch circuit protective device and its ratings or settings must not exceed those marked on the adjustable speed drive controller. Where the bypass circuit requires a different branch circuit short-circuit and ground-fault protective device, ratings or settings other than those marked on the adjustable speed drive controller, then separate branch circuit short-circuit and ground-fault protection shall be provided for both the adjustable speed drive controller and bypass circuit.
Substantiation: The panel has incorporated the intent of the submitters of both 11-108 and 11-110.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-108 Log #4405 NEC-P11 **Final Action: Accept in Principle**
(430.123)

Submitter: Jay Tamblingson, Rockwell Automation
Recommendation: Add new paragraph 430.123 as follows:

430.123 Branch Short-Circuit and Ground Fault Protection. The branch short-circuit and group fault protection for a circuit supplying power conversion equipment shall be of the type and size specified by the manufacturer’s instructions provided with the power conversion equipment. When the instructions do not specify the type and size, a branch-circuit fuse or inverse-time circuit breaker shall be used and shall be sized based upon the input current rating of the power conversion equipment multiplied by the percentage from Table 430.52.

Exception No. 1: Additional branch short-circuit and ground fault protection is not required for a power conversion equipment provided with integral inverse-time circuit breaker, branch-circuit, or semiconductor fuses in all ungrounded input conductors.

Exception No. 2: Unless specified in the manufacturer’s instructions supplied with the power conversion equipment, ”common dc bus” power conversion equipment is not required to have individual branch circuit protective devices installed in the dc input conductors.

Substantiation: Existing language in Article 430 does not specifically address how to select the branch circuit protection for power conversion equipment. As such, questions often arise as to acceptable types of devices and sizing. The proposed language is directly adapted from the language in UL 508A Paragraph 31.3.2 which provides the needed clarity.
Panel Meeting Action: Accept in Principle

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-110 Log #3960 NEC-P11 **Final Action: Accept in Principle**
(430.130 (New))

Submitter: Lori L. Tennant, Schneider Electric North America
Recommendation: Add new text as follows:

430.130 Branch Circuit Overcurrent Protective Devices.
(A) Drive Protection and Markings. The adjustable speed drive controller shall be protected by a branch circuit overcurrent protective device. Overcurrent protection shall be provided in accordance with the type of overcurrent device and the rating of the overcurrent device marked on the drive controller. Where a rating is not marked on the drive controller, overcurrent protection shall be provided in accordance with 430.52. The type of overcurrent protective device, its rating and setting may be marked on the adjustable speed drive controller or instruction literature referenced on the controller. In no event shall the rating or setting of the overcurrent protective device exceed that allowed by 430.52.
(B) Drive and Bypass Protection. Where a branch circuit overcurrent protective device provides protection for both the adjustable speed drive system and a bypass function, the specific branch circuit overcurrent protective device and its ratings or settings must not exceed those marked on the adjustable speed drive controller. Where the bypass function requires different overcurrent protective device, ratings or settings than those marked on the adjustable speed drive controller, then separate overcurrent protection shall be provided for both the adjustable speed drive controller and bypass function.

Substantiation: The selection of overcurrent protective devices used with adjustable speed drive controllers is unique as compare to presently described requirements found in section 430.52 which describes the allowable overcurrent protective devices for motor circuits and their ratings and settings. While the existing text is adequate for electromechanical motor starting equipment, adjustable speed drive controllers may have special requirements that preclude the use of certain or require different settings of the overcurrent protective devices.

The new section 430.130 will address the special requirements of the adjustable speed drive controller overcurrent protection functions.

Some protective devices found in section 430.52 may not be suitable for use with adjustable speed drive controllers or may require ratings or settings less than those found in section 430.52. Many adjustable speed drive controllers utilize power electronic conversion techniques instead or in addition to traditional electromechanical control devices. The power electronic conversion process utilizes semiconductor devices and therefore may have different protective coordination requirements.

Coordination of the overcurrent protective device for an adjustable speed drive controller considers the following points.

1. The ability to clear an external short-circuit at the motor output terminals of the drive controller.
2. The apparent transformation of current from the line to the motor terminals based on the power conversion process used in the drive controller. The continuous rated line current of the drive controller may be significantly different than the motor full-load current.
3. The ability to contain or limit the effects of a component breakdown in the internal circuitry of the drive controller when used in conjunction with appropriate enclosures or approach boundaries.

Panel Meeting Action: Accept in Principle

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-112 Log #682 NEC-P11 **Final Action: Accept**
(430.225(A) Exception)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise the Exception to 430.225(A) as follows:

Exception: Where a motor is ~~vital~~ critical to an operation ~~of the plant~~ and the motor should operate to failure…(the rest of the sentence is to remain unchanged.)

Substantiation: This proposal is the work of the "High Voltage Task Group" appointed by the Technical Correlating Committee. The task group consisted of the following members: Alan Peterson, Paul Barnhart, Lanny Floyd, Alan Manche, Donny Cook, Vince Saporita, Roger McDaniel, Stan Folz, Eddie Guidry, and Jim Dollard.

This proposal seeks to delete the phrase "vital to operation of the plant" and add the new word "critical" in the exception to 430.225(A) due to the fact that there is motor-driven machinery (over 600V) that is not located in a plant, but that must to operate to failure.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-113 Log #681 NEC-P11 **Final Action: Accept in Principle**
(430.225(B)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise text to read as follows:

430.225 Motor-Circuit Overcurrent Protection
(B) Overload Protection
(1) Type of Overload Device. Each motor shall be protected against dangerous heating due to motor overloads and failure to start by a thermal protector integral with the motor or external current-sensing devices, or both. A relay coordination study for each motor shall be performed under engineering supervision.

Substantiation: This proposal is the work of the "High Voltage Task Group" appointed by the Technical Correlating Committee. The task group consisted of the following members: Alan Peterson, Paul Barnhart, Lanny Floyd, Alan Manche, Donny Cook, Vince Saporita, Roger McDaniel, Stan Folz, Eddie Guidry, and Jim Dollard.

A relay coordination study should be performed to correctly size the protective relaying or thermal protectors based on the motor damage curves under qualified engineering supervision.

Selecting the proper overload and short-circuit protection for medium voltage motor circuits is much more complicated than for low voltage circuits. For medium voltage motor circuits, it becomes very critical for the overload relay to coordinate with the short-circuit protection because some short-circuit protective devices cannot safely open below certain multiples of their rating. In these overload cases the overload relay must open before the short-circuit protective device is asked to open. At the same time, the overload relay can not safely open beyond certain multiples of its rating, requiring the short-circuit protective device to open. This all requires the engineer to lay out the curves of both the overload relay and the short-circuit protective device and make sure that they are coordinated so that each opens only on levels of current for which it can safely open.

Panel Meeting Action: Accept in Principle
Revise text to read as follows:

430.225 Motor-Circuit Overcurrent Protection.
(B) Overload Protection.
(1) Type of Overload Device. Each motor shall be protected against dangerous heating due to motor overloads and failure to start by a thermal protector integral with the motor or external current-sensing devices, or both. Protective device settings for each motor circuit shall be determined under engineering supervision.

Panel Statement: The panel accepts the proposal in principle understanding the need for the determination of protective device settings under engineering supervision for motors over 600 volts. The revised text more accurately describes the process needed for proper motor circuit protection. These requirements will assist the AHJ to verify proper overload protection.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

HAMER, P.: We disagree with the committee action and the committee statement. This code section describes the purpose of an overload protection device as a means of preventing a motor overload condition and a failure to start a motor by means of the overload detecting device. Neither of these provisions require a relay coordination study to ensure that the motor overload protection method is coordinated with the motor overcurrent protection. Additionally, the previous section of the code, Article 430.225 (A) already requires "coordinated protection" to ensure proper overload and overcurrent protection. Furthermore, no substantiation has been presented to the panel to indicate that the existing requirements of Article 430.225 are contributing to electrical failures or injuries.

Comment on Affirmative:

DESJARLAIS, J.: A definition for engineering supervision should be considered for addition to Article 100.

Engineering Supervision - A process where by critical calculations, selection of components and decisions pertinent to the construction of the equipment under review are made with the collaboration of personnel trained in the relative discipline and the resulting decisions are acceptable to the AHJ.

WIDUP, R.: I agree with the panel action, but also think it is an important aspect for the AHJ to understand that "determining protective device settings" also includes function and system testing of the actual performance of the protective device settings (through fields testing is required if the owner is to be assured of a safe and reliable (motor) electrical power system. Merely setting it does not complete the process, you have to test it as well.

11-114 Log #1566 NEC-P11 **Final Action: Accept**
(430.227)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal and correlate with the action taken on Proposal 1-63.

This action will be considered by the panel as a public comment.

Submitter: Stanley J. Folz, Henderson, NV

Recommendation: Revise text to read as follows:

The controller disconnecting means. shall be **lockable.** ~~capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed~~.

Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.

A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."

Panel Meeting Action: Accept

Panel Statement: The panel accepts the proposed revision contingent upon Panel 1's acceptance of proposed definition of "lockable". This action is to be referred to the NEC Correlating Committee for review.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-115 Log #65 NEC-P11 **Final Action: Reject**
(430.243)

TCC Action: The Technical Correlating Committee understands that the "statement on Proposal 11-116" refers to the substantiation in Proposal 11-116.

Note: This Proposal appeared as Comment 11-35 on Proposal 11-87 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11=87 was:

Revise as follows:

The frames of portable motors supplied by a premises wiring system ~~that operate at over 150 volts to ground~~ shall be ~~guarded or~~ grounded unless guarded or isolated from contact.

Submitter: Charles A. Goetz, Underwriters Laboratories Inc.

Recommendation: Revised from 2005 edition as follows:

430.243 Portable Motors. The frames of portable motors supplied by a premises wiring system ~~that~~ and operate at 50 V or more ~~over 150 volts to ground~~ shall be ~~guarded or~~ grounded unless guarded or isolated from contact.

~~FPN No. 1: See 250.114(4) for grounding of portable appliances in other than residential occupancies.~~

FPN ~~No. 2~~: See 250.119(C) for color of equipment grounding conductor.

Exception No. 1: Listed motor operated tools, listed motor operated appliances, and listed motor operated equipment shall not be required to be grounded where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.

Exception No. 2: Listed motor operated tools, listed motor operated appliances, and listed motor operated equipment connected by a cord and attachment plug other than those required to be grounded in accordance with 250.114.

Substantiation: Acceptance of proposal 11-87 during the ROP meeting will require motor frames on all portable motor operated appliances, which must comply with Article 430 as noted in Section 422.3, to be grounded regardless of the use voltage, the intended use or listing for the purpose. By eliminating the voltage requirement, all portable motors are affected including those that operate at 50V or less where the revision imposes a higher level of compliance for motor frames than currently stated in section 430.232 for live parts. The revision to section 430.243 effectively supercedes the current section 250.114 which would otherwise cover cord and plug connected equipment operating at 150V to ground or less. Currently listed motor operated appliances operating at not more than 150V to ground and that do not involve water or use in wet locations may be connected by a two conductor cord and attachment plug. The listing requirements for such appliances operating at 150V or less to ground require leakage currents available at accessible metal parts to be monitored during various operating conditions including, in some cases, high humidity conditions, and to not exceed prescribed limits in the product Standards. The substantiation for proposal 11-87 did not indicate any problems with specific portable motors that necessitated the revision. The requirements in Section 250.114 appropriately cover grounding for residential and non-residential applications of motor operated appliances.

In addition, (portable) equipment, connected by a cord and plug, can be double insulated, which is neither grounded nor guarded, and would not comply with the revised section 430.243. The current section 250.114 permits listed double insulated equipment to be utilized without need for grounding, guarding or isolation.

To address these issues, the recommended text for 430.243 has been revised to (1) include provision to omit grounding for frames of motors rated 50V or less; (2) add exception for listed double insulated equipment similar to the current exception to 250.114; and (3) add exception to refer to section 250.114 for listed motor-operated appliances, and delete Fine Print Note 1.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 11-116.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-116 Log #2260 NEC-P11 **Final Action: Accept**
(430.243)

Submitter: Robert G. Fahey, City of Janesville

Recommendation: This proposal maintains existing 2008 NEC requirements.

Substantiation: This Code proposal is a result of Report on Comment 11-35 submitted by the Technical Correlating Committee. This proposal was crafted by Task Group 2-4, members included Chairman, Wayne Brinkmeyer (CMP 11), Jeff Desjarlais (CMP 11), Bob Fahey (CMP 11), Doug White (CMP 5) and Greg Steinman (CMP 5).

The Code language located in 430.243 is recommended to remain as presently written in the 2008 NEC in order to correlate with similar Code language in 250.114, as these Code sections relate to the minimum voltage of 150 volts to ground. By reducing the voltage to 50 volts or more to ground, this would encompass essentially all electrical products used in residential, commercial and industrial applications. The majority of these types of products are constructed in accordance with existing safety product standards, and in most cases certified by third parties. In commercial and residential applications the majority of products, except as noted in (3) and (4) of 250.114 are connected to the voltage source via two-prong attachment plugs. The existing standards to which these products are evaluated adequately address shock hazards.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-117 Log #2015 NEC-P11 **Final Action: Accept in Part**
(430.245)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete first paragraph, (A) and (B) and substitute:

(A) Terminal Housings. Where the supply circuit conductors to motor terminals are field-installed, junction boxes or enclosures to house motor terminals shall be provided.

(B) Separation of Junction Box from Motor. The junction box specified in 430.245(A) shall be permitted to be separated from the motor by not more than 1.8m (6ft) provided the leads to the motor are stranded within a flexible cord or cable identified for the use. Type AC cable, Type MC cable or an identified raceway and each strand of the conductors is not larger than 10 AWG.

Substantiation: The first paragraph is already covered by Article 250. The provisions of (A) should apply to field-wired motors whether or not fixed. Section 430.12 (A) implies some motors do not have terminal housings e.g., hot water circulating pumps, exhaust blowers for gas-fired water heaters which have integral factory installed flexible supply cords with no terminal housings. Flexible cords are permitted by 400.7 (A)(9), 501.140, 502.10, 503.10, etc.

Panel Meeting Action: Accept in Part

Revise 430.245(A) to read:

(A) Grounding Through Terminal Housings.
Where the wiring to motors is metal-enclosed cable or in metal raceways, junction boxes to house motor terminals shall be provided, and the armor of the cable or the metal raceways shall be connected to them in the manner specified in Article 250.

Panel Statement: The reference to Article 250 in the first paragraph is general to the entire section and provides the intent of the section. The panel has removed "fixed" in paragraph (A) as suggested by the submitter. The panel rejects the revised language for paragraph (B) as the present language provides clarity as to the intent of this section; this section applies to motors with permanent wiring methods.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-118 Log #1906 NEC-P11 **Final Action: Reject**
(430.245(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise (A): Where the wiring to fixed motors is metal-covered cable or in metal raceways, metal junction boxes or metal terminal housings to house for motor terminals shall be provided and bonded to the motor frame and the armor of the cable or the metal raceways in the manner specified in Article 250.

Revise latter part of first paragraph of (B):...or are stranded leads enclosed in liquidtight flexible metal conduit, <u>liquidtight flexible nonmetallic conduit,</u> flexible metal conduit, intermediate metal conduit, rigid metal conduit, <u>rigid nonmetallic conduit,</u> or electrical metallic tubing not smaller than metric designer 2 (trade size 3/8), <u>where these wiring methods are identified for the use.</u> ~~The armor or raceway being connected to the motor and to the box.~~

Delete the second paragraph.
Substantiation: Edit. Proposal incorporates the second paragraph. Stranded leads are required in the first paragraph. Connect of grounding conductors is covered elsewhere in the Code and apply.
Panel Meeting Action: Reject
Panel Statement: The present layout within (B) provides the user a separate paragraph for the nonmetallic conduits, which provides more clarity than does the proposed layout of the rules. The additional proposed text is not necessary as the permitted and not permitted uses are specified with the respective article.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-119 Log #3787 NEC-P11 **Final Action: Reject**
(Table 430.248)

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Add new text to read as follows:

<u>Include a column for 277 volt single-phase motors. The value of current can be calculated as follows:</u>

$$I = \frac{IP \times 746}{E \times COS\theta \times \frac{\%Eff.}{100\%}}$$

<u>where: E = 277v, COSΦ = power factor, H = Horsepower</u>
Substantiation: Current values for 277 volt, single phase AC motors are needed for engineers to properly size branch circuit wiring to such motors.
Panel Meeting Action: Reject
Panel Statement: The proposed language is not consistent with the layout of the present tables in Article 430 with the amperage values listed. The panel encourages the submitter to provide text similar to the present tables and provide technical documentation with the proposed amperage for 277 volt motors.
Number Eligible to Vote: 15

Recommendation: Change “Table 310.16 through Table 310.19” to “Table 310.15(B)(1) through Table 310.15(B)(4)”.
Substantiation: This revision will correlate with the proposal to revise the table designation of Tables 310.16 through 310.21 as Tables 310.15(B)(1) through 310.15(B)(6) to comply with 2.3.1 of the NEC Style Manual.
Panel Meeting Action: Accept
Panel Statement: The panel accepts this proposal based on the action of Panel 6 to change the numbering of the Tables in Article 310.
The panel refers this action to the NEC Correlating Committee for correlation based on Panel 6 action.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-121 Log #4245 NEC-P11 **Final Action: Reject**
(440.9)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 440.9 in Part I.

<u>440.9 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:</u>

<u>(1) Equipment listing or labeling</u>

<u>(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation</u>

<u>(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer’s self-evaluation or an owner’s engineering judgment</u>
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV’s, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of “other” options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be “approved”, it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: The proposal limits the ability of installing and constructing electrical equipment. The authority having jurisdiction already has the authority to require listing of electrical equipment through NEC sections 90.4, 90.7, and 110.2.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
FAHEY, R.: The action on this proposal requiring air conditioning and refrigeration equipment be listed should have been to accept. The acceptance of this proposal would improve electrical safety, and assure the AHJ this equipment is manufactured properly and safely. As of this date, the majority of this equipment utilized in residential, commercial and industrial applications is listed. The concern was regarding larger specialty equipment used in large industrial applications. Although present Code sections 90.7, 110.2 and 110.3(A) do allow the AHJ to require a product be listed, the proposed language would directly allow and greatly enhance the ability of the AHJ, as this proposal directly addresses the listing of air conditioning and refrigeration equipment. Panel members had a concern with the larger equipment where the air conditioners and refrigeration equipment are specifically manufactured for a particular application; this equipment is typically installed in large industrial facilities where the product could be field evaluated by a recognized testing agency for these special and limited situations. Overall, this proposal will add safety to the electrical system and assure the AHJ, the end user and the manufacturers of air conditioning and refrigeration equipment, that this equipment which is manufactured worldwide would be required to comply with the same standard of safety.

11-124 Log #4248 NEC-P11 **Final Action: Reject**
(440.9)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 440.9 in Part I.
440.9 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-123.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-125 Log #4249 NEC-P11 **Final Action: Reject**
(440.9)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new section 440.9 in Part I.
440.9 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-123.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-126 Log #2237 NEC-P11 **Final Action: Accept**
(440.14, FPN (New))

TCC Action: The Technical Correlating Committee directs that the panel reconsider its action on this proposal since there is no need to duplicate 110.26 in accordance with 4.1 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Michael Dempsey, Municipal Code Inspections
Recommendation: Add new FPN as follows:
440.14 Location.
FPN: See 110.26.
Substantiation: Just a reminder that 440.14 must still comply with 110.26.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
SAUNDERS, L.: Adequate substantiation has not been provided for the addition of the reference. The requirements of "110.26 Spaces About Electrical Equipment" already apply to this section.

11-127 Log #1567 NEC-P11 **Final Action: Accept**
(440.14 Exception No. 1)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal and correlate with the action taken on Proposal 1-63.
This action will be considered by the panel as a public comment.
Submitter: Stanley J. Folz, Henderson, NV
Recommendation: Revise text to read as follows:
Exception No. 1: Where ~~the~~ **a lockable** disconnecting means **is** provided in accordance with 430.102(A) ~~is capable of being locked in the open position,~~ and the refrigerating or air-conditioning equipment is essential to an industrial process in a facility with written safety procedures, and where the conditions of maintenance and supervision ensure that only qualified persons service the equipment, a disconnecting means within sight from the equipment shall not be required. ~~The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker and shall remain in place with or without the lock installed.~~
Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.
A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."
Panel Meeting Action: Accept

Panel Statement: The panel accepts the proposed revision contingent upon Panel 1's acceptance of proposed definition of "lockable". This action is to be referred to the correlating committee for review.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-128 Log #1801 NEC-P11 **Final Action: Reject**
(440.14 Exception No. 1)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Where the disconnecting means provided in accordance with 430.102(A) ~~is capable of~~ <u>has identified integral and permanent means for</u> being locked in the open <u>(off)</u> position, and the refrigeration or air-conditioning equipment is essential to the industrial <u>or commercia</u>l process in a facility with written safety procedures, and where the conditions of maintenance and supervision assure that only qualified persons service the equipment, a disconnecting means within sight of the equipment shall not be required.
Delete remainder.
Substantiation: Commercial facilities such as meat packing and storage should be included. Proposal for locking is specific and prohibits makeshift methods.
Panel Meeting Action: Reject
Panel Statement: The term "capable" is used many times throughout the code. When used in the context as an adverb it is defined as "having general efficiency and ability." The present text contains clear language and is more specific than the proposed language. The term "identified" is defined in Article 100 and relates to listings by testing agencies. The panel does not feel the expansion of this exception to commercial applications will provide a safe installation, the panel believes facilities such as meat packing plants would be an industrial process as covered in the present exception.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-129 Log #2053 NEC-P11 **Final Action: Accept in Principle**
(440.15 (New))

TCC Action: Technical Correlating Committee directs that this proposal be referred to Code-Making Panels 5, 7, and 8 for information.
Submitter: Chuck Rende, City of Park Ridge
Recommendation: Add new text to read as follows:
<u>Any wiring method employed shall contain an insulated coper equipment grounding conductor sized in accordance with 250.122. This grounding conductor shall extend from the panel upstream of the disconnect, bond to the disconnect and continue to the AC unit.</u>
Substantiation: (1) Consumer Product Safety Commission data for electrocutions due to Air Conditioners:
2000 = 10
2001 = 14
2002 = 8 (Latest information found)
(2) 2007: Boy in Chicago Area Electrocuted by AC (to fence).
(3) Concentric K.O.s on disconnects, loose fittings, and broken down conduit systems in a damp area lack for adequate safety. Photo 1&2.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Add new section 440.9 to read as follows:
<u>**440.9 Equipment Grounding.** Any wiring method employed shall contain an equipment grounding conductor in accordance with 250.118(1).</u>
Panel Statement: The panel has reworded the proposal to better align with other Chapter 4 articles in a clear manner. The action on the proposal better addresses the submitter's concerns by the rewording and relocation of the requirement.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 11 Negative: 4
Explanation of Negative:
BUNCH, R.: This should be rejected and continue to allow grounding per 250.188 requirements. The substantiation data is such that you don't know if the air conditioners were window units with the ground wire defeated for example. Likewise the one example could have had the same problem with a separate conductor not properly installed. Mandating a grounding conductor does not address either of these potential causes for the cited problems. Further, this section covers disconnects for all refrigeration and air conditioning equipment (indoor and outdoor). The change says "... to the AC unit." so we would be applying a special requirement which overrides 250.118 just for air conditioners. This does not appear justified based on the data provided.
DESJARLAIS, J.: Proposed revision eliminates currently accepted means of grounding equipment noted in 250.118.
TODD, L.: Documentation sent with the proposal only covers outdoor ground mounted Air Conditioning units. The accepted proposal goes into all product covered by Article 440 no matter where located. In addition the problem is a maintenance issue/installation issue and if maintained the original grounding would have been sufficient.
WRIGHT, J.: The Technical Correlating Committee should refer this Proposal to Panels 7 and 8 because these Panels have responsibility for acceptance of wiring methods as equipment grounding conductors.
Comment on Affirmative:
COLE, T.: During the discussion of this proposal numerous panel members confirmed their experience in noting that conduit installed on top of a roof is subject to damage and it is very easy for the conduit to become separated which affects the integrity of the grounding system. There are State jurisdictions that already require a separate ground in conduit installed on a roof top. Safety definitely would be enhanced by accepting this proposal. The panel's actions were correct in accepting this proposal in principal.
GLOVER, W.: The panel action was an appropriate remedy for an equipment grounding problem that exists with residential and commercial air conditioning installations. The supporting documentation identified a problem that exists with these residential and commercial installations but there was no evidence presented that the existing practices in industrial installations should be modified by this new code section. Typical industrial refrigeration units involve large motors whose installation does not require a local disconnect switch (440.14 Exception No. 1) and therefore the cited equipment grounding problem does not exist and the substantiation does not apply. The equipment grounding requirements of 250.118 should continue to apply to industrial installations and the following exception should be included:
<u>Exception: In industrial installations with written safety procedures and where the conditions of maintenance and supervision insure that only qualified persons service the equipment, provisions of 250.118 shall apply for equipment grounding.</u>

11-130 Log #191 NEC-P11 **Final Action: Reject**
(440.22(A) Exception No. 2 (New))

Submitter: Bryan P. Holland, City of North Port
Recommendation: Add an exception to read as follows:
Exception No. 2: Where the valves for branch-circuit short-circuit and ground-fault protective devices determined by 440.22(A) do not correspond to the standard size, the next higher overcurrent device rating shall be permitted to be used as permitted in 240.4(B), but shall not exceed 440.22(C).
Substantiation: It is unclear if the general allowance of 240.4(B) applies to Article 440 equipment. The last sentence in Section 440.21 implies it does not. Like for motors and other similar equipment, this exception provides more flexibility without reducing safety or the protection of the branch-circuit conductors.
Panel Meeting Action: Reject
Panel Statement: Section 440.22(A) addresses individual motor compressors and already permits the branch-circuit short-circuit and ground-fault protective device to be increased to 225 percent if the 175 percent is not sufficient for motor starting. The submitter has not provided technical substantiation to show a need to apply section 240.4(B).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-131 Log #2565 NEC-P11 **Final Action: Reject**
(440.22(B) Exception (New))

Submitter: Brian J. Dolan, IBEW/NECA Technical Institute
Recommendation: Add the following next text to 440.22(B)
Exception: Where the circuitry is interlocked so as to prevent simultaneous operation of the motor-compressor(s) and all other loads connected, the branch-circuit short-circuit and ground fault protection shall be determined from the load requiring the largest overcurrent protective device at a given time.
Substantiation: 440.12(B) permits the rating of the disconnecting means to be based on the largest simultaneous load. 440.33 and 440.34 permit conductor sizes to be based on the largest load at a given time. There is, however, no similar language for overcurrent protective devices. For example, a roof top unit with a motor-compressor load of 100 amperes and an electric heat load of 100 amperes would require an overcurrent device in excess of 200 amps even though the loads are noncoincident. Sizing the overcurrent device for the largest noncoincident load would add consistency to the requirements of Article 440 and Article 220.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are addressed in 430.53. The proposal describes a group installation and as a result 430.53(C)(4) as referenced by 440.22(B)(2) is required to be applied. The panel acknowledges that the ground-fault short-circuit protection for motors might be greater than is permitted for other loads in accordance with Article 240.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BUNCH, R.: This should be accepted. We allow for the disconnect and conductors to be sized per the largest load with the appropriate 125% factors. We also allow for conductor selection for interlock circuits in 430.24 exception 3. Accepting this would recognize the largest load for the BCSC and ground fault protection and in effect be based of a smaller load, providing added equipment and personnel safety.

11-132 Log #2014 NEC-P11 **Final Action: Accept in Part**
(440.34)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute: Conductors supplying a motor compressor load in addition to other load shall have an ampacity not less than required in 440.33 plus the other calculated load. Exception No. 1: Where the circuitry is interlocked to prevent simultaneous operation of the motor compressor(s) and all other loads, the required conductor ampacity shall be determined in accordance with 440.32 or 440.33 as applicable. Exception No. 2: Where conductors supply a motor-compressor(s), motor(s) and continuous load, they shall have an ampacity not less than 125 percent of the full-load current of the largest motor, the largest rated load or branch circuit selection current, or the continuous load, whichever is greater.
Substantiation: "Sufficient" is subjective and a term to be avoided per the Style Manual. Other loads cover lighting, appliances, motors, etc. Where a 125 percent ampacity is required for continuous load, the 125 percent ampacity requirement for motor compressors also applies, which is excessive since 125 percent ampacity for the motor-compressor or continuous load, whichever is greater, allows for overload current permitted by overload protection and heating at terminals and overcurrent devices from continuous current.
Panel Meeting Action: Accept in Part
Revise text to read as follows:
440.34 Combination Load.
Conductors supplying a motor-compressor load in addition to ~~a lighting or appliance~~ other load as calculated from Article 220 and other applicable articles shall have an ampacity sufficient for the ~~lighting or appliance~~ other load plus the required ampacity for the motor-compressor load determined in accordance with 440.33 or, for a single motor-compressor, in accordance with 440.32.
Panel Statement: The panel accepts the proposed change of the term "a lighting or appliance load" with "other load(s)" to be consistent with Article 220, specifically 220.18(A). The panel rejects the remainder of the proposal. The term "sufficient" is used many times throughout the code, and as used in this section accurately it describes the intent. The proposed revision in regards to the 125 percent requirements are not substantiated and does not improve the usability of this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
BUNCH, R.: Vote affirmative with panel action but want to clarify that the exception is still part of the section. It is not in the change but the action of AinP deals only with the struck and added text in the main section.

11-133 Log #3283 NEC-P11 **Final Action: Accept in Part**
(440.34)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Conducts supplying a motor-compressor load in addition to other load(s) ~~a lighting or appliance load~~ as calculated from Article 220 and other applicable articles, shall have an ampacity ~~sufficient~~ not less than calculated for the ~~lighting and appliance~~ other load(s) plus the required ampacity for the motor-compressor load determined in accordance with 440.33, or, for a single motor-compressor, in accordance with 440.32. Where the other load(s) is a continuous load the 125 percent ampacity requirement for continuous load and largest motor load shall only be required to apply to the largest of such loads.
Substantiation: A feeder may supply other loads which are not lighting and appliance loads such as motors. "Sufficient" is subjective and a term to be avoided per the Style Manual. The 125 percent ampacity requirement for continuous load and largest motor should apply to only the largest since it allows for temporary overcurrent (overload) of the motor-compressor and the effects of continuous load on overcurrent devices and terminals.
Panel Meeting Action: Accept in Part
Revise text to read as follows:
440.34 Combination Load.
Conducts supplying a motor-compressor load in addition to other load(s) ~~a lighting or appliance load~~ as calculated from Article 220 and other applicable articles, shall have an ampacity sufficient for the ~~lighting and appliance~~ other load(s) plus the required ampacity for the motor-compressor load determined in accordance with 440.33, or, for a single motor-compressor, in accordance with 440.32.
Panel Statement: The panel accepts the proposed change of the term "a lighting or appliance load" with "other load(s)" to be consistent with Article 220 specifically 220.18(A). The panel rejects the remainder of the proposal. The term "sufficient" is used many times throughout the code, and as used in this section accurately as it describes the intent. The proposed revision in regards to the 125 percent requirements are not substantiated and does not improve the usability of this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
BUNCH, R.: See my affirmative comment on Proposal 11-132.

11-134 Log #1802 NEC-P11 **Final Action: Reject**
(440.41(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: A motor-compressor controller shall have research papers, fire experience, etc. If more than 200 words, it may be abstracted for publication.)
Revise: A motor-compressor controller shall have both a continuous duty full-load current rating and a locked-current rating not less than the nameplate rated-load current or branch circuit selection current, whichever is greater, and locked-rotor current, respectively of the compressor, or be rated in horsepower in accordance with 430.110.
Substantiation: The first sentence has current requirements without exception; the second sentence implies there are no current ratings; which governs?
Panel Meeting Action: Reject
Panel Statement: It is unclear as to what the submitter is asking for in the first paragraph. The existing first sentence requires the controller be rated for the full load current and locked rotor current of the compressor. The second sentence allows the controller to omit these values if rated only in horsepower. Therefore, the present text adequately addresses the submitter's concerns.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-135 Log #2013 NEC-P11 **Final Action: Reject**
(440.51)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "branch circuit" to "supply".
Substantiation: Edit. The specified devices, while intended to protect branch circuit conductors from overheating, may also provide protection for other supply conductors depending on their ampacity and the load carried.
Panel Meeting Action: Reject
Panel Statement: The overload protective device is typically located in the branch circuit, downstream from the feeder or service conductors, and therefore cannot offer protection for these other supply conductors. It cannot protect for problems that occur on its line side.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-136 Log #2600 NEC-P11 **Final Action: Accept**
(440.55(B))

Submitter: Dan Leaf, Seneca, SC

(440.63)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text: "or cord connector" after "receptacle".
Substantiation: Edit. Cord connectors should be included.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-138 Log #3683 NEC-P11 **Final Action: Reject**
(440.63)

Submitter: Richard F. VanWert, Middle Department Inspection Agency
Recommendation: Revise text as follows:
...and located within 1.8 m (6 ft) of the floor ~~or (2) and approved manually operable disconnecting means is installed in a readily accessible location within sight from the room air conditioner.~~
Substantiation: ~~(2) an approved manually~~ etc. should be removed because it makes no sense. It is not required to have two disconnects, i.e., cord and plug in addition to a manually operable disconnecting means. It is only required to have one or the other.
Panel Meeting Action: Reject
Panel Statement: The intent of this section is to allow the unit to be turned off from a readily accessible location on the unit or within sight of the unit, thus eliminating the load before disconnecting the attachment plug from receptacle.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 445 — GENERATORS

13-3 Log #4415 NEC-P13 **Final Action: Accept in Principle**
(445.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.
Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
445.1 Scope.
This article covers the ~~installation~~ location, marking, overcurrent protection, internal bushing requirements, terminal housings and disconnecting means for generators and the ampacity of conductors from the generator terminal to the first disconnecting means with overcurrent protection.
Substantiation: Article 445 does not cover the installation of generators, as much as it covers the location, marking, overcurrent protection, ampacity sizing of conductors from the terminal housings to the disconnecting means incorporating overcurrent protection. Making this change to the scope will more accurately describe the coverage of Article 445, rather than describing the article as only the requirements for installation of generator.
This proposal was developed by a Task Group composed of Task Group Chairman Paul Casparro and Chair of Panel 3 (NJATC); Jim Wiseman at Square D Schneider-Electric and Panel 15 (NEMA); John R. Kovacik with Underwriters Laboratories, Panels 10, 13 and the NEC TCC (UL); Richard Owen with City of St Paul, Minnesota, Panel 3, and the NEC TCC (IAEI); and Mark C. Ode with Underwriters Laboratories, Panels 3, 13, and the NEC TCC (UL).
Panel Meeting Action: Accept in Principle
This article contains installation and other requirements for generators.
Panel Statement: The panel action provides a more general statement than recommended. This would preclude having to revise the scope each time new requirements are added to the article. The committee understands that scope statements are the responsibility of the NEC TCC and recommends that they accept this action.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-4 Log #4240 NEC-P13 **Final Action: Reject**
(445.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
445.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

Panel Statement: See the panel action and statement on Proposal 13-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-5 Log #4241 NEC-P13 **Final Action: Reject**
(445.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
445.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject

13-6 Log #4242 NEC-P13 **Final Action: Reject**
(445.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
445.5 Equipment Approval. The equipment required or permitted by this Article after December 31, 2016 shall be acceptable only if listed.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, the proposed text requires listing of all equipment covered by this Article by a qualified testing agency as defined in Article 100. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation and listing of that equipment.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-7 Log #4243 NEC-P13 **Final Action: Reject**
(445.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
445.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if listed.
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval. While some equipment historically has not been listed, a basis for approval of this equipment is needed. Very few enforcement agencies have internal equipment evaluation departments with access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-8 Log #4244 NEC-P13 **Final Action: Reject**
(445.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
445.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: The recommended text is unnecessary based on existing requirements in 90.7, 110.2, and 110.3. Section 110.2 already states that electrical equipment or conductors required or permitted by the NEC must be approved so repeating this text is unnecessary. Section 90.4, as well as 90.7, provides a method for the authority having jurisdiction (AHJ) to use "listing" as a means of accepting electrical equipment, especially where the AHJ does not have access to the listing standards, does not have the qualifications, or does not have the time for evaluation of the electrical equipment. Where electrical equipment is one of a kind or not listed at time of installation, Sections 90.4 and 90.7 permit field equipment evaluation, making this text unnecessary.
Permitting manufacturer's self-evaluation or an owner's engineering judgment may permit equipment to be installed as unevaluated, untested, and uninspected equipment to be installed since many states only have electrical inspection in the major metropolitan areas, not counties or unincorporated areas.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-9 Log #366 NEC-P13 **Final Action: Reject**
(445.11)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as follows:
"rated revolutions/minute ~~revolutions per minute~~"
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The context in which "per" is used is acceptable in accordance with the NEC Style Manual list of acceptable terms.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-10 Log #3909 NEC-P13 **Final Action: Reject**
(445.11)

Submitter: Eugene F. Swisher, City of Tampa / Rep. Tampa Area Apprenticeship Training
Recommendation: Add the following new sentence at end of paragraph:
The manufacturer's nameplate shall also include the minimum distance from combustible materials and the minimum distance from door and window openings.
Substantiation: With the dramatic increase in the use of permanently installed whole house generator systems, I find many of them installed in close proximity to door and window openings, thus, allowing hazardous amounts of exhaust fumes to enter the house. Also, if hot exhaust is too close to combustible material (wood siding) it is a fire hazard.
Panel Meeting Action: Reject
Panel Statement: The location of the generator should remain with the engineer, the installer, and the authority having jurisdiction as a field decision based on the construction of any structures as well as the type and amount of fuel stored in or with the generator. Generators are built for various types of fuel and various exhaust system configurations. Each different fuel and exhaust configuration may require a different distance from combustible materials and from window and door openings so providing manufacturers' data for all the possible distances would be almost impossible. In addition, the various types of construction may combine noncombustible materials, such as block or brick, with combustible frames for doors and windows. The location of the generator should remain with the engineer, the installer, and the authority having jurisdiction as a field decision based on the construction of any structures as well as the type and amount of fuel stored in or with the generator.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-11 Log #3146 NEC-P13 **Final Action: Accept in Part**
(445.12)

Submitter: Rick Lorenz, Cummins Power Generation
Recommendation: Revise text to read as follows:
445.12 Overcurrent Protection
(A) Constant-Voltage Generators. Constant-voltage generators, except ac generator exciters, shall be protected from ~~overload~~ overcurrent by ~~inherent design,~~ circuit breakers, fuses, protective relays or other acceptable overcurrent protective means suitable for the conditions of use.
445.13 Ampacity of Conductors
Exception: ~~*Where the design and operation of the generator prevent overloading, the ampacity of the conductors shall not be less than 100 percent of the nameplate current rating of the generator.*~~ *When design of the generator incorporates listed overcurrent protection, ampacity of the conductors shall not be less than 100 percent of the rating of the overcurrent device.*
Substantiation: With the advent of boosted excitation systems it is now possible for modern constant voltage generators to produce current over time in excess of generator and conductor thermal damage curves, unlike shunt excited generators produced in the past. The recommended change would also make generator feeder conductor protection consistent with feeder overcurrent protection in Article 215 and Article 240.
Panel Meeting Action: Accept in Part
The panel accepts in part the recommended revision of 445.12(A) and the resultant text is to read as follows:
(A) Constant-Voltage Generators. Constant-voltage generators, except ac generator exciters, shall be protected from ~~overload~~ overcurrent by inherent design, circuit breakers, fuses, protective relays, or other acceptable overcurrent protective means suitable for the conditions of use.
The panel rejects the recommendation to revise the exception to 445.13.
Panel Statement: The panel does not accept the deletion of "inherent design" from 445.12(A) because this is a protective technique currently employed by generator manufacturers. The panel rejects the changes to the exception in 445.13 because there has been no technical substantiation presented to change the rating from 100 percent of the nameplate of the generator to 100 percent of the overcurrent protective device. The conductors do not have overcurrent protection on the line side of the overcurrent protective device and may have to

carry the full value of the generator rating.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-12 Log #2596 NEC-P13 **Final Action: Reject**
(445.12 Exception to (A) through (E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text: "or damage to equipment or process" after "greater hazard to persons".
Substantiation: Edit. The provision should also apply where failure to operate would cause damage to equipment or processes.
Panel Meeting Action: Reject
Panel Statement: The submitter has failed to provide any technical substantiation to support the recommendation. The exception covers installations where generators should be permitted to operate to failure to prevent a greater hazard to people, not to equipment or processes. This section does not deal with failure to operate. For example, where a generator is providing power to a critical branch for an operating room in a hospital, installing an overload-sensing device that would shut the generator down during an overload would endanger the patient. This exception permits an annunciator to be installed that would provide an alarm rather than shutting the system down.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-13 Log #1009 NEC-P13 **Final Action: Reject**
(445.12(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "acceptable" to "identified".
Substantiation: Edit. Acceptable is not the same as identified.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation to support the recommendation. The submitter's use of the term "identified" is incorrect in the context of this requirement. The correct word is "acceptable".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-14 Log #457 NEC-P13 **Final Action: Reject**
(445.13)

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Change the existing Exception to Exception Number 1 and add new Exception Number 2 as follows:
Where the conductors are installed in accordance with the requirements of Sections 240.21(C)(2), (3), (4), and (6).
Substantiation: This change is intended to allow some flexibility in the connection of tap conductors from generator terminals. In particular, the change will allow for the installation of multiple sets of conductors to be connected to the generator terminals — similar to what is allowed for transformer secondary conductors. Generally, there should be no major differences in what is currently allowed for transformer secondary conductors and generator conductors. Logically, the conductors do not care if they receive their supply source from a transformer or a generator. A transformer and generator can be separately or non-separately derived systems — grounding and bonding requirements are generally the same. As presently worded, Section 445.13 requires that all conductors from the generator terminals be sized at 115 per cent of the nameplate current rating of the generator. This is over restrictive where the need for multiple generator taps is necessary, such as taps for emergency systems and optional standby systems. This change is well over
due and has no impact on safety. It simply provides further flexibility in the installation and use of generator feeder tap conductors. No different than what is presently allowed for the installation of other tap conductors from separately derived systems!
Panel Meeting Action: Reject
Panel Statement: The proposal fails to recognize the possibility of short circuits or ground faults between the source of supply and the first overcurrent protective device with the conductors having to carry the full current of the generator. Generators and transformers, using the same grounding electrode and bonding conductor sizing and installation rules, is really not the issue here since the size of the conductors from the generator source to the first overcurrent protective device must be large enough to carry the nameplate current of the generator, even in a short circuit (does not involve grounding or bonding issues since the fault may be between two phase conductors). There was no technical substantiation provided to permit the use of the requirements in 240.21(C) for conductors from the generator to the first overcurrent protective device.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-15 Log #2017 NEC-P13 **Final Action: Reject**
(445.13)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence: Neutral conductors of dc generators that must carry ground-fault currents shall ~~not be smaller than the minimum size of~~ have an ampacity not less than the largest conductor.
Substantiation: Ampacity should be the criterion; equal sizes of conductors of different material and insulation do not have the same ampacity.
Panel Meeting Action: Reject
Panel Statement: Conductors are rated in ampacity and sized based on this rating. The existing text using the words "not smaller than the minimum size" is technically correct. In addition, the submitter has proposed revising from "not smaller than the minimum size" to "not smaller than the maximum size", with no technical substantiation for the change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-16 Log #3002 NEC-P13 **Final Action: Reject**
(445.13)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:
445.13 Ampacity of Conductors.
The ampacity of the conductors from the generator terminals to the first ~~distribution device(s) containing~~ overcurrent protection device shall not be less than 115 percent of the nameplate current rating of the generator. It shall be permitted to size the neutral conductors in accordance with 220.61. Conductors that must carry ground-fault currents shall not be smaller than required by 250.30(A). Neutral conductors of dc generators that must carry ground-fault currents shall not be smaller than the minimum required size of the largest conductor.
Exception: Where the design and operation of the generator prevent overloading, the ampacity of the conductors shall not be less than 100 percent of the nameplate current rating of the generator.
Substantiation: The term "distribution device containing overcurrent protection" is the root of many debates. It can easily be argued that this means the conductors from the generator to the first panelboard must be rated 115%, although this would not make any sense. This proposal helps clarify that the conductors in the generator to the breaker in the generator must be 115%.
Panel Meeting Action: Reject
Panel Statement: The existing text is clear that the size of conductors from the source at the generator to the first overcurrent protective device at the point of distribution, on the generator as mentioned in the substantiation, within a switchboard, or within a panelboard, must be 115 percent of the rating of the generator. If a short circuit occurs before the overcurrent protective device at that point of distribution, the source conductors must be able to carry the full rating of the generator, hence the sizing at 115 percent.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-17 Log #1012 NEC-P13 **Final Action: Reject**
(445.14)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
Live parts of generators ~~operated at more than 50 volts to ground~~ shall not be exposed ~~to accidental contact~~ where accessible to unqualified persons.
Substantiation: Depending on conditions, 50 volts or less may not always be safe re: electric shock, arcing, and fire ignition.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation to support deleting the more than 50-volt requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-18 Log #66 NEC-P13 **Final Action: Reject**
(445.19)

TCC Action: The Technical Correlating Committee understands that the action on Proposal 13-18 does not add any new code text, and is superseded by the action taken on Proposal 13-19.
Note: This Proposal appeared as Comment 13-10 on Proposal 13-11 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-11 was:
Add text to read as follows:
Ground-Fault Circuit Interrupter Protection for Receptacles on Portable Generators. All 125-volt, single-phase, 15- 20-, and 30 ampere receptacle outlets that are a part of a portable generator shall have ground-fault circuit interrupter protection for personnel.
Submitter: Kurt Eckroth, Waukesha County Technical College
Recommendation: Proposal 13-11 should be rejected.
Substantiation: 702.6 requires the use of a transfer switch to connect a portable generator to premises wiring. The proposed addition to Article 445 would require GFCI protection on all outlets of all portable generators. Unfortunately, GFCI protected generators are incompatible with currently available transfer switch technology. If the proposed addition to Article 445 is approved, users may be encouraged, if not forced, to connect their new GFCI protected generator to their premises wiring by ungrounded backfeeding. Backfeeding is a notoriously dangerous practice, and the reason for the NEC transfer switch requirement in the first place. It is illogical to institute a change to Article 445 that forces/encourages users to violate Article 702. Therefore, the proposal should be rejected.

523.23(C) prohibits GFCI protection of egress lighting at carnivals, circuses, fairs and similar events. These events are commonly powered by portable generators. The proposed addition to Article 445, which would require GFCI protection on all outlets of all portable generators, would be in direct conflict with 523.23(C). It is illogical to institute a change to Article 445 that requires users to violate Article 523. Therefore, the proposal should be rejected.

The exception to 590.6(A) exempts GFCI protection of circuits in temporary installations where a greater hazard sold be created if power were interrupted. The proposed addition to Article 445, which would require GFCI protection on all outlets of all portable generators, would be in direct conflict with 590.6(A). It is illogical to institute a change to Article 445 that requires users to create safety hazards anticipated by Article 590. Therefore, the proposal should be rejected.

The proposed addition to Article 445 would require GFCI protection on all outlets of all portable generators. The GFCI protection would only function if the portable generator was properly grounded to a properly installed grounding rod. It is common knowledge that a significant percentage of users of portable generators do not ground the generator. It is illogical to require the addition of a “safety” device to a portable generator that, in many instances, will not function, but only provide the user with the illusion of safety and a false sense of security. Therefore, the proposal should be rejected.
Panel Meeting Action: Reject
Panel Statement: Ground-fault circuit-interrupter protection on generators is not incompatible with available transfer switches technology. A generator connected to a 2-pole transfer switch for a 120/240-volt single-phase grounded service will trip the GFCI protection on the generator. However, a 3-pole transfer switch (switching both phases and the neutral as a separately derived system) will provide proper isolation of the GFCI and permit the GFCI device on the generator to operate properly.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
CZARNECKI, N.: See NEMA statement on Proposal 13-19.

13-19 Log #4418 NEC-P13 **Final Action: Accept**
(445.20)

Submitter: Mark C. Ode, Underwriters Laboratories Inc.
Recommendation: Add new text to read as follows:
445.20. Ground-Fault Circuit Interrupter Protection for Receptacles on 15 kW or Smaller, Portable Generators. All 125-volt, single-phase, 15- 20-, and 30-ampere receptacle outlets, that are a part of a 15 kW or smaller, portable generator, shall have ground-fault circuit interrupter protection for personnel integral to the generator or receptacle.
Substantiation: Small portable generators, sized at 15 kW or smaller, are used for many different purposes, such as power on camping trips; on construction sites for temporary power for electrical equipment, such as table saws, pressure washers, and hand-held tools as well as lighting and similar purposes; for temporary connection of electrical circuits in a home or for small commercial buildings; and for power during emergency situations for all different types of installations due to natural disasters. In all of these applications, there are many potential hazards associated with these temporary installations, such as cut and abraded wire and cable, standing water and wet locations, and similar hazardous applications.

During power outages from storms and other natural disasters, persons who may not be familiar with adequate safety procedures often use these generators to supply power in less than optimal conditions. Requiring all 125-volt, single phase, 15-, 20-, and 30-ampere on 15 kW or smaller generators to be integrally GFCI protected will help eliminate the possibilities of shock hazards from damaged circuits, damaged equipment, or use of equipment in wet locations.

This new section will ensure that portable generators will have adequate personnel protection for these receptacles wherever these generators are used. By limiting GFCI protection to only 15-, 20-, and 30-ampere, single phase, 120 volt circuits, these small generators can still be used for supplying standby power for non-GFCI protected 20-ampere, 30-ampere, and larger 120/240 single phase, 3-wire with ground as well as 3-phase circuits of all sizes for houses and small commercial buildings. Providing the proper transfer switch or transfer method with the proper compliance with the requirements in Article 250 for separately derived systems or non-separately derived systems is incumbent upon the installer of the system.

This proposal was developed by a Task Group composed of Task Group Chairman Paul Casparro and Chair of Panel 3 (NJATC); Jim Wiseman at Square D Schneider-Electric and Panel 15 (NEMA); John R. Kovacik with Underwriters Laboratories, Panels 10, 13 and the NEC TCC (UL); Richard Owen with City of St Paul, Minnesota, Panel 3, and the NEC TCC (IAEI); and Mark C. Ode with Underwriters Laboratories, Panels 3, 13, and the NEC TCC (UL).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
CZARNECKI, N.: This proposal seeks to add GFCI protection to all 125V generator outlets without any substantiation that an issue exists at all levels. In order to establish a functional GFCI configuration on the generator, the generator is forced to be of the bonded neutral variety. Therefore, this proposal would have the effect of eliminating floating neutral generators used to power structures, non-separately derived standby systems, and transfer switches for non-separately derived systems. Eliminating such equipment will not enhance safety, but obsolete safe infrastructure already in place. Enhanced safety has not been accomplished and potentially compromised with users defeating the system by removing grounding connections to find a means to get power on in their home.
Comment on Affirmative:
CARON, D.: Although I agree with the panel action, I am concerned over the apparently arbitrary size of “15 kW or Smaller”. If GFCI devices are proven to increase safety for these types of generators, then they should be required for any size generator with integral receptacles.

ARTICLE 450 — TRANSFORMERS AND TRANSFORMER VAULTS

9-161 Log #4104 NEC-P09 **Final Action: Reject**
(450.2)

Submitter: Sebastien Muller, Transformer Protector Corp.
Recommendation: Revise text to read as follows:
450.2 Definition. For the purpose of this article, the following definitions shall apply.

Transformers. An individual transformer, single- or polyphase, identified by a single nameplate, unless otherwise indicated in this article.

Fast Tank Depressurization Technique. A protective system that prevents transformer tank explosion by activating within milliseconds after an electrical fault occurs and by depressurizing the whole tank before uniform static pressure makes the tank explodes.
Substantiation: The definition of a Fast Tank Depressurization Technique is inserted here in order to be used in the next paragraphs. To understand the use of such a definition and to explain the wording, the following gives a small summary of why oil-filled transformers explode and proposes a setting of an efficient chain of protections to limit the explosion.

In fact, oil-filled transformers explosions are caused by the sequence of the following events. For any reason (oil pollution, transformer overload, temperature increase...), low impedance faults that result in arcing can occur in transformer tanks. Oil is then vaporized and the generated gas is pressurized because the liquid inertia prevents bubble expansion. The pressure difference between the gas bubble and the surrounding liquid oil generates a dynamic pressure peak that propagates inside the tank and interacts with the walls. The dynamic pressure peak and its reflections build up static pressure inside the tank. The average pressure thus rises and the tank ruptures, resulting in very dangerous explosions, fires and very expensive damages.

To reduce the consequences of a transformer explosion, fuses enable limiting the electrical fault time duration, protective walls can surround the transformers to limit the propagation of the explosions while sprinklers extinguish the induced fire. But despite all these precautions, transformers can still explode very violently (“Some contend that the violent nature of a transformer failure renders automatic water spray systems useless.” [4] or see section 2.1 in report [5]). In many cases for indoor transformers, there is not enough oxygen to create a real fire so the short circuits result in the creation of a very hot gas bubble (approximately 1000°C) traveling through the substation and destroying all material on its way and that cannot be prevented by sprinklers.

Therefore, in order to complete the chain of protections, a strategy to mitigate transformer tank rupture should be considered. The attached research articles ([1], [2] and [3]) where experiments as well as numerical simulations were performed, show that an efficient tank protection includes using a technology based on the fast tank depressurization induced by the quick oil evacuation out of the transformer. This fast activation can be achieved by the direct and passive response of a rupture disc to the dynamic pressure peak generated by the electrical arc. Therefore, the protection is activated within milliseconds by the first dynamic pressure peak, avoiding transformer explosions before static pressure increases. Such fast tank depressurization strategies should thus be considered as an efficient first step of a global chain of protections against oil filled transformers explosions and their subsequent fires. This is why a reference to fast tank depressurization techniques in section 450.26 and 450.27 is proposed.

Ballot Results: Affirmative: 12

9-162 Log #683 NEC-P09 **Final Action: Reject**
(450.3(A) Note)

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Add note to 450.3(A) under header "Primary Protection over 600 Volts" to read:

Primary Protection over 600 Volts <u>**(See Note 6.)**</u>

Add a sixth note under Table 450.3(A) to read:

<u>**6. When selected under engineering supervision, differential relay protection is acceptable as an alternate to overcurrent protection provided by a circuit breaker or fuses.**</u>

Substantiation: This proposal is the work of the "High Voltage Task Group" appointed by the Technical Correlating Committee. The task group consisted of the following members: Alan Peterson, Paul Barnhart, Lanny Floyd, Alan Manche, Donny Cook, Vince Saporita, Roger McDaniel, Stan Folz, Eddie Guidry, and Jim Dollard.

Differential relays are often used in sophisticated protection schemes, in networks or other designs where current can flow in multiple directions. They are commonly used where continuity of service is critical, to protect switchgear, and transformers. The sophisticated nature of the protection scheme typically requires the expertise of a supervising engineer.

Panel Meeting Action: Reject

Panel Statement: There is no evidence that using only differential relay protection will always provide the level of protection required. Differential relay protection of a transformer consists of comparing input current to output current (factoring in the turns ratio) and providing tripping if there is a difference. Such differences would only be detected in the event there was a fault internal to the transformer. An overcurrent on the secondary side of the transformer would not be detected by differential relay protection. If differential relay protection were used in combination with overcurrent protection for the primary and secondary conductors, the combination would provide the necessary protection. The proposed Note 6 under Table 450.3(A) would allow differential relay protection as a substitute for overcurrent protection provided by a circuit breaker or fuses.

Number Eligible to Vote: 12

9-165 Log #2598 NEC-P09 **Final Action: Reject**
(450.3(C))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

~~VOLTAGE~~ INDOOR TRANSFORMERS Transformers installed indoors ~~or enclosed~~ shall be ~~protected~~ <u>provided</u> with primary <u>overcurrent protection</u> ~~fuses~~.

Substantiation: Edit. It is not clear if "enclosed" refers to a structure or the transformer case. Table 450.3(A) doesn't restrict overcurrent protection to fuses.

Panel Meeting Action: Reject

Panel Statement: This section covers instrument voltage (potential) transformers used for metering or relaying. The proposal addresses power transformers and is not relevant to this requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-166 Log #369 NEC-P09 **Final Action: Reject**
(450.5)

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise second sentence as follows:

"Such transformers shall have a continuous ~~per-phase~~ current rating <u>for each phase</u> and a continuous neutral current rating."

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.

Panel Meeting Action: Reject

Panel Statement: See committee statement on Proposal 9-27.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-167 Log #367 NEC-P09 **Final Action: Reject**
(450.5(A)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise first sentence as follows:
"An overcurrent sensing device shall be provided that will cause the main switch or common-trip overcurrent protection referred to in 450.5(A)(1) to open if the load on the autotransformer reaches or exceeds 125 percent of its continuous current on any phase ~~per-phase~~ or neutral rating."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See committee statement on Proposal 9-27.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-172 Log #3788 NEC-P09 **Final Action: Reject**
(450.11)

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Revise text to read as follows:
"Each transformer shall be provided with a name plate giving the name of the manufacturer, rated kilovolt-amperes, frequency, primary and secondary voltage, rated percent efficiency at full load, impedance..."
Substantiation: The rated efficiency at full load on the transformer secondary enables the engineer to more accurately determine the worst case full load amperes for the purpose of secondary conductor sizing and performing short circuit calculations as follows:
Examples:

$$(3\Phi \times \text{fmr})\text{FLA sec.} = \frac{\text{KVA} \times 1000}{\sqrt{3 \times \text{E sec.} \times (\%\text{Eff.}/100\%)}}$$

$$\text{Max. Short Circuit Current} = \frac{\text{FLA sec.}}{(\%\text{IZ}/100\%)}$$

Panel Meeting Action: Reject
Panel Statement: The information is available from the manufacturer and space on nameplates is limited. There is insufficient safety justification to justify a revised marking protocol for all transformer nameplates.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BREITKREUTZ, B.: The submitter's substantiation is incorrect. ANSI transformer MVA rating is secondary rating.

9-173 Log #1722 NEC-P09 **Final Action: Reject**
(450.13(B))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text as follows:
Where the hollow space is a suspended ceiling space used for environmental air, the dry-type transformers may not be installed.
Substantiation: 300.22(C)(2) references the electrical equipment that is suitable for this air-handling space, and dry-type transformers are not included.
Panel Meeting Action: Reject
Panel Statement: 300.22(C)(2) permits "electrical equipment with a metal enclosure … unless prohibited elsewhere in this Code." Since this section (450.13) does not prohibit this installation, it can proceed in accordance with 450.13(B). This proposal is not necessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-174 Log #1685 NEC-P09 **Final Action: Reject**
(450.13(B), FPN)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text as follows:
FPN: See 300.22(C)(2) for equipment in other space used for environmental air.
Substantiation: This section covers the installation of electrical equipment with a metal enclosure or with a nonmetallic enclosure listed for the use that is suitable for this space.
Panel Meeting Action: Reject
Panel Statement: This note is not required. The installation requirements in this case are straightforward. See also the panel statement on Proposal 9-173.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-175 Log #659 NEC-P09 **Final Action: Accept in Principle in Part**
(450.14)

Submitter: Harold F. Willman, Colorado Code Consulting
Recommendation: Add new text to read as follows:
450.14 Transformer disconnecting means. Transformers shall have a disconnecting means located within sight of the transformer.
Substantiation: In larger commercial buildings and multistory buildings, many transformers have the overcurrent protection and the disconnecting means for the transformer at the main distribution center. This main distribution center is normally located on the bottom floor of the multistory building or in an electrical room of a large commercial building. Transformers are scattered throughout the building without signage on the transformer indicating the location of disconnecting means for the transformer. By installing a disconnecting means within sight of the transformer, maintenance and modification of the primary and/or secondary side of the transformer would be safer for the electricians working on the transformer. The lock out-tag out method is not always available in the main distribution center.
Panel Meeting Action: Accept in Principle in Part
CMP-9 accepts in principle the concept of a disconnect provision for transformers. CMP-9 rejects the requirement that this disconnecting means must be located within sight of the transformer.
Panel Statement: See the action on Proposal 9-176 for the final requirement that addresses the concept in this proposal that is being accepted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-176 Log #3821 NEC-P09 **Final Action: Accept in Principle**
(450.14)

Submitter: James J. Rogers, Bay State Inspectional Agency
Recommendation: Add new text to read as follows:
450.14 Disconnecting Means. Transformers other than listed class 2 or class 3 transformers shall have a disconnecting means located either in sight of the transformer or remotely provided the remote disconnect is capable of being locked in the off position. When the disconnecting means is located remote from the transformer the locking means required shall remain in place whether or not the locking means is installed.
Substantiation: Requiring a disconnecting means for a transformer is intended to enhance safety for the qualified individual that is required to work on the transformer. This is especially true in installations utilizing the requirements of 240.21(B)(3) whereby there may be several transformers in different locations all tapped from one feeder and it may be impractical to de-energize the entire feeder system to work on one of the transformers.
Panel Meeting Action: Accept in Principle
Revise the rule to read as follows: “Transformers, other than Class 2 or Class 3, shall have a disconnecting means located either in sight of the transformer or in a remote location. Where located in a remote location, the disconnecting means shall be lockable, and the location shall be field marked on the transformer.”
Panel Statement: CMP-9 has made editorial changes to avoid a run-on sentence, used “open” instead of “off” for the disconnect position in accordance with customary code usage, used “where” instead of “when” because it is a question of place and not time, and removed the listing limitation on the Class 2 and 3 transformers because it has no bearing on whether a disconnecting means needs to be installed. The lockable wording correlates with the task group results reported in Proposal 9-201.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
YOUNG, R.: The disconnecting means should be lockable in the open position whether or not the disconnecting means is mounted either within sight of the transformer or in a remote location.

9-177 Log #4235 NEC-P09 **Final Action: Reject**
(450.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
450.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer’s self-evaluation or an owner’s engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 9-125.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BREITKREUTZ, B.: The AHJ should accept equipment unless he inspects it and identifies a specific NEC violation.

9-178 Log #4236 NEC-P09 **Final Action: Reject**

9-180 Log #4238 NEC-P09 **Final Action: Reject**
(450.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
450.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

9-182 Log #4105 NEC-P09 **Final Action: Reject**
(450.26)

Submitter: Sebastien Muller, Transformer Protector Corp.
Recommendation: Revise text to read as follows:
450.26 Oil-Insulated Transformers Installed Indoors. Oil-insulated transformers installed indoors shall be installed in a vault constructed as specified in Part III of this article.
In addition, for transformers rated more than 35,000 volts, the following protections should be considered:
(1) Automatic fire suppression systems
(2) Fast tank depressurization techniques.
Substantiation: The proposal follows the one made for section 450.2 by the same author.
When a short circuit occurs in a tank not equipped by any transformer-dedicated protections, the presence of a large quantity of oil can lead to huge transformer explosions and fires even if the transformer is in a vault [6, 7]. The role of a vault is to contain the explosion, however, adding protections such as automatic fire suppression systems associated with fast tank depressurization techniques enables sharply reducing the potential damages and thus the environmental pollution, the safety risks and the costs: after an electrical fault occurrence, a relatively short maintenance is performed so that the transformer can be reenergized more quickly after the short circuit.
Thus, as mentioned in the proposal made for section 450.2 and in the attached scientific articles ([1], [2] and [3]), an efficient chain of protections to reduce the consequences of a transformer explosion consists of:
- circuit breakers that enable limiting the electrical fault time duration (as mention in section 450.3);
- a vault that surround the transformers to limit the propagation of the explosions (as mention in the current section 450.26);
- sprinklers which extinguish the induced fire;
- and a fast tank depressurization technique to prevent transformer tank rupture and the release of flammable gases.

Note that during many indoor transformers explosions, there was not enough oxygen to create a fire so the short circuits resulted in the creation of a very hot gas bubble (approximately 1000°C). After tank explosion, this bubble, which often has a diameter of more than 1 meter travels in the plant galleries and destroys all materials on its way. This incident cannot be detected by fire detectors and sprinklers. Nevertheless, this type of incident can be avoided by fast tank depressurization techniques.
It is thus proposed to add references to automatic fire suppression systems and to fast tank depressurization techniques, especially for high power transformers.

[3] R. BRADY, S. MULLER, G. de BRESSY, P. MAGNIER, G. PERIGAUD, "Prevention of Transformer Tank Explosion, Part 2: Development and Application of a Numerical Simulation Tool", ASME PVP08 Conference, 2008, provided in attachment.
[6] Transformer explosions at Hartford Civic Center
[7] Transformer explosion at Pasadena, Texas,
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposed language "should be considered" is vague and unenforceable. Insufficient substantiation has been provided to warrant the additional language if stated as a mandatory requirement. Nothing in the Code currently precludes the use of such systems; an owner can choose such a protection system if desired.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-183 Log #4106 NEC-P09 **Final Action: Reject**
(450.27)

Submitter: Sebastien Muller, Transformer Protector Corp.
Recommendation: Revise text to read as follows:

450.27 Oil-Insulated Transformers Installed Outdoors. Combustible material, combustible buildings, and parts of buildings, fires escapes, and door and window openings shall be safeguarded from fires originating in oil-insulated transformers installed on roofs, attached to or adjacent to a building or combustible material.

In cases where the transformer installation present a fire hazard, one or more of the following safeguards shall be applied according to the degree of hazard involved:

(1) Space separations
(2) Fire-resistant barriers
(3) Automatic fire suppression systems
(4) Fast tank depressurization techniques
(5) Enclosures that confine the oil of a rupture transformer tank

Oil enclosures shall be permitted to consist of fire-resistant dikes, curbed areas or basins, or trenched filled with coarse, crushed stone. Oil enclosures shall be provided with trapped drains where the exposure and the quantity of oil involved are such that removal of oil is important.

Substantiation: The proposal follows the one made for section 450.2 by the same author.

To reduce the consequences of an electrical fault occurring in an outdoor transformer, circuit breakers enable limiting the electrical fault time duration, barriers and separations can surround the transformers to limit the propagation of the explosions while sprinklers extinguish the induced fire. But, despite all these precautions mentioned in section 450.3 or in the current 450.27 section, transformers can still explode very violently (see [4], [5]).

So, in order to complete this chain of protections, a strategy to mitigate transformer tank rupture should be considered. As shown in the attached scientific articles ([1], [2] and [3]), rupture mitigation can be obtained by a fast tank depressurization technique, as defined in the proposal related to section 450.2. Thus, during a transformer short circuit, the fast tank depressurization technique is activated within milliseconds by the first dynamic pressure peak generated by the arc, avoiding transformer explosions before static pressure increases.

Such a fast tank depressurization technique is thus an efficient complementary protection to automatic fire extinguishing systems, protective separations and enclosures in order to prevent huge transformers explosions, especially in cases where the transformer installation presents a fire hazard.

The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.

13-22 Log #4232 NEC-P13 **Final Action: Reject**
(455.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
455.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

Recommendation: Add new text as follows:
455.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

(460.8(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: An identified disconnecting means shall be permitted to disconnect a capacitor or bank of capacitors as a regular operating procedure. An identified disconnecting means shall disconnect each ungrounded conductor for a capacitor or capacitor bank and shall meet the following requirements:
(`) The disconnecting means shall simultaneously open all ungrounded conductors
(2) The current rating of the disconnecting means shall not be less than 135 percent of the rated capacitor(s).
Exception: no change.
Substantiation: The disconnecting means should be identified as suitable for the use. Present (2) is incorporated into the proposal since it is permitted and not a requirement.
Panel Meeting Action: Reject
Panel Statement: The term "identified" is defined in Article 100 and relates to listings by testing agencies. Using the term in this sense would require the disconnecting means to be listed and identified by testing agencies. The panel rejects the revisions as proposed as no technical substantiation has been provided in regards to the disconnecting means.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-145 Log #2671 NEC-P11 **Final Action: Reject**
(460.10 Exception No. 2 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add:
Exception No. 2: Capacitor cases installed on wood poles or structures for overhead line construction shall not be required to be grounded.
Substantiation: Most overhead pole line construction does not provide an equipment grounding conductor.
Panel Meeting Action: Reject
Panel Statement: The submitter refers to line construction. This section is contained in Part I of 460, which applies to 600 volts, nominal or less circuits. In these systems there is typically an equipment grounding conductor present. Therefore the present language is applicable.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-146 Log #1003 NEC-P11 **Final Action: Reject**
(460.27)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first sentence and substitute: Capacitor cases shall be grounded by approved means. Revise exception: Capacitor cases shall not be grounded ~~connected to an equipment grounding conductor~~ where the capacitor units are supported on a structure ~~designed to~~ operating at other than ground potential.
Substantiation: Pole line construction does not usually provide an equipment grounding conductor run with circuit conductors. The grounding means should be approved as to manner, wire size and material, electrode, etc.
Panel Meeting Action: Reject
Panel Statement: The present text allows multiple methods of grounding the capacitor. The submitter's concerns are presently addressed in the existing second sentence. The existing language uses the proper terminology used throughout the code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-147 Log #1011 NEC-P11 **Final Action: Reject**
(460.27 Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: The rule states "if grounded" and does not require grounding therefore the exception which appears to exempt grounding is not needed. A support structure for capacitor cases operating at above ground potential cannot also be grounded. See exception for 470.19. Pole line construction usually doesn't include an EGC.
Panel Meeting Action: Reject
Panel Statement: The proposal indicates that the code section states "if grounded". The actual language in the code section requires grounding by the term "shall", therefore, the present exception is needed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: See action and statement on Proposal 11-154.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-156 Log #4222 NEC-P11 **Final Action: Reject**
(470.29)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
470.29 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.
Panel Meeting Action: Reject
Panel Statement: See action and statement on Proposal 11-154.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-157 Log #4223 NEC-P11 **Final Action: Reject**
(470.29)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
470.29 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

ARTICLE 480 — STORAGE BATTERIES

13-26 Log #2850 NEC-P13 **Final Action: Reject**
(480)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
Article 480 ~~Storage~~ ~~Batteries~~ Stationary Batteries.
Substantiation: The focus of Article 480 should be on stationary battery systems that might be viewed as part of the premises wiring. The Standards Correlating Committee is requested to consider change to the title and scope of Article 480.
Per the IEEE Stationary Battery Committee/ Glossary WG:
"Storage battery" is another name for a "secondary battery," which is the preferred term.
A **secondary battery** is "an electrochemical cell that is capable of being discharged and then recharged."
A **stationary battery** is "a battery designed for service in a permanent location."
Stationary batteries are, almost without exception, secondary (or storage) batteries, but not all secondary batteries are stationary.
Secondary batteries can be portable (e.g., AAA) or stationary.

See proposals on 480.1 (scope) and 480.2: (storage battery definition.)
The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, utilities, battery service organizations, battery testing companies, and consulting engineering firms. Current members at the time of this proposal include: Samuel Aguirre / FAA; Phyllis Archer / C&D Technologies ; Curtis Ashton / Qwest Communications; Gary Balash / East Penn Mfg ; Tim Bolgeo / Southern Company ; Allen Byrne / Interstate Batteries ; Thomas Carpenter / Arnold AFB ; Richard Hassick / Dekka; Dan Lambert / Schneider Electric; Daniel Levin / New York Port Authority; Ronald Marts / Telcordia; Dan McMenamin / consultant; Stephen McCluer / APC; Russell Miller / Douglas Battery; John Polenz / Emerson Electric; Chris Searles / BAE Batteries.
Panel Meeting Action: Reject
Panel Statement: The scope of the article specifies that the article applies to stationary installations of storage batteries. The key is the stationary installation, not a stationary battery or a secondary battery as alluded to in the substantiation. The article title of storage battery is correct.
The panel understands that article titles and scope statements are under the jurisdiction of the Technical Correlating Committee and any action to revise an article title or scope statement by this panel is only advisory. Additionally, the term “storage battery” is used in NFPA 111, *Standard on Stored Electrical Energy Emergency and Standby Power Systems*, and acceptance of this recommendation creates a correlation problem between the NEC and that standard. CMP-13 requests the TCC to work with IEEE in developing a joint NEC/IEEE task group to work toward harmonization between terminology used in the NEC Article 480 requirements and the terminology used in IEEE standards.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-27 Log #2851 NEC-P13 **Final Action: Reject**
(480.1)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
480.1 Scope The provisions of this article shall apply to all ~~stationary installations of storage batteries~~ rechargeable batteries intended for service in a permanent location.
480.1(A) Covered:
(1) Rechargeable batteries or cells rated over 20 Ampere-hours or 50 volts nominal.
480.1(B) Not covered:
(1) portable batteries
(2) primary (non-rechargeable)batteries
(3) starting batteries
(4) motive (fork lift) batteries.
Substantiation: This proposal clarifies that Article 480 covers rechargeable batteries above a certain size. It should not cover primary batteries or small secondary batteries such as those in small, plug-in electronic systems (e.g., personal computers or desktop UPS systems), even though they be intended to stay in one place once installed.
The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, battery service organizations, battery testing companies, and consulting engineering firms.
Panel Meeting Action: Reject
Panel Statement: The existing scope is more definitive than the suggested change to “rechargeable batteries intended for service in a permanent location.” The phrase “intended for service” in the NEC denotes utility supplied power and may cause confusion for the user of the NEC. While there is no argument that small batteries in a personal computer or a desktop UPS system are not covered in Article 480, there was no technical substantiation to justify the ampere-hour size or voltage change in the proposal. Referencing portable batteries, non-rechargeable batteries, starting batteries, and forklift batteries in Article 480 is unnecessary because this article only applies to stationary installations of storage batteries. Storage batteries are defined as a battery comprised of one or more rechargeable cells of the lead-acid, nickel-cadmium, or other rechargeable electrochemical types, not internal to equipment.
This Panel would appreciate it if the IEEE Stationary Battery Committee/Code Working Group would provide technical data for the suggested changes. The NEC cannot be changed without sufficient technical substantiation. Any recommendations to revise the scope are first submitted to the responsible code-making panel whose action is subject to the approval of the NEC TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-28 Log #2852 NEC-P13 **Final Action: Accept in Principle**
(480.2.Battery System)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Add new text to read as follows:
Battery System – A system that consists of these interconnected subsystems:
- stationary batteries;
- battery chargers
- a collection of inverters, converters, and associated electrical equipment as required for a particular application.

Substantiation: The term “battery system” is used in several places within Article 480, yet it has not been defined. The proposed definition is derived from NFPA-1 Paragraph 3.3.22, except that it is suitable for all types of batteries including (but not limited to) lead-acid batteries.
The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, utilities, battery service organizations, battery testing companies, and consulting engineering firms.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Battery System. Interconnected battery subsystems consisting of storage batteries, battery chargers, inverters, converters, and associated electrical equipment.
Panel Statement: Based on the NEC Style Manual, a definition cannot use mandatory phrases (“as required for a particular application”) and cannot use the definition as part of the definitive portion (“a system”).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-29 Log #374 NEC-P13 **Final Action: Accept**
(480.2.Nominal Battery Voltage)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise Nominal Battery Voltage as shown:
“The voltage calculated on the basis of 2 volts for each ~~per~~ cell for the lead-acid type and 1.2 volts for each ~~per~~ cell for the alkali type.
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-30 Log #2853 NEC-P13 **Final Action: Accept in Principle in Part**
(480.2.Nominal Battery Voltage)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
Nominal ~~Battery~~ Voltage - The voltage ~~calculated on the basis of 2 volts per cell for the lead-acid type and 1.2 volts per cell for the alkali type.~~value assigned to a cell or a battery (as opposed to its actual voltage at any given moment) for the purpose of conveniently designating its voltage as appropriate to its electrochemistry
FPN: The most common nominal cell voltages are; 2 volts per cell for the lead-acid systems, 1.2 volts per cell for alkali systems, and 4 volts per cell for Li-ion systems.
Substantiation: This proposal changes the NEC definition to be consistent with IEEE preferred definition. It clarifies that “nominal voltage” can be applied to either a cell or a complete battery. For example, a nominal 48-volt lead-acid “battery” would be made up of 24 nominal 2-volt “cells.” This proposal moves product-specific examples to a Fine Print Note (FPN).
The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, battery service organizations, battery testing companies, and consulting engineering firms.
Panel Meeting Action: Accept in Principle in Part
Revise the existing definition in 480.2 to read:
Nominal Battery Voltage. The voltage calculated on the basis of 2 volts for each cell for the lead-acid type, 1.2 volts for each cell for the alkali type, and 4 volts for each cell for lithium-ion type.
Panel Statement: The panel accepts only the inclusion of the information on lithium ion batteries in the existing definition and rejects the remainder of the recommendation. The existing definition provides the user of the NEC with voltage specific levels for the battery types covered in Article 480.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-31 Log #2854 NEC-P13 **Final Action: Accept in Principle in Part**
(480.2.Sealed Cell or Battery)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
Sealed Cell ~~or Battery~~. ~~A sealed cell or battery is one:~~ One that has no provision for the routine addition of water or electrolyte or for external measurement of electrolyte specific gravity. The individual cells shall be permitted to contain a venting arrangement as described in 480.10(B).
Substantiation: A "battery" is made up of multiple "cells." The provisions for pressure relief valves apply only to the cells, not to the entire battery. The proper term for such cells is "valve-regulated."
The word "routine" is added because some recovery activities do provide a way to re-hydrate a dried out VRLA cell, even though such practice was not intended in the original design.
This proposed definition is consistent with the IEEE stationary battery committee definition -
"sealed cell: A cell that is designed not to allow release of gas to the atmosphere during normal operation. "
Valve-regulated cells, as the name implies, are technically not "sealed." Although valve regulated cells "function" as sealed cells under normal operation, they are designed with a safety mechanism to permit release of gas under excess internal pressure.
See related proposal: 480.10(B)
The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, utilities, battery service organizations, battery testing companies, and consulting engineering firms.
Panel Meeting Action: Accept in Principle in Part
Revise the existing definition to read:
Sealed Cell or Sealed Battery. A cell or battery that has no provision for the addition of water or electrolyte or for external measurement of electrolyte specific gravity and may contain pressure relief venting.
Panel Statement: The deletion of the phrase "A sealed cell or battery is" was accepted to comply with the NEC Style Manual to not repeat the defined words in the text of the definition. "Sealed" was added to the title and to the text to indicate the definition applies to both sealed cells and sealed batteries. The "shall be permitted to" was eliminated, as well as the reference to 480.10(B), and "may" was added to conform to the NEC Style Manual to not contain mandatory text in a definition.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-32 Log #2855 NEC-P13 **Final Action: Reject**
(480.2.Storage Stationary Battery)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
~~Storage~~ Stationary Battery. A secondary battery designed for service in a permanent location, and comprised of one or more rechargeable cells. ~~of the lead-acid, nickel-cadmium, or other rechargeable electrochemical types~~. Individual cells may be contained in either single-cell or multi-cell containers.
Substantiation: See proposal on paragraph 480.
"Secondary battery," is the preferred term over "Storage battery," which is often used interchangeably but incorrectly.
Per the IEEE Stationary Battery Committee/ Glossary WG:
"Secondary battery: An electrochemical cell that is capable of being discharged and then recharged."
A "**stationary battery**" is:
"A battery designed for service in a permanent location." Stationary batteries are, almost without exception, secondary batteries.
Secondary batteries can be portable (e.g., AAA) or stationary. The focus of Article 480 is on stationary battery systems that might be viewed as part of the premises wiring.
The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, battery service organizations, battery testing companies, and consulting engineering firms.
Panel Meeting Action: Reject
Panel Statement: The proposed definition uses the phrase "secondary battery" that is not defined but "storage battery" is a more common phrase than "secondary battery". The scope of the article already states that storage batteries are for stationary installations so adding "permanent location" into the definition is unnecessary. "Designed for service" is a misapplication in the NEC since the word "service" denotes utility company power. The phrase "individual cell" can only denote a single cell, not multi-cells. This panel would appreciate it if the IEEI Stationary Battery Committee/Code Working Group would provide technical data for the suggested changes. The NEC cannot be changed without sufficient technical substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-33 Log #4896 NEC-P13 **Final Action: Accept in Principle**
(480.4)

Submitter: Leo F. Martin, Jr., Martin Electrical & Technical Training Services
Recommendation: Add a fine print note as follows:
FPN: See 240.21(H) for information on the location of the overcurrent device for battery conductors.
Substantiation: To reference other code section containing information on battery conductor overcurrent protection.
Panel Meeting Action: Accept in Principle
Move the recommended fine print note to Section 480.5.
Panel Statement: This information is more appropriately located as a fine print note to Section 480.5.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-34 Log #1116 NEC-P13 **Final Action: Reject**
(480.5)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industries Solutions (ATIS)
Recommendation: Delete entire section 480.5 as follows:
~~**480.5 Disconnecting Means.** A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system over 30 volts. A disconnecting means shall be readily accessible and located within sight of the battery system.~~
Substantiation: Section 480.5 should be deleted for the following reasons:
(1) The assignment of the 30 volt threshold, above which a disconnect for stationary batteries is required, is arbitrary and is in conflict with requirements elsewhere in the NEC. For example, Article 690, *Solar Photovoltaic Systems*, Sections 690.71(E) and (F) require a "disconnecting means" for battery circuits of more than 48 volts, nominal. Hence, there is a correlation issue between 690.71(E) and (F), and 480.5. Section 480.4, the directly preceding section, cites 50 volts at which an action must be taken.
(1) Section 480.5 will serve to confuse the reader or AHJ regarding the term "disconnecting means". Article 100 defines "Disconnecting Means" as "A device, or group of devices, or other means by which the conductors of a circuit can be disconnected from their source of supply". Clearly the definition implies a switch or similar device. Stationary batteries are typically connected via bolted connections; switches introduce reliability concerns.
(2) The concern for isolation of a stationary battery for shock hazard is flawed as 480.5 addresses only "all ungrounded conductors". This would not protect a technician from electrical shock hazard or from hazards associated with a ground fault while maintaining the battery system.
(3) Concern over explosive gases is invalid. Battery rooms are vented and exhausted to prevent the accumulation of explosive gas. Further, if explosive gas is a concern, a disconnect would not necessarily prevent accidental arcing or sparking during battery maintenance.
(4) Section 480.5 makes no mention of the energy level of the battery, i.e. the ampere-hour rating. Any "hazard" is directly proportional to the stored (potential) energy within the battery.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no technical substantiation for deleting the disconnecting means requirement in 480.5. The voltage difference between 480.5 and the requirements in 690.71(E) and (F) is permitted based on 90.3 where Chapter 6 can modify or supplement the requirements in Chapters 1 through 4. Section 480.5 does not mention hazardous locations; however, lead-acid batteries can generate hydrogen, and without proper ventilation based on 480.9(A) the battery area could be a classified location. The panel action on Proposal 13-28 meets the intent of the recommendation with respect to the second paragraph of the submitter's substantiation. The new definition of "battery system" will clarify that the required disconnecting means is for the "battery system" conductors and not for individual cells or batteries.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
DEGNAN, J.: In conjunction with the panel statements on proposals 13-26, 13-28 and the text of 480.1 the panel should consider changing "stationary battery" in 480.5 to "storage battery". "Stationary" is unnecessarily redundant to 480.1. The panel should also consider acceptance in part for this proposal for applications where the addition of a disconnecting means may introduce a significant reduction in reliability, such as when a battery system is used to start a generator.

13-35 Log #2856 NEC-P13 **Final Action: Accept in Principle in Part**
(480.6)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
480.6 Insulation of Batteries ~~Not Over 250 Volts.~~
This section shall apply to stationary battery containers ~~storage batteries having cells connected so as to operate at a nominal battery voltage of not over 250 volts.~~

(A) **Vented Lead-Acid Batteries** Cells ~~and multicomparment batteries~~ (and single containers with more than one cell) with their covers sealed to containers of nonconductive ~~heat-resistant~~ material shall not require additional insulating support.

(B) Vented Alkaline-Type Batteries. Cells with covers sealed to jars of nonconductive~~, heat-resistant~~ material shall require no additional insulation support. Cells in ~~jars~~ containers of conductive material shall be installed in trays or on racks of nonconductive material with not more than 20 cells (24 volts, nominal) in the series circuit in any one tray.

~~**(C)** Rubber Jars. Cells in rubber or composition containers shall require no additional insulating support where the total nominal voltage of all cells in series does not exceed 150 volts. Where the total voltage exceeds 150 volts, batteries shall be sectionalized into groups of 150 volts or less, and each group shall have the individual cells installed in trays or on racks.~~

~~**(D)** Sealed Cells or Batteries. Sealed cells and multicompartment sealed batteries constructed of nonconductive, heat-resistant material shall not require additional insulating support. Batteries constructed of a conducting container shall have insulating support if a voltage is present between the container and ground.~~

Substantiation: (A) The term "multicompartment batteries" is not a recognized term. A "battery" consists of multiple "cells". A container can consist of one or more cells, and a battery usually consists of multiple containers. So by addressing sealing of the cells, the proposal automatically addresses the entire battery.

The term "heat-resistant" is deleted because battery materials are typically plastic that is not rated by heat resistance; they are classified by their flammability and mechanical ratings.

(B) The term "heat-resistant" is deleted because battery materials are typically plastic and are classified by their flammability and mechanical ratings.

The term "jar" is a slang term. The preferred term is "container."

We are aware of no technology that permits cells to be installed in containers made of conductive material. However, there are containers that are steel encased. We are not sure of the intent of this section, what problem it attempts to solve, or how the existing language mitigates the problem. We request that the panel consider deleting the final sentence. ~~Cells in jars of conductive material shall be installed in trays of nonconductive material with not more than 20 cells (24 volts, nominal) in the series circuit in any one tray.~~

(C) Delete this requirement. Rubber or composition containers are no longer available.

(D) The requirements for insulation of cells & batteries of conductive material are already covered in 480.6 (A) & (B).

There are no known batteries manufactured with containers of conductive material.

The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, utilities, battery service organizations, battery testing companies, and consulting engineering firms.

Panel Meeting Action: Accept in Principle in Part
The panel accepts the deletion of the term "multi-compartment" and replacing it with "multi-cell" to read as follows:

(A) Vented Lead-Acid Batteries. Cells and multi-cell batteries with covers sealed to containers of nonconductive, heat-resistant material shall not require additional insulating support.

The panel rejects the remainder of the recommendation.

Panel Statement: By deleting "not over 250 volts," this section could apply to unlimited voltage cells. There was no technical substantiation provided for deleting "not over 250 volts." The existing text in 480.6(A) concerning "heat-resistant" battery containers is retained since the intent is to require the battery containers to be manufactured from a material that will withstand a level of heat without distortion, warping, or leaking and does not allude to flammability rating. The term "jar" and "container" are interchangeable and the electrical industry is familiar with the term "jar" and these jars can be hard rubber or glass but also can be nickel-plated steel containers. The submitter has stated that rubber or composition battery containers are not available but does not provide any information whether there are existing rubber or composition systems still in use so deletion of the text must not be done until this issue can be determined from a study or a technical review.

The submitter stated that the reason for deleting 480.6(D) was that there are no known batteries manufactured with containers of conductive material but states in (B) of the substantiation that there are containers that are steel encased. These two statements are in conflict with each other so the text in 480.6(D) should not be deleted until the submitter provides more technical substantiation. Deleting existing text in the NEC must be based on technical substantiation, not just based on perception that something is not "available" anymore.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-36 Log #2857 NEC-P13 **Final Action: Reject**
(480.7)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Delete the following text:
~~**480.7 Insulation of Batteries Over 250 Volts.**~~
~~The provisions of 480.6 shall apply to storage batteries having the cells connected so as to operate at a nominal voltage exceeding 250 volts, and, in addition, the provisions of this section shall also apply to such batteries. Cells shall be installed in groups having a total nominal voltage of not over 250 volts. Insulation, which can be air, shall be provided between groups and shall have a minimum separation between live battery parts of opposite polarity of 50 mm (2 in.) for battery voltages not exceeding 600 volts.~~

Substantiation: DELETE 480.7

The intent of this requirement is not clear. There is no evidence that the separation or insulating material required by this section creates any safety benefit.

For example, let's say we have a nominal 480 volt battery consisting of (240) two-volt cells. The voltage or fault potential between cells 125 and 126 will not change just because we have added a 2" separation. It only increases the cost and complexity of installation and introduces failure points. The voltage on all cells past the mid-point will still be higher than 250 volts. The voltage at the end of the string will still be 480 volts.

The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, battery service organizations, battery testing companies, and consulting engineering firms.

Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided for deleting this text. The substantiation states the submitter does not understand the intent of this requirement and that there is no safety benefit. This simple statement is not a technical reason for deleting existing text.

This Panel would appreciate it if the IEEI Stationary Battery Committee/Code Working Group would provide technical data for the suggested changes. The NEC cannot be changed without sufficient technical substantiation.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-37 Log #3765 NEC-P13 **Final Action: Reject**
(480.9)

Submitter: Bobby J. Summerville, Metropolitan Atlanta Transit Consultants
Recommendation: Add:

FPN: For large installations requiring ventilation see Article 500.5 Classification of Locations (B) Class I Locations (2) Class I, Division 2 (2) in which ignitable concentrations of gases or vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment, or

Substantiation: Article 500.5 (B)(2) is clear, but much misunderstanding is caused by a FPN to the NEC Handbook which states that ventilating battery rooms eliminates the need to classify these areas. I have provided articles for more information.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided by the proposal for the recommended fine print note. With proper ventilation provided and/or a combustible gas detection system installed that would activate a mechanical ventilation limiting the hydrogen level to no more than 25 percent of the lower flammable limit, a hazardous (classified) location can be avoided. There are also batteries available that can be installed that have self-containment of gases and do not constitute a hazard of gas ignition.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-38 Log #2858 NEC-P13 **Final Action: Reject**
(480.9(A))

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
480.9 Battery Locations.
(A) Ventilation. Provisions appropriate to the battery technology shall be made for sufficient diffusion and ventilation of ~~the~~ any gases from the battery to prevent the accumulation of an explosive mixture.

Add new text as follows:

FPN: See IEEE / ASHRAE Std 1635, *Guide for the Ventilation and Thermal Management of Stationary Battery Installations.*
Substantiation: Some battery technologies do not require ventilation greater than that required for human habitation.
A new FPN references a new standard, created jointly by the Stationary Battery Committee of the Institute of Electrical and Electronics Engineers (IEEE) and the American Society of Heating, Refrigeration, and Air-conditioning Engineers (ASHRAE), which provides guidelines for calculating gassing hazards on battery systems.
The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, battery service organizations, battery testing companies, and consulting engineering firms.
Panel Meeting Action: Reject
Panel Statement: The existing text already provides the requirement for ventilation to keep the accumulation of gases to an appropriate level. The battery technology used in the installation would determine the amount of ventilation necessary to keep the accumulation of gases to 25 percent of the lower flammable limit based on Article 500 of the NEC. The referenced standard is not available from IEEE, ASHRAE, or ANSI. If the standard is to be referenced in a fine print note the panel needs verification that it can be obtained.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-39 Log #3904 NEC-P13 **Final Action: Reject**
(480.9(A), FPN (New))

Submitter: Bobby J. Summerville, Metropolitan Atlanta Transit Consultants
Recommendation: Add:
FPN: For large installations requiring ventilation see 500.5 Classification of Locations (B) Class I Locations (2) Class I, Division 2 (2) in which ignitable concentrations of gases or vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment.
Substantiation: 500.5(B)(2) is clear, but much misunderstanding is caused by a FPN to the NEC Handbook, 480.9 Battery Locations (A) Ventilation, which states that ventilating battery rooms eliminates the need to classify these areas. Please refer to the articles I have provided for more information.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-37.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-40 Log #1008 NEC-P13 **Final Action: Reject**
(480.9(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
~~Guarding of~~ Live parts shall ~~comply with 110.27~~ not be exposed where accessible to other than qualified persons.
Substantiation: This article applies to stationary installations which generally involve industrial or commercial occupancies. Banks of batteries at 50 volts or less can provide substantial arcing current and shock hazard under certain conditions.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation to indicate there have been specific safety related problems in systems under 50 volts. The recommendation is based on supposition and does not provide documentation that the current requirement is inadequate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-41 Log #2859 NEC-P13 **Final Action: Reject**
(480.10)

Submitter: Stephen McCluer, APC by Schneider Electric
Recommendation: Revise text to read as follows:
480.10 Vents.
(A) Vented Cells. Each vented cell shall be equipped with a flame arrester that is designed to prevent destruction of the cell due to ignition of gases within the cell by an external spark or flame under normal operating conditions.
(B) Sealed Cells Sealed cells shall comply with (B)(1) or (B)(2).
(1) Sealed ~~battery or~~ cells ~~shall be~~ equipped with a pressure-release vent to prevent excessive accumulation of gas pressure shall be permitted.
(2) Sealed cells or batteries without pressure-release vents ~~or the battery or cell~~ shall be designed to ~~prevent~~ minimize scatter of cell parts in event of a cell explosion.
Substantiation: (B) A "battery" is made up of multiple "cells." The provisions for pressure relief valves apply only to the cells, not to the entire battery. The proper term for such cells is "valve-regulated."
Cells that have no mechanism for release of gas are truly "sealed." Explosions in sealed stationary batteries are extremely rare, but let's assume that such an event could occur (typically as a result of being consumed by fire, puncture, or a severe short circuit). Some stationary batteries, such as lithium-ion, might be (but typically are not) encased in an enclosure which could mitigate the consequences of an explosion, but cannot prevent the spread of debris altogether in all circumstances.
The IEEE Stationary Battery Committee/Codes Working Group is made up of members who are battery manufacturers, battery integrators, battery users, utilities, battery service organizations, battery testing companies, and consulting engineering firms.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient technical substantiation to support a significant reduction in the level of safety provided by the current wording. The existing text in 480.10(B) requires a pressure-release vent for sealed batteries or sealed cells while the proposed text in (B)(1) makes it permissive, not mandatory. Where a pressure-release vent is not installed, the sealed batteries or sealed cells must be designed to prevent the scatter of cell parts. This design would normally require an enclosure that would surround the sealed battery or sealed cell. This would prevent scatter of parts, not just minimize the scatter. The recommended reorganization of 480.10(B) does not improve the clarity of this section.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-42 Log #4209 NEC-P13 **Final Action: Reject**
(480.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
480.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Through January 1, 2017, evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text provides time (two code cycles) for equipment manufacturers with unlisted equipment to submit the equipment and time for third party certification agencies to complete the evaluation of that equipment. The delayed implementation allows local enforcement agencies the flexibility to utilize any methods currently in place such as; product evaluation by a local professional engineer or review of manufacturers test data; as the basis for approval of equipment. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. At the end of the two code cycles, evaluation of all equipment covered by this Article would be required by a qualified testing laboratory or inspection agency concerned with product evaluation.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-8.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

13-43 Log #4210 NEC-P13 **Final Action: Reject**
(480.19)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
480.19 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. The basis for that approval shall include listing where required by other NEC provisions. Where listing is not required by other NEC provisions, the basis for approval shall be determined by one of the following methods:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
Substantiation: NEC 110.2 currently indicates all conductors and equipment shall be acceptable only if approved (acceptable to the authority having jurisdiction). Authorities must have a basis for that approval and while listing is the preferred basis for approval, listing is not available or has not been provided for some equipment. While some equipment historically has not been listed, a basis for approval of this equipment is needed. The proposed text allows for three options as the basis for equipment approval. Item 1 recognizes listed equipment, the preferred method of many enforcement departments as a basis for approval. Item 2 recognizes field evaluations by testing labs or other locally approved agencies concerned with product evaluation of unlisted equipment. While very few enforcement agencies have internal equipment evaluation departments, this option would recognize evaluations by those departments as an acceptable basis for approval. This item would also allow certification of manufactured homes, RV's, and manufactured buildings that are typically evaluated by state agencies that evaluate those facilities to a combination of standards including the HUD Standards. Item 3 recognizes other possible methods as a basis for approval of unlisted equipment. Enforcement agencies across the country currently have a variety of "other" options used for their basis of approval for unlisted equipment including product evaluation by a local professional engineer or review of manufacturers test data. The procedures and parameters used by those enforcement agencies vary from jurisdiction to jurisdiction. Some require the non-test-lab certifiers to include the standard used to evaluate the equipment and an explanation of the process used to determine compliance. Some require peer review of the local evaluation. Some require the evaluation report to be sealed by a State Registered professional Engineer. Item 3 the evidence to be acceptable to the authority having jurisdiction which gives the local authority the ability to determine what type of evaluation and documentation is acceptable. While item 3 is very similar to simply requiring the equipment to be "approved", it does give the AHJ the NEC text that requires evaluation of the equipment by someone other than the local inspector. Local inspectors generally do not have access to product standards, test equipment, required training, nor time for evaluation of equipment construction and internal wiring. The proposed text requires an outside party to provide the equipment evaluation.

ARTICLE 490 — EQUIPMENT, OVER 600 VOLTS, NOMINAL

9-185 Log #4763 NEC-P09 **Final Action: Reject**
(490.2.High Voltage)

Submitter: Steven Bruno, Sabic Industrial Plastics
Recommendation: Add new text to read as follows:
Put high voltage and medium voltage in definitions for clarity because I consider medium voltage of 2001 to be high voltage.
A companion proposal has been sent to CMP 7 for 328.2.
Substantiation: Article 328 and Article 490 are confusing to the electrical industry.
Panel Meeting Action: Reject
Panel Statement: Submitter failed to provide suggested text for recommended change. The terms “high voltage” and “medium voltage” are used in many US and international standards, but the definitions of these terms are inconsistent within these standards. Defining these terms in NFPA 70 will merely add another set of definitions to the wide array of definitions already in existence. Currently, 490.2 defines high voltage as more than 600 V, nominal. For the purposes of the requirements in NFPA 70, this definition is adequate, since “over 600 volt” installations, such as “medium voltage” and “high voltage” systems, are treated similarly throughout the NEC with respect to installation requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-186 Log #1977 NEC-P09 **Final Action: Accept in Principle**
(490.2.Low Voltage (New))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal regarding “600 volts, and below” to what is more commonly used in the Code “600 volts, nominal, or less”.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Add definition: LOW VOLTAGE. For the purpose of this Article, 600 volts, nominal, or less.
Substantiation: There should be a definition of low voltage as pertaining to this article in 490.33 and 490.35.
Panel Meeting Action: Accept in Principle
Do not insert the proposed definition. In 490.33 retitle the section to read “Guarding of Energized Parts Operating at 600 Volts and Below Within Compartments.” In 490.35(B), revise as follows: “(B) Control Equipment. Where operating at 600 volts and below, control equipment, relays, … (remainder as in the present NEC).
Panel Statement: CMP-9 does not want to introduce the concept of a defined term “low voltage” because it would raise the low, medium, and high voltage definition problem that prompted the rejection of Proposal 9-1. This rewording eliminates the problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-187 Log #375 NEC-P09 **Final Action: Reject**
(490.3)

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as shown:
“Installation of electrical equipment, other than transformers covered in Article 450, containing more than 38 L (10 gal) of flammable oil in each ~~per~~ unit shall meet the requirements of Parts II and III of Article 450.”
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 9-27.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-188 Log #4204 NEC-P09 **Final Action: Reject**
(490.5)

Submitter: Donald R. Cook, Shelby County Development Services
Recommendation: Add new text as follows:
490.5 Equipment Approval. The equipment required or permitted by this Article shall be acceptable only if approved. 9-193 Log #3351 NEC-P09 **Final Action: Accept in Part**
(490.21(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(A)(1)(b) circuit breakers used to control-filled transformers in a vault shall be located in the vault or ~~be capable of~~ have identified means of operation from outside the vault.
(2)(1) An accessible mechanical or other ~~approved~~ identified means for manual tripping independent of control power.
(2)(3) If ~~capable of~~ having identified means ~~of~~ for being opened or closed manually while energized, main contacts that operate independently of the speed of the manual operation.
(2)(5) ~~A~~ An approved means of indicating the open and closed position of the breaker at the breaker and at the point(s) from which it ~~may~~ can be operated.
Add (2)(6): Where more than one circuit breaker is installed to provide for alternate connection to deferent supply conductors each circuit breaker shall be mechanically or electrically interlocked to prevent more than one circuit breaker from being closed at the same time. A prominent and durable sign shall be provided on or immediately adjacent to each circuit breaker with the following words or equivalent: WARNING Load side terminals may be energized by backfeed.
Substantiation: Edit. "Approved" is not necessarily the same as "identified". "Capable" is not specific.
Proposed (6) is similar to 404.6(C) exception for knife switches and 490.2(E).
Panel Meeting Action: Accept in Part
Accept the insertion of the words "in a vault" after the words "control oil-filled transformers" in 490.21(A)(1)(b). Accept the change in 490.21(A)(2)(1). Reject all other parts of the proposal.
Panel Statement: In 490.21(A)(1)(b) the change from "be capable of" is rejected because the proposed text is no clearer and the method may or may not meet the definition of "identified" in Article 100. In 490.21(A)(2)(3) the changes are rejected because the capability of the operating means can be determined at the time of inspections, such as by reviewing whether there is a stored energy mechanical operating mechanism that functions independently of the speed of the manual operator. The change in 490.21(A)(2)(5) is rejected because the type of indication, if any, can be easily determined at the time of inspection and no increased standard of product acceptance is required. The additional provision 490.21(A)(2)(6) is rejected because the ability to close multiple breakers at the same time is technically justified. The parallel wording to comparable applications operating at 600 volts and below is not correct, and the existence of such a requirement for lower voltages is insufficient substantiation to justify this change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-194 Log #1007 NEC-P09 **Final Action: Reject**
(490.21(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second paragraph: Where more than one switch or circuit breaker is installed with interconnected load terminals to provide for alternate connection to different supply conductors, the switches and circuit breakers shall be mechanically or electrically interlocked to prevent simultaneous, closing of more than one switch or circuit breaker and each switch and circuit breaker shall be provided with a conspicuous durable sign identifying ~~this hazard~~ the presence of more than one source of supply.
Substantiation: The exception for 490.21(B)(7) for fuses is appropriate for this section. Proposed wording for the sign is more specific than "identifying the hazard".
Panel Meeting Action: Reject
Panel Statement: The substantiation cites an exception dealing with access, not system design. No justification was provided to add circuit breakers to this section, which addresses load interrupters. The ability to close multiple load interrupter switches at the same time is technically justified.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-195 Log #1781 NEC-P09 **Final Action: Reject**
(490.21(E))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise heading and last sentence: LOAD INTERRUPTERS and CIRCUIT BREAKERS. Where more than one switch or circuit breaker or combination of both is installed with interconnected load terminals to provide for alternate connections to different supply conductors each switch and circuit breaker shall be provided with an interlock(s) to prevent more than the switch or circuit breaker being closed at the same time. A durable and conspicuous sign on the exterior front of each switch and circuit breaker indicating load terminals may be energized in the open (off) position.
Substantiation: Circuit breakers used for this function should be included. A sign alone is not sufficient to prevent a potential hazard.
Panel Meeting Action: Reject
Panel Statement: No justification was provided to add circuit breakers to this section, which addresses load interrupters. The ability to close multiple load interrupter switches at the same time is technically justified. The additional sign requirements are not necessary to deal with the hazard.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-196 Log #1006 NEC-P09 **Final Action: Accept in Principle in Part**
(490.22)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by providing specific text on "designed for the purpose" in the last sentence of this section.
This action will be considered by the panel as a public comment.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: Means shall be provided to completely isolate an item of equipment from supply conductors, including grounded conductors.
Substantiation: Complete isolation includes disconnection of grounded conductors and should be clearly indicated.
Panel Meeting Action: Accept in Principle in Part
Accept the principle that the concept of complete isolation should be clarified.
Reject the solution offered because it is diametrically opposite to the intent.
Revise 490.22 as follows:
490.22 Isolating Means.
Means shall be provided to completely isolate an item of equipment from all ungrounded conductors. The use of isolating switches shall not be required where there are other ways of de-energizing the equipment for inspection and repairs, such as draw-out-type metal-enclosed switchgear units and removable truck panels.
Isolating switches not interlocked with an approved circuit-interrupting device shall be provided with a sign warning against opening them under load.
A fuseholder and fuse, designed for the purpose, shall be permitted as an isolating switch.
Panel Statement: The intent of this section is to isolate equipment from ungrounded conductors. Isolation from a grounded conductor is not required. CMP-9 has clarified the text accordingly.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-197 Log #657 NEC-P09 **Final Action: Accept in Principle**
(Table 490.24)

Submitter: David L. Hittinger, IEC of Greater Cincinnati
Recommendation: In the heading of Table 490.24 the following text "Impulse Withstand, B. I. L" is used. B. I. L is an abbreviation that is not defined. Please define the abbreviation.
Substantiation: Users of the Code may not know what this abbreviation means. The NFPA Manual of Style provides guidance on the use of acronyms and abbreviations as found in 3.2.5.1.1. All acronyms and any abbreviations that are not in common use shall be spelled out with the acronym or abbreviation following in parentheses for the first use of the term in the document.
This may have been extracted material from the NESC. The term is used frequently in that Code as basic impulse insulation level or BIL.
Panel Meeting Action: Accept in Principle
Add a third line to the column header between "Impulse Withstand" and "B.I.L. (kV)" reading as follows: "Basic Impulse Level".
Panel Statement: This provides the reference required by the NFPA Style Manual. The definition of this term can be found in engineering handbooks and need not be actually explained in the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-198 Log #647 NEC-P09 **Final Action: Reject**
(Table 490.24, Note 2)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Recommendation: Add new text to read as follows:
For approach boundaries to live parts for shock protection, see NFPA 70E, Standard for Electrical Safety in the Workplace.
Substantiation: The approach boundaries of NFPA 70E, Table 130.2(E), are related to the minimum clearances referenced in Table 490.24 and this information will be helpful in understanding this relationship.
Panel Meeting Action: Reject
Panel Statement: This information might be appropriate to include in NFPA handbooks both on the NEC and also on 70E but does not belong in the NEC itself. The referenced note is not a fine print note; rather it is mandatory text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-198a Log #4314 NEC-P09 **Final Action: Accept in Principle in Part**
(490.40)

Submitter: Tim Rohrer, IRISS, Inc.
Recommendation: Revise text as follows:
430.40 Inspection Windows.
(A) Visual Inspection Windows. Windows intended for inspection of disconnecting switches or other devices shall be of a suitable transparent material.
(B) Infrared Inspection Windows. Windows intended for use with an infrared camera or imager to facilitate thermographic inspection of energized conductors and circuit parts of electrical equipment while keeping panel covers and doors closed, shall utilize materials which will maintain a stable and reasonably unchanging infrared transmission rate.
Substantiation: The assumed intent of the current requirement for an "Inspection Windows" to "be of suitable transparent material" is to ensure that the functionality of this critical feature of switchgear is not compromised, so that users are able to perform important visual inspections (as per 70E lockout/tagout requirements, etc). If a manufacturer or installer were to utilize a material in the visual inspection window which either provided poor transparency on day 1 or if the material's transparency degraded over a period of a few years, that material would by definition interfere with the safe and proper use of that equipment since the intended use of the inspection window would be compromised.
Just as the functional performance of a visual inspection window is critical to verification and troubleshooting of high-voltage gear, the functional performance of an infrared window is equally important to verification and troubleshooting of high voltage electrical equipment. Therefore if a manufacturer of high-voltage equipment will be including infrared windows on that equipment it is important that the infrared inspection window functions as reliably as the visual inspection window. Ie. the infrared inspection window should be able to transmit the infrared wavelengths in a consistent manner so the window itself does not compromise the thermographic inspection which could thereby lead to unsafe use of the equipment.
Infrared thermography as a troubleshooting tool is valued by NFPA as is evidenced in the many references to using thermography in the 70B Electrical Preventive Maintenance Standard. In fact, 70B section 20.17 goes into great detail with regard to the use of infrared thermography. Section 20.17.5.6 refers practitioners to the NETA temperature benchmarks which prescribe a course of action based on temperature differences. For example:
· Temperature difference of 1° to 3°C indicates a possible deficiency and warrants investigation

· Temperature differences of 4° to 15°C indicates a deficiency; repairs should be made as time permits

· Temperature differences of 16°C and above indicates a major deficiency; repairs should be made immediately

Obviously NFPA and NETA both see the importance of accurate temperature calculations to prescribe a course of action based on the condition of the equipment in question. This is similar to the importance which an accurate visual inspection would provide relative to inspecting whether or not a switch or contact was successfully disconnected prior to opening a panel cover or cabinet door.

Unfortunately, infrared windows pose a unique issue: whereas a user would be able to ascertain the condition of a visual inspection panel simply by looking through it (so that the user would understand that if visibility was restricted, additional care should be taken), the same cannot be said for an infrared window. Instead, the transmission rate (the ability of infrared wavelengths to pass through a material) of an infrared window cannot be determined simply by "looking through" the material with an infrared imager in practical field use. Therefore a thermographer could assume his transmission rate to be one value, he would calibrate his camera or software to compensate for that value, but if the transmission rate is actually a different value, then the temperature calculations will be wrong. As a result, an apparent difference in temperature of 7°C could be a real difference in temperature of 18°C if the window material was transmitting at less than the thermographer expected. The result of this error could cause a company to delay the repairs which are actually in urgent need.

The transmission rate in the visual light spectrum is what NFPA is referring to as suitably transparent. The transmission rate for an infrared window in the infrared spectrum is a similar issue with more significant consequences. The reality is that there are many optic materials which will maintain a stable transmission rate, while there are some others which will experience degradation in the transmission rate. Therefore, equipment manufacturers must utilize materials that will support the intended use of the inspection window.

Panel Meeting Action: Accept in Principle in Part

Accept the proposed revision to the title of 490.40 and reject the proposed 490.40(B) as follows:

490.40 <u>Visual</u> Inspection Windows.

Windows intended for <u>visual</u> inspection of disconnecting switches or other devices shall be of suitable transparent material.

Panel Statement: CMP-9 has clarified the intended application of this section. Windows that are transparent in the infrared spectrum are available as a design option.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-199 Log #4629 NEC-P09 **Final Action: Accept in Principle**
(490.41)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Provide wording following the section title to clarify the intended application and organization of the section, as follows:

Location of Industrial Control Equipment. Routinely operated industrial control equipment shall meet the requirements of (A) unless infrequently operated, as covered in (B).

(A) Control and Instrument Transfer Switch Handles or Pushbuttons. Control and instrument transfer switch handles or pushbuttons shall be in a readily accessible location at an elevation of not over 2.0 m (6 ft 7 in.).

Exception (unchanged from 2008 NEC)

(B) Infrequently Operated Devices. (unchanged from 2008 NEC)

Substantiation: This wording is more clear as to the intended application of this rule, and better structured. This proposal will also afford CMP 9 the opportunity to discuss whether further modifications are appropriate relative to permitted mounting heights in 490.41(B), which was the topic at a UL discussion relative to whether 404.8(A) limits apply in this section.

The issue of 490.41(B) is an interesting one, because it is an example of inadvertent outcomes when material moves from Chapter 7 to Chapter 4. Of course, this material was 710-24(I) Exception No. 2 and automatically modified what was then 380-8(a) through the operation of 90-3. The issue gets even murkier, however, because when it was an exception, it was an exception to what is now 490.41(A), and therefore only applied to equipment covered in (A). The title has changed, but the content of this subsection reads exactly the way it did prior to the Article 710 diaspora.

The current wording follows the action on the submitter's editorial Comment 13-54 in the 1999 cycle. In particular, the equipment covered in (B) that is proposed to be exempt from the vertical height limit must still be, as was the case prior to the 1999 NEC, "control and instrument transfer switchhandles or pushbuttons." To say otherwise would require the insertion of parent text in 490.41 that sets forth which subsection applies when. This proposal clarifies this question by its minor rarrangement of the material.

This leads to the question whether an isolating switch for a motor power circuit qualifies in the category of "control... switch handles". There is a jurisdictional problem, however, because this happens to be about medium-voltage motor equipment. Through the scope of Article 430, CMP 11 has exclusive jurisdiction over this equipment, in Parts VIII and XI of that article.

On the merits, this submitter is somewhat uncomfortable saying any isolating switch is "infrequently operated" in this context, because with the exception of an actual medium-voltage motor controller, almost no medium voltage equipment of is frequently operated in the way one usually thinks that phrasing describes. For example, during the submitter's tenure as the head electrician at a college, medium-voltage sectionalizing switches in the campus distributions would be operated perhaps once in five years, typically when an underground cable fault necessitated isolation of the faulted section and the reverse feeding of the remaining loads.

Every five years is, presumably, infrequent, but do we then reach the conclusion that any medium-voltage equipment, excepting only equipment handles requiring over 50 lbs of force to operate [see 490.41(A) Exception)], gets the height exception? This would seem counterintuitive. This section must be read in the context of 490.41(A), which does not suggest a general application to most across-the-line devices. Note that the "bus transfer switches" covered in 490.41(B) seem philosophically consistent with the busway switches covered in 404.8(A) Exception No. 1, so not much of a problem there. This proposal will provide a vehicle for more feedback from industrial users of this equipment.

Panel Meeting Action: Accept in Principle

Accept 490.41 as organized in this proposal, but the wording of (B) will be as accepted in Proposal 9-200.

Panel Statement: This will correlate with Proposal 9-200 and still meet the intent of the submitter.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-200 Log #1159 NEC-P09 **Final Action: Accept in Principle**
(490.41(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Revise text to read as follows:

(B) Infrequently Operated Devices. <u>If the</u> ~~O~~operating handles for ~~infrequently operated devices~~ such <u>devices</u> as drawout fuses, fused potential or control transformers and their primary disconnects, and bus transfer <u>and isolating</u> switches~~,~~ <u>are only operated infrequently, the handles</u> shall be permitted to be located where they are safely operable and serviceable from a portable platform.

Substantiation: Isolating switches of the type used in controllers over 600V are intended to isolate the controller for the purposes of maintenance and service after the load has been interrupted by a switching device (i.e. contactor). In most applications, these switches are infrequently operated. Isolating switches are, however. not specifically mentioned in the "such as" list of devices in 490.41(B), prompting some AHJ's to interpret that the 2.0 m maximum handle height of 404.8(A) applies. The purpose of this proposal is to clarify the applicability of 490.41(B) to isolating switches.

Note: See companion proposal to 404.8(A).

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(B) Infrequently Operated Devices. <u>Where</u> ~~O~~operating handles for ~~infrequently operated devices~~ such <u>devices</u> as drawout fuses, fused potential or control transformers and their primary disconnects, and bus transfer <u>and isolating</u> switches~~,~~ <u>are only operated infrequently, the handles</u> shall be permitted to be located where they are safely operable and serviceable from a portable platform.

Panel Statement: The panel action corrects a violation of the NEC Style Manual.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-201 Log #1568 NEC-P09 **Final Action: Accept**
(490.44(C))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered by Code-Making Panel 9 based upon the action of Code-Making Panel 1 taken on Proposal 1-63.

This action will be considered by the panel as a public comment.

Submitter: Stanley J. Folz, Henderson, NV

Recommendation: Revise text to read as follows:

(C) Switching Mechanism. The switching mechanism shall be arranged to be operated from a location outside the enclosure where the operator is not exposed to energized parts and shall be arranged to open all ungrounded conductors of the circuit simultaneously with one operation. Switches shall be <u>**a lockable disconnecting means.**</u> ~~capable of being locked in the open position. The provisions for locking shall remain in place with or without the lock installed.~~

Substantiation: This lockable disconnect concept is used through the code. One definition in Article 100 would harmonize its use in all Articles. This proposal was developed by a Task Group that was appointed by the NEC Technical Correlating Committee and consisted of Stanley J. Folz, Chair, Monte Ewing, Ralph Pritchard, Sondra Todd, and Randy Yasenchak.

A companion proposal has been submitted to Article 100 containing a new definition for "Disconnecting Means, Lockable."

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-202 Log #3414 NEC-P09 **Final Action: Accept**
(490.47)

TCC Action: The Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.
Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light and Power NEC Task Force
Recommendation: Revise text to read as follows:
490.47 Metal-Enclosed and Metal-Clad Service Equipment. Metal-enclosed and metal-clad switchgear installed as high-voltage service equipment shall include a ground bus for the connection of service-entrance cable shields and to facilitate the attachment of safety grounds for personnel protection. This bus shall be extended into the compartment where the service-entrance conductors are terminated.
Substantiation: Separate Proposals have been submitted to change the definitions of Service Cable, Service Conductors, and Service Equipment. This Proposal is intended to provide the Panel with information about the proposed changes and to provide a means to update corresponding affected text using the defined terms. The following is a listing of the proposed changes to the definitions and the technical substantiation for those changes:
Service-Entrance Cable. Service-entrance conductors made up in the form of a cable.
Service-Entrance Conductors. The conductors from the service point to the service disconnecting means.
Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service-entrance conductors to a building or other structure, or and otherwise designated area, and intended to constitute the main cutoff and control of the supply.
The aspect of Service and what constitutes Service, and related issues, has been the subject of comments and revisions for the last several code cycles. That issue has also been debated by Panel 1 vis-à-vis the NEC Section 90.2(B)(5) over the last several cycles and it was finally clarified in the 2005 NEC. The primary concept that has been carried forth is that only utilities supply service. That has also been carried forth via the definitions of “service drops” and “service laterals”. Those, too, are utility installed extensions of the services. What comes after the “point of delivery” or “the point of connection” are “service-entrance conductors,” either underground or overhead.
It is recognized, however, that the definitions of “service entrance conductors” (either overhead and/or underground) need to have the concept of “service point” added to ensure further clarity of the issue. As the TCC noted in its comments in the ROP for the 2008 NEC, the concept of “Service Drop” and “Service Lateral” are “by current definitions and code requirements, not limited to the ‘utility company side of the service point’.” These revised definitions (and corresponding changes to related NEC Sections that use these terms as well as “Service Drop” and “Service Lateral”) will clarify the application of NEC requirements.
By changing these definitions (and the corresponding Sections where the affected terms are used), these terms will be updated to correlate with existing definitions related to services and service entrances and capture the stated intent and understanding in the NEC.
Panel Meeting Action: Accept

14-8 Log #4438 NEC-P14 **Final Action: Accept**
(500.2)

TCC Action: The Technical Correlating Committee directs that the number, title and edition of the document from which this extract is taken be listed at the end of the extract in accordance with NEC Style Manual 4.3.2.3.
This action will be considered by the panel as a public comment.
Submitter: Eliana Beattie, ISA
Recommendation: Add new text to read as follows:
<u>**Combustible dust.** Any finely divided solid material that is 420 microns (0.017 in) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air.</u>
Substantiation: This definition is extracted from NFPA 499. The definition for combustible dust has been changed in a number of other NFPA documents. This change eliminates the dust size and creates confusion with the NEC and NFPA 499 considerations of a dust. For example, in NFPA 654, a combustible dust is now defined as: "Combustible Dust. A combustible particulate solid that presents a fire or deflagration hazard when suspended in air or some other oxidizing medium over a range of concentrations, regardless of particle size or shape." Inclusion of the proper historic definition for combustible dust upon which these NEC Articles and NFPA 499 are based will retain this important term without adding confusion.
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 14-9.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
OFFERDAHL, D.: The definition of combustible dust is covered in NFPA 499 which is reference in 500.4 (B). The classification of the area should be determined by professionals using NFPA 499. Once that is completed it is required to be documented in accordance with 500.4 (A) This process take place before the inspector or electrician gets involved. Placing the definition in 500.2 could create confusion that there is enough information that the electrician or inspector can classify the area. In result placing undue pressure from the user to have the area classify as a class 2 area or even worse to unclassified the area. If accepted at all, this proposal should be placed in 500.5c as a fine print note. Placing the definition as a fine print note would achieve the recommendations that submitter proposes. In addition enforces the fact that the responsibly of classification of the area is the responsibly of the owner or user.

14-9 Log #4311 NEC-P14 **Final Action: Accept**
(500.2.Combustible Dust)

Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Add the following new definition under 500.2:
<u>Combustible Dust. Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air.</u>
Substantiation: For many different reasons, the definition for combustible dust has been changed in a number of other NFPA documents. This change eliminates the dust size and creates confusion with the NEC and NFPA 499 considerations of a dust. For example, in NFPA 654, a combustible dust is now defined as "Combustible Dust. A combustible particulate solid the presents a fire or deflagration hazard when suspended in air or some other oxidizing medium over a range of concentrations, regardless of particle size or shape." Inclusion of the proper historic definition for combustible dust upon which these NEC Articles and NFPA 499 are based will retain this important term without adding confusion.
Panel Meeting Action: Accept
Accept the definition verbatim, but add the appropriate designation for extracted text so that the definition reads as follows:
<u>Combustible Dust. Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air. (***499***, 2008)</u>
Panel Statement: The added text complies with NFPA's Regulations Governing Committee Projects and NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
OFFERDAHL, D.: The definition of combustible dust is covered in NFPA 499 which is reference in 500.4 (B). The classification of the area should be determined by professionals using NFPA 499. Once that is completed it is required to be documented in accordance with 500.4 (A) This process take place before the inspector or electrician gets involved. Placing the definition in 500.2 could create confusion that there is enough information that the electrician or inspector can classify the area. In result placing undue pressure from the user to have the area classify as a class 2 area or even worse to unclassified the area. If accepted at all, this proposal should be placed in 500.5c as a fine print note. Placing the definition as a fine print note would achieve the recommendations that submitter proposes. 14-10 Log #1268 NEC-P14 **Final Action: Reject**
(500.2.Dusttight, Explosionproof Apparatus)

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW
Recommendation: Revise text to read as follows:
500.2 Definitions
~~**Dusttight.** Enclosures constructed so that dust will not enter under specified test conditions.~~
~~FPN: See ANSI/ISA-12.12.01-2000, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~
~~**Explosionproof Apparatus.** Apparatus enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.~~
~~FPN: For further information, see ANSI/UL 1203-1994, *Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.*~~
Substantiation: Definitions that are in Article 100 should not have to be repeated in Section 500.2 word for word as stated in the scope of Article 100. We will submit a proposal to move the FPN to Dusttight in 500.2 to Article 100's definition.
Panel Meeting Action: Reject
Panel Statement: It is appropriate for these definitions to be retained in Article 500.2, as they pertain directly to the subject matter of Chapter 5. There is no prohibition in the NEC or in 2.2.2.1 of the NEC Style Manual against definitions appearing in other articles of the code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-11 Log #2824 NEC-P14 **Final Action: Accept**
(500.2.Explosionproof Apparatus)

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:

Explosionproof Equipment ~~Apparatus~~. Equipment ~~Apparatus~~ enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

FPN: For further information, see ANSI/UL 1203-2006~~1999~~, *Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.*

Substantiation: Equipment is a defined term. Apparatus is included within the definition of equipment. Explosionproof equipment is a commonly used term to describe electrical equipment that is explosion protected by use of an explosionproof enclosure. Explosionproof apparatus is not in common use. Both terms are used in various places within the Code. This proposal corrects this inconsistency and is a companion to proposals in 100 and 500.7.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-12 Log #4425 NEC-P14 **Final Action: Accept**
(500.4(B))

Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:

FPN No. 1: Change the Instrumentation, Systems, and Automation Society (ISA) to ISA, the International Society of Automation
Substantiation: Update to ISA new name.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-13 Log #3972 NEC-P14 **Final Action: Reject**
(500.4(B), FPN 2)

Submitter: Gordon Robertson, American Petroleum Institute (API)
Recommendation: For ANSI/API RP500, Change the document date from ~~1997~~ to 2009.
Substantiation: ANSI/API RP 500, Recommended Practice for Classification of Locations of Electrical Installations at Petroleum Facilities is being updated. The 2009 revision is anticipated to be released well in advance of the release of the 2011 NEC.
Panel Meeting Action: Reject
Panel Statement: CMP-14 has taken action, in accordance with Panel Proposal 14-6a, to delete publication dates for referenced documents.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-14 Log #4298 NEC-P14 **Final Action: Reject**
(500.5(C)(1)(3), FPN)

Submitter: Mindy Wang, Ampco Safety Tools
Recommendation: Add new text as follows:
500.5 Classification of Locations

(C) Class II Locations.

(1) Class II, Division 1.

(3) In which Group E combustible dusts may be present in quantities sufficient to be hazardous.

FPN: Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution is necessary to avoid ignition and explosion. For additional information on safeguards against fire and explosion for combustible metal dusts, see NFPA 484 – 2009, Standard for Combustible Metals.
Substantiation: NFPA 484 is a standard containing guidelines for handling of combustible metals dust including magnesium and aluminum. Adding proposed text provides reference to an existing standard for information on safeguards against fire and explosion in handling of combustible metals, powders, and dusts.
Panel Meeting Action: Reject
Panel Statement: The information included in NFPA 484 does not address area classification.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-15 Log #1853 NEC-P14 **Final Action: Reject**
(500.5(C)(2)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: In which combustible dusts due to abnormal operations ~~may~~ is likely to be present in the air...remainder unchanged).
Substantiation: Edit. “May” is subjective and a term to be avoided per the Style Manual. “Likely” is defined as such a nature or circumstance as to make something probable and is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: The current text is correct. “May” is not subjective, but denotes physical possibility and is the appropriate term. The term “is likely to be” denotes probability, or a greater chance of occurrence.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-16 Log #868 NEC-P14 **Final Action: Reject**
(500.5(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:

Class III locations are those that are hazardous because of the presence of easily ignitible fibers/flyings ~~or where materials producing combustible fibers/flyings~~ are handled, manufactured, or used but in which such fibers/flyings are not likely to be in suspension in the air in quantities ~~sufficient~~ to produce ignitable mixtures. (remainder unchanged).
Substantiation: Edit. Proposed deletion is superfluous. “Easily” and “sufficient” are subjective and terms to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The change suggested by the submitter does not add clarity to the requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

NEAGLE, J.: I agree with the panel action and statement. However, the submitter introduces text (although shown incorrectly with struck-through formatting) which would clarify the current text of the code. Revise 500.5(D) as follows:
‘(D) Class III Locations. Class III locations are those that are hazardous because of the presence of easily ignitible fibers or where materials producing combustible flyings are handled, manufactured, or used, but in which such fibers/flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in 500.5(D)(1) and (D)(2).’

14-17 Log #910 NEC-P14 **Final Action: Reject**
(500.5(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete first sentence and substitute: Class III locations are those that are hazardous because of the presence of easily ignitable fibers/flyings in quantities likely to produce explosive mixtures.
Substantiation: “Flyings” should be noted to conform to (D)(1) and (2). This is a general type provision; (D)(1) and (2) are specific re: handled, manufactured, used, or stored. This provision specifies a Class III location where the combustible material is NOT likely to be in suspension in quantities sufficient for ignitable mixtures; why then would it be classified if there is no hazard? Proposal covers locations where ignitable material is suspended or accumulated in or on equipment and other surfaces.
Panel Meeting Action: Reject
Panel Statement: The criteria for Class III locations is ignition, not explosibility.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-18 Log #3864 NEC-P14 **Final Action: Accept in Part**
(500.6(B)(2))

Submitter: Mark Goodman, Jacobs Engineering Group
Recommendation: Add Fine Print Note after the paragraph.
FPN: Carbonaceous dusts that contain more than 8 percent total entrapped volatiles are not necessarily combustible. Testing of specific dust samples, following established ASTM testing procedures, is a method used to identify the combustibility of a specific dust and the need to classify those locations containing that material as Group F.
Substantiation: As currently written as extracted text from NFPA 499, 500.6(B)(2) has been widely interpreted to require that all carbonaceous dusts containing more than 8 percent total entrapped volatiles be identified as a Group F material. This is incorrect as the requirement only applies to “combustible” carbonaceous dusts. There are several factors in addition to the percent of volatiles necessary for a dust to be combustible, such as particle size. This FPN provides the reader with additional information about testing as a method to determine whether a specific dust is combustible and the need (or lack thereof) to classify a location as Group F. ASTM tests Include: ASTM E 1491 Autoignition Temperature of Dust Clouds and ASTM E 2021 Hot Surface Ignition of Dust Layers.
Panel Meeting Action: Accept in Part
Accept only the second sentence of the proposed Fine Print Note so that it reads:
FPN: Testing of specific dust samples, following established ASTM testing procedures, is a method used to identify the combustibility of a specific dust and the need to classify those locations containing that material as Group F.
Panel Statement: The first sentence is not accepted because it conflicts with the Group F definition in NFPA 499, which states that carbonaceous dusts having greater than 8 percent total entrapped volatiles are combustible. However, CMP-14 accepts the fact that testing might show otherwise. This action meets the submitters intent.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-19 Log #2825 NEC-P14 **Final Action: Accept**
(500.7(A))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
500.7 Protection Techniques. Section 500.7(A) through (L) shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.
(A) Explosionproof Equipment ~~Apparatus~~. This protection technique shall be permitted for equipment in Class I, Division 1 or 2 locations.
Substantiation: Equipment is a defined term. Apparatus is included within the definition of equipment. Explosionproof equipment is a commonly used term to describe electrical equipment that is explosion protected by use of an explosionproof enclosure. Explosionproof apparatus is not in common use. Both terms are used in various places within the Code. This proposal corrects this inconsistency and is a companion to proposals in 100 and 500.2.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-20 Log #4426 NEC-P14 **Final Action: Accept**
(500.7(K))

Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:
FPN No. 1: Change ANSI/ISA-12.13.01-2003 (IEC 61779-1 through -5 Mod), *Performance Requirements Combustible Gas Detectors* to ANSI/ISA-60079-29-1, *Explosive Atmospheres - Part 29-1: Gas detectors - Performance requirements of detectors for flammable gases*
FPN No. 3: Change ANSI/ISA-RP 12.13.02-2003 (IEC 61779-6 Mod), *Installation, Operation, and Maintenance of Combustible Gas Detection Instruments* to ANSI/ISA-60079-29-2, *Explosive Atmospheres - Part 29-2: Gas detectors - Selection, installation, use and maintenance of detectors for flammable gases and oxygen*
Substantiation: Change format to match actual ISA standards title.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-21 Log #4439 NEC-P14 **Final Action: Accept**
(500.7(K), FPN 4 (New))

Submitter: Eliana Beattie, ISA
Recommendation: Add new text to read as follows:
FPN No. 4: For further information, see ISA-TR12.13.03, Guide for Combustible Gas Detection as a Method of Protection,
Substantiation: There is currently no guidance on recommended practices for the use of combustible gas detection equipment as a method of protection. It is recommended that a reference to ISA-TR12.13.03 be provided within the text for such recommended practice. The ISA-TR12.13.03 is directly based upon API practices that have been applied for 30+ years in the petroleum industry.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-22 Log #1854 NEC-P14 **Final Action: Reject**
(500.7(K)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: In a building or structure located in or with an opening into a Class 1 Division 2 location where the interior does not contain a source of flammable ~~gas or~~ vapor or liquid, electrical equipment for unclassified locations shall be permitted where identified for the use.
Substantiation: Edit. The provision should include structures not deemed as “buildings”; “gas” is superfluous as it is a vapor. Liquid should be included. Equipment for unclassified locations should be identified for the use so as not to infer this section modifies other provisions of this Code.
Panel Meeting Action: Reject
Panel Statement: The proposal is rejected for the following reasons:
- The terms “gas” and “vapor” are correct. Liquids do not burn; their vapors do.
- The focus of the requirement is on buildings, which are enclosed. Structures may or may not be enclosed.
- Equipment is not identified for use in unclassified locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-23 Log #4297 NEC-P14 **Final Action: Reject**
(500.8, FPN 1)

Submitter: Mindy Wang, Ampco Safety Tools
Recommendation: Add the following new text:
500.8 Equipment.
FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance. Non-sparking tools may be needed to control ignition sources in classified locations.
Substantiation: · NFPA 30, Flammable and Combustible Liquids, Chapter 6, section 6.5.1 lists frictional heat or sparks as sources of ignition of flammable vapors and precaution shall be taken to control ignition sources.
· Recognizing the potential for steel tools to be an ignition source in flammable environment, the Occupational Safety & Health Administration (OSHA) provides guidance in booklet 3080 Hand and Power Tools, 2002 revised, “iron and steel hand tools may produce sparks that can be an ignition source around flammable substances. Where this hazard exists, spark-resistant tools should be used.”
· A few documented incidents related to steel tools in classified locations:
OSHA inspection # 127357804, Employee #1 was working in an infrared flare composition mixing building. He completed installation of a metal vacuum filter table in Bay #1, permanently anchoring it to the concrete floor by drilling holes in the concrete floor, installing concrete anchor bolts, and bolting down the table. Employee #1 then removed the eight anchor bolts from the concrete floor at the old table location by hitting them with a ball peen hammer until they broke. On the last anchor bolt, some residual flare composition on the bolt threads or on the floor ignited due to the impact of the hammer. Employee #1 suffered second- and third-degree burns over 80 percent of his body and later died.
OSHA inspection # 2272953, employees were assigned the job of tending a 100 gallon (water-jacket) reactor kettle of methyl methacrylate in the mixing room. Employee #1 was standing between Kettle #1 and Kettle #2, preparing to check the viscosity of the liquid product, employee#2 was standing 5 feet south of employee#1, asking him how the batch was progressing. Employee#1 used a metal wrench (Visegrips) to pry open the cover of kettle #1. The wrench handle struck the angle iron support for the agitator motor, producing a spark. Employee#2 noticed the spark, which was immediately followed by a massive “Fireball”. Employee#1 and #2 were engulfed in the fireball. Employee#2 came to the area of kettle #1 to assist the other employees and also received injuries. All three employees received first and second degree burns on their face, arms and abdomen. No bonding or grounding was used for the transfer of flammable liquids; nor were non-sparking tools provided.

OSHA violation inspection # 17697327, the employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or likely to cause death or serious physical harm to employees in that employees were exposed to: a) C-5 Process Unit; The metal hand tools being used by employees at the Class I Division 1 and 2 locations at the number 1 reactor were not the non-sparking type. Among other methods, one feasible and acceptable abatement method to correct this hazard is to use bronze non-sparking tools.

Adding proposed text provides additional information to control ignition sources in hazardous locations.

Panel Meeting Action: Reject

Panel Statement: This proposal is addressing an issue of mechanical sources of ignition, which are beyond the scope of the code.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-23a Log #CP1403 NEC-P14 **Final Action: Accept**
(500.8(A)(3))

Submitter: Code-Making Panel 14,

Recommendation: Revise the Fine Print Note to 500.8(A)(3) to read:

FPN: Additional documentation for equipment may include certificates demonstrating compliance with applicable equipment standards, indicating special conditions of use, and other pertinent information. Guidelines for certificates may be found in ANSI/ISA 12.00.02, Certificate Standard for AEx Equipment for Hazardous (Classified) Locations.

Substantiation: The referenced document provides additional information and clarification as to the contents of a certificate.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

WECHSLER, D.: While this action was taken on 500.8(A)(3), the same action also should be taken under sections 505.9 (A)(3) and 506.9(A)(3) as these deal with the same fpn subject materials.

14-24 Log #376 NEC-P14 **Final Action: Accept**
(500.8(B)(2)(b))

Submitter: James M. Daly, Upper Saddle River, NJ

Recommendation: Revise text to read as shown:

"Equipment that is required to be explosionproof shall incorporate seals in accordance with ~~per~~ 501.15(A) or (D) when the wiring methods of 501.10(B) are employed."

Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-25 Log #1857 NEC-P14 **Final Action: Reject**
(500.8(B)(3) and (6))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise: (3) Where specifically permitted in Articles 501 through 503, equipment or equipment in ~~general-purpose enclosures~~ enclosures identified for use in other than hazardous (classified) locations shall be permitted...(remainder unchanged).

(6) Where flammable gases or liquids flammable ~~liquid produced~~ vapors, ~~combustible liquid produced vapors~~ or combustible dusts are or likely to be present at the same time that their simultaneous presence shall be considered when determining the safe operating temperature of the electrical equipment.

Substantiation: Edit. Liquids are included in the FPN No. 1 and 2 for 500.5(B)(1). "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.

Panel Meeting Action: Reject

Panel Statement: CMP-14 rejects the proposal because no substantiation is offered for proposed changes to 500.8(B)(3). In 500.8(B)(6), the proposed changes eliminate an important criteria for combustible liquids.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

NEAGLE, J.: I agree with the panel action. However, the panel statement discussed at the ROP meeting included the following text:

'CMP-14 rejects the proposal because no substantiation is offered for proposed changes to 500.8(B)(3). In 500.8(B)(6), the proposed changes eliminate an important criteria for combustible liquids that have been heated above their flashpoint.'

14-26 Log #3188 NEC-P14 **Final Action: Reject**
(500.8(C)(4))

Submitter: A. W. Ballard, Cooper Crouse-Hinds

Recommendation: Revise the first sentence as follows:

"The marking shall specify the temperature class or operating temperature at a 40°C ambient temperature, or at the higher or lower upper ambient temperature if the equipment is rated and marked for an upper ambient temperature of ~~greater~~ other than 40°C.

Substantiation: Other proposals from this submitter to clarify that the ambient temperatures both inside as well as outside the default range are acceptable for the effective operation of equipment if the range is marked on it. Apparently, the principle is that even if the equipment will not function at 40°C, it should still remain safe and not constitute a source of ignition from high temperatures. This is not at all clear to the user who doesn't know that the marked ambient is for the effective operation, but that the equipment will still be safe at 40°C. Maybe the user thinks that the equipment will operate effectively up to the marked ambient, but will be safe regardless of the ambient.

Panel Meeting Action: Reject

Panel Statement: The substantiation for this proposal does not address all the elements of risk associated with the varying types of equipment covered by these requirements.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-27 Log #3189 NEC-P14 **Final Action: Reject**
(500.8(C)(4))

Submitter: A. W. Ballard, Cooper Crouse-Hinds

Recommendation: Add a new penultimate sentence as follows:

"...shown in Table 500.8(C). Electrical equipment designed for use in the ambient temperature range between –25°C and +40°C shall require no additional ambient temperature marking. Equipment for Class I and Class II..."

Substantiation: This sentence appears in 505.9(D)(1), except that there the lower limit is –20°C, and should be included in Article 500 for consistency.

Panel Meeting Action: Reject

Panel Statement: This proposed new sentence is redundant to the requirement in 500.8(C)(5), as accepted in Proposal 14-28.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-28 Log #3186 NEC-P14 **Final Action: Accept**
(500.8(C)(5))

Submitter: A. W. Ballard, Cooper Crouse-Hinds

Recommendation: Add a new first sentence: "Electrical equipment designed for use in the ambient temperature range between –25°C and +40°C shall require no ~~additional~~ ambient temperature marking."

Substantiation: This clarification in 505.9(D)(1) should be added, without the term "additional", to 500.8(C)(5). See related proposal to 505.9(D)(1).

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-29 Log #3187 NEC-P14 **Final Action: Reject**
(500.8(C)(5))

Submitter: A. W. Ballard, Cooper Crouse-Hinds

Recommendation: Add a new second sentence as follows:

"For equipment rated for a temperature range other than –25°C to +40°C, the marking shall specify the special range of ambient temperatures in degrees Celsius. Either limit of this special range shall be permitted to be inside or outside of the standard range. The marking shall include either the symbol "Ta" or "Tamb."

Substantiation: This paragraph has been interpreted as permitting a special ambient limit to be only outside of the default limits. This has caused difficulties for certain types of temperature-sensitive equipment within an explosion protected enclosure. As an example, explosion proof circuit breakers inside an explosionproof enclosure will not dissipate heat produced as readily as normal circuit breakers inside a sheet metal enclosure. This restricts the number of circuits to prevent nuisance tripping in a 40°C ambient. There is no logic in requiring equipment that will be used inside a building whose year-round temperature will be 24°C to operate effectively at a 40°C ambient. This does not change the requirement that it operate safely in a 40°C ambient.

See companion proposal for 505.9(D)(1).

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-26.

Panel Statement: The reorganization of this section has been made with modifications for clarity and consistency and incorporates Proposals 14-31 and 14-32.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
NEAGLE, J.: I agree with the panel action and statement. However, the third sentence of 500.8(E)(2) should be revised to read as follows:
'…Metric threaded entries into explosionproof equipment shall have a class of fit of at least 6g/6H and shall be made up with at least five threads fully engaged for Group C and Group D, and at least ~~not less than~~ eight ~~full~~ threads fully engaged for Group A and Group B…'.

14-31 Log #1477 NEC-P14 **Final Action: Accept in Principle**
(500.8(E)(1))

Submitter: Richard A. Janoski, Finleyville, PA
Recommendation: Revise text to read as follows:
Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, the following shall be used or required: listed conduit, conduit fittings, or cable fittings.
Substantiation: Incorrect use of punctuation has created a sentence that is difficult to interpret. The phrase "NPT threaded conduit or fittings," currently ends with a comma. The phrase is then followed by "listed conduit, conduit fittings, or cable fittings." This sentence currently reads as a long list, which it is not. The proposed text separates the code rule from the items that comprise the "approved for use" list.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 14-33 (Log #2826). CMP 14 points out that the referenced section should be 500.8(E)(1).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-34 Log #4630 NEC-P14 **Final Action: Reject**
(500.8(E)(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change "identified as being metric" to "marked as being metric."
Substantiation: The use of the word "identified" in this paragraph is almost certainly a misuse of a defined term in Article 100. Identified does not mean marked The point of this rule is to be certain that the end user is quite aware of a different threading style, as would be the case with a marking, or actual adapters can be provided with the equipment. The fact that the equipment may have a cut sheet that indicates its suitability of a particular use (identified per Article 100) does not meet the objective in this case.
Panel Meeting Action: Reject
Panel Statement: The use of the term "identified" in this context does not refer to the equipment and is, therefore, appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-35 Log #146 NEC-P14 **Final Action: Accept in Principle**
(500.8(F))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
(F) ~~Fiber~~ Optical Fiber Cables ~~Assembly~~. ~~Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly~~ Composite and conductive optical fiber cables shall be installed in accordance with the requirements of Articles 500, 501, 502, or 503, as applicable.
FPN: See 770.2 for definitions of optical fiber cables.
Substantiation: The Code should use consistent terminology throughout.
Article 770 definitions:
Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering.
Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors.
Conductive Optical Fiber Cable. These optical fiber cables contain non–current-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.
Acceptance of this proposal will result in correlation with Article 770.
Panel Meeting Action: Accept in Principle
(F) ~~Fiber~~ Optical Fiber Cables ~~Assembly~~. Where an ~~fiber~~ optical fiber cable ~~assembly~~ contains conductors that are capable of carrying current (composite optical fiber cable), the ~~fiber~~ optical fiber cable ~~assembly~~ shall be installed in accordance with the requirements of Articles 500, 501, 502, or 503, as applicable.
Panel Statement: The Panel agrees that using common terminology from Article 770 is correct, but the substantiation does not support adding conductive optical cable to Article 500. Also, the Fine Print Note is redundant and is, therefore, not accepted.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 501 — CLASS 1 LOCATIONS

14-36 Log #3352 NEC-P14 **Final Action: Reject**
(501.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:
WIRING METHODS. Wiring methods shall comply with 501.10(A) or 501.10(B).
(A) CLASS I DIVISION 1.
GENERAL In Class I Division 1 locations only the wiring methods in (a) through (d) shall be permitted.
(a) threaded rigid metal conduit or threaded steel intermediate metal conduit, with threaded fittings and connections.
Exception: Rigid nonmetallic conduit enclosing an equipment grounding conductor shall be permitted underground where encased in a minimum 50 mm (2 in.) concrete envelope and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to finished grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit with threaded fittings and connections shall be used for not less than the last 600 mm (24 in.) of the underground run to emergency and to the point of connection to an aboveground wiring method or enclosure.
(b) Type MI cable identified for the use and with fittings listed for the location.
(c) In establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons install and maintain the installation. Type MC-HL cable containing, an equipment grounding conductor, with a vapor tight continuous corrugated metal sheath, an overall jacket of identified polymeric material, and provided with fittings listed for the location.
(2) FLEXIBLE CONNECTIONS. Where necessary to employ flexible connections, flexible fittings listed for Class I Division 1 locations containing an equipment grounding conductor or flexible cord or cable in accordance with 501.140 shall be permitted where the length is not longer than necessary.
(3) BOXES and FITTINGS. All boxes, other enclosures and fittings shall be identified for Class I Division 1 locations.
Substantiation: Edit. Threaded fittings and connections should be specified. (See 342.42(A) and 344.42(A).) "Permitted" is not a requirement per 90.5. The reference to 514.8 Exception No. 2 and 515.8(A) are unnecessary. Installation and support of Type MI cable is covered in Article 332. The 24 in. requirement for RMC and IMC should be a minimum. Establishments other than industrial such as governmental should be included; the criteria should be maintenance and supervision, not the type of occupancy. All fittings such as straps and threaded conduit couplings do not have to be listed for Class 1.
The exception for (A)(1) is unnecessary.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation that supporting a problem with the current text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-37 Log #2827 NEC-P14 **Final Action: Accept in Principle**
(501.10(A))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action as it relates to 4.1.1 of the NEC Style Manual concerning references to entire articles.
This action will be considered by the panel as a public comment.
Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
501.10 Wiring Methods. Wiring methods shall comply with 501.10(A) or (B).
(A) Class I, Division 1.
(1) General. In Class I, Division 1 locations, the wiring methods in (a) through (d) shall be permitted.
(a) *Threaded rigid metal conduit or threaded steel intermediate metal conduit.*
Exception: Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less
than 600 mm (24 in.) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8,
Exception No. 2, and 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.
(b) *Type MI cable ~~with termination~~ terminated with fittings listed for the location.* Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(c) *In industrial establishments with restricted public access,* where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class I, Zone 1, or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and ~~provided~~ terminated with ~~termination~~ fittings listed for the application.

FPN: See 330.12 for restrictions on use of Type MC cable.

(d) *In industrial establishments with restricted public access,* where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable, listed for use in Class I, Zone 1, or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and ~~provided~~ terminated with ~~termination~~ fittings listed for the application, and installed in accordance with the provisions of Article 727.

~~FPN: See 727.4 and 727.5 for restrictions on use of Type ITC cable.~~

(2) Flexible Connections. Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for ~~Class I, Division 1 locations~~ the location or flexible cord in accordance with the provisions of 501.140 terminated with cord connectors listed for the location shall be permitted.

(3) Boxes and Fittings. All boxes and fittings shall be approved for Class I, Division 1.

Substantiation: Cable is *terminated* with fittings, but the fittings are not *provided* with the cable, they are sourced separately. Terminology is made consistent with other portions of the section.

Panel Meeting Action: Accept in Principle

Revise text as follows:

501.10 Wiring Methods. *Wiring methods shall comply with 501.10(A) or (B).*

(A) Class I, Division 1.

(1) General. *In Class I, Division 1 locations, the wiring methods in (a) through (d) shall be permitted.*

(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit.

Exception: Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8, Exception No. 2, and 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

(b) Type MI cable ~~with termination~~ terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class I, Zone 1, or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and ~~provided~~ terminated with ~~termination~~ fittings listed for the application.

Type MC-HL cable shall be installed in accordance with the provisions of Article 330.

~~FPN: See 330.12 for restrictions on use of Type MC cable.~~

(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable, listed for use in Class I, Zone 1, or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and ~~provided~~ terminated with ~~termination~~ fittings listed for the application, and installed in accordance with the provisions of Article 727.

~~FPN: See 727.4 and 727.5 for restrictions on use of Type ITC cable.~~

(2) Flexible Connections. *Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for ~~Class I, Division 1 locations~~ the location or flexible cord in accordance with the provisions of 501.140 terminated with cord connectors listed for the location shall be permitted.*

(3) Boxes and Fittings. *All boxes and fittings shall be approved for Class I, Division 1.*

Panel Statement: The panel agrees with the changes made by the submitter and has made additional changes to (c) to align with (d) to clarify that the requirements of Article 330 also apply to the installation of Type MC-HL cable. The panel has made additional changes in (2) to clarify that the type of protection applies to the terminal compartment.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-38 Log #2585 NEC-P14 **Final Action: Reject**
(501.10(A)(1))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete (A)(1) and substitute:

General. In Class I division 1 locations only the wiring methods in (a) through (d) shall be permitted.

(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit with threaded fittings and connections.

Exception: Rigid nonmetallic conduit containing an equipment grounding conductor shall be permitted where installed underground encased in a concrete envelope not less than 50 mm (2 in.) and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to finished grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit with threaded fittings and connections shall be used for not less than the last 600 mm (24 in.) of the underground run to emergence and the point of connection to the aboveground wiring method or enclosure.

Revise (b) to read as follows: Type MI cable identified for the use and with fittings identified for Class I Division 1 locations.

Revise (c) and (d): In ~~industrial~~ establishments with restricted public access, where the conditions of maintenance and supervision.... (remainder unchanged).

Revise (2): Flexible Connections. Where necessary to employ flexible connections ~~as at motor terminals~~, flexible fittings, listed for Class I division locations, or flexible cord or cable in accordance with 501.140 shall be permitted provided the length is not longer than necessary.

Revise (3) Boxes and Fittings. All boxes, other electrical enclosures and fittings shall be ~~approved~~ listed or identified for Class I division 1 locations.

Substantiation: "Permitted" does not impose a requirement per 90.5. Threaded fittings and connections should be specified (see 342.42(A) and 344.2(A)) The last 24 in. of RMC or IMC should be a minimum not an exact length. The point of connection aboveground may not be a raceway. Boxes and other enclosures (such as conduit bodies) should be identified (listing is one means). All fittings such as straps do not require listing. Establishments that are not industrial such as governmental should be permitted in (c) and (d); type of occupancy should not be a criterion.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text. The submitter's substantiation does not support the recommended action.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-39 Log #1855 NEC-P14 **Final Action: Reject**
(501.10(A)(1)(a) Exception)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise first sentence: Type PVC conduit and RTRC conduit shall be permitted underground where encased...(remainder unchanged).

Revise penultimate sentence: Threaded rigid metal conduit or threaded ~~steel~~ intermediate metal conduit with threaded fittings shall be used for not less than the last 600 mm (24 in.) of the underground run to the point of emergence ~~or to the point of connection to the aboveground raceway~~.

Substantiation: Present wording does not permit more than 24 in. to the point of emergence and implies the conduit will connect to aboveground raceways, whereas it may terminate in a switchboard or other enclosure, or connect to wiring methods other than raceways. "Threaded rigid metal conduit" does not exclude aluminum; why does IMC have to be steel?

Panel Meeting Action: Reject

Panel Statement: The substantiation erroneously interprets the requirement as limiting the length of the metal conduit to 24 in. The requirement only applies to the last 24 in. of the run. PVC conduit is addressed in 352.10(g), which refers the user to 300.5 and 300.50. The substantiation does not address the recommendation for adding "underground" or "with threaded fittings". The submitter is directed to 342.2 for the definition of IMC and to 344.10(A)(3) for permitted uses of aluminum RMC.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-40 Log #3567 NEC-P14 **Final Action: Reject**
(501.10(A)(1)(a) Exception)

Submitter: James R. Steed, Malcolm Pirnie, Inc.
Recommendation: Revise text to read as follows:
Exception: Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick. ~~and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade.~~ The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8, Exception No. 2, and 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the ~~underground~~ encased run to emergence. ~~or to the point of connection to the aboveground raceway.~~ An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.
Substantiation: As written the exception does not allow the use of PVC or RTRC embedded within concrete slabs or walls of buildings with Class I Division 1 or Division 2 rated interior spaces (501.10(B) for Division 2 areas references back to 501.10(A)).
The surface of a concrete slab or wall is the boundary of the rated area, the interior of the slab or wall is not included as part of the rated area.
The reference to “top of the conduit to grade” and “underground run” implies that this exception was originally intended to apply only to exterior locations. However, it is sometimes being interpreted by inspectors in the field as requiring 24” of cover between a PVC or RTRC conduit and a rated area regardless of the location (i.e. under/within a building floor slab) resulting in a failed inspections and construction delays while the issue is discussed.
Panel Meeting Action: Reject
Panel Statement: This exception is specific to underground installations and not applicable to walls or aboveground installations. The 24 in. of cover is essential to maintaining the level of protection.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-41 Log #927 NEC-P14 **Final Action: Reject**
(501.10(A)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
All boxes and fittings shall be ~~approved~~ listed for Class 1 Division 1.
Substantiation: Edit. “Approved” is not necessarily the same as “listed”; 501.30(B)(2), for example, requires listed fittings.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text. The panel has previously conducted extensive studies of the use of the terms “approved”, “listed”, and “identified”. “Approved” is the appropriate term within the context of this provision of the code. The substantiation reference of 501.30(B)(2) does not exist.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-42 Log #968 NEC-P14 **Final Action: Reject**
(501.10(A)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
All boxes and fittings, and enclosures shall be ~~approved~~ identified for Class I Division I.
Substantiation: Edit. Enclosures such as cabinets should be included. “Approved” per definition is not necessarily the same as “identified”.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-41.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-43 Log #2828 NEC-P14 **Final Action: Accept in Principle**
(501.10(B)(1))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(B) Class I, Division 2.
(1) General. In Class I, Division 2 locations, the following wiring methods shall be permitted:
(1) All wiring methods permitted in 501.10(A).
(2) Threaded rigid metal conduit, threaded steel intermediate metal conduit.
(3) Enclosed gasketed busways, enclosed gasketed wireways.
(4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, ~~or in cable tray systems~~ terminated with fittings listed for the type of protection. ~~PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.~~
(5) Type ITC and Type ITC-ER cable as permitted in 727.4 terminated with fittings listed for the type of protection.
(6) Type MI, MC, MV, or TC cable terminated with ~~termination~~ fittings listed for the type of protection~~, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings~~.
(7) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted.
Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the seal, which shall be located on the Division 2 side of the Division 1–Division 2 boundary.
Substantiation: This proposal reflects the current installation requirements of 725.154(D) that in conjunction with a companion proposal to revise 725.154(D) move the Classified location permitted wiring methods into Chapter 5, with the installation requirements for these types of cables retained for all users in 725.154(D). See companion proposal on 725.154(D).
Panel Meeting Action: Accept in Principle
Revise text as follows:
(B) Class I, Division 2.
(1) General. In Class I, Division 2 locations, the following wiring methods shall be permitted:
(1) All wiring methods permitted in 501.10(A).
(2) Threaded rigid metal conduit, threaded steel intermediate metal conduit.
(3) Enclosed gasketed busways, enclosed gasketed wireways.
(4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including ~~or~~ installation in cable tray systems. The cable shall be terminated with listed fittings. ~~PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.~~
(5) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
(6) Type MI, MC, MV, or TC cable, including installation in cable tray systems. The cable shall be terminated with listed fittings. ~~with termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings.~~
(7) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted.
Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the seal, which shall be located on the Division 2 side of the Division 1–Division 2 boundary.
Panel Statement: The panel has retained the language “in cable tray systems”, which was deleted in the proposal, in items (4) and (6) to permit their use, as provided in other articles in the code. The panel also clarified the language for listed fittings.

(501.10(B)(2))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(2) Flexible Connections. Where provision must be made for limited flexibility, one or more of the following shall ~~also~~ be permitted:
(1) Listed flexible metal fittings.
(2) Flexible metal conduit with listed fittings.
(3) Liquidtight flexible metal conduit with listed fittings.
(4) Liquidtight flexible nonmetallic conduit with listed fittings.
(5) Flexible cord listed for extra-hard usage and terminated ~~provided~~ with listed ~~bushed~~ fittings. A conductor for use as an equipment grounding conductor shall be included in the flexible cord.
Substantiation: Cable is *terminated* with fittings, but the fittings are not *provided* with the cable, they are sourced separately. Terminology is made consistent with other portions of the section.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-49 Log #926 NEC-P14 **Final Action: Reject**
(501.10(B)(2)(5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: Flexible cord ~~listed~~ identified for extra-hard usage and the application, and provided with ~~listed~~ identified bushed fittings.
Substantiation: Article 400 does not specify listing. Cords should be suitable for the use. Not all are oil or sunlight resistant; some are for electric vehicles.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text. The Panel has previously conducted extensive studies of the use of the terms “approved”, “listed”, and “identified”. “Listed” is the appropriate term within the context of this provision of the code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-50 Log #1792 NEC-P14 **Final Action: Reject**
(501.10(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: Nonincendive field wiring shall be permitted using any ~~of the~~ identified wiring methods permitted for unclassified locations.
In (B)(3)(I), add: “or raceways”.
Substantiation: Edit. All wiring methods permitted for unclassified locations may not be suitable. This provision may be deemed to modify “not permitted use”. Nonincendive field wiring should be permitted in separate raceways.
Panel Meeting Action: Reject
Panel Statement: Wiring is not identified for unclassified locations. The proposal is not clear as to where the phrase “or raceways” is to be inserted or for what reason.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
NEAGLE, J.: I agree with the panel action and statement. However, it is noted that the current text of 501.10(B)(3) does not permit the installation of separate nonincendive field wiring circuits in a single raceway using other than multiconductor cables (e.g., discreet conductors). Revise the second paragraph of 501.10(B)(3) as follows:
(Retain first paragraph and FPN).
‘Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:
(1) In separate cables
(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
(3) In multiconductor cables or raceways, where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)’

14-51 Log #4091 NEC-P14 **Final Action: Accept in Principle**
(501.15)

Submitter: Michael P. Walls, American Chemistry Council
Recommendation: 501.15: Add a new section (G) “Process Connected Equipment”, move all of the existing text under (F)(3) into this section, and then add the following new statement as a new paragraph following the statement “Process-connected equipment that is listed and marked “Dual Seal” shall not require additional process sealing when used within the manufacturer’s ratings”.
In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation secondary seals shall not be required between devices containing a primary seal and conduit or cable seals, where suitable means are provided to address failure of a single component in the device containing the primary seal which could allow the abnormal passage of process fluids into the device.
Substantiation: The revised text provides the needed flexibility required an industrial applications to address unique installations in which some processing conditions may have the potential for seal failures but for which means other than the use of a secondary seal can be used quite effectively to prevent the process fluid from contacting the device electronics. Examples of alternative methods include the use of a short transition section of cable, or provisions of an air-gap.
Panel Meeting Action: Accept in Principle

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-52 Log #1978 NEC-P14 **Final Action: Reject**
(501.15(B)(2) Exception No. 4)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise condition (2): The conduit system segment is located entirely in outdoor locations not enclosed by solid walls or structures which impede air circulation.
Substantiation: Outdoor locations may be closed in by walls or structures that affect air circulation.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-53 Log #925 NEC-P14 **Final Action: Reject**
(501.15(C)(6))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
The cross sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross section area of a rigid metal conduit or intermediate metal conduit of the same trade size...”. (remainder unchanged)
Substantiation: Edit. The number of conductors in IMC may vary from RMC.
Panel Meeting Action: Reject
Panel Statement: CMP-14 in writing this requirement intentionally used RMC because the inside diameter is smaller and is, therefore, more conservative.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-54 Log #4631 NEC-P14 **Final Action: Reject**
(501.15(D)(1) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
Cables with twisted pairs of conductors shall not require the separation of individual twisted pairs, and cables with shielding over individual twisted pairs shall not require the removal of the shielding material, provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.
Substantiation: The existing wording of this exception fails to take into account the fact that shielding may be applied to each pair individually, or to the entire group of twisted pairs (usually four pairs in the case of common Ethernet cabling, for example) taken collectively. The product listing for this mastic and the installation instructions that come with it only cover shielding on the individual pairs. This submitter has learned that this was the only form the panel considered in writing this part of the exception. If the shielding is applied just under the cable jacket and over the entire group of twisted pairs, that cable (unless flooded and therefore covered in a different part of this section) will be capable of gas migration. This proposal limits the application of this exception to the types of cabling for which this procedure is safe.
Panel Meeting Action: Reject
Panel Statement: The current wording covers this condition regardless of whether a means of sealing is approved. Also, the proposed wording is limited to twisted pairs of cables only, whereas the existing language addresses all types of shielded cables - pairs, triads, quads, etc.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-55 Log #3190 NEC-P14 **Final Action: Reject**
(501.15(D)(2))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Add a new paragraph below the present exception as follows:
"Cables shall be sealed at the point at which they leave the Division 1 location".
Add a new Exception as follows:
"Exception: Where cable is sealed at the termination point."
Substantiation: The present text dates back to when the only cable allowed in Class I, Division 1 had to be in conduit. When MC (now MC-HL) cable was allowed without conduit in the early '90s, no provision was made for boundary seals. This proposal replicates the requirement in 505.16(B)(8) that requires a boundary seal for cable. It also proposes the same exception, which is necessary because there is no other feasible way to seal MC cable except at a termination.
Panel Meeting Action: Reject
Panel Statement: This is already addressed by the termination requirements for Division 1 in 501.15(D)(1).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-56 Log #3191 NEC-P14 **Final Action: Reject**
(501.15(D)(2))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Revise the last sentence of the Exception to read:
"*For shielded, twisted pair cables...*".
Substantiation: As I recall, the discussion when this exception was added was about shielded, twisted pair cables. There are listed means to seal them properly inside an enclosure. There are, however, cables with twisted pairs or individual conductors with the shielding around the entire bundle. As written, the exception would allow sealing around the shielding of the entire bundle of twisted pairs or individual conductors. I do not think this was envisioned and can not believe such a seal could be properly made.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-54.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-57 Log #4632 NEC-P14 **Final Action: Reject**
(501.15(D)(2) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise the last sentence to read as follows: "Cables with twisted pairs of conductors shall not require the separation of individual twisted pairs, and cables with shielding over individual twisted pairs shall not require the removal of the shielding material."
Substantiation: The existing wording of this exception fails to take into account the fact that shielding may be applied to each pair individually, or to the entire group of twisted pairs (usually four pairs in the case of common Ethernet cabling, for example) taken collectively. The product listing for this mastic and the installation instructions that come with it only cover shielding on the individual pairs. This submitter has learned that this was the only form the panel considered in writing this part of the exception. If the shielding is applied just under the cable jacket and over the entire group of twisted pairs, that cable (unless flooded and therefore covered in a different part of this section) will be capable of gas migration. This proposal limits the application of this exception to the types of cabling for which this procedure is safe.

14-58 Log #924 NEC-P14 **Final Action: Reject**
(501.15(F)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "approved" to "identified".
Substantiation: Edit. "Identified" is more specific than "approved".
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text. The panel has reviewed all of the editorial proposals presented by the submitter and one or more of the following statements apply to the specific proposal,
(1) The panel has previously conducted extensive studies of the use of the terms "approved", "listed", and "identified". The term used in the current text is appropriate within the context of this provision of the code.
(2) The current text is correct. "May" is not subjective, but denotes physical possibility and is the appropriate term. The term "is likely to be" denotes probability, or a greater chance of occurrence.
(3) The word "suitable" as used in this section is not unenforceable and does not create confusion, as indicated in the requirements of the NEC Style Manual. As such, it does not need to be replaced.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-59 Log #4440 NEC-P14 **Final Action: Accept in Principle**
(501.15(F)(3))

Submitter: Eliana Beattie, ISA
Recommendation: Add the following at the end of the section:
"FPN: For construction and testing requirements for dual seal process, connected equipment, refer to ANSI/ISA-12.27.01-2003, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids. "
Substantiation: FPN provides reference standard for process sealing requirements. This change will make 501.15 agree with the equivalent provisions of 505.16.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 14-60.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-60 Log #4441 NEC-P14 **Final Action: Accept in Principle**
(501.15(F)(3))

TCC Action: The Technical Correlating Committee directs that the publication date of the ANSI document be included in the text as required by the Manual of Style for NFPA Technical Committee Documents Section 2.3.1.2.4 which requires dates of publication for referenced documents.
In addition, the Technical Correlating directs that the panel revise the meeting action text to comply with the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Eliana Beattie, ISA
Recommendation: Modify the existing text as follows:
Process-connected equipment that is listed and marked "Single Seal" or "Dual Seal" shall not require additional process sealing when used within the manufacturer's ratings.
FPN: For construction and testing requirements for single and dual seal process, connected equipment, refer to ANSI/ISA-12.27.01-2003, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids.
Substantiation: The provisions of ANSI/ISA-12.27.01 include both construction and performance requirements for single and dual sealed electrical equipment. The additional requirements for single seal equipment include both pressure and temperature cycling, followed by a leakage and burst test.
Panel Meeting Action: Accept in Principle
Delete 501.15(F)(3) and create a new section 501.17 to read:
501.17 Process Sealing This section applies to process connected equipment which includes, but is not limited to, canned pumps, submersible pumps, flow, pressure, temperature, or analysis measurement instruments. A process seal is a device to prevent the migration of process fluids from the designed containment into the external electrical system. One of the following means shall be provided to prevent process fluids from entering the electrical raceway or cable system:
(1) Process connected electrical equipment that incorporates a single process seal, such as single compression seal, diaphragm, or tube to isolate flammable or combustible fluids from entering a conduit or cable system capable of transmitting fluids, shall be provided with an additional means to mitigate a single process seal failure. The additional means may include, but is not limited to the following:
a. A suitable barrier meeting the process temperature and pressure conditions that the barrier will be subjected to upon failure of the single process seal. There shall be a vent or drain between the single process seal and the suitable barrier. Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.
b. A listed Type MI cable assembly, rated at not less than 125 percent of the process pressure and not less than 125 percent of the maximum process temperature (in degrees Celsius), installed between the cable or conduit and the single process seal.
c. A drain or vent located between the single process seal and a conduit or cable seal. The drain or vent shall be sufficiently sized to prevent overpressuring the conduit or cable seal above 6 in. water column (1493 Pa). Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.
(2) Process-connected electrical equipment that is listed and marked "single seal" or "dual seal".
FPN: For construction and testing requirements for process sealing for listed and marked "single seal" or "dual seal" requirements refer to ANSI/ISA-12.27.01, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids.
Panel Statement: The revised text more clearly states the proposed requirements for process sealing.
Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

COSPOLICH, J.: Revise Panel Meeting Action wording as follows:

In new Section 505.26(1) a., change the wording, "..., an audible whistle,..." to read "..., an audible indication,...".

In new Section 505.26(1) b., change the wording, "...and not less than 125% of the maximum or minimum process temperature (in degrees Celsius),..." to read "...and not less than 125% of the maximum or minimum process temperature (in degrees Celsius),...".

In new Section 505.26(1) c., change the wording, "...above 6 in. water (1493 Pa). Indication of the single process seal failure shall be provided by visible leakage, an audible whistle,..." to read "...above 1493 Pa (6 in. water). Indication of the single process seal failure shall be provided by visible leakage, an audible indication,...".

Ballot Results: Affirmative: 14

14-64 Log #3309 NEC-P14 **Final Action: Reject**
(501.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: <u>Electrical</u> wiring and equipment in Class 1 Division 1 and 2 locations shall be grounded ~~as specified in Article 250~~ ~~and with~~ the requirements in 501.30(A), 501.30(B) <u>shall apply</u>.
Substantiation: Article 250 already applies and has provisions which are alternatives or exceptions to grounding which do not appear to be intended to apply. Many sections simply state "shall be grounded"... Similar requirements worded differently may cause confusion per 3.3.5 of the Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63. The substantiation does not provide a reason for adding the word "electrical". Section 4.1.1 of the NEC Style Manual allows references to code articles where additional conditions are specified.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-65 Log #2587 NEC-P14 **Final Action: Reject**
(501.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

TYPES of EQUIPMENT GROUNDING <u>and BONDING CONDUCTORS.</u> Flexible metal conduit<u>,</u> ~~and~~ liquidtight flexible metal conduit <u>and flexible metal fittings</u> shall not be used as the sole ground-fault current path. ~~Where equipment bonding jumpers are installed they shall comply with 250.102.~~ Exception in Class I Division 2 locations, ~~the~~ <u>a wire-type equipment grounding or</u> bonding conductor shall ~~be permitted to be deleted~~ <u>not be required</u> where all of the following conditions are met:

(1) ~~Listed~~ <u>L</u>iquidtight flexible metal conduit 1.8 m (6 ft) or less in length ~~with fittings listed from grounding~~ is used.

(2) Overcurrent protection in the circuit is limited to 10 amperes or less. The load is not a power ~~utilization~~ <u>or lighting</u> load.

Substantiation: Edit. The heading should include bonding conductors addressed in the text. Since the conduit is a grounding and bonding conductor the omission should refer to wire types. The grounding or bonding conductor cannot be deleted unless first installed. Fittings are already required to be listed in the respective articles. "Power" infers a particular type of load such as one that is not lighting or control Section 250.102 already applies, as do other requirements of Article 250, which are not referenced.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-66 Log #3078 NEC-P14 **Final Action: Accept**
(501.30(B))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(B) Types of Equipment Grounding Conductors. Flexible metal conduit and liquidtight flexible metal conduit shall <u>include an equipment bonding jumper of the wire type, in compliance with 250.102.</u>~~not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.~~
Exception: Text to remain unchanged.
Substantiation: Because many things (such as earth itself) are types of ground fault current paths [250.2], the existing language doesn't really tell the code user what the requirement is. This revised language makes it much clearer.
Panel Meeting Action: Accept

(501.40)

Submitter: Alan Chech, Alan Chech Electrical Seminars
Recommendation: Delete section 501.40.
Substantiation: All multi-wire branch circuits are now required by 210.4(B) to be disconnected simultaneously.
Panel Meeting Action: Reject
Panel Statement: This multi-wire branch circuit requirement must be retained due to its importance. This is directed at prevention of fire and explosion as well as personnel safety, as addressed in 210.4. These two sections are not in conflict.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-68 Log #545 NEC-P14 **Final Action: Reject**
(501.40)

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Delete this section.
~~501.40 Multiwire Branch Circuits.~~
~~In a Class I, Division 1 location, a multiwire branch circuit shall not be permitted.~~
~~*Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.*~~
Substantiation: To conform to the Style Manual. Section 210.4(B) already requires the disconnecting simultaneously of all ungrounded conductors or multiwire branch circuit and applies per 90.3.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-69 Log #569 NEC-P14 **Final Action: Reject**
(501.40)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Delete text as follows:
~~501.40 Multiwire Branch Circuits.~~
~~In a Class I, Division 1 location, a multiwire branch circuit shall not be permitted.~~
~~*Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.*~~
Substantiation: Section 210.4(B) requires all ungrounded conductors of multiwire branch circuits to be provided with a means of simultaneous disconnection at the point where the branch circuit originates. This makes the requirement and Exception in 501.40 unnecessary because Chapters 1-4 have general application.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-70 Log #3210 NEC-P14 **Final Action: Reject**
(501.40)

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Delete 501.40.
This is a companion proposal with 502.40, 505.21, and 506.21.
Substantiation: Since 210.4(B) now requires all multiwire branch circuits to "be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates", 501.40 is redundant.
The deletion has been suggested by some, but it will likely be rejected because 210(B) is a requirement for personnel protection and could at some point be changed. The requirement here is for prevention of fire and explosion. In either case, this will get CMP 14 on record.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-71 Log #3675 NEC-P14 **Final Action: Reject**
(501.40)

Submitter: Mark Smythe, Smythe Electric Inc.
Recommendation: Delete 501.40 and its associated exception in its entirety.
Substantiation: 501.40 is redundant as new 2008 210.4(B) does already encompass the intent of 501.40.
210.4(B) Disconnecting Means. "Each multiwire branch circuit shall be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates."
Panel Meeting Action: Reject

Ballot Results: Affirmative: 14

14-75 Log #1277 NEC-P14 **Final Action: Reject**
(501.100(B))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Add new text to existing text to read:
(B) Class I, Division 2. In Class I, Division 2 locations, transformers ~~and capacitors~~ shall comply with 450.21 through 450.27. <u>Transformers shall be one of the following:</u>
<u>(1) Identified for Class I, Division 1 or 2 locations.</u>
(2) <u>Of a type that has been tested in order to determine the marked operating temperature or temperature class (T Code).</u>
<u>(3) Marked with the maximum exposed surface temperature, including hotspots of open, dry-type transformer windings. The winding hotspot shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved.</u>
<u>Capacitors shall comply with 460.2 through 460.28.</u>
Substantiation: There are many instances today where 150 deg. C temperature rise transformers are being installed in hazardous areas. The problem is for example, a 40 deg. C ambient (which is fairly common), plus a 150 deg. C rise on the transformer, plus a 30 deg. C hotspot which typically is allowed, the exposed winding temperature can be 220 deg. C. Transformers like this are being installed in locations that would require a maximum surface temperature of 160 deg. C, (a T3C area) for example, or other areas where the temperature of the transformer is exceeding 80 percent of the ignition temperature of the gas involved. Even though logically an AHJ could use Section 500.8(C) to enforce this violation, it is not readily apparent to some that are applying 501.100 that heat is additive and they need to follow more than just Art. 450. A marking on the transformer would make this easier for design engineers, inspectors, and electricians to apply this section properly. This would also be in line with rules required for heaters and luminaires.
The other part of this proposal is to reference applicable parts of Art. 460 for capacitors, since Art. 450 doesn't really have anything to do with capacitors in Class I, Div. 2 locations.
Panel Meeting Action: Reject
Panel Statement: This submitter's concern is already addressed by 500.8(D)(1).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-76 Log #905 NEC-P14 **Final Action: Reject**
(501.105(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
(B)(1) Exception: ~~General purpose~~ Identified enclosures other than those specified in 501.105(A) shall be permitted... (remainder unchanged)
(B)(2) Exception: ~~General purpose~~ ~~type~~ Identified enclosures other than those specified in 501.105(A) shall be permitted.. (remainder unchanged).
(B)(3), last sentence: ~~General purpose type~~ Identified enclosures other than those specified in 501.105(A) shall be permitted.
(B)(4) ~~General Purpose~~ Other Assemblies. Where an assembly is made up of components for which ~~general purpose~~ enclosures are acceptable as provided in the exceptions for 501.105(B)(1), (2), and (3), a single enclosure shall be acceptable for the assembly... (remainder unchanged).
(B)(5) Fuses. Where ~~general purpose~~ enclosures permitted by 501.105(B)(1) through (B)(4) are used, fuses for overcurrent protection of instrument circuits not likely to be overloaded ~~not subject to overloading in normal~~ use shall be permitted to be ~~mounted~~ installed in ~~general purpose~~ such enclosures if each fuse is ~~preceded with a~~ supplied by a switch or circuit breaker complying with 501.105(B)(1).
(B)(6)(3): The power supply flexible cord or cable does not exceed 900 mm (3 ft) is ~~listed for~~ an extra-hard usage type identified for the application or hard-usage type identified for the application ~~if protected by location~~ and is supplied ~~through~~ by an attachment plug and receptacle of the locking and grounding type. (remainder unchanged).
Substantiation: "General purpose" is not defined; is it intended to prohibit or accept other types which may be suitable such as weatherproof watertight, dusttight, etc.? Article 400 does not specify flexible cords (or cables which may be suitable) to be listed. Flexible cords should be identified for the use such as wet locations, oil, sunlight resistance, and not for electric vehicle charging.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text. See also Proposal 14-30.

Recommendation: Revise text to read as follows:
Connections. ~~To facilitate replacements p~~Process control instruments shall be permitted to be connected through a flexible cord in accordance with 501.140(B), a locking type and grounding type attachment plug and receptacle, provided all the following conditions apply:
(1) A switch or circuit breaker complying with 501.105(B) is provided that disconnects all ungrounded conductors supplying the receptacle. ~~So that the attachment plug is not depended on to interrupt current.~~
(2) The rated current and voltage of the process control instruments do not exceed 3 amperes ~~at~~ and 120 volts, nominal.
(3) The power supply flexible cord does not exceed 900 mm (3 ft), is of a type ~~listed for~~ identified for extra-hard usage or hard usage and the application, and is supplied by an attachment plug and receptacle of the locking and grounding type.
(4) No change (5) ~~The receptacle carries~~ A permanent and durable label is provided immediately adjacent to the receptacle warning against unplugging under load.
Substantiation: Edit. The purpose of the rule is irrelevant, most provisions do not provide reasons. A circuit breaker should also be suitable for disconnection and its exact function indicated. (B)(6)(2) should clearly relate to instruments and their rated current and voltage. Article 400 does not require listing. Cords should be identified for the use; electric vehicle cable types are not suitable for this use, others may not be suitable for wet or oily environments or sunlight resistance.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-79 Log #2218 NEC-P14 **Final Action: Reject**
(501.115(B)(3))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Recommendation: Revise as follows:
(3) Fuses. For the protection of motors, appliances, and lamps, other than as provided in 501.115(B)(4), standard plug or cartridge fuses shall be permitted, provided they are:
(1) placed within enclosures identified for the location, or
(2) ~~fuses shall be permitted if they are~~ placed within general-purpose enclosures~~, and~~ if they are of a type in which the operating element is immersed in oil or other approved liquid, or the operating element is enclosed within a chamber hermetically sealed against the entrance of gases and vapors, or
(3) placed within general-purpose enclosures, and the fuse is a nonindicating, filled, current-limiting type and the fuse cannot be removed while energized.
Substantiation: Even though safe work practices dictate that fuses shouldn't normally be removed while energized, there are cases for example, in Class I, Div. 2 locations a light fixture with an in-line fuse may be opened under load because it may be used as a disconnecting means. The fuse may be OK since it is a filled, current limiting type, but there can be an arc when opening the fuseholder which may cause a problem.
The remainder of the changes is suggested to make the section easier to understand instead of one, long, run-on sentence.
Panel Meeting Action: Reject
Panel Statement: The National Electrical Code is an installation code, not a maintenance document or safe work practice. See 90.1(C) of the code. The submitter is directed to NFPA 70E. The submitter is also suggesting a type of construction for the fuse that is impractical to implement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-80 Log #603 NEC-P14 **Final Action: Accept in Principle**
(501.125(B))

Submitter: William G. Lawrence, Jr., S. Yarmouth, MA
Recommendation: Revise text to read as follows:
The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum surface temperature [based on a 40°C ~~(104°F)~~ or higher marked ambient] shall be permanently marked on a visible nameplate mounted on the motor.
Substantiation: 500.8(B)(5) no longer permits degrees Fahrenheit for ambient temperature marking. Maintaining the °F here is misleading.
500.8(B)(4) specifies that the operating temperature be determined "at a 40°C ambient temperature or at the higher ambient temperature if the equipment is rated and marked for an ambient temperature greater than 40°C." The current wording of 501.125(B) would allow the maximum surface temperature of a space heater on a motor rated and marked for an 85°C ambient to be determined at 40°C. This would result in an unsafe condition as the true surface temperature of the heater would be higher than the marking would indicate.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum space heater surface temperature [based on a 40°C ~~(104°F)~~ or higher marked ambient] shall be permanently marked on a visible nameplate mounted on the motor.
Panel Statement: The modification made clarifies that the surface temperature marked is that of the space heater, not the motor itself.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-81 Log #3211 NEC-P14 **Final Action: Reject**
(501.130(B)(3))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: After first sentence, add the following:
"Threaded joints shall be provided with set screws or other effective means to prevent loosening."
Substantiation: This requirement is in (A)(3) for Class I, Division 1 luminaires and should apply to Division 2 luminaires as well.
Panel Meeting Action: Reject
Panel Statement: The substantiation does not state why a set screw is a necessity in a Division 2 location. The equipment requirements for Division 1 locations are more restrictive than for Division 2 locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-82 Log #1838 NEC-P14 **Final Action: Reject**
(501.140)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: FLEXIBLECORDS and PORTABLE POWER CABLE.
(A) Flexible cords and portable power cable shall be permitted:
(1) For connection between ~~portable lighting equipment~~ portable utilization equipment and the fixed portion of their supply circuit where conditions of maintenance and supervision ensure that only qualified persons install and service the installation.
(2) For that portion of the circuit where the fixed wiring methods of 501.10
(A) cannot provide the necessary degree of movement ~~for fixed and mobile utilization equipment~~, and the flexible cord or portable power cable is not likely to be subject to physical damage or destructive conditions or is protected by identified means. ~~location or by a suitable guard from damage and only in industrial establishments where conditions of maintenance and engineering supervision ensure that only qualified persons install and service the installation.~~
(3) No change.
(4) No change.
(B) INSTALLATION. Where flexible cords or portable power cables are used they shall comply with all of the following:
(1) Be type G, G-GC, PPE, S, SE, SEW, SEO, SEOW, SO, SOW, SOO, SOOW, ST, STW, STO, STOW, or STOO, and where applicable, identified for wet locations, oil resistance, and sunlight resistance.
(2) ~~Contain in addition to conductors of the circuit an equipment grounding conductor complying with 400.23.~~
(3) Be connected to terminals and supply conductors in ~~an approved manner~~ accordance with 110.14.
(4) Be ~~supported by clamps or other suitable means~~ installed in such a manner that there is no tension on the terminal connections or be provided with an identified means of strain relief.
(5) Be provided with ~~suitable~~ conduit seals where the flexible cord or portable power cable enters ~~boxes, fittings or~~ enclosures of the explosion-proof type.
Delete exception to (5).
(6) Be of one continuous length.
FPN no change.
Substantiation: Portable power cables should be included. Utilization equipment includes lighting equipment. "Fixed and mobile" is superfluous. Maintenance and supervision should be the criteria, not only for industrial establishments. The proposed type of cords and cables covers the suitable types of Article 400. Equipment grounding conductors are already covered by 400.23 which applies. An "approved" manner is not necessarily the same as 110.14. Seals should be conduit seals, "suitable" is subjective and a term to be avoided per the Style Manual. "Boxes and fittings" is superfluous; covered by "enclosures".
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text. In addition, portable power cables are a subset of flexible cords and are, therefore, already covered. CMP-14 points out that this proposal would eliminate the equipment grounding conductor, which is an essential safety feature.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-83 Log #1864 NEC-P14 **Final Action: Reject**
(501.140)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: FLEXIBLE CORDS and CABLES in CLASS 1 and 2 LOCATIONS.
(A) PERMITTED USES. Flexible cords and cables shall be permitted only as follows:
(1) For connection between portable lighting equipment or other portable utilization equipment and or the fixed portion of their supply circuit.
(2) For connections other than permitted in (A) on premises where conditions of maintenance and supervision ensure that only qualified persons install and service the installation and all of the following apply:
(1) The flexible fittings specified in 510.10(A)(2) cannot provide the necessary degree of movement;
(2) The cords or cables are extra-hard usage types identified for the use and sunlight resistant where exposed to direct sunlight;
(3) The cords or cable are provided with identified bushings where entering raceways or other enclosures;
(4) Conduit seals are provided in accordance with 501.15;
(5) The cords or cables contain an equipment grounding conductor;
(6) The cords or cables are not longer than necessary;
(7) The cords or cables are not likely to be subject to physical damage or deteriorating agents; identified means shall be provided to prevent tension on terminal connections.
Substantiation: "Permitted" should be restricted by the word "only". Conditions of maintenance and supervision should be the criteria for permitting cords, not the type of establishment; many commercial establishments meet this criteria. "Engineering supervision" is not specific; is a chemical engineer qualified? Flexible cords and cables other than for portable equipment should be limited to where the flexible fittings of 501.10(A)(2) are not suitable. Article 400 does not require listing. All extra-hard usage may not be suitable (identified) for the use such as Types EV, EVE, EVT, wet locations, oil resistant, or sunlight resistant. Flexible cord and cables should not be longer than necessary.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-82.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-84 Log #3269 NEC-P14 **Final Action: Reject**
(501.140(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:
(A) Flexible Cords and Portable Power Cables. On premises where conditions of supervision and maintenance ensure that only qualified persons install and service the installation, flexible cords and cables shall only be permitted as follows:
(1) In accordance with 501.10(A)(2).
(2) The flexible cord or power cable is not likely to be subject to physical damage or is protected by identified means.
(3) For electric submersible pump motors with means for removal without entering the wet-pit. The extension of the flexible cord or power cable within an identified raceway extending from the wet-pit shall be permitted.
(4) For electric mixers that travel into and out of mixing tanks or vats.
(B) Installation. Where flexible cords or power cables are used they shall:
(1) Contain an equipment grounding conductor
(2) Be an extra-hard usage type identified for the use such as wet locations, exposed to oil or direct sunlight.
(3) Be connected to terminals in accordance with 110.14(3).

(4) Be provided with identified strain relief devices or installed so there is no tension on terminal connections.
(5) Be provided with conduit seals in accordance with applicable provisions of 501.15.
(6) Be of continuous lengths.
FPN: No change.
Substantiation: Portable power cables should be included. Conditions of maintenance and supervision should be the criterion, not type of occupancy which has no relevance. Section 501.10(A)(2) is a suitable reference for use. All extra-hard usage cords are not suitable, e.g., EV, EVE, EVT. Section 110.14(3) is more specific that "approved" which only requires acceptance by the AHJ. Present exception for (B)(5) does not appear relevant for nonincendive wiring and 501.105(B)(6) doesn't void seal requirements. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-82.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-85 Log #3192 NEC-P14 **Final Action: Accept**
(501.140(A)(5))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Add new text as follows:
"<u>(5) For temporary portable assemblies consisting of receptacles, switches, and other devices that are not considered portable utilization equipment but are individually listed for the location.</u>"
Substantiation: Periodically, manufacturers are asked to furnish portable power carts, as they are sometimes called, for use in Class I hazardous locations. These are typically used by refineries during times of periodic maintenance, called turnarounds. The problem is that the carts themselves don't meet the definition of portable utilization equipment, and so cannot be used to supply power through receptacles to the actual portable utilization equipment because 501.140(B)(5) requires the cord to be of continuous length.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-86 Log #1984 NEC-P14 **Final Action: Reject**
(501.140(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or revise: (3) Be connected to supply terminals in an approved manner in accordance with 110.14.
Substantiation: Edit. Already covered by 110.14; does not conform to 3.3.5 of the Style Manual and increases bulk of the Code. It may be deemed that "approved manner" (see definition of approved) sanctions connections that may not comply with 110.14.
Panel Meeting Action: Reject
Panel Statement: The submitter provided two alternatives in a single proposal, which does not meet the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
NEAGLE, J.: I agree that the submitter's proposal does not conform with the NFPA Regulations Governing Committee Projects for the reason stated. However, I also agree that 501.140(B)(3) is superfluous text which is already covered by 110.14. This section should be deleted.

14-87 Log #2020 NEC-P14 **Final Action: Reject**
(501.140(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or revise (B)(3) as follows: Be connected to ~~supply~~ terminals in ~~an approved manner~~ <u>accordance with 110.14</u>.
Substantiation: Already covered by 110.14. "Approved" may sanction connections that do not comply with 110.14. Load terminals should be included in the provision.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-86.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
NEAGLE, J.: I agree that the submitter's proposal does not conform with the NFPA Regulations Governing Committee Projects for the reason stated. However, I also agree that 501.140(B)(3) is superfluous text which is already covered by 110.14. This section should be deleted.

14-88 Log #2830 NEC-P14 **Final Action: Accept**
(501.140(B)(5))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(5) Be <u>terminated with a cord connector or attachment plug listed for the location and be</u> provided with ~~suitable~~ <u>listed</u> seals where the flexible cord enters boxes, fittings, or enclosures <u>required to be</u> ~~of the~~ explosionproof ~~type~~
~~*Exception to (5): Seals shall not be required as provided in 501.10(B) and 501.105(B)(6).*~~
Substantiation: Cord is *terminated* with fittings, but the fittings are not *provided* with the cord, they are sourced separately. This proposal makes clear the intent to terminate the flexible cord with attachment plugs or fittings that comply with consensus safety requirements for such devices, including strain relief and ingress protection.
The exception is removed since neither 501.10(B) or 501.105(B)(6) give specific cord sealing requirements and there is no exception to completing an enclosure that is required to be explosionproof with a seal on the entry.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-89 Log #3193 NEC-P14 **Final Action: Reject**
(501.140(B)(6))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Delete 501.140(B) ~~(6) Be of continuous length.~~
See companion proposal for 501.140(A).
Substantiation: Neither 502.140 nor 503.140 require that flexible cords be of a continuous length. In fact, neither section has two paragraphs, one on permitted uses and one on installation, as does 501.140. Are Class I locations that much more dangerous than Class II or III? It has been commonly thought that CMP 14 didn't want to see "extension cords" in Class I, not even in Division 2. In Canada, connectors are permitted in Class I locations. An IEC standard 309-3 was published years ago that had requirements for connectors for use in hazardous atmospheres. For unknown reasons it was allowed to lapse, but it shows that the rest of the world thinks properly rated connectors are suitable for Class I hazardous locations.
Panel Meeting Action: Reject
Panel Statement: If accepted, this proposal would allow the use of splices in cords. The fact that this provision is not included for Class II and Class III locations is not justification for removing the provision for Class I locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 502— CLASS II LOCATIONS

14-90 Log #4443 NEC-P14 **Final Action: Accept in Principle**
(502)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal relative to the requirements for Class II, Division 2.
This action will be considered by the panel as a public comment.
Submitter: Eliana Beattie, ISA
Recommendation: Revise and add new text to read as follows:
(3) <u>Group E</u> ~~**Metal Dusts.**~~ No transformer or capacitor shall be installed. ~~in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.~~
502.115 (A):
(1) <u>Groups F and G</u> ~~**Type Required.**~~ Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with identified dust-ignitionproof enclosures. <u>Isolating switches containing no fuses shall be permitted to be dusttight.</u>
(2) <u>Group E</u> ~~**Metal Dusts.**~~ ~~In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present,~~ <u>F</u>fuses, switches, motor controllers, and circuit breakers shall have enclosures identified for such locations.
502.120 (A):
(A) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall <u>comply with 502.120 (A) (1) and (A) (2).</u>
<u>(1) Groups F and G: Control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall be installed in</u> ~~have~~ dust-ignitionproof enclosures <u>for the specific</u> ~~identified for~~ Class II locations.
<u>(2) Group E: Control</u> ~~No control~~ transformer<u>s</u>, impedance coil<u>s</u>, or resistor<u>s</u> shall <u>be installed in enclosures</u> ~~be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present unless provided with an enclosure~~ identified for the specific location.

In 502.120 (B) (2) and (3):

(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall ~~be provided with tight metal housings without ventilating openings or~~ shall be installed in dusttight enclosures. ~~Effective January 1, 2011, only dusttight enclosures shall be permitted.~~

(3) Resistors. Resistors and resistance devices shall comply with 502.120 (A). ~~have dust-ignitionproof enclosures identified for Class II locations.~~

Exception: Where the maximum normal operating temperature of the resistor will not exceed 120°C.......

In 502.135 (A):

(A) Class II, Division 1. In Class II, Division 1 locations, all utilization equipment shall comply with 502.135 (A) (1) and (A) (2).

(1) Group F and G: Utilization equipment shall be for the specific ~~identified for~~ Class II location~~s~~.

(2) Group E: ~~Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, such~~ ~~E~~equipment shall be identified for the specific location.

In 502.150 (A), and (4) and (5), and (B)(3):

(A) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(A)(1) through (A)(4~~5~~).

~~**(4) Combustible, Electrically Conductive Dusts.** Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be identified for Class II locations.~~

(4~~5~~) Group E ~~**Metal Dusts.** Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present,~~ A~~a~~ll apparatus and equipment shall be identified for the specific conditions.

(B) (3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120 (A) ~~(B)(3)~~.

Substantiation: In 502.100 (3) the text is simply being improved by using the correct Group E and cleaning up the text. As this is already considered as being a Division 1 location, no other changes are needed.

In 502.115 (1) the term "type required" is redundant since what is required is so stated. During the 2008 code cycle an error was made in deleting an isolation disconnect during consideration of metal tight enclosures vs dust-tight. The acceptable condition for use has been reinserted using the NEC defined term for an isolating switch.

In 502.120 the text has been clarified by the correct use of "Group E" and the Group F and G text made consistent with (B) (3).

In 502.120 again the text has been clarified since the effective date has been eliminated with this 2011 document and the text under (3) consolidated back up under 502.120 (A) as indicated.

In 502.135 again the text has been made consistent with the former sections as well as clarified with the use of the dust Group terms.

In 502.150, again the use of Group E was added, this eliminated the need for an item (4). Numbering changes were then needed as indicated.

Panel Meeting Action: Accept in Principle

Revise Article 502 Part III to read:

III. Equipment

502.100 Transformers and Capacitors. (A) Class II, Division 1. In Class II, Division 1 locations, transformers and capacitors shall comply with 502.100(A) (1) through (A)(3).

(1) Containing Liquid That Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in vaults complying with 450.41 through 450.48, and, in addition, (1), (2), and (3) shall apply.

(1) Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.

(2) Vent openings and ducts shall communicate only with the outside air.

(3) Suitable pressure-relief openings communicating with the outside air shall be provided.

(2) Not Containing Liquid That Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 450.41 through 450.48 or be identified as a complete assembly, including terminal connections for Class II locations.

(3) ~~Metal Dusts~~ Group E. No transformer or capacitor shall be installed in a Class II, Division 1, Group E location. ~~where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.~~

(B) Class II, Division 2. In Class II, Division 2 locations, transformers and capacitors shall comply with 502.100(B)(1) through (B)(3).

(1) Containing Liquid That Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed in vaults that comply with 450.41 through 450.48.

(2) Containing Askarel. Transformers containing askarel and rated in excess of 25 kVA shall be as follows:

(1) Provided with pressure-relief vents

(2) Provided with a means for absorbing any gases generated by arcing inside the case, or leave the pressure-relief vents connected to a chimney or flue that will carry such gases outside the building

(3) Have an airspace of not less than 150 mm (6 in.) between the transformer cases and any adjacent combustible material

(3) Dry-Type Transformers. Dry-type transformers shall be installed in vaults or shall have their windings and terminal connections enclosed in tight metal housings without ventilating or other openings and shall operate at not over 600 volts, nominal.

502.115 Switches, Circuit Breakers, Motor Controllers, and Fuses.

(A) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, ~~shall comply with 502.115(A)(1) and (A)(2).~~

~~(1) Type Required. Switches, circuit breakers, motor controllers, and fuses,~~ including pushbuttons, relays, and similar devices, shall be provided with enclosures identified for the location ~~dust-ignitionproof enclosures~~.

~~(2) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified for such locations.~~

(B) Class II, Division 2. In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, shall be dusttight or otherwise identified for the location.

502.120 Control Transformers and Resistors.

(A) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall be provided with ~~have dust-ignitionproof~~ enclosures identified for the ~~Class II~~ location~~s~~. ~~No control transformer, impedance coil, or resistor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present unless provided with an enclosure identified for the specific location.~~

(B) Class II, Division 2. In Class II, Division 2 locations, transformers and resistors shall comply with 502.120(B)(1) through (B)(3).

(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with enclosures that are dusttight or otherwise identified for the location ~~enclosures~~.

(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with enclosures that are ~~tight metal housings without ventilating openings or shall be installed in~~h dusttight or otherwise identified for the location. ~~enclosures. Effective January 1, 2011, only dusttight enclosures shall be permitted.~~

(3) Resistors. Resistors and resistance devices shall have ~~dust-ignitionproof~~ enclosures that are dusttight or otherwise identified for the location ~~enclosures identified for Class II locations~~.

~~Exception: Where the maximum normal operating temperature of the resistor will not exceed 120°C (248°F), nonadjustable resistors or resistors that are part of an automatically timed starting sequence shall be permitted to have enclosures complying with 502.120(B)(2).~~

502.125 Motors and Generators.

(A) Class II, Division 1. In Class II, Division 1 locations, motors, generators, and other rotating electrical machinery shall be in conformance with either of the following:

(1) Identified for the ~~Class II, Division 1~~ location~~s~~

(2) Totally enclosed pipe-ventilated, meeting temperature limitations in 502.5

(B) Class II, Division 2. In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water-air-cooled, totally enclosed fan-cooled, or dust-ignitionproof for which maximum full-load external temperature shall be in accordance with 500.8(D)(2) for normal operation when operating in free air (not dust blanketed) and shall have no external openings.

Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:

(1) Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices

(2) Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings

(3) Self-cleaning textile motors of the squirrel-cage type

502.128 Ventilating Piping Ventilating pipes for motors, generators, or other rotating electrical machinery, or for enclosures for electrical equipment, shall be of metal not less than 0.53 mm (0.021 in.) in thickness or of equally substantial noncombustible material and shall comply with all of the following:

(1) Lead directly to a source of clean air outside of buildings

(2) Be screened at the outer ends to prevent the entrance of small animals or birds

(3) Be protected against physical damage and against rusting or other corrosive influences

Ventilating pipes shall also comply with 502.128(A) and (B).

(A) Class II, Division 1. In Class II, Division 1 locations, ventilating pipes, including their connections to motors or to the dust-ignitionproof enclosures for other equipment, shall be dusttight throughout their length. For metal pipes, seams and joints shall comply with one of the following:

(1) Be riveted and soldered
(2) Be bolted and soldered
(3) Be welded
(4) Be rendered dusttight by some other equally effective means

(B) Class II, Division 2. In Class II, Division 2 locations, ventilating pipes and their connections shall be sufficiently tight to prevent the entrance of appreciable quantities of dust into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite dust accumulations or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

502.130 Luminaires. ~~Luminaires shall comply with 502.130(A) and (B).~~

(A) Class II, Division 1. In Class II, Division 1 locations, luminaires for fixed and portable lighting shall comply with 502.130(A)(1) through (A)(4).

(1) Luminaires ~~Fixtures~~. Each luminaire shall be identified for the ~~Class II~~ location~~s~~ and shall be clearly marked to indicate the maximum wattage of the lamp for which it is designed. ~~In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, luminaires for fixed or portable lighting and all auxiliary equipment shall be identified for the specific location.~~

(2) Physical Damage. Each luminaire shall be protected against physical damage by a suitable guard or by location.

(3) Pendant Luminaires. Pendant luminaires shall be suspended by threaded rigid metal conduit stems, by threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed for the location shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant luminaire is not enclosed in conduit, flexible cord listed for hard usage shall be permitted when terminated with a listed cord connector that maintains the protection technique~~,~~ ~~used, and suitable seals shall be provided~~ where the cord enters the luminaire and the outlet box ~~or fitting~~. Flexible cord shall not serve as the supporting means for a luminaire ~~fixture~~.

(4) Supports. Boxes, box assemblies, or fittings used for the support of luminaires shall be identified for Class II locations.

(B) Class II, Division 2. In Class II, Division 2 locations, luminaires shall comply with 502.130(B)(1) through (B)(5).

(1) Portable Lighting Equipment. Portable lighting equipment shall be identified for the ~~Class II~~ location~~s~~. They shall be clearly marked to indicate the maximum wattage of lamps for which they are designed.

(2) Fixed Lighting. Luminaires for fixed lighting~~, where not of a type identified for Class II locations,~~ shall be provided with enclosures that are dusttight or otherwise identified for the location ~~enclosures~~. Each luminaire ~~fixture~~ shall be clearly marked to indicate the maximum wattage of the lamp that shall be permitted without exceeding an exposed surface temperature in accordance with 500.8(D)(2) under normal conditions of use.

(3) Physical Damage. Luminaires for fixed lighting shall be protected from physical damage by suitable guards or by location.

(4) Pendant Luminaires. Pendant luminaires shall be suspended by threaded rigid metal conduit stems, by threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of an identified fitting or a flexible connector shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting. Where wiring between an outlet box or fitting and a pendant luminaire is not enclosed in conduit, flexible cord listed for hard usage shall be permitted when terminated with a listed cord connector that maintains the protection technique ~~used~~. Flexible cord shall not serve as the supporting means for a luminaire ~~fixture~~.

(5) Electric-Discharge Lamps. Starting and control equipment for electric-discharge lamps shall comply with the requirements of 502.120(B).

502.135 Utilization Equipment.

(A) Class II, Division 1. In Class II, Division 1 locations, all utilization equipment shall be identified for the ~~Class II~~ location~~s~~. ~~Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, such equipment shall be identified for the specific location.~~

(B) Class II, Division 2. In Class II, Division 2 locations, all utilization equipment shall comply with 502.135(B)(1) through (B)(4).

(1) Heaters. Electrically heated utilization equipment shall be identified for the ~~Class II~~ location~~s~~.

Exception: Metal-enclosed radiant heating panel equipment shall be permitted to be dusttight and marked in accordance with 500.8(C).

(2) Motors. Motors of motor-driven utilization equipment shall comply with 502.125(B).

(3) Switches, Circuit Breakers, and Fuses. Enclosures for switches, circuit breakers, and fuses shall comply with 502.115(B) ~~be dusttight~~.

(4) Transformers, Solenoids, Impedance Coils, and Resistors. Transformers, solenoids, impedance coils, and resistors shall comply with 502.120(B).

OTHER SECTIONS in 502.135 REMAIN UNCHANGED

502.150 Signaling, Alarm, Remote-Control, and Communications Systems and Meters, Instruments, and Relays.

FPN: See Article 800 for rules governing the installation of communications circuits.

(A) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems and meters, instruments, and relays shall comply with 502.150(A)(1) through (A)(3~~5~~).

(1) Contacts. Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs may be produced shall be provided with enclosures identified for the ~~a Class II~~ location.

Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(2) Resistors and Similar Equipment. Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures identified for the ~~Class II~~ location~~s~~.

Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(3) Rotating Machinery. Motors, generators, and other rotating electrical machinery shall comply with 502.125(A).

~~(4) Combustible, Electrically Conductive Dusts. Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be identified for Class II locations.~~

~~(5) Metal Dusts. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, Aall apparatus and equipment shall be identified for the locationspecific conditions.~~

~~(B) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(B)(1) through (B)(4).~~

(4) Contacts. Contacts shall comply with 502.150(A)(1) or ~~contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape or~~ shall be installed in enclosures that are dusttight or otherwise identified for the location. ~~dusttight enclosures. Effective January 1, 2011, only dusttight enclosures shall be permitted.~~

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

(5) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall comply with 502.120(B)(2).

(6) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120(B)(3).

(7) Rotating Machinery. Motors, generators, and other rotating electrical machinery shall comply with 502.125(B).

Panel Statement: The panel's rewrites of sections 502.100, 115, 120, 125, 128, 130, 135, and 150 have accomplished the objectives of the submitter. CMP-14 has also revised the text to improve clarity and to remove unnecessary text. The addition of the sentence identifying isolation switches has not been incorporated, as it is already covered by the revised text covering switches.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

WECHSLER, D.: The action taken under 502.100 (3) is not consistent with other sections and uses redundant text. A more correct wording which does agree with the other modified sections should read: " Group E ~~Metal Dusts.~~ No transformer or capacitor shall be installed ~~*in a Class II, Division 1, Group E location*~~." The Italic ~~*in a Class II, Division 1, Group E location*~~ is redundant as this section is under (A) Class II, Division 1 already. Under 502.125 (A) (1) this redundancy was eliminated.

Lastly, the proposal text for 14-90 has missing/incomplete references and is more correctly presented in proposal Log 14-113.

14-91 Log #3872 NEC-P14 **Final Action: Reject**
(502.5)

Submitter: Mike Weitzel, Bechtel

Recommendation: Revise as follows:

502.5 Explosionproof Equipment. Explosionproof equipment and wiring shall not be required and shall ~~not be acceptable in Class II locations unless identified for such locations~~. be listed and marked for use in Class II locations.

Substantiation: There are types of equipment that need to be listed and marked for use in these installations.

Panel Meeting Action: Reject

Panel Statement: This proposal does not add clarity to the existing text. Also, this proposal would require that all explosionproof equipment be constructed and listed for Class II locations.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-92 Log #4097 NEC-P14 **Final Action: Accept in Principle**
(502.5)

Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Revise text to read as follows:
502.5 Explosionproof Equipment.
~~Explosionproof equipment and wiring shall not be required and shall not be acceptable in Class II locations unless identified for such locations.~~
Explosionproof equipment because of its design is generally not a replacement for Dust ignitionproof or Dusttight equipment. However in some instances, like locations having both Class I and Class II hazardous area classifications, explosionproof electrical equipment and wiring may be acceptable. Explosionproof equipment and wiring is not required to be installed in a Class II location.
Substantiation: The current text makes it unacceptable to install explosionproof equipment in a Class II location, even if the location is also Class I. The proposed modified text, reinforces the original aspects dealing with explosionproof equipment in Class II locations, but clarifies that in a location having both Class I and Class II materials that it may be acceptable to use explosionproof equipment.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
502.5 Explosionproof Equipment.
Explosionproof equipment and wiring shall not be required and shall not be acceptable in Class II locations unless also identified for such locations.
Panel Statement: The addition of the word "also" meets the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-93 Log #4442 NEC-P14 **Final Action: Accept**
(502.6)

Submitter: Eliana Beattie, ISA
Recommendation: Add new text to read as follows:
502.6 Zone Equipment
Equipment listed and marked in accordance with 506.9(C)(2) for Zone 20 locations shall be permitted in Class II, Division 1 locations for the same dust atmosphere; and with a suitable temperature class.
Equipment listed and marked in accordance with 506.9(C)(2) for Zone 20, 21, or 22 locations shall be permitted in Class II, Division 2 locations for the same dust atmosphere and with a suitable temperature class.
Substantiation: An area classified as a Zone 20 could alternatively be classified as Class II Division 1, therefore the equipment suitable for Zone 20 is acceptable for installation in a Class II Division 1 location.
An area classified as a Zone 22 could alternatively be classified as Class II Division 2, therefore the equipment suitable for Zone 20, Zone 21 or Zone 22 is acceptable for installation in a Class II Division 2 location.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-94 Log #3266 NEC-P14 **Final Action: Reject**
(502.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise the following:
(A) CLASS II DIVISION 1
(1) General. In Class II Division 1 locations only the wiring methods in (1) through (4) shall be permitted.
(1) Threaded rigid metal conduit ~~or~~ and threaded steel intermediate metal conduit with threaded connections.
(2) Type MI cable with termination fittings listed for the location. ~~Type MI cable shall be installed and supported in a manner to avoid stress at the termination fittings.~~
(3) In ~~industrial~~ establishments with limited general public access where the condition of maintenance and supervision ensure that only qualified persons install and service the installation Type MC - HL cable listed for use in Class II Division 1 locations, with a ~~gas/~~vapor tight continuous corrugated metallic sheath, an overall jacket of ~~suitable~~ identified polymeric material, an enclosed equipment grounding conductor(s) in accordance with 250.122 and provided with termination fittings listed for the application, shall be permitted.
(2) Flexible Connections. Where necessary to employ flexible connections they shall not be longer than necessary and one or more of the following shall be used ~~permitted~~.
(1) Listed dustight flexible connectors
(2) Flexible metal conduit ~~with listed fittings~~
(3) Liquidtight flexible metal conduit ~~with listed fittings~~
(4) Liquidtight flexible nonmetallic conduit ~~with listed fittings~~
(5) Extra-hard usage type flexible cord or portable power cable identified for the use and provided with identified bushed fittings where the cord or portable power cable enters boxes, cabinets, or other enclosures.
(3) delete "industrial.
(B) CLASS II DIVISION 2. In Class II Division 2 locations only the following wiring methods shall be permitted:
(1) No change.
(2) Threaded rigid metal conduit and threaded steel intermediate metal conduit with threaded connections, electrical metallic tubing with compression type fittings. Dustight wireways and auxillary gutters.
(3) Type MC or Type MI cable with listed termination fittings.
Substantiation: "Permitted" as presently used does not entail a requirement per 90.5 (B). Threaded connections should be specified for RMC and IMC; (see 342.42 and 344.42 re: threadless fittings) Installation of Type MI cable is covered in Article 332. Flexible connections should not be longer than necessary. Listing for flexible conduits and fittings is already required in the respective articles. Portable power cable should be included. All extra-hard usage type flexible cords may not be suitable for wet or oily locations or exposed to direct sunlight or those designated as electric vehicle cables.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-95 Log #2831 NEC-P14 **Final Action: Accept**
(502.10(A)(2)(5))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(5) Flexible cord listed for extra-hard usage and terminated ~~provided~~ with ~~bushed~~ fittings listed for the location. Where flexible cords are used, they shall comply with 502.140.
FPN: See 502.30(B) for grounding requirements where flexible conduit is used.
Substantiation: Cable is *terminated* with fittings, but the fittings are not *provided* with the cable, they are sourced separately. Terminology is made consistent with other portions of the section.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-96 Log #3923 NEC-P14 **Final Action: Reject**
(502.10(B))

Submitter: Goran Haag, Champion Fiberglass, Inc.
Recommendation: Add new text to read as follows:
Type RTRC marked with the suffix -XW" to be added.
Substantiation: Type RTRC marked with the suffix –XW were permitted in the NEC 2008 for Class I Division 2. We want it to be included for Class II Division 2 as well. Shouldn't be any engineering arguments against this proposal.
Panel Meeting Action: Reject
Panel Statement: Type RTRC was added to 501.10(B)(7) with very specific restrictions, primarily for protection from corrosion. This proposal does not provide these restrictions. The substantiation does not provide any technical data to show that this wiring method is necessary in a Class II Division 2 location.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-97 Log #2832 NEC-P14 **Final Action: Accept in Principle**
(502.10(B)(1))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(B) Class II, Division 2.
(1) General. In Class II, Division 2 locations, the following wiring methods shall be permitted:
(1) All wiring methods permitted in 502.10(A).
(2) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.
(3) Type MC or MI cable with listed termination fittings.
(4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, ~~in cable trays~~ with listed termination fittings.
(5) Type ITC and Type ITC-ER ~~trays~~ with listed termination fittings.~~in cable trays~~, and installed in accordance with the provisions of Article 727.
(6) Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.
Exception to (6): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by (6).
Substantiation: This proposal reflects the current installation requirements of 725.154(D) that in conjunction with a companion proposal to revise 725.154(D) move the Classified location permitted wiring methods into Chapter 5, with the installation requirements for these types of cables retained for all users in 725.154(D). See companion proposal on 725.154(D).
Panel Meeting Action: Accept in Principle
Revise text as follows:

(B) Class II, Division 2.

(1) General. In Class II, Division 2 locations, the following wiring methods shall be permitted:

(1) All wiring methods permitted in 502.10(A).

(2) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.

(3) Type MC or MI cable with listed termination fittings.

(4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including ~~or~~ installation in cable tray systems. The cable shall be terminated with listed fittings. ~~PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.~~

(5) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.

(6) Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.

Exception to (6): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by (6).

Panel Statement: The panel has retained the language "in cable tray systems", which was deleted in the proposal, in items (4) and (5) to permit their use, as provided in other articles in the code. The panel also clarified the language for listed fittings.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-98 Log #1786 NEC-P14 **Final Action: Reject**
(502.10(B)(3))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise first sentence: Nonincendive field wiring shall be permitted using any ~~of the~~ identified wiring methods permitted for unclassified locations.

In (B)(3)(1), add: "or raceways".

Substantiation: Edit. All wiring methods permitted for unclassified locations may not be suitable. This provision may be deemed to modify "not permitted use". Nonincendive field wiring should be permitted in separate raceways.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-50.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

NEAGLE, J.: I agree with the panel action and statement. However, it is noted that the current text of 502.10(B)(3) does not permit the installation of separate nonincendive field wiring circuits in a single raceway using other than multiconductor cables (e.g., discreet conductors). Revise the second paragraph of 502.10(B)(3) as follows:

(Retain first paragraph and FPN).

'Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

(1) In separate cables

(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield

(3) In multiconductor cables or raceways, where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)'

14-99 Log #1808 NEC-P14 **Final Action: Reject**
(502.30)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete and substitute: GROUNDING and BONDING class II divisions 1 and 2. Metal enclosed wiring and equipment shall be grounded and comply with 502.30(A) and (B).

(A) BONDING. The locknut, double-locknut, and locknut-bushing shall not be permitted as the sole bonding means. Bonding jumpers with identified fittings or other identified means shall be used. Such means of bonding shall apply to all intervening metal raceways, cables, fittings, boxes, and other enclosures and equipment in Class II locations to the point of grounding for service equipment.

Exception: The specific bonding means shall only be required to the point where the grounded conductor (if used) and the grounding electrode conductor are connected on the load side of the building or structure, or separately derived system disconnecting means which includes overcurrent protection.

FPN No change.

Substantiation: Single locknut connections such as commonly used with cable and flexible conduit connectors should be included. Locknuts and bushings should only be prohibited as the sole bonding means. Intervening cables such as Type MI should be included All wiring systems may not include a grounded circuit conductor.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-36.

14-100 Log #3308 NEC-P14 **Final Action: Reject**
(502.30)

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: Electrical wiring and equipment in Class II Division 1 and 2 locations shall be grounded ~~as specified in Article 250 and with~~ the requirements in 502.30(A), 502.30(B) shall apply.

Substantiation: Article 250 already applies and has provisions which are alternatives or exceptions to grounding which do not appear to be intended to apply. Many sections simply state "shall be grounded"... Similar requirements worded differently may cause confusion per 3.3.5 of the Style Manual.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-64.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-101 Log #867 NEC-P14 **Final Action: Reject**
(502.30(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise:

TYPES of EQUIPMENT GROUNDING and BONDING CONDUCTORS. Liquidtight flexible metal shall not be used as the sole ground-fault current path. ~~Where equipment grounding conductors are installed they shall comply with 250.102.~~

Exception: In Class II Division 2 locations the equipment grounding conductors and equipment bonding jumpers shall be permitted to be omitted ~~deleted~~ where all of the following conditions are met:

(1) Listed the Liquidtight flexible metal conduit is 1.8 m (6 ft) or less in length ~~with fittings listed for grounding is used~~.

(2) No change.

(3) No change.

Substantiation: Edit. The heading and text should cover both equipment grounding and bonding conductors. 250.102 already applies unless amended. LTFMC and fittings are already required to be listed by 350.6 which applies unless amended. Something cannot be deleted unless it is first installed.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-36.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-102 Log #1810 NEC-P14 **Final Action: Reject**
(502.30(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Delete and substitute: BONDING CONDUCTORS. Where equipment grounding conductors are not installed in flexible conduit, bonding conductors for each such conduit shall be installed.

Exception: In Class II Division 2 locations bonding jumpers shall be permitted to be deleted where all the following conditions are met:

(1) Liquidtight flexible metal conduit 1.8 m (6 ft) or less in total length with fittings listed for grounding is used.

(2) Overcurrent protection in the circuit is limited to does not exceed 10 amperes.

(3) The load is not a power or lighting load.

Substantiation: This provision relates primarily to bonding conductors. Something cannot be deleted unless it is first installed. The provision should also include LFNMC permitted in
502.10 (A)(2) The exception should apply to total length involved, not multiple individual lengths interposed in a run of raceway. Reference to 250.102 is superfluous; Article 250 applies unless modified.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-36.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-103 Log #2588 NEC-P14 **Final Action: Reject**
(502.30(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

TYPES of EQUIPMENT GROUNDING and BONDING CONDUCTORS. Flexible metal conduit~~,~~ ~~and~~ liquidtight flexible metal conduit and flexible metal fittings shall not be used as the sole ground-fault current path. ~~Where equipment bonding jumpers are installed they shall comply with 250.102.~~ Exception in Class I I Division 2 locations, ~~the~~ a wire-type equipment grounding or bonding conductor shall ~~be permitted to be deleted~~ not be required where all of the following conditions are met:

(1) ~~Listed~~ Liquidtight flexible metal conduit 1.8 m (6 ft) or less in length ~~with fittings listed from grounding~~ is used.

(2) Overcurrent protection in the circuit is limited to 10 amperes or less. The load is not a power ~~utilization~~ or lighting load.

Substantiation: Edit. The heading should include bonding conductors addressed in the text. Since the conduit is a grounding and bonding conductor the omission should refer to wire types. The grounding or bonding conductor cannot be deleted unless first installed. Fittings are already required to be listed in the respective articles. "Power" infers a particular type of load such as one that is not lighting or control. Section 250.102 already applies, as do other requirements of Article 250, which are not referenced.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-104 Log #3079 NEC-P14 **Final Action: Accept**
(502.30(B))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(B) Types of Equipment Grounding Conductors. Liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type, in compliance with 250.102.~~not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.~~
Exception: Text to remain unchanged.
Substantiation: Because many things (such as earth itself) are types of ground fault current paths [250.2], the existing language doesn't really tell the code user what the requirement is. This revised language makes it much clearer.
Panel Meeting Action: Accept
Number Eligible to Vote: 14

(502.40)

Submitter: Mark Smythe, Smythe Electric Inc.
Recommendation: Delete 502.40 and its associated exception in its entirety.
Substantiation: 502.40 is redundant as new 2008 210.4(B) does already encompass the intent of 502.40.
210.4(B) Disconnecting Means. "Each multiwire branch circuit shall be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates."
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-109 Log #4634 NEC-P14 **Final Action: Reject**
(502.40)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this section.
Substantiation: This section now effectively repeats, without change, the provisions of 210.4(B) that requires simultaneous disconnection for all multiwire branch circuits wherever installed.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-110 Log #2615 NEC-P14 **Final Action: Reject**
(502.40 Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows:
"without the use of handle ties"
Substantiation: For hazardous (classified) areas reliance should not be on handle ties which can be removed. See 514.11(A).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-73.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-111 Log #832 NEC-P14 **Final Action: Reject**
(502.100)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
In (A)(I), change "suitable" and "may" to "approved" in two places. In (A)(3), change "may" to "likely to".
Substantiation: Edit. "Suitable" and "may" are terms to be avoided per the Style Manual. "Likely" is a term often used in the Code.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-112 Log #841 NEC-P14 **Final Action: Reject**
(502.100(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(1) CONTAINING FLAMMABLE LIQUID ~~THAT WILL BURN~~
Transformers and capacitors containing a flammable liquid ~~that will burn~~ shall be... (remainder unchanged)
In (1) and (3), change "suitable" to "identified".
Substantiation: Edit. Proposed deletion is superfluous. "Suitable" is a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: This provision is intended to apply to any liquid that burns, whether characterized as flammable or combustible.
The word "suitable" as used in (1) and (3) is not unenforceable and does not create confusion, as indicated in the requirements of the NEC Style Manual. As such, it does not need to be replaced.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-113 Log #4092 NEC-P14 **Final Action: Accept in Principle**
(502.100(A)(3) 502.115(A), 502.120(A), 502.135(A), 502.150(A) and (B))

Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Make the following revisions as noted:
502.100(3) Group E ~~Metal Dusts~~. No transformer or capacitor shall be installed. ~~in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.~~

502.115(A):

(1) Groups F and G ~~Type Required~~. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with identified dust-ignitionproof enclosures. Isolation switches containing no fuses shall be permitted to be dusttight.

(2) Group E ~~Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present,~~ Ffuses, switches, motor controllers, and circuit breakers shall have enclosures identified for such locations.

502.120(A):

(A) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall comply with 502.120(A)(1) and (A)(2).

(1) Groups F and G: Control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall be installed in ~~have~~ dust-ignitionproof enclosures identified for the specific Class II locations.

(2) Group E: Control ~~No control~~ transformers, impedance coils, or resistors shall be installed in enclosures ~~be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present unless provided with an enclosure~~ identified for the specific location.

(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall ~~be provided with tight metal housings without ventilating openings or~~ shall be installed in dusttight enclosures. ~~Effective January 1, 2011, only dusttight enclosures shall be permitted.~~

(3) Resistors. Resistors and resistance devices shall comply with 502.120(A). ~~have dust ignitionproof enclosures identified for Class II locations.~~

Exception: Where the maximum normal operating temperature of the resistor will not exceed 120°C...".

In 502..135(A):

(A) Class II, Division 1. In Class II, Division 1 locations, all utilization equipment shall comply with 502.135(A)(1) and (A)(2).

(1) Group F and G: Utilization equipment shall be identified for the specific Class II locations.

(2) Group E: ~~Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, such~~ Eequipment shall be identified for the specific locations.

In 502.150(A), and (4),(5), and (B)(3):

(A) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(A)(1) through (A)(45).

~~(4) Combustible, Electrically Conductive Dusts. Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be identified for Class II locations.~~

(45) Group E ~~Metal Dusts. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present,~~ Aall apparatus and equipment shall be identified for the specific conditions.

(B)(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120(A)~~(B)(3).~~

Substantiation: In 502.100(3) the text is simply being improved by using the correct Group E and cleaning up the text. As this is already considered as being a Division 1 location, no other changes are needed.

In 502.115(1) the term "type required" is redundant since what is required is so stated. During the 2008 code cycle an error was made in deleting an isolation disconnect during consideration of metal tight enclosures vs. dust-tight. The acceptable condition for use has been reinserted using the NEC defined term for an isolation switch.

In 502.120 the text has been clarified by the correct use of "Group E" and the Group F and G text made consistent with (B)(3).

In 502.120 again the text has been clarified since the effective date has been eliminated with this 2011 document and the text under (3) consolidated back up under 502.120(A) as indicated.

In 502.135 again the text has been consistent with the former sections as well as clarified with the use of the dust Group terms.

In 502.150, again the use of Group E was added, this eliminated the need for an item (4). Numbering changes were then needed as indicated.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 14-90.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

WECHSLER, D.: The action taken under 502.100 (3) is not consistent with other sections and uses redundant text. A more correct wording which does agree with the other modified sections should read: " Group E ~~**Metal Dusts.**~~ No transformer or capacitor shall be installed ~~*in a Class II, Division 1, Group E location*~~." The Italic ~~*in a Class II, Division 1, Group E location*~~ is redundant as this section is under (A) Class II, Division 1 already. Under 502.125 (A) (1) this redundancy was eliminated.

Lastly, the proposal text for 14-90 has missing/incomplete references and is more correctly presented in proposal Log 14-113.

14-114 Log #3195 NEC-P14 **Final Action: Reject**
(502.115(A))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Revise 502.115(A) as follows:

(A) Class II, Division 1: In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with 505.115(A)(1) ~~and (A)(2)~~ through (A)(3).

(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices~~, shall be provided with identified dust-ignitionproof enclosures~~ that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with identified dust-ignitionproof enclosures.

(2) Isolating Switches. Disconnection and isolating switches containing no fuses and not intended to interrupt current shall be provided with dusttight enclosures.

~~(2)~~ (3) Metal Dusts. No change to text.

Substantiation: Proposal 14-25 for the 2008 NEC resulted in changing the requirement for isolating switches from the old "telescoping or close fitting covers..." to dust-ignitionproof enclosures. The substantiation was that the "current requirement permits a construction which would not even be permitted by 502.115(B) in Division 2." Technically, that is correct because over the last several code cycles, the Panel has been eliminating the old text and replacing it with "dusttight." That is what should have been proposed in 502.115(A) and what is now proposed. Since an isolating switch is not intended to be operated under load and, therefore, does not produce an arc, the old text allowed a Division 2 construction that should have been changed to the new Division 2 construction, "dusttight."

Note: The proposed text is the same as that in the 2005 NEC except that in (2) the old text is changed to "dusttight enclosures", and the text on conductive dust is omitted because that is covered by (1).

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 14-90.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-115 Log #831 NEC-P14 **Final Action: Reject**
(502.115(A)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "may" to "are likely to".
Substantiation: Edit. "May" is a term to be avoided per the Style Manual. "Likely" is a term used often in the Code.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-15.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-116 Log #871 NEC-P14 **Final Action: Reject**
(502.130)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "and lampholders" after "luminaries".
Substantiation: Lighting fixtures not classified as luminaries should be included, e.g., portable lighting in (A) and (B).
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-117 Log #2833 NEC-P14 **Final Action: Accept in Principle**
(502.130(A)(3))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(3) Pendant Luminaires. Pendant luminaires shall be suspended by threaded rigid metal conduit stems, by threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed for the location shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set screws or other effective means to prevent loosening.

Where wiring between an outlet box or fitting and a pendant luminaire is not enclosed in conduit, flexible cord listed for hard usage shall be permitted when terminated with a listed cord connector that maintains the type of protection ~~used, and~~ ~~suitable seals~~ ~~shall be provided~~ where the cord enters the luminaire and the outlet box ~~or fitting~~. Flexible cord shall not serve as the supporting means for a ~~fixture~~ luminaire.
Substantiation: This proposal makes clear the intent to terminate the flexible cord with fittings that comply with ANSI requirements for such devices including strain relief and the type of protection.

The reference to a fixture is revised to luminaire.
Panel Meeting Action: Accept in Principle

Accept the proposal, but change "type of protection" to "protection technique".
Panel Statement: In Class II locations, the proper term is "protection technique".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-118 Log #2834 NEC-P14 **Final Action: Accept in Principle**

(502.140)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text and substitute:

Flexible cords and cables used in Class II locations shall comply with all of the following:

(1) Be extra-hard usage type identified for the purpose.

Exception: Hard usage type flexible cord identified for the purpose shall be permitted in accordance with 502.130(A)(3) and (B)(4).

(2) Contain an equipment grounding conductor

(3) Be connected to terminals in accordance with 110.14.

(4) Be provided with identified means to prevent tension on terminal connections

(5) Be provided with identified means to prevent the entrance of dust where the flexible cords or cables enter enclosures or fittings that are dust-ignition proof.
Substantiation: Flexible cables should be included such as G, GC, W. Article 400 does not require listing. Cords and cables should be suitable for the use such as wet locations, sunlight resistance, exposure to oil, and not electric vehicle cable. Section 400.23 already applies. "Approved" connections are not necessarily the same as 110.14. Support to prevent tension should be by identified means not makeshift methods such as tying or taping. Seals should be identified for the use and required for other than boxes. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(502.140)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with regard to the final text.

This action will be considered the panel as a public comment.
Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
502.140 Flexible Cords — Class II, Divisions 1 and 2.
Flexible cords used in Class II locations shall comply with all of the following:

(1) Be of a type listed for extra-hard usage

Exception: Flexible cord listed for hard usage as permitted by 502.130(A)(3) and (B)(4).

(2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23

(3) Be connected to terminals or to supply conductors in an approved manner

(4) Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections

(5) Be ~~provided~~ terminated with a listed cord connector that maintains the type of protection ~~with suitable seals to prevent the entrance of dust~~ where the flexible cord enters ~~boxes or fittings that are required to be dust-ignitionproof~~ the equipment
Substantiation: This proposal makes clear the intent to terminate the flexible cord with attachment plugs or fittings that comply with consensus safety requirements for such devices.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 14-117.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-124 Log #3267 NEC-P14 **Final Action: Reject**
(502.140)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:
FLEXIBLE CORDS AND PORTABLE POWER CABLES CLASS II DIVISIONS 1 and 2. Flexible cords and portable power cables used as permitted in 502.10(A)(2) shall:
(1) Be identified for the use including sunlight and oil resistance where applicable.
(2) Contain an equipment grounding conductor.
(3) Be connected to terminals in accordance with 110.14(5).
(4) Be provided with identified strain relief devices or installed so there is no tension on terminals.
(5) Be provided with identified means to prevent the entrance of dust where the flexible cords or portable power cables enter boxes, cabinets or other enclosures.
Substantiation: Portable power cables should be included. All hard-usage types specified in 502.10(A)(2) may not be identified (suitable) for the use such as where subject to oil and sunlight, or type EV, EVE, EVT. Reference to 400.23 is superfluous; it already applies. “Suitable” is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text. In addition, portable power cables are a subset of flexible cords and are, therefore, already covered.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-125 Log #1983 NEC-P14 **Final Action: Reject**
(502.140(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or revise: (3) Be connected to supply terminals in an approved manner in accordance with 110.14.
Substantiation: Edit. Already covered by 110.14; does not conform to 3.3.5 of the Style Manual and increases bulk of the Code. It may be deemed that “approved manner” (see definition of approved) sanctions connections that may not comply with 110.14.
Panel Meeting Action: Reject
Panel Statement: The submitter provided two alternatives in a single proposal, which does not meet the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
NEAGLE, J.: I agree that the submitter’s proposal does not conform with the NFPA Regulations Governing Committee Projects for the reason stated. However, I also agree that 502.140(3) is superfluous text which is already covered by 110.14. This section should be deleted.

14-126 Log #2021 NEC-P14 **Final Action: Reject**
(502.140(3))

(503.10(A))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
II. Wiring
503.10 Wiring Methods. Wiring methods shall comply with 503.10(A) or (B).
(A) Class III, Division 1.
(1) In Class III, Division 1 locations, the following wiring method shall be permitted:
(1) rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.~~, or~~
(2) Type MC or MI cable with listed termination fittings.
(3) Type MC or MI cable with listed termination fittings.
(4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725 with listed termination fittings.
(5) Type ITC and Type ITC-ER cable as permitted in 727.4 with listed termination fittings.
(6) Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed adjacent cables, shall be the wiring method employed.
Exception to (6): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by (6).
(~~1~~2) Boxes and Fittings. All boxes and fittings shall be dusttight.
(~~2~~3) Flexible Connections. Where necessary to employ flexible connections, one or more of the following shall be permitted:
(1) dusttight flexible connectors,
(2) liquidtight flexible metal conduit with listed fittings,
(3) liquidtight flexible nonmetallic conduit with listed fittings,
(4) Interlocked armor Type MC cable having an overall jacket of suitable polymeric material and provided with termination fittings listed for the location
(5) Flexible cord listed for extra-hard usage and terminated with a listed cord connector suitable for the location.
Where flexible cords are used, they shall be in compliance with 503.140 ~~shall be used~~.
(~~3~~4) Nonincendive Field Wiring. Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.
FPN: Simple apparatus is defined in 504.2. Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:
(1) In separate cables
(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
(3) In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)
(B) Class III, Division 2. In Class III, Division 2 locations, the wiring method shall comply with 503.10(A).
Exception: In sections, compartments, or areas used solely for storage and containing no machinery, open wiring on insulators shall be permitted where installed in accordance with Article 398, but only on condition that protection as required by 398.15(C) be provided where conductors are not run in roof spaces and are well out of reach of sources of physical damage.
Substantiation: This proposal adds additional wiring methods suitable in a Class III location, and aligns the formatting with the structure of other Articles in Chapter 5.
Panel Meeting Action: Accept in Principle
Revise text as follows:
II. Wiring
503.10 Wiring Methods. Wiring methods shall comply with 503.10(A) or (B).
(A) Class III, Division 1.
(1) In Class III, Division 1 locations, the following wiring methods shall be permitted:
(1) Rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.~~, or~~
(2) Type MC or MI cable with listed termination fittings.
(3) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725 including installation in cable tray systems. The cable shall be terminated with listed fittings.
(4) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
(5) Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed adjacent cables
Exception to (6): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by (6).
(~~1~~2) Boxes and Fittings. All boxes and fittings shall be dusttight.
(~~2~~3) Flexible Connections. Where necessary to employ flexible connections, one or more of the following shall be permitted:
(1) Dusttight flexible connectors
(2) Liquidtight flexible metal conduit with listed fittings,
(3) Liquidtight flexible nonmetallic conduit with listed fittings,
(4) Interlocked armor Type MC cable having an overall jacket of suitable polymeric material and provided with termination fittings listed for the location
(5) Flexible cord in compliance with 503.140 ~~shall be used~~
(~~3~~4) Nonincendive Field Wiring. Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.
FPN: Simple apparatus is defined in 504.2. Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:
(1) In separate cables
(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
(3) In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)
(B) Class III, Division 2. In Class III, Division 2 locations, the wiring method shall comply with 503.10(A).
Exception: In sections, compartments, or areas used solely for storage and containing no machinery, open wiring on insulators shall be permitted where installed in accordance with Article 398, but only on condition that protection as required by 398.15(C) be provided where conductors are not run in roof spaces and are well out of reach of sources of physical damage.
Panel Statement: Changes have been made to correlate with similar changes in 502.10.
See Proposal 14-97.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-132 Log #3924 NEC-P14 **Final Action: Reject**
(503.10(B))

Submitter: Goran Haag, Champion Fiberglass, Inc.
Recommendation: Add new text to read as follows:
Type RTRC marked with the suffix -XW" to be added.
Substantiation: Type RTRC marked with the suffix –XW were permitted in the NEC 2008 for Class I Division 2. We want it to be included for Class III Division 2 as well. Shouldn't be any engineering arguments against this proposal.
Panel Meeting Action: Reject
Panel Statement: Type RTRC was added to 501.10(B)(7) with very specific restrictions, primarily for protection from corrosion. This proposal does not provide these restrictions. The substantiation does not provide any technical data to show that this wiring method is necessary in a Class III location.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-133 Log #864 NEC-P14 **Final Action: Reject**
(503.10(B) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter portion:...where conductors are not run in roof spaces and are ~~well out of reach of sources~~ not likely to be subject to physical damage.
Substantiation: Edit. "Well out of reach" is subjective and vague and doesn't specify from what. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-134 Log #1791 NEC-P14 **Final Action: Reject**
(503.10(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first sentence: Nonincendive field wiring shall be permitted using any ~~of the~~ identified wiring methods permitted for unclassified locations.
In (B)(3)(I), add: "or raceways".
Substantiation: Edit. All wiring methods permitted for unclassified locations may not be suitable. This provision may be deemed to modify "not permitted use". Nonincendive field wiring should be permitted in separate raceways.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-50. The panel notes that Section 503.10(B)(3) does not exist.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-135 Log #863 NEC-P14 **Final Action: Reject**
(503.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
~~Wiring~~ Metal raceways, metal covered cables, and non-current-carrying metal equipment in Class III Division I and 2 locations shall be grounded. ~~As specified in Article 250~~ and with the following additional requirements in 503.30(A) and (B).
Revise (B):
~~TYPES of~~ EQUIPMENT GROUNDING AND BONDING CONDUCTORS. Liquidtight flexible metal conduit shall not be used as the sole groundfault current path. ~~Where equipment bonding conductors are installed they shall comply with 250.102.~~
Exception: In Class III division 1 and 2 locations an equipment grounding or ~~the~~ equipment bonding conductor shall not be required ~~permitted to be deleted~~ where all of the following conditions are met.
Substantiation: "Wiring" may be construed to apply to conductors, for which grounding is specified elsewhere in the Code. The present wording as to types of equipment grounding conductors does not relate to the rest of the section. The exception should also apply to equipment grounding conductors. 250.102 already applies; something cannot be deleted unless it is first installed.
Panel Meeting Action: Reject
Panel Statement: The proposal does not add anything to the existing provisions of the text. The substantiation is unclear as to what benefit or correction is being applied.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-136 Log #1806 NEC-P14 **Final Action: Reject**
(503.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: GROUNDING and BONDING class I DIVISIONS 1 and 2. Metal enclosed wiring and equipment shall be grounded and comply with 502.30(A) and (B).
(A) BONDING. The locknut, double-locknut, and locknut-bushing shall not be permitted as the sole bonding means. Bonding jumpers with identified fittings or other identified means shall be used. Such means of bonding shall apply to all intervening metal raceways, cables, fittings, boxes, and other enclosures and equipment in Class III locations to the point of grounding for service equipment.
Exception: The specific bonding means shall only be required to the point where the grounded conductor (if used) and the grounding electrode conductor are connected on the load side of the building or structure, or separately derived system disconnecting means which includes overcurrent protection.
FPN No change
Substantiation: Single locknut connections such as commonly used with cable and flexible conduit connectors should be included. Locknuts and bushings should only be prohibited as the sole bonding means. Intervening cables such as Type MI should be included. All wiring systems may not include a grounded circuit conductor.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-137 Log #3307 NEC-P14 **Final Action: Reject**
(503.30)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Electrical wiring and equipment in Class III Division 1 and 2 locations shall be grounded ~~as specified in Article 250~~ and ~~with~~ the requirements in 502.30(A), 502.30(B) shall apply.
Substantiation: Article 250 already applies and has provisions which are alternatives or exceptions to grounding which do not appear to be intended to apply. Many sections simply state "shall be grounded"... Similar requirements worded differently many cause confusion per 3.3.5 of the Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63. The substantiation does not provide a reason for adding the word "Electrical". Section 4.1.1 of the NEC Style Manual allows references to code articles where additional conditions are specified.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-138 Log #1816 NEC-P14 **Final Action: Reject**
(503.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: ~~TYPES of~~ EQUIPMENT GROUNDING and BONDING CONDUCTOR. Liquidtight flexible metal conduit shall not be used as the sole ground fault current path. ~~Where equipment bonding conductors are installed they shall comply with 250.102.~~
Exception: In Class III Division 1 and 2 locations ~~the~~ an equipment grounding or bonding conductor jumper shall ~~be permitted to be deleted~~ not be required where all of the following conditions are met: (1) ~~LISTED~~ LIQUIDTIGHT FLEXIBLE METAL CONDUIT 1.8 M (6 FT) OR LESS IN LENGTH ~~WITH FITTINGS LISTED FOR GROUNDING~~ IS USED. (REMAINDER UNCHANGED).
Substantiation: Equipment grounding conductors are appropriate for inclusion. This section relates to installation and omission not types. Section 2.102 already applies unless modified. To delete a bonding jumper, it must be first installed. LFMC AND FITTINGS ARE ALREADY REQUIRED TO BE LISTED PER 350.6.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-139 Log #2586 NEC-P14 **Final Action: Reject**
(503.30(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
TYPES of EQUIPMENT GROUNDING and BONDING CONDUCTORS. Flexible metal conduit, ~~and~~ liquidtight flexible metal conduit and flexible metal fittings shall not be used as the sole ground-fault current path. ~~Where equipment bonding jumpers are installed they shall comply with 250.102.~~ Exception in Class III Division 1 and 2 locations, ~~the~~ a wire-type equipment grounding or bonding jumper conductor shall ~~be permitted to be deleted~~ not be required where all of the following conditions are met:
(1) ~~Listed~~ Liquidtight flexible metal conduit 1.8 m (6 ft) or less ~~in length with fittings listed from grounding~~ is used.
(2) Overcurrent protection in the circuit is limited to 10 amperes or less. The load is not a power ~~utilization~~ or lighting load.
Substantiation: Edit. The heading should include bonding conductors addressed in the text. Since the conduit is a grounding and bonding conductor the omission should refer to wire types. The grounding or bonding conductor cannot be deleted unless first installed. Fittings are already required to be listed in the respective articles. "Power" infers a particular type of load such as one that is not lighting or control Section 250.102 already applies, as do other requirements of Article 250, which are not referenced.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-140 Log #3080 NEC-P14 **Final Action: Accept in Principle**
(503.30(B))

Submitter: Mike Holt, Leesburg, FL
Recommendation: Revise text as follows:
(B) Types of Equipment Grounding Conductors. Liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type. ~~not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.~~
Exception: Text to remain unchanged.
Substantiation: Because many things (such as earth itself) are types of ground fault current paths [250.2], the existing language doesn't really tell the code user what the requirement is. This revised language makes it much clearer.
Panel Meeting Action: Accept in Principle
Include the reference to 250.102, so that the revised paragraph reads:
(B) Types of Equipment Grounding Conductors. Liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type, in compliance with 250.102.~~not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.~~
Exception: Text to remain unchanged.
Panel Statement: The panel has added a reference to 250.102, similar to accepted Proposals 14-66 and 14-104.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-141 Log #1818 NEC-P14 **Final Action: Reject**
(503.128(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise: Be protected ~~against~~ by identified means where likely to be subject to physical damage, rusting, or other corrosive agents ~~influences~~.
Substantiation: Edit. The provision is not appropriate for installations where damage, rust, or corrosion is not a factor. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-142 Log #862 NEC-P14 **Final Action: Reject**
(503.130(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
Luminaires and lampholders for fixed lighting, electric exit signs and other types of electric signs, shall ~~provide~~ be provided with enclosures that are designed to minimize the entrance of fibers/flyings and to prevent the escape of sparks, burning material, or hot metal. Each luminaire, lampholder and electric sign shall be clearly marked... (remainder unchanged).
Revise text of (B):
A luminaire, lampholder, or electric sign that ~~may~~ is likely to be exposed to physical damage shall be identified for the location or protected by ~~a~~ an identified guard.
Substantiation: Suitable lampholders (fixtures) other than luminaries, and electric signs should be included. "May" is a term to be avoided per the Style Manual; "likely" is defined as such a nature or circumstance as to make something probable, and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: The current text is correct. "May" is not subjective, but denotes physical possibility and is the appropriate term. The term "is likely to be" denotes probability, or a greater chance of occurrence. See also panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-143 Log #1844 NEC-P14 **Final Action: Reject**
(503.130(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: A luminaire (fixture) that ~~may~~ is likely to be exposed to physical damage shall be protected by a ~~suitable~~ identified guard.
Substantiation: Edit. "May" and "suitable" are subjective and terms to be avoided per the Style Manual. "Likely" is defined as such a nature or circumstance as to make something probable and a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-144 Log #1979 NEC-P14 **Final Action: Reject**
(503.130(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: A luminaire that ~~may be~~ is likely to be exposed subject to physical damage shall be protected by ~~a suitable~~ an identified guard.
Substantiation: The word "may" includes unforeseeable future conditions. Although "may" and "likely" are possible vague terms per 3.2.1 of the Style Manual, if my proposal for definition of "likely" in Article 100 is accepted, the term, which is used in many sections, will be clear.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-145 Log #861 NEC-P14 **Final Action: Reject**
(503.140)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(1) Be of a type ~~listed~~ identified for extra-hard usage and the application.
(2) No change.
(3) Be connected to terminals in ~~an approved manner~~ accordance with 110.14.
(4) Be supported by clamps or other ~~suitable~~ identified means ~~in such a manner that there will be no~~ to prevent tension on the terminal connections.
(5) Be provided with ~~suitable~~ identified means to prevent the entrance of fibers/flyings where the cord enters ~~boxes~~ enclosures or fittings.
Substantiation: Article 400 does not specify cords to be listed. "Approved" is not necessarily in compliance with 110.14 and may be deemed to modify that section. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text. The panel has previously conducted extensive studies of the use of the terms "approved", "listed", and "identified". The term used in the current text is appropriate within the context of this provision of the code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-146 Log #2838 NEC-P14 **Final Action: Accept in Principle**
(503.140)

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
503.140 Flexible Cords — Class III, Divisions 1 and 2.
Flexible cords shall comply with the following:
(1) Be of a type listed for extra-hard usage
(2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23
(3) Be connected to terminals or to supply conductors in an approved manner
(4) Be supported by clamps or other suitable means in such a manner that there will be no tension on the terminal connections
(5) Be terminated with a cord connector or attachment plug listed for the location ~~provided with suitable means~~ to prevent the entrance of fibers/flyings where the cord enters enclosures, boxes or fittings
Substantiation: This proposal makes clear the intent to terminate the flexible cord with attachment plugs or fittings that comply with ANSI requirements for such devices.
Panel Meeting Action: Accept in Principle
Revise text as follows:
503.140 Flexible Cords — Class III, Divisions 1 and 2.
Flexible cords shall comply with the following:
(1) Be of a type listed for extra-hard usage
(2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23
(3) Be connected to terminals or to supply conductors in an approved manner
(4) Be supported by clamps or other suitable means in such a manner that there will be no tension on the terminal connections
(5) Be terminated with a listed cord connector that maintains the protection technique or with an attachment plug listed for the location ~~provided with suitable means~~ to prevent the entrance of fibers/flyings where the cord enters enclosures, boxes, or fittings permitted when terminated with a listed cord connector that maintains the type of protection
Panel Statement: The proposed text has been aligned with that of 502.140. See Proposal 14-123.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-147 Log #3268 NEC-P14 **Final Action: Reject**
(503.140)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute:
FLEXIBLE CORDS AND PORTABLE POWER CABLES CLASS III DIVISIONS 1 and 2. Flexible cords and portable power cables shall comply with the following:
(1) Be extra-hard usage type identified for the use, including sunlight resistance where exposed to direct sunlight.
(2) Contain an equipment grounding conductor.
(3) Be connected to terminals in accordance with 110.14(5).
(4) Be provided with identified strain relief devices or installed so there is no tension on terminal connections.
(5) Be provided with identified means to prevent the entrance of fibers/flyings where the flexible cords or portable power cables enter boxes, cabinets, or other enclosures.
Substantiation: Portable power cables should be included. The extra-hard usage types should be identified for the purpose, since all are not suitable (wet locations, oil resistance, type EV, EVE, EVT). Reference to 110.14(5) is specific; "approved" is not necessarily the same as "identified". Reference to 400.23 is superfluous; already applies. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-124.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-148 Log #1982 NEC-P14 **Final Action: Reject**
(503.140(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or revise: (3) Be connected to supply terminals in an approved manner in accordance with 110.14.
Substantiation: Edit. Already covered by 110.14; does not conform to 3.3.5 of the Style Manual and increases bulk of the Code. It may be deemed that "approved manner" (see definition of approved) sanctions connections that may not comply with 110.14.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-86.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-149 Log #2022 NEC-P14 **Final Action: Reject**
(503.140(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete or revise (3) as follows: Be connected to ~~supply~~ terminals in an ~~approved manner~~ accordance with 110.14.
Substantiation: Already covered by 110.14. "Approved" may sanction connections that do not comply with 110.14. Load terminals should be included in the provision.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-86.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-150 Log #1845 NEC-P14 **Final Action: Reject**
(503.140(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: 110.2 and 110.14 are general requirements that already apply and are more comprehensive. "Approved" does not necessarily incorporate those requirements.
Panel Meeting Action: Reject
Panel Statement: The referenced section does not exist.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-151 Log #860 NEC-P14 **Final Action: Reject**
(503.155(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
In (A) change "acceptable" to "identified".
Revise (B): Contact conductors shall be located or guarded so as to be ~~inaccessible to other than~~ accessible only to authorized personnel and shall be protected where likely to be subject to physical damage or ~~against~~ accidental contact ~~with foreign objects~~.
Substantiation: "Acceptable" is subjective and a term to be avoided per the Style Manual. Since the definition of accessible (as applied to wiring methods) is capable of being exposed or not permanently closed in, "inaccessible" may imply contact conductors may be closed in by the structure. Protection should be required where likely to be subject to physical damage or accidental contact, whether by persons or objects. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
The word "acceptable" as used in this section is not unenforceable and does not create confusion, as indicated in the requirements of the NEC Style Manual. As such, it does not need to be replaced.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 504 — INTRINSICALLY SAFE SYSTEMS

14-152 Log #4427 NEC-P14 **Final Action: Accept**
(504.1)

TCC Action: The Technical Correlating Committee directs that this proposal be reported as "Accept" since, as modified by the panel, it violates the Manual of Style for NFPA Technical Committee Documents section 2.3.1.2.4 which requires dates of publication for referenced documents.
Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:
Change ANSI/ISA-RP 12.06.01-2003, *Wiring Methods for Hazardous (Classified) Locations Instrumentation – Part 1: Intrinsic Safety* to ANSI/ISA-RP12.06.01-2003, *Recommended Practice for Wiring Methods for Hazardous (Classified) Locations Instrumentation – Part 1: Intrinsic Safety*
Substantiation: Change format to match actual ISA standards title.
Panel Meeting Action: Accept in Part
Accept only the title of the referenced documents.
Panel Statement: CMP-14 has taken action, in accordance with Panel Proposal 14-6a, to delete publication dates for referenced documents.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-153 Log #859 NEC-P14 **Final Action: Reject**
(504.3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete.
Substantiation: Already covered by 90.3.
Panel Meeting Action: Reject
Panel Statement: This statement is needed to emphasize the fact that intrinsically safe systems are still subject to the other provisions of the code, including those in Chapter 5.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-154 Log #1460 NEC-P14 **Final Action: Reject**
(504.10(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence of first paragraph: ~~General purpose~~ Identified enclosures of any type shall be permitted for intrinsically safe apparatus.
Substantiation: Edit. General purpose is not defined; does it include or exclude weatherproof, watertight, dusttight, explosionproof, etc., which may not be deemed general purpose.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 14-30.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-155 Log #2839 NEC-P14 **Final Action: Accept**
(Table 504.10(B))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise table as follows:

Table 504.10(B) Assessment for T4 Classification According to Component Size and Temperature

Total Surface Area Excluding Lead Wires	Requirement for T4 Classification ~~(Based on 40°C Ambient Temperature)~~
<20 mm²	Surface temperature ≤275°C
≥20 mm² ≤10 cm²	Surface temperature ≤200°C
≥20 mm²	Power not exceeding 1.3 W*

*Based on 40°C Ambient Temperature. Reduce to 1.2 W with an ambient of 60°C or 1.0 W with 80°C ambient temperature.
Substantiation: The 40°C ambient temperature limit in Table 504.10(B) applies only to temperature classifications determined solely on available power. For determination of temperature based on component size, the ambient temperature is included in the formula for determining the maximum surface temperature.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-156 Log #284 NEC-P14 **Final Action: Accept**
(504.10(B)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Change "formula" to "equation".
Substantiation: The term formula normally refers to a chemical composition whereas an equation refers to a mathematical expression, which follows in the section.
This is one of a series of proposals to have consistent terminology throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-157 Log #908 NEC-P14 **Final Action: Reject**
(504.20)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Any ~~of the~~ identified wiring methods ~~suitable for unclassified locations~~ including those covered by Chapter 7 and Chapter 8 shall be permitted for installing intrinsically safe ~~apparatus~~ systems.
Substantiation: Edit. Wiring methods should be identified for the use. "Suitable" is a term to be avoided per the Style Manual. Article 504 is titled Intrinsically Safe Systems not "apparatus", which may be deemed to apply to equipment other than the wiring methods.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-158 Log #4635 NEC-P14 **Final Action: Accept in Principle**
(504.30(A)(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
Conductors of intrinsically safe circuits shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal. The conductors shall be separated from conductors of nonintrinsically safe circuits by one of the methods in (1) through (4).
Delete (5).
Substantiation: Item (5) is problematic because the syntax of this rule places it as one of five options to achieve the system separation requirement. This "option" is to tie the intrinsically safe conductors down so that if they fall out of a terminal, they cannot come in contact with any other terminal. If read as an option, and that is what the literal text says, then any degree of intermingling within the enclosure would be acceptable as long as the ends are tied down. This is completely inconsistent with every other provision in 504.30, and obviously a mistake. It seems quite clear that this is not a fifth option, but rather an additional basic requirement, as it was in the 2005 NEC, and it should continue to be applied in this way. This proposal relocates it as part of the parent text, and also removes a Style Manual issue regarding the use of "following" instead of actual citations.
Panel Meeting Action: Accept in Principle
Delete (5) and revise the submitter's proposed text to read:
"Conductors of intrinsically safe circuits shall be secured so that any conductor that might come loose from a terminal is unlikely to ~~cannot~~ come in contact with another terminal. The conductors shall be separated from conductors of nonintrinsically safe circuits by one of the methods in (1) through (4).
Panel Statement: The panel agrees with the intent of this proposal, but has replaced the word "cannot" since it presents an impractical requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-159 Log #1014 NEC-P14 **Final Action: Accept in Principle**
(504.30(A)(2)(5))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
All conductosr shall be secured or arranged so that any conductor that ~~might~~ becomes ~~loose~~ detached from a terminal cannot come in contact with another terminal.
Substantiation: Edit. The provision should apply where the conductor becomes detached, not loose, since a loose connection is not necessarily detached. FPN No. 1 indicates an arrangement not securement.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 14-158.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-160 Log #2840 NEC-P14 **Final Action: Accept**
(504.30(B))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(B) From Different Intrinsically Safe Circuit Conductors.
The clearance between two terminals for connection of field wiring of different intrinsically safe circuits shall be at least 6 mm (0.25 in.) unless this clearance is permitted to be reduced by the control drawing. Different intrinsically safe circuits ~~shall be in separate cables or~~ shall be separated from each other by one of the following means:
(1) The conductors of each circuit are within a grounded metal shield.
(2) The conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.).
Exception: Unless otherwise identified.
~~(3) The clearance between two terminals for connection of field wiring of different intrinsically safe circuits shall~~
~~be at least 6 mm (0.25 in.) unless this clearance is permitted to be reduced by the control drawing.~~
Substantiation: The clearance between the two terminals must be satisfied in addition to the separation between the conductors.
Satisfying the clearance requirement between the two field wiring terminals does not satisfy the intent of separating the conductors for the different intrinsically safe circuits. It is proposed that the words "shall be in separate cables or" be removed because having the circuits in separate cables does not necessarily provide the same level of separation as required by Items (1) and (2).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-161 Log #4636 NEC-P14 **Final Action: Accept in Principle**
(504.30(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
The clearance between two terminals for connection of field wiring of different intrinsically safe circuits shall be at least 6 mm (0.25 in.) unless the clearance is permitted to be reduced by the control drawing. Different intrinsically safe circuits shall be in separate cables or shall be separated from each other in accordance with (1) or (2)
Delete (3).
Substantiation: Item (3) is problematic because the syntax of this rule places it as one of three options to achieve the system separation requirement. This "option" is to space the intrinsically safe conductor terminations by at least ¼ in. unless otherwise covered in the control drawing. If read as an option, and that is what the literal text says, then any style of intermingling within a common cable jacket would be acceptable as long as the terminations are separated. This is completely inconsistent with every other provision in 504.30, and obviously a mistake. It seems quite clear that this is not a third option, but rather an additional basic requirement. This proposal relocates it as part of the parent text, and also removes a Style Manual issue regarding the use of "following" instead of actual citations.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 14-160.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-162 Log #4428 NEC-P14 **Final Action: Accept**
(504.50)

TCC Action: The Technical Correlating Committee directs that this proposal be reported as "Accept" since, as modified by the panel, it violates the Manual of Style for NFPA Technical Committee Documents section 2.3.1.2.4 which requires dates of publication for referenced documents.
Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:
(A) Change ANSI/ISA-RP 12.06.01-2003, *Wiring Methods for Hazardous (Classified) Locations Instrumentation – Part 1: Intrinsic Safety* to ANSI/ISA-RP12.06.01-2003, *Recommended Practice for Wiring Methods for Hazardous (Classified) Locations Instrumentation – Part 1: Intrinsic Safety*
(B) Change ANSI/ISA RP 12.06.01-2003,*Wiring Methods for Hazardous (Classified) Locations Instrumentation* - Part 1: Intrinsic Safety to ANSI/ISA-RP12.06.01-2003, *Recommended Practice for Wiring Methods for Hazardous (Classified) Locations Instrumentation – Part 1: Intrinsic Safety*
Substantiation: Change format to match actual ISA standards title.
Panel Meeting Action: Accept in Part
Accept only the titles of the referenced documents.
Panel Statement: CMP-14 has taken action, in accordance with Panel Proposal 14-6a, to delete publication dates for referenced documents.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-163 Log #3229 NEC-P14 **Final Action: Reject**
(504.50(C))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 5-102 which was "Accepted in Principle" by Code-Making Panel 5.

This action shall be considered by the panel as a public comment.
Submitter: Mark R. Hilbert, State of New Hampshire
Recommendation: Revise as follows:
(C) Connection to Grounding Electrodes. Where connections to a grounding electrode is required, the grounding electrode shall be as specified in 250.52(A)(1), (A)(2), (A)(3), and (A)(4) and shall comply with 250.30(A)~~(7)~~(4). Sections 250.52(A)(5), (A)(7), and (A)(8) shall not be used if any of the electrodes specified in 250.52(A)(1), (A)(2), (A)(3), or (A)(4) are present.
Substantiation: This proposal is being submitted as part of a series of proposals addressing a revision of 250.30. The subsection referencing grounding electrodes will be changed to 250.30(A)(4) as part of this revision.
Panel Meeting Action: Reject
Panel Statement: This proposal asks to amend 504.50(C) based on another proposal that has not yet been accepted.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-164 Log #1459 NEC-P14 **Final Action: Reject**
(504.60(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "in accordance with 250.100".
Substantiation: Edit. Reference is unnecessary; that section applies unless modified.
Panel Meeting Action: Reject
Panel Statement: The reference to 250.100 is necessary, since it deals specifically with hazardous (classified) locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-165 Log #3199 NEC-P14 **Final Action: Reject**
(504.70)

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Revise text to read as follows:
"...501.15, 502.15, and 505.16~~, and 506.16~~ shall...".
Substantiation: The scope of Article 504 includes Class I, II, and III locations. It does not include Zones 20, 21, and 22.
Panel Meeting Action: Reject
Panel Statement: Article 506 specifically refers to the requirements of Article 504.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-166 Log #1817 NEC-P14 **Final Action: Reject**
(504.80(B) and Exception No. 2 (New))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "exposed" between "entire" and length" in the second sentence
Add: Exception No. 2: Color coding specified in 504.80(C) shall be permitted in lieu of labels.
Substantiation: Labels should only be required where wiring is exposed. Where color coding is provided per 504.80(C), labels should not be necessary.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-167 Log #1815 NEC-P14 **Final Action: Reject**
(504.80(C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete and substitute: Intrinsically safe circuit conductors shall be identified by one or more of the following means:
1. Light blue colored insulation where no other conductors on the premises have light blue colored insulation.
2. Tagging or other approved means at every point identification where the conductors are accessible.
Substantiation: There is no provision that requires any specific identification of conductors other than identification provisions in other articles. Present wording permits but doesn't require a color; 404.80(B) only requires identification of the wiring method.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36. In addition, the proposal also omits the requirements for cable trays, raceways, and junction boxes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 505 — CLASS I, ZONE 0, 1 AND 2 LOCATIONS

14-168 Log #4087 NEC-P14 **Final Action: Reject**
(505)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Delete "Class I" before "Zone" in all of Article 505 and in the following other sections:
500.1 FPN No. 2, Definition "Electrical and Electronic Equipment FPN, 500.2 definition of unclassified locations, 501.1 FPN, 501.5, 501.10(c) and (d).
Substantiation: The term "Class I, as included when the zone methodology was initially added to the NEC to improve understanding when the zone concept was first introduced to provide added clarification that the Zones all addressed flammable gases, vapors, etc. Zone 0, zone 1 and zone 2 are now clearly understood and there is no need to continue to carry along this redundant label. Additionally making this change would better harmonize Article 506 since it does not use Class II before its zone naming convention.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 5
Explanation of Negative:
BRIESCH, E.: This proposal should be rejected. Class I was included when Article 505 was added to the 1996 NEC to be consistent with Article 500 which defines gases and vapors as Class I. When Article 506 was introduced, since it included both dusts (Class II) and fibers and flyings (Class III), including a Class became problematic. It was, therefore, omitted. The submitter hasn't even stated that a problem exists with the inclusion of Class I, only that it is redundant. Acceptance of this proposal will require revisions of all product standards and installation documents such as NFPA 30, 33 and 497 that reference Class I, Zone locations. It will also require manufacturers to revise their product markings to remove the Class I. It is a burdensome change that provides no benefit to users of the Code.
COSPOLICH, J.: "Class I" wording should remain. Having "Class I" appear on labeling and listings clearly distinguishes American from European Zone equipment. This helps to prevent confusion if all one sees is "Zone 0, Zone 1, or Zone 2" markings for the more widely used Class I equipment and does not understand AEx versus EEx versus ATEX markings. Maintaining Class I also coordinates with American equipment standards and markings.
GOODMAN, M.: The removal of the "Class I" before "Zone" is detrimental to the code and will add confusion with respect to the marking of products and proper application. "Class I" establishes the equipment in accordance with the NEC requirements vs. the requirements of other standards. The literally hundreds of text changes are not warranted or required as there is nothing technically incorrect or unsafe with the current language. Additionally, the impacts on equipment marking are significant and would lead to inconsistent marking (with and without "Class I") that would make identification of "suitable" equipment impossible. The submitters claim that "Class I" is a "redundant label" is unfounded, unsubstantiated, and incorrect.
KUCZKA, J.: NEMA does not agree that the concept is clearly understood and the Class I designation should be retained when referring to Zones 0, 1, and 2.
WIRFS, M.: I agree with the Explanations of Negative Votes submitted by Mr. Briesch, Mr. Cospolich, Mr. Goodman, and Mr. Kuczka.

14-169 Log #4429 NEC-P14 **Final Action: Accept**
(505.2)

TCC Action: The Technical Correlating Committee directs that this proposal be reported as "Accept" since, as modified by the panel, it violates the Manual of Style for NFPA Technical Committee Documents section 2.3.1.2.4 which requires dates of publication for referenced documents.
Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:
Encapsulation "m" FPN No. 1: Change ANSI/ISA-60079-18 (12.23.01)-2005, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection – Encapsulation "m"* to ANSI/ISA-60079-18 (12.23.01)-2009, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations: Type of Protection – Encapsulation "m"*

Intrinsic Safety "i" FPN No. 1: Change ANSI/ISA-60079-11 (12.02.01)-2002, *Electrical Apparatus for Use in Class I, Zones 0, 1 and 2 Hazardous (Classified) Locations – Intrinsic Safety "i"* to ANSI/ISA-60079-11 (12.02.01)-2009, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety "i"*

Oil Immersion "o" FPN: Change ANSI/ISA-60079-6 (12.26.01)-1998, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection – Oil Immersion "o"* to ANSI/ISA-60079-6 (12.00.05)-2009, *Explosive Atmospheres, Part 6: Equipment protection by oil immersion "o"*

Powder Filling "q" FPN: Change ANSI/ISA-60079-5 (12.25.01)-1998, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection – Powder Filling "q"* to ANSI/ISA-60079-5 (12.00.04)-2009, *Explosive Atmospheres, Part 5: Equipment protection by powder filling "q"*

Pressurization "p" FPN: Change ANSI/ISA-60079-2 (12.04.01)-2004, *Electrical Apparatus for Explosive Gas Atmospheres – Part 2: Pressurized Enclosures "p"* to ANSI/ISA-60079-2 (12.04.01)-2009, *Explosive Atmospheres, Part 2: Equipment protection by pressurized enclosures "p"*

Type of Protection "n" FPN: Change ANSI/ISA-60079-15 (12.12.02)-2003, *Electrical Apparatus for Use in Class I, Zone 2 Hazardous (Classified) Locations: Type of Protection "n"* to ANSI/ISA-60079-15 (12.12.02)-2008, *Electrical Apparatus for Use in Class I, Zone 2 Hazardous (Classified) Locations: Type of Protection "n"*

Substantiation: Change format to match actual ISA standards title.

Panel Meeting Action: Accept in Part

Accept only the titles of the referenced documents.

Panel Statement: CMP-14 has taken action, in accordance with Panel Proposal 14-6a, to delete publication dates for referenced documents.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-170 Log #4446 NEC-P14 **Final Action: Reject**
(505.2)

Submitter: Eliana Beattie, ISA

Recommendation: Revise text to read as follows:

FPN No. 1: See ANSI/UL 913-1997, *Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations*; ANSI/ISA-60079-11 (12.02.01)-2009, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety "i"* ~~*Electrical Apparatus for Use in Class I, Zones 0, 1 and 2 Hazardous (Classified) Locations — Intrinsic Safety "i"*~~; and ANSI/UL 60079-11, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety "i"* ~~*Electrical Apparatus for Explosive Gas Atmospheres — Part II: Intrinsic Safety "i."*~~

FPN No. 2: Intrinsic safety is designated type of protection "ia" for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" for use in Zone 1 locations. Intrinsic safety is designated type of protection "ic" for use in Zone 2 locations.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] ~~or~~ [ib] or [ic], is connected to intrinsically safe apparatus ("ia" ~~or~~ "ib," or "ic" respectively) but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Substantiation: The new edition of ANSI/ISA-60079-11 introduces an extension of the intrinsic safety concept for use in Zone 2. This is designated "ic" and "[ic]". This protection technique uses a similar philosophy to that used for "ia" and "ib" except that the concept does not apply any faults and is very similar to the existing Nonincendive technique that is already permitted by the Code.

Panel Meeting Action: Reject

Panel Statement: The panel agrees with the concept of the proposal but cannot accept it because the standard involved has not been published.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

MASSEY, L.: Assuming that the subject standard is published prior to the publication of the 2011 edition of the NEC,the panel should approve this proposal.

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise text as follows:

(B) Reference Standards. Important information relating to topics covered in Chapter 5 may be found in other publications.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), the Instrumentation, Systems, and Automation Society (ISA), and the International Electrotechnical Commission (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see NFPA 497-2008, *Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*. ANSI/API RP 505-1997, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2*; ANSI/ISA-TR (12.24.01)-1998 (IEC 60079-10 Mod), *Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2*; IEC 60079-10-1995, *Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas*; and *Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations*, IP 15, The Institute of Petroleum, London.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see NFPA 77-2007, *Recommended Practice on Static Electricity*; NFPA 780-2004, *Standard for the Installation of Lightning Protection Systems*; and API RP 2003-1998, *Protection Against Ignitions Arising Out of Static Lightning and Stray Currents*.

FPN No. 4: For further information on ventilation, see NFPA 30-2007, *Flammable and Combustible Liquids Code*, and ANSI/API RP 505-1997, *Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1,or Zone 2*.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see ANSI/API RP 14FZ-2000, *Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Zone 0, Zone 1, and Zone 2 Locations*.

FPN No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see IEC 60079-14-1996, *Electrical apparatus for explosive gas atmospheres — Part 14: Electrical installations in explosive gas atmospheres (other than mines)*, and IEC 60079-16-1990, *Electrical apparatus for explosive gas atmospheres — Part 16: Artificial ventilation for the protection of analyzer(s) houses*.

FPN No. 7: For further information on application of electrical equipment in hazardous (classified) locations in general, see ANSI/ISA-60079-0 (12.00.01)-2005, *Electrical Apparatus for Use in Class I, Zones 0 and 1, Hazardous (Classified) Locations: General Requirements*; ANSI/ISA- 12.01.01-1999, *Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations*; and ANSI/UL 60079-0, *Electrical Apparatus for Explosive Gas Atmospheres — Part 0: General Requirements*.

Substantiation: NFPA 497 is an additional source of information regarding Classification of Class I, Zone areas.

This proposal reflects the current practice for gauging and engagement of NPT and metric thread forms found in the product standards referenced in the fine print note.

Panel Meeting Action: Accept in Principle

Accept text verbatim, except:

- Change IEC 60079-10 to IEC 60079-10-1
- Delete dates of referenced document.s

Panel Statement: The panel has corrected the designation of the IEC document and has deleted publication dates of referenced documents in accordance with Proposal 14-6a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-173 Log #1069 NEC-P14 **Final Action: Reject**
(505.5(A))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second paragraph:
Rooms and areas containing ammonia refrigeration systems that are provided equipped with ~~adequate mechanical~~ electrically powered ventilation systems that prevent accumulation of vapor or gases ~~may be classified as "unclassified" locations~~ shall be permitted to be unclassified, provided an approved audible or visual means or both, is provided at an approved location to indicate when the ventilation system is not functioning.
Substantiation: "Mechanical" ventilation implies louvers, roof mounted nonelectrical wind turbines and the like. "Adequate" is a term to be avoided per the Style Manual. There should be a means to indicate malfunction of the ventilation system.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-174 Log #1776 NEC-P14 **Final Action: Reject**
(505.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: Article 505 requires equipment connection and installation that ~~ensures~~ provides for safe performance under normal conditions of proper use and maintenance.
Substantiation: Edit. "Ensure" is defined as sure or certain which cannot be applied for an abnormal condition that may result from physical damage, fire, earthquake and other occurrences.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-175 Log #3201 NEC-P14 **Final Action: Accept in Principle**
(505.7(D) (New))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Add a new D as follows:
"**(D) Simultaneous Presence of Flammable Gases and Combustible Dusts or Fibers/Flyings.** Where flammable gases, combustible dusts, or fibers/flyings are or may be present at the same time, the simultaneous presence shall be considered during the selection and installation of the electrical equipment and the wiring methods, including the determination of the safe operating temperature of the electrical equipment."
Substantiation: There is no provision for "simultaneous presence" in Class I zone areas and there needs to be such a provision. This paragraph is in 506.6(D) and should be included in Article 505 for consistency. 500.8(C)(4) ties Class I (Divisions only since Class I Zones stand alone in Article 505) to Class II (Divisions only since 506 is not called Class II). And 506.6(D) ties Zones 20, 21, and 22 to Class I Zones. But, nothing ties Class I Zones to Class II Divisions, a situation not precluded by Reclassification Permitted 505.7(C) or 506.6(C). This addition would allow areas previously classified as Class I, Division x and Class II, Division y simultaneously to reclassify the Class I, Division x as Class I, Zone x, which may be useful.
Panel Meeting Action: Accept in Principle
Accept the text, but designate the paragraph as "(E)", not "(D)".
Panel Statement: Paragraph 505.7(D) already exists.

Recommendation: Add new text to read as follows:
FPN No. 3: For further information, see ISA-TR12.13.03, Guide for Combustible Gas Detection as a Method of Protection,
Substantiation: There is currently no guidance on recommended practices for the use of combustible gas detection equipment as a method of protection. It is recommended that a reference to ISA-TR12.13.03 be provided within the text for such recommended practice. The ISA-TR12.13.03 is directly based upon API practices that have been applied for 30+ years in the petroleum industry.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-179 Log #4448 NEC-P14 **Final Action: Accept**
(505.9(C)(2))

Submitter: Eliana Beattie, ISA
Recommendation: Add new text to read as follows:
FPN No.4: EPL (or Equipment Protection Level) may appear in the product marking. The EPLs are designated as G for Gas, D for Dust or M for Mining, and then followed by a letter (a,b,c) to give the user a better understanding as to whether the equipment provides either (a) a "very high", (b) "high", or (c) "enhanced" level of protection against ignition of an explosive atmosphere. For example, an AEx d IIC T4 motor (which is suitable by protection concept for application in Zone 1) may additionally be marked with the EPL of "Gb" to indicate that it was provided with a "high" level of protection such as AEx d IIC T4 Gb.
Substantiation: Our US Standards development process follows that of the IEC. EPLs were introduced into the IEC standards in 2006, and have now been introduced into ANSI/ISA-60079-0 and ANSI/UL 60079-0. The fine print note is to alert users that this additional marking may be present on products. This additional marking in no way affects any of the required marking.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-180 Log #4449 NEC-P14 **Final Action: Accept**
(505.9(C)(2))

Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:
FPN No. 4: Equipment installed outside a Class I, Zone 0, electrically connected to equipment located inside Class I, Zone 0 may be marked Class I Zone 0/1. The "/" indicates that equipment contains a separation element and can be installed at the boundary between a Class I Zone 0 and a Class I Zone 1 location. See ANSI/ISA-60079-26, Electrical Apparatus for Use in Class I, Zone 0 Hazardous (Classified) Locations.
Substantiation: ANSI/ISA-60079-26, Electrical Apparatus for Use in Class I, Zone 0 Hazardous (Classified) Locations introduces new marking which is not identified in any of the other "zone" standards but which could appear on products in the US market, but the Code does not recognize these and without some explanation this could lead to confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-181 Log #4450 NEC-P14 **Final Action: Reject**
(505.9(C)(2))

Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:
Electrical equipment of types of protection "e," "m," "ma," "mb," "px," "py," "pz," or "q" shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "ic" "[ia]," ~~or~~ "[ib]" or "[ic]" shall be marked Group IIA, IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it be marked Group IIA, IIB, or IIC, or a specific gas or vapor.
Substantiation: The new edition of ANSI/ISA-60079-11 introduces an extension of the intrinsic safety concept for use in Zone 2. This is designated "ic" and "[ic]". This protection technique uses a similar philosophy to that used for "ia" and "ib" except that the concept does not apply any faults and is very similar to the existing nonincendive technique that is already permitted by the Code.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the concept of the proposal but cannot accept it because the standard involved has not been published.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MASSEY, L.: Assuming that the subject standard is published prior to the publication of the 2011 edition of the NEC,the panel should approve this proposal.

14-182 Log #4459 NEC-P14 **Final Action: Reject**
(Table 505.9(C)(2)(4))

Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:

qb	Powder filled	1

*Does not address use where a combination of techniques is used.
**Associated apparatus is permitted to be installed in a hazardous (classified) location if suitably protected using another type of protection.

Substantiation: Changes to the NEC are proposed to align with the changes in the product standard.
The marking in IEC 60079-0 has been revised to show alternative designations for some of the types of protection. The US adoption, ANSI/ISA-60079-0 – ANSI/UL 60079-0 has maintained these alternate designations. The change to the NEC is proposed to maintain alignment with the product standard.
As an alternate to the existing marking, the lower case letter indicating the "Equipment Protection Level" is added to the type of protection where it does not already exist. For example, with Intrinsic Safety "ia" for Equipment Protection Level "a" already exists in the type of protection
Panel Meeting Action: Reject

Panel Statement: The panel agrees with the concept of the proposal but cannot accept it because the standard involved has not been published.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MASSEY, L.: Assuming that the subject standard is published prior to the publication of the 2011 edition of the NEC,the panel should approve this proposal.

14-183 Log #604 NEC-P14 **Final Action: Accept**
(505.9(D)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with regard to the accepted language in Proposal 14-184.
This action will be considered by the panel as a public comment.
Submitter: William G. Lawrence, Jr., S. Yarmouth, MA
Recommendation: Revise text to read as follows:
(1) Temperature Classifications. Equipment shall be marked to show the operating temperature or temperature class referenced to a 40°C ~~(104°F)~~ ambient, or at the higher ambient temperature if the equipment is rated and marked for an ambient temperature of greater than 40°C. The temperature class, if provided, shall be indicated using the temperature class (T Code) shown in Table 505.9(D)(1).
Electrical equipment designed for use in the ambient temperature range between -20°C and +40°C shall require no additional ambient temperature marking.
Electrical equipment that is designed for use in a range of ambient temperatures other than -20°C to +40°C is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol “Ta” or “Tamb” together with the special range of ambient temperatures, in degrees Celsius.
~~Electrical equipment suitable for ambient temperatures exceeding 40°C (104°F) shall be marked with both the maximum ambient temperature and the operating temperature or temperature class at that ambient temperature.~~
Substantiation: The 3rd paragraph no longer permits degrees Fahrenheit for ambient temperature marking. Maintaining the °F here is misleading. **505.9(D)(1)** currently indicates that for equipment with a rated ambient temperature of greater than 40°C, the equipment shall be marked with a temperature class for the 40°C ambient, AND a temperature class for the higher ambient. This is not consistent with 500.8(B)(4) where this is an “OR” situation, not an “AND”. Employing the same text as in Article 500 to expand the requirement in the 1st paragraph should resolve the confusion. The existing 4th paragraph can then be deleted.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-184 Log #3202 NEC-P14 **Final Action: Accept**
(505.9(D)(1))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with regard to the accepted language in Proposal 14-183.
This action will be considered by the panel as a public comment.
Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: In the second paragraph delete “additional” so that it reads:
“Electrical equipment designed for use in the ambient temperature range between –20°C and +40°C shall require no ~~additional~~ ambient temperature marking.”
Substantiation: There is no other marking related to ambient, so “additional” is not necessary.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-185 Log #3203 NEC-P14 **Final Action: Reject**
(505.9(D)(1))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Revise the fourth paragraph as follows:
“Electrical equipment suitable for ambient temperatures ~~exceeding~~ other than 40°C (104°F) shall be marked with both the maximum ambient temperature and the operating temperature or temperature class at the ambient temperature.
Substantiation: Other proposals from this submitter are intended to clarify that the ambient temperatures both inside as well as outside the default range are acceptable for the effective operation of equipment if the range is marked on it. Apparently, the principle is that even if the equipment will not function at 40°C, it should still remain safe and not constitute a source of ignition from high temperatures. This is not at all clear to the user who doesn’t know that the marked ambient is for the effective operation, but that the equipment will still be safe at 40°C. Maybe the user thinks that the equipment will operate effectively up to the marked ambient, but will be safe regardless of the ambient.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-26.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-186 Log #3204 NEC-P14 **Final Action: Reject**
(505.9(D)(1))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Add a new sentence at the end of the penultimate paragraph as follows:
“Electrical equipment that is designed for use in a range of ambient temperatures other than –20°C to +40°C is considered to be special; and the ambient temperature range shall than be marked on the equipment, including either the symbol “Ta” or “Tamb” together with the special range of ambient temperatures, in degrees Celsius. Either limit of this special range shall be permitted to be inside or outside of the standard range.
Substantiation: This paragraph has been interpreted as permitting a special ambient limit to be only outside of the default limits. This has caused difficulties for certain types of temperature-sensitive equipment within an explosion protected enclosure. As an example, flameproof, encapsulated circuit breakers inside a Type “e” enclosure will not dissipate heat produced as readily as normal circuit breakers inside a sheet metal enclosure. This restricts the number of circuits to prevent nuisance tripping in a 40°C ambient. There is no logic in requiring equipment that will be used inside a building whose year-round temperature will be 24°C to operate effectively at a 40°C ambient. This does not change the requirement that it operate safely in a +40°C ambient.
See companion proposal for 500.8(C)(5).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-26.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-187 Log #378 NEC-P14 **Final Action: Accept in Principle**
(505.9(E))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise first sentence as shown:
“All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 ($^3/_4$ in. taper/foot) ~~(3/4-in. taper per foot)~~.”
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 14-188.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-188 Log #2842 NEC-P14 **Final Action: Accept**
(505.9(E))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered since it violates the Manual of Style for NFPA Technical Committee Documents section 2.3.1.2.4 which requires dates of publication for referenced documents.
This action will be considered by the panel as a public comment.
Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(E) Threading. Supply connection entry thread form shall be NPT or metric. ~~All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 (3/4-in. taper per foot).~~ Conduit and fittings shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof integrity of the conduit system where applicable. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 500.8(E)(1) or (E)(2). ~~Threaded entries into explosionproof equipment shall be made up with at least five threads fully engaged.~~
~~*Exception: For listed explosionproof or flameproof equipment, factory threaded NPT entries shall be made up with at least 41/2 threads fully engaged.*~~
(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.
All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 (3/4-in. taper per foot).
NPT threaded entries into explosionproof equipment shall be made up with at least five threads fully engaged.
Exception: For listed explosionproof equipment, factory threaded NPT entries shall be made up with at least 41/2 threads fully engaged.
FPN No. 1: Thread form specifications for NPT threads are located in ANSI/ASME B1.20.1-1983, *Pipe Threads, General Purpose (Inch).*

FPN No. 2: Female NPT threaded entries use a modified National Standard Pipe Taper (NPT) thread with thread form per ANSI/ASME B1.20.1-1983, *Pipe Threads, General Purpose (Inch)*. See ANSI UL/ISA 60079-1 *Electrical Apparatus for Explosive Gas Atmospheres – Part 1: Flameproof Enclosures "d"*.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, listed conduit fittings or listed cable fittings shall be used. s Such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment~~. Adapters~~ and shall be used for connection to conduit or NPT-threaded fittings. ~~Listed cable fittings that have metric threads shall be permitted to be used.~~

Metric threaded entries into explosionproof equipment shall have a class of fit of at least 6g/6H and be made up with at least five threads fully engaged for Group C and D, and not less than eight full threads for Group A and Group B.

FPN: Threading specifications for metric threaded entries are located in ISO 965/1-1980, *Metric Screw Threads*, and ISO 965/3-1980, *Metric Screw Threads*

(3) Unused Openings.

All unused openings shall be closed with close-up plugs listed for the location and shall maintain the type of protection. The plug engagement shall comply with 500.8(E)(1) or 500.8(E)(2).

Substantiation: This proposal reflects the current practice for gauging and engagement of NPT and metric thread forms found in the product standards referenced in the fine print note.

Panel Meeting Action: Accept in Principle

Revise text as follows:

(E) Threading. Supply connection entry thread form shall be NPT or metric. ~~All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 (3/4-in. taper per foot).~~ Conduit and fittings shall be made wrenchtight to prevent sparking when fault current flows through the conduit system and to ensure the explosionproof integrity of the conduit system where applicable. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 505.9(E)(1) or (E)(2). ~~Threaded entries into explosionproof equipment shall be made up with at least five threads fully engaged.~~

~~*Exception: For listed explosionproof or flameproof equipment, factory threaded NPT entries shall be made up with at least 41/2 threads fully engaged.*~~

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread.

NPT threaded entries into explosionproof or flameproof equipment shall be made up with at least five threads fully engaged.

Exception: For listed explosionproof or flameproof equipment, factory threaded NPT entries shall be made up with at least 4-1/2 threads fully engaged.

FPN No. 1: Thread ~~form~~ specifications for male NPT threads are located in ANSI/ASME B1.20.1, *Pipe Threads, General Purpose (Inch)*.

FPN No. 2: Female NPT threaded entries use a modified National Standard Pipe Taper (NPT) thread with thread form per ANSI/ASME B1.20.1, *Pipe Threads, General Purpose (Inch)*. See ANSI UL/ISA 60079-1 *Electrical Apparatus for Explosive Gas Atmospheres – Part 1: Flameproof Enclosures "d"*.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, listed conduit fittings or listed cable fittings shall be used. s Such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment~~. Adapters~~ and shall be used for connection to conduit or NPT-threaded fittings. ~~Listed cable fittings that have metric threads shall be permitted to be used.~~

Metric threaded entries into explosionproof or flameproof equipment shall have a class of fit of at least 6g/6H and be made up with at least five threads fully engaged for Groups C, D, IIB, or IIA and not less than eight threads fully engaged for Groups A, B, IIC, or IIB + H2.

FPN: Threading specifications for metric threaded entries are located in ISO 965/1, *Metric Screw Threads*, and ISO 965/3, *Metric Screw Threads*

(3) Unused Openings.

All unused openings shall be closed with close-up plugs listed for the location and shall maintain the type of protection. The plug engagement shall comply with 505.9(E)(1) or 505.9(E)(2).

Panel Statement: The reorganization of this section has been made with modifications for clarity and consistency and aligns with Proposal 14-33.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-189 Log #145 NEC-P14 **Final Action: Accept in Principle**
(505.9(F))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal. The panel did not indicate whether it accepted the proposed FPN or not.

This action will be considered by the panel as a public comment.

Submitter: Stanley Kaufman, CableSafe Inc.

Recommendation: Revise as follows:

(F) ~~Fiber~~ Optical Fiber Cables ~~Assembly~~. ~~Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly~~ Composite and conductive optical fiber cables shall be installed in accordance with 505.15 and 506.15 as applicable.

FPN: See 770.2 for definitions of optical fiber cables.

Substantiation: The Code should use consistent terminology throughout.

Article 770 definitions:

Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering.

Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors.

Conductive Optical Fiber Cable. These optical fiber cables contain non–current-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.

Acceptance of this proposal will result in correlation with Article 770.

Panel Meeting Action: Accept in Principle

(F) ~~Fiber~~ Optical Fiber Cables ~~Assembly~~. Where an ~~fiber~~ optical fiber cable ~~assembly~~ contains conductors that are capable of carrying current (composite optical fiber cable), the ~~fiber~~ optical fiber cable ~~assembly~~ shall be installed in accordance with the requirements of Articles 505.15 and 505.16.

Panel Statement: See panel statement on Proposal 14-35. The panel notes that the second referenced section was in error in the original proposal; this has been corrected.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-190 Log #1015 NEC-P14 **Final Action: Reject**
(505.15(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

In (B)(1)(b)(c) insert "likely to be" between "not" and "subject".

Revise (f) Type PVC conduit and RTRC shall be permitted underground where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to finish grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit with threaded fittings shall be used for not less than the last 600 mm (24 in.) of the underground run to emergence. ~~Or to the point of connection to the aboveground wiring~~.

Substantiation: "Underground" should be specified in the first sentence to correlate with "grade" and "underground" in the second sentence. Literal wording does not permit more than 24 in. of RMC or IMC for the last portion of the run. "To emergence" is the determining requirement whether or not above ground connection is to a raceway, cabinet, or box. "Above ground raceway" implies the underground run cannot terminate in a pole, box, or cabinet. All extensions aboveground have to comply with applicable provisions.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-39.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-191 Log #2843 NEC-P14 **Final Action: Accept in Principle**
(505.15(B))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action as it relates to 4.1.1 of the NEC Style Manual concerning references to entire articles.

This action will be considered by the panel as a public comment.

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise text as follows:

(B) Class I, Zone 1.

(1) General. In Class I, Zone 1 locations, the wiring methods in (B)(1)(a) through (B)(1)(f) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation,
and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and terminated ~~provided~~ with ~~termination~~ fittings listed for the application.

FPN: See 330.12 for restrictions on use of Type MC cable.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation,

and where the cable is not subject to physical damage, Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and terminated ~~provided~~ with ~~termination~~ fittings listed for the application.

FPN: See 727.4 and 727.5 for restrictions on use of Type ITC cable.

(d) Type MI cable terminated with ~~termination~~ fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

(2) Flexible Connections. Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of 505.17 terminated with a listed cord connector that maintains the type of protection shall be permitted.

Substantiation: Cable is *terminated* with fittings, but the fittings are not *provided* with the cable, they are sourced separately. Terminology is made consistent with other portions of the section.

Panel Meeting Action: Accept in Principle

Revise text as follows:

(B) Class I, Zone 1.

(1) General. In Class I, Zone 1 locations, the wiring methods in (B)(1)(a) through (B)(1)(f) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation,

and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and terminated ~~provided~~ with ~~termination~~ fittings listed for the application. Type MC-HL cable shall be installed in accordance with the provisions of Article 330.

~~FPN: See 330.12 for restrictions on use of Type MC cable.~~

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation,

and where the cable is not subject to physical damage, Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and terminated ~~provided~~ with ~~termination~~ fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.

~~FPN: See 727.4 and 727.5 for restrictions on use of Type ITC cable.~~

(d) Type MI cable terminated with ~~termination~~ fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

(2) Flexible Connections. Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of 505.17 terminated with a listed cord connector that maintains the type of protection of the terminal compartment shall be permitted.

Panel Statement: The panel agrees with the changes made by the submitter and has made additional changes to (b) to clarify that the requirements of Article 330 also apply to the installation of Type MC-HL cable. The panel has also made additional changes to (c) to clarify that the requirements of Article 727 also apply to the installation of Type ITC-HL cable. The panel has made additional changes in (2) to clarify that the type of protection applies to the terminal compartment.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-192 Log #1778 NEC-P14 **Final Action: Reject**
(505.15(B)(1))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Revise text: In Class I Zone 1 locations, only the wiring methods in (B)(1)(a) through (B)(1)(f) shall be permitted.

Substantiation: Edit. Present wording does not exclude other wiring methods. 90.5(B) states "permitted" describes actions or options that are allowed but not require. 230.43, for example, specifically limits wiring methods as do other sections.

Panel Meeting Action: Reject

Panel Statement: The addition of the word "only" does not add to the clarity of the code language nor is it required to restrict other wiring methods.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-193 Log #1068 NEC-P14 **Final Action: Reject**
(505.15(B)(1)(b) and (c))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Insert "likely to be" between "not" and "subject".

Substantiation: It is difficult to determine that something is not subject to damage. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-36.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-194 Log #4323 NEC-P14 **Final Action: Reject**
(505.15(B)(2))

Submitter: Robert L. Seitz, Artech Engineering

Recommendation: Add to end of the paragraph:

Armored TC-ER cable as described in 336.10 and 336.100 shall be permitted to be employed as a flexible connection for distances not to exceed 10 meters between end devices and utilization equipment and a termination enclosure.

Substantiation: Allowance that a braided armor TC-ER cable is acceptable for flexible connection in Class I, Zone 1 areas would improve the choice of flexible connections that might be made in Zone 1 areas. TC cables are already permitted to be installed in Class I, Zone 2 areas. Extra hard usage cord can now be used for flexible connection in Class I, Zone 1 areas. The addition of an armored TC-ER cable for a limited length of 10 meters would allow a flexible connection to be made between utilization equipment and a termination point that is necessarily (by location and construction) greater than 6 ft apart. 10 meters was selected as reasonable to accommodate a 6 ft jump of the tray that would be used on both ends, which would then leave a cable tray length of 6 meters or about 20 feet would allow bridging distance that might exist around installed equipment. The flexible connection would than be able to be disconnected and moved out of the way during equipment change out or servicing. A companion proposal has been submitted for 336.100 to permit a braided armor for TC.

Panel Meeting Action: Reject

Panel Statement: The type of cable and its construction is not currently permitted by 336.100.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-195 Log #2844 NEC-P14 **Final Action: Accept in Principle**
(505.15(C))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise text as follows:

(C) Class I, Zone 2.

(1) General. In Class I, Zone 2 locations, the wiring methods in (C)(1)(a) through (C)(1)(h) shall be permitted.

(a) All wiring methods permitted by 505.15(B).

(b) Types MI, MC, MV, or TC cable terminated with ~~termination~~ fittings listed for the type of protection~~, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings~~.

Single conductor Type MV cables shall be shielded or metallic armored.

(c) Type ITC and Type ITC-ER cable as permitted in 727.4 terminated with fittings listed for the type of protection.

(d) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, ~~or in cable tray systems~~ terminated with fittings listed for the type of protection. ~~PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.~~

(e) Enclosed gasketed busways, enclosed gasketed wireways.

(f) Threaded rigid metal conduit, threaded steel intermediate metal conduit.

(g) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation

and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted. Where seals are required for boundary conditions as defined in 505.16(C)(1)(b), the Zone 1 wiring method shall extend into the Zone 2 area to the seal, which shall be located on the Zone 2 side of the Zone 1–Zone 2 boundary.

(h) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations.

Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in
a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in 504.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

(1) In separate cables

(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield

(3) In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

(2) Flexible Connections. Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit
with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord in accordance with the provisions of 505.17 terminated with a listed cord connector that maintains the type of protection shall be permitted.

FPN: See 505.25(B) for grounding requirements where flexible conduit is used.

Substantiation: This proposal reflects the current installation requirements of 725.154(D) that in conjunction with a companion proposal to revise 725.154(D) move the Classified location permitted wiring methods into Chapter 5, with the installation requirements for these types of cables retained for all users in 725.154(D). See companion proposal on 725.154(D).

Panel Meeting Action: Accept in Principle

Revise text as follows:

(C) Class I, Zone 2.

(1) General. In Class I, Zone 2 locations, the following wiring methods shall be permitted,

(a) All wiring methods permitted by 505.15(B).

(b) Types MI, MC, MV, or TC cable including installation in cable tray systems. The cable shall be terminated with listed fittings. ~~with termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings~~.

Single conductor Type MV cables shall be shielded or metallic armored.

(c) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.

(d) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including ~~or~~ installation in cable tray systems. The cable shall be terminated with listed fittings. ~~PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.~~

(e) Enclosed gasketed busways, enclosed gasketed wireways.

(f) Threaded rigid metal conduit, threaded steel intermediate metal conduit.

(g) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted. Where seals are required for boundary conditions as defined in 505.16(C)(1)(b), the Zone 1 wiring method shall extend into the Zone 2 area to the seal, which shall be located on the Zone 2 side of the Zone 1–Zone 2 boundary.

(h) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations.

Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in 504.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

(1) In separate cables

(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield

(3) In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

(2) Flexible Connections. Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord in accordance with the provisions of 505.17 terminated with a listed cord connector that maintains the type of protection of the terminal compartment shall be permitted.

FPN: See 505.25(B) for grounding requirements where flexible conduit is used.

Panel Statement: The panel has retained the language "in cable tray systems", which was deleted in the proposal, in items (b) and (d) to permit their use, as provided in other articles in the code. The panel also clarified the language for listed fittings. The panel has made additional changes in (2) to clarify that the type of protection applies to the terminal compartment.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-196 Log #4904 NEC-P14 **Final Action: Accept**
(505.15(C)(1)(b))

Submitter: Jeremy Neagle, Intertek ETL SEMKO

Recommendation: Delete Type MI cable from 505.15.(c)(1)(b).

Substantiation: 505.15(C)(1)(a) permits the use of all wiring methods permitted in 505.15(B), which includes Type MI cable. There is no need to re-state this wiring method in 505.15(C)(1)(b).

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-197 Log #4906 NEC-P14 **Final Action: Accept in Principle**
(505.15(C)(1)(b))

Submitter: Jeremy Neagle, Intertek ETL SEMKO

Recommendation: Revise text as follows:

(b) Types MI, MC, MV, or TC cables with termination fittings, ~~or in cable tray systems~~ and installed in a manner to avoid tensile stress at the termination fittings. Single conductor Type MV cables shall be shielded or metallic armored.

Substantiation: Cable tray systems are not a suitable replacement for proper termination fittings at the entry into equipment. The requirements for installation of such cables in trays are covered in other articles.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 14-195.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

(Note: Sequence 14-197a moved to follow 14-198)

14-198 Log #4451 NEC-P14 **Final Action: Reject**
(505.15(C)(1)(h))

Submitter: Eliana Beattie, ISA

Recommendation: Revise text to read as follows:

(h) ~~Nonincendive field wiring~~ Intrinsic safety type of protection "ic" shall be permitted using any of the wiring methods permitted for unclassified locations. ~~Nonincendive field wiring systems~~ Intrinsic safety type of protection "ic" systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in ~~a nonincendive field wiring circuits~~ an intrinsic safety type of protection "ic" circuit, provided the simple apparatus does not interconnect the ~~nonincendive field wiring circuits~~ intrinsic safety type of protection "ic" systems to any other circuit.

FPN: Simple apparatus is defined in 504.2.

Separate ~~nonincendive field wiring circuits~~ intrinsic safety type of protection "ic" systems shall be installed in accordance with one of the following:

(1) In separate cables

(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield

(3) In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

Substantiation: The new edition of ANSI/ISA-60079-11 introduces an extension of the intrinsic safety concept for use in Zone 2. This is designated "ic" and "[ic]". This protection technique uses a similar philosophy to that used for "ia" and "ib" except that the concept does not apply any faults and is very similar to the existing nonincendive technique that is already permitted by the Code. This technique is not intended to replace nonincendive field wiring as this will still be permitted for use in Zones under 509.9(C)(1).

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 14-170.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-197a Log #CP1404 NEC-P14 **Final Action: Accept**
(505.15(C)(1)(f).)

Submitter: Code-Making Panel 14,

Recommendation: Delete 505.15(C)(1)(f).

Substantiation: 505.15(C)(1)(a) permits all of the wiring methods permitted in 505.15(B), which includes threaded rigid metal conduit and threaded steel intermediate metal conduit. There is no need to restate these wiring methods in 505.15(C)(1)(f).

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-199 Log #4322 NEC-P14 **Final Action: Reject**
(505.15(C)(2))

Submitter: Robert L. Seitz, Artech Engineering
Recommendation: Revise to read:
Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations, or flexible cord in accordance with the provisions of 505.17 shall be permitted. <u>Additionally armored TC-ER cable as permitted in 336.10 may be used.</u>
Substantiation: Clarification that TC-ER cable is acceptable for flexible connection in Class I, Zone 2 areas would improve the choice of flexible connections that might be made. TC cables are already permitted to be installed in Class I, Zone 2 areas.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-194.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-200 Log #3205 NEC-P14 **Final Action: Reject**
(505.15(C)(3))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Add a new 505.15(C)(3) as follows:
"(3) Boxes and Fittings. Boxes and fittings shall not be required to be explosion protected unless they contain apparatus that may produce arcs, sparks or high temperatures (temperatures exceeding 80% of the autoignition temperature of the gas or vapor involved) that are considered to be an ignition source in normal operation. Such apparatus includes, but is not limited to, switches, circuit breakers, motor controllers, fuses, variable frequency drives, alarm bells and horns, relays, GFCIs, AFCIs, and resistors.
Substantiation: There is nothing in Article 505 similar to 501.10(B)(4). This has led end users and others to think that all boxes and fittings for use in Zone 2 must be identified for such.
Panel Meeting Action: Reject
Panel Statement: The proposal as written would permit equipment that is not listed as required by 505.20.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-201 Log #306 NEC-P14 **Final Action: Reject**
(505.16(B)(7))

Submitter: Leslie Zabel, ConocoPhillips Alaska, Inc.
Recommendation: Revise text to read as follows:
505.16(B)(7) Cables Entering Enclosures. Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with 505.16(D).
<u>*Exception:* Cables entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors comply with one of the following:</u>
<u>(1) Are enclosed within a chamber hermetically sealed against the entrance of gases or vapors.</u>
<u>(2) Are immersed in oil.</u>
<u>(3) Are enclosed within a factory-sealed explosion proof chamber located within the enclosure, identified for the location, and marked "factory sealed" or equivalent, unless the entry is metric designator 53 (trade size 2) or larger. Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a cable seal.</u>
Substantiation: When using MC-HL cable to connect factory sealed equipment, we are required to use cable seals. This is unnecessarily adding to installation costs of equipment that is already sealed against gas intrusion. This exception is currently used for conduit and should be expanded to include cables.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-202 Log #3206 NEC-P14 **Final Action: Accept in Principle**
(505.16(C)(1)(b))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Add to end of paragraph as follows:
"<u>Conduits shall be sealed to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Such seals shall not be required to be explosionproof but shall be identified for the purpose of minimizing passage of gases under normal operating conditions and shall be accessible.</u>"
Substantiation: This text was added to Article 501 in the 2002 NEC, but was not added to Article 505.
Panel Meeting Action: Accept in Principle
Revise the proposed text as follows:
"<u>Conduits shall be sealed to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Such seals shall not be required to be flameproof or explosionproof but shall be identified for the purpose of minimizing passage of gases under normal operating conditions and shall be accessible.</u>"
Panel Statement: The panel agrees with the proposed text, but has added "flameproof" to be consistent with other sections.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
(Note: Sequence 14-203 moved to follow 14-204)

14-204 Log #4452 NEC-P14 **Final Action: Accept in Principle**
(505.16(E)(3))

TCC Action: The Technical Correlating Committee directs that this proposal be reconsidered since it violates the Manual of Style for NFPA Technical Committee Documents section 2.3.1.2.4 which requires dates of publication for referenced documents.
In addition, the Technical Correlating directs that that panel revise the meeting action text to comply with the NEC Style Manual.
This action will be considered by the panel as a public comment.
Submitter: Eliana Beattie, ISA
Recommendation: Add new text to read as follows:
Modify the existing text as follows:
Process-connected equipment that is listed and marked <u>"Single Seal" or</u> "Dual Seal" shall not require additional process sealing when used within the manufacturer's ratings.
FPN: For construction and testing requirements for <u>single and</u> dual seal process, connected equipment, refer to ANSI/ISA-12.27.01-2003, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids.
Substantiation: The provisions of ANSI/ISA-12.27.01 include both construction and performance requirements for single and dual sealed electrical equipment. The additional requirements for single seal equipment include both pressure and temperature cycling, followed by a leakage and burst test.
Panel Meeting Action: Accept in Principle
Delete 505.16(E)(3) and create a new section 505.26 to read:
505.26 Process Sealing This section applies to process connected equipment which includes, but is not limited to, canned pumps, submersible pumps, flow, pressure, temperature, or analysis measurement instruments. A process seal is a device to prevent the migration of process fluids from the designed containment into the external electrical system. One of the following means shall be provided to prevent process fluids from entering the electrical raceway or cable system:
(1) Process connected electrical equipment that incorporates a single process seal, such as single compression seal, diaphragm, or tube to isolate flammable or combustible fluids from entering a conduit or cable system capable of transmitting fluids, shall be provided with an additional means to mitigate a single process seal failure. The additional means may include, but is not limited to the following:
a. A suitable barrier meeting the process temperature and pressure conditions that the barrier will be subjected to upon failure of the single process seal. There shall be a vent or drain between the single process seal and the suitable barrier. Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.
b. A listed Type MI cable assembly, rated at not less than 125% of the process pressure and not less than 125% of the maximum process temperature (in degrees Celsius), installed between the cable or conduit and the single process seal.
c. A drain or vent located between the single process seal and a conduit or cable seal. The drain or vent shall be sufficiently sized to prevent overpressuring the conduit or cable seal above 6 in. water column (1493 Pa). Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.
(2) Process-connected electrical equipment that is listed and marked "single seal" or "dual seal".
FPN: For construction and testing requirements for process sealing for listed and marked "single seal" or "dual seal" requirements refer to ANSI/ISA-12.27.01, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids.
Panel Statement: The revised text more clearly states the proposed requirements for process sealing.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
COSPOLICH, J.: Revise Panel Meeting Action wording as follows:
In new Section 505.26(1) a., change the wording, "..., an audible whistle,..." to read "..., an audible indication,...".
In new Section 505.26(1) b., change the wording, "...and not less than 125% of the maximum or minimum process temperature (in degrees Celsius),..." to read "...and not less than 125% of the maximum or minimum process temperature (in degrees Celsius),...".
In new Section 505.26(1) c., change the wording, "...above 6 in. water (1493 Pa). Indication of the single process seal failure shall be provided by visible leakage, an audible whistle,..." to read "...above 1493 Pa (6 in. water). Indication of the single process seal failure shall be provided by visible leakage, an audible indication,...".

14-203 Log #4432 NEC-P14 **Final Action: Accept**
(505.16(E)(3), FPN 2)

TCC Action: The Technical Correlating Committee directs that this proposal be reported as "Accept" since, as modified by the panel, it violates the Manual of Style for NFPA Technical Committee Documents section 2.3.1.2.4 which requires dates of publication for referenced documents.
Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:
Change ANSI/ISA-12.27.01-2003, *Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids* to ANSI/ISA-12.27.01-2003, *Requirements for Process Sealing Between Electrical Systems and Flammable or Combustible Process Fluids.*
Substantiation: Change format to match actual ISA standards title.
Panel Meeting Action: Accept in Part
Accept only the title of the referenced documents and incorporate the reference in the FPN of new section 505.26.
Panel Statement: CMP-14 has taken action, in accordance with Panel Proposal 14-6a, to delete publication dates for referenced documents. CMP-14 has incorporated the reference in the FPN in the new section 505.26. See panel action and statement on Proposal 14-204.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-205 Log #3207 NEC-P14 **Final Action: Reject**
(505.17)

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Revise as follows:
(A) Permitted Uses. Flexible cord shall be permitted:
(1) For connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit.
(2) For that portion of the circuit where the fixed wiring methods of 501.10(A) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment and the flexible cord is protected by location or by a suitable guard from damage and only in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons install and service the installation.
(3) For electric submersible pumps with means for removal without entering the wet-pit. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.
(4) For electric mixers intended for travel into and out of open-type mixing tanks or vats.
<u>(5) For temporary portable assemblies consisting of receptacles, switches, and other devices that are not considered portable utilization equipment but are individually listed for the location.</u>
(B) Installation. Where flexible cords are used, the cords shall comply with all of the following:
(1) Be of a type listed for extra-hard usage
(2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23
(3) Be connected to terminals or to supply conductors in an approved manner
(4) Be supported by clamps or by other suitable means in such a manner that there is no tension on the terminal connections
(5) Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures of the explosionproof type
Exception to (5): ~~Seals shall not be required as provided in 501.105(B)(6).~~
~~(6) Be of continuous length~~
FPN: See ~~501.20~~ <u>505.23</u> for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.
Substantiation: The intent of this proposal is to make 505.17 appear the same as 501.140. For clarity, the text from 501.40 is not underlined; the text of proposals for 501.140(A) and (B) and 505.23 are <u>underlined</u> or ~~struckthrough~~.
See substantiation for proposals for 501.140(A) and (B) and 505.23.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the concept provided by the submitter however the recommendation uses the incorrect referenced text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-206 Log #2845 NEC-P14 **Final Action: Accept**
(505.17(5))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
(5) Be <u>terminated with a listed cord connector that maintains the type of protection</u> ~~provided with listed seals~~ where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof
~~Exception to (5): As provided in 505.16~~
Substantiation: This proposal makes clear the intent to terminate the flexible cord with fittings that comply with ANSI requirements for such devices including strain relief and the type of protection.
The exception is removed since 505.16 has no specific cord sealing requirements and there is no exception to completing the explosionproof or flameproof enclosure with a seal on the entry.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 14

14-208 Log #896 NEC-P14 **Final Action: Reject**
(505.19)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "uninsulated" in the heading and text.
Substantiation: Edit. Superfluous; the definition of exposed (as applied to live parts) applies to parts that are not suitably insulated.
Panel Meeting Action: Reject
Panel Statement: See panel statement in Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-209 Log #547 NEC-P14 **Final Action: Reject**
(505.21)

Submitter: Margarito Aragon, Jr., Aragon's Electrical Consulting
Recommendation: Delete this section:
~~505.21 Multiwire Branch Circuits.~~
~~In a Class I, Zone 1 location, a multiwire branch circuit shall not be permitted.~~
~~*Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.*~~
Substantiation: To conform to the Style Manual. Section 210.4(B) already requires the disconnecting simultaneously of all ungrounded conductors or multiwire ranch circuit and applies per 90.3.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-210 Log #571 NEC-P14 **Final Action: Reject**
(505.21)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Delete text as follows:
~~505.21 Multiwire Branch Circuits.~~
~~In a Class I, Zone 1 location, a multiwire branch circuit shall not be permitted.~~
~~*Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.*~~
Substantiation: Section 210.4(B) requires all ungrounded conductors of multiwire branch circuits to be provided with a means of simultaneous disconnection at the point where the branch circuit originates. This makes the requirement and Exception in 505.21 unnecessary because Chapters 1-4 have general application.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-211 Log #3208 NEC-P14 **Final Action: Reject**
(505.21)

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Delete 505.21.
This is a companion proposal with 501.40, 502.40, and 506.21.
Substantiation: Since 210.4(B) now requires all multiwire branch circuits to "be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates", 505.21 is redundant.
The deletion has been suggested by some, but I expect it will be rejected because 210(B) is a requirement for personnel protection and could at some point be changed. The requirement here is for prevention of fire and explosion.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.

Ballot Results: Affirmative: 14

14-212 Log #2616 NEC-P14 **Final Action: Reject**
(505.21 Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add text as follows:
<u>"without the use of handle ties"</u>
Substantiation: For hazardous (classified) areas reliance should not be on handle ties which can be removed. See 514.11(A).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-73.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-213 Log #3209 NEC-P14 **Final Action: Reject**
(505.23 (New))

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Add new 505.23 as follows:
<u>505.23 Conductor Insulation, Class I, Zones 1 and 3. Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type identified for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.</u>
Substantiation: The requirement is in 501.20 and should also appear in Article 505.
Panel Meeting Action: Reject
Panel Statement: This text already appears in 505.18(B). The panel notes that this proposal should refer to Zones 1 and 2, not 1 and 3.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-214 Log #895 NEC-P14 **Final Action: Reject**
(505.25)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of first paragraph:
~~Grounding and bonding shall comply with Article 250.~~ <u>Metal raceways, cables and noncurrent-carrying metal parts of electrical equipment shall be grounded and also comply with the requirements of 505.25(A) and (B).</u>
Revise (B):
TYPES OF EQUIPMENT GROUNDING ~~and BONDING~~ CONDUCTORS. Flexible metal conduit and flexible liquidtight metal conduit shall ~~not be used as the sole ground-fault current path~~ <u>be installed with equipment grounding or bonding conductors</u>. ~~Where equipment bonding conductors are installed they shall comply with Article 250.~~
Exception: In class II zone 2 locations ~~the~~ <u>an equipment grounding conductor</u> or equipment bonding conductor shall <u>not</u> be <u>required</u> ~~permitted to be deleted~~ where all the following conditions are met:
Substantiation: Bonding should be included in the heading since the text covers them. Equipment grounding conductors should be noted in the exception. Since there is no specific requirement for a bonding jumper in the text "shall be permitted to be deleted" is irrelevant; something cannot be deleted unless it is first installed but may be "omitted".
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-215 Log #2718 NEC-P14 **Final Action: Reject**
(505.25)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first paragraph:
Grounding and bonding shall comply with <u>applicable provisions</u> of Article 250 and the requirements in 505.25(A) and (B).
Substantiation: Edit. Reference should not be made to an entire article per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: Section 4.1.1 of the NEC Style Manual allows references to code articles where additional conditions are specified.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-215a Log #CP1405 NEC-P14 **Final Action: Accept**
(505.25(B))

Submitter: Code-Making Panel 14,
Recommendation: Revise text to read as follows:
(B) Types of Equipment Grounding Conductors. Flexible metal conduit and liquidtight flexible metal conduit shall <u>include an equipment bonding jumper of the wire type, in compliance with 250.102</u> ~~not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102~~.
Retain existing exception.
Substantiation: This proposal correlates the equipment grounding conductor requirements in Article 505 with changes made to those in Articles 501, 502, and 503 by Proposals 14-40, 14-66, and 14-140 respectively.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 14

ARTICLE 506 — ZONE 20, 21, AND 22 LOCATIONS FOR COMBUSTIBLE DUSTS, FIBERS, AND FLYINGS

14-216 Log #4093 NEC-P14 **Final Action: Reject**
(506)

Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Delete the entire chapter and under 502 make provisions to permit the use of Zone 22, Group III B equipment to be used in Class II, Division 2 locations.
502.6 Zone equipment.
Equipment listed and marked for use in Zone 20, 21 or 22 locations, with (1) Symbol "AEx", (2) using a recognized Protection Technique defined under Article 500, 3) a Temperature classifications, marked as a temperature value, in degrees C, preceded by T, and 4) ambient temperature, shall be permitted in Class II, Division 2 locations for the same combustible dust atmosphere and with a suitable temperature class.
Substantiation: Article 506 was initially added to the NEC to provide harmonization with the IEC combustible dust zone methodology. Over the last two code cycles more information has been added to make the Article usable. However given the recent concerns with combustible dust explosions and the fact that this Article is in direct conflict with both NFPA 499 and positions taken by CMP in the past regarding the combustible dust groups, it appears that retaining this article is counterproductive and could in fact result in unsafe installations.
The specific issues are that Article 506 was based upon IEC 61241-xx in which combustible dusts included not only combustible metal dusts, chemical and agricultural dusts, but also ignitable fibers and flyings. Three combustible dust groups were established within the IEC, using conductivity as the basis for two of these groups, Group IIIC and IIIB. The IIIC may mirror Group E, while IIIB that of Groups F and G. The third group is IIIA for the fibers.
Article 506 does not address combustible metallic dusts per scope 506.1. Fibers under the Division methodology are addressed as Class III, a separate Article in 503.
Prior to the 1981 edition of the National Electrical Code (NEC) (1979 and prior editions), all Group E dusts (metal dusts such as aluminum, magnesium, and their commercial alloys) and Group F dusts (carbonaceous dusts such as carbon black, charcoal, or coke dusts having more than 8 percent total volatile materials) were considered to be electrically conductive. As a result, areas containing Group E or Group F dusts were all classified Division 1, as required by the definition of a Class II, Division 1 location. It was only possible to have a Division 2 location for Group G dusts.
The 1984 edition of the NEC eliminated Group F altogether. Carbonaceous dusts with resistivity of less than 10^5 ohm/cm were considered conductive and were classified as Group E. Carbonaceous dusts with resistivity of 10^5 ohm/cm or greater were considered nonconductive and were classified as Group G. This reclassification allowed the use of Group G, Division 2 electrical equipment for many carbonaceous materials.
The 1987 edition of the NEC reinstated Group F because the close tolerances in Group E motors necessary for metal dusts are unnecessary for conductive carbonaceous dusts, and the low temperature specifications in Group G equipment necessary for grain, flour, and some chemical dusts are unnecessary

for nonconductive carbonaceous dusts. This imposed an unwarranted expense on users.

This change allowed the use of Group F, Division 2 electrical equipment for carbonaceous dust with a resistivity greater than 10^5 ohm/cm.

The overall problem with this work was that the resistivity value, a number that related to the dust's ability to conduct an electric current, was not a constant and varied considerably based on dust particle size and extent of oxidation, the moisture content, voltage applied, temperature, and test apparatus and technique. No standardized test method for the resistivity value considering long term environmental effects has been devleoped. Finally, the resisitivity value is not directly related to the explosion hazard.

Since the basic condition of conductivity has been rejected by both NEC CMP-14 and the NFPA EECA Committee in NFPA 499, there seems to be no valid reason to retain Article 506.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation is incorrect. Conductivity is not used as a criterion for classification of combustible dusts in the NEC.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

WECHSLER, D.: The action should have been to accept this proposal as the submitter provides a technically correct summary which while brief supports the need to delete Article 506.

Article 506 was added to the NEC to harmonize with the IEC combustible dust zone methodology. However somewhere between our history past with our best intensions and the current development of the IEC Zone 20-22 standards, the US hazardous area classification system for dusts is on the verge of being corrupted by a nightmare of conflicting terms and requirements.

To understand this problem we need to look at an IEC zone document and since one was suggested under ROP 14-228, we will use the proposed 60079-0 standard as a guide. Recall that there is an IEC 60079-0 version of this standard as well as a US 60079-0 Mod standard; wherein the US '79-0 mod' when accepted, is considered to represent the US acceptable standard with deviations.

In the IEC 79-0, the following scope statement exists:

"This part of IEC 60079 specifies the general requirements for construction, testing and marking of electrical equipment and Ex components intended for use in explosive atmospheres."

The US Mod version reads as follows with the cross-out being removed text from the standard and the underlined being added texts:

This ~~part of IEC 60079~~ standard specifies the general requirements for construction, testing and marking of electrical equipment and Ex components intended for use in explosive atmospheres. Explosive atmospheres are identified by the National Electrical Code®, ANSI/NFPA 70 as hazardous (classified) locations and include the following specified locations:

· Class I, Zone 0
· Class I, Zone 1
· Class I, Zone 2
· Zone 20
· Zone 21
· Zone 22

As can be seen the US Mod version with "Zone 20, 21 and Zone 22 methodology includes the hazardous area classification assessment and equipment protection schemes. While the equipment protection schemes are quite basic; keep the dust out of the enclosure, the handling of the hazardous area classification should be of concern to all US users, inspectors, installers and designers.

In both the IEC and US Mod version of 79-0, the following definition exists:

dust

generic term including both combustible dust and combustible flyings

Neither the US NEC nor NFPA 499 address dust in this manner. In the NEC, combustible dust is addressed as a Class II material in Article 502. Combustible dust is also addressed in NFPA 499.

Combustible flyings are not defined in the NEC nor in NFPA 499. The NEC in Article 503 does address ignitible fibers/flyings as Class III materials.

The submitter provided quite an extensive summary dealing with the issue of combustible dust groups and within that context, conductivity as a basis for the groups was mentioned. The Panel comment implies that the submitter was not correct.

Again, from the IEC 79-0 document consider the following definitions:

3.11.1.1

conductive dust

combustible dust with electrical resistivity equal to or less than 103 Ω.m

NOTE IEC 61241-2-2 contains the test method for determining the electrical resistivity of dusts.

3.11.1.2

non-conductive dust

combustible dust with electrical resistivity greater than 103 Ω.m

The US 79-0 Mod reflects the following revisions to these definitions:

3.11.1.1

conductive dust

~~combustible dust with electrical resistivity equal to or less than 10^3 Ω.m~~ metal dust

~~NOTE IEC 61241-2-2 contains the test method for determining the electrical resistivity of dusts.~~

3.11.1.2

non-conductive dust

~~combustible dust with electrical resistivity greater than 10^3 Ω.m~~ dust other than metal dust

If the terms 'conductive' and 'non-conductive' dust still resides in the US Mod, and if in fact CMP-14 takes action to reference this US 79-0 Mod (NEC Log 14-228), is it really incorrect to make the statement that the Zone 20, 21, 22 system does in fact use conductivity as a basis for its groups?

As an added source of confusion, should there be a reference standard dealing with a requirement which is not a requirement in the referring standard document? For example, the proposed US Mod IEC standard contains 'metal' dust requirements, but metal dusts are excluded from Article 506.

The IEC 79-0 also provides in Section 4.3 a defined group, Group III. For purposes of understanding the following is the 4.3 text (note the underlined portion is that from the US 79-0 Mod):

Group III

Electrical equipment of Group III is intended for use in places with an explosive dust atmosphere other than mines susceptible to firedamp.

Electrical equipment of Group III is subdivided according to the nature of the explosive dust atmosphere for which it is intended.

Group III subdivisions:

· IIIA: combustible flyings
· IIIB: non-conductive dust
· IIIC: conductive dust

NOTE 1 Equipment marked IIIB is suitable for applications requiring Group IIIA equipment. Similarly, equipment marked IIIC is suitable for applications requiring Group IIIA or Group IIIB equipment.

NOTE 2 The 2008 NEC does not recognize the identification of locations or equipment as "Group IIIA, IIIB, or IIIC", but identifies equipment suitable for Zone 20, 21, or 22 by the use of equipment marking where a "D" is appended to the type of protection, for example "iaD" and no separate differentiation is made of combustible dusts or ignitable fibers.

The Group III subdivisions are in fact "Groups" and these Groups do not agree with Article 500 for the NEC Article 502 Class II materials groups or for the NEC Article 503 Class III materials.

Additionally, the NFPA Standards Council ruled that it was the responsibility of NFPA 499 and not the NEC CMP-14 to define material groups. Thus Article 506 should not have any groups which have not been defined by the NFPA 499 Committee.

This then brings up the question of Article 506. First, what is Article 506 addressing? According to the Article 506 scope, "This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 500, Article 502, and Article 503 for electrical and electronic equipment and wiring for all voltages in Zone 20, Zone 21, and Zone 22 hazardous (classified) locations where fire and explosion hazards may exist due to combustible dusts or ignitible fibers/flyings. Combustible metallic dusts are not covered by the requirements of this article."

Please examine the evidence presented.

Article 506 specifically excludes combustible metallic dusts, in its current form.

Article 506 uses the un-defined term "ignitible fibers/flyings" and does not mention the IEC term "combustible flyings".

Article 506 contains references to IEC US Mod standards which have been revised to address groups that are not in agreement with either the current NEC or NFPA 499. Additionally these same standards address conductive dusts and non-conductive dusts, which as indicated in the submitter's statement were not supported by the NEC or NFPA 499.

The US House of Representatives is currently considering a new Legislative Bill, HR 849, to address worker protection against combustible dust explosions and fires. The bill considers an emergency to exist. It cites the tragic results from the Feb. 7, 2008 Imperial Sugar dust explosion in which 14 workers killed and more than 60 others were seriously injured. This bill also summarizes the Chemical Safety and Hazard Investigation Board (CSB). The CSB identified loss of life and serious injuries from more than 280 combustible dust incidents between 1980 and 2005. It also concluded that combustible dusts are a serious hazard in American industry.

Given this as background, we cannot tolerate providing conflicting information in our standards. Until a working group can resolve Article 506 and its references with other aspects of the US Electrical Code, which really include a need to focus not equipment, but on hazardous (classified) location assessments, Article 506 needs to be pulled from the NEC.

(506.2)

TCC Action: The Technical Correlating Committee directs that the number, title and edition of the document from which this extract is taken be listed at the end of the extract in accordance with the NEC Style Manual 4.3.2.3.
This action will be considered by the panel as a public comment.
Submitter: Michael P. Walls, American Chemistry Council
Recommendation: Add the following new definition under 506.2:
<u>Combustible dust. Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air.</u>
Substantiation: For many different reasons, the definition for combustible dust has been changed in a number of other NFPA documents. This change eliminates the dust size and creates confusion with the NEC and NFPA 499 considerations of a dust. For example, in NFPA 654, a combustible dust is now defined as: "Combustible Dust. A combustible particulate solid that presents a fire or deflagration hazard when suspended in air or some other oxidizing medium over a range of concentrations, regardless of particle size or shape." Inclusion of the proper historic definition for combustible dust upon which these NEC Articles and NFPA 499 are based will retain this important term without adding confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
OFFERDAHL, D.: The definition of combustible dust is covered in NFPA 499 which is reference in 500.4 (B). The classification of the area should be determined by professionals using NFPA 499. Once that is completed it is required to be documented in accordance with 500.4 (A) This process take place before the inspector or electrician gets involved. Placing the definition in 500.2 could create confusion that there is enough information that the electrician or inspector can classify the area. In result placing undue pressure from the user to have the area classify as a class 2 area or even worse to unclassified the area. If accepted at all, this proposal should be placed in 500.5c as a fine print note. Placing the definition as a fine print note would achieve the recommendations that submitter proposes. In addition enforces the fact that the responsibly of classification of the area is the responsibly of the owner or user.

Recommendation: Revise text to read as follows:

FPN No. 2: Zone 22 locations usually include outlets from bag filter vents, because in the event of a malfunction there can be emission of combustible mixtures; locations near equipment that has to be opened at infrequent intervals or equipment that from experience can easily form leaks where, due to pressure above atmospheric, dust will blow out; pneumatic equipment, flexible connections that can become damaged, etc.; storage locations for bags containing dusty product, since failure of bags can occur during handling, causing dust leakage; and locations where controllable dust layers are formed that are likely to be raised into explosive dust–air mixtures. Only if the layer is removed by cleaning before hazardous dust–air mixtures can be formed is the area <u>unclassified</u> ~~designated non-hazardous~~.

Substantiation: The code has made effort over the last few cycles to replace the term "non-hazardous" with "unclassified". This proposal is intended to assist that effort.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

OFFERDAHL, D.: This proposal should have been accepted. 514.8 Exception 2 in pertains to the non-metallic raceway buried 2 feet below the earth. This underground installation comply with articles 352.10, 353.10 and 355.10 as well as Articles 352.100 353.100 and 355.100 listing the construction specification of these wiring method and UL product standards rigid nonmetallic underground conduit, plastic (eazx) reinforced thermosetting resin conduit (dzkt).

14-228 Log #4455 NEC-P14 **Final Action: Reject**
(506.6)

Submitter: Eliana Beattie, ISA
Recommendation: Add the following and renumber the sections which follow as needed:
506.6 Group III Materials. Group III shall be subdivided into Subdivisions IIIC, IIIB, and IIIA, as noted in 505.6(A), (B), and (C).
FPN: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This *Code* does not apply to installations underground in mines. See 90.2(B). Group II is intended for places with an explosive gas atmosphere other than mines. Group III is intended for places with an explosive dust atmosphere other than mines.
(A) Subdivision IIIC. Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.
(B) Subdivision IIIB. Atmospheres containing either
1) combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see ASTM D3175-07, *Standard Test Method for Volatile Matter in the Analysis Sample for Coal and Coke*, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts, or
2) combustible dusts not included in Group IIIC, including flour, grain, wood, plastic, and chemicals.
FPN No. 1: For additional information on IIIB and IIIC, see NFPA 499-2008, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*.
FPN No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For designations IIIC and IIIB, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be identified not only for the class but also for the specific group of dust that will be present.
FPN No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitible gases. See ANSI C2-2007, *National Electrical Safety Code*, Section 127A, Coal Handling Areas.
(C) Subdivision IIIA. Atmospheres containing ignitable flyings and fibers.
506.~~6~~ 7 Special Precaution.
Substantiation: The original adoptions of the IEC standards did not include dust groups; the current adoption differentiates among metal dusts, non metal dusts, fibers and flyings. Dust group definitions have been added to address changes made within US adoptions of the IEC standards.
Panel Meeting Action: Reject
Panel Statement: The panel cannot accept the proposal because the standard involved has not been published.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MASSEY, L.: Assuming that the subject standard is published prior to the publication of the 2011 edition of the NEC,the panel should approve this proposal.
WECHSLER, D.: See my Explanation of Negative Vote on Proposal 14-216.

14-229 Log #4456 NEC-P14 **Final Action: Accept**
(506.8(E), (F))

Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:
Revise 506.8(E) to read:
(E) Protection by Encapsulation ~~“maD”~~”mD”. This protection technique shall be permitted for equipment in Zone 20, Zone 21, and Zone 22 locations for which it is identified.
FPN: See Table 506.9(C)(2)(2) for the descriptions of subdivisions for encapsulation.
Delete 506.8(F)
Substantiation: For consistency of format, item 506.8(F) has been removed and 506.8(E) has been revised to include all levels of protection for protection technique “mD”. This is consistent with the format used for Protection by Intrinsic Safety “iD”.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-230 Log #4458 NEC-P14 **Final Action: Reject**
(Table 506.9(C)(2)(2))

Submitter: Eliana Beattie, ISA
Recommendation: Revise text to read as follows:

Table 506.9(C)(2)(2) Types of Protection Designation

Designation	Technique	Zone*
iaD	Protection by intrinsic safety	20
ia	Protection by intrinsic safety	20
ibD	Protection by intrinsic safety	21
ib	Protection by intrinsic safety	21
[iaD]	Associated apparatus	Unclassified **
[ia]	Associated apparatus	Unclassified **
[ibD]	Associated apparatus	Unclassified **
[ib]	Associated apparatus	Unclassified **
maD	Protection by encapsulation	20
ma	Protection by encapsulation	20
mbD	Protection by encapsulation	21
mb	Protection by encapsulation	21
pD	Protection by pressurization	21
p	Protection by pressurization	21
pb	Protection by pressurization	21
tD	Protection by enclosures	21
ta	Protection by enclosures	21
tb	Protection by enclosures	21
tc	Protection by enclosures	22

*Does not address use where a combination of techniques is used.
**Associated apparatus is permitted to be installed in a hazardous (classified) location if suitably protected using another type of protection.

FPN: The “D” suffix on the type of protection designation was employed prior to the introduction of Group IIIA, IIIB, and IIIC; which is now used to distinguish between the type of protection employed for Group II (Gases) or Group III (Dusts).
Substantiation: The change to the NEC is proposed to maintain alignment with the product standard.
The marking in IEC 60079-0 has been revised to supersede IEC 61241-0 and to replace the current marking of “D” with a Group “III” designation. The US adoption, ANSI/ISA-60079 – ANSI/UL 60079-0 has introduced this marking. It should be noted that the IEC adoption of designations of Groups IIIA, IIIB, and IIIC was based on a US proposal.
As was done for explosive gas atmospheres, the marking in IEC 60079-0 has been revised to show alternative designations for some of the types of protection. The US adoption, ANSI/ISA-60079 – ANSI/UL 60079-0 has maintained these alternate designations. The change to the NEC is proposed to maintain alignment with the product standard. As an alternate to the existing marking, the lower case letter indicating the “Equipment Protection Level” is added to the type of protection where it does not already exist. For example, with Intrinsic Safety “ia” for Equipment Protection Level “a” already exists in the type of protection.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 14-228.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MASSEY, L.: Assuming that the subject standard is published prior to the publication of the 2011 edition of the NEC,the panel should approve this proposal.

14-231 Log #4457 NEC-P14 **Final Action: Accept**
(506.9(C)(5))

Submitter: Eliana Beattie, ISA
Recommendation: Add new text to read as follows:
FPN No.1: EPL (or Equipment Protection Level) may appear in the product marking. The EPLs are designated as G for Gas, D for Dust or M for Mining, and then followed by a letter (a,b,c) to give the user a better understanding as to whether the equipment provides either (a) a “very high”, (b) “high”, or (c) “enhanced” level of protection against ignition of an explosive atmosphere. For example a AEx pb IIIB T165 °C motor (which is suitable by protection concept for application in Zone 21) may additionally be marked with the EPL of “Db”. AEx p IIIB T165 °C Db.
Substantiation: Our US Standards development process parallels that of the IEC. EPLs were introduced into the IEC standard, and are being introduced into ANSI/ISA-60079-0 and ANSI/UL 60079-0.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-232 Log #379 NEC-P14 **Final Action: Accept in Principle**
(506.9(E))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise first sentence as shown:
“All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 (3/4 in. taper/foot) ~~(3/4-in. taper per foot)~~.”
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. “Per” is not an appropriate term for a standard.
Panel Meeting Action: Accept in Principle
Revise 506.9(E) to read:
(E) Threading. Supply connection entry thread form shall be NPT or metric. ~~All NPT threads referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 (3/4-in. taper per foot).~~ Conduit and fittings shall be made wrenchtight to prevent sparking when the fault current flows through the conduit system and to ensure the integrity of the conduit system. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 506.9(E)(1) or (E)(2).
(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit fittings, or cable fittings shall be used. All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread.
FPN: Thread specifications for NPT threads are located in ANSI/ASME B1.20.1, Pipe Threads, General Purpose (Inch).
(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries listed conduit fittings or listed cable fittings shall be used.~~, such~~ Such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment~~. Adapters~~ and shall be used for connection to conduit or NPT-threaded fittings. ~~Listed cable fittings that have metric threads shall be permitted to be used.~~ Metric threaded entries shall be made up with at least five threads fully engaged.
(3) Unused Openings. All unused openings shall be closed with listed metal close-up plugs. The plug engagement shall comply with 506.9(E)(1) or 506.9(E)(2).
Panel Statement: The panel action correlates with previous actions taken on Proposals 14-188 and 14-33.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-233 Log #147 NEC-P14 **Final Action: Accept in Principle**
(506.9(F))

Submitter: Stanley Kaufman, CableSafe Inc.
Recommendation: Revise as follows:
(F) ~~Fiber~~ Optical Fiber Cables ~~Assembly~~. ~~Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly~~ Composite and conductive optical fiber cables shall be installed in accordance with 506.15 and 506.15, applicable.
FPN: See 770.2 for definitions of optical fiber cables.
Substantiation: The Code should use consistent terminology throughout.
Article 770 definitions:
Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering.
Composite Optical Fiber Cable. These cables contain optical fibers and current-carrying electrical conductors.
Conductive Optical Fiber Cable. These optical fiber cables contain non–current-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.
Acceptance of this proposal will result in correlation with Article 770.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(F) ~~Fiber~~ Optical Fiber Cables ~~Assembly~~. Where an ~~fiber~~ optical fiber cable ~~assembly~~ contains conductors that are capable of carrying current (composite optical fiber cable), the ~~fiber~~ optical fiber cable ~~assembly~~ shall be installed in accordance with the requirements of Articles 506.15 and 506.16.
Panel Statement: See panel statement on Proposal 14-35. The panel notes that the second referenced section was in error in the original proposal; this has been corrected.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-234 Log #2846 NEC-P14 **Final Action: Accept in Principle**
(506.15(A))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action as it relates to 4.1.1 of the NEC Style Manual concerning references to entire articles.
This action will be considered by the panel as a public comment.
Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text as follows:
506.15 Wiring Methods. Wiring methods shall maintain the integrity of the protection techniques and shall comply with 506.15(A), (B), or (C).
(A) Zone 20. In Zone 20 locations, the wiring methods in (1) through (5) shall be permitted.
(1) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
(2) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
Exception: MI cable and fittings listed for Class II, Division 1 locations are permitted to be used.
(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation,
Type MC-HL cable, listed for use in Zone 20 locations, with a gas/vaportight continuous corrugated metallic sheath and overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and ~~provided with termination~~ terminated with fittings listed for the application, shall be permitted.
Exception: Type MC-HL cable and fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used.
FPN: See 330.12 for restrictions on use of Type MC cable.
(4) Fittings and boxes shall be identified for use in Zone 20 locations.
Exception: Boxes and fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used.
(5) Where necessary to employ flexible connections, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed fittings shall be used. Where flexible cords are used, they shall also comply with 506.17. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed for the condition or shall be protected by means of a suitable sheath.
Exception: Flexible conduit and flexible conduit and cord fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used.
FPN: See 506.25 for grounding requirements where flexible conduit is used.
Substantiation: Cable is *terminated* with fittings, but the fittings are not *provided* with the cable, they are sourced separately. Terminology is made consistent with other portions of the section.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
506.15 Wiring Methods. Wiring methods shall maintain the integrity of the protection techniques and shall comply with 506.15(A), (B), or (C).
(A) Zone 20. In Zone 20 locations, the following wiring methods shall be permitted,
(1) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
(2) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
Exception: MI cable and fittings listed for Class II, Division 1 locations are permitted to be used.
(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Zone 20 locations, with a gas/vaportight continuous corrugated metallic sheath and overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and ~~provided with termination~~ terminated with fittings listed for the application, shall be permitted. Type MC-HL cable shall be installed in accordance with the provisions of Article 330.
Exception: Type MC-HL cable and fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used.
~~FPN: See 330.12 for restrictions on use of Type MC cable.~~
(4) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage,

Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.

(5 ~~4~~) Fittings and boxes shall be identified for use in Zone 20 locations.

Exception: Boxes and fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used.

(6 ~~5~~) Where necessary to employ flexible connections, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed fittings shall be used. Where flexible cords are used, they shall also comply with 506.17 and shall be terminated with a listed cord connector that maintains the type of protection of the terminal compartment. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed for the condition or shall be protected by means of a suitable sheath.

Exception: Flexible conduit and flexible conduit and cord fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used.

FPN: See 506.25 for grounding requirements where flexible conduit is used.

Panel Statement: The panel agrees with the changes made by the submitter and has made additional changes to (3) to clarify that the requirements of Article 330 also apply to the installation of Type MC-HL cable. The panel has also added (4) for the installation of Type ITC-HL cable. The panel has renumbered (4) and (5) to (5) and (6), respectively. The panel has made additional changes in (new) (6) to clarify that the type of protection used for the terminal compartment must be maintained.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

NEAGLE, J.: I agree with the panel action and statement. However, as this section deals with dust locations, gas/vaportight cable sheaths are not necessary. 506.15(A)(3) should be revised to read as follows:

'(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Zone 20 locations, with a ~~gas/vaportight~~ continuous corrugated metallic sheath and overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and provided with termination fittings listed for the application, shall be permitted.'

14-235 Log #1037 NEC-P14 **Final Action: Reject**
(506.15(A)(5) and (C)(7))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Change "listed" to "identified" in (A)(5); in (C)(7) revise first sentence: Nonincendive field wiring shall be permitted using any of the identified wiring methods permitted for unclassified locations.

Substantiation: Article 400 does not specify listing for flexible cord and cables; 513.7(B) and 513.10(D)(2) use the word "identified". All wiring methods permitted for unclassified locations may not be suitable and may be perceived as modifying permitted and not permitted uses in wiring method articles.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-58.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-236 Log #3925 NEC-P14 **Final Action: Reject**
(506.15(B) and (C))

Submitter: Goran Haag, Champion Fiberglass, Inc.

Recommendation: Add new text to read as follows:

Type RTRC marked with the suffix -XW" to be added.

Substantiation: Type RTRC marked with the suffix –XW were permitted in the NEC 2008 for Class I Division 2. We want it to be included for Zone 21 and Zone 21 as well. Don't foresee any engineering arguments against this proposal.

Panel Meeting Action: Reject

Panel Statement: Type RTRC was added to 501.10(B)(7) with very specific restrictions, primarily for protection from corrosion. This proposal does not provide these restrictions. The substantiation does not provide any technical data to show that this wiring method is necessary in a Zone 21 or Zone 22 location. CMP 14 did not support its use in Class I, Division 1 and would not support its use in Zone 21.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BRIESCH, E.: Since this proposal is for Zones 21 and 22, the last sentence in the Panel Statement incorrectly references Class I, Division 1 as one of the reasons for rejection. Since the issue is suitability in a dust atmosphere, the correct reference should be to Class II, Division 1.

14-237 Log #2847 NEC-P14 **Final Action: Accept in Principle**
(506.15(C))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action as it relates to 4.1.1 of the NEC Style Manual concerning references to entire articles.

This action will be considered by the panel as a public comment.

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise text as follows:

(C) Zone 22. In Zone 22 locations, the wiring methods in (1) through (8) shall be permitted.

(1) All wiring methods permitted in 506.15(B).

(2) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.

(3) Type MC or MI cable with listed termination fittings.

(4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, ~~in cable trays~~ with listed termination fittings.

(5) Type ITC and Type ITC-ER cable as permitted in 727.4 with listed termination fittings. ~~in cable trays~~.

(6) Type MC, MI, MV, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between two adjacent cables, shall be the wiring method employed. Single-conductor Type MV cables shall be shielded or metallic armored.

(7) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations.

Nonincendive field wiring systems shall be installed in accordance with the control drawing(s).

Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: *Simple apparatus* is defined in 504.2.

Separation of nonincendive field wiring circuits shall be in accordance with one of the following:

a. Be in separate cables

b. Be in multiconductor cables where the conductors of each circuit are within a grounded metal shield

c. Be in multiconductor cables where the conductors have insulation with a minimum thickness of 0.25 mm (0.01 in.)

(8) Boxes and fittings shall be dusttight.

Substantiation: This proposal reflects the current installation requirements of 725.154(D) that in conjunction with a companion proposal to revise 725.154(D) move the Classified location permitted wiring methods into Chapter 5, with the installation requirements for these types of cables retained for all users in 725.154(D). See companion proposal on 725.154(D).

Panel Meeting Action: Accept in Principle

Revise text as follows:

(C) Zone 22. In Zone 22 locations, the following wiring methods shall be permitted.

(1) All wiring methods permitted in 506.15(B).

(2) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.

(3) Type MC or MI cable with listed termination fittings.

(4) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including ~~or~~ installation in cable tray systems. The cable shall be terminated with listed fittings. ~~PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.~~

(5) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.

(6) Type MC, MI, MV, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between two adjacent cables, shall be the wiring method employed. Single-conductor Type MV cables shall be shielded or metallic armored.

(7) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations.

Nonincendive field wiring systems shall be installed in accordance with the control drawing(s).

Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: *Simple apparatus* is defined in 504.2.

Separation of nonincendive field wiring circuits shall be in accordance with one of the following:

a. Be in separate cables

b. Be in multiconductor cables where the conductors of each circuit are within a grounded metal shield

c. Be in multiconductor cables where the conductors have insulation with a minimum thickness of 0.25 mm (0.01 in.)

(8) Boxes and fittings shall be dusttight.

(506.21)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Delete text as follows:
~~506.21 Multiwire Branch Circuits.~~
~~In Zone 20 and Zone 21 locations, a multiwire branch circuit shall not be permitted.~~
~~Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.~~
Substantiation: Section 210.4(B) requires all ungrounded conductors of multiwire branch circuits to be provided with a means of simultaneous disconnection at the point where the branch circuit originates. This makes the requirement and Exception in 506.21 unnecessary because Chapters 1-4 have general application.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-243 Log #3200 NEC-P14 **Final Action: Reject**
(506.21)

Submitter: A. W. Ballard, Cooper Crouse-Hinds
Recommendation: Delete 506.21.
This is a companion proposal with 501.40, 502.40, and 505.21.
Substantiation: Since 210.4(B) now requires all multiwire branch circuits to "be provided with a means that will simultaneously disconnect all ungrounded conductors at the point where the branch circuit originates", 506.21 is redundant.
This deletion has been suggested by some, but I expect it will be rejected because 210(B) is a requirement for personnel protection and could at some point be changed. The requirement here is for prevention of fire and explosion.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-244 Log #1035 NEC-P14 **Final Action: Reject**
(506.25)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first paragraph:
Metal enclosures for wiring and equipment shall be grounded. ~~Grounding and bonding shall comply with Article 250~~ and in accordance with the requirements in 506.25(A) and (B).
Revise (B):
TYPES OF EQUIPMENT GROUNDING AND BONDING CONDUCTORS. ~~Liquidtight flexible metal conduit shall not be used as the sole ground fault current path.~~ Separate equipment grounding or bonding conductors shall be installed with liquidtight flexible metal conduit. ~~Where equipment bonding jumpers are installed they shall comply with 250.102.~~
Exception: In Zone 22 equipment grounding and bonding conductors shall ~~be permitted to be deleted~~ not be required where all the following conditions are met. (remainder unchanged).
Substantiation: The grounding requirement should apply to metal enclosures not wiring systems which are covered elsewhere. Compliance with Article 250 includes exceptions and alternatives permitted in that article. The heading of (B) should include bonding conductors addressed in the text and exception. Conductors can be omitted but not deleted unless they are first installed.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-245 Log #2717 NEC-P14 **Final Action: Reject**
(506.25)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise first paragraph:
Grounding and bonding shall comply with applicable provisions of Article 250 and the requirements in 506.25(A) and (B).
Substantiation: Edit. Reference should not be made to an entire article per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-215.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-245a Log #CP1406 NEC-P14 **Final Action: Accept**
(506.25(B))

Submitter: Code-Making Panel 14,
Recommendation: Revise text to read as follows:
(B) Types of Equipment Grounding Conductors. Liquidtight flexible metal conduit shall include an equipment bonding jumper of the wire type, in compliance with 250.102 ~~not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102~~.
Retain existing exception.
Substantiation: This proposal correlates the equipment grounding conductor requirements in Article 506 with changes made to those in Articles 501, 502, and 503 by Proposals 14-40, 14-66, and 14-140 respectively.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 511 — COMMERCIAL GARAGES, REPAIR AND STORAGE

14-246 Log #654 NEC-P14 **Final Action: Reject**
(511)

Submitter: Samuel J. Goble, Just Good Electrical Code Training
Recommendation: Revise text to read as follows:
Article 511 Commercial Garages, Repair ~~and~~, Storage and Laboratories.
Substantiation: Forensic laboratories have advanced to include investigations in vehicles. Government authorities are now building new laboratories to include vehicle bays to perform forensics on vehicles for investigations. In the past, this was done in police garages where this change was not warranted. These vehicles can be dismantled to the frame for investigations. These laboratories will have the same hazards as commercial garages with flammable fuels in the vehicles and should be included in the NEC. Including the word "laboratories" in the title of this Article 511 will include all types of laboratories that do testing and investigations on vehicles.
Panel Meeting Action: Reject
Panel Statement: This is already covered under the scope of this article. Laboratories are addressed in NFPA 45.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-247 Log #655 NEC-P14 **Final Action: Reject**
(511.1)

Submitter: Samuel J. Goble, Just Good Electrical Code Training
Recommendation: Revise text to read as follows:
These occupancies shall include locations used for service ~~and~~, repair and laboratories operations in connection with self-propelled vehicles (including, but not limited to, passenger automobiles, buses, trucks, and tractors) in which volatile flammable liquids or flammable gases are used for fuel or power.
Substantiation: Forensic laboratories have advanced to include investigations in vehicles. Government authorities are now building new laboratories to include vehicle bays to perform forensics on vehicles for investigations. In the past, this was done in police garages where this change was not warranted. These vehicles can be dismantled to the frame for investigations. These laboratories will have the same hazards as commercial garages with flammable fuels in the vehicles and should be included in the NEC. Including the word "laboratories" in this section will include all types of laboratories that do testing and investigations on vehicles.
Panel Meeting Action: Reject
Panel Statement: The scope of an article is not the responsibility of the panel it is the responsibility of the Technical Correlating Committee (TCC).
CMP-14 does not recommend to the TCC that the scope be changed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-248 Log #1034 NEC-P14 **Final Action: Reject**
(511.3)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "and installed" after "designed" in the first paragraph. In (C)(1), (C)(3)(A)(D)(1)(a) delete "mechanical" and insert "electrical powered".
Add: (C)(4) Electrical powered ventilation systems shall be provided with an approved audible or plainly visible means to indicate when the ventilation system is not operating during working hours.
Substantiation: "Mechanical" ventilation may be deemed to be louvers, roof mounted nonelectrical wind turbines, or the like. Indication of malfunction or deenergization should be required.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-249 Log #380 NEC-P14 **Final Action: Reject**
(511.3(C)(1)(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as shown:
"The floor area shall be unclassified where there is mechanical ventilation providing a minimum of four air changes each ~~per~~ hour or one cubic foot/minute ~~cubic foot per minute~~ of exchanged air for each square foot of floor area. Ventilation shall provide for air exchange across the entire floor area, and exhaust air shall be taken at a point within 0.3 m (12 in.) of the floor."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: The term "per" is needed and provides improved understanding. The style manual attempts to reduce confusion and this is a correct use of the term.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-250 Log #4637 NEC-P14 **Final Action: Accept**
(511.3(C)(2)(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Change "from a point not less than" to "from a point not more than".
Substantiation: This is to correct an obvious error. The submitter, who drafted this text, apologizes for the mistake.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-251 Log #381 NEC-P14 **Final Action: Reject**
(511.3(C)(3)(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as shown:
"The pit area shall be a Class I, Division 2 location where there is mechanical ventilation providing a minimum of six air changes each ~~per~~ hour."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-249.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-252 Log #382 NEC-P14 **Final Action: Reject**
(511.3(D)(1)(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise the first sentence as shown:
"The entire floor area shall be unclassified where there is mechanical ventilation providing a minimum of four air changes each ~~per~~ hour or one cubic foot/minute ~~foot per minute~~ of exchanged air for each square foot of floor area."
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-249.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-253 Log #383 NEC-P14 **Final Action: Reject**
(511.3(E)(1))

Submitter: James M. Daly, Upper Saddle River, NJ
Recommendation: Revise text to read as shown:
"…ventilated at a rate of four or more air changes each ~~per~~ hour, or designed with positive air pressure…".
Substantiation: This revision will comply with the recommendations in the NEC Style Manual and the Manual of Style for NFPA Technical Committee Documents and provide consistency throughout the Code. "Per" is not an appropriate term for a standard.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-249.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-254 Log #1097 NEC-P14 **Final Action: Reject**
(511.4(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last paragraph:
Where electrically powered ventilation is provided in the dispensing area... (remainder unchanged).
Substantiation: Edit. Present wording infers the ventilation system is electrically powered but "Mechanical" can imply louvers, wind powered roof turbines, etc.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-255 Log #942 NEC-P14 **Final Action: Reject**
(511.7)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete text of (A)(2) and substitute:
Extra hard-usage or hard-usage types of flexible cords or cables identified for the use shall be permitted as pendants in accordance with all of the following:
(1) No parts extends into the defined Class 1 location unless it complies with all applicable provisions for Class 1 locations.
(2) The lower end does not terminate in equipment or devices likely to produce sparks or hot metal particles.
(3) The flexible cord or cable is not likely to be subject to physical damage.
(4) The pendant does not support luminaries or lampholders.
(5) The flexible cord or cable contains an equipment grounding conductor.
Revise (B)(1)(a): ARCING EQUIPMENT. Equipment that is less than 3.7 m (12 ft) above finished grade, the floor, platform or other standing surface and that ~~may~~ is likely to produce arcs, sparks...". (remainder unchanged)
Revise (B)(1)(b): FIXED LIGHTING. Luminaires, lamps, and lampholders ~~for fixed lighting~~ that ~~is~~ are located over ~~lanes~~ areas through which vehicles are commonly driven shall be located not less than 3.7 m (12 ft) above floor or grade level, unless of the totally enclosed type or other constructed to prevent escape of sparks or hot metal particles.
Substantiation: "Suitable" is subjective and a term to be avoided per the Style Manual. Article 400 does not require listing. Extra hard usage types should be permitted and identified for the use; some hard usage types may not be suitable, e.g., electric vehicle cable, not sunlight resistant, not oil resistant, not for use in wet locations. Proposal provides additional requirements which should be considered such as not supporting luminaries (501.130(A)(3). "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-256 Log #1096 NEC-P14 **Final Action: Reject**
(511.10(B)(3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
~~PLUG~~ CORD CONNECTIONS to VEHICLES. Where the cord is suspended from overhead it shall be arranged so that lowest point of ~~sag~~ the cord and connector is at least 150 mm (6 in.) above the floor. ~~Where an automatic arrangement is provided to pull both cord and plug beyond the range of physical damage no additional connector shall be required in the cable or at the outlet.~~
Substantiation: Sag may be inferred as a bow or loop in the cord or cable not necessarily including a cord connector. "Automatic" implies no personal action; most retractable cord reels require a pull on the cord to actuate retrieval. The last sentence is unclear as to intent; there is no provision for an additional required connector. Devices on the load end of cords supplying vehicles will be connectors, not plugs.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-257 Log #1222 NEC-P14 **Final Action: Reject**
(511.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
GROUNDING. ~~and BONDING REQUIREMENTS~~
(A) GENERAL GROUNDING REQUIREMENTS.
Metal raceways, ~~the metal armor or metallic sheath on~~ and metal covering of cables, and all exposed noncurrent-carrying metal Parts of fixed or portable electrical equipment regardless of voltage, shall be grounded. ~~Grounding and bonding shall comply with 501.30 for Class I Division 1 and 2 locations and 505.25 for Class I Zone 0, 1, and 2 locations~~.
Add: Exception: Listed equipment except portable electric drills, hammers, saws, and chippers shall not be required to be grounded if protected by a system of double insulation and clearly marked as such.
Revise latter portion of (B)(1): "or to the grounded circuit conductor terminal of any utilization equipment".
In (B), delete Grounding in Class I locations shall comply with 501.30".
In (B)(2), change "approved" to "identified".
Substantiation: In (A), noncurrent-carrying should apply to exposed parts. Sections 501.30 and 505.25 already apply. The exception is proposed for consideration whether or not suitable. The grounded terminal of (B)(1) should be the circuit conductor terminal, not the EGC terminal. "Approved" is not the same as "identified"; all means acceptable to the AHJ may not be suitable for the use.
Bonding requirements are already covered by 250.90 and 250.100.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-258 Log #3873 NEC-P14 **Final Action: Reject**
(511.16, FPN (New))

Submitter: Michael J. Farrell, III, Lucas County Building Regulations
Recommendation: Add new Fine Print Note (FPN) following text of 511.16 Grounding and Bonding Requirements
FPN: See 610.61 for bonding jumper requirements required by this section for automotive type hoists.
Substantiation: Placement of a new FPN will direct the code user in all of the requirements for proper application of this article.
Commercial garages and repair facilities use hoists as well as lifts for typical repair of vehicles and the bonding requirements for hoists as located in 610.61 should be observed at these locations for the safety of those who operate the hoist.
Panel Meeting Action: Reject
Panel Statement: CMP-14 does not agree that this fine print note is warranted because the requirements for bonding and grounding of hoists, which would include automotive hoists, is already covered by Section 610.61.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-259 Log #1789 NEC-P14 **Final Action: Reject**
(511.16(B)(1))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part: "...or to the grounded circuit conductor terminal or lead of any utilization equipment supplied.
Substantiation: Edit. A grounded terminal is one that is grounded and may be inferred as an equipment grounding or bonding conductor connection.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-260 Log #1389 NEC-P14 **Final Action: Reject**
(511.16(B)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise as follows:
~~Approved~~ Identified Means. ~~Approved~~ Identified means shall be provided... (remainder unchanged).
Substantiation: Edit. "Approved" is not the same as "identified"; the means should be suitable for the use.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 513 — AIRCRAFT HANGARS

14-261 Log #2432 NEC-P14 **Final Action: Reject**
(513.2)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:
Article 100
DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.
Substantiation: If Power Safe Protector is accepted in 513.12 only, a definition will be needed. There is a proposal for Article 100 also.
Panel Meeting Action: Reject
Panel Statement: There are no product requirements for PSP protection. A thorough study of wiring device failure mechanisms and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated by the code. Installation of these devices is not currently prohibited by the NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-262 Log #458 NEC-P14 **Final Action: Reject**
(513.3(D))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Delete existing subsection (D) and replace with new subsection (D) as follows:
~~**(D) Areas Suitably Cut Off and Ventilated.** Adjacent areas in which flammable liquids or vapors are not likely to be released, such as stock rooms, electrical control rooms, and other similar locations, shall be unclassified where adequately ventilated and where effectively cut off from the hangar itself by walls or partitions.~~
(D) Specific Areas Adjacent to Classified Locations. Areas adjacent to classified locations in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, shall be unclassified where mechanically ventilated at a rate of four or more air changes per hour, or designed with positive air pressure, or where effectively cut off by walls or partitions.
Substantiation: This change is intended to attain consistency between code sections where requirements are similar, such as in Section 511.3(E)(1). There is no intent to change the safety aspect or code allowance as presently worded in the section. Since the hazards are the same, and the adjacent areas are the same, the code sections should also be the same. This change will help to eliminate confusion the currently exists in code enforcement requirements.
Panel Meeting Action: Reject
Panel Statement: CMP-14 supports the intent of the Airport Facilities Committee that the requirement in 513.3(D) require both ventilation and separation. The requirement of 511 allows either.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-263 Log #1388 NEC-P14 **Final Action: Reject**
(513.3(D))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise latter part: ... where ~~adequately ventilated~~ approved ventilation is provided and where... (remainder unchanged).
Substantiation: Edit. "Adequately" is a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The word "adequately" as used in this section is not unenforceable and does not create confusion, as indicated in the requirements of the NEC Style Manual. As such, it does not need to be replaced.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-264 Log #1790 NEC-P14 **Final Action: Reject**
(513.7(A) Exception)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "suitable" to "identified".
Substantiation: Edit. "Suitable" is subjective and a term to be avoided per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-265 Log #4363 NEC-P14 **Final Action: Reject**
(513.8(A))

Submitter: James S. Conrad, Tyco Thermal Controls
Recommendation: Revise text as follows:
A) Wiring and Equipment ~~Embedded, Under Slab, or~~ Under Ground All wiring installed ~~in or under the hangar floor~~ in vaults, pits, or ducts shall comply with the requirements for Class I, Division 1 locations. ~~Where s~~Such wiring shall be provided ~~is located~~ with adequate drainage.
Substantiation: Wiring in or under the hangar floor does not pose a risk because of the lack of oxygen to support combustion. This requirement was changed it section 514.8 during the 2005 ROP.
Panel Meeting Action: Reject
Panel Statement: CMP-14 supports the Airport Facilities Committee's concern about the large volume of fuel that may be present beneath the floor of a hangar. Lack of oxygen beneath the floor cannot be guaranteed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-266 Log #1798 NEC-P14 **Final Action: Reject**
(513.8(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete last sentence of (A) and substitute: Vaults, pits, or ducts in which wiring is installed shall be provided with drains to prevent accumulation of liquids.
Delete (B).
Substantiation: Edit. Present wording can be interpreted to require drainage for the wiring. "Adequate" is subjective and a term to be avoided per the Style Manual. Subsection (A) appears to adequately cover buried and embedded raceways, whether or not "interrupted".
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-267 Log #1387 NEC-P14 **Final Action: Reject**
(513.8(B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
~~Uninterrupted Raceways~~ and Cables Embedded In Or Under Slab Underground. I. ~~Uninterrupted~~ Raceways and cables that are embedded in a hanger floor or buried beneath the hanger floor shall be considered to be within the class I location above the floor, regardless of the point at which the raceway or cable emerges. ~~Descends below or rises above the floor.~~
Substantiation: Edit. The provision should also apply to permitted cables [332.10(7)(10), 501.10(A)(1)(b)].
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(513.10(E)(2))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "approved" to "identified".
Substantiation: Edit. "Approved" is not necessarily the same as "identified". 513.10(E)(1) and others use the term "identified".
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-269 Log #1797 NEC-P14 **Final Action: Reject**
(513.12)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text: All 125-volt ~~50/60 Hz single phase~~ 15-and 20 ampere receptacles ~~installed in areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used~~ shall have ground-fault circuit-interruption protection for personnel.
Substantiation: Edit. Whether 60 or 400 Hz or dc, 125 volt receptacles should have GFCI protection. Specifying equipment that is to be used is irrelevant to the provision.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-270 Log #2433 NEC-P14 **Final Action: Reject**
(513.12)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Revise text to read as follows:
513.12 ~~Ground-Fault Circuit-Interrupter~~ <u>Power Safe Protector</u> Protection for Personnel.

All 125-volt, 50/60-Hz, single-phase, 15- and 20-ampere receptacles installed in areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used shall have ~~ground-fault circuit-interrupter~~ <u>power safe protector</u> protection for personnel.
Substantiation: Serious shocks can occur in the time it takes a GFCI device to trip because they are designed to trip only after a fault has occurred. Additionally, GFCI devices also do not prevent fires caused by loose connecting wires that overheat and ignite nearby flammable material.
The Power Safe Protector (PSP) device overcomes these limitations in three ways:

1. The PSP receptacle uses a "Power Off" safety paradigm that supplies power only for the duration that an appliance is actually using it. Before it supplies power to a connected appliance it performs several safety checks to detect unsafe conditions *before* they can cause injury. These safety checks happen each time an attached appliance is switched on prior to supplying power to the appliance. When the PSP receptacle has energized an appliance, it provides traditional GFCI protection.
2. A PSP receptacle monitors the temperature of supply wire connections to recognize unsafe heating associated with glowing connections or series arc faults.
3. A PSP receptacle calls immediate attention to any problems by blinking a red warning lamp and sounding an alarm. A green light illuminates while the PSP receptacle supplies power to an appliance.

Please see the document I have provided titled *Power Safe Protector Receptacles* for more detail.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-261.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-271 Log #1220 NEC-P14 **Final Action: Reject**
(513.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:

GROUNDING. ~~and BONDING~~ All metal raceways, the ~~metal armor or metallic sheath on~~ <u>covering</u> of cables and all <u>exposed</u> noncurrent-carrying metal parts of fixed or portable electric equipment shall be grounded ~~and bonded as provided in Article 250. Grounding and bonding shall comply with 501.30 for Class I Division 1 and 2 locations and 505.25 for Class I Zone O, 1, and 2 locations~~.

Exception: Listed equipment except portable electric drills, hammers, saws, and chippers shall not be required to be grounded if protected by a system of double insulation and clearly marked as such.

Revise latter portion of (B)(1): "or to the grounded <u>circuit conductor</u> of any utilization equipment".

In (B)(2), change "approved" to "identified".
Substantiation: Noncurrent-carrying should apply to exposed parts. Article 250 and sections 501.30 and 505.25 already apply. The exception is proposed for consideration whether or not suitable. The grounded terminal of (B)(1) should be the circuit conductor terminal not the EGC. "Approved" is not the same as "identified"; all means acceptable to the AHJ may not be suitable for the use. Bonding requirements are already covered by 250.90 and 250.100.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.

Substantiation: Approved is not necessarily the same as identified; 513.10(E)(2) and others use the word "identified".
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 514 — MOTOR FUEL DISPENSING FACILITIES

14-273 Log #4877 NEC-P14 **Final Action: Reject**
(Table 514.3(B)(1))

Submitter: Technical Committee on Automotive and Marine Service Stations,
Recommendation: Revise table 514.3(B)(1) as follows:

See Table 514.3(B)(1) on Pages 667 and 668

Substantiation: The attached revision of Table 514.3(B)(1) of Article 514 more clearly incorporates the Zone classification system as it is intended to be presented by the source table, Table 8.3.1 of NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*. Also, a Division 1 classification has been added for the internal area of an Overhead Dispenser and the prior reference to UL 87 has been deleted, as UL 87 does not include requirements for such a device and none are known to be listed in the U.S.

The word "nonclassified" has been changed to "unclassified" to correlate with NFPA 70 usage and the overall format of the table reflects NFPA 70 usage.

The intent of this proposal is that both tables, Table 514.3(B)(1) in NFPA 70 and Table 8.3.1 in NFPA 30A, be identical in their respective new editions.
Panel Meeting Action: Reject
Panel Statement: Table 514.3(B)(1) is extracted material from NFPA 30A. The table being proposed is not a part of NFPA 30A at this time. CMP-14 notes the following issues that need to be addressed:
- Group designations need to be added for both Divisions and Zones.
- Consideration should be given to adding Zone 0 for the interior of storage tanks.
- Reverse US customary and SI units to match NEC usage.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

Table 514.3(B)(1) Class I Locations — Motor Fuel Dispensing Facilities

Location	Class I Division	Class I Zone	Extent of Classified Location[1]
Dispensing Device (except Overhead Type) [2,3]			
Pits	1	1	Entire space within any pit or box below grade level, any part of which is within a Division 1 or Division 2 classified location or within a Zone 1 or Zone 2 classified location
Dispenser	2	2	Within 18 in. (450 mm) of dispenser enclosure or that portion of dispenser enclosure containing liquid handling components, extending horizontally in all directions and down to grade level
Outdoor	2	2	Up to 18 in. (450 mm) above grade level, extending 20 ft (6 m) horizontally in all directions from dispenser enclosure
Indoor			
- with mechanical ventilation	2	2	Up to 18 in. (450 mm) above floor level, extending 20 ft. (6 m) horizontally in all directions from dispenser enclosure
- with gravity ventilation	2	2	Up to 18 in. (450 mm) above floor level, extending 25 ft (7.5 m) horizontally in all directions from dispenser enclosure
Dispensing Device — Overhead Type[4]	1	1	Space within dispenser enclosure and all electrical equipment integral with dispensing hose or nozzle
	2	2	Within 18 in. (450 mm) of dispenser enclosure, extending horizontally in all directions and down to grade level
	2	2	Up to 18 in. (450 mm) above grade level, extending 20 ft (6 m) horizontally in all directions from a point vertically below edge of dispenser enclosure
Remote Pump —			
Outdoor	1	1	Entire space within any pit or box below grade level, any part of which is within 10 ft (3 m) horizontally from any edge of pump
	2	2	Within 3 ft (900 mm) of any edge of pump, extending horizontally in all directions
	2	2	Up to 18 in. (450 mm) above grade level, extending 20 ft (6 m) horizontally in all directions from any edge of pump
Indoor	1	1	Entire space within any pit
	2	2	Within 5 ft (1.5 m) of any edge of pump, extending horizontally in all directions
	2	2	Up to 3 ft (900 mm) above floor level, extending 25 ft (7.5) horizontally in all directions from any edge of pump
Sales, Storage, Rest Rooms	unclassified	unclassified	Except as noted below
	1	1	Entire room, if there is any opening to room within the extent of a Division 1 or Zone 1 location,
Tank, Aboveground			
Shell, ends, roof, dike area	1	1	Entire space within dike, where dike height exceeds distance from tank shell to inside of dike wall for more than 50 percent of tank circumference
	2	2	Entire space within dike, where dike height does not exceed distance from tank shell to inside of dike wall for more than 50 percent of tank circumference

Table 514.3(B)(1) Class I Locations — Motor Fuel Dispensing Facilities *(continued)*

Location	Class I Division	Class I Zone	Extent of Classified Location[1]
	2	2	Within 10 ft (3 m) of shell, ends , or roof of tank
Specific areas adjacent to classified locations	2	2	Areas adjacent to classified locations where flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, shall not be classified where mechanically ventilated at a rate of four or more air changes per hour, or designed with positive air pressure, or where effectively cut off by walls or partitions
Vent	1	1	Within 5 ft (1.5 m) of open end of vent, extending in all directions
	2	2	Between 5 ft and 10 ft (1.5 m and 3 m) from open end of vent, extending in all directions
Tank, Underground Fill Opening	1	1	Entire space within any pit or box below grade level, any part of which is within a Division 1 or Division 2 classified location or within a Zone 1 or Zone 2 classified location
	2	2	Within 18 in. (450 mm) of any loose-fill connection or within 5 ft (1.5 m) from any tight-fill connection, extending horizontally in all directions
Vent	1	1	Within 5 ft (1.5 m) of open end of vent, extending in all directions
	2	2	Between 5 ft and 10 ft (1.5 m and 3 m) from open end of vent, extending in all directions
Vapor Processing System Pits	1	1	Entire space within any pit or box below grade level, any part of which: (1) is within a Division 1 or Division 2 classified location; (2) is within a Zone 1 or Zone 2 classified location; (3) houses any equipment used to transfer or process vapors
Equipment in protective enclosures	2	2	Entire space within enclosure
Equipment not within protective enclosure	2	2	Within 18 in. (450 mm) of equipment containing flammable vapors or liquid, extending horizontally in all directions and down to grade level
	2	2	Up to 18 in. (450 mm) above grade level within 10 ft (3 m) horizontally of the vapor processing equipment
- Equipment enclosure	1	1	Entire space within enclosure, if flammable vapor or liquid is present under normal operating conditions
	2	2	Entire space within enclosure, if flammable vapor or liquid is not present under normal operating conditions
- Vacuum assist blower	2	2	Within 18 in. (450 mm) of blower, extending horizontally in all directions and down to grade level
	2	2	Up to 18 in. (450 mm) above grade level, extending 10 ft (3 m) horizontally in all directions
Vault	1	1	Entire interior space, if Class I liquids are stored within

[1]For marine application, *grade level* means the surface of a pier, extending down to water level.
[2]Refer to Figure 514.3 for an illustration of classified areas around dispensing devices.
[3]Area classification inside the dispenser enclosure is covered in UL 87, *Standard for Power-Operated Dispensing Devices for Petroleum Products.*
[4]Ceiling-mounted hose reel.

14-274 Log #563 NEC-P14 **Final Action: Reject**
(514.8 Exception No. 2)

TCC Action: In response to the request from Code-Making Panel 14, the Technical Correlating Committee notes that the term "rigid nonmetallic conduit" includes Types PVC, RTRC, and HDPE. The suitability of any type of rigid nonmetallic conduit in a hazardous (classified) location is under the purview of Code-Making Panel 14.
Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text to read as follows:
Exception No. 2: ~~Rigid~~ PVC ~~nonmetallic~~ conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where ~~rigid~~ PVC ~~nonmetallic~~ conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (2 ft) of the underground run to emergence or to the point of connection to the aboveground raceway, and an equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.
Substantiation: In the 2008 NEC development cycle, Article 352 was revised to change the title of the Article from Rigid Nonmetallic Conduit to Rigid Polyvinyl Chloride Conduit: Type PVC. This revision was also to have been implemented globally in the NEC. The continued use of this term appears to be an inadvertent oversight. The revision promotes consistency with revisions in the 2008 NEC cycle and replaces the term "rigid nonmetallic conduit" in this section with the term now used for this wiring method.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-277.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
BRIESCH, E.: See My Explanation of Negative on 14-277 (Log #2785).
OFFERDAHL, D.: This proposal should have been accepted in principal. 514.8 Exception 2 in pertains to the non-metallic raceway buried 2 feet below the earth. This underground installation comply with articles 352.10, 353.10 and 355.10 as well as Articles 352.100 353.100 and 355.100 listing the construction specification of these wiring method and UL product standards rigid nonmetallic underground conduit, plastic (eazx) reinforced thermosetting resin conduit (dzkt).

14-275 Log #1027 NEC-P14 **Final Action: Reject**
(514.8 Exception No. 2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise second sentence:
Where rigid nonmetallic conduit is used threaded rigid metal conduit or threaded steel intermediate conduit with threaded or watertight fittings shall be used for at least the last 600 mm (2 ft) of the underground run to emergence or to the point of connection to the aboveground wiring and an equipment grounding conductor equipment bonding conductor shall be provided in the raceway. ~~To provide electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.~~
Substantiation: The purpose of the EGC is understood and grounding is covered elsewhere in the Code.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-276 Log #2417 NEC-P14 **Final Action: Reject**
(514.8 Exception No. 2)

TCC Action: In response to the request from Code-Making Panel 14, the Technical Correlating Committee notes that term "rigid nonmetallic conduit" includes Types PVC, RTRC, and HDPE. The suitability of any type of rigid nonmetallic conduit in a hazardous (classified) location is under the purview of Code-Making Panel 14.
Submitter: Jerry Feagans, City of St. Louis
Recommendation: Revise text to read as follows:
rigid ~~non-metallic~~ PVC conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. "Where rigid ~~non-metallic~~ PVC conduit...".
Substantiation: Conforming to style manual Article 352.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-277.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
BRIESCH, E.: See My Explanation of Negative on 14-277 (Log #2785).
OFFERDAHL, D.: This proposal should have been accepted in principal. 514.8 Exception 2 in pertains to the non-metallic raceway buried 2 feet below the earth. This underground installation comply with articles 352.10, 353.10 and 355.10 as well as Articles 352.100 353.100 and 355.100 listing the construction specification of these wiring method and UL product standards rigid nonmetallic underground conduit, plastic (eazx) reinforced thermosetting resin conduit (dzkt).

14-277 Log #2785 NEC-P14 **Final Action: Reject**
(514.8 Exception No. 2)

TCC Action: In response to the request from Code-Making Panel 14, the Technical Correlating Committee notes that term "rigid nonmetallic conduit" includes Types PVC, RTRC, and HDPE. The suitability of any type of rigid nonmetallic conduit in a hazardous (classified) location is under the purview of Code-Making Panel 14.
Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise Exception No. 2 of 514.8 as shown:
Exception No. 2: Rigid PVC, RTRC, or HDPE ~~nonmetallic~~ conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where rigid PVC, RTRC, or HDPE ~~nonmetallic~~ conduit is used...
Substantiation: In the 2008 NEC development cycle, Article 352 was revised to change the title of the article from rigid nonmetallic conduit to Rigid Polyvinyl Chloride Conduit: type PVC. In addition, HDPE had already been moved to another article and a new article for RTRC was introduced and accepted. All of these conduits are types of rigid nonmetallic conduits and should be considered equally in this exception. The revision from "rigid nonmetallic conduit" to the various types was also to have been implemented globally in the NEC. The continued use of the old term appears to be an inadvertent oversight. The revision promotes consistency with revisions in the 2008 NEC cycle and replaces the term rigid nonmetallic conduit in this section with the terms now used for this general wiring method.
Panel Meeting Action: Reject
Panel Statement: This is an issue that extends throughout the code. At the present time, CMP-14 is not sure what constitutes rigid nonmetallic conduit. Furthermore, it is of great concern to CMP-14 that the suitability of the conduit is appropriate for use in hazardous (classified) locations, including items such as minimum wall thickness, rigidity, etc. CMP-14 respectfully requests direction from the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
BRIESCH, E.: I agree with the Panel that the issue of rigid nonmetallic conduit needs to be addressed throughout the Code. Rejection of this proposal, however, does nothing to alleviate the existing problem. The present text permits any type of rigid nonmetallic conduit in any thickness. This is exactly what the panel has stated is not acceptable. The proposal should be accepted since it removes the ambiguity by stating the specific types of conduit permitted.
OFFERDAHL, D.: This proposal should have been accepted. 514.8 Exception 2 in pertains to the non-metallic raceway buried 2 feet below the earth. This underground installation comply with articles 352.10, 353.10 and 355.10 as well as Articles 352.100 353.100 and 355.100 listing the construction specification of these wiring method and UL product standards rigid nonmetallic underground conduit, plastic (eazx) reinforced thermosetting resin conduit (dzkt).

14-278 Log #3672 NEC-P14 **Final Action: Reject**
(514.8 Exception No. 2)

Submitter: Mark Smythe, Smythe Electric Inc.
Recommendation: Revise text as follows:
514.8 Exception No. 2: Rigid nonmetallic conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (2 ft) of the underground run to emergence or to the point of connection to the above ground raceway, and an equipment grounding conductor, sized per 250.122, shall be included to provide electrical continuity of the raceway system and for grounding of non-current carrying metal parts.
Substantiation: This change would provide installers with direction for sizing the equipment grounding conductors required in underground nonmetallic conduits supplying power to Motor Fuel Dispensers.
Panel Meeting Action: Reject
Panel Statement: The rules for sizing equipment grounding are found in Article 250. CMP-14 does not agree that special emphasis is needed since Article 250 is such a basic part of the code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-279 Log #4045 NEC-P14 **Final Action: Accept in Principle**
(514.11)

Submitter: Jimmy Ford, Power Integrity Corp.
Recommendation: Revise text to read as follows:
514.11 Circuit Disconnects.
(A) General. Each circuit leading to or through dispensing equipment, including all associated power, communication, and equipment for remote pumping systems, shall be provided with a clearly identified and readily accessible switch or other listed a~~cceptable~~ means, located remote from the dispensing devices, to disconnect simultaneously from the source of supply, all conductors of the circuits, including the grounded conductor, if any.
Single-pole breakers utilizing handle ties shall not be permitted.
Substantiation: The current wording of Section 514.11 creates discrepancies in the way this section is applied to the design, installation and the inspection of dispensing equipment. In many cases the Emergency Stop Control Circuit controlling power to the dispenser is considered to be acceptable and the only required disconnect of external voltage sources. This is incorrect. Dispensing equipment is supplied by more than one external voltage source, 120 VAC power for dispenser operation plus low voltage power for the data/communication circuits. These voltage sources supply power to energize the dispenser as well as numerous data and communication circuits. While an Emergency Stop Control Circuit may be an acceptable means for disconnecting the AC power source from dispensing equipment, the control circuit does not disconnect the low voltage data/communication circuits. When not properly disconnected, the data/communication circuits create an explosion and electrical shock hazard.
Updating the language in this Section becomes more important due to the increasing number of circuits connected to dispensing equipment. Today's advanced dispensing equipment now often requires additional circuits to add features such as "marketing at the pump". This feature uses closed caption video feeds, advanced networking and display options. Other circuits can include but are not limited to AC power, intercom, serial data, and current loop circuits.
It is very important that the installer understands how this Section of the code is applied to the equipment he is installing, as it is up to him to provide a proper means of removing the numerous external voltage sources.
While dispenser manufacturers show the installation of a breaker and mentions an Emergency Stop Control circuit (which can be used as a means for removing the external voltage source of the AC power circuit) it becomes complicated in determining what means needs to be installed to remove the other external voltages. Typically the dispenser manufacturers do not illustrate the installation of a disconnecting means for circuits other than the AC power circuit.
There are also third party equipment manufacturers providing equipment that can be installed on the dispensers with their circuits being routed to and through the dispenser. This third party equipment requires even more circuits, and needs to be considered when field installing a proper emergency stop means of removing external voltage sources.
For those technicians, service people and inspectors who feel these requirements should not be applied to low voltage communication and data circuits, it is important to understand the risks and rejections to previous proposed changes to this section of code.
Previous proposals to exclude intrinsically safe circuits from Section 514.13 have been rejected by the panel. (See 2004 May Association Technical Meeting. National Electrical Code Committee Report on Proposals. 14-141 (Log #1279), Volume 1:1307; 14-143 (Log #2804), Volume 1:1308; 2003). The panel stated, "Some intrinsically safe circuits can present a shock hazard. Some communications circuits can also present a shock hazard and an ignition hazard."
In addition to the proposed text defining the types of circuits that are to be disconnected, the means of removing the voltage should be described as a "listed" means. It is important that the means disconnects the wiring from the source. This insures that any stored energy in the source cannot be discharged through the data wiring during servicing of the dispensing equipment.
Therefore I feel it is important to adopt the proposed changes to accomplish the following:
1) Specifically identify the circuits of the dispensing equipment that need to be disconnected, as required by this Section, to eliminate any question of installers and inspectors.
2) Require that the means for removing the voltage sources be an "Approved" means to insure full compliance to these requirements and that the removal of external voltage sources is done in a manner that provides the level of safeguards intended.
The following supporting material has been provided:
1) "Safety Letters A Compilation 1980-1994"; Petroleum Equipment Institute, ISBN 0-9642638-0-7; Excerpts, Pages 39, 52, 53.
2) "Dispenser Disconnects - Critical safety net that is overlooked?"; Pages 75-77, IAEI, Vol. 80, Number 6 November/December 2008.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
514.11 Circuit Disconnects. (A) General. Each circuit leading to or through dispensing equipment, including all associated power, communication, data, and video circuits, and equipment for remote pumping systems, shall be provided with a clearly identified and readily accessible switch or other approved a~~cceptable~~ means, located remote from the dispensing devices, to disconnect simultaneously from the source of supply, all conductors of the circuits, including the grounded conductor, if any.
Single-pole breakers utilizing handle ties shall not be permitted.
Panel Statement: The panel agrees with the proposal, but has added data and video circuits because these may also present a hazard. The panel concluded that "approved" is a more appropriate term.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BATTA, JR., D.: This proposal should be rejected. Disconnect hardware to disconnect all of these various type circuits in one device may not be available. Safety and security at a dispensing station will be impaired by disconnecting lighting and video. Restart of communication circuits will be difficult after isolating these data and video circuits since the entire system shuts down when this happens.

14-280 Log #1026 NEC-P14 **Final Action: Reject**
(514.13)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
Each dispensing device shall be provided with identified means to simultaneously disconnect all conductors installed to or through the dispensing device ~~remove all external voltage sources including feedback, during periods of maintenance and service of the dispensing equipment~~. The location of this means shall be permitted to be other than inside or adjacent to the dispensing equipment. The disconnecting means shall be ~~capable of~~ provided with an identified integral and permanent means for being locked in the open (off) position.
Substantiation: Edit. "Removal of all sources" literally applies to conductors, transformers, switchboards, and all other sources of supply. "During periods of maintenance and service" is irrelevant to the requirement. Proposal for locking is specific and doesn't allow for makeshift methods.
Panel Meeting Action: Reject
Panel Statement: This requirement applies to maintenance and there is no reason or need for simultaneous disconnection of the conductors. Also, literal interpretation of the proposed language would require disconnection of the equipment grounding conductor. CMP-14 notes that the substantiation does not address these points.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-281 Log #4046 NEC-P14 **Final Action: Accept in Principle**
(514.13)

Submitter: Jimmy Ford, Power Integrity Corp.
Recommendation: Revise text to read as follows:
514.13 Provisions for Maintenance and Service of Dispensing Equipment. Each dispensing device shall be provided with a listed means to remove all external voltage sources of power and communication circuits, including feedback, during periods of maintenance and service of the dispensing equipment. The location of this shall be permitted to be other than inside or adjacent to the dispensing device. The means shall be capable of being locked in the open position.
Substantiation: The current wording of Section 514.11 creates discrepancies in the way this section is applied to the design, installation and the inspection of dispensing equipment. In many cases the Emergency Stop Control Circuit controlling power to the dispenser is considered to be acceptable and the only required disconnect of external voltage sources. This is incorrect. Dispensing equipment is supplied by more than one external voltage source, 120 VAC power for dispenser operation plus low voltage power for the data/communication circuits. These voltage sources supply power to energize the dispenser as well as numerous data and communication circuits. While an Emergency Stop Control Circuit may be an acceptable means for disconnecting the AC power source from dispensing equipment, the control circuit does not disconnect the low voltage data/communication circuits. When not properly disconnected, the data/communication circuits create an explosion and electrical shock hazard.
Updating the language in this Section becomes more important due to the increasing number of circuits connected to dispensing equipment. Today's advanced dispensing equipment now often requires additional circuits to add features such as "marketing at the pump". This feature uses closed caption video feeds, advanced networking and display options. Other circuits can include but are not limited to AC power, intercom, serial data, and current loop circuits.
It is very important that the installer understands how this Section of the code is applied to the equipment he is installing, as it is up to him to provide a proper means of removing the numerous external voltage sources.

While dispenser manufacturers show the installation of a breaker and mentions an Emergency Stop Control circuit (which can be used as a means for removing the external voltage source of the AC power circuit) it becomes complicated in determining what means needs to be installed to remove the other external voltages. Typically the dispenser manufacturers do not illustrate the installation of a disconnecting means for circuits other than the AC power circuit.

There are also third party equipment manufacturers providing equipment that can be installed on the dispensers with their circuits being routed to and through the dispenser. This third party equipment requires even more circuits, and needs to be considered when field installing a proper emergency stop means of removing external voltage sources.

For those technicians, service people and inspectors who feel these requirements should not be applied to low voltage communication and data circuits, it is important to understand the risks and rejections to previous proposed changes to this section of code.

Previous proposals to exclude intrinsically safe circuits from Section 514.13 have been rejected by the panel. (See 2004 May Association Technical Meeting. National Electrical Code Committee Report on Proposals. 14-141 (Log #1279), Volume 1:1307; 14-143 (Log #2804), Volume 1:1308; 2003). The panel stated, "Some intrinsically safe circuits can present a shock hazard. Some communications circuits can also present a shock hazard and an ignition hazard."

In addition to the proposed text defining the types of circuits that are to be disconnected, the means of removing the voltage should be described as a "listed" means. It is important that the means disconnects the wiring from the source. This insures that any stored energy in the source cannot be discharged through the data wiring during servicing of the dispensing equipment.

Therefore I feel it is important to adopt the proposed changes to accomplish the following:

1) Specifically identify the circuits of the dispensing equipment that need to be disconnected, as required by this Section, to eliminate any question of installers and inspectors.

2) Require that the means for removing the voltage sources be an "Approved" means to insure full compliance to these requirements and that the removal of external voltage sources is done in a manner that provides the level of safeguards intended.

1) "Safety Letters A Compilation 1980-1994"; Petroleum Equipment Institute, ISBN 0-9642638-0-7; Excerpts, Pages 39, 52, 53.

2) "Dispenser Disconnects - Critical safety net that is overlooked?"; Pages 75-77, IAEI, Vol. 80, Number 6 November/December 2008.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

514.13 Provisions for Maintenance and Service of Dispensing Equipment. Each dispensing device shall be provided with a means to remove all external voltage sources, <u>including power, communication, data, and video circuits and</u>~~,~~ including feedback, during periods of maintenance and service of the dispensing equipment. The location of this shall be permitted to be other than inside or adjacent to the dispensing device. The means shall be capable of being locked in the open position.

Panel Statement: The panel agrees with the proposal but has added data and video circuits because these may also present a hazard. The panel concluded that "listed" is not necessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

BATTA, JR., D.: This proposal should be rejected. See my ballot comment on Proposal 14-279.

14-282 Log #3908 NEC-P14 **Final Action: Accept in Part**
(514.16)

Submitter: Eugene F. Swisher, City of Tampa / Rep. IBEW Local 915

Recommendation: Revise text as follows:

"...all metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metals parts of <u>all</u> fixed <u>and</u> portable electrical equipment, regardless of...".

Substantiation: Equipment cannot be both fixed and portable. This will clarify that equipment, whether fixed or portable, must be grounded and bonded.

Panel Meeting Action: Accept in Part

Accept the word "and". Do not accept the word "all".

Panel Statement: The panel recognizes there was a typographical error during the last code cycle, which has been resolved by adding the word "and". Adding the word "all" is not required.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

ARTICLE 515 — BULK STORAGE PLANTS

14-282a Log #CP1402 NEC-P14 **Final Action: Accept**
(Table 515.3)

Submitter: Code-Making Panel 14,

Recommendation: In the description of "Shell, ends, or roof and dike area" correct the wording: "…area inside dike to level of top of ~~tank~~ <u>dike wall.</u>

Substantiation: The current wording appears to be a misprint, as Table 515.3 is essentially extracted from NFPA 30 Table 7.3.3 which has the correct wording "…to top of dike wall".

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-283 Log #4422 NEC-P14 **Final Action: Accept in Principle**
(515.7(A))

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with regard to which cables require the listed fitting.

In addition, the Technical Correlating Committee directs that the panel clarify the panel action as it relates to 4.1.1 of the NEC Style Manual concerning references to entire articles.

This action will be considered by the panel as a public comment.

Submitter: Bruce Decker, NuStar Energy, L.P.

Recommendation: Revise text to read as follows:

(A) Fixed Wiring. All fixed wiring above Class I locations shall be in metal raceways, Schedule 80 PVC conduit, Type RTRC marked with the suffix –XW, or type MI, TC, or MC cable<u>, or PLTC cable in accordance with Article 725, or Type ITC cable in accordance with Article 727.</u>

Substantiation: The current rule prohibits the use of PLTC cable or Type ITC cable above Class I locations in bulk storage facilities. PLTC cable and Type ITC cable are commonly used in bulk storage facilities for class 1, class 2, and class 3 remote-control, signaling, and power-limited circuits. Current rules allow their installation in both classified and unclassified locations, including both classified and unclassified locations in bulk storage facilities with the exception of 515.7(A). Many times, however, PLTC cable or Type ITC cable is installed in cable trays and many times the cable tray is located above the classified area.

One example consists of a cable tray containing PLTC cable or Type ITC cable that is run from an electrical/control building into a tank farm. The cable tray and cables originate in the unclassified area, pass over a dike wall, and then reside above the classified area until (1) the cable tray drops down into the classified area, or (2) the cable tray maintains its height above the classified area and the cables themselves drop down via conduit or other approved method into the classified area to specific pieces of equipment. In either case, in its current form, 515.7(A) prohibits this necessary installation.

The omission of PLTC cable and Type ITC cable from 515.7(A) is inadvertent, and the revised text will allow PLTC cable and Type ITC cable to be properly utilized in bulk storage facilities.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

(A) Fixed Wiring. All fixed wiring above Class I locations shall be in metal raceways, Schedule 80 PVC conduit, Type RTRC marked with the suffix –XW, or Type MI, Type TC, or Type MC cable<u>, or Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems or Type ITC and Type ITC-ER cable as permitted in 727.4. The cable shall be terminated with listed fittings.</u>

Panel Statement: The changes made by CMP-14 correlate with previous changes made in Proposal 14-43.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-284 Log #1025 NEC-P14 **Final Action: Reject**
(515.7(B))

Submitter: Dan Leaf, Seneca, SC

Recommendation: Change "may" to "is likely to".

Substantiation: "May" is a term to be avoided per the Style Manual. "Likely" is defined as such a nature or circumstance as to make something probable and is used in many sections.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 14-15.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-285 Log #2418 NEC-P14 **Final Action: Reject**
(515.8)

TCC Action: In response to the request from Code-Making Panel 14, the Technical Correlating Committee notes that term "rigid nonmetallic conduit" includes Types PVC, RTRC, and HDPE. The suitability of any type of rigid nonmetallic conduit in a hazardous (classified) location is under the purview of Code-Making Panel 14.
Submitter: Jerry Feagans, City of St. Louis
Recommendation: Revise text to read as follows:
"...where rigid ~~non-metallic~~ PVC conduit is used, threaded rigid metal conduit.
Substantiation: Conforming to style manual Article 352.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-277.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BRIESCH, E.: See My Explanation of Negative on 14-277 (Log #2785).

14-286 Log #564 NEC-P14 **Final Action: Reject**
(515.8(A))

TCC Action: In response to the request from Code-Making Panel 14, the Technical Correlating Committee notes that term "rigid nonmetallic conduit" includes Types PVC, RTRC, and HDPE. The suitability of any type of rigid nonmetallic conduit in a hazardous (classified) location is under the purview of Code-Making Panel 14.
Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text to read as follows:
515.8 Underground Wiring.
(A) Wiring Method. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit or, where buried under not less than 600 mm (2 ft) of cover, shall be permitted in PVC ~~rigid nonmetallic~~ conduit or a listed cable. Where PVC ~~rigid nonmetallic~~ conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (2 ft) of the conduit run to emergence or to the point of connection to the aboveground raceway.
Substantiation: In the 2008 NEC development cycle, Article 352 was revised to change the title of the Article from Rigid Nonmetallic Conduit to Rigid Polyvinyl Chloride Conduit: Type PVC. This revision was also to have been implemented globally in the NEC. The continued use of this term appears to be an inadvertent oversight. The revision promotes consistency with revisions in the 2008 NEC cycle and replaces the term "rigid nonmetallic conduit" in this section with the term now used for this wiring method.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-277.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BRIESCH, E.: See My Explanation of Negative on 14-277 (Log #2785).

14-287 Log #858 NEC-P14 **Final Action: Reject**
(515.8(A) and (C))

TCC Action: In response to the request from Code-Making Panel 14, the Technical Correlating Committee notes that term "rigid nonmetallic conduit" includes Types PVC, RTRC, and HDPE. The suitability of any type of rigid nonmetallic conduit in a hazardous (classified) location is under the purview of Code-Making Panel 14.
Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise:
(A) WIRING METHOD. Underground wiring shall be installed in threaded rigid metal conduit or threaded intermediate metal conduit with threaded fittings or, where buried under not less than 600 mm (2 ft) of earth ~~cover~~ or 100 mm (4 in.) of concrete shall be permitted in Type PVC rigid nonmetallic conduit. Where Type PVC rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded intermediate metal conduit with threaded fittings shall be used for not less than the last 600 mm (2 ft) of the conduit run to emergency ~~or~~ and to the point of ~~connection~~ transition to an aboveground wiring method or enclosure. ~~The aboveground raceway.~~
In (C), delete text after "included".
Substantiation: Threaded fittings should be specified; 342.42(A) and 344.42(A) permit threadless couplings and connectors. PVC should be permitted where under 4 in. or more of concrete. The provision should indicate the last 2 ft is a minimum. An emerging raceway may not always connect to an aboveground raceway, it may transition to a cable or terminate in a cabinet, switch, or other enclosure. The latter part of (C) is superfluous, the purpose of an EGC is defined in Article 100.
Panel Meeting Action: Reject
Panel Statement: This is an issue that extends throughout the Code. At the present time, CMP-14 is not sure what constitutes rigid nonmetallic conduit. Furthermore, it is of great concern to CMP-14 that the suitability of the conduit is appropriate for use in hazardous (classified) locations, including items such as minimum wall thickness, rigidity, etc. CMP-14 respectfully requests direction from the TCC.
See also panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BRIESCH, E.: This proposal should have been Accepted in Principle in Part. Addition of the Type PVC should have been accepted and the rigid nonmetallic conduit deleted. The remainder of the proposal should not be accepted. See Comment on Proposal 14-277.

14-288 Log #1024 NEC-P14 **Final Action: Reject**
(515.8(A) and (C))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text of (A):
Underground wiring shall be installed in a threaded rigid metal conduit or threaded intermediate metal conduit, with threaded fittings, or where buried under not less than 600 mm (2 ft) of cover or 100 mm (4 in.) of concrete shall be permitted in rigid nonmetallic conduit or an identified cable. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit with threaded fittings shall be used for not less than the last 1600 mm (2 ft) of the conduit run to emergence. ~~Or to the point of connection to an aboveground raceway.~~ Where cable is used it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate conduit with threaded fittings from the lowest buried cable level to the point of emergence connection ~~to the aboveground raceway~~.
In (C), delete text after "included".
Substantiation: All cables which are listed may not be suitable. The provision for the last two feet literally does not permit more than two feet. The existing last sentence is covered by the proposed addition of cable in the second sentence. "To emergence" is the defining requirement; underground wiring may terminate in poles, in walls, in enclosures, or connect to wiring other than raceways. The requirement in (C) to provide an EGC does not need to include the reason, which is superfluous and generally not included in similar requirements.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-289 Log #565 NEC-P14 **Final Action: Reject**
(515.8(C))

TCC Action: In response to the request from Code-Making Panel 14, the Technical Correlating Committee notes that term "rigid nonmetallic conduit" includes Types PVC, RTRC, and HDPE. The suitability of any type of rigid nonmetallic conduit in a hazardous (classified) location is under the purview of Code-Making Panel 14.
Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text to read as follows:
(C) Nonmetallic Wiring. Where PVC ~~rigid nonmetallic~~ conduit or cable with a nonmetallic sheath is used, an equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.
Substantiation: In the 2008 NEC development cycle, Article 352 was revised to change the title of the Article from Rigid Nonmetallic Conduit to Rigid Polyvinyl Chloride Conduit: Type PVC. This revision was also to have been implemented globally in the NEC. The continued use of this term appears to be an inadvertent oversight. The revision promotes consistency with revisions in the 2008 NEC cycle and replaces the term "rigid nonmetallic conduit" in this section with the term now used for this wiring method.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-277.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BRIESCH, E.: See My Explanation of Negative on 14-277 (Log #2785).

14-290 Log #1022 NEC-P14 **Final Action: Reject**
(515.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "as provided in Article 250".
Substantiation: Edit. Article 250 contains provisions and exceptions for where grounding is not required. Many sections do not use this phrase which eliminates ambiguity.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-215.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-291 Log #1221 NEC-P14 **Final Action: Reject**
(515.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text as follows:
GROUNDING ~~and BONDING~~ All metal raceways, the metal ~~armor or metallic shield on~~ covering of cables and all exposed noncurrent-carrying metal parts of electrical equipment regardless of voltage shall be grounded ~~and bonded as provided in Article 250. Grounding and bonding shall comply with 501.30 for Class I Division 1 and 2 locations and 505.25 for Class I Zone O, 1, and 2 locations~~. Exception: Listed equipment except portable electric drill motors, electric saws, electric hammers and chippers, shall not be required to be grounded if protected by a system of double insulation and clearly marked as such.
Substantiation: Grounding should apply to exposed parts. Article 250 and 501.30 and 505.30 already apply. The exception is proposed for consideration whether or not suitable. Bonding requirements are covered by 250.90 and 250.100.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-292 Log #1886 NEC-P14 **Final Action: Reject**
(515.16)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete: "as provided in Article 250."
Substantiation: Edit. Per 4.1.1 of the Style Manual, reference should not be made to an entire article. Article 250 has provisions which permit non-grounding which may be deemed to void or nullify the apparent intent of this provision. Many sections re: grounding do not use this phrase. See 3.3.5 of the Style Manual.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-215.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 516 — SPRAY APPLICATION, DIPPING, AND COATING PROCESSES

14-293 Log #1021 NEC-P14 **Final Action: Reject**
(516.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise last sentence:
The spray booth is provided with a dedicated electrically powered ventilation exhaust and supply system. But may shall be permitted to draw supply air from a larger room or area or have a dedicated air supply.
Substantiation: Edit. The exhaust system should be electrically powered; nonelectrical systems are not adequate.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-294 Log #1023 NEC-P14 **Final Action: Reject**
(516.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
A purposely enclosed room built for spray (coating) dipping applications provided with a dedicated ventilation supply and electrically powered exhaust system. The exhaust system shall be arranged to operate when spray/coating/dipping operations are conducted and be provided with identified means, visual or audible or both, at an approved location, to indicate when the exhaust system is not operable.
Substantiation: The exhaust system should be electrically powered; mechanical louvers and roof turbines should not constitute the exhaust system.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-295 Log #582 NEC-P14 **Final Action: Reject**
(516.3(C)(2)(a) and (b))

Submitter: Mitch Feininger, North Dakota State Electrical Board
Recommendation: Revise text to read as follows:
(a) If the exhaust ventilation system is interlocked with the spray application equipment, the Division 2 or Zone 2 location shall encompass a radius of 1.5 m (5 ft) horizontally 900 mm (3 ft) vertically...". (Remainder unchanged).
(b) If the exhaust ventilation system is not interlocked with the spray application equipment, the Division 2 or Zone 2 location shall encompass a radius of 3 m (10 ft) horizontally and 900 mm (3 ft)...". (Remainder unchanged).
Substantiation: This proposal's intent is to establish a relationship between the article which makes no reference to the concept of a radical inclusion, while Figure 516.3(2) uses the word radius in every illustration subtext.
Panel Meeting Action: Reject
Panel Statement: This is text extracted from NFPA 33 and CMP-14 cannot alter it in any substantive sense. This submittal does not add clarity. CMP-14 notes that the figures are referenced to provide the necessary information.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-296 Log #466 NEC-P14 **Final Action: Reject**
(516.3(E))

Submitter: Lanny G. McMahill, Phoenix, AZ
Recommendation: Delete existing subsection (E) and replace with new subsection (E) as follows:
~~**(E) Adjacent Locations.** Adjacent locations that are cut off from the defined class I or Class II locations by tight partitions without communicating openings, and within which flammable vapors or combustible powders are not likely to be released, shall be unclassified.~~
(E) Specific Areas Adjacent to Classified Locations. Areas adjacent to classified locations in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, shall be unclassified where mechanically ventilated at a rate of four or more air changes per hour, or designed with positive air pressure, or where effectively cut off by walls or partitions.
Substantiation: This change is intended to attain consistency between code sections where requirements are similar, such as in Section 511.3(E)(1). There is no intent to change the safety aspect or code allowance as presently worded in the section. Since the hazards are the same, and the adjacent areas are the same, the code sections should also be the same. This change will help to eliminate confusion the currently exists in code enforcement requirements.
Panel Meeting Action: Reject
Panel Statement: The proposal removes text that is specific to spray application processes. There is no substantiation provided for correlating the text of 511.3(E)(1) with that of 516.3(E). The hazards in Article 511 are different than those in Article 516.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-297 Log #1020 NEC-P14 **Final Action: Accept**
(516.4(D) Exception No. 2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "automobile" to "vehicle".
Substantiation: Edit. Trucks and other vehicles may not be deemed "automobiles".
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
NEAGLE, J.: The provision for portable electric drying apparatus should not be limited to use in automotive refinishing type spray booths. Such equipment has application in industrial and other spray coating operations also falling within the scope of NFPA 33 and NEC Article 516. 516.4(D) Exception No. 2 should be revised as follows:
'Exception No. 2: Where portable electric drying apparatus is used in ~~automobile refinishing~~ spray booths and the following requirements are met:…'.
Retain items (a) through (d).

14-298 Log #1019 NEC-P14 **Final Action: Reject**
(516.7(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Recommendation: Change "suitable" to "identified" and "may" to "is likely to".
Substantiation: Edit. "Suitable" and "may" are subjective and terms to be avoided per the Style Manual. "Identified" is defined and "likely" is a term used in many sections, defined as such a nature or circumstance as to make something probable.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-299 Log #1017 NEC-P14 **Final Action: Reject**
(516.10)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Delete "adequate" in (A)(7).
In (A)(8), change qualified to "authorized".
In (B)(4), revise first sentence: All electrically conductive objects in the spray in area shall be adequately grounded in an approved manner.
Substantiation: Edit. "Adequate" is a term to be avoided per the Style Manual; additionally the latter part suggests that adequacy is achieved. Qualified person (personnel) is defined as one who has skills and knowledge relating to the construction of electrical equipment; painters are not likely to be so qualified.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 14-36. The word "adequate" as used in this section is not unenforceable and does not create confusion, as indicated in the requirements of the NEC Style Manual. As such, it does not need to be replaced.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-300 Log #1018 NEC-P14 **Final Action: Reject**
(516.10(A)(2) and (3))

Submitter: Dan Leaf, Seneca, SC
Recommendation: In (A)(2), change "adequately" to "securely".
Revise text of (A)(3):
High-voltage leads shall be properly insulated for the voltage employed and protected from mechanical physical damage or and exposure to destructive agents chemicals.
Substantiation: Edit. "Adequately" and "properly" are terms to be avoided per the Style Manual. "Mechanical" implies machinery or tools. "Agents" is more inclusive and covers more than chemicals.
Panel Meeting Action: Reject
Panel Statement: In 516.10(A)(2) the word "adequately" as used in this section is not unenforceable and does not create confusion, as indicated in the requirements of the NEC Style Manual. As such, it does not need to be replaced.
The text of 516.10(A)(3) already clearly requires what the submitter is proposing.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 517 — HEALTH CARE FACILITIES

15-3a Log #CP1503 NEC-P15 **Final Action: Accept**
(517.2 (NEW))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comment expressed in the voting.
In addition, the Technical Correlating Committee directs the panel to clarify the action on this proposal as it relates to 2.2.2 of the NEC Style Manual concerning the use of mandatory text in a definition.
This action shall be considered by the panel as a public comment.
Submitter: Code-Making Panel 15,
Recommendation: Add a new definition to 517-2:
Battery Powered Lighting Units.
Individual unit equipment for back up illumination shall consist of the following:
(1) A rechargeable battery
(2) A battery charging means
(3) Provisions for one or more lamps mounted on the equipment, or shall be permitted to have terminals for remote lamps, or both
(4) A relaying device arranged to energize the lamps automatically upon failure of the supply to the unit equipment.
Substantiation: The adoption of proposal 15-109 details Battery Powered Lighting Units, these units should be defined in Article 517 as per Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.
Comment on Affirmative:
SAMPSON, M.: I respectfully request that the panel revisit this issue. This new definition for "Battery Powered Lighting Units" is identical to that in 700.12(F) for "Unit Equipment." Using the same definition for two different terms within the Code is contradictory. The name should be agreed upon and the definition moved to Article 100 or the reference to unit equipment in 700.12(F) should be restored.

15-4 Log #3252 NEC-P15 **Final Action: Reject**
(517.2)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Add: "with the core and case connected to an equipment grounding conductor."
Substantiation: Editorial. Correlation with present 517.64(C)(2).
Panel Meeting Action: Reject
Panel Statement: The proposal does not meet the requirements of 4.3.3.(b) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-5 Log #260 NEC-P15 **Final Action: Reject**
(517.2.Ambulatory Health Care Occupancy)

Submitter: Kyle Medaugh, State of Michigan - MDCH / Rep. Health Care
Recommendation: 517.2 Definitions
Ambulatory Health Care Facility. A building or part thereof used to provide services or treatment to four or more patients at the same time and meeting either (1) or (2).
(1) Those facilities that provide, on an outpatient basis, treatment for patients that would render them incapable of taking action for self-preservation under emergency conditions without assistance from others, ~~such as hemodialysis units or freestanding emergency medical units.~~
(2) Those facilities that provide, on an outpatient basis, surgical treatment requiring general anesthesia.
Substantiation: Definition does not match NFPA 101 (2006 edition)
3.3.168.1 Ambulatory Health Care Occupancy. A building or portion thereof used to provide services or treatment simultaneously to four or more patients that provides, on an outpatient basis, one or more of the following: (1) treatment for patients that renders the patients incapable of taking action for self-preservation under emergency conditions without the assistance of others; (2) anesthesia that renders the patients incapable of taking action for self-preservation under emergency conditions without the assistance of others; (3) emergency or urgent care for patients who, due to the nature of their injury or illness, are incapable of taking action for self-preservation under emergency conditions without the assistance of others.
A3.3.168.1 Ambulatory Health Care Occupancy. It is not the intent that occupants be considered to be incapable of self-preservation just because they are in a wheelchair or use assistive walking devices, such as a cane, a walker, or crutches. Rather it is the intent to address emergency care centers that receive patients who have been rendered incapable of self-preservation due to the emergency, such as being rendered unconscious as a result of an accident or being unable to move due to sudden illness.
By specifically stating that hemodialysis units are Ambulatory Health Care Facilities is contradictory to the language of "self-preservation" because patients in outpatient hemodialysis facilities are required by the Center for Medicare and Medicaid Services (CMS) to be able to disconnect themselves from medical equipment in the event of an emergency. In some cases a patient may not be able to disconnect themselves but it would not be more then one or two, below the requirement of four or more in the definition.
CMS Conditions for Coverage of Suppliers of End-Stage Renal Disease Services
42 CFR 405 Subpart U
405.2140(d)(5) Patients are trained to handle medical and non-medical emergencies. Patients must be fully informed regarding what to do, where to go, and whom to contact if a medical or non-medical emergency occurs.
Panel Meeting Action: Reject
Panel Statement: The text of the 2008 NEC already contains this language submitted by the proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-6 Log #4136 NEC-P15 **Final Action: Accept**
(517.2.Critical Branch)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
Critical Branch. A subsystem of the ~~emergency~~ essential electrical system consisting of feeders and branch circuits supplying energy to task illumination, special power circuits, and selected receptacles serving areas and functions related to patient care and that are connected to alternate power sources by one or more transfer switches during interruption of normal power source. [**99:**3.3.26]
Substantiation: To coordinate with the 2010 Edition of NFPA 99.
Panel Meeting Action: Accept
Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 2
Ballot Not Returned: 1 Lau, L.
Explanation of Negative:

SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word "emergency" from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.

WHITE, A.: The code making cycle for NFPA 99 is not yet complete. Any action taken before this standard is issued by Standards Council is premature.

15-7 Log #4137 NEC-P15 **Final Action: Accept**
(517.2.Emergency System)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.

This action will be considered by the panel as a public comment.

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Delete as follows:

~~**Emergency System.** A system of circuits and equipment intended to supply alternate power to a limited number of prescribed functions vital to the protection of life and safety. [**99:**3.3.41]~~

Substantiation: Defining the parts of the health care facility essential electrical system as three branches (critical, life safety, and equipment) instead of two systems (emergency and equipment) eliminates an unnecessary hierarchal level. More important, this change creates a clear distinction between the requirements for essential systems of health care facilities and those in NFPA Article 700 for emergency, legally required standby, and optional standby systems in other occupancies. Although some functions of the health care facility essential electrical system do have commonality with functions of emergency and standby systems in other occupancies, there are many patient care related functions that are uniquely performance related and apply only in the health care environment because of the unique needs of operating a health care facility, including during fire emergencies, there is an urgent need to distinguish the two sets of requirements.

The fundamental purpose of this proposal is to coordinate with the 2010 version of NFPA 99.

Panel Meeting Action: Accept
Panel Statement: The panel action is based on the action in proposal 15-72. The panel does not necessarily agree with the substantiation provided by the submitter with regard to Article 700.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Lau, L.
Explanation of Negative:

SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word "emergency" from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.

15-8 Log #4135 NEC-P15 **Final Action: Accept**
(517.2.Equipment System Branch)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.

This action will be considered by the panel as a public comment.

Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
Equipment ~~System~~ <u>Branch</u>. A system of circuits and equipment arranged for delayed, automatic, or manual connection to the alternate power source and that serves primarily 3-phase power equipment.
Substantiation: This is one of three branches on the essential electrical power supply system. It is not a separate system, but a vital part of the EEPSS. Refer to proposal by same author on 517.2.

To coordinate with the 2010 Edition of NFPA 99.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2
Ballot Not Returned: 1 Lau, L.

15-9 Log #4162 NEC-P15 **Final Action: Reject**
(517.2.Health Care Facilities)

Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Revise text to read as follows:

Section 517.2 Definitions.

Health Care Facilities. Buildings or portions or buildings in which medical, dental, psychiatric, nursing, obstetrical, or surgical care are provided. Health care facilities include, but are not limited to, hospitals, nursing homes, limited care facilities, clinics, medical and dental offices, <u>chiropractic offices, physical therapy offices</u> and ambulatory care centers, whether permanent or movable.

Substantiation: Doctors of Chiropractic Medicine and physical therapists frequently use electrical diagnostic and therapeutic equipment during the treatment of patients and the patients are subjected to many of the same hazards of any other medical office. In many cases, the equipment design requires compliance with Article 517 patient care area requirements. The lack of inclusion in this definition leads Architects, Engineers, Inspectors, and Contractors to believe these offices should not be considered health care facilities and the wiring methods for these facilities in Article 517 for exam and treatment rooms do not apply.
Panel Meeting Action: Reject
Panel Statement: It is inappropriate to create and attempt to maintain a laundry list of occupancies that may or may not be considered health care facilities. NFPA 99 is taking a risk based approach to classify buildings or areas of buildings that provide patient treatment. We expect these definitions to be revised in the near future to align with NFPA 99.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-10 Log #1434 NEC-P15 **Final Action: Reject**
(517.2.Isolated Power System)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

A system comprising an <u>isolation</u> ~~isolating~~ transformer or ~~its equivalent~~ <u>other power source with no direct connection between its supply conductors and the conductors it supplies,</u> a line isolation monitor, and its ungrounded <u>secondary system and</u> circuit conductors.

Substantiation: There is no definition for isolating transformer. In addition to ungrounded circuit conductors the system should be specified as ungrounded. Present wording does not prohibit a 240-volt 2-wire circuit supplied from a 120/240 volt grounded secondary. The phrase "ungrounded secondary" is used in 668.20(B).
Panel Meeting Action: Reject
Panel Statement: The term "isolating" is correct as used. This is an adjective that describes what the noun is. Webster's defines "ing" as "adding to verbs or sometimes nouns to form verbal nouns-the act or instance of (a specified verb) painting, digging." Isolating is a v.t. or verb transition. Isolating describes the action of the noun – what it does for the transformer. The rest of the proposed text appears to not meet the NEC Manual of Style. Proposed language contains requirements. Requirements for these systems should be in Part VII he existing definition is consistent with that in NFPA 99 and should remain consistent for clarity."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-11 Log #1016 NEC-P15 **Final Action: Reject**
(517.2.Isolating Transformer)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

ISOLATED POWER SYSTEM. Change "isolating" to "isolation".

Substantiation: Isolating transformer is not defined whereas isolation transformer is; are two different types intended? Different wording pertaining to the same thing may cause confusion per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: The existing definition is consistent with that in NFPA 99 and should remain consistent for clarity. The term "isolating" is correct as it is an adverb that describes what the noun is. Webster's defines "ing" as "adding to verbs or sometimes nouns to form verbal nouns - the act or instance of (a specified verb) painting, digging." Isolating is a v.t. or verb transition. Isolating describes the action of the noun – what it does for the transformer."
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-12 Log #1063 NEC-P15 **Final Action: Accept**
(517.2.Isolation Transformer)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
ISOLATION TRANSFORMER: A transformer of the multiple winding type, with the primary and secondary windings physically separated, which inductively couples its secondary winding(s) to ~~the grounded feeder systems that energize~~ circuit conductors connected to its primary windings(s).
Substantiation: Edit. A transformer may (and is often) supplied (energized) by a branch circuit or an ungrounded system or circuit which may energize the secondary winding(s) (reverse connected).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-13 Log #4134 NEC-P15 **Final Action: Accept**
(517.2.Life Safety Branch)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
Life Safety Branch. A subsystem of the ~~emergency~~ essential electrical system consisting of feeders and branch circuits, ~~meeting the requirements of Article 700 and~~ intended to provide adequate power needs to ensure safety to patients and personnel, and that are automatically connected to alternate power sources during interruption of the normal power source. [**99:**3.3.96]
Substantiation: Article 700 no longer applies to essential electrical systems of health care facilities. These systems shall meet only the requirements of Article 517. See justification in Proposal regarding 517.2 for further justification.
To coordinate with the 2010 Edition of NFPA 99.
Panel Meeting Action: Accept
Panel Statement: The panel action is based on the action in Proposal 15-72. The panel does not necessarily agree with the substantiation provided by the submitter with regard to Article 700.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2
Ballot Not Returned: 1 Lau, L.
Explanation of Negative:
SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word "emergency" from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.
WHITE, A.: The code making cycle for NFPA 99 is not yet complete. Any action taken before this standard is issued by Standards Council is premature.

15-14 Log #2272a NEC-P15 **Final Action: Reject**
(517.2.Long-Time Rating (X-Ray Equipment) and Momentary Rating (X-Ray Equipment) (New))

TCC Action: The Technical Correlating Committee directs that this proposal be referred to Code-Making Panel 12 for correlating action in Article 660.
This action will be considered by Code-Making Panel 12 as a public comment.
Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Relocate and revise two definitions from Articles 660 and 517 to Article 100.
Long-Time Rating (X-Ray Equipment). A rating based on an operating interval of 5 minutes or longer.
Momentary Rating (X-Ray Equipment). A rating based on an operating interval that does not exceed 5 seconds.
This proposal has also been sent to CMP-12 for 660.2.
Substantiation: These definitions are identical and are used in two separate articles of the NEC. This change proposal is in compliance with the NEC Style Manual section 2.2.2.1.
Panel Meeting Action: Reject
Panel Statement: While the definitions are identical and appear in two different NEC articles, the type of x-ray equipment found in 517 and 660 are radically different from one another. 517 refers to medical x-ray equipment and 660 refers to industrial x-ray equipment. It is important that the definitions stay in the appropriate articles to aid code users.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-15 Log #4133 NEC-P15 **Final Action: Accept**
(517.2.Patient Bed Location)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
Patient Bed Location. The location of a patient sleeping bed, or the bed or procedure table of a critical care ~~area~~ room. [**99:**3.3.137]
Substantiation: To coordinate with the 2010 edition of NFPA 99. NFPA 99 uses this definition to distinguish the location of various performance requirements for the health care facility. As such, the definition is a necessary part of 99, and should be common between 70 and 99.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2
Ballot Not Returned: 1 Lau, L.
Explanation of Negative:
SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word "emergency" from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.
WHITE, A.: The code making cycle for NFPA 99 is not yet complete. Any action taken before this standard is issued by Standards Council is premature.

15-16 Log #4132 NEC-P15 **Final Action: Accept**
(517.2.Patient Care Area)

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
The Technical Correlating Committee further directs that the panel clarify the panel action related to the word "portion".
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
Patient Care ~~Area~~ Room. Any portion room of a health care facility wherein patients are intended to be examined or treated. ~~Areas~~ Rooms of a health care facility in which patient care is administered are classified as basic care rooms, general care ~~areas~~ rooms, or critical care ~~areas~~ rooms. The governing body of the facility designates these areas rooms in accordance with the type of patient care anticipated and with the following definitions of the room ~~area~~ classification.
Basic Care Rooms. Rooms in which the failure of equipment or systems is not likely to cause injury to the patients or caregivers but may cause patient discomfort.
FPN: Basic care rooms are typically rooms in which basic medical or dental care, treatment, or examinations are performed. Examples include but are not limited to examination or treatment rooms in hospitals, clinics, medical and dental offices, nursing homes, and limited care facilities.
General Care ~~Areas~~ Rooms. ~~Patient bedrooms, examining rooms, treatment rooms, clinics, and similar areas in which it is intended that the patient will come in contact with ordinary appliances such as a nurse call system, electric beds, examining lamps, telephones, and entertainment devices. [99, 2005]~~ Rooms in which failure of equipment or systems is likely to cause minor injury to patients or caregivers.
FPN: Examples of general patient care rooms include but are not limited to inpatient bedrooms, dialysis rooms, invitro-fertilization rooms, IV sedation rooms, and similar rooms.
Critical Care ~~Areas~~ Rooms. ~~Those special care units, intensive care units, coronary care units, angiography laboratories, cardiac catheterization laboratories, delivery rooms, operating rooms, and similar areas in which patients are intended to be subjected to invasive procedures and connected to line operated, electromedical devices.~~ Rooms in which failure of equipment or systems is likely to cause major injury or death of patients or caregivers.
FPN: Critical care rooms are typically where patients are intended to be subjected to invasive procedures and connected to line operated, patient care related appliances. Examples include but are not limited to special care patient rooms used for critical care, intensive care, and special care treatment rooms such as angiography labs, cardiac catheterization laboratories, delivery rooms, operating rooms, post anesthesia care units, trauma rooms, and other similar rooms.
Substantiation: Patient care is delivered in specific rooms within a health care occupancy. The term area is misleading to the electrical inspector because corridors, nurses stations, clean and soiled utility rooms should not be included as a patient care treatment room. NFPA 99 uses this definition to distinguish the location of various performance requirements for the health care facility. As such, the definition is a necessary part of 99, and should be common between 70 and 99.

Basic care rooms are those locations where a failure of the electrical system will only cause patients or caregivers a minor injury. This definition better defines the use of basic care rooms in health care facilities.

This change is necessary to coordinate with the 2010 edition of NFPA 99.

15-18 Log #2795 NEC-P15 **Final Action: Accept**
(517.2.Patient Care Location, Wet Procedure Locations)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: Revise last sentence as follows:

Patient Care Location.

Wet Procedure Locations...Routine housekeeping procedures and incidental spillage of liquids do not define a wet procedure location.

Substantiation: Providing the additional word "procedure" between "wet" and "locations" in the last sentence does not substantially change the definition of this application, but does provide added description to the phrase and differentiates between "Wet Locations: as defined in Article 100 and this very special type of Wet Location here in Article 517. General housekeeping procedures may require washing the area down and that action could define a wet location requiring compliance with 406.8(B) but would not define a wet procedure location.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-19 Log #2434 NEC-P15 **Final Action: Reject**
(517.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Recommendation: Add new text to read as follows:

Article 100

DEFINITION: Power Safe Protector (PSP). A device intended to keep the power off until a circuit check can assure that any equipment or other items connected are free of any line to ground faults, neutral to ground faults, or short circuits, before the device can be energized. It will protect from ground faults, and overheating of the device associated with glowing connections, or series arc faults while energized by turning the device off when there is a problem causing an audible sound and a red indicator light to notify where there is a problem. This device will automatically reset only after it has verified that the problem is cleared. This protection is provided independently on each receptacle outlet. It will illuminate a green indicator light when energizing any equipment or other items connected.

Substantiation: If Power Safe Protector is accepted in 517.20(A) and 517.21, a definition will be needed here. There is a proposal for Article 100 also.

Panel Meeting Action: Reject
Panel Statement: The proposal is not specific to Article 517.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-20 Log #4163 NEC-P15 **Final Action: Accept**
(517.2.Wet Procedure Locations)

Submitter: Ron B. Chilton, North Carolina Department of Insurance
Recommendation: Add new text as follows:

Wet Procedure Locations. Those spaces within patient care areas where a procedure is performed and that are normally subject to wet conditions while patients are present. These include standing fluids on the floor or drenching of the work area, either of which condition is intimate to the patient or staff. Routine housekeeping procedures and incidental spillage of liquids do not define a wet procedure location.

Substantiation: Providing the additional word procedure between "wet" and "locations" in the last sentence does not substantially change the definition of this application, but does provide added description to the phrase and differentiates between "Wet Locations" as defined in Article 100 and this very special type of Wet Location here in Article 517. General housekeeping procedures may require washing the area down and that action could define a wet location requiring compliance with 406.8(B), but would not define a wet procedure location.

15-21 Log #1064 NEC-P15 **Final Action: Accept**
(517.2. X-ray Installations Transportable)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal since it accepted the proposal, and then modified the text in the panel statement.

This action will be considered by the panel as a public comment.

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

X-ray INSTALLATIONS TRANSPORTABLE X-ray equipment to be ~~installed in~~ transported by a vehicle or that ~~may be~~ is readily disassembled for transport by a vehicle.

Substantiation: Edit. Provision should allow for transport by, but not necessarily in, a vehicle. "May" is a term to be avoided per the Style Manual.

Panel Meeting Action: Accept
Panel Statement: The definition is identical to the definition found in NFPA 70, Article 660 X-Ray Equipment
a t Instead of hte st portion of the revised text of the author, it is proposed to insert the word "conveyed" for the two words deleted (installed in) by the author in the original document. Using the same root word to describe the word being defined is not usually recommended. This change would coincide with the author's intent. Elimination of "may be" should take place as set forth in the NEC Style Manual. Definition to read "X-ray equipment to be conveyed by a vehicle or that is readily disassembled…""
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-22 Log #882 NEC-P15 **Final Action: Reject**
(517.11)

Submitter: Dan Leaf, Seneca, SC
Recommendation: Revise text:
~~The purpose of~~ This article ~~is to~~ specifies the installation criteria and wiring methods that minimize electrical hazards by the maintenance of ~~adequately~~ low potential differences ~~only~~ between exposed conductive surfaces that are likely to become energized and ~~could~~ be contacted by a person ~~patient~~.
Substantiation: Edit. Most articles have a scope but do not explain the purpose, nor is the purpose explained for most rules, which normally is not necessary or pertinent. “Could” is irrelevant, subjective, and a term to be avoided per the Style Manual. The provision should apply where exposed surfaces can be contacted by persons other than patients. The definition of “exposed” applies to any person whether patient, employee, or visitor.
Panel Meeting Action: Reject
Panel Statement: The current code language more correctly and clearly defines the purpose of the Article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-23 Log #943 NEC-P15 **Final Action: Reject**

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-25 Log #3755 NEC-P15 **Final Action: Accept**
(517.13(B))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 15-29 in relation to isolated ground receptacles.
This action will be considered by the panel as a public comment.
Submitter: Jim Pauley, Square D Company/Schneider Electric
Recommendation: Revise 517.13(B) to read as follows
(B) Insulated Equipment Grounding Conductor.
(1) General. The following shall be directly connected to an insulated copper equipment grounding conductor that is installed in metal raceways or as a part of listed cables having a metallic armor or sheath assembly with the branch-circuit conductors supplying these receptacles or fixed equipment.
(1) The grounding terminals of all receptacles.
(2) Metal boxes and enclosures containing receptacles.
(3) All non–current carrying conductive surfaces of fixed electrical equipment likely to become energized that are subject to personal contact, operating at over 100 volts.
Exception No. 1 to (1): The equipment grounding terminal of a receptacle shall be permitted to be connected to an insulated equipment bonding jumper that extends from a metal box or enclosure that is connected to an insulated equipment grounding conductor.
Exception No. 2 to (2): Metal boxes and enclosures containing an isolated ground receptacle(s) as permitted by 250.146(D)
Exception No. 3 to (3): Metal faceplates shall be permitted to be connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.
Exception No. 4 to (3): Luminaires more than 2.3 m (71/2 ft) above the floor and switches located outside of the patient care vicinity shall be permitted to be connected to an equipment grounding return path complying with 517.13(A).
(2) Sizing. Equipment grounding conductors and equipment bonding jumpers shall be sized in accordance with Table 250.122.
Substantiation: The objective of this proposal is to rearrange the text in 517.13(B) for usability and to clear up some confusion about whether or not the metal box is required to be directly connected to the insulated equipment grounding conductor.
The revisions rearrange the paragraph to create a direct first sentence to state what must be connected to the copper equipment grounding conductor. The existing items in the paragraph are now numbered and a new item (2) is added to specifically state that the insulated equipment grounding conductor must be connected to the metal box that contains the receptacle. This arrangement is the only way to get true “redundant” paths. Today, many of these installations are being made by taking the insulated equipment grounding conductor to the receptacle without connection to the box.
Two new exceptions are added that will recognize some additional situations. Exception No. 1 would allow a bonding jumper to be installed from the box to the receptacle. This would result in the insulated equipment grounding conductor being terminated to the box and then a bonding jumper to go from the box to the receptacle.
Exception No. 2 is to recognize that there are situations where isolated ground receptacles may be installed and this exception would allow you to omit the connection to the box and take the conductor directly to the receptacle.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.
Comment on Affirmative:
SAMPSON, M.: Per the panel action on Proposal 15-29, exception #2 needs to be eliminated and the subsequent exceptions renumbered accordingly.

15-26 Log #2534 NEC-P15 **Final Action: Reject**
(517.14)

Submitter: Marcus R. Sampson, Lysistrata Electric
Recommendation: Revise text to read as follows:
517.14 Panelboard Bonding.
The equipment grounding terminal buses of the normal and essential branch-circuit panelboards serving the same individual patient care vicinity shall be connected together with an ~~insulated~~ continuous copper conductor not smaller than ~~10~~ 8 AWG. Where two or more panelboards serving the same individual patient care vicinity are served from separate transfer switches on the emergency system, the equipment grounding terminal buses of those panelboards shall be connected together with an ~~insulated~~ continuous copper conductor not smaller than ~~10~~ 8 AWG. This conductor shall be permitted to be broken in order to terminate on the equipment grounding terminal bus in each panelboard.
Substantiation: While we want to be extremely cautious with electrical distribution in health care facilities, why would any bonding conductor be required to be insulated?
And if the minimum size is only required to be #10 copper, would anything larger ever be required? Since this is considered an equipotential bond, shouldn’t the conductor be at least #8 copper - the same minimum size used for the equipotential bonding conductor in an animal confinement building or swimming pool?
Panel Meeting Action: Reject
Panel Statement: The submitter failed to provide any technical substantiation that a problem exists in the field to warrant a change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-27 Log #4113 NEC-P15 **Final Action: Accept in Principle**
(517.15 (New))

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.

This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Add new text to read as follows:
Overcurrent protective devices shall not be located in public access spaces. Isolated power panels shall be permitted to be located in patient care rooms.
Substantiation: Panelboards and the overcurrent devices should not be accessible to the public. These devices should be in a space that is only accessed by facility personnel. Furthermore, healthcare facility staff frequently access the electrical equipment for service, and should not do so in public areas. This requirement was extensively debated by the NFPA 99 Electrical Systems Technical Committee and it will appear in NFPA 99. NFPA 70 should extract it so as to ensure compliance with this important safety measure and to ensure coordination between the two documents.

Unless the isolated power panels are within the designated area, excessive cable-induced leakage currents may seriously limit the number of fixed and portable medical devices that can be powered from the isolated power supply.
Panel Meeting Action: Accept in Principle

Revise the text as follows:
517.15 Panelboard Location.
Panelboards shall not be located in public access spaces. Isolated power panels shall be permitted to be located in patient care rooms.
Panel Statement: The panel agreed with the proposal but added a 5itle for clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-28 Log #568 NEC-P15 **Final Action: Reject**
(517.16)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Recommendation: Revise text to read as follows:

517.16 Receptacles with Insulated Grounding Terminals.

(A) Identification. Receptacles with insulated grounding terminals, as permitted in 250.146(D), shall be identified; such identification shall be visible after installation.

(B) Equipment Grounding Conductors. Isolated ground receptacles installed in branch circuits for patient care areas shall be connected to an insulated equipment grounding conductor in accordance with 250.146(D) in addition to the two equipment grounding conductor paths required in 517.13(A) and (B).

(C) Equipment Grounding Conductor Identification. The equipment grounding conductor installed for isolated grounding receptacles in patient care areas shall be clearly identified in accordance with 250.119 from the insulated equipment grounding conductor required by 517.13(A) and (B).

FPN: Caution is important in specifying such a system with receptacles having insulated grounding terminals, since the grounding impedance is controlled only by the single equipment grounding conductors and does not benefit functionally from any parallel grounding paths. This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary and parallel grounding paths are to be avoided.
Substantiation: Confusion exists regarding the number of equipment grounding conductors that must be installed for isolated ground receptacles when they are installed in a patient care location. The proposed revision clarifies what is required to satisfy the equipment grounding conductor requirements for branch circuits serving these areas where the isolated equipment grounding conductor and IG receptacles are specified. The proposal also clarifies what is already vaguely addressed only in the fine print note to this section. The proposal organizes these into two requirements to clearly distinguish the identification requirement from the number of equipment grounding conductor requirement.
Panel Meeting Action: Reject
Panel Statement: Panel action on Proposal 15-29 makes this proposal unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-29 Log #3004 NEC-P15 **Final Action: Accept**
(517.16)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 15-25.

This action will be considered by the panel as a public comment.
Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise text to read as follows:

517.16 Receptacles with Insulated Grounding Terminals.

Receptacles with insulated grounding terminals, as described ~~permitted~~ in 250.146(D), shall not be permitted. ~~be identified; such identification shall be visible after installation.~~

~~FPN: Caution is important in specifying such a system with receptacles having insulated grounding terminals, since the grounding impedance is controlled only by the equipment grounding conductors and does not benefit functionally from any parallel grounding paths. This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary and parallel grounding paths are to be avoided.~~
Substantiation: The very existence of the existing fine print note tells us that that the use of an isolated grounding receptacle is a bad idea in a patient care area. The reduction of electrical noise should not be taken more seriously than protecting the patient, particularly in an invasive procedure area.
Panel Meeting Action: Accept
Number Eligible to Vote: 12

Ballot Not Returned: 1 Lau, L.

15-30 Log #3222 NEC-P15 **Final Action: Reject**
(517.16, FPN)

Submitter: Jack E. Jamison, Jr., MEGCO Inspections, Inc. / Rep. WV Division Ohio Chapter
Recommendation: Revise text as follows:

517.16 FPN: Caution is important when specifying such a system with receptacles having insulated grounding terminals since the grounding impedance is controlled only by the insulated grounding conductor and does not benefit functionally from the parallel grounding paths. This type of installation is typically used where the reduction of electric noise (electromagnetic interference) is necessary and parallel grounding paths are to be avoided.

Two insulated equipment grounding conductors are required to be installed in the metallic wiring system of this system to meet the requirements of 250.146(D), 517.13(B), and 517.16.
Substantiation: 250.146(D) allows the isolated equipment grounding conductor to pass unattached through the entire wiring system back to the building service grounding point for use on receptacles with isolated equipment grounding terminal.

517.13(B) Insulated Equipment Grounding Conductors. The grounding terminals of all receptacles and all non current carrying conductive surfaces of fixed electrical equipment likely to become energized that are subject to personnel contacts, operating over 100V, shall be connected an insulated copper equipment grounding conductor sized in accordance with 250.122 and installed in a metal raceway.

517.16 Receptacles with Insulated Grounding Terminals

These three code articles will substantiate the code requirement for two insulated copper equipment grounding conductors in a metallic wiring system for receptacles with insulated equipment grounding terminals in patient care areas of health care facilities.
Panel Meeting Action: Reject
Panel Statement: Panel action on Proposal 15-29 makes this proposal unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-31 Log #4910 NEC-P15 **Final Action: Reject**
(517.17)

Submitter: James Brozek, Acton, MA
Recommendation: Delete 517.17 entirely. This is a companion proposal in association with a proposal covering new 240.27 and 240.28, which consolidates requirements from 246.13, 230.95, 700.26, 215.10, 517.17, and 708.52.
Substantiation: If the proposal for new 240.27 and 240.28 is accepted, 517.17 will no longer be necessary.
Panel Meeting Action: Reject
Panel Statement: While CMP-10 has responsibility for the concept and methods of ground-fault protection for equipment, other CMPs need the flexibility to enact requirements and permissions as appropriate to their areas of responsibility.
Panel 15 is best suited to make decisions regarding GFP for the essential system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Lau, L.

15-32 Log #4130 NEC-P15 **Final Action: Accept**
(517.17(A))

TCC Action: The Technical Correlating Committee directs that this action be reconsidered and correlated with the final text of NFPA 99 after its adoption.
This action will be considered by the panel as a public comment.
Submitter: Walter N. Vernon, IV, Mazzetti & Associates Inc.
Recommendation: Revise text to read as follows:
(A) Applicability. The requirements of 517.17 shall apply to hospitals and other buildings (including multiple occupancy buildings) with critical care ~~areas~~ rooms or utilizing electrical life support equipment, and buildings that provide the required essential utilities or services for the operation of critical care ~~areas~~ rooms or electrical life support equipment.
Substantiation: To coordinate with the 2010 edition of NFPA 99, and with definitions submitted in other proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2
Ballot Not Returned: 1 Lau, L.
Explanation of Negative:
SAMPSON, M.: The panel should look closely at the lack argument for reconfiguring the essential system by eliminating the emergency system tier. The emergency system of a hospital is for life safety - a branch for those exiting the building and one for those who cannot. Removing the word “emergency” from Article 517 to escape the requirements of Article 700 is clearly cost driven and not in the best interest of the building occupants.
WHITE, A.: The code making cycle for NFPA 99 is not yet complete. Any action taken before this standard is issued by Standards Council is premature.

15-33 Log #18 NEC-P15 **Final Action: Accept in Principle in Part**
(517.17(B))

NOTE: This proposal appeared as Comment 15-20 on Proposal 15-29 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-29 was:
Delete the following text from 517.17(B):
~~The additional levels of ground-fault protection shall not be installed as follows:~~
~~(1) On the load side of an essential electrical system transfer switch~~
~~(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es)~~
~~(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase~~
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: NEMA recommends that Proposal 15-29 be Accept as written.
Substantiation: In order to provide the reliability in the essential electrical system that the CMP wants, multiple levels of GFP (ground fault protection) must be provided for the following reasons:
1. Ground faults are the most common form of faults in a operating electrical system. Multiple levels of GFP on both the normal and alternate source sides of the system are needed to isolate such faults as close to their point of occurrence as possible, thus providing a level of selective coordination and yielding the minimum disruption to the essential electrical system. It would seem that minimizing such disruption is even more important when a ground fault has occurred.
2. Closing a transfer switch or a generator into a ground fault presents the real possibility of damaging the transfer switch, or generator, or both, thus potentially decreasing system reliability.
As Mr. Wiseman pointed out in his negative comment, the panel statement is incorrect. The proposed deletion does not establish a conflict. The conflict is in the existing language since the additional level of ground-fault protection is prohibited in portions of the essential electrical system that could be fed from the alternate power source, while Article 700 actually permits ground-fault protection at the source. There is no substantiation that deviating from the requirement in Article 700 for ground-fault protection enhances the reliability of the system.
The panel statement suggests that most generators are small and, therefore, the risk of burn-down is not an issue. That statement may be accurate, but has no relevance to this discussion since the requirement for ground-fault protection is triggered by the size of the service disconnect in 230.95 or the feeder in 215.10. Therefore, the smaller generators which do not include a feeder disconnect rated 1000A or greater are not required to have ground-fault protection.
There has been no evidence presented or substantiation presented in the panel statement that supports rejecting this proposal.
Panel Meeting Action: Accept in Principle in Part
Merge introductory phrase and (1), to read (in total): “The additional levels of ground-fault protection shall not be installed on the load side of an essential system transfer switch”.
Delete (2) and (3), entirely.
Panel Statement: Subsections (2) and (3) address situations in which first -level ground-fault protection (GFPE) is not required by the code. Therefore, second -level GFPE could never be required, and exempting it is unnecessary. Eliminating (2) permits multiple levels of (GFPE) ahead of the transfer switch when the choice is made to provide GFPE on the alternate source. In this case, the second level of GFPE will greatly assist in needed coordination.
Number Eligible to Vote: 12

15-34 Log #19 NEC-P15 **Final Action: Reject**
(517.17(B))

NOTE: This proposal appeared as Comment 15-21 on Proposal 15-29 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-29 was:
Delete the following text from 517.17(B):
~~The additional levels of ground-fault protection shall not be installed as follows:~~
~~(1) On the load side of an essential electrical system transfer switch~~
~~(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es)~~
~~(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase~~
Submitter: Eugene E. Morgan, Clakamas County, Building Codes Divison
Recommendation: Panel 15 should reconsider the merits of this proposal. The submitter’s intent could be met and clarified with a revision of existing and new text, rather than a deletion as originally proposed:
517.15(B) Feeders. Revise last sentence of main paragraph as follows and add new text:
The additional levels of ground-fault protection shall not be ~~installed as follows~~: required on the following systems:
(1) On the load side of an essential electrical system transfer switch, where the alternate power source is 750 kVA or less
(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es), where the alternate power source is 750 kVA or less
(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase
Essential electrical systems where the alternate power source is rated over 750 kVA, and the system is designed under qualified engineering supervision, shall be permitted to have ground-fault protection. Where the alternate power source is 750 kVA or less, ground-fault detection shall be provided in accordance with 700.7(D), and shall include detection at the second level of feeders as specified in this section.
Substantiation: I respectfully disagree with the panel’s action and statement on three points:
(1) The original submittal, and the comment submitted herewith are not in conflict with 700.7(D), which provides for ground-fault detection. Article 700 provides for ground-fault detection, but it does not prohibit the use of ground-fault protection.
(2) Section 700.26 states that ground-fault protection shall not be required, but it is not prohibited.

(3) There is a trend toward larger regional hospitals with generators that exceed 1 megawatt of output. The original proposal gave the example of an 8 megawatt installation. In the jurisdiction that I serve, there is a new hospital generator system installation rated at 4.5 megawatts. The argument that a majority of hospitals have smaller alternate power sources does not answer the need for safety in the newer, larger installations. In the 4.5 megawatt system installed locally, the available fault current at the first transfer switch is 51,800 amps. The potential for a system meltdown in the event of a fault actually exceeds the fault current and potential damage from the utility transformers.

There should be some valid point at which ground-fault protection is needed. It is true that small alternate power sources should have ground-fault detection, and not ground-fault protection. The distinction between systems over 750 kVA (typically 1 megawatt or larger), and those 750 kVA or under, distinguishes between systems where available fault current would be significant. With the revision outlined above, the provision for an engineer to utilize ground-fault protection is available, but it is clearly at the engineer's discretion and not mandatory. This is also an opportunity to point out that Section 700.7(D) provides for ground-fault detection, which should always be installed when ground-fault protection is not an option.

(517.17(B))

NOTE: This proposal appeared as Comment 15-22 on Proposal 15-29 in the 2007 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2008 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-29 was:

Delete the following text from 517.17(B):

~~The additional levels of ground-fault protection shall not be installed as follows:~~

~~(1) On the load side of an essential electrical system transfer switch~~

~~(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es)~~

~~(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase~~

Submitter: Alan Manche, Square D Co.

Recommendation: The Panel should reconsider Proposal 15-29 and Accept it.

Substantiation: In order to provide the reliability in the essential electrical system that the CMP wants, multiple levels of GFP (ground fault protection) must be provided, once the first level is provided, for the following reasons:

1. Ground faults are the most common form of faults in an operating electrical system. Multiple levels of GFP on both the normal and alternate source sides of the system are needed to isolate such faults as close to their point of occurrence as possible, thus providing a level of selective coordination and yielding the minimum disruption to the essential electrical system. It would seem that minimizing such disruption is even more important when a ground fault has occurred.

2. Closing a transfer switch or a generator into a ground fault presents the real possibility of damaging the transfer switch, or generator, or both, thus potentially decreasing system reliability.

As Mr. Wiseman pointed out in his negative comment, the panel statement is incorrect. The proposed deletion does not establish a conflict. The conflict is in the existing language since the additional level of ground-fault protection is prohibited in portions of the essential electrical system that could be fed from the alternate power source, while NEC 700 actually permits ground-fault protection at the source. There is no substantiation indicating a need to amend NEC Article 700 for NEC 517 installations nor is there substantiation that disallowing a properly installed ground-fault protection system will enhance the reliability of the system.

The panel statement suggests that most generators are small and therefore the risk of burn-down is not an issue. That statement may be accurate but has no relevance to this discussion since the requirement for ground-fault protection is triggered by the size of the service disconnect in 230.95 or the feeder in 215.10. Therefore, the smaller generators which do not include a feeder disconnect rated 1000A or greater are not required to have ground-fault protection, and this revision would have no impact on them.

There has been no evidence presented or substantiation presented in the panel statement that supports rejecting this proposal.

15-36 Log #2221 NEC-P15 **Final Action: Reject**

(517.17(B))

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: 517.17 Ground-Fault Protection. (B) Feeders. Delete the text as follows:

"...~~The additional levels of ground-fault protection shall not be installed as follows: (1) On the load side of an essential electrical system transfer switch (2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es) (3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase~~."

Substantiation: If the intent is to achieve maximum reliability with the lowest impact to the distribution system during ground faults, such as system-wide black-outs, the prohibition of this overcurrent protection technology is questionable at best. This issue was put on HOLD in the previous code-change cycle and should be carefully re-considered for the 2011 NEC edition.
